

This file contains 179 comment letters received on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments. As noted in the Medicare Drug Price Negotiation Program: Revised Memorandum, Implementation of Sections 1191—1198 of the Social Security Act for Initial Price Applicability Year 2026 (the “revised guidance”), for comment letters from individuals not representing organizations, CMS has removed the name, address, and contact information of the individual for privacy purposes. Additionally, substantively duplicative comments (e.g., submitted as a part of a coordinated advocacy campaign) are combined into a single comment. Any organization, academic institution, or members of Congress or their staff have not been deidentified.

CMS received three substantively duplicative coordinated campaigns. The comment letter shown on page 2 had over 6,945 substantively duplicative comments. The comment letter shown on page 3 had over 155 substantively duplicative comments. The comment letter shown on page 4 had over 245 substantively duplicative comments.

CMS,

I was excited when the Inflation Reduction Act passed and Medicare was allowed to negotiate lower prices for key drugs. But I'm concerned about CMS' current plans for what Medicare drug price negotiation will actually look like:

I'm worried that using the current price of similar drugs as a starting point for negotiations will create too much of a bias in favor of the current — completely unfair — status quo that exists with Big Pharma monopoly pricing. Drug prices are already too high, so using current prices of alternative therapies as the starting point in negotiations will only ensure that drug prices stay too high.

Not only will using existing therapeutic alternative prices as a starting point bias negotiations towards prices that are too high, but taking this approach would also miss the opportunity for broader Medicare drug pricing impacts. If you successfully negotiate fair prices for Medicare, other manufacturers may start lowering prices for similar medications in order to stay competitive — further benefiting Medicare beneficiaries and taxpayers.

CMS should take a modified cost-plus approach, under which drug corporations are paid a fair portion of the revenue necessary to recover risk-adjusted R&D costs, accounting for therapeutic advancement, plus the marginal cost of production and distribution.

Please reconsider your approach to Medicare drug price negotiation and fight for lower drug prices, not the status quo that has led to our current prescription drug price crisis!

Thank you for your time.

A large black rectangular redaction box covering the signature and name of the sender.

Dear Administrator Brooks-LaSure:

As an individual with a rare disease called Gaucher Disease. I have a very expensive infusion every 2 weeks.

I urge you to implement the Inflation Reduction Act (IRA) in a way that works for the rare disease community.

I have been getting this treatment for many years and will continue for as long as I live.

Key provisions in the IRA, including the \$2,000 annual and amortized monthly caps on out-of-pocket costs for Medicare Part D beneficiaries that start in 2025 will ensure that more rare disease patients will be able to afford the life-altering therapies they need.

At the same time, the vast majority of the more than 7,000 known rare diseases do not have an FDA approved treatment. This makes continued research and innovation especially important to the rare disease community. Unfortunately, the small patient populations and medical complexity associated with rare diseases creates unique challenges to rare disease drug development and can make determining a "fair price" difficult.

Here are three tangible ways CMS can better support the rare disease community in the implementation of the IRA:

1. Patients and caregivers have key insights on issues such as determining the value of a therapy and how it compares to potential alternate treatment options. I urge you to expand the opportunities available to patients to provide input into the negotiation process by making it easy for patients to submit data and organizing patient listening sessions specific to selected drugs to collect representative data while CMS is preparing the initial offer for a negotiated price.
2. Once a drug's price has been negotiated, it has been shown to be appropriately priced according to CMS; therefore it should be placed on a higher formulary tier to reduce patient out-of-pocket costs. In addition, CMS should require Medicare Part D plans to significantly reduce or eliminate utilization management tools, including step therapy and/or prior authorization barriers to ensure patients are able to quickly access a negotiated product because health care providers, in partnership with their patients, are best positioned to choose the right therapy.
3. Clarify that orphan drugs are exempt from price negotiations until the drug is actually FDA-approved and marketed for more than one disease. Otherwise CMS risks creating big disincentives for rare disease drug development.

Thank you for keeping the complex needs of the rare disease community in mind when implementing this law.

Sincerely,

A black rectangular redaction box covering the signature area.

Dear Administrator Brooks-LaSure,

As you implement the Inflation Reduction Act, please solicit feedback from patients, as they could be the ones negatively impacted from any unintended consequences of the law. Anything that results in fewer choices, higher costs, or reduced access to medicines will be unacceptable for patients.

I appreciate your attention to this issue.

Thank you,

A solid black rectangular box used to redact the signature of the sender.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Seshamani:

340B Health represents over 1,400 public and private nonprofit hospitals that participate in the 340B federal drug discount program. We appreciate the opportunity to provide comments on the Center for Medicare's guidance regarding implementation of Sections 1191-1198 of the Medicare Drug Price Negotiation Program for initial price applicability in 2026.¹

The guidance specially addresses how manufacturers will make the Maximum Fair Price (MFP) available to pharmacies, noting that the MFP does not need to be available to providers that participate in 340B ("covered entities"), for qualifying drugs dispensed to 340B eligible patients, except in situations where the MFP is lower than the 340B ceiling price.² Since the MFP does not need to be made available to covered entities, except in rare situations, we understand the CMS guidance will not interfere with current 340B operations, and that covered entities will continue to use their existing 340B purchasing and dispensing processes for their Medicare patients that qualify for 340B, and that manufacturers will continue to provide the 340B discount at the time that the covered entity purchases the drug. We strongly support this position.

For situations where the MFP is lower than the 340B ceiling price, the guidance states that the manufacturer is responsible for providing the covered entity the difference between the MFP and the 340B ceiling price.³ This could happen as a result of errors made by the manufacturer when calculating the 340B price, prompting a recalculation of the 340B ceiling price that would apply retroactively. It could also happen during the first two quarters that a new MFP price applies, as that price will not have factored into the 340B statutory formula as the "best price" for purposes of calculating the ceiling price until the third quarter. Processes used by 340B covered entities

¹ CMS, Medicare Drug Price Negotiation Program, Initial Memorandum, March 15, 2023, <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

² *Id.* at 32-33.

³ *Id.* at 33.

distinguish claims that qualify for 340B from those that do not and 340B covered entities maintain extensive accumulation and purchase records that distinguish between drugs purchased at 340B and at non-340B prices. As such, covered entities will have records to support the manufacturer's obligation to repay the difference between the 340B price and the MFP. This holds true for covered entity pharmacies as well as for their contract pharmacies, as records must be maintained to identify which dispenses were for 340B drugs and which were for non-340B drugs in those situations as well. Maintenance of these records are a core requirement of 340B, and are regularly enforced by the Health Resources and Services Administration (HRSA) in audits.

Thank you for considering our comments. Please feel free to reach out to me if you have any questions or if we can provide any additional information.

Sincerely,

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani:

On behalf of our nearly 38 million members and all older Americans nationwide, AARP appreciates the opportunity to comment on the March 15, 2023, memorandum of proposed initial guidance pertaining to the implementation of the Medicare Drug Price Negotiation Program. AARP strongly supported the Medicare Drug Price Negotiation Program (hereinafter “Program”) and the other prescription drug-related policies contained in the Inflation Reduction Act of 2022 that will help address high prescription drug prices and costs. It is not fair or right to ask patients and taxpayers to continue paying for prescription drugs that have been priced based on what the market will bear. Successful implementation of the new federal law will help reduce prescription drug prices and costs and ensure that millions of older Americans are better able to access the prescription drugs they need at a price they can afford. It will also generate billions in savings for the Medicare program.

AARP commends CMS for soliciting input from the public on this guidance and appreciates its efforts to ensure that patients, caregivers, and health care providers have a voice in the negotiation process. AARP strongly believes that the needs of Medicare beneficiaries should remain paramount as the agency implements the Negotiation Program. To realize the savings that were intended, we encourage CMS to ensure that the negotiation process achieves the lowest possible maximum fair price (MFP) for each selected drug. It is also important for the agency to provide as much transparency as possible to help ensure that the public has confidence that MFPs are in fact fair and appropriate. CMS should place a high priority on conducting robust outreach and education for Medicare beneficiaries and health care providers to ensure that they are aware of the MFPs for selected drugs. These efforts should include clear, consumer-friendly reporting and appeals processes for when an MFP is not provided as required under the law.

AARP also strongly supports the collection and consideration of appropriate clinical evidence, including non-discriminatory drug value assessments, to inform CMS’ evaluations of selected drugs. We also support efforts to help ensure program integrity and reduce opportunities for drug companies to game the system.

While the statute that created the Program is broadly prescriptive, the agency is tasked with developing many specific details for the operation of the Program in a number of important areas. Below we offer more specific comments in response to the initial guidance.

Identification of Qualifying Single Source Drugs and Selected Drugs

AARP recognizes that section 30 of the initial guidance is considered final and not subject to comment, but nonetheless expresses its strong support for the agency's approach to establishing the date of approval or licensure that will determine when a drug is eligible for the negotiation process. By design, virtually all drug companies will have already made billions of dollars from selected drugs prior to the start of the negotiation process. Waiting 9 or 13 years, respectively, before an MFP for a traditional or biologic drug becomes available is already a very long period of time for beneficiaries and Medicare to be paying prices based on what the market will bear. Drug companies should not be given the opportunity to extend this period for longer.

AARP also supports CMS' approach to temporarily delay the selection of certain brand name biologic drugs for negotiation to protect against potential gaming of the selection process by drug companies. More specifically, AARP applauds CMS' approach that will assess whether there is a high likelihood that a competing biosimilar will enter the market in the two years after a brand name biologic drug becomes otherwise eligible for negotiation, which we believe will help curtail potential gaming of the system. AARP also appreciates that brand name biologic drug companies that enter into agreements with biosimilar drug companies that require or incentivize them to submit a delay request to CMS or restricts the quantity of the biosimilar that may be sold will not be able to benefit from this exemption. Such "pay for delay" gaming is well-known for its harmful impact on competition and helping to artificially maintain high prescription drug prices.

Supporting and Encouraging Further Transparency

AARP supports and strongly encourages transparency to the greatest extent possible in all aspects of the Program and especially throughout the negotiation process. While the statute limits how CMS can use or disclose propriety information, the statute nonetheless directs the agency to identify what information is in fact proprietary. AARP encourages the agency to consider, within the confines of the law, what is in the best interest of the Program and the public when determining which information is proprietary and to favor making relevant information publicly available whenever possible. This is especially important when the agency posts the MFP negotiated for a selected drug and its justification, where a high level of transparency will help instill confidence that the MFP represents the lowest price that the agency can reasonably obtain.

Negotiation Factors Regarding Therapeutic Alternatives and Consideration of Evidence from Any Interested Party

AARP supports CMS' decision to allow any interested party to submit data and evidence to CMS about therapeutic alternatives to drugs selected for negotiation. AARP agrees that

information from members of the public, including manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties, can play an important role in informing the agency's negotiating position. However, AARP is also extremely concerned that the amount of information that is submitted could be overwhelming and strongly encourages CMS to develop guardrails, potentially informed by best practices used by other health authorities, to help ensure that such input is meaningful and useful to the process.

AARP supports CMS' proposal to identify each FDA-approved indication for selected drugs and to identify therapeutic alternative(s) for each indication of the selected drug. We also agree that indications for therapeutic alternative(s) should include both FDA-approved indications *and* off-label uses that are supported by appropriate clinical evidence. In addition, AARP strongly supports CMS' decision to consider research on real-world evidence in Medicare-aged populations. AARP is aware that many prescription drugs are not tested under real-world conditions prior to FDA approval and appreciates the potential usefulness of this data in the negotiation process, and notes that CMS' interest could help encourage more drug companies to engage in such research.

AARP recognizes and supports the statutory prohibition against using evidence from comparative clinical effectiveness research that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill. However, AARP believes that there are health measures that do not violate this prohibition and that non-discriminatory drug value assessments are an extremely valuable source of information, and strongly supports using as much of such research as possible in the negotiation process. AARP also supports CMS' intent to consider studies that clearly separate prohibited evidence from other evidence that is relevant to the negotiation process.

AARP broadly supports the definitions included in Appendix C of the guidance, as such terms are applied for purposes of the negotiation process.

Developing Maximum Fair Price

AARP supports the proposed starting points for the initial offer for the MFP, including using the Medicare Part D net price and/or Average Sales Price (ASP) of therapeutic alternative(s) (or, in the case of multiple therapeutic alternatives, the range of net prices or ASPs) as the starting point; and using the Federal Supply Schedule or Big Four Agency price as the starting point if there is no therapeutic alternative or if use of the net price or ASP would result in a starting point higher than the statutory ceiling price. In the case of drugs with multiple therapeutic alternatives, AARP encourages CMS to consider using the lowest net price or ASP of all the alternatives as the starting point for the initial offer to help ensure that the MFP is the lowest price possible. AARP strongly supports adjusting the starting point for the initial offer based on clinical benefit, which will help ensure that the MFP reflects the value of the selected drug to Medicare beneficiaries and subpopulations of interest. AARP appreciates the breadth of evidence that CMS intends to include in this process and urges CMS to consider including non-discriminatory drug value assessments when appropriate and available. AARP also strongly supports the considerations CMS outlined for comparing the effectiveness and clinical benefit between a selected drug and its therapeutic alternatives and believes the considerations to be meaningful comparison points. Specifically, AARP supports CMS' intent to consider health outcomes,

intermediate outcomes that indicate a change in health outcomes, validated surrogate endpoints that predict a relevant health outcome, patient-reported outcomes, and patient experience. We also support CMS' intent to prioritize studies focused on the impact of the selected drug and its therapeutic alternatives on individuals with disabilities, the elderly, individuals who are terminally ill, and other patient populations represented among Medicare beneficiaries. AARP encourages CMS to also prioritize studies with participants from diverse racial and ethnic backgrounds that, as of 2021, make up an estimated 26 percent of the Medicare population.

Additionally, AARP supports the method specified for adjusting the preliminary price based on manufacturer reported data, and believes the method described will encourage an informed and appropriate initial offer amount. Specifically, AARP supports CMS' decision to compare research and development (R&D) costs to the relevant drug company's global, total lifetime net revenue in order to determine whether it has recouped its R&D costs. AARP supports a downward adjustment to be applied to the preliminary price if the unit cost of production and distribution is lower than the preliminary price; if the discovery and development funding was received from Federal sources; if the average commercial net price is lower than the preliminary price; or, if the selected drug has patents and exclusivities that will last for a number of years.

AARP strongly encourages CMS to develop a stringent process for validating manufacturer-submitted data, as it is essential that data used to inform the negotiation process are as accurate and complete as possible.

Finally, AARP appreciates the information that CMS intends to publish on its website regarding MFPs, including an explanation for the final price, and strongly urges CMS to publish as much information as possible. A high level of transparency will help ensure that the public has confidence that MFPs are fair and appropriate.

Consumer Protection, Oversight, and Manufacturer Compliance

AARP supports strong program integrity protections for the Medicare Drug Price Negotiation Program and seeks to ensure that the negotiation process captures as many high-cost drugs as possible. Thus, we are concerned that selected drugs cannot be replaced if they subsequently face generic or biosimilar competition and are removed from the negotiation process. We believe that this requirement has created the potential for gaming of the system and encourage CMS to take such actions as it can, consistent with the statute, to capture as many selected drugs in the negotiation process as possible for each initial price applicability year.

AARP is also concerned with the agency's reliance on a Primary Manufacturer (the holder of the NDA/BLA) to ensure that Secondary Manufacturer(s) (listed as the manufacturer in the NDA/BLA that markets the drug under an agreement with NDA/BLA holder) make the MFP for a selected drug available to MFP eligible individuals. While we are encouraged that the guidance speaks to the issue, AARP urges CMS to regularly monitor whether manufacturers, be they primary or secondary, are fully compliant with their duties under the law and guidance with respect to all duties under the Program. If manufacturers are not fully compliant, then appropriate sanctions should be promptly implemented to foster compliance.

As noted earlier, AARP strongly encourages CMS to develop a simple, straightforward process for beneficiaries and health care providers to report instances when eligible individuals do not

receive the MFP, and to seek reimbursement for any overpayments. The agency should also develop clear, concise educational materials and conduct regular outreach to beneficiaries, health care providers patient advocacy groups, State Health Insurance Assistance Programs (SHIPs), Area Agencies on Aging, and Medicare Part D plan sponsors on the Program generally. CMS should seek feedback from consumer advocates and organizations that work with Medicare beneficiaries about best practices and should also consider more targeted efforts as needed.

Both the statute and the initial guidance require CMS to monitor bona fide marketing to determine whether a drug is a qualifying single source drug. That monitoring is designed to ensure that the presence in the market of a generic drug means that there is robust and meaningful competition in the market. AARP strongly urges CMS to monitor for unusually low market penetration for new generic drugs that does not represent meaningful competition for a high-cost drug that would have otherwise been subject to negotiation. Strong oversight of whether competition is in fact bona fide is one of the pillars of program integrity that will ensure the success of the Program in lowering costs of medicines for the Medicare program and its beneficiaries.

Finally, the civil money penalties (CMPs) that the statute imposes for violations of the Program agreements are essential enforcement mechanisms to help ensure the goals of the Program are realized. For example, it is important for the integrity of the negotiation process that the information submitted to CMS for purposes of those negotiations be both comprehensive and accurate. While the goal is for full and honest disclosure of the requisite information to CMS for the negotiation process, it is important that manufacturers know the financial implications of any failure to do so. AARP encourages the judicious use of CMPs to ensure integrity in the negotiation process.

We thank you for the opportunity to submit comments on the initial guidance for the Program and look forward to its strong implementation. For decades, people in this country have paid the highest prices in the world for prescription drugs – often three times higher than people in other countries. Now is the time to change that. Effective implementation of this Program will represent a major victory for families across the country who are struggling to afford their prescriptions. It will also help encourage and appropriately reward the development of truly innovative products. AARP stands ready to assist in any way with these and other efforts to bring down drug prices and help older Americans afford the medications and treatments they need.

If you have any questions, please do not hesitate to contact me or Gidget Benitez at gbenitez@aarp.org.

Sincerely,

Re: “Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments”

Dear Dr. Seshamani:

AbbVie Inc. (“AbbVie”) appreciates the opportunity to provide feedback on the March 15, 2023, memorandum issued by the Centers for Medicare & Medicaid Services (“CMS”), entitled *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments* (“Guidance”), which contains guidance on how CMS intends to implement the “Drug Price Negotiation Program” of the Inflation Reduction Act (“IRA”).

AbbVie is a biopharmaceutical company committed to discovering and delivering transformational medicines and products in key therapeutic areas, including immunology, oncology, neuroscience, eye care, virology, and women’s health. Through this patient-focused approach, AbbVie does more than just treat diseases—it aims to make a remarkable impact on people’s lives. Innovation for patients is the lifeblood of our company. Since AbbVie’s launch in 2013, we have invested approximately \$50 billion in research to discover, develop, and deliver new medicines to patients.

The United States currently leads the world in innovation and high-risk drug development, with credit to American biopharmaceutical manufacturers who make the necessary investments to develop new, safe, and effective medications. However, the Guidance impedes Congress’s incentives for the biopharmaceutical industry to develop and test new treatments that benefit all Americans and to engage in the critical development and collaborative efforts needed to benefit patients. In fact, the Guidance seeks to implement policies that even undercut the Biden Administration’s broader health care priorities, such as the President’s Moonshot initiative to reduce the deadly impact of cancer.¹ Accordingly, AbbVie is concerned that the IRA—particularly as implemented in the CMS Guidance—will stymie these efforts and have serious unintended consequences for innovation and for patient care.

We are also concerned that, in this Guidance, CMS contemplates agency action that is unconstitutional or not authorized by Congress. Specifically, CMS is not taking adequate time to develop the processes necessary to implement the IRA faithfully. For example, CMS intends not to comply with essential notice-and-comment rulemaking procedures even though it seeks to impose substantive obligations and restrict private rights in ways that extend far beyond the statute’s text and the authority granted by Congress. The Guidance contravenes clear statutory mandates, imposes new and unauthorized enforcement and data acquisition requirements,

¹ See Cancer Moonshot, *available at*: <https://www.whitehouse.gov/cancermoonshot/>.

violates manufacturers' First Amendment rights, interferes with private contractual arrangements, and fails to include provisions necessary to protect confidential trade secret information.

AbbVie's requests, objections, and recommendations are set forth below. We respectfully urge CMS to reconsider the Guidance, to respond meaningfully to feedback submitted, and to take the time needed to implement the IRA consistently with the statute's provisions and basic constitutional law requirements.

I. The Guidance Exceeds CMS's Statutory Authority for Determining Which Drugs Will be Subject to the "Drug Price Negotiation Program."

A. The IRA's Definition of a Qualifying Single Source Drug ("QSSD") Referring to a Bundle of Drug Products Renders the Entire "Drug Price Negotiation Program" Unworkable (Sections 30.1, 60.1, 60.2, 60.5).²

CMS interprets a QSSD to refer to:

- "For drug products, all dosage forms and strengths of the drug with the same *active moiety* and the same holder of a New Drug Application (NDA), inclusive of products that are marketed pursuant to different NDAs;" and
- "For biological products, all dosage forms and strengths of the biological product with the same *active ingredient* and the same holder of a Biologics License Application (BLA), inclusive of products that are marketed pursuant to different BLAs."³

In other words, each QSSD that CMS designates as a selected drug for price "negotiation" represents a bundle of all drug/biological products from the same NDA/BLA holder having the same active moiety/ingredient. CMS's interpretation that a QSSD refers to a bundle of drug products is *ultra vires*, violates the IRA's explicit requirements, and contravenes Congress's framework for selecting only a limited number of drug products each year.

CMS must comply with the definition of a QSSD provided in the IRA. Under the IRA, a "Drug Product" or "Biological Product" must satisfy several criteria to fall within the statutory definition of a QSSD: (i) it must be a product covered by Medicare Part B or Part D, (ii) it must be approved by the FDA for at least 7 years (for drugs) or licensed by the FDA for at least 11 years (for biologics), and (iii) it must not be the reference listed drug for an approved and marketed generic drug under FDCA § 505(j) or the reference product for an approved and marketed biosimilar under PHSA § 351(k).⁴ Drug and biological products that do not meet these statutory criteria cannot be QSSDs or selected drugs subject to the IRA's price controls.

The IRA's definition of a QSSD does not contemplate bundling different drug products as a single QSSD, nor does it mention using the "active moiety" or "active ingredient" to describe a QSSD. Indeed, the IRA's definition forecloses using an "active moiety" or "active ingredient" to delineate the scope of a QSSD. The relevant statutory language can be paraphrased as follows:

² AbbVie recognizes that CMS has not asked for feedback on section 30 of its Guidance, which CMS has deemed final. AbbVie is therefore not providing feedback on section 30 in its entirety and with respect to all of its provisions. Nonetheless, AbbVie reserves its rights, including its position that section 30's provisions are unlawful and not enforceable. Section 30 does not comply with the definition of QSSD provided in the statute and represents *ultra vires* action. CMS's failure to undertake public notice-and-comment rulemaking on this important provision is unlawful and violates constitutional requirements, and we have significant due process concerns. Since many pieces of the Guidance are based on CMS's erroneous interpretation of QSSD, we do address the effect this erroneous definition has on the entire "Drug Price Negotiation Program."

³ Guidance § 30.1 (emphasis added).

⁴ Social Security Act ("SSA") § 1192(e).

“[t]he term ‘qualifying single source drug’ means . . . a drug . . . that is not the listed drug for any [generic] drug that is approved and marketed under [FDCA § 505(j)].”⁵ Under FDCA § 505(j), the “listed drug” for a generic drug must be an FDA-approved finished drug product—not an active moiety.⁶ To be approved and marketed under FDCA § 505(j), a proposed generic drug must rely on a listed drug that, among other shared characteristics, has the same route of administration, dosage form, and strength as the proposed generic drug.⁷ Only finished drug products—not active moieties—exhibit such characteristics. Indeed, a proposed generic drug submitted for approval in an ANDA that relies solely on a particular active moiety as its listed drug—but which is agnostic as to dosage form, strength, and route of administration—could not be approved by FDA. Similarly, the PHSA defines a “reference product” for a biosimilar to mean “the *single biological product* licensed under subsection (a) against which a [biosimilar] biological product is evaluated in an application submitted under subsection (k).”⁸ Biosimilar products, like generic drugs, must also match the strength, route of administration, and dosage form of a “reference product” to be licensed and marketed under PHSA § 351(k).⁹ By cross-referencing the established definitions of a generic drug “approved and marketed under section 505(j)” of the FDCA and a biosimilar product “licensed and marketed under section 351(k)” of the PHSA, Congress purposefully defined a QSSD to refer to a specific referenced product—not its active moiety or active ingredient.

CMS’s misapplication of the IRA’s definition of a QSSD expands the scope of what constitutes a “selected drug,” rendering the process for negotiating a single “maximum fair price” (“MFP”) for such selected drug unworkable. The IRA instructs CMS to rank the negotiation-eligible QSSDs by the highest total expenditures to create the “selected drug” list.¹⁰ Then, the IRA directs CMS to “negotiate a maximum fair price for such [selected] drug.”¹¹ However, since CMS has interpreted a “selected drug” to represent a bundle of finished products containing the same active moiety or active ingredient, CMS must reconcile how this single MFP can be equitably applied across all dosage forms and strengths of such active moiety or active ingredient. As discussed in Section III below, CMS’s Guidance relies on complex and arbitrary formulas to aggregate prices across finished products, and then creates a single MFP to be applied across all dosage forms and strengths of the selected drug, and then further disaggregates the single MFP to determine what is the actual MFP provided to patients.¹² The IRA directs CMS to publish this MFP “for such [selected] drug negotiated with the manufacturer.”¹³ CMS apparently recognizes that establishing a single MFP across all dosage strengths and dosage forms of a selected drug in CMS’s QSSD bundle is unworkable. As such, CMS states that it “intends to publish the MFP at the per unit (e.g., tablet) level for each dosage form and strength associated with the selected drug.”¹⁴ CMS’s machinations to determine what is the single MFP for each selected drug, while still meaningfully informing patients of what MFP would apply to their drug product, directly results from CMS’s

⁵ SSA § 1192(e)(1).

⁶ 21 U.S.C. § 355(j)(2)(A)(i); see also 21 C.F.R. § 314.3(b) (defining a “listed drug” as “a new *drug product* that has been approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act for safety and effectiveness or under section 505(j) of the Federal Food, Drug, and Cosmetic Act, which has not been withdrawn or suspended under section 505(e)(1) through (5) or section 505(j)(6) of the Federal Food, Drug, and Cosmetic Act, and which has not been withdrawn from sale for what FDA has determined are reasons of safety or effectiveness”) (emphasis added).

⁷ FDCA § 505(j)(2)(A)(i), (iii).

⁸ 42 U.S.C. § 262(i)(4).

⁹ PHSA § 351(k)(2)(A)(i)(IV).

¹⁰ SSA § 1192(a), (c).

¹¹ SSA §§ 1193(a)(1), 1194(a)(1) (emphasis added).

¹² Guidance §§ 60.1, 60.2.2-4.

¹³ SSA § 1195(a)(1).

¹⁴ Guidance § 60.5.

disregard of Congress's commands, rewriting the definition of a QSSD to refer to a bundle of drug products having the same active moiety or active ingredient.

B. CMS's Guidance Undermines Innovation by Expanding the Scope of the IRA's Drug Price Controls Far Beyond What Congress Intended (Section 60.5).

The IRA limits the number of drugs that CMS may select for price setting each year—starting with 10 negotiation-eligible Part D drugs in the first year (2026) and increasing to 20 negotiation-eligible Part B and D drugs for the fourth year (2029) and beyond.¹⁵ CMS's approach, which impermissibly bundles together a manufacturer's finished products containing the same active moiety or active ingredient, contravenes Congress's framework for selecting only a limited number of drug products each year to subject to price controls. And once a single product in such a bundle has been approved for 7 years (or 11, in the case of a biological product), all products in the bundle would be potentially subject to price controls. CMS would "negotiate" a price that it would apply to each manufacturer's products having the same active moiety or active ingredient, including new products that have just been approved and launched, and even new products introduced after the Manufacturer Agreement is signed and the "negotiation" occurs.¹⁶ This defies Congress's manifest intent to restrict the IRA's price controls to only products that have been on the market for an extended period without generic or biosimilar competition. Sweeping newly approved drug products into the IRA's price controls would severely harm innovation in the biopharmaceutical industry—ultimately, to the detriment of patient care.

CMS's Guidance undermines the incentives Congress has provided for the biopharmaceutical industry to continue innovating around previously approved active moieties and active ingredients. Presently, continuing innovation is not only common in the biopharmaceutical industry but also a natural consequence of the modern drug approval paradigm. The research and development necessary to develop the first FDA-approved product with a novel active moiety or active ingredient is resource intensive and fraught with risk. As a result, an innovator company will often file its NDA/BLA with the FDA once it completes enough research and development to secure its first approval, even though it may have already started research and development on further improvements. This prioritizes getting safe and effective drug and biological products to patients as soon as FDA approval is possible. CMS's Guidance changes this paradigm. With CMS failing to honor the IRA's 7- and 11-year protections from drug selection, the timing of when and in which order a manufacturer seeks FDA approval first for a novel active moiety or active ingredient becomes significant.

Patients benefit from the continued investment by the biopharmaceutical industry to develop new and improved products of previously approved active moieties or active ingredients. For example, new dosage forms, strengths, and routes of administration may: (i) enhance effectiveness for the same or new indications—e.g., by providing for controlled release of the active ingredient, or new dosing regimens required for new indications; (ii) present a better adverse event profile—e.g., by reducing the incidence of injection site reactions for an injectable product; (iii) improve patient compliance—e.g., by reducing frequency of administration; and (iv) otherwise offer distinct advantages to specific patient groups. Healthcare professionals benefit from the flexibility to treat the individual needs of their diverse patients with a precise selection from a range of products, leading to better health outcomes.

FDA's annual review of new drug approvals highlights the significant benefits to patient health from the biopharmaceutical industry's innovation surrounding new formulations and dosage forms of previously approved active ingredients, including the following examples:

¹⁵ SSA § 1192(a).

¹⁶ Guidance § 60.5.1.

- “Tivicay PD (dolutegravir), tablets for oral suspension, approved in 2020 to treat HIV-1 infection in pediatric patients . . . Dolutegravir was originally approved by CDER in 2013 to treat HIV-1 infection in adults and children 12 years of age and older . . . This approval expands the patient population approved to use this drug to include much younger and smaller children—a *significant advance*; for babies and young children with HIV, getting treatment early is very important as HIV can progress more quickly in children than adults.”¹⁷
- “Baqsimi (glucagon), nasal powder, approved [in 2019] to treat patients with diabetes ages four and older who have severe hypoglycemia --- which occurs when a patient’s blood sugar level falls to a point where he or she becomes confused or unconscious or suffers from other symptoms that require assistance from another person to treat. [Glucagon was originally approved by FDA in 1960.] Until this approval, people suffering from a severe hypoglycemic episode had to be treated with a glucagon injection that first had to be mixed in a several-step process. *This new way to administer glucagon may simplify the process, which can be critical during an episode*, especially since the patient may have lost consciousness or may be having a seizure.”¹⁸
- “Cuvrior (trientine tetrahydrochloride) tablets were approved in 2022 with the previously approved active ingredient trientine to treat patients with stable Wilson’s disease, a genetic disorder in which excess copper builds up in the body. . . Cuvrior does not require refrigeration, unlike the original formulation of trientine [originally approved by FDA in 1985].”¹⁹

Subjecting newly approved products to price setting on account of the active moiety or active ingredient’s initial entry to the market undercuts the incentive to invest in developing these new products. Patients ultimately lose if the investment in continued innovation becomes too risky.²⁰

C. The Guidance Establishes an Unauthorized, *Ultra Vires* Process for CMS to Determine Which Drugs May Be Selected and When to Remove Drugs from the Selected Drug List (Sections 60.7, 70, 90.4).

The IRA is intended to focus on drugs that have been on the market for extended periods of time without any generic or biosimilar competition, and Congress intended for only those qualifying drugs that are truly “single source” to be subjected to the IRA’s “Drug Price Negotiation Program.” Under the IRA, a drug product that is the listed drug for any generic that is “approved and marketed” under FDCA § 505(j) or a biological product that is the reference product for any biosimilar that is “licensed and marketed” under PHSA § 351(k) is ineligible to be a QSSD.²¹ Similarly, a drug is removed from the selected drug list following CMS’s determination that an

¹⁸ FDA, Center for Drug Evaluation and Research, *Advancing Health Through Innovation: New Drug Therapy Approvals 2019* (Jan. 2020), at 37, available at <https://www.fda.gov/media/134493/download> (emphasis added).

¹⁹ FDA, Center for Drug Evaluation and Research, *Advancing Health Through Innovation: New Drug Therapy Approvals 2022* (Jan. 2023), at 25, available at <https://www.fda.gov/media/164429/download>.

²⁰ See Congressional Budget Office, Research and Development in the Pharmaceutical Industry, at 11, box 3 (April 2021), <https://tinyurl.com/bddtnbtX> (discussing how price controls would reduce incentives for innovation and decrease the number of new drugs that could be brought to market).

²¹ SSA § 1192(e)(1)(A), (B).

approved generic under FDCA § 505(j) or a licensed biosimilar under PHSA § 351(k) has been “marketed pursuant to such approval or licensure.”²²

CMS is moving far beyond Congress’s statutory framework and its authority as an agency by imposing a heightened requirement for a generic or biosimilar to be deemed “marketed.” Instead of performing the straightforward determination that Congress required, CMS has crafted a complex, extra-statutory scheme requiring “*bona fide* marketing” based on CMS’s evaluation of whether there has been “robust and meaningful” competition from a generic or biosimilar.²³ This is an impermissible overstep of CMS’s authority under the IRA.²⁴ CMS does not have the expertise to determine whether a generic or biosimilar creates enough “robust and meaningful” competition.

“Marketing” of a generic or biosimilar product is a well-established and well-defined term—it means the introduction or delivery for introduction into interstate commerce of a drug product. This concept of marketing is applied consistently in FDA and CMS regulations and guidance governing drug and biological products.²⁵ Indeed, in Appendix C of the Guidance, CMS adopts this definition of marketing for purposes of reviewing a selected manufacturer’s data under SSA §§ 1193(a)(4)(A) and 1194(e)(1) but not for purposes of determining when to remove drugs from the selected drug list under SSA § 1192(c)(1)(A).²⁶ Congress did not intend separate definitions of “marketing” for different parts of the statute. Nor did Congress grant CMS discretion to adopt a new definition of “marketing” that is inconsistent with its established meaning existing at the time of passage of the IRA.

Despite the statute’s plain meaning, however, CMS’s Guidance creates extra-statutory requirements under which CMS will give credence to a generic drug or biosimilar’s marketing only if it is “*bona fide*.”²⁷ CMS’s Guidance contends that “*bona fide*” marketing requires monitoring for “robust and meaningful competition,” which will include considering factors such as whether a generic drug or biosimilar is available for purchase “in sufficient quantities” and the drug’s market share.²⁸ Nothing in the statute contemplates such monitoring. Nor does the statute support the vague terms and arbitrary lines CMS seeks to draw by establishing metrics like “sufficient quantities” and “market share.”

²² SSA § 1192(c)(1)(A).

²³ Guidance §§ 60.7, 70, 90.4.

²⁴ Guidance § 90.4. See *Gonzales v. Oregon*, 546 U.S. 243, 257 (2006) (finding that the Attorney General lacked legal authority under the Controlled Substances Act to regulate medical practices); *Rapanos v. United States*, 547 U.S. 715 (2006) (finding EPA lacked the power to regulate wetlands under the Clean Water Act because they did not qualify as “navigable waters”).

²⁵ See, e.g., 21 C.F.R. § 314.3 (defining “commercial marketing” as “the introduction or delivery for introduction into interstate commerce of a drug product described in an ANDA, outside the control of the ANDA applicant”); 21 C.F.R. § 330.14(b)(2) (describing market history requirements for inclusion in the OTC drug monograph system); see also *Sandoz, Inc. v. F.D.A.*, 439 F. Supp. 2d 26 (D.D.C. 2006) (explaining that the date the generic manufacturer began distributing its generic drug constituted “the first commercial marketing of the drug” and triggered the start of the generic manufacturer’s 180-day exclusivity); Medicaid Drug Rebate Data Guide for Labelers § 4.15 (August 2018) (“Market Date: For S, I, and N drugs marketed under an FDA-approved application (e.g., BLA, NDA, ANDA), the earliest date the drug was first marketed under the application number by any labeler.”); National Drug Rebate Agreement Between HHS and the Manufacturer, 83 Fed. Reg. 12,784 (Mar. 23, 2018) (“‘Marketed’ means that a covered outpatient drug is available for sale by a manufacturer in the states.”).

²⁶ Guidance at Appendix C (“‘Marketing’ is defined as the introduction or delivery for introduction into interstate commerce of a drug product.”).

²⁷ Guidance §§ 60.7, 70.

²⁸ Guidance § 90.4.

CMS also intends to review Medicare Part D Prescription Drug Event (“PDE”) data as a proxy to determine whether there has been *bona fide* marketing of a generic or biosimilar. This proxy is inappropriate, because it is not indicative of broader market realities beyond the Medicare program and, therefore, not a reliable indicator of when a drug is marketed.²⁹ A generic or biosimilar product may be marketed but have little Part D utilization. This could result from a time lag associated with securing placement on Part D formularies or difficulties negotiating for Part D formulary inclusion. There are other data sources CMS itself has available that indicate whether a drug is being marketed, such as the National Average Drug Acquisition Cost (NADAC) for Medicaid Covered Outpatient Drugs survey, which CMS updates weekly for generic drugs.³⁰

Also, CMS arbitrarily focuses on looking back at 12 months of data to determine whether a generic or biosimilar manufacturer has engaged in *bona fide* marketing.³¹ CMS fails to explain why a 12-month period is appropriate for this determination. The IRA clearly requires that, in order for a drug to be considered multi-source, the generic or biosimilar product will have been marketed at the time of CMS’s determination—not that the generic or biosimilar has met some undefined level of market performance over an arbitrary length of time.

D. CMS Should Be Transparent About the Process by Which a Drug Product Is Deemed a Selected Drug and Eventually Exits the Selected Drug List.

CMS’s Guidance is devoid of much-needed certainty and transparency, depriving stakeholders of meaningful opportunity to engage throughout the process. For example, under CMS’s Guidance for initial price applicability year (“IPAY”) 2026, manufacturers of selected drugs will not have certainty of which drug products will be subject to the “Negotiation Program” until September 1, 2023, giving them a mere 30 days to collect required information and determine whether to sign the Manufacturer Agreement or be subject to an exorbitant excise tax.

AbbVie urges CMS to ensure additional transparency along all steps of this process, including by publishing (1) its supporting calculations regarding how it determined the list of selected drugs; (2) for both newly selected drug products and drug products that remain on the selected drug list, its determinations that those drug products are not the listed drug or reference product for an approved and marketed generic or a licensed and marketed biosimilar; and (3) how those determinations were reached. In addition, CMS should ensure transparency with respect to delay requests of biosimilar manufacturers by publishing a list of biosimilar manufacturers submitting an Initial Delay Request, including the date by which CMS will approve or reject those requests, and by making CMS’s delay decisions known publicly. Taking those steps is critical to ensure predictability and accountability in the process. Moreover, because reference product sponsors are potentially liable for rebates under the biosimilar delay provisions, they should have notice and an opportunity to comment before a delay is granted or denied.

II. The “Negotiation” Process Is Not Properly Designed to Result in a Fair Negotiation.

AbbVie is concerned that both the IRA and CMS’s Guidance characterize the IRA’s price-setting provisions as creating a “negotiation” process when, in reality, they provide no meaningful opportunity for manufacturers to develop and submit information to influence CMS’s decisions.

²⁹ Guidance §§ 30.1, 70.

³⁰ <https://www.medicaid.gov/medicaid/prescription-drugs/retail-price-survey/index.html>.

³¹ Guidance §§ 30.1, 70.

A. The Guidance’s Process to Establish a Single Maximum Fair Price Exceeds CMS’s Authority and Contravenes Congress’s Intent (Sections 60.1, 60.4, 60.5).

The IRA directs CMS to generate a single MFP per drug,³² which is inconsistent with CMS’s interpretation of QSSD. Due to this erroneous interpretation, CMS has proposed distorting pricing metrics by aggregating across products, generating an overarching MFP, and dividing up this metric using complex and arbitrary formulas.³³ That approach exceeds CMS’s authority, violates the statute’s express mandates, and contravenes Congress’s intent.

It is also concerning that CMS intends to base the single price on the cost of the selected drug per 30-day equivalent supply, weighted across dosage forms and strengths, instead of per unit (e.g., a tablet, capsule, injection, or per volume or weight-based metric) for the purposes of determining a single price included in an initial offer.³⁴ This approach does not reflect patients’ true experiences, including how many doses a patient must take, side effects, efficacy, adherence, and other factors that significantly influence patient outcomes. For many drugs, a 30-day supply differs from patient to patient depending on any number of factors, such as patient weight, severity of condition, and the indication for which the product is prescribed. Many drugs also require ramp-up protocols or frequent changes in dosage, and other medicines are only utilized by patients on an as-needed basis. Moreover, CMS would be treating an active moiety (or active ingredient) as though it is the same across different types of delivery, which also does not reflect the patient experience—nor does it reflect the differing costs across delivery devices, which sometimes can be significant (e.g., the cost difference between an on-body injector and a prefilled syringe, or a complex ophthalmic dispenser versus a vial).

In addition, CMS’s proposal to determine a single 30-day equivalent supply by volume weighting multiple price points based on the presentations’ Medicare Part D utilization during the 12-month period ending May 31, 2023, does not reflect real world experience. Because this weighting does not correct for any of the patient-specific conditions noted above, it could result in a price point that is not reflective of actual cost or value of any specific presentation, but rather a split-the-difference average that undervalues some presentations while overvaluing others.

B. The Methodology for Developing an Initial Offer is Also Flawed (Sections 60.2, 60.3).

Similarly concerning, CMS is relying on flawed reasoning when developing an initial offer by “(1) identify[ing] therapeutic alternative(s), if any, for the selected drug . . . (2) us[ing] the Part D net price . . . and/or the Part B average sales price (ASP) for the therapeutic alternative(s) . . . (3) evaluat[ing] the clinical benefit of the selected drug (including compared to its therapeutic alternative(s)) . . . and (4) further adjust[ing] the preliminary price by the negotiation factors outlined in section 1194(e)(1) of the Act.”³⁵

The statute requires that the ceiling “*for the MFP* for a selected drug shall not exceed the lower of . . . an amount equal to the sum of the plan specific enrollment weighted amounts; or . . . an amount equal to the applicable percent, with respect to the selected drug, of the average [inflation-adjusted 2021] non-FAMP.”³⁶ In the Guidance, however, CMS states that it intends to have the *starting point for the initial offer* capped at the *MFP* ceiling price. CMS would take this approach, even if the price for a therapeutic alternative is higher—or, if there is no therapeutic alternative, if the Federal Supply Schedule/“Big Four” price is higher. Nothing in the statute authorizes CMS to impose a new requirement that the steps *within the initial offer* process cannot

³² See, e.g., SSA §§ 1191(c)(3) and 1194(c); Guidance §§ 60.1, 60.5.

³³ *Id.*

³⁴ *Id.*

³⁵ Guidance § 60.3.

³⁶ Guidance § 60.2.1 (emphasis added).

include prices higher than the *MFP* ceiling price—only that the ultimate MFP cannot be higher than the MFP ceiling price (and CMS has not undertaken the notice-and-comment rulemaking procedures that would be required to impose such a requirement). This approach not only runs afoul of statutory intent, but it also could result in unintended consequences that do not reflect the reality of market dynamics.

CMS states that it will *penalize* manufacturers by *decreasing* the initial price offer for selected drugs whose research and innovation has been recognized with the award of patents and FDA exclusivities.³⁷ As an example, CMS states that “if the selected drug has patents and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward.”³⁸ This policy repudiates the foundation under which the United States’ robust biopharmaceutical industry was built. CMS’s Guidance presents a clear and direct conflict with the purpose of the patent system to promote innovation and the purpose of the federal regulatory schemes conferring FDA exclusivities to encourage drug development. CMS’s Guidance harms those manufacturers that have invested in innovative research and development. This serves to blunt the incentive for manufacturers to continue to innovate and publicly disclose their inventions in patent applications. Similarly, CMS’s Guidance would serve to actively disincentivize the areas for which Congress has tried for years to incentivize biopharmaceutical research and development, including pediatric research, orphan drugs, and antibiotics. Pediatric exclusivity, and the children that Congress sought to help by incentivizing research and development for new products intended to treat pediatric patients, are in particular harmed by CMS’s approach, because the pediatric exclusivity runs after the expiry of any patent and regulatory exclusivity listed in the FDA’s Orange Book—the same period of time that the selected drug would be impacted by the IRA’s price controls. Perversely, CMS’s Guidance will penalize manufacturers for conducting those clinical studies in young children for which pediatric exclusivity is granted. CMS’s policy would thus punish—not reward—the investments in research and development that improve care for patients, in particular pediatric patients.

In addition, as CMS examines available evidence about therapeutic alternatives as the basis for determining offers and counteroffers, we note that therapeutic alternatives will almost invariably be indication specific. CMS should take into consideration whether a therapeutic alternative is medically appropriate for the same group of patients, and not just rely on the Part D net price and/or ASP of therapeutic alternatives for a selected drug (which itself has been inappropriately bundled across all formulations). All decisions should be driven by clinical guidelines, real world practice, and evidence-based medicine. The Guidance states that CMS intends to consider whether the product “represents a therapeutic advance compared to existing therapeutic alternatives”³⁹ and whether it fills an “unmet medical need.”⁴⁰ CMS should be aware that these determinations are extremely complex scientifically and have significant implications for the FDA approval process, comparative efficacy claims, labeling and promotion, and more.

C. The Process Is Not a True “Negotiation” and Does Not Adequately Engage Manufacturers or Account for Patient Experiences (Sections 50, 60.3, 60.4).

Unfortunately, the “negotiation factors” and “negotiation process” outlined in the Guidance amplify the unconstitutional nature of the IRA’s “Drug Price Negotiation Program.” The factors and the vague “process” provided do not allow for meaningful engagement from manufacturers and other critical stakeholders, and they do not adequately account for true patient experiences. To have a meaningful process, CMS should engage with manufacturers—along with other

³⁷ Guidance § 60.3.4.

³⁸ *Id.*

³⁹ Guidance § 50.2.

⁴⁰ *Id.*

stakeholders, such as health care providers—to define important outcomes and appropriate therapeutic alternatives. From a clinical perspective, manufacturers should also be able to provide information and evidence as it relates to the totality of a selected drug product. Furthermore, CMS should provide more transparency into the criteria CMS will utilize to identify academic experts, clinicians, and other interested parties who may weigh in on therapeutic alternatives, and it should have a transparent and even-handed process if the public disagrees with CMS’s selection of these experts.

Also troubling, CMS has said that it intends to offer only up to three meetings with manufacturers, and only if the manufacturer’s written counteroffer is not accepted by CMS. In other words, CMS intends to conduct the “negotiation process” using arbitrary benchmarks and without accepting adequate feedback from manufacturers or other stakeholders. This lack of ability for manufacturers to engage with CMS in a meaningful way is especially alarming because manufacturers of selected drugs must “agree” to “negotiate” or otherwise be subject to an excessive excise tax. This not only emphasizes the concerns around lack of proper process, but it also highlights that the process is not a true negotiation.

III. The Guidance Mandates Unreasonable Obligations on Primary Manufacturers.

CMS intends to enter into “Medicare Drug Price Negotiation Program Agreements” not with *all* manufacturers of selected drugs, but only with those manufacturers that hold the NDA(s) or BLA(s) for selected drugs, deemed the “Primary Manufacturers.”⁴¹ The Guidance also dictates that the Primary Manufacturer will be held liable for any failure by a Secondary Manufacturer to provide its information to the government and to make the MFP available to eligible individuals.⁴²

CMS has departed from the statutory definition of “manufacturer” by determining that a single “Primary Manufacturer” will be responsible for fulfilling the statutory “requirements” for any selected drug, including by providing information held by third parties. Nothing in the IRA distinguishes between “Primary Manufacturers” and “Secondary Manufacturers.” To the contrary, the statute states: “[t]he term ‘manufacturer’ has the meaning given that term in section 1847A(c)(6)(A) [of the SSA].”⁴³ That definition cross-references section 1927(k)(5) of the SSA, which defines a manufacturer as:

any entity which is engaged in—

(A) the production, preparation, propagation, compounding, conversion, or processing of prescription drug products, either directly or indirectly by extraction from substances of natural origin, or independently by means of chemical synthesis, or by a combination of extraction and chemical synthesis, or

(B) in the packaging, repackaging, labeling, relabeling, or distribution of prescription drug products.

⁴¹ The guidance defines a “Primary Manufacturer” as the entity that holds an NDA(s)/BLA(s) for the selected drug, and it defines a “Secondary Manufacturer” as any other entity that meets the statutory definition of manufacturer for a drug product included in the selected drug and that either (1) is listed as a manufacturer in an NDA or BLA for the selected drug or (2) markets the selected drug pursuant to an agreement with the Primary Manufacturer. The definition for a Secondary Manufacturer also includes any manufacturer of any authorized generics and any re-packer or re-labeler of the selected drug that meet these criteria. Guidance § 40.

⁴² See Guidance § 90.2.

⁴³ SSA § 1191(c)(1).

Such term does not include a wholesale distributor of drugs or a retail pharmacy licensed under State law.⁴⁴

The Guidance departs from this statutory definition clearly referenced in the IRA.

It is concerning that CMS's Guidance seeks to impose binding requirements that Congress did not intend. The Guidance makes the Primary Manufacturer responsible to CMS when it signs an "agreement" to "negotiate" with the Secretary (or else be subject to a steep excise tax), and for not only its own information and conduct, but also that of every Secondary Manufacturer. CMS's Guidance does not provide any mechanism for Primary Manufacturers to collect information from Secondary Manufacturers or to control the prices at which Secondary Manufacturers sell their goods. While we understand that an entity required to comply with certain laws must make sure its agents or subcontractors comply with those laws as well, relationships between Primary and Secondary Manufacturers are not the same as those of entities and their agents. Even for those Primary and Secondary Manufacturers that do have an existing contractual relationship, CMS's Guidance risks irreparable harm by transforming those parties' relationships and rendering their existing contracts effectively void.⁴⁵ There is no evidence that Congress intended to authorize CMS to transform the pharmaceutical industry's ability to engage in private contractual relations.

We are also concerned that CMS cannot guarantee the confidentiality of Secondary Manufacturers' proprietary information because, under the Guidance, the Primary Manufacturer will be the conduit for the submission of the Secondary Manufacturer's information. Requiring the Secondary Manufacturer to provide its data to the Primary Manufacturer strips the Secondary Manufacturer of its proprietary information, and CMS cannot guarantee the confidentiality of the Secondary Manufacturer's proprietary data. The government cannot ensure that proprietary information "shall be used only by the Secretary"⁴⁶ and simultaneously require that it be turned over to (and verified for completeness by) a manufacturer's direct competitor.

The forced transfer of such highly sensitive data between private firms also raises anti-competitive concerns, especially when the Primary Manufacturer and Secondary Manufacturer are direct competitors. Indeed, re-packaged/re-labeled drugs often compete with branded products, and manufacturers of authorized generics often launch their own non-authorized generic drugs and end up in fierce competition with NDA-holding manufacturers. Critical pricing data are rarely shared between brand and authorized generic manufacturers for competitive and antitrust reasons, and the unauthorized disclosure of such information would result in far-reaching, irreparable harm. CMS recognized these concerns in the 2016 line extension rule when it backed away from a similar conflation of Primary and Secondary Manufacturers.⁴⁷ There is no reason it should take a different approach under the IRA, a statute that does not authorize CMS to distinguish between Primary and Secondary Manufacturers, let alone authorize CMS to impose

⁴⁴ Codified at 42 U.S.C. § 1396r-8(k)(5).

⁴⁵ See *E. Enterprises v. Apfel*, 524 U.S. 498, 523, 527 (1998) (plurality) (economic regulation that interferes with a contract or "investment-backed expectations" may affect a taking); *id.* at 547 (Kennedy, J., concurring) (economic regulation with retroactive effect may violate due process).

⁴⁶ SSA § 1193(c).

⁴⁷ "We are persuaded by the comments regarding the concerns associated with sharing of pricing data between competing manufacturers and have changed our position concerning the inclusion of another manufacturer's pricing data in the calculations of the additional rebate for line extension drugs. We also recognize the challenges of obtaining pricing information from non-related manufacturers, based on the comments received. Therefore, we are applying the line extension obligations to drugs that are manufactured by the initial brand name listed drug company and any other companies that have a corporate relationship with the manufacturer of the initial brand name listed drug." 81 Fed. Reg. 5170, 5267 (February 1, 2016).

obligations on NDA-holding manufacturers to be responsible for obtaining sensitive, proprietary information from competitors.

IV. The Guidance Raises Concerns Regarding Treatment of Proprietary Information.

CMS's Guidance improperly threatens to strip manufacturers of their rights in their own confidential trade secret and proprietary information. Numerous provisions call for the submission of confidential and trade secret information beyond what the IRA authorizes. While CMS's Guidance states that it intends, for IPAY 2026, to treat certain data elements submitted by a Primary Manufacturer as confidential,⁴⁸ AbbVie has concerns with what data will be protected and how that data may be used and disclosed. The absence of adequate guidelines raises significant concerns, because disclosure could result in significant and irreparable harm.

A. CMS Must Ensure, with Deference to Manufactures, That Proprietary Information Is Used Only for Purposes of Carrying Out the "Drug Price Negotiation Program" (Section 40.2.1).

The IRA provides that proprietary information (as determined by the Secretary) that a manufacturer submits "shall be used only by the Secretary or disclosed to and used by the Comptroller General of the United States for purposes of carrying out the [Negotiation Program]."⁴⁹ CMS acknowledges that "proprietary information, including trade secret and confidential commercial or financial information, is protected from disclosure under Exemption 4 of the Freedom of Information Act (FOIA) (5 U.S.C. § 552(b)(4))."⁵⁰ CMS also notes that it "intends to implement a confidentiality policy that is consistent with existing requirements for protecting proprietary information, such as Exemption 4 of FOIA. CMS intends to strike an appropriate balance between (1) protecting the highly sensitive information of manufacturers and ensuring that manufacturers submit the information CMS needs for the Negotiation Program and (2) avoiding treating information that does not qualify for such protection as proprietary."⁵¹

AbbVie agrees with CMS's plans to implement a confidentiality policy that is consistent with existing legal and regulatory requirements, including Exemption 4 of FOIA. AbbVie also agrees that non-public, confidential business information should be treated as proprietary. That would include, at a minimum, the non-FAMP of the selected drug, and the specific data elements described in Appendix C of the Guidance regarding research and development costs and recoupment, unit costs of production and distribution, pending patent applications, market data, and revenue and sales volume data. There also could be other confidential, proprietary, and trade secret information that manufacturers might provide to CMS as part of the "Drug Price Negotiation Program." For example, the IRA also requires the manufacturer of a selected drug to submit to the Secretary "information that the Secretary requires to carry out the negotiation (or renegotiation process)" under the "Negotiation Program."⁵² These technical and commercial data are proprietary information whose public disclosure could present a substantial risk of serious harm to manufacturers' operation for the selected drug and its other related assets.

Therefore, AbbVie strongly urges CMS to afford manufacturers deference in making case-by-case, good-faith determinations as to the proprietary information that must be protected from public disclosure and subject to the protections around its use, as set forth in the IRA. In most cases, only the manufacturer—as the submitter of the information—will be able to make reasonable determinations as to whether any specific data provided to the Agency are trade

⁴⁸ See Guidance § 40.2.1.

⁴⁹ SSA § 1193(c).

⁵⁰ Guidance § 40.2.1.

⁵¹ *Id.*

⁵² SSA § 1193(a)(4); *see also* Guidance § 40.2.

secrets or confidential commercial or financial information. Manufacturers must have confidence that their good faith determinations regarding proprietary information will be upheld by CMS, especially with respect to any information that is not already publicly available. Otherwise, if CMS were to disclose such confidential, proprietary information to the public, manufacturers would suffer irreparable harm without any ability to seek an adequate remedy. This harm could extend beyond the specific selected drug and affect confidential technical and commercial information concerning other assets of the manufacturer. This harm is preventable. Accordingly, CMS should treat as proprietary any non-public information that a manufacturer provides to CMS as a part of the “negotiation process” that the manufacturer reasonably believes to constitute, and designates as, its proprietary information.

CMS should take meaningful steps to ensure that any proprietary information is used only for purposes of carrying out the “Negotiation Program,” consistent with the terms of the IRA.⁵³ CMS should also ensure that its information technology security systems and processes are sufficient to protect the information from unauthorized use, disclosure, viewing, or dissemination.

B. CMS Should Adopt Safeguards to Protect Against the Disclosure of Confidential Information When Publishing an Explanation of the MFP (Section 40.2.1).

Under section 1195(a)(2) of the SSA, as added by the IRA, the Secretary is required to publish an explanation for the MFP. CMS’s Guidance states that, in publishing this explanation, it “intends to make high-level comments about the data submitted to CMS, without sharing any proprietary information reported to CMS. . . for purposes of the negotiation.”⁵⁴ As an example, CMS offers that it “does not intend to make public the research and development costs reported by a Primary Manufacturer, as CMS would treat that data as proprietary, but CMS may say ‘the manufacturer has recouped its research and development costs.’”⁵⁵

AbbVie acknowledges CMS’s mandate under the IRA to publish an explanation for the MFP. However, AbbVie is concerned with the high potential for inadvertent disclosure of proprietary information through these published explanations. These explanations could also create or perpetuate inaccurate impressions or conclusions about a manufacturer and its proprietary information. That is particularly true when the comments are meant to be “high-level” and therefore by-design cannot include enough context or detail to provide a proper explanation for such a complex process.

Accordingly, AbbVie respectfully requests that before publishing an explanation (or otherwise disclosing information that a manufacturer has designated confidential and proprietary), CMS provide manufacturers a “pre-release review” so they may review and object to the Agency’s proposed explanations. Not only would such a notification help avoid any inadvertent or inaccurate disclosure of proprietary information, but it also would be consistent, for example, with regulations that govern FOIA requests involving confidential commercial information.⁵⁶ It also would be consistent with the practices of FDA in handling trade secret and confidential commercial information.⁵⁷ As noted, any information included in CMS’s public explanations of MFP could be proprietary, and we believe it is important that manufacturers be afforded an opportunity to review the explanations and object to the inclusion of any proprietary information.

⁵³ See Guidance § 40.2.1.

⁵⁴ *Id.*

⁵⁵ *Id.*

⁵⁶ See 45 C.F.R. § 5.42 (requiring data submitters be provided 10 working days from the date of the FOIA request notice to object to disclosure of any part of the records and to state all bases for their objections).

⁵⁷ See 21 C.F.R. §§ 20.61, 314.430.

C. CMS's Guidance Violates the Constitution by Prohibiting Manufacturers from Disclosing Information and Requiring Document Destruction (Section 40.2.2).

The IRA directs the Secretary to enter into “Manufacturer Agreements” under which “the manufacturer complies with requirements determined by the Secretary to be necessary for purposes of administering the program and monitoring compliance with the program.”⁵⁸ CMS relies on this vague grant of authority to impose mandatory non-disclosure and information destruction requirements on manufacturers that violate the First Amendment.⁵⁹

Specifically, the Primary Manufacturer is barred from disclosing “any information in the initial offer or any subsequent offer by CMS, the ceiling price contained in any offer, or any information contained in any concise justification provided with an offer,” as well as “any information exchanged verbally during the negotiation period.”⁶⁰ In addition to preventing manufacturers from speaking truthfully about the “negotiation” process, CMS also requires that manufacturers destroy information if the drug or biologic no longer qualifies as a selected drug.

Nowhere in the IRA does Congress authorize CMS to impose this forced gag order on manufacturers. CMS's mandatory non-disclosure and information-destruction provisions impede manufacturers' rights to free speech and are not necessary to administer or monitor compliance with the “Negotiation Program.” CMS provides no explanation as to why this proposal would be permitted under the IRA as “necessary for purposes of administering the program.”⁶¹

CMS's Guidance exacerbates First Amendment concerns by silencing any dissenting or even neutral information sharing about the “negotiation” process. Courts find compelled speech even more objectionable than censorship because those who are forced to speak are “coerced into betraying their convictions.”⁶² The Guidance *both* compels speech *and* censors speech. Indeed, because prior governmental restraints on speech “are the most serious and the least tolerable infringement on First Amendment rights,”⁶³ they are subject to a “heavy presumption against [their] constitutional validity.”⁶⁴ That principle applies with special force to restraints on the disclosure of “truthful information about a matter of public significance”—such as the data subject to use restrictions in section 40.2.2. Those types of restrictions are almost never permissible under the First Amendment.⁶⁵

AbbVie is unaware of any price negotiation with the government in which a private party is compelled to destroy its records once the negotiation is complete. Moreover, this absurd practice would harm manufacturers and put them at an unnecessary disadvantage. Contrary to CMS's suggestion that document destruction would be necessary for purposes of administering the program, CMS's proposed Guidance would serve to hinder the program's administration and efficiency. Retaining information about the process will help make any “negotiation” of subsequent selected drugs more efficient—especially as CMS and manufacturer personnel change over time. Retaining this information would also help to ensure that CMS remains consistent in its determination of MFP across a manufacturer's drugs or biologics. Therefore, record destruction serves no understandable purpose in an alleged “fair negotiation process.”

⁵⁸ SSA § 1193(a)(5).

⁶⁵ *Bartnicki v. Vopper*, 532 U.S. 514, 527 (2001).

V. The Guidance Lacks Adequate Operational Safeguards for Effectuating the MFP.

The Guidance does not provide enough information about how CMS intends to implement two critical operational complexities presented by the IRA: (1) how manufacturers are to “provide access” to the MFP to MFP-eligible individuals; and (2) how this access can be achieved without violating the 340B nonduplication provision of the statute.⁶⁶

A. CMS’s Guidance Does Not Contain Safeguards Necessary to Ensure That the MFP Is Provided to Only Eligible Individuals (Section 40.4).

The Guidance does not contemplate adequate safeguards to ensure that the MFP is made available only to eligible individuals. For example, CMS does not consider that manufacturers and/or third-party administrators (“TPAs”) need access to sufficient claims-level data for in order to validate MFP-eligibility. Absent legitimate procedures to ensure that access to the MFP be limited only to those individuals entitled to that price—consistent with the clear statutory language⁶⁷—the program risks operational failure and substantial abuse. CMS should be clear to participating dispensaries that diversion will not be tolerated, and it should establish a manufacturer right to audit dispensaries for appropriate use and distribution of units purchased at the MFP.

Further, the requirement for timely reimbursement within 14 days, as proposed in the Guidance (but not in the statute), is insufficient to obtain data, validate claims, and process appropriate reimbursements. In other government programs requiring eligibility verification and rebating, the timetable for rebates is more than twice as long (38 days in the Medicaid Drug Rebate Program and 38 days in the Part D Coverage Gap Discount Program).⁶⁸

Additionally, CMS’s Guidance fails to recognize that manufacturers typically do not have existing contractual relationships with the roughly 60,000 retail dispensers (e.g., pharmacies) across the U.S.⁶⁹ In most cases, this Guidance would require manufacturers to develop entirely new contracts, financial relationships, data systems, and other capabilities, to provide the MFP only to eligible individuals. Given the existing complexity in the biopharmaceutical supply chain, CMS’s Guidance would have done well to consider existing contractual relationships and processes that could have been leveraged to reduce the complexity, confusion, and burden of providing the MFP.

B. CMS’s Guidance Does Not Contain Safeguards Necessary to Avoid 340B Duplication.

The statute is clear that manufacturers shall not be required to provide access to the MFP and the 340B discount on the same unit.⁷⁰ Rather, manufacturers of selected drugs must provide

⁶⁶ Guidance § 40.4.

⁶⁷ Individuals entitled to the MFP must be “enrolled in a prescription drug plan under part D . . . or an MA-PD plan under part C.” SSA § 1191(c)(2).

⁶⁸ See 42 CFR § 423.2315(b)(3) (providing requirements for the Medicare Coverage Gap Discount Program Agreement); CMS, Medicaid Drug Rebate Program Notice, Release No. 89 (March 10, 2014), available at: <https://www.medicaid.gov/medicaid-chip-program-information/by-topics/prescription-drugs/downloads/rx-releases/mfr-releases/mfr-rel-089.pdf> (noting that “manufacturers have 37 calendar days (as evidenced by the postmark by the U.S. Postal Service on the envelope) to pay rebates before interest begins to accrue”).

⁶⁹ See Commonwealth Fund, *Competition, Consolidation, and Evolution in the Pharmacy Market*, available at: <https://www.commonwealthfund.org/publications/issue-briefs/2021/aug/competition-consolidation-evolution-pharmacy-market#:~:text=Of%20the%20roughly%2060%2C000%20retail,percent%20of%20retail%20prescription%20revenues> (Aug. 12, 2021).

⁷⁰ See SSA § 1193(d).

the lower of the MFP or the 340B price to individuals who are eligible for both. Many factors complicate application of this nonduplication requirement:

- 340B-covered entities purchase at both (a) the 340B price for 340B-eligible patients and (b) a non-340B price for ineligible patients (e.g., Medicaid carve-out).
- Covered entities (and their TPAs) choose to identify eligible 340B patients well after a dispense to such patient has occurred, including sometimes months after a dispense has occurred.
- There are no consistent, minimum standards or documentation requirements currently being enforced to ensure appropriate, transparent 340B patient identification.
- 340B-covered entities often utilize commercial contract pharmacies,⁷¹ outsourced dispensaries to patients of the covered entity made whole via replenishment.
- Covered entities and commercial contract pharmacies resist providing transparency and data to confirm 340B patient eligibility.
- Only some 340B covered entity pharmacy fills are to 340B-eligible patients, only some 340B covered entity pharmacy fills are to MFP-eligible patients, and those populations only sometimes overlap.

It will therefore be necessary for CMS to coordinate with the Health Resources and Services Administration (“HRSA”) to develop a mechanism to address these varied complexities.

In addition to these MFP-related concerns, a much larger issue exists around 340B patient eligibility when drugs are dispensed through contract pharmacies. Manufacturers do not have adequate insight into which prescriptions are designated as 340B-eligible by a covered entity and why. HRSA’s failure to enforce the 340B patient definition means that some pharmacies may claim 340B eligibility for prescriptions associated with patients who were treated at the covered entity at some point in the past, regardless of whether the prescription was written by a covered entity provider. Covered entity software vendors called “third party administrators” review contract pharmacy dispensing data in an effort to identify prescriptions associated with “patients of the covered entity;” however, this is defined at each covered entity. These software programs can even make strategic financial decisions and choose not to designate prescriptions as 340B-eligible if they are not sufficiently profitable. In many instances, multiple covered entities will claim 340B eligibility for the same prescription, leaving the manufacturer to pay a 340B chargeback multiple times for the same dispensed unit. These 340B program deficiencies, left unaddressed, will hinder the proper administration of the MFP.

CMS’s Guidance suggests that it may not yet be fully aware of the complexities of, or potential for ambiguity associated with, covered entities identifying 340B-eligible patients. Failure to appreciate and address these complexities could result in covered entities receiving both the MFP and a 340B discount for the same patient in violation of the IRA’s express requirements. CMS coordination with HRSA should focus on key areas that reduce the risk of duplicative

⁷¹ The 340B statute does not authorize the use of contract pharmacies and their use by 340B-covered entities raises serious concerns that drugs subject to 340B pricing are being diverted to non-patients or subjected to unlawful duplicate discounts. In light of these abuses, it is important that CMS put in place proper mechanisms, as described herein, to enforce the IRA’s non-duplication requirements and to ensure that covered entities receive only either the 340B price (if the patient is 340B eligible) or the MFP price (if the patient is MFP-eligible”), but not both.

discounts, including: (1) requiring that the identification of 340B-eligible patients and MFP-eligible patients must occur and be documented at the time of dispense; (2) establishing clear minimum documentation requirements for covered entities to support the identification of a 340B-eligible patient; and (3) requiring 340B discounts be paid as a rebate (as is currently the case with ADAPs) conditioned on the provision of adequate data to allow manufacturers to confirm the appropriateness of the discount and avoid duplicative MFP and 340B discounts.

VI. Conclusion

AbbVie strives to ensure that continued innovation and patient interests are upheld through the implementation of the IRA. Therefore, we urge CMS to comply with required notice-and-comment rulemaking procedures, allow for adequate public input, and respond meaningfully to requests, objections, and other feedback through this implementation process.

AbbVie appreciates this opportunity to provide input on this Guidance. If you have any questions, please feel free to contact Ashley Flint, Director, U.S. Policy & Analytics, at ashley.flint@abbvie.com.

Sincerely,

Hayden Kennedy

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of
Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026,
and Solicitation of Comments

Dear Director Seshamani:

The Academy of Managed Care Pharmacy (AMCP) thanks the Centers for Medicare & Medicaid Services (CMS) for the opportunity to provide comments in response to the above captioned guidance (the “Guidance”) setting forth CMS’ proposed policies for implementing the Medicare Drug Price Negotiation Program (Negotiation Program) for initial price applicability year 2026.

AMCP is the nation’s leading professional association dedicated to increasing patient access to affordable medicines, improving health outcomes, and ensuring the wise use of healthcare dollars. Through evidence and value-based strategies and practices, AMCP’s nearly 8,000 pharmacists, physicians, nurses, and other practitioners manage medication therapies for the 270 million Americans served by health plans, pharmacy benefit management firms, emerging care models, and government health programs.

Our comments are addressed below in the order in which they appear in the Guidance.

Section 30.3.1

The manufacturer of a biosimilar biological product (Biosimilar) may request, prior to the selected drug publication date, a delay in the inclusion of a negotiation-eligible drug that includes the reference product for the Biosimilar on the selected drug list. AMCP urges CMS to consider how to mitigate potential unintended consequences such as possible barriers to entry for new biosimilars and market forces that may exert upward pressure on prices.

Section 40.4 – Providing Access to the MFP.

In the guidance, CMS proposes to define “providing access to the MFP” to mean that the amount paid by the dispensing entity for the selected drug is no greater than the maximum fair price (MFP). To accomplish this, CMS proposes to require that the entity that holds the New

Drug Application(s) or Biologics License Application(s) for the selected drug (Primary Manufacturer) provide access to the MFP to dispensers (including pharmacies) in one of two ways: (1) by ensuring the price paid by the dispensing entity is no greater than MFP; or (2) by providing retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP. CMS thus intends to allow access to MFP by dispensers either at the point-of-sale or through the provision of retrospective reimbursement for the difference. Primary Manufacturers would be required to ensure that dispensers are reimbursed the difference between their acquisition cost and the MFP within 14 days.

AMCP believes it will be critical for dispensers, including pharmacies, to have access to MFP pricing at the point-of-sale. Existing supply chains do not generally contemplate payment directly from the manufacturer to the dispensing entity, nor are wholesalers and specialty distributors (who supply drugs to pharmacies) under any obligation to comply with the requirements to offer MFP. Fortunately, there is strong precedent and a clear model for facilitating manufacturer price concessions at the point-of-sale, already built into the existing Medicare Part D program. Under the Coverage Gap Discount Program (CGDP), CMS utilizes a third-party administrator (TPA) to aggregate Part D data, distribute invoices to manufacturers, and reimburse Part D plans for advancing access to the manufacturer discount at the point-of-sale. This existing framework for the CGDP (which CMS has indicated will be largely carried over with the transition to the new Manufacturer Discount Program (MDP) in January 2025) is the most effective approach to facilitate access to the MFP at the point-of-sale, and would fulfill the agency's policy goal of ensuring that stakeholders receive the full benefit of the MFP at the time of dispensing an MFP-eligible drug.

AMCP encourages CMS to explicitly recognize the roles of Part D plan sponsors and pharmacy benefit managers (PBMs) in being able to facilitate access to MFP prices at the point-of-sale through the existing CGDP framework or a framework modeled on this program.

Section 50.1. Manufacturer-Specific Data.

Section 1194(e) of the IRA directs CMS, for purposes of negotiating the MFP of a selected drug with the Primary Manufacturer, to consider certain factors, as applicable to the selected drug, as the basis for determining its offer. These factors are required to be reported by the Primary Manufacturer and include research and development (R&D) costs; current unit costs of production and distribution; prior Federal financial support for novel therapeutic discovery and development; data on pending and approved patent applications; exclusivities recognized by the FDA and FDA applications and approvals; and market data and revenue and sales volume data in the United States. As described in Appendix C of the Guidance, CMS is adopting a number of definitions to guide its data collection efforts. On March 21, 2023, CMS announced in the Federal Register an Information Collection Request (ICR) Form, as required by the Paperwork Reduction Act (PRA), for Negotiation Data Elements under Sections 11001 and 11002 of the IRA. AMCP intends to separately comment on this ICR request.

Overall, AMCP believes the definitions in Appendix C are comprehensive and clear but that some definitions may need to be fine-tuned over time as experience with the program brings additional context. For example, the definition of "global, total lifetime net revenue for the selected drug" may be more of an administrative lift than necessary if subtracting the "discounts, chargebacks, rebates, cash discounts, free goods contingent on a purchase agreement, up-front payments, coupons, goods in kind, free or reduced-price services, grants, other price

concessions or similar benefits” turns out not to be particularly impactful against overall global R&D costs and global revenue.

Section 50.2. Evidence About Therapeutic Alternatives for the Selected Drug.

The IRA requires CMS to consider “evidence about therapeutic alternatives” for purposes of negotiating an MFP for the selected drug. The factors on therapeutic alternatives CMS must consider include the extent to which the selected drug represents a therapeutic advance and the extent to which the selected drug and the therapeutic alternatives address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy. CMS must also consider the FDA-approved prescribing information for the selected drug and therapeutic alternatives, and evidence on the comparative effectiveness of the selected drug and its therapeutic alternatives.

AMCP’s members are at the forefront of evaluating therapeutic alternatives through our role on Pharmacy & Therapeutic Committee where we design value-based, patient-focused formularies built around scientific evidence. This collective experience in value-based formulary design leads us to support CMS’ reliance on therapeutic alternatives as an important factor for negotiating an MFP for a selected drug while urging caution about the potential for unexpected consequences. AMCP urges caution that the comparison with the therapeutic alternative may exert unanticipated market pressures, potentially increasing the comparator’s price. AMCP also believes that CMS should consider safety and efficacy of the selected drug versus the therapeutic alternative.

AMCP supports CMS’ approach to aligning the value of selected drugs with meaningful therapeutic alternatives. In the guidance, CMS states that it intends to consider evidence about therapeutic alternatives submitted by members of the public, including manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties. AMCP appreciates an approach that relies on public feedback and stakeholder solicitations to arrive at appropriate therapeutic alternatives, given the complexities involved in evaluating clinical evidence and placing drugs on formularies. Therapeutic alternatives can serve as a useful benchmark and guide the decision-making process, helping to meet medical needs and assuring clinical effectiveness. CMS’ robust approach to assessing therapeutic alternatives, including considering a variety of patient-centered factors, supports value for patients.

Section 60.3. Methodology for Developing an Initial Offer.

In developing an initial offer, CMS intends to identify therapeutic alternatives, if any, for the selected drug; use the Part D net price for the therapeutic alternatives to determine a starting point for developing an initial offer; evaluate the clinical benefit of the selected drug (including compared to its therapeutic alternatives) for the purposes of adjusting the starting point using the negotiation factors, resulting in the preliminary price; and further adjust the preliminary price by the negotiation factors to determine the initial offer price.

AMCP supports CMS’ approach to relying on the net price of therapeutic alternatives as the starting point for negotiating for the selected drug. AMCP agrees with CMS’ plan to use the net prices from Part D as this is a more accurate reflection of revenue than the listed price. This approach mirrors the approach used by many payers when developing formularies, including an assessment of the value of the drug, performed after the clinical evaluation, by evaluating the net cost, market share, and drug utilization trends of clinically similar medications.

As CMS continues to develop the Negotiation Program, AMCP urges the agency to ensure that there are no unintended consequences that could undermine existing market-based negotiations. While CMS intends to address the renegotiation process in greater detail in future guidance, it is important to note that one of the limited circumstances in which the statute allows for renegotiation is for a “material change” to the manufacturer-specific negotiation factors, which CMS is proposing to define in this Guidance. In particular, CMS is proposing in Appendix C to define “market data and revenue and sales volume data” to include the average net unit price of the selected drug for Part D plan sponsors. This raises the concern that a manufacturer negotiating discounts or rebates in excess of the MFP could be risking the prospect of renegotiation, unless CMS clarifies in future guidance that such negotiations *will not* suffice to qualify as a “material change” to the manufacturer-specific negotiation factor that would require a selected drug to undergo renegotiation. In the absence of such clarity, AMCP is concerned that market-based negotiations will be hampered, essentially resulting in the MFP becoming a ceiling for any future negotiations.

Section 70. Removal from the Selected Drug List Before or During Negotiation, or After an MFP is in Effect.

Under the IRA a selected drug will no longer be subject to the negotiation process and will cease to be a selected drug, subject to the timeline and situations discussed below, if CMS determines the FDA has approved a generic drug under section 505(j) of the FD&C Act that identifies as its reference listed drug a product that is included in the selected drug, or the FDA has licensed a biosimilar biological product under section 351(k) of the PHS Act that identifies as its reference product a product that is included in the selected drug; and the generic drug or biosimilar biological product, as applicable, is marketed pursuant to such approval or licensure.

Biosimilar and generic competition are critical to lowering the overall cost of therapies and enhancing formulary competition. As a result, CMS should take all steps necessary to remove impediments to market-based negotiations to ensure that “robust and meaningful” competition from generic or biosimilar entrants is encouraged. In particular, expeditious removal of a selected drug when removal criteria are met will be essential to allow Plan D sponsors and PBMs to fulfill their role of promoting substitution of generics and biosimilars as lowest net cost products, where applicable. At a time when health care expenditures are escalating at alarming rates, greater access to safe and effective biosimilars and generics can aid in reducing prescription drug expenditures for patients and payers.

Section 110. Part D Formulary Inclusion of Selected Drugs.

As noted in the Guidance, CMS intends to require Medicare Part D plans to include in their Part D formularies “each covered Part D drug that is a selected drug” during 2026 and all subsequent years for which the MFP of the selected drug is in effect. While AMCP has not provided comment on Section 30 of this Guidance (as the agency noted it is not open for comment), it is important to note that the proposed broad interpretation of qualifying single source drugs (QSSD) raises concerns about formulary inclusion of selected drugs. Most notably, AMCP notes that CMS’ broad approach to defining QSSDs may lead to an increased number of unique marketed products subject to MFP each year. QSSD is defined to include all dosage forms and strengths of the drug with the same active moiety, meaning potentially dozens of drugs, including multiple NDAs, would fall under the same QSSD definition. We are particularly concerned about drugs with the same active ingredient but different modes of administration. There may be substantial cost variation among different modes of

administration. There is a risk that the MFP could be set too low, causing potential issues for patient access. CMS should also consider what could happen if the drug's dosage forms overlap between Part B (for example, infused dose form) versus Part D (oral dose form). It is therefore critical that CMS clarify that the agency will not require formularies to include every dose form and strength of the QSSD, including new formulations. While such an interpretation is clearly not supported by the statute and would fundamentally undermine value-based formulary design, clarity on this issue is critical to avoid disrupting formulary negotiations.

An approach that requires formulary coverage of all dosage forms and strength of the QSSD, including new formulations, is out of step with current practice and would harm the market-based negotiations that currently underly the Part D program. Current practice involves evaluation of the indications and differences in safety, efficacy, and cost. If there are differences based upon formulation, then step requirements or medical justification are often considered for a specific dosage form. There can often be significant cost differences between a tablet or capsule formulation, an injectable, and an oral solution for any given product. There might also be reasons (e.g., swallowing disorders, G- or J- tubes, advanced conditions that impact swallowing) that justify the specialized or more costly dosage form, but these could be addressed by medical necessity review. AMCP recommends that plans be required to cover at least one dosage form, with an option for members and/or providers to request an alternative medically necessary dosage form. This would allow health plans to cover medically necessary dosage forms without the potential burden and increased costs of covering all dosage forms regardless of medical necessity.

Finally, AMCP encourages CMS to provide clarity that the formulary inclusion requirement does not otherwise disrupt existing formulary management tools, including value-based tools such as utilization management (UM) that are used to ensure that drugs are provided in the safest and most cost-efficient manner. CMS should continue to allow Part D plans the flexibility to implement UM edits on selected drugs to ensure safety and appropriate utilization. The initial guidance notes that the negotiated drugs must be on formularies but does not require a specific tier. AMCP supports this flexibility for plans when building their formularies.

Conclusion

AMCP appreciates your consideration of the concerns outlined above and looks forward to continuing work on these issues with CMS. If you have any questions regarding AMCP's comments or would like further information, please contact AMCP's Director of Regulatory Affairs, Geni Tunstall, at etunstall@amcp.org or (703) 705-9358.

Sincerely,

Susan A. Cantrell, MHL, RPh, CAE

Dear Administrator Brooks-LaSure,

Re: Medicare Drug Price Negotiation Program Guidance

Achilles Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

We are a clinical-stage biopharmaceutical company developing precision T cell therapies to treat solid tumor cancers including advanced non-small cell lung cancer (NSCLC) and recurrent or metastatic melanoma. The therapy we are developing, which uses cutting edge technology to find personalized neoantigen targets in each patient, could become the first genomic cell therapy.

While our investigational product is a biologic, we can empathize with our peers at other companies who are working on small molecules that the IRA, in our view, just made far less attractive to investors that provide the required capital for pre-revenue, drug developers. Without this capital, innovative early-stage companies like ours simply cannot afford to create these potentially lifesaving medicines for the patients who need them.

We are fortunate that biologics have retained 13 years of market-based pricing before having their price impacted by Medicare negotiation (which also spills over into Medicaid) and would urge CMS to only reduce the prices of small molecule drugs during the 9-13 year period as little as required by IRA. Wherever it may be possible to interpret the IRA in such a way as to exempt a small molecule from the IRA, we hope CMS will do so.

Achilles Therapeutics plc

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Aerovate Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance). I understand that CMS is not allowing comments on Section 30 of the IRA which outlines the selection process for drugs in the first year of the program, but I am providing the comments that would have been made if allowed.

Aerovate Therapeutics is developing a small molecule for the potential treatment of Pulmonary Arterial Hypertension (PAH), a fatal disease for which we have Orphan designation. Aerovate's drug candidate is AV-101, a novel **inhaled formulation** of the generic **oral drug imatinib**. Oral imatinib is approved for treating leukemia and other rare forms of cancer. Oral imatinib was also studied in a global clinical trial in patients with PAH, and although oral imatinib was highly effective in the PAH trial, systemic administration of oral imatinib resulted in serious adverse events and development was discontinued. Oral imatinib was not approved for the treatment of PAH patients because of the unacceptable safety profile of oral imatinib in PAH patients.

Aerovate was founded based on the invention of a novel (i.e., patent-protected) inhaled formulation of imatinib that targets the lung directly, and is therefore administered in doses that are 65%-80% lower than the dose of oral imatinib that was shown to be highly effective but unacceptably toxic in PAH patients. We believe a lower dose of inhaled imatinib could provide a novel, effective treatment for patients without the toxicity of oral imatinib. Although generic imatinib exists, it cannot be safely used to treat PAH, but we are concerned that AV-101 could be categorized with oral imatinib based on the active moiety.

By making Aerovate's AV-101 potentially eligible for price negotiation at nine years, CMS's guidance in Section 30 could undermine continued investment in clinical development, and pose a significant threat to a novel, potentially life-saving Orphan drug. If CMS were to cite generic imatinib to invalidate the ODD exemption for AV-101, then CMS ought to include generic imatinib to conclude AV-101 isn't a single-source drug eligible for negotiation. Thank you very much.

Sincerely,

RE: Medicare Drug Price Negotiation Program Guidance

Submitted via email to: IRAREbateandNegotiation@cms.hhs.gov

Dear Dr. Seshamani:

Every American deserves access to affordable prescription drugs, and with that commitment in mind, AHIP¹ appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program Guidance issued March 15, 2023 (the Guidance). The Guidance is focused on the process by which the Centers for Medicare & Medicaid Services (CMS) will negotiate Maximum Fair Prices (MFP) with drug manufacturers for a limited number of single-source Medicare Part D drugs for 2026, pursuant to sections 11001 and 11002 of the Inflation Reduction Act (IRA). The Guidance is also of interest to our members, many of which offer Part D coverage, given its potential implications for their delivery of Part D benefits and other types of coverage.

As advocates for Americans that negotiate lower drug prices for patients and consumers, health insurance providers have provided seniors and people with disabilities with robust access to prescription drugs through Part D coverage and kept premiums steady since the program's inception. Health insurance providers add tremendous value by negotiating lower costs with drug manufacturers and pharmacies, leveraging proven and effective cost-management and negotiating tools. To support these efforts in Part D and for other types of coverage, AHIP has consistently supported market-based solutions that deliver real competition; remove barriers to full and fair negotiation; create more consumer choice; and ensure open and honest drug prices for patients, consumers, employers, and government payers. Our policy recommendations have included:

- Using evidence-based criteria for comparing the value of treatment options, along with expanding flexibility in using other formulary management tools for high-cost drugs for which rebates are often limited or unavailable (e.g., for protected class drugs and drugs with no therapeutic competition).
- Increasing transparency in how drug prices are set and increased, which would help to mitigate anticompetitive pricing practices, allow patients to make informed decisions, and allow Americans to recognize when drug companies have been hiking prices as well as when competition is working to keep drugs affordable.
- Taking various steps such as improved clinician and patient education and product approvals to create a more robust and competitive marketplace for biosimilars as affordable alternatives to expensive branded biologics.

¹ AHIP is the national association whose members provide health care coverage, services, and solutions to hundreds of millions of Americans every day. We are committed to market-based solutions and public-private partnerships that make health care better and coverage more affordable and accessible for everyone. Visit www.ahip.org to learn how working together, we are Guiding Greater Health.

- Preventing brand-name drug manufacturers from using risk evaluation and mitigation strategies (REMS) and other egregious drug company practices to block competition from generic drug makers.

Our comments below are focused on interpretive elements in the Guidance that could affect these key objectives regarding enhanced competition, choice, and affordability in Part D and other programs.

Section 30 – Identification of Selected Drugs for Initial Price Applicability Year 2026:

AHIP Comments: AHIP understands that CMS is not accepting comments on the criteria for identifying and selecting Part D drugs for Initial Price Applicability Year 2026, given the practical challenges of meeting implementation timelines.² However, it is important for CMS as a matter of course to make important guidance documents available for public comment to the greatest extent possible, regardless of statutory authority that exempts any particular guidance from notice-and-comment processes. It is critical that stakeholders have an opportunity to provide feedback notwithstanding CMS’ view that a particular piece of guidance may be “unnecessary” or that feedback is “contrary to the public interest.” Meaningful comment from the public is fundamental to ensuring that the agency can adequately assess the costs and benefits of particular policies and consider alternatives. Accordingly, we urge CMS to solicit comments on section 30 for future price applicability years, and to commit to notice-and-comment processes for future guidance documents relating to the IRA.

Section 40.2.1 – Confidentiality of Proprietary Information:

Section 1193(c) of the Social Security Act, as added under the IRA, provides that information submitted by a manufacturer that is proprietary information (as determined by CMS) shall be used only by CMS or disclosed to the Comptroller General of the United States for purposes of carrying out the IRA. Guidance Section 40.2.1 describes CMS’ proposed confidentiality policies for proprietary manufacturer-specific data (detailed in Appendix C of guidance) that will be collected to inform negotiations, and for certain other aspects of that process.

In general, CMS states that it will treat as proprietary information and not publicly disclose any commercial or financial information submitted by manufacturers that cannot be found publicly. CMS specifies that research and development costs and recoupment, unit costs of production and distribution, pending patent applications, and market data and revenue and sales volume data will be treated as proprietary unless publicly available. CMS also specifies that data on prior Federal funding and approved patent applications, exclusivities, and applications and approvals under section 505(c) of the FD&C Act or section 351(a) of the PHS Act will be treated as non-proprietary because CMS believes these data are available publicly.

CMS further states that it will not publish proprietary information as part of public documents otherwise discussing the MFP, including in the explanation for a selected drug’s MFP that CMS is required to publish under the IRA. CMS indicates such public documents will include only “high-level” comments about data submitted. As a specific example, the guidance notes CMS could indicate that for a particular MFP a manufacturer will have “recouped its research and development costs.”

² However, CMS is accepting comments in response to a separately-issued information collection request for data relating to implementation of an exception for small biotech drugs.

AHIP Comments: AHIP supports protection for non-public commercial, financial, and other non-public proprietary information that may be collected under the IRA. Government confidentiality policies that protect proprietary information that may be collected for purposes of implementing and overseeing programs like Medicare Part D (such as in exemptions from disclosure under the Freedom of Information Act) advance important public policy goals, including safeguarding private entities from the competitive disadvantages that could result from disclosure.

We note that in some circumstances, a government policy that provides for release of “high level” government comments about proprietary data collected for purposes of implementing or overseeing programs could also have anti-competitive effects, depending on the particular facts and circumstances of the comments. We recognize CMS is adopting this policy under the unique circumstances of the IRA, which requires CMS to publish an explanation for each MFP with respect to the factors that CMS considered, including manufacturer-specific data, while it also requires that CMS keep proprietary information confidential. We urge CMS to limit this policy to the IRA and continue to provide strong protections to proprietary data otherwise collected under Part D.

Section 40.2.2 – Data Use Provisions and Limitations:

CMS will prohibit manufacturer disclosure to the public of any information contained in CMS’ initial or subsequent offers, including ceiling prices, etc., nor use such information “. . . for any purposes other than the Medicare Drug Price Negotiation Program, except as may be required by applicable state or federal law.”

AHIP Comments: We agree that manufacturer disclosure or use of information in connection with the negotiation process could be problematic. Especially concerning would be the potential opportunities presented for manufacturers to selectively release information that could be presented out of context and used to manipulate negotiations in Part D or other programs, thereby increasing costs to patients, employers, and taxpayers. As noted above, AHIP supports market-based solutions that include full and fair negotiations to enhance affordability and choice for Americans. Accordingly, to avoid potential anti-competitive impacts for other drugs within Part D and for other programs, we agree that CMS should adopt policies relating to confidentiality of negotiations that are as consistent as possible with private sector negotiation processes.

Section 50 – Negotiation Factors:

For purposes of negotiating the MFP for a selected drug, in addition to considering manufacturer-specific data, Section 1194(e)(2) of the Social Security Act added by the IRA provides that CMS must evaluate evidence about therapeutic alternatives. Under the Guidance, CMS will use evidence about therapeutic alternatives submitted by members of the public such as “. . . manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties.”

AHIP Comments: We appreciate CMS’ recognition that parties aside from drug manufacturers have valuable perspectives and unique information on evidence about therapeutic alternatives, and we support CMS’ proposal to allow submission of this information from non-manufacturer parties. Health insurance providers and their contracted pharmacy benefit managers (PBMs) have a core role in the American health care system in providing safe and affordable access to prescription drugs. In fulfilling this role, they use evidence-based reviews of clinical data, including therapeutic alternatives, in negotiations with drug manufacturers and in establishing benefit designs and formulary management tools to create a cost-effective system that encourages competition and the use of high-value drugs. Given this role and

expertise and the potential for negotiations for prices of selected drugs in Part D to have broader implications within the Part D program and beyond, we encourage CMS to specifically cite health insurance providers and PBMs as another group of “interested parties” permitted to submit evidence about therapeutic alternatives.

Section 50.2 – Evidence About Therapeutic Alternatives for the Selected Drug:

Section 1194(e)(2) of the Social Security Act, as added by the IRA, provides for CMS to use the following if available in considering therapeutic alternatives:

- The extent a selected drug is a “therapeutic advance” compared to existing Rx treatments;
- FDA-approved prescribing information and its therapeutic alternatives;
- Comparative effectiveness of the selected drug and therapeutic alternatives, including effects on specific populations, such as individuals with disabilities, the elderly, the terminally ill, children, and other patient populations; and
- Whether the selected drug and available alternatives address needs unmet by available therapies.

The Guidance indicates that in addition to considering information submitted by manufacturers and the public, CMS will review existing literature and “real-world” evidence, conduct internal analytics, and consult subject matter and clinical experts. The Guidance describes key metrics to be used in assessing the literature. The Guidance also indicates that CMS will prioritize research specifically designed to focus on Medicare populations - individuals with qualifying disabilities, patients with ESRD, and Medicare-aged populations - over studies for which these populations were not the primary focus.

The Guidance also notes the prohibition in the IRA on use of comparative clinical effectiveness research that treats extending the lives of individuals who are elderly, disabled, or terminally ill as of lower value than those of individuals without such status. CMS specifies that for purposes of the negotiation process, the agency will not take into account information submitted by the public or otherwise considered by CMS that uses quality adjusted life years (QALYs). The agency solicits comments on other metrics that should be excluded from consideration.

AHIP Comments: Concerns and prohibitions on the use of QALYs have generated alternative comparative effectiveness measures that do not differently value life extension based on the enumerated characteristics. These measures, including the equal-value life year gained (evLYG), health years in total (HYT), and generalized risk adjusted QALY (GRA-QALY), are important metrics for CMS to employ when meeting the statutory requirement to assess the comparative effectiveness of the negotiation-eligible drug relative to therapeutic alternatives. Comparative effectiveness metrics serve to expand access by helping to reduce the high prices caused by drug manufacturers’ long-standing practice of pricing drugs far above their value. Further, Part D formulary requirements ensure continued access to drugs, including those for which comparative effectiveness metrics are applied. We strongly urge CMS to affirmatively recognize that non-QALY metrics are appropriate, and indeed required, elements of price negotiation.

Section 90.4 – Monitoring for Bona Fide Marketing of Generic or Biosimilar Product:

Under the IRA, a selected drug is no longer subject to negotiation if CMS determines: (1) the FDA has approved a generic drug or biosimilar for which the selected drug is a reference product, and (2) the generic drug or biosimilar biological product is marketed pursuant to such approval or licensure. CMS provides examples of monitoring that include whether the drug or biosimilar product is regularly and

consistently available for purchase through the pharmaceutical supply chain and whether it is available for purchase by community retail pharmacies in sufficient quantities from their wholesale suppliers. CMS also intends to analyze the share of generic drug or biosimilar product units identified in Part D Prescription Drug Event (PDE) data as a percentage of total units of Part D expenditure.

AHIP Comments: Drug manufacturers repeatedly use myriad schemes and techniques to limit generic competition. For example, the manufacturer Celgene recently entered into an agreement to allow extremely limited generic competition for the drug Revlimid (lenalidomide). Under this agreement, from March 2022 through December 2026, one sole generic manufacturer would be allowed to market generic lenalidomide under the condition that total sales of the generic drug remain less than 10 percent of total Revlimid/lenalidomide sales.³ This arrangement is an example of how manufacturers engage in anticompetitive activities to forestall the price benefits of generic competition. CMS should consider taking steps to monitor and shine a light on such arrangements. Schemes designed to avoid bona fide marketing of generic or biosimilar products not only affect the negotiation status of a selected drug, but they reduce competition and limit affordability of products for patients and other stakeholders more broadly in Part D and other programs.

Section 110 – Part D Formulary Inclusion of Selected Drugs:

The IRA requires Part D plans to include each covered Part D drug that is a selected drug on Part D formularies during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period. This section in the Guidance reiterates those requirements for implementation.

AHIP Comments: The IRA does not specify how selected drugs are required to be included on Part D formularies. Accordingly, nothing in the IRA should prohibit Part D plans from using formulary designs and formulary management activities with respect to selected drugs based on input from Pharmacy and Therapeutics (P&T) committees, scientific evidence, and pharmacoeconomic considerations to support appropriate, safe, and cost-effective access to the extent permitted for other drug therapies.

We encourage CMS to reiterate these plan flexibilities. We also encourage CMS to clarify when the formulary inclusion requirement does not apply. One example would be when a selected drug ultimately does not become subject to an MFP due to the introduction of a generic or biosimilar competitor after the drug selection. Another example is the ability specified in the IRA to remove a selected drug from the formulary when a therapeutically equivalent generic drug becomes available to the extent permitted under Part D regulations. CMS should further clarify the availability of other Part D plan flexibilities (such as changing a brand name drug's preferred or tiered cost-sharing) when a generic drug or biosimilar becomes available.

In addition, the Guidance (in Section 60.6) reiterates the statutory requirement that CMS publish, by September 1, 2024, the MFP for each selected drug for CY 2026. Given the formulary inclusion requirement and other provisions (e.g., a Part D plan's negotiated price for a selected drug cannot exceed the MFP plus any dispensing fee), it is critical that CMS meet this publication deadline so Part D plans can appropriately operationalize these provisions and incorporate them into pharmacy negotiations and bid development for 2026.

Again, AHIP appreciates the opportunity to offer comments on the Medicare Prescription Drug Price Negotiation Program initial memorandum. We also urge CMS to carefully consider options to minimize potential disruptive impacts from additional operational changes to the program's enrollees and other stakeholders, such as changes to pharmacy acquisition and reimbursement processes that may adversely affect long-established supply-chain operations. We look forward to continuing to work with CMS to achieve the shared goal of lower drug prices and more affordable access for Medicare-eligible Americans. Please contact me if additional information would be helpful or if you have questions about the issues raised in this letter. I can be reached at (202) 778-3256 or mhamelburg@ahip.org.

Sincerely,

A handwritten signature in black ink, appearing to read 'mhamelburg', written in a cursive style.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure:

We are leaders in advancing education, advocacy, and research for those impacted by autoimmune and autoinflammatory arthritis (AiArthritis) diseases through peer-led guidance, collaboration, and resources that are driven by patient-identified issues and patient-infused solutions. As we are led by patients we understand the importance of ensuring better health outcomes and lower costs for patients, particularly those with chronic, degenerative diseases like Psoriatic Arthritis, Rheumatoid Arthritis, Lupus, Spondyloarthritis, and over a dozen other AiArthritis Diseases.

We thank the Centers for Medicare & Medicaid Services (CMS) for the opportunity to submit comments on the *Medicare Drug Price Negotiation Program Initial Guidance* for the initial price applicability year of 2026. We understand that this step was not explicitly required in the *Inflation Reduction Act* (IRA) and it is appreciated by patient groups. The Maximum Fair Price (MFP) provisions within the IRA provide CMS with significant new authority to reduce drug prices for Medicare beneficiaries. As your guidance recognized, the MFP provisions of the law also include requirements to protect patients and support patient-centered action. With this new authority, CMS has the opportunity to advance the crucial goal of ensuring better outcomes and reducing costs for patients throughout the implementation of the Medicare Drug Price Negotiation Program. It is imperative that CMS center its decisions around patients and key components that may impact their access to optimal care.

We believe AiArthritis and CMS aim to achieve better health outcomes for patients. While there are several areas we could address, the following considerations focus on key points considerate of heterogeneous diseases where one-size-fits-all treatments do not exist. We respectfully suggest CMS refines its negotiation process to consider: 1) The welfare of patients must be in the forefront of the implementation, and their input should be considered 2) There must be incentives for innovation by the

pharmaceutical industry 3) Transparency must be prioritized 4) The use of the QALY from any secondary source should be justified in any price negotiation 5) Precision Medicine must be considered when research demonstrates a trial-and-error approach can lead to worse outcomes and elevated healthcare costs.

1. **Patients and Patient Organizations must be included at every step along the way.** We are an organization whose leadership is comprised entirely of patients with AiArthritis disease, thus we bridge broad patient voice representation with actual patient voice perspectives. As such we look forward to being more involved with providing feedback as CMS continues forward with this process. We are dedicated to working with other patients and Patient Organizations who represent the community voice, as well as all other stakeholders as CMS undertakes drug price negotiation. **We ask that you provide meaningful opportunities for all of us to give continuous feedback during all steps of the process - especially with regard to our viewpoints on value, preferred outcomes, updated research, societal benefits, and unmet need.**
2. **Access to innovative treatments is vital for those with rare disease.** 95% of all rare diseases have no FDA approved treatment. Thus, drug price negotiations should not disrupt innovation and patient access to the best therapies for their unique needs. In addition to all of our diseases being heterogeneous, some are also rare. We appreciate that the IRA included a limited exception for orphan drugs (drugs that treat only one rare disease) from negotiation. However, we are concerned that this will disincentivize pharmaceutical companies from conducting research into treatment for other diseases for fear that the drug will be subject to price negotiation. Failure to appropriately categorize these medications would stymie research with regard to additional therapeutic options for orphan drugs. There must be incentives for the pharmaceutical industry to continue to innovate, otherwise those with rare disease will continue to be alienated. **We ask that CMS clarify that obtaining additional designations for a drug will not make that drug eligible for negotiation unless and until it is approved by the FDA for another disease.**
3. **Maintain transparency in drug price negotiations to ensure accountability, build public trust, realize cost savings, and achieve better outcomes for patients.** Accountability is essential to ensure that CMS is acting in the best interest of the public. Transparency during negotiations will demonstrate that CMS is dedicated to fair and unbiased decision-making. When the public and stakeholders are able to see how prices are determined, it will help drive innovation and competition, resulting in lower prices and more variability in medications. **We urge CMS to be sufficiently transparent so that all stakeholders are informed on its progress and can be assured that the negotiation process is fair and equitable.**
4. **We realize that while CMS has requested input on other measures that might be used as a substitute for the QALY, data generated from its past implementation is extensive.** So while we understand that the IRA prohibits CMS from using QALY metrics in the negotiation, there

are no provisions to limit secondary sources that incorporate QALY-related data in evaluations. Our rationale for concern lies in the restrictive nature of the QALY, which does not account for patient heterogeneity, disease progression, or other factors that are not considered in general population models. **When and if this occurs, we suggest CMS justify the incorporation of that data, CMS should also prioritize patient and patient organization viewpoints, clinical utility and effectiveness, societal benefits, and patient-centered health outcomes in all pricing considerations.**

- 5. Precision Medicine is considered as a viable and necessary component of disease management and improving healthcare costs.** Precision medicine can expedite diagnosis, accelerate matching patients to treatments that can help doctors identify and better treat aggressive disease, predict harmful side effects, and eliminate costly trial-and-error processes. For diseases like ours, where no two patients are alike, it provides hope that we can gain access to a treatment that may work the first time, rather than spend years trying and failing various options. It provides hope that remission is possible, as now most of us will remain on costly medications for the rest of our lives. Its impact will improve outcomes, decrease rates of disability, and produce cost savings to the healthcare system. However, since little is said regarding consideration of precision medicine in negotiations, we wanted to take this opportunity to express its importance. **We encourage CMS to consider precision medicine in its negotiations, especially as implementation methods may impact patient access to both new and existing treatments.**

As a patient-led organization focused on improving the lives of those impacted by autoimmune and autoinflammatory arthritis (AiArthritis) diseases, we urge CMS to consider these recommendations. Together we can achieve the crucial goal of ensuring better outcomes and reducing costs for patients. Thank you again for this opportunity and for considering what patients feel is most important.

Sincerely,

Lindsey Viscarra
Public Policy Manager

**RE: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price
Applicability Year 2026, and Solicitation of Comments**

Dear Deputy Administrator Seshamani,

Alexion, AstraZeneca Rare Disease (Alexion) appreciates the opportunity to comment in response to the above captioned guidance (the “Guidance”) setting forth the Centers for Medicare & Medicaid Services’ (CMS’) proposed policies for implementing the Medicare Drug Price Negotiation Program (Negotiation Program) for initial price applicability year (IPAY) 2026.

Alexion is the group within AstraZeneca focused on rare diseases. Our mission is to transform the lives of people affected by rare diseases through the development and delivery of innovative medicines as well as supportive technologies and health care services. For 30 years, patients and their caregivers have been at the center of everything we do, and our mission is driven by understanding who they are as unique individuals, not just their disease. Every day, we are inspired to think differently and follow the science to create better outcomes for them and their families.

Our pioneering legacy in rare diseases is rooted in being the first to translate the complex biology of the complement system into transformative medicines. We have delivered transformative medicines for people living with paroxysmal nocturnal hemoglobinuria, atypical hemolytic uremic syndrome, antiaquaporin-4 antibody-positive neuromyelitis optica spectrum disorder (NMOSD), generalized myasthenia gravis (gMG), hypophosphatasia, and lysosomal acid lipase deficiency (LAL-D). Today, we continue to push the boundaries of science and deepen our understanding of rare diseases. This knowledge allows us to innovate and evolve into new areas where there is great unmet need and opportunity to help people fully live their best lives. We have provided comments regarding the Guidance in a section-by-section format, below. Our key areas of focus can be summarized as follows:

- **Alexion opposes CMS's “qualifying single source drug” (QSSD) definition as overly broad and not supported by the statute.** For both small-molecule drugs and large-molecule biological products, the statute unambiguously anchors the QSSD definition to the singular approval by the Food and Drug Administration (FDA) under which the product is marketed. The statute in no way authorizes CMS to convert the statute's focus on a

singular FDA approval to a definition that sweeps in products with multiple separate FDA approvals through the addition of an “active moiety/ingredient” test. As such, the term QSSD should be defined no more broadly than the NDA/BLA, which is the approval under which the product is originally marketed. CMS’s aggregate approach to defining QSSD may stymie innovation and limit patient access to new therapies that could improve their health outcomes.

- **Alexion appreciates CMS’s recognition of Congressional intent to exclude orphan drugs from the Negotiation Program, as well as CMS’s request for feedback about how to best preserve the orphan drug development pipeline. Unfortunately, the agency’s interpretation of the orphan drug exclusion is inconsistent with the statute, and we recommend that CMS exclude from inclusion in a QSSD any products marketed under a distinct NDA or BLA which are individually eligible for the orphan drug exclusion.** Specifically, because CMS is defining QSSD by reference to active ingredient/moiety, a single QSSD could include multiple drugs approved under separate NDAs/BLAs. Under CMS’s policy, an orphan drug approved under a new NDA/BLA would not fall within the scope of the orphan drug exclusion if it were aggregated into a broad QSSD with non-orphan products with the same active ingredient/moiety, which would discourage the development of orphan drugs and thus runs contrary to Congress’ decision to exclude orphan drugs from negotiation. However, the statute is clear that a QSSD cannot include a drug that would qualify for the orphan drug exclusion, and this approach preserves incentives to continue to develop orphan drugs and avoids arbitrarily failing to apply the orphan drug exclusion to qualifying drugs based solely on their aggregation into a QSSD with other non-qualifying drugs.
- **To preserve the incentive structure established by the Orphan Drug Act, Alexion also asks CMS to exclude from negotiation any product for which all indications, in the aggregate, treat fewer than 200,000 patients in the United States.** The express purpose of the ODA is to encourage the development of innovative pharmaceutical products to treat diseases and conditions with very small patient populations, defined by Congress as those affecting fewer than 200,000 persons in the United States. While the IRA includes an orphan drug exclusion, evincing a clear intent to preserve Congress’ longstanding support and incentives for drugs treating small patient populations, namely populations of fewer than 200,000 patients, CMS’ approach to implementing this exception fundamentally disrupts this purpose by leaving unprotected rare disease therapies that treat fewer than 200,000 patients even across multiple indications.
- **Alexion further urges CMS to support orphan drug development by clarifying that, in the context of an orphan drug, the 7- or 11-year period that must elapse before a drug can be considered for negotiation begins upon the date that the orphan drug exclusion no longer applies.** CMS should issue additional guidance to clarify that the orphan drug exclusion insulates a product from the IRA’s negotiation provisions for the entire duration the exclusion applies. Notably, the orphan drug exclusion constitutes a

threshold exclusion from the definition of a QSSD. It must follow from this structural placement that the 7- or 11-year pre-negotiation period that would otherwise apply to a QSSD is *tolled* until the first day after the orphan drug no longer meets the requirements of the orphan drug exclusion. This approach will better enable innovator companies to initially pursue orphan indications by initiating the pre-negotiation period only upon a subsequent approval for a distinct disease or condition.

- **Alexion urges CMS to take a holistic approach to considering a selected drug's clinical value.** While Alexion appreciates that CMS is required by statute to take into consideration certain factors in setting the maximum fair price (MFP) for a selected drug, we note that such factors are to be considered only “as applicable to the drug” and not all the statutory negotiation factors must be weighted equally. We recommend that CMS replace its proposed approach with one that accounts for the clinical value of a product using five core principles (outlined below). We also encourage CMS to implement an MFP methodology that provides the MFP ceiling price for products that either treat conditions with an unmet need or represent a significant therapeutic advance.
- **Alexion urges CMS to provide a more detailed framework regarding how the agency intends to consider therapeutic alternatives and evaluate comparative effectiveness, and to engage manufacturers on the shared objective of assessing a treatment’s clinical value.** There are numerous open questions that warrant CMS engaging the selected drug manufacturer regarding the methodology that the agency will use to evaluate therapeutic alternatives and assess comparative effectiveness.
- **Alexion supports CMS’s policy of not considering QALYs for purposes of the Negotiation Process, which is consistent with the plain statutory language of the IRA.** We similarly support the agency's scrutiny of any comparative effectiveness research that may rely on QALYs for its conclusions.

We describe each of these comments in greater detail, below.

I. Section 30: Identification of Selected Drugs for Initial Price Applicability Year 2026

Alexion understands that CMS has limited time to implement the Negotiation Program for IPAY 2026 and we acknowledge that CMS is issuing section 30 of the Guidance in final form without an opportunity to comment. However, Alexion is concerned that CMS is moving forward with policies that significantly reshape the way drugs are priced in the Medicare program without providing the public with the opportunity for comment, particularly because some of the policies described in section 30 appear to exceed the agency's statutory authority, and others pose significant policy or operational concerns that the agency may not have considered. Alexion is therefore submitting comments on section 30 and urges CMS to take these comments into account in the agency's implementation of the Negotiation Program going forward.

- A. CMS’s “qualifying single source drug” definition is overly broad and not supported by the statute. (Section 30.1)

CMS is defining the term “qualifying single source drug” (QSSD) broadly to include all dosage forms and strengths of the drug with the same active moiety (or for biologics, active ingredient) and the same holder of the New Drug Application (NDA) (or for biologics, Biological License Application (BLA)), inclusive of products that are marketed pursuant to different NDAs or BLAs.

CMS’s QSSD definition is overly broad and not supported by the statute. Section 1192(e)(1) of the Social Security Act (the “Act”) outlines the definitional criteria for QSSDs. For both small-molecule drugs and large-molecule biological products, the statute unambiguously anchors the QSSD definition to the *singular* approval by the Food and Drug Administration (FDA) under which the product is marketed.¹ The statute in no way authorizes CMS to convert this focus on the *singular* FDA approval to a definition that sweeps in products with multiple separate FDA approvals through the addition of an “active moiety/ingredient” test. As such, the term QSSD should be defined no more broadly than the NDA/BLA, which is the approval under which the product is originally marketed.

CMS’s reliance on section 1192(d)(3)(B) of the Act to support its aggregation of NDA/BLAs into a single QSSD is misplaced because it ignores sequential placement of the QSSD definition relative to the “total expenditures” calculation. Section 1192(d)(3)(B) of the Act describes the aggregation of *dosage forms and strengths* for purposes of calculating Parts B and D total expenditures to determine whether a drug that is *already* a QSSD qualifies as a “negotiation-eligible” drug. Section 1192(d)(3)(B) does not govern the identification of the underlying QSSD. Stated differently, section 1192(d)(3)(B) applies *after* the QSSD is identified and ensures that the different dosage forms and strengths of a QSSD are incorporated into the total expenditure calculation. This requirement is intended to account for the common circumstance where a single NDA/BLA, and even a single supplemental NDA/BLA, can have multiple dosage forms and strengths.

Additionally, CMS’s aggregate approach to defining QSSD may stymie innovation and limit patient access to new therapies that could improve their health outcomes. Pursuing FDA approval or licensure for a new product affords patient access to new scientific advances, including products that are easier to administer, have fewer side effects, or treat new indications. However, obtaining such approval involves a significant expenditure of resources, even if the new product shares the same active ingredient/moiety with an existing therapy. If CMS aggregates separate NDAs/BLAs into a single QSSD, manufacturers will be deterred from making these investments

¹ For drugs to be a QSSD, section 1192(e)(1) of the Act requires only that the drug be ““approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act and is marketed pursuant to such approval.”” Likewise for biological products, section 1192(e)(2) requires only that the biological product be ““licensed under section 351(a) of the Public Health Service Act and is marketed under section 351 of such Act.”” Canons of statutory construction suggest that a legislative drafter writes precisely and in accordance with the rules of grammar. *See, e.g.,* *Arcadia v. Ohio Power Co.*, 498 U.S. 73, 79 (1990) (“In casual conversation, perhaps, such absent-minded duplication and omission are possible, but Congress is not presumed to draft its laws that way.”) Thus, Congress’ reference to only a singular approval should be given weight. *See, e.g.,* *Niz-Chavez v. Garland*, 141 S. Ct. 1474, 1480 (2021) (emphasizing the use of “the singular article ‘a’” to conclude that the statute referred to a singular term).

that would otherwise advance the scientific understanding of disease states and bring scientific applications to bear for patients.

B. Alexion supports CMS’s policy that a generic/biosimilar for “any of the strengths or dosage forms of the potential qualifying single source drug” would disqualify the drug/biological product from the QSSD definition. (Section 30.1)

CMS states that “[i]f any strength or dosage form of a potential qualifying single source drug is the listed drug or reference product, as applicable, for one or more generic or biosimilar biological products that CMS determines are approved and marketed . . . the potential qualifying single source drug will not be considered a qualifying single source drug for initial price applicability year 2026.”²

While Alexion opposes CMS’s QSSD definition, to the extent CMS proceeds with such an overly expansive interpretation, Alexion would support CMS’s policy position in relation to the impact of generic/biosimilar competition on a QSSD. Specifically, since CMS’s QSSD definition is so broad, it is necessary (as a limiting principle) that a generic/biosimilar for *any* of the branded product’s strengths and/or dosage forms is a sufficient condition to disqualify the potential QSSD, particularly because generic/biosimilar manufacturers may not seek approval for all of the strengths or dosage forms of the branded product.

However, we do have some concerns regarding CMS’s policy with respect to confirming the presence of “bona fide” marketing of the generic or biosimilar product, which we believe exceeds the statute and will be difficult to apply in a non-arbitrary manner. In adopting this policy, CMS relies on sections 1192(e)(1)(A)(iii) and 1192(e)(1)(B)(iii) of the Act for drug products and biological products, respectively.³ While these provisions require that a generic or biosimilar be “marketed” in order for the branded product to lose its QSSD status, the term “marketed” is best understood consistent with its ordinary meaning, which is to “expose for sale in a market”⁴ or “to offer products for sale to buyers.”⁵ Nothing about the “ordinary meaning” of the term “marketed” suggests that sellers must sell the product in a “robust and meaningful” manner. CMS should not operate beyond the statute by establishing a separate “robust and meaningful competition” standard. The availability of the generic/biosimilar for purchase should be sufficient to make a determination that the product is “marketed” as required by the statute. At the very least, a single sale of the generic/biosimilar product should suffice.

C. CMS should support orphan drug development and access. (Section 30.1.1)

CMS intends to interpret the orphan drug exclusion under section 1192(e)(3)(A) of the Act as applying to a drug or biological product that must (1) be designated as a drug for only one rare

² Guidance at 10.

disease or condition under section 526 of the FD&C Act and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition.⁶ As described in the Guidance, all dosage forms and strengths and different formulations of the QSSD must meet the criteria for the exclusion.⁷ CMS would then use the FDA's Orphan Drug Product designation database and approvals on the FDA website to identify a qualifying orphan drug. Importantly, CMS states that it is “considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development.”⁸

As described below, developing drugs for rare diseases is an exceedingly challenging proposition, and many rare diseases still lack an approved therapy. It is therefore essential that CMS implement the IRA's orphan drug exclusion in a manner that encourages the continued development of rare disease drugs, consistent with the intent of the Orphan Drug Act (ODA).

While each rare disease affects a relatively limited patient population, in the aggregate, rare diseases affect a significant number of Americans. There are approximately 30 million people living with over 7,000 rare diseases in the United States, including millions of Medicare beneficiaries.⁹ Many of these rare diseases are debilitating and costly, particularly for those in minority and underserved communities, negatively affecting the quality of life not only for the patients but their families and caregivers.¹⁰ Inequities caused by delays in diagnosis and treatment access to rare disease therapies are compounded by health disparities for rare disease patients, especially those that belong to racial or ethnic minority groups.

Although there has been a significant increase in the number of drugs approved to treat rare diseases since the Orphan Drug Act (ODA) was enacted 40 years ago, over 90 percent of known rare diseases still do not have a treatment. This is due, in part, to circumstances unique to rare diseases that further complicate the extremely costly¹¹ and high-risk¹² drug-development process.

For example, it can be challenging to enroll a sufficient number of patients in clinical trials for rare diseases given small patient numbers, uneven distribution of disease across populations, and heterogeneity of diseases. It is similarly challenging to design clinical trials for rare disease populations given difficulties designating an appropriate comparator, validating novel endpoints, and obtaining sufficient data from small patient populations. Obtaining the high-quality data

necessary to evaluate the clinical trial outcomes for rare diseases is also a challenge given diversity in clinical presentation, disease progress, and other patient characteristics.

Meanwhile, because many rare disease drugs are the first and/or only products for a given disease, rare diseases lend themselves to being a starting point in the translation of new scientific discoveries to clinical medicine. As data emerge, drug manufacturers sometimes identify promising new uses for existing orphan therapies – in many cases for additional orphan indications. In addition to identifying patient needs and scientific pathways, there needs to be a business case for making this investment since the exploration of new indications requires significant resources.

Alexion continues to believe that CMS can take additional actions to “best support orphan drug development” as it relates to the implementation of the orphan drug exclusion. We appreciate CMS’s focus on the importance of orphan drugs to patients who need them and support CMS implementing policies that recognize the individual contributions of each orphan indication as it evaluates Medicare spending and other negotiation factors for orphan products. We offer three approaches to help CMS best support orphan drug development and access.

- i. CMS should exclude drugs that treat indications with a collective total of fewer than 200,000 patients from the Negotiation Program to preserve the incentives for orphan drug development created by Congress in the Orphan Drug Act.*

The express purpose of the ODA, enacted by Congress in 1983, is to encourage the development of innovative pharmaceutical products to treat diseases and conditions with very small patient populations, defined by Congress as those affecting fewer than 200,000 persons in the United States.¹³ The FDA, the agency with direct oversight of this program, recognizes this clear purpose, noting that it is challenging to create treatments and cures for rare diseases, including “...the complex biology and the lack of understanding of the natural history of many rare diseases. The inherently small population of patients with a rare disease can also make conducting clinical trials difficult.”¹⁴

In passing the IRA, Congress included orphan drugs as one of just three exclusions from the QSSD definition, evincing a clear intent to preserve Congress’ longstanding support and incentives for drugs treating small patient populations, namely populations of fewer than 200,000 patients.¹⁵ CMS’ approach to implementing Congress’ exemption, however, fundamentally disrupts this purpose by leaving unprotected rare disease therapies that treat fewer than 200,000 patients even across multiple indications.

When designating a drug as an orphan drug, FDA pays careful attention to the 200,000 patient prevalence limit. Further, FDA acknowledges that a drug may show promise even in

¹³ The ODA defines the term “rare disease or condition” to mean “any disease or condition which (A) affects less than 200,000 persons in the United States, or (B) affects more than 200,000 in the United States and for which there is no reasonable expectation that the cost of developing and making available in the United States a drug for such disease or condition will be recovered from sales in the United States of such drug.” See 21 U.S.C. § 360bb(a)(2).

¹⁴ “Rare Diseases at FDA,” Available at <https://www.fda.gov/patients/rare-diseases-fda> (Accessed April 7, 2023).

¹⁵ Section 1192(e)(1) of the Act.

multiple, different rare diseases. Such drugs may be eligible for multiple orphan designations because FDA considers the prevalence within each disease or condition. By way of example, in 2007 the FDA approved Alexion's SOLIRIS® (eculizumab) as the first therapy approved for paroxysmal nocturnal hemoglobinuria (PNH), a rare, disabling and life-threatening blood disorder defined by chronic red blood cell destruction, or hemolysis.¹⁶ Alexion has since continued to invest in advanced clinical research to bring the clinical benefits of SOLIRIS to other rare patient populations: atypical hemolytic uremic syndrome (aHUS) (in 2011),¹⁷ generalized myasthenia gravis (gMG) (in 2017),¹⁸ and neuromyelitis optica spectrum disorder (NMOSD) (in 2019).¹⁹ Using the highest U.S. prevalence numbers available, the current total estimated disease prevalence across all four conditions is estimated to be only 167,112 patients, still far fewer than the 200,000 patient size contemplated by Congress in enacting the ODA.²⁰ Yet, under CMS' interpretation of the IRA's orphan drug exclusion, the 2011 approval of SOLIRIS for aHUS in 2011 would have resulted in the loss of the orphan drug exclusion for SOLIRIS, at a time when the therapy was approved for a combined population of fewer than 500 patients nationwide across both approved indications. This would have made it difficult for Alexion to justify the significant investment necessary to obtain FDA approval for the two remaining indications had the IRA been in effect at the time.

As is clear, CMS's approach will have the effect of including in the Negotiation Program orphan drugs treating patient populations well below the 200,000 threshold Congress sought to protect in the ODA, undermining the ODA's purpose and disturbing a carefully crafted framework that has been remarkably successful in bringing new lifesaving treatments to patient populations that may otherwise have lacked access to any therapy for their rare condition.

Considering these significant concerns, we strongly urge CMS to exclude from negotiation any drug that, in aggregate, treats indications for which there are fewer than 200,000 patients in the United States.

- ii. *The orphan drug exclusion should be applied to exclude a drug from a QSSD if the drug falls within the scope of the orphan drug exclusion.*

Promulgating an orphan exclusion that focuses on broad targeting of orphan drugs for negotiation will mean fewer products qualify for the orphan drug exclusion and harms patients by discouraging the continued development of orphan drugs. We oppose the agency's interpretation

of the orphan drug exclusion on these grounds, and because it is inconsistent with the statutory requirements of the IRA.

Under CMS's policy, an orphan drug approved under a separate NDA/BLA would not fall within the scope of the orphan drug exclusion if it were aggregated into a broad QSSD with non-orphan products with the same active ingredient/moiety, which would discourage the development of orphan drugs. Specifically, because CMS has adopted an overbroad interpretation of QSSD, which is defined by reference to the active ingredient/moiety, a single QSSD could include multiple drugs approved under separate NDAs/BLAs. As a practical matter, it is possible that only one such drug qualifies for the orphan drug exclusion (i.e., approved by FDA only for one or more indications within a single rare disease or condition).²¹ However, CMS would prevent that drug from benefitting from the orphan drug exclusion by requiring that “all dosage forms and strengths and different formulations” of the QSSD into which the orphan drug is aggregated meet the orphan drug exclusion. Such a result effectively discourages developers from developing new therapies and runs contrary to Congress’ decision to exclude orphan drugs from negotiation.

Such a read is also inconsistent with the statutory text of the orphan drug exclusion. Section 1192(e)(3)(A) of the Act provides that the term “qualifying single source drug” does not include “a drug” that is “designated as a drug for only one rare disease or condition under section 526 of the Federal Food, Drug, and Cosmetic Act and for which the only approved indication (or indications) is for such disease or condition falls within the orphan drug exclusion.” This language excludes a drug from inclusion in a QSSD if the drug falls within the orphan drug exclusion. Stated differently, the statute contemplates that CMS would first identify the full potential scope of the QSSD, and then subsequently apply the orphan drug exclusion to exclude qualifying orphan drugs from inclusion therein. Therefore, if CMS proceeds with a broad interpretation of QSSD that includes all dosage forms and strengths of the same active moiety or active ingredient—inclusive of products that are marketed pursuant to different NDAs or BLAs from the same market authorization holder—CMS should exclude from a QSSD any products marketed under a distinct NDA or BLA which are individually eligible for the orphan drug exclusion.

This approach may help preserve incentives to continue to develop orphan drugs and avoids arbitrarily failing to apply the orphan drug exclusion to qualifying drugs based solely on their aggregation into a QSSD with other non-qualifying drugs.

- iii. *The 7- or 11-year period that must elapse before a drug or biological can be subject to negotiation should begin on the date a drug loses eligibility for the orphan drug exclusion.*

²¹ We note that CMS’s interpretation of the orphan drug exclusion could be read as precluding a drug with multiple orphan drug designations (ODDs) from qualifying for the exclusion, even if only one of the ODDs had any approved indications. Alexion strongly opposes this read of the statute, which would further discourage the development of therapies for rare disease by creating an incentive not to seek multiple ODDs, and even to withdraw ODDs already rewarded. We therefore urge CMS to focus only on approved indications in applying the orphan drug exclusion.

In the case of a drug that initially qualifies for the orphan drug exclusion from inclusion in a QSSD, as described above, CMS should clarify that the 7- or 11-year period prior to negotiation eligibility begins to run only upon the loss of the orphan drug exclusion.

As discussed above, pursuant to section 1192(e) of the Act, a drug can only be classified as a QSSD (and hence be subject to negotiation) once “*at least 7 years...since the date of such approval [under section 505(c)]*” or “*at least 11 years...since the date of such licensure [under section 351(a)]*” have elapsed. This language must be read in the context of the orphan drug exclusion, which provides that: “[T]he term ‘qualifying single source drug’ does not include any of the following . . . [a] drug that is designated as a drug for only one rare disease or condition under section 526 of the [FDCA] and for which the only approved indication (or indications) is for such disease or condition.”²²

Under CMS’s guidance, a drug that initially qualifies for the orphan drug exclusion would lose this exclusion, and could potentially be classified as a QSSD, following the approval, with respect to the same active moiety, of a non-orphan indication or a new orphan indication for a distinct disease or condition. CMS’s guidance, however, does not address *when* such a drug could potentially be classified as a QSSD and hence become eligible for negotiation.

CMS should issue additional guidance to clarify that the orphan drug exclusion entirely insulates a product from the IRA’s negotiation provisions for the entire duration the exclusion applies. Thus, the 7- or 11-year pre-negotiation period would commence only upon the date a drug loses eligibility for the orphan drug exclusion. This outcome is supported by the statute’s plain language and scheme.

Notably, the orphan drug exclusion constitutes a threshold exclusion from the definition of a QSSD.²³ It must follow from this structural placement that the 7- or 11-year pre-negotiation period that would otherwise apply to a QSSD is *tolled* until the first day after the orphan drug no longer meets the requirements of the orphan drug exclusion. Indeed, any other approach would defeat the intent of excluding relevant orphan drugs from the QSSD definition, including the statutory sub-elements. (Consider, by contrast, the small-biotech exclusion, which was specifically inserted as an exclusion to the definition of a “*negotiation-eligible drug*” under section 1192(d)(2) of the Act.)²⁴

By issuing guidance that sets forth the interaction between the orphan drug exclusion and the QSSD definition in this way, CMS will be following the plain text of the statute. Additionally, we believe that CMS should interpret the Medicare Negotiation program in a way

²² See SSA § 1192(e)(3)(A).

²³ See SSA § 1192(e)(3)(A) (“Exclusions.—In this part, the term [QSSD] does not include any of the following... (A) Certain Orphan Drugs.”)

²⁴ See SSA § 1192(d)(2) (stating that “term ‘negotiation-eligible drug’ shall not include... a qualifying single source drug that meets [the listed criteria]”).

that supports and safeguards the important progress the ODA has achieved in sharing the benefits of medical innovation with patients with orphan diseases. The approach outlined here better enables innovator companies to pursue orphan indications by initiating the pre-negotiation period only upon a subsequent approval for a distinct disease or condition.

II. Section 50: Negotiation Factors

Alexion supports CMS's solicitation of information from patients and Medicare beneficiaries to inform the negotiation process and urges CMS to give substantial weight to the patient voice. We further support CMS's policy of not considering quality-adjusted life years (QALYs) for purposes of the Negotiation Program and the agency's close scrutiny of any comparative effectiveness research that may rely on QALYs for its conclusions. However, we urge CMS to allow for manufacturer input regarding the selection of therapeutic alternatives, and to develop a more detailed framework for how the agency will consider therapeutic alternative and comparative effectiveness data based on five core principles, discussed below.

A. Alexion supports CMS's solicitation of information from patients and Medicare beneficiaries and urges CMS to give substantial weight to the patient voice (Section 50.2).

As described in the Guidance, CMS will consider therapeutic alternative and comparative effectiveness data submitted by Medicare beneficiaries, academic experts, clinicians, and other interested members of the public.²⁵ We strongly support this solicitation, and we note that the patient voice is often ignored, even in the comparative effectiveness research that purports to assess the best treatments for patients. This is particularly true for people of color with rare diseases, who face additional disparities in access to care, including differences in health care utilization, delayed or missed care due to a lack of transportation or work flexibility, and a lack of representation in clinical trials and research. Alexion therefore urges CMS to give substantial weight to the patient experience in CMS's evaluation of therapeutic alternatives and comparative effectiveness. Factors such as patient convenience due to route of administration, caregiver burden, and improvements in quality of life not otherwise measured by endpoints in a clinical trial nevertheless represent a significant benefit to the patient experience. Such a seemingly innocuous benefit can directly impact other health outcome metrics, such as medication adherence and patient self-sufficiency through an improved ability to consistently engage in gainful employment. We urge CMS to not only take into account the beneficiary and caregiver experience, but to prioritize it when evaluating the value of a drug product.

B. Alexion supports CMS's policy of not considering QALYs in applying comparative effectiveness research. (Section 50.2)

As required by statute, CMS will assess a selected drug's comparative effectiveness as compared to "therapeutic alternatives."²⁶ In so doing, CMS stated the agency will not use evidence from comparative clinical effectiveness research that treats extending the life of an individual who

²⁵ *Id.*

²⁶ *Id.* at 36.

is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill, including quality-adjusted life years (QALYs).²⁷ To the extent that studies regarding comparative effectiveness employ QALYs in its analysis, CMS will not consider it unless it is able to separate such evidence.²⁸ Alexion supports CMS's policy of not considering QALYs for purposes of the Negotiation Process, which is consistent with the plain statutory language of the IRA. We similarly support the agency's close scrutiny of any comparative effectiveness research that may rely on QALYs for its conclusions.

C. CMS should allow for manufacturer input on the selection of therapeutic alternatives. (Section 50.2)

Alexion further urges CMS to allow for manufacturer input into the selection of therapeutic alternatives in applying comparative effectiveness research as part of the Negotiation Program. In the Guidance, CMS outlines a flexible approach to considering therapeutic alternatives and evaluating comparative effectiveness. We note that Alexion has serious concerns that certain studies have drawn improper comparisons across therapies. As a result, we have a number of open questions including, for example: Will CMS consider products that treat the same disease area, or that treat the same specific indication, as therapeutic alternatives? How will CMS distinguish between different mechanisms of action or routes of administration, even when the drugs under consideration treat the same disease area or specific indication? How will CMS consider comparative effectiveness research in light of demonstrable differences in heterogeneous patient populations where what may work for one patient may not work for another, thereby confounding the comparability of comparative effectiveness comparisons? How does CMS intend to resolve conflicting evidence as it relates to a selected drug's comparative effectiveness?

Given these significant uncertainties, at a minimum Alexion urges CMS to provide manufacturers with an opportunity to engage with CMS and review CMS's methodology for the selection of therapeutic alternatives before CMS makes such a determination. We also urge CMS to consider only on-label indications in selecting therapeutic alternatives, as off-label indications have not been approved by FDA and have significantly less robust data regarding safety and efficacy, relative to on-label uses.

D. CMS should develop a more detailed framework for how the agency will consider therapeutic alternative and comparative effectiveness data based on five core principles (Section 50.2)

As described in the Guidance, CMS will consider therapeutic alternative and comparative effectiveness data submitted by Medicare beneficiaries, academic experts, clinicians, and other interested members of the public. Assessment of a treatment's clinical value should be a shared endeavor between CMS and pharmaceutical manufacturers. Alexion supports a framework for assessment of clinical value that considers the following five core principles:

²⁷ *Id.*

²⁸ *Id.*

1. **The process of clinical value assessment should be transparent.** Using scientific principles, a consistent methodology, and appropriate evidence, various stakeholders should be able to come to similar conclusions.
2. **While adhering to a consistent methodology, clinical value assessments should consider contextual factors associated with the disease in question.** This is particularly important for rare diseases. Aside from the obvious recruitment challenges in rare disease clinical trials, the basic pathophysiology of many rare diseases is less well understood compared to more common diseases. Because of this, clinical trials for rare disease treatments often use endpoints that are not specifically developed to capture the full impact of the rare disease or its treatment. In generalized Myasthenia Gravis, for instance, the primary endpoint focuses on physical aspects of the disease, just one of eight domains patients reported that are impacted by the disease.
3. **Appropriate therapeutic alternatives must be assessed, based on clinical, not economic factors.** Therapeutic alternatives should be licensed and approved for the disease in question and there should be sufficient data to make a valid assessment of each alternative's clinical value feasible. For many rare diseases with existing treatments, there may be only one appropriate therapeutic choice. And, as noted above, the manufacturer should have input regarding the identification of therapeutic alternatives.
4. **The perspective of clinical value assessment should be holistic.** The assessment must include not just short-term efficacy endpoints used in clinical trials, but safety, long-term health outcomes, patient experience factors such as route and frequency of administration, impacts on population health equity, health system resource use, and societal impacts outside the healthcare system as well. A study conducted by the EveryLife foundation²⁹ concluded that 55 percent of the total burden of rare diseases is experienced outside of the healthcare system. But these impacts outside the healthcare system are still very much part of the lived experience of rare disease patients. In NMOSD, the primary endpoint in clinical trials is the reduction in relapses. What remains unmeasured, however, is how the reduction of debilitating attacks on nerves in the eye and the spine allows patients to continue to earn a living or live a life without fear of the next attack. Equity deserves additional consideration. Evidence in generalized Myasthenia Gravis shows non-white patients are diagnosed and treated with a delay of many years, often initiating treatment with a higher level of disease activity. Access to treatment options for these patients may address a disproportionately higher unmet medical need.
5. **The data to inform a holistic perspective of clinical value will necessarily need to come from a wide range of sources.** Appropriate data sources should include, but should not be limited to, clinical trials, patient registries, and other real-world data. Here again, consideration of disease rarity will be important because real-world data is more challenging to collect for rare disease. Despite this, patient registries and other real-world

²⁹ Yang et al. Orphanet Journal of Rare Diseases (2022) 17:163.

data have been important sources of data to demonstrate the value of rare diseases treatments. For example, after asfotase alfa was associated with a significant improvement in survival among infants with hypophosphatasia (HPP) and bone health among children with HPP within our clinical trials, the Global HPP Registry has subsequently demonstrated that adults with HPP treated with Strensiq® (asfotase alfa) in real-world settings experience significant improvements in physical function and quality of life. Real-world data are also needed to assess some endpoints not easily measured in clinical trial settings, such as caregiver burden and non-medical costs.

III. Section 60: Negotiation Process

A. CMS should holistically consider a selected drug’s clinical value, rather than narrowly focusing on R&D spend and recoupment. (Section 60.3).

As described in section 60 of the Guidance, CMS is proposing a four-step process to determine an initial offer and counteroffer for a selected drug. Specifically, CMS intends to: (1) identify indications for the selected drug and therapeutic alternative(s); (2) use as a starting point the Part D net price for Part D drug therapeutic alternative(s) and/or Part B average sales price for Part B therapeutic alternative(s); (3) evaluate clinical benefits of the selected drug to adjust the starting point; and (4) further adjust the preliminary price through consideration of manufacturer-specific data (e.g., R&D costs; current unit costs of production and distribution) to determine the initial offer price. While Alexion supports CMS’s proposal to prioritize the consideration of clinical benefits, we are concerned that the proposed methodology does not predictably recognize therapeutic advances or treatment options that address unmet needs.

First, we are concerned that CMS may be putting undue weight on certain manufacturer-specific factors. For instance, CMS is seeking extensive information on manufacturer R&D costs as well as global recoupment of development costs. This raises the concern that the extent to which manufacturers have recouped development costs will have undue weight on the price of selected drugs. Although obviously very important to drug discovery and development, the amount of R&D costs for a drug are not necessarily indicative of the drug’s value. Indeed, while developers may expend large R&D investments to develop a product that ultimately brings tremendous clinical value, products with lower R&D spend can have an equal or greater value. Conversely, products with significant R&D costs may not work any better than the current standard of care, or only marginally better.

Alexion acknowledges that CMS is required by statute to take into consideration certain factors—including R&D costs—in setting the maximum fair price (MFP) for a selected drug. However, such factors are to be considered only “as applicable to the drug” and not all the statutory negotiation factors must be weighted equally. More importantly, we are concerned that CMS’s proposed approach will undervalue innovative selected drugs, including therapies approved to treat rare diseases. If the MFP for meaningful clinical improvements is set too low, investment in both initial and post-approval R&D will decline, resulting in reduced access to needed therapies for patients.

As also noted in our comments regarding section 60.3.3 and 60.3.4 of the Guidance, below, Alexion urges CMS to instead prioritize the negotiation factors described in section 1194(e)(2) of the Act. Specifically, CMS should establish the MFP at the ceiling price for products that, over the course of the product's lifecycle, have provided therapeutic advancements or treated previously unmet medical needs. This approach would best preserve incentives for the development of orphan drugs, establish a clear and predictable methodology for determining drug pricing, and enable CMS to meet its statutory obligations under the IRA.

B. CMS should allow for manufacturer input on the selection of therapeutic alternatives for purposes of identifying the “starting point” for the initial MFP offer calculation. (Section 60.3.1).

As described above, CMS is proposing a four-step process to determine an initial offer and counteroffer for a selected drug. To the extent CMS retains this framework, we have some concerns regarding how it might be implemented. For instance, as to this first step, as described in response to our comments to section 50.2, above, manufacturers should be given an opportunity to weigh in regarding CMS's selection of therapeutic alternatives as certain studies have drawn improper comparisons across therapies. In addition, an off-label product is priced for use in its licensed indication, making its price an unsuitable starting point for negotiations.

C. CMS should start with the ceiling price rather than the Federal Supply Schedule (FSS) or “Big Four Agency” pricing when there are no therapeutic alternatives or pricing for the therapeutic alternatives is above the ceiling price. (Section 60.3.2)

As to the second step, CMS intends to use the Part D net price(s) and/or average sales price(s) (ASP(s)) of therapeutic alternative(s) for the selected drug as the starting point for developing the MFP initial offer unless the resulting price is higher than the statutory ceiling.³⁰ Where there is no therapeutic alternatives available on the market, or where the pricing for the therapeutic alternatives is greater than the statutory ceiling price, CMS intends to determine the starting point for the initial offer based on the FSS or “Big Four Agency” pricing.³¹

Alexion opposes CMS's proposed use of the FSS or “Big Four Agency” pricing as the “default” starting point for the initial offer for those products with no therapeutic alternative. Many therapies for rare disease fall into this category, and the FSS and “Big Four Agency” prices do not reflect market pricing, as these pricing benchmarks incorporate significant and mandatory price cuts that would otherwise undermine patient access in a market setting. The use of the FSS or “Big Four Agency” prices as the default starting point thus arbitrarily punishes manufacturers that develop drugs for patients who lack therapeutic alternatives. If anything, the starting point for these products should be *higher* than products that have therapeutic alternatives. CMS should therefore use the statutory ceiling price as the starting point in such circumstances, consistent with the underlying statutory language. Unlike FSS and “Big Four Agency” pricing, the statutory

³⁰ *Id.* at 48.

³¹ *Id.* at 49.

ceiling price is a market-based price that more closely approximates the starting price point for other therapies.

D. CMS should provide a clearer framework for how the clinical factors will be used to establish the MFP. (Section 60.3.3)

After identification of therapeutic alternatives for purposes of establishing a starting point for negotiation, CMS intends to adjust the starting point based on the clinical benefit that the selected drug confers as compared to its therapeutic alternatives. CMS will broadly evaluate the body of clinical evidence through a CMS-led literature review, and CMS may also analyze Medicare claims data or other pharmaceutical drug datasets for utilization patterns, clinical data, or other information relevant to the selected drug and its therapeutic alternatives. CMS's adjustments to the starting point will be referred to as the “preliminary price.”

As noted above, we recommend that CMS set the MFP at the ceiling price for selected drugs that, over the course of the product's life cycle, have provided therapeutic advancements or treated previously unmet medical needs. For other products, we believe CMS should provide clearer guidance on the specific elements that will be evaluated, the weight applied to any one individual element, and the directional adjustments that CMS would make based on its evaluation of such elements and their relative weight.

Any determination of clinical benefit or of unmet medical need must also explicitly include a framework for weighing the patient and caregiver voice and lived experiences, in addition to clinical factors such as disease prognosis and the lack of alternative therapies. While patient and caregiver voices are important in the consideration of any therapy's advantages, these voices are doubly important in the context of diseases without therapeutic alternatives. This is often the case for rare disease, as 90 percent of rare diseases currently lack an approved therapy.

E. CMS should apply special considerations when evaluating selected drugs, such as orphan drugs due to their unique circumstances. (Sections 60.3.3)

We appreciate that CMS has, elsewhere in the Guidance, recognized the need to work with stakeholders to “support orphan drug development.”³² As a leader in rare disease treatment development, we are deeply interested in ensuring that CMS's clinical benefit assessment for selected drugs without therapeutic alternatives is appropriately calibrated to account for the unique characteristics of rare disease and to appropriately recognize the value of orphan drugs. As CMS develops a clinical benefit assessment for selected drugs that are orphan drugs, it must do so with a recognition that rare diseases are rare and diverse, and thus tend to be less well understood than therapies for more common disease. CMS should similarly adopt special considerations that recognize some of the data and other limitations associated with orphan therapies.

F. Manufacturer-specific factors should not be used for drugs that represent a therapeutic advance or address an unmet need (Section 60.3.4).

³² *Id.* at 11.

As to the fourth step in the process, as described our comments in response to Section 60.3.3, above, Alexion urges CMS to prioritize the clinical negotiation factors. Specifically, CMS should focus on whether a selected drug demonstrates a clinical benefit and addresses an unmet need in calculating the MFP. To avoid setting the MFP too low, CMS should not incorporate the manufacturer-specific factors unless a product does not address an unmet need or represent a therapeutic advance over its therapeutic alternatives. As noted above, this approach would best preserve incentives for innovation, establish a clear and predictable methodology for determining drug pricing, and enable CMS to meet the statutory obligations of the IRA.

**Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial
Price Applicability Year 2026, and Solicitation of Comments**

Dear Dr. Seshamani,

The Alliance for Aging Research (“Alliance”) appreciates the opportunity to review and comment on the initial guidance regarding the implementation of the Medicare Drug Price Negotiation Program. The Alliance is the leading nonprofit organization dedicated to accelerating the pace of scientific discoveries and their application to vastly improve the universal human experience of aging and health.

The Alliance actively supported several provisions in the Inflation Reduction Act of 2022—expansion of the low-income subsidy program; reducing beneficiary costs for vaccination; an inflationary cap; and most notably, the Medicare Part D provisions restructuring the benefit and adding a much-needed annual cap on out-of-pocket costs. However, since 2019, the Alliance has consistently urged federal policymakers to reject reliance on cost-effectiveness methodologies that discriminate against older adults and persons with a disability – the very populations that Medicare serves. As CMS implements the price negotiation provisions of the IRA, it is vital that the agency avoid

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

the use of such methodologies and instead focus on use of patient-centered value assessment techniques.

Our concerns regarding implementation without due consideration of potential beneficiary impacts—including significantly decreased access to necessary drugs, therapeutics, and other forms of care—remain, and we have outlined them in our comments below. We thank CMS for the opportunity to provide feedback and suggestions to ensure that any potential negative impacts of the Medicare Drug Price Negotiation Program (“Negotiation Program”) on patient access to care are avoided or mitigated.

§50.2 and §60.3.3: Indirect Use of the Quality-Adjusted Life Year and Other Similar Metrics

The older adult and disability communities have communicated at length about the discriminatory impacts of the quality-adjusted life year (QALY) on patient access to care. While the Alliance supported the QALY-related language in the Inflation Reduction Act of 2022, it did not go far enough. The language states, “the Secretary shall not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, non- disabled, or not terminally ill”. Further, this language did not communicate the full extent to which the law forbids CMS from using QALYs in the negotiation process. Previously-established statutory language from the Affordable Care Act (ACA) states:

”The Patient-Centered Outcomes Research Institute established under section 1181(b)(1) shall not develop or employ a dollars-per-quality adjusted life year (or similar measure that discounts the value of a life because of an individual’s disability) as a threshold to establish what type of health care is cost effective or recommended. **The Secretary shall not utilize such an adjusted life year**

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

(or such a similar measure) as a threshold to determine coverage, reimbursement, or incentive programs under title XVIII.”¹

The language in the initial guidance does not go far enough to meet the standard set forth in the ACA in relation to avoiding use of the QALY for coverage or reimbursement decisions in the Medicare program. Further, the National Council on Disability (NCD), an independent federal agency, has noted that use of the QALY and similar measures would undermine major disability and civil rights laws, including the Americans with Disabilities Act.² Further, there are similar metrics that operate similarly to the QALY that CMS should avoid using in the Negotiation Program to ensure that the metrics used to assess value support the provision of equitable, fair, and nondiscriminatory healthcare in the Medicare program.

In the draft guidance, the Medicare program has stated that reports that use QALYs will likely be a tool and reference point for price-setting, indicating that complimentary metrics like the estimated value of life years gained (evLYG) and conclusions drawn from incomplete data and discriminatory assumptions are still on the table for consideration. However, when the output of these methodologies is used, it has detrimental impacts on patient access, patient-centered care, and shared decision-making. In the initial guidance, CMS proposed the following:

“Information submitted ... that treats extending the life of individuals in these populations as of lower value, for example certain uses of quality-adjusted life-years (QALYs), will not be used in the negotiation process. In instances where a study uses QALYs in a life-extension context but has clearly separated this use of QALYs from other evidence in the report (e.g., clinical effectiveness, risks, harms,

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

etc.) that is relevant to the factors listed in section 1194(e)(2) of the Act, CMS intends to consider such separate evidence. CMS will ask entities submitting information to indicate whether or not their submission contains information from studies that use QALYs in a life-extension context.

We have deep concerns that CMS has expressed interest in utilizing QALYs as long as they are not used in a “life extension context.” Though the IRA language speaks to life extension only, this does not abrogate the clear prohibition on the use of QALY and similar metrics in Medicare’s coverage and reimbursement decisions codified in the ACA. It is troubling that the draft guidance proposes an intent to include direct or indirect application of discriminatory cost-effectiveness standards, including contracting with these third-party organizations such as the Institute for Clinical and Economic Review (ICER) that have adopted and endorsed the use of these metrics.

Clearly stated, CMS should not utilize information that includes reference to the QALY, even if its use is not specific to life extension.

In light of the ban on QALYs, ICER and the organization’s allies³ are advocating that Medicare use the equal value life years gained metric (evLYG) in the Negotiation Process, characterizing the evLYG as an alternative to the QALY. However, these perspectives fail to acknowledge the major pitfalls of the evLYG. The evLYG was never intended to be used as a standalone metric, it was developed to serve in partnership with the QALY and to be compared when the outcomes of the evLYG analysis differed starkly from the QALY. Because of this, the evLYG maintains the same discriminatory lineage as the QALY. The only difference between the evLYG and the QALY is that the evLYG uses a static health state preference value of .85 as opposed to using values that vary by condition. The calculation is done in the same way for both—by multiplying the amount

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

of time patients are likely to spend in their disease state.⁴ As a result, the evLYG maintains its discriminatory effects. The underlying assumption in both metrics is that older adults have fewer life years to gain than younger individuals from the use of therapeutics. As a result, any condition that disproportionately impacts the aging population will be evaluated as being of lower value than therapeutics whose evLYG is calculated based on a relatively younger population.

Further, the evLYG does not accurately take into account the heterogeneity of patient groups, leaving “quality of life” out of the equation entirely. This choice is marketed as the solution to the improper calculation of quality found in the QALY framework, but leaving this process out entirely does not solve the issue. By not considering the value of quality of life at all, the evLYG measure has no sensitivity given to the alleviation of side effects, symptomatic treatment, or a treatment’s method of distribution. All of these factors play a role in a therapeutic’s value to patients.

Neither the NCD nor the Disability Rights Education and Defense Fund (DREDF) endorses the evLYG, with the DREDF saying, “Neither [the evLYG or the QALY] accounts for both the full value of life-extension and the value of quality of life improvement.” The NCD notes that under the evLYG system, “denial of coverage is still possible, even where a drug would provide significant clinical benefit including life extension.”⁵ Further, methods for the underlying data collection and analysis of the evLYG are incomplete and immature. At present, groups like ICER rely solely on clinical trial data, which typically include exclusion criteria that disqualify individuals from participating in a trial based on comorbidities, age, and other factors. As a result, clinical trial data often reflects a population that differs significantly from real-world users,

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

meaning that any calculations of evLYG is not representative of a drug's entire intended user base.⁶ Further, the evLYG fails to assess treatments that improve quality of life as cost-effective.

Therapeutics evaluated based only on – or for which a price is benchmarked based upon – criteria consistent with traditional cost-effectiveness analysis (CEA) suffer because they can be unfairly and poorly subjected to utilization management practices, lower formulary placement or being left off a formulary all together, resulting in higher co-payments for patients or denial of coverage. Considerations that may be left out by traditional CEA include, “a new therapy's ability to treat a previously inadequately treated illness; its ability to broaden therapeutic options for diseases with great variability in treatment response; the possibility of cure and the importance of hope related to it; the ease of a regimen when alternative therapies are complex, cumbersome, and time consuming; or, its novel mechanism of action that could lead to markedly improved derivative treatments.”⁷ **We ask that the Medicare program meaningfully consider the heterogeneity of treatment effects, sensitivity assessments, and not rely on reports that tout evidence from traditional CEA models like the QALY or evLYG. It is unacceptable to rely on these models when there are suitable alternatives that do not reference discriminatory methodologies.**

Price Matching with the Department of Veterans Affairs

The Alliance is also concerned that CMS may utilize the prices paid by the Department of Veterans Affairs (VA) to help establish the negotiated price for drugs in Medicare. In 2017, the VA entered into a cooperative agreement with ICER as a component of the formulary development process and to assist in setting benchmarks for price

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

negotiation.⁸ Therefore, referencing the VA’s negotiated prices would inappropriately incorporate and adopt the use of the QALY, which would be antithetical to the language in the ACA that prohibits QALY use for the Medicare program. Further, a 2020 report from the Government Accountability Office noted that the two programs have “very different authorities to bargain and negotiate with drug manufacturers and other market participants.”⁹ As a result of these differences, the VA formulary is significantly narrower than that of Medicare Part D. This narrower formulary is not preferred by Medicare beneficiaries – in fact, a 2021 Morning Consult survey commissioned by the Alliance indicated that only one in five older adults would be willing to trade their current prescription drug coverage for a system resembling the VA’s formulary.¹⁰

Alternative Methodologies for Consideration

There are many other methodologies and perspectives that are useful in determining a maximum fair price (MFP). Several groups are working to define value assessment in ways that do not discriminate and are working to actively identify and quantify endpoints that are meaningful to patients. The Patient Centered Outcomes Research Institute (PCORI) was established through the Affordable Care Act and focuses on comparative clinical effectiveness research. PCORI’s approach to value assessment calls for consideration of economic impacts as a part of the larger whole of outcomes that matter to patients and caregivers.¹¹ Other groups are also working to develop consensus-based principles on the most effective methods for value assessment, including specific efforts to address health equity. The Innovation and Value Initiative (IVI) has identified four areas where value assessment has failed to address equity, including lack of

incorporation in study objectives, non-representative patient participation, an absence of analysis of impacts across segments or subpopulations, and missing data on patient preferences from communities of color.¹² To address these identified issues, the IVI is now working to develop best practice protocols to inform value assessors and help mitigate these gaps.

The Medicare program *is not required* to use CEA to set a maximum fair price. There are many alternatives; this includes cost-benefit analysis, in which the dollar value of the health outcomes of a treatment are subtracted from the cost of a treatment, which the NCD notes could be a potential alternative to QALY based CEA.¹³ It is imperative that the Medicare program be discerning and ensure that discriminatory methodologies are not being used at any point during the price setting process, that decisions are only made where there is robust clinical evidence, and that patient voices are included in the process. Before an MFP is finalized, calculations must be done to ensure that patient access to care is prioritized and maintained. **Overall, if the new MFP lessens patient access based on methodologies placing a lower value on conditions affecting older adults or individuals with a disability, it is not a fair price at all.**

§60: Involving patients more substantially in the process

In its press release on its recent guidance on the Medicare Drug Price Negotiation Program for Price Applicability Year 2026, CMS publicly committed¹⁴ “to collaborating and engaging with the public” on Medicare negotiation, including involving “patients

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

and consumers.” Additionally, throughout Section 60 of this guidance, CMS mentions several times that it will consider the “patient experience” in the Negotiation Program’s implementation.

We commend CMS for having an open-door policy to patient groups throughout this process and have appreciated the opportunity to share the Alliance’s perspective as CMS navigates implementation of the IRA. We hope that the role for the patient voice and perspective will become more formalized as this process continues in order to allow a broad representation of patient groups the opportunity to meaningfully engage. Any decisions made must keep the patient in mind. In order to do so, the patient voice must be heard, understood, and acted upon.

CMS should develop a patient engagement infrastructure that creates an ongoing dialogue about IRA implementation and systemic issues with those most affected by them. This should include:

- Creating a patient ombudsman charged with oversight of implementation;
- Convening public roundtables of disease or treatment-specific experts from the patient and disability communities for each drug selected for MFP negotiation;
- An Administrator-level Patient Advisory Committee for overall feedback on this program and other work of the Agency;
- Publicly posting all comments; and
- Seeking input from diverse communities in order to gain insights and information on the priorities and needs of those subpopulations.

Further, we ask that CMS announce a plan to ensure that the impacts of negotiation on patients will be studied following implementation and that comments will be solicited from stakeholders, including the patient community, on this topic. This study should include quantitative metrics to assess patient access to care before and after negotiation, and look to meaningfully engage the patient community in the process of developing

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

solutions to any beneficiary experience problems that may occur. This study should include quantitative metrics to assess patient access to care before and after negotiation and look to meaningfully engage the patient community in the process of developing solutions to any beneficiary experience problems that may occur.

§60.3.3: Definition of unmet medical needs

In the initial guidance, meeting “unmet clinical need” is defined as “treating a disease or condition in cases where very limited or no other treatment options exist.” This definition is not nearly as expansive as the FDA’s definition for unmet clinical need. FDA defines unmet need as a “condition whose treatment or diagnosis is not addressed adequately by available therapy.” FDA notes that a new treatment generally would be considered to address an unmet medical need if it, for example, “has an improved effect on a serious outcome(s) of the condition compared with available therapy,” “has an effect on a serious outcome of the condition in patients who are unable to tolerate or failed to respond to available therapy,” or “provides safety and efficacy comparable to those of available therapy but has a documented benefit, such as improved compliance, that is expected to lead to an improvement in serious outcomes.”¹⁵

Under the Negotiation Program, CMS is required to consider “the extent to which the selected drug and therapeutic alternatives to the drug address unmet clinical needs”. The CMS definition of unmet need is far too narrow to adequately consider conditions that require complex treatments and for which there are different possibilities for positive clinical outcomes. A more robust definition will ensure that CMS is not undervaluing the patient perspective. There are many reasons patients may believe that the needs of their community are not met by current treatments and therapeutics. This can include but is not limited to treatments having major side effects, not being totally

¹⁵ U.S. Food and Drug Administration. Guidance for Industry Expedited Programs for Serious Conditions – Drugs and Biologics. June 2014. <https://www.fda.gov/files/drugs/published/Expedited-Programs-for-Serious-Conditions-Drugs-and-Biologics.pdf>

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

effective, or adversely interacting with other medications/comorbidities for the patient. To protect patients, this definition must be expanded to align more closely with the needs of the Medicare population. Unmet need cannot mean only that no other treatment options exist. Instead, it must look at the nuanced factors that go into managing, treating, and curing a given condition. **CMS should expand their definition of unmet clinical needs to align with that of the FDA.**

§110: Utilization management and Requirements for Coverage

As noted in the initial guidance, drugs selected for negotiation must be included on Medicare plan formularies. However, the guidance did not provide information regarding the potential use of utilization management (UM) tools, even if selected drugs are required to be included on formularies.

The Negotiation Process will allow the Medicare program to negotiate and accrue per unit savings on the eligible drugs and biologics that accrue the highest annual expenditures. UM tools are most commonly applied to direct beneficiaries through tiered formulary placement or step therapy. However, Medicare's establishment of the MFP by definition indicates that the program is paying a "fair price" for the therapeutic benefit derived from a drug or biologic. In isolation, the utilization-based need for UM techniques should be severely lessened.

At the same time, the IRA included a broader redesign of the Part D program which increases plan liability for drug costs once a beneficiary has reached the annual out-of-pocket limit (\$2,000 in 2025, indexed to growth in Part D expenditures in subsequent years). This change in liability is likely to broadly incentivize increased use of UM tools. This would be problematic, as UM efforts like prior authorization, step therapy, and cost sharing lead to increased patient and administrative burden, worse long-term outcomes, stress, costly out-of-pocket expenses, and an inability for a patient to work with their care provider to determine the best course of treatment. This would be problematic, as

Alliance for Aging Research

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

UM efforts like step therapy and cost sharing through placement on non-preferred formulary tiers leads to increased patient and administrative burden, worse long-term outcomes, costly out-of-pocket expenses, and an inability for a patient to work with their care provider to determine the best course of treatment.

The Alliance encourages CMS to provide guidance directing MA-PD and PDP plans to limit or avoid use of UM for drugs selected for negotiation. It is currently unclear if and how negotiation may impact patient access. However, incentives to increase use of UM may confound the access impacts of negotiation with impacts of Part D redesign. By prohibiting plans from using step therapy or placing drugs selected for negotiation on non-preferred or specialty formulary tiers, CMS can better observe changes in access as a result of these policies. Further, beneficiaries should be able to broadly access drugs for which the cost as established through the MFN is reflective of therapeutic benefit.

The Honorable Chiquita Brooks-LaSure
Centers for Medicare & Medicaid Services
U.S. Department of Health and Human Services
200 Independence Avenue SW
Washington, DC

Re: Medicare Drug Price Negotiation Program Initial Guidance

Dear Administrator Brooks-LaSure:

On behalf of the Alliance for Patient Access (AfPA), thank you for the opportunity to comment on the initial guidance implementing the Medicare drug price negotiation program. As CMS continues the implementation process, we urge you to continue to engage patients and providers during the process, address the potential usage of new or additional utilization management tools on these negotiated treatments and continue to examine and evaluate how current guidance affects innovation, especially for rare diseases treated by orphan drugs.

About AfPA

Founded in 2006, AfPA is a national network of policy-minded health care providers who advocate for patient-centered care. AfPA supports health policies that reinforce clinical decision making, promote personalized care and protect the clinician-patient relationship. Motivated by these principles, AfPA members participate in clinician working groups, advocacy initiatives, stakeholder coalitions and the creation of educational materials.

Patient and Provider Perspective

CMS is correct to seek input from a broad range of stakeholders to ensure this new authority fairly and accurately meets the needs of interested stakeholders. Patient and provider voices are crucial to this process, providing feedback that can only be obtained through lived experience, either with prescribing the treatments being negotiated under the proposed guidance or using them. It is important to combine real-world experience with data and information gathered via engagement with manufacturers and insurers. Patients who live with the conditions treated using the negotiated medications can provide information on patient benefits. Health care providers who treat these conditions can provide their perspective on how IRA implementation could limit their ability to treat these conditions and unintended consequences regarding the clinician-patient relationship.

To ensure optimal care, it is critical that providers can utilize every tool in their toolbox, and patients can access timely, personalized care. We encourage CMS to engage patients and providers in implementation discussions throughout the process to ensure proposed guidance does not limit access to care.

This comment period for the initial guidance is a great opportunity for patients and providers to provide perspective on how CMS should implement this authority, but further opportunities should be built into future rulemaking and guidance. We ask CMS to prioritize finding ways to engage these crucial voices in the process, whether it is through written comment and opportunities such as town halls or public roundtables.

Patient Access – Utilization Management

The goal of this program is to reduce costs to the federal government by negotiating drug prices, which we are appreciative of. Patients pay significant money for their treatments and all solutions to bring down patient costs should be thoroughly examined. However, we urge CMS to ensure that patients still retain access to these medications, even after the prices have been negotiated.

We'd like to thank CMS for requiring Part D plans to cover the negotiated treatments; however, initial guidance has not yet addressed the use of utilization management techniques or patient cost-sharing tactics, commonly used by insurers to limit access to treatments. These tools can include long prior authorization processes and step therapy protocols. When utilization management tools are implemented, patient access to the treatment prescribed by their clinician is delayed or denied. These delays can lead to worsening conditions, new, potentially dangerous side-effects, and higher downstream medical costs.

We urge CMS to explicitly address these tactics and make clear that negotiated drugs cannot be subjected to onerous utilization management requirements. Doing so would help ensure patients can continue to access timely, appropriate care. Patients should have clear access to all covered medications and CMS should ensure that insurance providers do not limit access to negotiated treatments.

Quality Adjusted Life Year

The Inflation Reduction Act (IRA) prohibits CMS from using the quality-adjusted life year (QALY) in setting prices. This is critical as the QALY is an artificial valuation metric that discriminates against patients with chronic conditions, older beneficiaries and patients living with disabilities. While the outright use of the QALY to determine value is prohibited, we are concerned that implicit usage of the QALY could still find its way to the process. We urge CMS to ban the use of the QALY, either explicitly, or implicitly via mediums such as studies that utilize the QALY in their methodology or referencing countries, such as Canada, that use the QALY when reviewing medications. The QALY restricts access to medications for some of the most vulnerable patients and should not be used in this process.

Orphan Drugs

The federal government has instituted laws and regulations to encourage innovation for conditions that do not have adequate treatment options available to them. Some of the most needed breakthroughs have occurred in the orphan drug space. Orphan conditions are defined as rare diseases that affect less than 200,000 people in the United States. Federal policy encouraging innovation has led to breakthroughs for many of these conditions, but to ensure new drug discovery continues for patients living with rare diseases, it is important to ensure that these new regulations do not halt progress that has been made to find treatments for these conditions. The IRA does recognize this by prohibiting CMS from requiring negotiation for a treatment that is indicated for only one rare disease; however, CMS has indicated that this exception will only apply to medications indicated for a single rare disease, meaning that a medication indicated for multiple rare diseases could be subjected to negotiations. This could limit rare disease treatment development and innovation as manufacturers often continue research to see if a therapy can treat other diseases. For rare diseases, CMS should consider the unintended consequence that this limited exception could have on continued research and work to ensure that therapies approved for orphan/rare diseases are excluded from negotiations.

Conclusion

We understand the difficult and sensitive nature of drug pricing reform for CMS and appreciate the work being done to ensure that patients can afford their medications. We urge CMS to work to include the patient and provider perspective in each step of the process to ensure patients and health care providers do not face

unintended consequences related to access and future innovation. Specifically, we ask CMS to actively engage the patient and provider community for input on potential consequences of the guidance, ensure that utilization management cannot be instituted for treatments chosen to be negotiated, and protect a clear path to development of orphan drugs throughout this process. We recognize the complexity of the issues facing CMS, and we thank you for allowing the opportunity to comment. If you have questions or would like further information, please contact the Alliance for Patient Access at (202) 951-7097.

Sincerely,

A handwritten signature in cursive script, reading "Josie Cooper". The signature is written in a dark ink and is positioned above the printed name and title.

Re: *Medicare Drug Price Negotiation Program Guidance*

Submitted via email to: IRAREbateandNegotiation@cms.hhs.gov

Dear Sir or Madam,

Thank you for the opportunity to provide comments on the initial guidance memorandum regarding implementation of the Medicare Drug Price Negotiation Program.

The Alliance for Safe Biologic Medicines (ASBM) is a diverse group of stakeholders that includes physicians, pharmacists, patient advocates, researchers, and biopharmaceutical manufacturers. Since 2010, ASBM has worked closely with regulators worldwide as they develop and implement health policies, to ensure that these reflect the best interests of patients. To that end, we have surveyed thousands of physicians in 15 countries; and presented findings to regulators including the U.S. Food and Drug Administration (FDA), the World Health Organization (WHO), the Australian Therapeutic Goods Administration (TGA), Health Canada, the European Commission, the Italian and Spanish Ministries of Health, and others. We also regularly share with policymakers the perspectives of patient advocacy organizations which comprise the bulk of our membership.

ASBM supports policies which increase patient access to affordable, innovative medicines. We further believe that the perspectives of physicians and patients should be given particular weight during this process. Based on these principles, ASBM offers the following comments on CMS' initial guidance for the Inflation Reduction Act's Medicare Drug Price Negotiation Program.

A. Medicare Part D: A Highly Successful Program with a High Satisfaction Rate

Prior to my role as ASBM's Executive Director, I served for 6 years in the Department of Health and Human Services' Office of the Secretary, during which time Medicare Part D (prescription drug benefit) was developed and implemented. The idea of 'negotiation' was raised, evaluated, and rejected during the development of Part D due to numerous factors; among them were the negative impact on innovation and patient access to new drugs.

A recent survey of seniors enrolled in a Medicare Part D plan revealed a 90% satisfaction rate with the program—the highest rate since annual polling began 7 years ago. This high satisfaction rate is based on the program being user-friendly and affordable; over 85% of seniors surveyed claim affordable monthly premiums and co-pays.¹

B. Historical Impact of Price Controls on Innovation and Patient Access

¹ <https://www.hlc.org/post/medicare-part-d-the-successes-and-the-challenges/>

In European countries and Canada, government-negotiated drug pricing (ie, price controls) have negatively impacted patients by undermining innovation and limiting patient access:

- In the 1970s, European companies developed most new drugs; however, since the implementation of price controls in Europe, 60% of new drugs are currently developed in the US, compared to 13% in Switzerland, 8% in the United Kingdom (UK), and 6% in Germany and France.¹
- Of cancer medicines launched globally between 2011 and 2019, more than 96% are available to US patients while only 65% are available in other developed nations such as Australia, Japan and the UK.² Furthermore, cancer death rates per 100,000 are 1.6 to 1.8 times higher in Europe than those in the US.³
- Of new cancer medications, 90% are available to US patients within the first year of launch, whereas less than half of these are available to cancer patients in Germany, the UK, France, and Canada.⁴

Current US policy contributes to the availability of more life-saving medicines, earlier access to new drug launches, and fewer cancer-related deaths.

C. Negative Impact on Development and Adoption of Biosimilars

ASBM seeks to ensure that patients have access to safe biologic treatment options, including lower-cost biosimilar versions of innovator biologics. Market competition (between innovator products and multiple biosimilars to that product) has proven to be an effective means of reducing costs, both in the European Union and in the U.S.

For example, the cumulative savings in drug spend for classes with biosimilar competition is estimated to have been \$21 billion over the past 6 years. Trends show an acceleration in savings per quarter, and in Q2 2022 alone, savings in drug spend due to biosimilar competition were estimated at \$3.2 billion. As these products compete for market share, the average sales price (ASP) of biologics (both reference products and biosimilars) is declining. The prices of biosimilars have decreased at a negative compound annual growth rate (CAGR) of -9% to -24%; the prices of most reference products have decreased at a negative CAGR of -4% to -21%.^{8 5}

Despite these successes, the MFP statute threatens to undermine this market. Rather than providing clarity with its draft guidance, CMS has created more uncertainty. It is particularly concerning that CMS issued final policy for Sec. 30 without any opportunity for stakeholders to comment on the “pause” (“Special Rule”) provisions which will have a major impact on the biosimilars sector. In addition, it imposes a new, subjective standard of “bona fide” marketing of a biosimilar before a reference product may be removed from the selected drug list in Sec. 70 of the guidance.

⁵ 2022 Biosimilar Trends Report, Amgen

D. Limitations on Stakeholder Input

Implementation of the Medicare Drug Price Negotiation Program will not follow typical timelines as in the case of other major health care legislation. Under the Inflation Reduction Act (IRA), CMS will implement policy changes via ‘program instruction or other forms of program guidance’ rather than traditional notice-and-comment rulemaking.

CMS has required stakeholders to submit comments on the guidance within 30 days of the March 15, 2023 memorandum (by April 14, 2023); the notice-and-comment period of the Administrative Procedure Act or the Medicare Act is typically longer for complex legislation. ASBM believes that the shortened comment period limits the ability of patients and other stakeholders to provide meaningful input on the guidance. Furthermore, CMS is only seeking input on select portions of the guidance and is not soliciting comments on provisions that are considered ‘final.’ ASBM believes that some of these ‘final’ provisions, such as those related to selection of drugs for price setting and biosimilars are key issues upon which stakeholders deserve an opportunity to comment. For example, Congress has specified that drugs must reach a certain age (9 or 13 years post-launch) before they are subject to maximum fair price (MFP) setting. CMS has finalized (without accepting comments) a policy that will include innovative drugs that have not yet reached the requirements for time on market that are outlined in the IRA.

E. Process Pitfalls

Stakeholders will have limited visibility on how CMS negotiates the MFPs for selected medicines. As outlined in the guidance, the only point of engagement for patients and physicians is via an information collection request (ICR)—a process typically used for technical data collection under the Paperwork Reduction Act.

MFP price setting will be based on therapeutic reference pricing. This standard often fails to consider patient subgroups and preferences, as many alternative therapies do not fit within broad judgments of clinical similarity. In addition, referencing price reporting metrics used by other government agencies (eg, the US Department of Veterans Affairs) are inappropriate benchmarks for care delivered in a community setting, as these procurement prices are intended for special populations receiving care in closed health care delivery systems.

Furthermore, CMS proposes a narrow definition of ‘unmet’ need when setting prices, including only diseases for which there are limited or no treatment options. ASBM believes that defining unmet need in this way will devalue medicines that address important patient needs and will reinforce, rather than reduce, expected harm to progress against unmet need.

F. Impact of CMS Guidance on Innovation

ASBM believes that CMS’ guidance negatively impacts continued innovation by setting rules that will devalue existing patents or exclusivities for selected drugs. Specifically, the Agency intends to consider the length of the available patents and exclusivities and may consider adjusting the preliminary price downward if the patents and exclusivities will last for a number of years. This policy could penalize companies for having secured

patent rights prior to FDA approval (particularly for small molecules) but would be especially damaging for post-approval research and development (R&D).

The R&D that happens after initial FDA approval, including costly and labor-intensive clinical trials, results in innovations that improve patients' lives. Post-approval research is vital, particularly for disease areas like cancer. More than 60% of oncology medicines approved a decade ago went on to receive additional approvals—70% of which occurred seven or more years after initial approval and required significant investment in research and development on the part of the manufacturer. These new uses can provide treatment options for different diseases or patient populations (e.g., pediatric populations). With the policies defined in the IRA guidance, manufacturers will have to reconsider whether post-approval research is feasible in terms of time and resources. They must also consider the impact of a lower MFP if they have obtained patents or exclusivities for these post-approval indications.

ASBM believes that the CMS guidance increases uncertainty for the future of the emerging biosimilars market. Biosimilars play an important role in bringing lower-cost therapies to patients and have provided \$21 billion in savings over the last six years. While Congress enacted a 'Special Rule' enabling certain biosimilar manufacturers to request a delay in the selection and price setting for certain reference biological products, the timelines and criteria imposed to obtain this 'pause' may offer insufficient predictability for biologic and biosimilar manufacturers in the marketplace.

CMS' guidance states that the biosimilar delay will not be available when patent litigation between the biosimilar and reference product manufacturers is ongoing, even if there is a high likelihood that a biosimilar will be approved and marketed under the required timeframes. For example, there may be a settlement for certain dosage forms or strengths, or a biosimilar may elect to market at risk. Nevertheless, CMS would find active litigation 'determinative' that a delay should not be granted.

The MFP initial guidance also does not adequately describe how CMS will protect continued R&D of medicines that help reduce barriers to care for medically underserved communities or meaningfully engage those communities in its decision-making.

ASBM believes that CMS' determination of price for selected drugs may disincentivize innovation in areas that help improve equitable access to care, including for small molecule medicines. A 30-day window to submit data on a selected drug (including whether it meets an unmet need) may not be sufficient to obtain the perspectives of underserved communities with fewer resources. Consequently, this would lead to the inclusion of skewed evidence that does not reflect inputs from diverse and underrepresented groups, such as value assessments conducted by the Institute for Clinical and Economic Review.

G. Implications for Patient Access

While the Part D redesign will help patients by establishing a cap on out-of-pocket spending, government price setting under the IRA could significantly impact patients' access to medicines in Medicare Part D. Specifically, price setting for one selected drug could impact other therapeutic competitors in the same class of medicines. In some cases, Part D plans could force patients to switch from medicines that they have been stable on for months or years. Numerous studies have found that switching stable

patients to a new medicine for non-clinical reasons leads to increased side effects and non-adherence and is often associated with negative health outcomes.

ASBM fears that the downstream effects of broad government price setting will ultimately reduce consumers' choice of plans and formularies in Part D—aspects considered to be hallmarks of the program. As more medicines are subject to MFP over time, the factors that differentiate plans from one another will likely decrease, leading to fewer choices for patients.

In summary, ASBM advocates for policies that ensure the affordability and accessibility of medications and actively promote the paramount importance of patient safety. We believe that government policies that impact patient safety and access to medicines should be transparent, value the input of stakeholders, and incentivize innovation.

ASBM thanks you for the opportunity to provide comments.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator and Director Seshamani:

Alnylam Pharmaceuticals, Inc. (Alnylam) thanks the Centers for Medicare & Medicaid Services (CMS) for this opportunity to comment on the Initial Memorandum regarding the Medicare Drug Price Negotiation Program ('initial guidance')¹.

Alnylam has led the translation of RNA interference (RNAi) from a Nobel Prize-winning discovery into a new class of innovative medicines with the potential to transform the lives of patients who have limited or inadequate treatment options. Our pioneering work delivered the world's first approved RNAi therapeutic with ONPATTRO® (patisiran) in 2018, and we are pleased to have five Food & Drug Administration (FDA)-approved products on the market today that are marketed by Alnylam or other partners. Alnylam also has a deep pipeline of investigational RNAi therapeutics focused on addressing the unmet needs of patients across the following strategic therapeutic areas: genetic medicines, cardio-metabolic diseases, infectious diseases, and central nervous system and ocular diseases.

Alnylam appreciates this opportunity to comment on the initial guidance on the Medicare Drug Price Negotiation Program (MDPNP). As a member of the Biotechnology Innovation Organization (BIO) trade association, we express our broad support of BIO's comments on the guidance. In particular, we echo BIO's recommendations regarding the ways in which CMS can support orphan drug research and development (R&D) and commercialization as it implements the MDPNP. In addition, we underscore the importance of transparency in the negotiations process for drug manufacturers. We urge the agency to implement a predictable and transparent negotiations process, which will help to support continued innovation in the biopharmaceutical industry. We have provided additional comments below related to the support of orphan drug development and commercialization, the agency's consideration of therapeutic alternatives, and the incorporation of level of innovation and

¹ CMS. Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments. 15 March 2023.

investment into the agency's assessment of a Maximum Fair Price (MFP). We hope these comments will be useful to CMS in its implementation of the MDPNP.

1. Alnylam strongly encourages CMS to utilize its existing authority to minimize the impact of the MDPNP on orphan drug innovation.

Congress recognized the importance of supporting access to treatments for patients with rare disease by establishing a protection for certain orphan drugs within the MDPNP of the Inflation Reduction Act (IRA) of 2022.² Specifically, drugs for which there is only one orphan designation and for which the approved indication (or indications) is associated with that designated rare disease or condition are exempted from Medicare drug price negotiations. In creating this exemption, Congress also acknowledged the difficulties drug manufacturers must overcome with respect to the unique scientific, clinical, and commercial challenges of developing transformational rare disease drugs.

Unfortunately, the specifics of the orphan drug exemption mean that the protection will be confined to a narrow set of orphan medicines. This narrowness calls into question the extent to which innovation in rare disease development will be unharmed by Medicare drug price negotiations. Alnylam is concerned that, absent broader protections for orphan medicines – particularly drugs with multiple orphan-only indications – Medicare negotiations could discourage companies from pursuing new indications for existing rare disease drugs or developing rare disease drugs altogether. A meaningful portion of orphan drugs ultimately obtain multiple orphan indications to treat multiple rare conditions; a recent report found that as of 2019, 25% of orphan drugs had multiple orphan designations. The narrow exemption within the IRA undermines existing incentives and protections for orphan drug development, and undermines manufacturers' abilities to investigate new applications for existing therapies.³ In fact, since the passage of the IRA, multiple companies, including Alnylam, have announced changes to their clinical development pipeline plans in light of the narrowness of the orphan drug exemption, highlighting the real-world impact that the legislation is already having on orphan drug R&D and investment.^{4,5}

Alnylam is appreciative that, in its initial guidance, CMS is “considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development.” We strongly encourage the agency to utilize its current authority to mitigate against any unintended consequences from negotiations on the development of new treatments for rare diseases. Specifically, we urge the agency to clarify that, where an orphan drug loses eligibility for the orphan drug exclusion, the seven-

or eleven-year “qualified single source drug” clock runs from the date on which the drug lost eligibility for the exclusion. Additionally, as many orphan medicines are molecules with multiple orphan-only indications – and therefore are not currently protected from Medicare negotiations – we strongly urge the agency to apply a different standard when considering therapeutic alternatives for such orphan medicines to take into account the advancements in innovation which have enabled novel approaches to targeting rare diseases, including targeting the underlying genetic basis for disease.

We thank CMS for considering these recommendations and any additional actions in order to ensure the orphan drug exclusion is maximally protective of rare disease therapy development, commercialization, and access.

2. Alnylam requests that CMS carefully consider the level of innovation and assess whether true therapeutic alternatives exist for a selected drug when determining an MFP to protect incentives for American scientific innovation.

In its initial guidance, CMS has established a qualitative approach to form its ongoing “preliminary price” offer. The approach is founded on referencing the net prices / average sales prices (ASPs) of therapeutic alternatives treating the same indication in order to establish a “starting point,” which is then adjusted based on the agency’s assessment of clinical benefit compared to its therapeutic alternatives. The agency acknowledges that multiple methods for establishing the starting point were evaluated, including using production and distribution costs, the statutory ceiling price, a domestic reference price, a “fair profit” price based on R&D or production and distribution costs, or the net prices / ASPs of therapeutic alternatives. The approach based on therapeutic alternatives was the only method which allowed CMS to take the cost of other treatment options into account when assessing the clinical benefit of a selected drug.

Alnylam is concerned that by basing the starting point for a preliminary price on net prices / ASPs of therapeutic alternatives, and by taking a broad approach to the set of therapies which might be considered viable therapeutic alternatives for comparison, CMS risks undermining the importance of and incentives for innovation in the research and development of new treatments, particularly for rare, debilitating and often-fatal diseases. As proposed, the selection of therapeutic alternatives does not currently account for innovation, and allows for highly innovative drugs to be compared to older, less-advanced therapies. Many emerging technologies represent a dramatic advancement over existing therapeutic alternatives. For instance, Alnylam’s RNAi technology has provided a novel mechanism of action with the potential to halt – or even reverse – disease progression in certain disease areas where other treatments cannot. A method that uses existing alternatives as a starting point for price negotiation fails to accurately reflect the value of a selected drug which might have a significantly improved delivery profile, safety profile, or a demonstration of outcomes relative to drugs identified as potential therapeutic alternatives.

It is crucial that CMS continue to foster technological advancements even in categories where therapeutic alternatives may exist. Setting a starting point price for negotiations

based on a therapeutic alternative regardless of the alternative's level of innovation risks comparing truly novel therapeutic advances against therapies which predate important scientific advances in a particular disease area. The risk of drawing such a comparison for the purposes of setting an MFP may result in a negotiated price which does not reflect the value provided by an innovative drug, and as a result is likely to disincentivize highly meaningful new developments for patients, as noted above, particularly in categories where there are or may be upcoming therapeutic alternatives – even if there is significant room for improvement in terms of delivery, safety, and outcomes.

Alnylam is further concerned that the agency proposes an overly broad scope of literature review to identify therapeutic alternatives. Given the diversity of the US population and specific needs of the Medicare population, broadening the scope of literature review beyond peer-reviewed research involving one or more US-based investigators to include data submitted by the public may lead to the consideration of drugs whose status as viable therapeutic alternatives is not adequately supported by available evidence, as real-world prescribing practices (as reflected in public data submissions) may often deviate from evidence-based standards.⁶ Similarly, the inclusion of studies conducted exclusively by investigators outside the United States may result in inappropriate consideration of drugs that are not used in clinical practice in the indication of interest (and are therefore not true therapeutic alternatives) in the United States.

In addition, we are concerned that the data and other considerations CMS will consider to establish the MFP as part of its flexible process do not sufficiently take into account the level of innovation offered by a selected drug. The absence of explicit consideration of the level of innovation possessed by a selected drug risks inconsistent application of, and insufficient accounting for, the value of innovation in the assessment process, and risks the selection of an MFP which fails to fully account for the value offered by an innovative therapy.

In summary, Alnylam urges CMS to reconsider its approach to selecting therapeutic alternatives for selected drugs, and to take selected drugs' levels of innovation into account when drawing comparisons to existing treatments. It is of utmost importance that the MDPNP preserves the ecosystem and protects the incentives which foster new healthcare innovations for patients in need.

3. Alnylam urges CMS to account for the extensive high-risk investments needed to bring new medicines to patients in identifying a drug's MFP.

Research and development in the biopharmaceutical industry are highly time- and resource-intensive and entail a great deal of risk. The process of bringing a new therapy to market, particularly one which is highly innovative, often takes many years and also entails a high rate of failure in order to achieve success. At Alnylam, we have invested over twenty years and have raised over \$7.7 billion to fund our efforts to create a new therapeutic class

⁶ Chin et al. Heart Fail Rev. 2016;21:675–697.

based on ribonucleic acid (RNA) interference using Nobel Prize-winning technology.⁷ Our first commercial product, ONPATTRO® (patisiran), was approved in 2018 after sixteen years of R&D, and at the time it was the first and only approved treatment in the U.S. for the polyneuropathy of hATTR amyloidosis in adults and the first approved RNAi therapy. hATTR amyloidosis is a multisystem, rapidly progressive, often fatal disease that impacts approximately fifty thousand patients worldwide.

The investment made by Alnylam to create an innovative new class of medicines was significant, and it is not unique. In general, it is estimated that each newly approved drug takes over ten to fifteen years and costs over \$1-2 billion on average to develop.⁸ This substantial outlay of time and capital resource is impacted in part by the high degree of resources attributed to the over 90% of drug candidates which fail prior to entering clinical studies or during phase I, II, or III trials or approval.^{9,10,11}

In its passage of the IRA, Congress directed CMS to consider R&D spending and recoupment of direct and indirect costs as a factor to determine a selected drug's negotiated price. Alnylam is concerned that the implementation of the R&D spending factor, as currently proposed, does not account for the other significant investments required to achieve approval and marketed status of a selected drug. There are an increasing number of drugs today which are generated by platform technologies, like Alnylam's RNAi class of medicines. Indeed, Congress has recognized the potential of platform technologies to speed access to therapies when it passed the Food and Drug Omnibus Reform Act (FDORA) of 2022, with the goal of promoting a more efficient, streamlined pathway to innovative new therapies.¹² The resources required upfront to support platform R&D are significant, with further innovations needed over time to improve the platform to support the development of multiple, new therapies. As such, Alnylam is particularly concerned that the language in CMS's initial guidance does not appear to take into account spending on innovation, such as the resources required to build a platform technology, which can be applied to multiple drugs, or drugs which never achieve marketed status.

The agency's current framing of how it will consider R&D costs for the purposes of the MDPNP appears to be too limited and not aligned with how biopharmaceutical organizations or investors account for R&D costs in practice. Neglecting the investments made on the over 90% of drug candidates which fail to reach approval could lead to significant under-valuing of drugs in the negotiation process. This could have drastic implications for patient access to medicines, especially in areas of high unmet need. We therefore urge CMS to consider a more holistic view of R&D costs among the other

¹² 117th Congress (2021-2022). H.R.2617 - Food and Drug Omnibus Reform Act of 2022, signed into law as part of the Consolidated Appropriations Act, 2023. Public Law No: 117-328.

considerations informing their ingoing offers to negotiating with manufacturers. Incorporating a broader set of R&D costs will better account for the high-level of risk the biotechnology industry and its investment partners assume to bring new medicines to patients.

* * *

In summary, Alnylam supports the comments offered by our trade organization, BIO. Additionally, we encourage CMS to take any possible actions to better support the development of important new orphan drugs. We call on CMS to ensure that therapeutic alternatives are identified and evaluated in an appropriate manner, and that the level of innovation offered by a selected drug is adequately considered and accounted for to protect existing incentives for American scientific innovation. Finally, we urge CMS to reframe their consideration of R&D costs to account for the extensive high-risk investments the biotechnology and pharmaceutical industries are required to make in order to bring new medicines to patients.

We greatly appreciate the opportunity to comment on this initial guidance. Should you have any questions, please do not hesitate to contact me at dparsons@alnylam.com.

Regards,

Deirdre Parsons

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator LaSure:

The American Cancer Society Cancer Action Network (ACS CAN) is making cancer a top priority for public officials and candidates at the federal, state, and local levels. ACS CAN empowers advocates across the country to make their voices heard and influence evidence-based public policy change, as well as legislative and regulatory solutions, which will reduce the cancer burden. As the American Cancer Society's nonprofit, nonpartisan advocacy affiliate, ACS CAN is more determined than ever to end cancer as we know it, for everyone.

As CMS implements Medicare drug price negotiation, ACS CAN offers recommendations to ensure Medicare beneficiaries realize the full potential of this new program. Every Medicare beneficiary is either a cancer patient, survivor, or at risk of developing the disease and the affordability and availability of cancer prevention, early detection, treatment, and survivorship is critical to reducing the significant nationwide cancer burden.

Drug therapies play an integral role in cancer treatment and survival. Both cancer patients and survivors rely on medications to treat their cancer and prevent recurrence. Over the course of the last few years there has been a remarkable increase in the number of new cancer drug therapies. In 2022 alone, 10 out of the 37 new drug therapies approved by the Food and Drug Administration (FDA) were for cancer.¹

Advances in research have significantly improved our understanding of cancer at the molecular level – leading to the development of more precise detection and diagnostic tools and the corresponding therapies that can attack cancer. However, if patients likely to benefit from these advancements face barriers of affordability or accessibility, the opportunity to reach the national goal of eliminating death and suffering

¹U.S Food and Drug Administration, New Drug Therapy Approvals 2022, <https://www.fda.gov/drugs/new-drugs-fda-cders-new-molecular-entities-and-new-therapeutic-biological-products/new-drug-therapy-approvals-2022>.

from cancer is greatly hindered. Access to a full range of prescription drug therapies is, therefore, a key determinant in successful cancer outcomes.

The affordability of cancer therapies, however, remains a serious obstacle for many cancer patients. Even with Medicare coverage, beneficiaries who need access to innovative cancer drugs may find their out-of-pocket costs running into thousands of dollars each year. For those battling cancer, skipping pills, or abandoning prescribed drug therapies because of cost can have serious health consequences. Other patients go into significant debt, even bankruptcy, to pay for their treatments.²

The newly enacted cap on Medicare Part D out-of-pocket drug costs will help to make prescription drugs more affordable. As CMS begins to negotiate lower prices for select drugs in Medicare, there is the potential for further savings for millions of beneficiaries if the program is administered in a manner to ensure that access to new and innovative therapies is protected and savings directly reach beneficiaries, not just overall savings for the program. Given historical Medicare spending data, it is highly likely that cancer drugs will account for a substantial proportion of the drugs to be negotiated. If this is the case, it is even more critical that CMS consider the many unique oncology considerations to ensure critical therapies and future innovation is not impeded.

ACS CAN appreciates the opportunity to comment on the initial program memoranda. We offer some general recommendations for ensuring that patients benefit the most out of the negotiations as well as specific comments in direct response to questions CMS has raised in different sections of the draft.

The Importance of Patient Guardrails

ACS CAN views affordability and access as equally critical for ensuring that cancer patients receive the best treatment to survive their disease. As CMS moves forward with implementation of the new prescription drug negotiation program, we urge you to carefully balance the need to lower the cost of drugs offered through Medicare with ensuring patient access to new drug therapies. To this end, ACS CAN asks you to consider several patient “guardrails” that could help to achieve that goal.

Monitoring and Reporting

ACS CAN encourages CMS to carefully monitor and publicly report on the implementation of the negotiation process as it pertains to beneficiary access and cost, specifically:

- We urge CMS to ensure that Medicare enrollees realize the savings related to drugs that are the subject of negotiation and in no case pay more out-of-pocket for a drug that is subject to negotiation than they were paying previously. Absent clear directive from CMS, a drug that is subject to negotiation could be placed on a higher formulary tier (for example, a non-preferred brand) and enrollees could pay higher cost-sharing as a result.
- As CMS identifies the drugs subject to negotiation, we urge the Agency to determine whether a particular disease (like cancer) represents a majority of drugs subject to negotiation. If a majority of

² Liz Szabo, “Sticker Shock Forces Thousands Of Cancer Patients To Skip Drugs, Skimp On Treatment”, Kaiser Health News, March 15, 2017, <https://khn.org/news/sticker-shock-forces-thousands-of-cancer-patients-to-skip-drugs-skimp-on-treatment/view/republish/>.

drugs subject to negotiation pertain to one disease or condition, CMS should consider (as part of the factors related to negotiation) the impact on long-term research, investment, and unique characteristics of innovation for that disease. For example, drugs with a single orphan designation are exempt from negotiation, but the protection is not extended to products with multiple orphan designations. This seems to provide a powerful disincentive for drug sponsors to explore new, lifesaving uses in rare diseases, of which most cancers are, for drugs already proven safe and effective.

- While the guidance document pertains to the Medicare negotiation process for Part D covered drugs and the guidance related to Part B drugs is forthcoming, we also recognize that CMS has a vested interest in adopting similar rules pertaining to both programs (in order to reduce administrative complexity for both the program, manufacturers, and plans). Therefore, we urge CMS to monitor the prescribing patterns of drugs subject to negotiation to determine whether prescribing patterns are generally on trend after the negotiation process. If prescribing patterns fall beyond a statistically significant measure, we urge CMS to conduct independent analysis to determine why prescribing has changed. This may be more of an issue with respect to Part B negotiation given the direct impact of physician reimbursement, but we recommend that CMS put in place monitoring processes for both programs to ensure beneficiary access.

Review the Potential for Steering

CMS should monitor plan formularies to determine the extent to which plans are using more utilization management tools for non-negotiated drugs, which can hinder access to these medications. ACS CAN is concerned about the extent to which beneficiaries could be steered towards negotiated drugs. For cancer patients who have found a specific drug that works for treating their cancer, being steered towards another – potentially less effective drug – could be detrimental. Medicare Part D is administered entirely through private plans which have a financial incentive to steer beneficiaries toward a drug with the lowest price the plan is able to negotiate. To the extent that providers have a choice of drugs to prescribe (e.g., several drugs available in the same therapeutic category and class) the Part D plan could steer beneficiaries toward the negotiated drug and may impose barriers (such as more rigorous prior authorization or step therapy requirements) on non-negotiated drugs.

Examine Impact on Launch Prices

CMS should examine any potential increase in launch prices as a result of negotiation and the overall impact on beneficiary costs and determine the extent to which higher launch prices potentially negate some of the potential beneficiary savings from negotiation. CMS should monitor and publicly report this information as part of the transparency of the Medicare negotiation process. This will help inform stakeholders as they seek to make refinements through the program, some of which may require Congressional action.

Monitoring Access Issues

Cancer is not just one disease it is hundreds of diseases. As such, there are many FDA-approved cancer drugs that are used for cancers not indicated in the formal label. According to the Agency for Healthcare Research and Quality (AHRQ) one in five prescriptions written today are for off-label use.³ There is a statutory recognition of the appropriateness of such prescribing by covering oncology drugs for off-label use when

³ Agency for Healthcare Research and Quality. Off-label drugs: What you need to know. Available at <https://www.ahrq.gov/patients-consumers/patient-involvement/off-label-drug-usage.html#:~:text=Off%2Dlabel%20prescribing%20is%20when,are%20for%20off%2Dlabel%20use> .

included in a recognized compendia.⁴ Given this important feature of oncology drug use, CMS should consider not only the FDA-approved label indication of the drug but also the extent to which the drug is prescribed as an off-label use for another cancer. If the negotiation process unintentionally results in barriers to accessing medications (e.g., overuse of utilization management tools) or prescribing changes, there is a concern that beneficiary access to non-negotiated drugs may be negatively impacted. Therefore, CMS should begin to monitor any potential beneficiary access problems to establish a baseline for future comparison.

Examine Impact on Research and Development of New Therapies

While the overall cancer mortality rate continues to decline, there is still enormous unmet need for the development of therapies to treat cancer. Because the creation of negotiation processes will have downstream impact on research and development, we encourage CMS to work closely with the FDA, particularly on issues related to the trends in the number of new cancer therapies brought to market.

Specifically, we ask CMS to closely monitor two provisions that may negatively impact research and development of new therapies - the implications on research of additional indications for new therapies and the impact on the development of small-molecule therapies since they are eligible for negotiation after only seven years on the market.

Many oncology medicines approved a decade ago also received approvals for additional indications in later years, and most of those were seven or more years after initial FDA approval. Often times these indications are for earlier stage cancers when cancer is more treatable, and many expanded indications are for rare cancers. We ask CMS to work with the FDA to monitor and report on the implications of this new price negotiation program on the submission of applications for new indications of existing therapies and to identify negative trends.

Small-molecule oral oncology drugs are very important tools in the treatment of cancer. These therapies can be taken by patients at home, which can reduce patient time and transportation burdens. We ask CMS to work with FDA to monitor the implications of this new price negotiation program on the submission of applications for small molecule therapies.

Future Revisions to the Negotiation Process

We recognize that given the statutory deadlines, CMS was not able to obtain stakeholder input regarding the Medicare Part D negotiation process through rulemaking and instead is implementing the program through guidance. We thank the Agency for its willingness to release the draft guidance and for solicitation of stakeholder input.

At the same time, we recognize that the negotiation process is new to the Medicare Part D program and there are bound to be opportunities for improvements to the program moving forward. CMS should consider undergoing rulemaking in future years to formalize the negotiation process. CMS could also use this process to establish a timeline by which the Agency intends to revisit the rules regarding the negotiation process. Using the rulemaking authority will provide stakeholders clear direction regarding the process for negotiation and will ensure an open and transparent process for any subsequent changes to the negotiation process.

⁴ 42 U.S.C. §§13952w-102(e)(4).

Recommendations on Specific Sections of the Memoranda

CMS is soliciting comments on specific issues raised in the memoranda. ACS CAN offers the following comments and recommendations in response to some of the questions CMS raised.

Section 50.2 – Evidence about Therapeutic Alternatives for the Selected Drug

To determine the maximum fair price of a selected drug CMS is required by law to consider evidence about alternative treatments including the comparative effectiveness of the selected drug and therapeutic alternatives, and the effects of the selected drug and its therapeutic alternatives on specific populations (including individuals with disabilities, the elderly, the terminally ill, children, and other patient populations). CMS is prohibited from using comparative clinical effectiveness research – including quality-adjusted life years (QALYs) in a way “that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.”

ACS CAN supports comparative effectiveness research because it provides clinicians with information regarding the relative clinical effectiveness of a given intervention and potential differences in side effects. We appreciate CMS clearly stating that it will “not use evidence in a manner that treats extending the life of any individual as lower value than the life of another individual; this includes QALYs when used in association with life extension.”

ACS CAN strongly opposes the use of quality-adjusted life years to determine whether to provide coverage or to set patient cost-sharing for a given treatment. Doing so fails to consider the value an individual may place on the quality of life provided to them for a given treatment. ACS CAN believes that cancer treatments should be patient-centered and ensure a patient’s preferences in treatments and outcomes.

Section 60.3.3.1 – Analysis for Selected Drugs with Therapeutic Alternatives

To compare the effectiveness and clinical benefit between a selected drug and its therapeutic alternatives, CMS indicates it intends to:

- Identify outcomes to evaluate for each indication of the selected drug, and consider the safety profile of the selected drug and the therapeutic alternative;
- Consider health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience;
- Focus the review of clinical benefit on outcomes of particular importance to the condition or disease being treated by the selected drug;
- Consider the effects on specific populations, as required by section 1194(e)(2)(C);
- Consider if the selected drug fills an unmet medical need; and
- Examine improvements in outcomes with the selected drug as compared to its therapeutic alternative to determine whether a selected drug represents a therapeutic advance.

We remind CMS that in oncology, there are very few drugs that are truly equivalent with respect to the FDA-approved label indication and the scientific evidence supporting the efficacy of a given drug. For example, both Keytruda and Opdivo are FDA-approved to treat lung cancer, but the efficacy of both drugs is not the same across all patients with lung cancer. Lung cancer itself is not a single disease but is subdivided into small-cell lung cancer and non-small cell lung cancer, which is further defined by up to 10 distinct biomarker-driven subtypes. We urge CMS to consider the real-world use of a particular medication across all types and subtypes of a disease for purposes of determining whether a drug has a therapeutic alternative.

ACS CAN supports the use of both patient-reported outcomes and patient experience data. Patients have first-hand knowledge of the effectiveness of a treatment as well as the impact on quality of life. We also support CMS considering health outcomes such as cure, survival, progression-free survival, or improved morbidity when comparing the selected drug to therapeutic alternatives. We support CMS considering whether a selected drug fills an unmet medical need such as treating a disease or condition in cases where extremely limited or no other treatment options exist as this is particularly important for cancer patients.

Section 60.7 – Exclusions from Negotiation Process

Under the new law, negotiation is delayed for those drugs where there is a high likelihood that a biosimilar will be licensed and marketed in the next two years.

ACS CAN has long supported the appropriate use of generic drugs and has been a staunch supporter of bringing more biosimilars to market. This is another way of both expanding options for cancer patients and lowering costs for their drugs. While outside the direct scope of implementing the new negotiation program, ACS CAN urges CMS to work with FDA to expedite approval of generics and biosimilars.

Section 90.2 – Monitoring Access to the MFP

ACS CAN supports CMS' intent to require Primary Manufacturers to establish safeguards to ensure information about the maximum fair price for selected drugs is available to eligible individuals, pharmacies, mail order services, and other dispensers. Program transparency and, in this case, price transparency will be key to overall success of the negotiation program.

We support the proposal for CMS to publish the information on its website and recommend that it be done in an easy to read, easy to access, consumer-friendly format. We also recommend that CMS update the Medicare Plan Finder with information for those drugs that are subject to Medicare negotiation. In reviewing Part D plan formularies, CMS should ensure that enrollees' cost sharing is based on the Medicare negotiated rate. We further suggest CMS consider other avenues consumers generally use to get information on coverage including:

- the Medicare toll free line and call center;
- insurance plan websites;
- pharmacies and pharmacy applications;
- patient navigators; and
- patient advocacy organizations.

We support CMS' proposal to establish a process by which beneficiaries can report violations. This system should be easy to use – such as a toll-free number or an online notification system – and widely publicized. We urge CMS to set a time limit – no more than 48 hours – for responding to beneficiaries reporting violations and guidance as to the steps they should take. CMS should also report the number of complaints it receives and the number of complaints which resulted in CMS action. Finally, we urge CMS to consider creating an Ombudsman that serves as a direct point of contact for beneficiaries.

Conclusion

ACS CAN appreciates the opportunity to comment on the implementation of the new prescription drug negotiation program. If you have any questions or need additional information, please feel free to contact me directly or Kirsten Sloan, Managing Director, Public Policy at Kirsten.Sloan@cancer.org.

Sincerely,

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure,

The American College of Rheumatology (ACR), representing over 7,700 rheumatologists and rheumatology interprofessional team members, appreciates the opportunity to provide thoughts on the Medicare Drug Price Negotiation guidance that was released on March 15, 2023. We recognize that establishing this complex program is a tremendous undertaking and appreciate all opportunities for the public to participate in the process.

Rheumatologists and rheumatology healthcare professionals provide ongoing care for Medicare beneficiaries with complex chronic and acute conditions that require specialized expertise. They provide primarily non-procedure-based care to patients with severe conditions that can be difficult to diagnose and treat, including rheumatoid arthritis and other forms of inflammatory arthritis, vasculitis, systemic lupus erythematosus, and multiple other debilitating diseases. Rheumatologists and rheumatology professionals work side by side with pharmacists and PharmD's to ensure patients' access to medically necessary therapy. Early and appropriate treatment by rheumatologists and rheumatology professionals can control disease activity and prevent or slow disease progression, improve patient outcomes, and reduce the need for costly surgical or interventional procedures. The improved outcome enables our patients to continue to be more productive than they would have been without timely treatment.

Therapeutics for rheumatic diseases are as complex as the diseases they treat, and we recognize the tremendous investment in research and development that is needed to bring these innovative drugs and biologics to market. However, R&D costs do not account for soaring drug prices – prices that routinely block patients' access to medically necessary therapies. The ACR believes that, in order to allow patients access to needed treatments, all participants in the pharmaceutical marketplace, not just manufacturers, must be called upon to improve transparency, address perverse incentives, incentivize world-class innovation in drug development as well as reliable manufacturing and distribution systems, and reduce the cost borne by patients to levels that no longer preclude access to medically necessary therapy.

Ensuring Accessibility and Innovation

The ACR recognizes that this guidance outlines technical steps that will allow the agency to negotiate select drug prices with manufacturers. The drug negotiation provisions within the Inflation Reduction Act (IRA) require an aggressive timeline in order to meet the 2026 applicability deadline. We note that an aggressive timeline could lead to unintended consequences in that a relatively short interval between approval by the Food and Drug Administration (FDA) of a drug and its listing on the drug pricing negotiation list could disincentivize manufacturers from investing in new and innovative therapies. Therefore, as CMS continues to refine the program, we urge the agency to ensure that the drug pricing timeline and eligibility requirements allow for high-spend drugs to be negotiated without prejudicing innovation.

Provider and Patient Perspective

As prescribers, we sit at the nexus between innovative therapies and the patients who would benefit if they could afford them. This unique perspective will be invaluable to the successful rollout of CMS's evolving policies. Therefore, we urge CMS to ensure appropriate stakeholder and public participation, including 60- or 90-day comment periods and the inclusion of patient and provider perspectives throughout the process. Incorporating patient and provider real-world perspectives as the end-users of these products is integral to any plan to reduce drug prices.

We encourage CMS to make negotiation methodologies transparent, accessible, and understandable to all stakeholders. Along these lines, we urge CMS to publish all subsequent policies related to this program in line with the customary regulatory process, including an adequate comment period.

Finally, we urge CMS to include patient and provider groups, including the ACR, throughout the program's development. While the negotiations toward a maximum fair price are largely between the pharmaceutical industry and CMS, the implications of these negotiations are far-reaching. We appreciate that the agency recognizes the need for quarterly strategic and stakeholder meetings. We urge CMS to be candid and transparent in these discussions and allow for additional mechanisms, including listening sessions, by which others might participate to ensure the program meets all objectives and mitigates unintended consequences.

The ACR appreciates the transparency CMS has provided in the early stages of the implementation of the negotiation program. We urge continued transparency and more time for input from stakeholders. The ACR welcomes all opportunities to serve as a resource to CMS as drug negotiations begin. Please do not hesitate to contact Amanda Grimm Wiegrefe, MScHSRA, Director of Regulatory Affairs, at awiegrefe@rheumatology.org should you have any questions or need clarification.

Sincerely,

A handwritten signature in black ink, appearing to read "D. White".

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure:

Amgen Inc. (Amgen) appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year (IPAY) 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Amgen is committed to using science and innovation to dramatically improve people's lives, improving access to drugs and biologics (collectively, "drugs," consistent with CMS's convention), and promoting high-quality care for patients. Amgen develops innovator medicines and biosimilar biological products. Thus, our interest is to ensure a robust market for, and improve patient access in the United States to both innovator and biosimilar biological products.

We are pleased to provide CMS with feedback on certain aspects of the implementation of the Drug Price Negotiation Program. However, Amgen remains concerned that the government price controls on certain medicines provided through Medicare under the guise of price "negotiation" under the Inflation Reduction Act (IRA) is likely to stymie biopharmaceutical innovation at precisely the time when the world needs more new medicines to treat an aging population. Government price setting provisions are forcing biopharmaceutical companies to make hard

choices when it comes to research and development (R&D) investment. Companies are having to rethink how and where they invest in medical innovation, with the government essentially picking winners and losers by discouraging the development of some types of medicines and treatments for certain patient populations.

Biopharmaceutical innovation is key to addressing long term sustainability of health systems (e.g., prevention and avoided acute events in the future because of prevention efforts), improving public health and people's lives. We encourage CMS to consider the impact to innovation, including for biosimilars and the improved affordability options these medicines offer, and patient access as the agency considers guidance for this and other IRA-related programs.

Amgen also supports the comments of the Pharmaceutical Research and Manufacturers of America (PhRMA) and the Biotechnology Innovation Organization (BIO) on the Drug Price Negotiation Program Guidance.

TABLE OF CONTENTS

- I. AMGEN HAS SIGNIFICANT CONCERNS WITH SECTION 30, BUT CMS HAS NOT PERMITTED COMMENT**
- II. RECOMMENDATIONS REGARDING INCLUSION AND REMOVAL OF PRODUCTS FROM THE MAXIMUM FAIR PRICE (MFP) PROGRAM**
 - A. CMS Must Abandon Its Extra-Statutory and Ill-Advised Bona Fide Marketing Standard (Section 90.4)
 - B. CMS Should Remove a Drug from the Selected Drug List After the “Negotiation Period,” But Before an MFP is in Effect (Section 70)
- III. RECOMMENDATIONS REGARDING THE PRICE SETTING FACTORS**
 - A. CMS Should Reconsider Information It Requires Manufacturers to Submit under Appendix C (Appendix C)
 - B. CMS Should Not Reduce the Initial Offer Price If R&D Costs Were Recouped (Section 60.3)
 - C. CMS Should Disclose the Non-Manufacturer Submitted Information on Which It Relied in Making an Offer or Responding to a Counteroffer (Section 60.4)
 - D. CMS Should Specify That It Will Consider All Information Submitted by a Manufacturer in Setting the MFP (Section 60.4)
 - E. CMS Should Allow a Manufacturer to Submit Additional Relevant Information as It Arises Throughout the Price Setting Process (Section 40.2)
 - F. CMS Should Abandon the Overly Broad Confidentiality Obligations That It Proposes to Impose on Manufacturers (Section 40.2)
 - G. CMS Should Establish Clear Rules for Its Price Setting Methodology and Enforcement, Without Using Certain Reference Points (Section 60.3)
 - H. CMS Should Provide a Methodological Framework that is Predictable, Transparent, and Fair to All Stakeholders (Section 60)
 - I. CMS Should Consider a Broad Array of Patient-Centered Outcomes, Including Elements Most Important to Patients, When Assessing “Therapeutic Advance” (Sections 50.2 and 60.3)
 - J. CMS Should Choose Appropriate Therapeutic Alternatives Based on Clinical Standards, Not Cost (Sections 50.2 and 60.3)
 - K. CMS Should Establish and Adhere to a Clearly Defined Hierarchy of Evidence, Which Gives Significant Weight to Real-World Evidence, Indirect Treatment Comparisons, and Broader Measures of Unmet Need (Section 60)

Global Government Affairs & Policy

- L. CMS Should Incorporate Meaningful, Transparent, and Predictable Stakeholder Engagement Throughout the Assessment Process (Section 60.4)

IV. RECOMMENDATIONS REGARDING THE PROVISION OF THE MFP (Section 40)

- A. CMS Should Finalize Its Proposal Permitting a Manufacturer to Provide Access to The MFP Via a Rebate Model and Clarify That the Fourteen-Day Clock for Payment of An MFP Rebate Runs from The Date on Which The Manufacturer Validates Eligibility For The Rebate (Section 40.4)
- B. CMS Should Adopt an Enforceable Mechanism to Identify 340B-Purchased Units to Prevent MFP/340B Duplicate Discounts Under Medicare Parts B, C, and D (Section 40.4)
- C. CMS Should Continue to Recognize That a Manufacturer Cannot Directly Provide Access to the MFP to a Part D Beneficiary at the Point-Of-Sale (Section 40.4)

V. RECOMMENDATIONS REGARDING CIVIL MONETARY PENALTIES (CMPS) (Section 100)

- A. CMS Should Establish Procedural Safeguards That Ensure That CMPs Are Imposed Only After Notice and a Reasonable Opportunity to Cure (Section 100)

VI. OTHER RECOMMENDATIONS

- A. CMS Should Establish a Transparent, Predictable, and Reasonable Process for Meaningful Price Setting (Section 60)

VII. RECOMMENDATIONS REGARDING NOTICE AND COMMENT

- A. CMS Should Propose and Solicit Comment on the Content of the Agreement It Will Utilize Well in Advance of the Date on Which the First Set of Manufacturers Must Execute the Agreement (Section 40.1)
- B. CMS Should Consider Comments on All Provisions of the Guidance and Respond to Comments on the Guidance in the Final Guidance

I. AMGEN HAS SIGNIFICANT CONCERNS WITH SECTION 30, BUT CMS HAS NOT PERMITTED COMMENT

Although Amgen appreciates the opportunity to submit comments on several aspects of the Drug Price Negotiation Program Guidance, Amgen is troubled by the statement in the Guidance that CMS need not accept comments on Section 30. Section 30 of the Drug Price Negotiation Program Guidance addresses several key aspects of the Program, including CMS's plan to implement portions of the statute permitting CMS to delay, under certain circumstances, selection of a reference biologic for inclusion in the Drug Price Negotiation Program. Even if CMS could permissibly implement these policies without public input, CMS should not do so.

To the contrary, Amgen believes that the uninformed execution of Section 30 will have negative and unintended consequences. As one example, in Section 30.3.1 of the guidance, CMS interprets Section 1192(f) of the Social Security Act (SSA), which establishes a Special Rule that permits CMS to delay selection of a reference biologic for price setting for up to two years under certain circumstances. But in so doing, CMS actually has created a framework that will erect significant barriers to biosimilars ever reaching patients, because the timelines established in Section 30.3.1 will create uncertainty for would-be biosimilar manufacturers and depress incentive for development. If given the opportunity to comment on Section 30, Amgen would have submitted comments to: 1) help CMS understand the challenges posed to biosimilar manufacturers by section 30.3.1 and 2) propose solutions to these problems. Amgen is disappointed to not be given a chance to voice its perspective on these issues and to work with CMS in order to avoid a dramatically negative impact on the biosimilars market.

II. RECOMMENDATIONS REGARDING INCLUSION AND REMOVAL OF PRODUCTS FROM THE MAXIMUM FAIR PRICE (MFP) PROGRAM

A. CMS Must Abandon Its Extra-Statutory and Ill-Advised Bona Fide Marketing Standard (Section 90.4)

With respect to the "bona fide marketing" standard under Section 90.4 of the guidance,¹ there is no statutory basis for CMS's proposal "to monitor whether robust and meaningful competition exists in the market once it makes such a determination [that a generic drug or biosimilar biological product has been marketed]."² The National Drug Code (NDC) Directory published and

¹ Note that we are commenting only on the discussion of "bona fide marketing" under section 90.4 of the guidance. If CMS had permitted comment on section 30, Amgen would have submitted comments on the discussion of "bona fide marketing" in section 30.1.

² Drug Price Negotiation Program Guidance § 90.4.

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

maintained by the Food and Drug Administration (FDA) includes the “start marketing date” and “end marketing date” for NDCs and these dates in the NDC Directory should be the beginning and end of CMS’s inquiry.

First and foremost, the agency’s proposed standard is incompatible with the clear language of the statute. By definition, marketing means “[t]he act[] . . . of bringing or sending a product or commodity to market.”³ Thus, once a product has been bought or sold, it has been marketed. CMS does not have the discretion to interpret this statutory term otherwise. Notably, CMS proposes a definition of “marketing” that is consistent with law in Appendix C of the guidance, proposing to define the term as “the introduction or delivery for introduction into interstate commerce of a drug product.”⁴

The statute contemplates that a selected drug will exit the program based on such a determination but does not provide CMS a role in monitoring generic and biosimilar competition.

Any monitoring by CMS of the competitive landscape for pharmaceuticals would duplicate the existing efforts of the Federal Trade Commission (FTC), which has the statutory authority and expertise to perform this function. It is also unnecessary in light of FDA initiatives, including the Drug Competition Action Plan⁵ and Biosimilars Action Plan,⁶ which have focused on improving access to generic and biosimilar products in the U.S. Moreover, the FTC and FDA have been working together on these issues releasing joint statements and holding joint workshops, most recently focusing on competition for biologics and biosimilars.⁷ CMS also lacks the expertise and resources to police marketplace competition issues. CMS’ proposed monitoring of the status of competition in the marketplace is therefore unauthorized and unnecessary.

Notably, the subjectivity of the standard provides the agency with boundless discretion in implementing the program, a circumstance Congress clearly did not intend. Take the Maximum Fair Price (MFP) termination date: Congress expressly defined that date by reference to the date

³ Oxford English Dictionary, Definition of Marketing, <https://www.oed.com/view/Entry/114186?rskey=36dfg4&result=2&isAdvanced=false#eid> (last visited Mar. 19, 2023).

Email: gportner@amgen.com
www.amgen.com

on which CMS determines that a generic or biosimilar has been marketed.⁸ Yet, for no justifiable reason, CMS has indicated that such date does not similarly trigger the termination of the IRA's MFP liability. In doing so, the agency purports to vest itself with limitless discretion to determine the MFP termination date, based on its subjective judgment. Similarly, the agency has implicitly asserted the power to, after an MFP has been terminated, *re-institute* an MFP should the agency conclude that utilization of the generic or biosimilar is no longer "robust and meaningful"⁹—again, an entirely subjective standard.

There is no indication, in the text or structure of the statute, that Congress intended to give CMS such sweeping authority. To the contrary, CMS's action is patently unlawful, in light of the clear statutory boundary imposed by the objective, point-in-time date of marketing standard. "It is axiomatic that an administrative agency's power to promulgate legislative regulations is limited to the authority delegated by Congress. Thus, if there is no statute conferring authority, a federal agency has none."¹⁰ Yet through its bona fide marketing standard, CMS is "effectively [seeking to] introduce a whole new regime of regulation," which "is not the one that Congress established."¹¹ No statute has conferred authority to implement such a regime.

Another significant concern is the agency's apparent assumption that widespread utilization of a new generic or biosimilar will occur overnight. In actuality, there will inevitably be a ramp-up period for a newly launched product, not only because there is a lag before sales are reflected in claims data, but also because there is a period during which providers and patients transition to a new product.¹² This is especially true for biosimilars, given that it can take months or years for newly launched biosimilars to gain traction in the marketplace. But, by any rational understanding, the product is in fact marketed during this transition period. The existence of a period before Prescription Drug Event (PDE) data reflect widespread utilization should not preclude a finding that a generic or biosimilar has been marketed. CMS's proposed approach also fails to account for circumstances where there is not "robust and meaningful competition" on account of an unexpected shortage or supply chain concern.

B. CMS Should Remove a Drug from the Selected Drug List After the "Negotiation Period," But Before an MFP is in Effect (Section 70)

⁸ SSA § 1192(c)(2).

We urge CMS to interpret the IRA to allow a reference product to exit the MFP program if a generic or biosimilar product is marketed after the “negotiation period” but before the start of the IPAY. Such reading aligns with the statutory definition of a “qualifying single source drug” (QSSD)—a threshold requirement for a drug to be subject to price setting. The statute defines a QSSD “with respect to an [IPAY],”¹³ indicating that a product’s status as a QSSD must exist as of the first day of the IPAY, not just at the selected drug publication date, as CMS suggests in section 70 of the guidance. Had Congress intended QSSD status to be assessed only as of the selected drug publication date, it would have said so. Thus, a product that has become multisource before the IPAY should not be subjected to price setting.

This view also comports with the definition of “price applicability period,” which means, “*with respect to a qualifying single source drug*, the period beginning with the first IPAY with respect to which such drug is a selected drug and ending with the last year during which the drug is a selected drug.”¹⁴ This reference to QSSD status signals that a product that has gone multisource and hence no longer meets the QSSD definition should not be subject to a price applicability period. Moreover, as the statute and CMS’ Figure 1 show, only products that are QSSDs may be negotiation-eligible drugs. Where a product is no longer a QSSD, it cannot, by definition, be considered a negotiation-eligible drug or a selected drug.¹⁵

Our position aligns with subsection (c)(1) in section 1192 and its use of the phrases, “with respect to an IPAY” and “with respect to such year” in paragraph (1).¹⁶ This phrasing supports the conclusion that negotiation-eligible status (and hence, QSSD status) must remain in place as of January 1 of the IPAY for subsection (c)(1) to apply to the drug. Thus, this provision speaks to the exit process for drugs that remain a QSSD and selected drug on the first day of the IPAY and then experience generic or biosimilar competition. Paragraph (2) provides a “clarification” of the application of paragraph (1) to a specific time period when various tasks otherwise would need to be performed by both CMS and the manufacturer, i.e., during the “negotiation period.” The provision does not address what happens if the generic or biosimilar is marketed after the “negotiation period,” as there is no “negotiation process” to which the manufacturer is subject, and thus no need for a clarification that the process must stop. Paragraph (2)’s styling as a “clarification” shows that the statutory terms referenced in subsection (c) must be given full effect in subsection (c)(1). In other words, it does not change the fact that the statute defines QSSD “with respect to an IPAY.”

This position is grounded in sound policy. Congress crafted the IRA to provide for price setting for *single source* products. CMS’s current position undermines this intent by applying MFPs to

¹³ SSA § 1192(e)(1).

¹⁴ *Id.* § 1191(b)(2) (emphasis added).

¹⁵ *Id.* §§ 1192(c) (defining “selected drug”), 1192(d) (defining “negotiation-eligible drug”).

¹⁶ *Id.* § 1192(c)(1).

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

products that are already multisource. This position thereby directly undermines generic and biosimilar competition and incentives for pursuing approval of such products. For generic and biosimilar companies, developing and marketing generic and biosimilar products within the timeframes under the law is already challenging. The processes necessary to market a generic or biosimilar product can be complex, and there are many steps that are not solely in control of the generic or biosimilar sponsor, including FDA review timelines. The price-controlled MFP may go into effect before such companies are ever able to market their products and CMS may set a price below the level of economic viability. CMS's position compounds this problem by essentially providing that generic or biosimilar marketing in the last thirteen months before the IPAY does not trigger exit from the MFP program. In other words, a generic or biosimilar company that brings its products to the market during these thirteen months will nevertheless be forced to compete against a medicine that has its price set with an MFP.

We therefore urge CMS to revise the Drug Price Negotiation Program Guidance to provide that a reference product or listed drug exits the program if generic or biosimilar marketing occurs after the "negotiation period" but before IPAY. CMS also should amend the table on page 63 of the Guidance as follows:

Date on which CMS determines that a generic drug or biosimilar biological product is approved and marketed	Result with respect to selected drug for the Negotiation Program
September 1, 2023 through August 1, 2024 <u>December 31, 2025</u> (which includes Negotiation Period for initial price applicability year 2026)	Selected drug remains a selected drug for initial price applicability year 2026, though MFP does not apply; selected drug ceases to be a selected drug on January 1, 2027
August 2, 2024 <u>January 1, 2026</u> through March 31, 2026	Selected drug remains a selected drug and MFP applies for initial price applicability year 2026; selected drug ceases to be a selected drug on January 1, 2027.
April 1, 2026 through March 31, 2027	Selected drug remains a selected drug and MFP applies for initial price applicability year 2026 and calendar year 2027; selected drug ceases to be a selected drug on January 1, 2028.

III. RECOMMENDATIONS REGARDING THE PRICE SETTING FACTORS

Global Government Affairs & Policy
601 Thirteenth Street, NW

www.amgen.com

A. CMS Should Reconsider Information It Requires Manufacturers to Submit under Appendix C (Appendix C)

Section 1194(e)(1) of the SSA lists the following categories of data to be submitted by manufacturers for consideration by CMS in setting the MFP:

- Research and development costs;
- Unit costs of production and distribution;
- Federal financial support for discovery and development;
- Data on certain pending and approved patent applications, exclusivities, and FDA applications or approvals; and
- Market, revenue, and sales volume data in the United States.¹⁷

In Appendix C to the Drug Price Negotiation Program Guidance, CMS proposes definitions of these five categories of information. As discussed further below, Amgen is concerned that it will be impossible or infeasible for manufacturers to produce some of the information described in Appendix C, particularly given the excessive civil monetary penalties (CMPs) that can be imposed for failure to comply. Moreover, other information described in Appendix C is highly sensitive, yet inappropriate and unnecessary for setting the MFP.

1. CMS should limit mandatory disclosures to information necessary to administer the Maximum Fair Price Program

The proposed mandatory submissions described in Appendix C are incredibly broad and burdensome, but it is unclear how CMS intends to use most of the information for price setting. For example, CMS proposes to require manufacturers to report R&D costs broken down by six categories (where, as discussed below, manufacturers are unlikely to track R&D costs in this way). However, under section 60.3.4, CMS appears to be proposing to consider only total R&D costs, stating that it will consider adjusting the initial offer price upward or downward based on whether the manufacturer has recouped its R&D costs. Thus, CMS is proposing to require a burdensome (and, as discussed below, potentially impossible) allocation of R&D costs into six categories with no articulated purpose.

Likewise, CMS proposes to require manufacturers to provide an extensive list of confidential commercial information characterized as “market data and revenue and sales volume data,” yet,

¹⁷ SSA § 1194(e)(1); *see also* Drug Price Negotiation Program Guidance § 60.3.4.

Global Government Affairs & Policy

Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

in section 60.3.4, CMS struggles to explain how it will use this data, other than indicating “if the average commercial net price is lower than the preliminary price, CMS may consider adjusting the preliminary price downward.”¹⁸

Another example is that CMS is proposing to require disclosure of a poorly defined category of information labeled “U.S. commercial average net unit price— best.” Manufacturers already expend significant resources to report “best price” under the Medicaid Drug Rebate Program (MDRP) and CMS provides no rationale as to why it needs manufacturers to calculate and report this additional best price.

CMS also provides no explanation as to why it would mandate disclosure of “quarterly total U.S. unit volume.”¹⁹ As the IRA is a Medicare-only price setting program, it is not obvious why CMS needs manufacturers to report non-Medicare unit volume. Even if one could guess at potential uses for such information, this is sensitive, potentially market-moving information that manufacturers should not be disclosing to CMS without good reason.

Congress did not give CMS carte blanche. Under section 1193(a)(4)(B) of the SSA, CMS may require manufacturers to submit “information that the Secretary requires to carry out” the agency’s price setting activities.²⁰ In order for CMS to be authorized to mandate disclosure of information, CMS must articulate why the agency “requires” such information for the MFP program.

2. CMS should permit manufacturers to adopt reasonable assumptions with respect to manufacturer-submitted information

In lieu of its proposed definitions,²¹ CMS should clarify that, in submitting such information, a manufacturer may make reasonable assumptions when interpreting the statutory terms describing such information.²² In doing so, CMS can rely on existing reasonable assumptions policy, under which manufacturers have long been permitted to operate.²³

¹⁸ Drug Price Negotiation Program Guidance § 60.3.4.

²¹ Drug Price Negotiation Program Guidance, Appendix C.

²² See SSA § 1194(e)(1); see also *id.* § 1193(a)(4), 1194(b)(2)(A) (addressing manufacturer information submission obligations).

²³ See, e.g., 83 Fed. Reg. 12,770, 12,785 (Mar. 23, 2018) (providing for an MDRP agreement provision governing reasonable assumptions); 71 Fed. Reg. 69,624, 69,667 (Dec. 1, 2006) (discussing reasonable assumptions regarding ASP reporting). Allowing manufacturers to rely on reasonable assumptions will be particularly important in the early years of the Drug Price Negotiation Program, while CMS and stakeholders are determining how to best implement it. But reliance on reasonable assumptions should be allowed to

Global Government Affairs & Policy

Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

Reasonable assumptions enable manufacturers to adopt an appropriate approach to meeting a legal requirement where law and policy do not specify one. Reasonable assumptions thereby allow manufacturers to meet complex and nuanced legal requirements without requiring Congress or CMS to speak to the unique circumstance of each manufacturer and its product portfolio and business practice. As a result, regulatory regimes can be readily operationalized notwithstanding routine ambiguities in law and policy.

This recommended approach is preferable to the proposed rigidly standardized one across all manufacturers and products notwithstanding the unique characteristics of each of the over 20,000 prescription drug products currently approved for marketing in the United States.²⁴ These products feature diverse histories of development and FDA regulation, chains of ownership, and pricing and sales arrangements in complex drug distribution chains. The proposed rigidly standardized approach would therefore necessarily result in arbitrary treatment of products that would inappropriately advantage some manufacturers and products over others.²⁵ Further, it could result in CMS not receiving information that the manufacturer has concluded is most relevant for consideration in the price setting process.²⁶

3. *CMS should allow manufacturers to submit information maintained in the usual course of business with respect to R&D costs*

continue on an ongoing basis given the complexity of the program and the diverse business realities of manufacturers. Such an approach is consistent with the approach CMS has taken under other new and complex programs. For example, with respect to whether “a self-insured group health plan, a large group market health plan, or a grandfathered group health plan . . . have used a permissible definition of [Essential Health Benefits (EHB)] under . . . the Affordable Care Act,” the Departments of Health and Human Services, Labor, and the Treasury have stated that they “intend to use their enforcement discretion and work with those plans that make a *good faith effort* to apply an authorized definition of EHB to ensure there are no annual or lifetime dollar limits on EHB.” CMS, FAQ on Essential Health Benefits Bulletin, <https://www.cms.gov/ccio/resources/files/downloads/ehb-faq-508.pdf> (last accessed Apr. 4, 2023) (emphasis added).

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

As an initial matter, Amgen joins PhRMA in urging CMS to take a global view to R&D costs and look at the total investments across the entire portfolio, rather than asking manufacturers to produce information at a product-specific level.

If CMS moves forward with mandating disclosure of product-specific information, we ask that it abandon the proposed detailed definition of R&D costs, including the six specific categories listed and permit manufacturers to submit estimates of R&D costs using reasonable allocation methodologies and information maintained in the usual course of business. We are concerned that CMS is under the impression that manufacturers track and maintain R&D cost information at a level of detail that does not correspond with actual business practices. Amgen does not track product-specific R&D costs in the six categories in Appendix C, nor is such tracking a standard industry practice, making it doubtful that any manufacturers track expenses in this manner either. An attempt at compliance would require Amgen to review prior expense records and invoices and retrospectively flag them by product and CMS R&D cost category. It may prove to be an impossible task to assemble and submit accurate information, but, even if did not, it would be immensely time consuming, expensive, and burdensome. It would be even more challenging for older products, such as those subject to the MFP program, and products acquired through merger or acquisition.

In contrast, many manufacturers have developed methodologies for business planning purposes to allocate R&D costs across products, although we are not aware of a uniform industry standard. Permitting manufacturers to submit this information would not only be more feasible, but it likely would provide a more accurate estimate of costs than trying to piece together old expense records and invoices.

4. Acquisition costs allocated to R&D should be included in R&D costs

In the Drug Price Negotiation Program Guidance, CMS proposes that manufacturers not include drug acquisition costs as part of R&D.²⁷ This is an ill-conceived policy that CMS should reverse when it issues its final guidance document. Given that CMS proposes under section 60.3.4 to adjust the initial offer price upward or downward based on whether the manufacturer has recouped R&D costs, it appears that CMS believes that molecules developed in-house should be assigned greater value than products that have been acquired. This distinction makes no business sense. Manufacturers such as Amgen are constantly investing in their internal R&D as well as evaluating opportunities to “buy R&D” through external acquisitions. In either case, the value of the therapy is the same to patients, health care providers, and payers. And the product

²⁷ Drug Price Negotiation Program Guidance, Appendix C; see also Information Collection Request (ICR) Form for Negotiation Data Elements under Sections 11001 and 11002 of the Inflation Reduction Act (IRA) (CMS-10847, OMB 0938-NEW) at 5 (Mar. 21, 2023) (ICR).

Global Government Affairs & Policy

Email: gportner@amgen.com
www.amgen.com

may be of greater benefit to patients in the hands of an acquiring company if the company has better capability to market and manufacture a reliable supply of the product. Furthermore, when developing reasonable allocation methodologies related to R&D costs (as discussed above), a manufacturer would never exclude acquisition costs because such an approach would understate, in some cases drastically, the manufacturer's investment.

5. CMS should permit manufacturers to submit a list of patents, exclusivities, and approvals to CMS as part of the initial information request

In the Drug Price Negotiation Program Guidance, CMS proposes to require the submission of "all pending and approved patent applications . . . submitted, sponsored, licensed, and/or acquired" by the manufacturer related to a selected drug, including those that are expired or unexpired, pending or approved, or where the manufacturer is not listed as the assignee/applicant (as for a joint venture).²⁸ In addition, CMS proposes to ask for detailed information on exclusivity periods granted by FDA and all active and pending applications and approvals of the selected drug in which the manufacturer is directly or indirectly involved.²⁹ Given the significant volume of such information, and that such information must be provided only a short time after a drug's selection date (by October 2, 2023, for IPAY 2026 or March 1 of the year that is two years before the IPAY for subsequent IPAYs),³⁰ CMS should permit manufacturers to satisfy this requirement by providing a list of such documentation. CMS would then either be able to access such patent, exclusivity, and application related information via other federal agencies or manufacturers could then provide to CMS requested information related to particular patents, exclusivities, and applications as a supplement to the initial submission of information.

6. CMS should allow manufacturers to submit information maintained in the usual course of business with respect to unit costs of production and distribution

Similar to our comments above with respect to R&D costs, the definitions in Appendix C imagine that costs of production and distribution are tracked in a more uniform, detailed, and product-specific manner than is the case. Accordingly, CMS should permit manufacturers to submit information regarding unit costs of production and distribution using reasonable allocation methodologies that they maintain in the usual course of business.

7. Sales and marketing costs should be included in costs of distribution

²⁸ Drug Price Negotiation Program Guidance, Appendix C; see also ICR at 19-20.

²⁹ *Id.*

³⁰ SSA §§ 1194(b)(2), 1191(d)(5); Drug Price Negotiation Program Guidance § 40.2

Global Government Affairs & Policy

Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

CMS proposes to define current unit costs of production and distribution as expressly excluding marketing costs.³¹ CMS proposes to define marketing “as the introduction or delivery for introduction into interstate commerce of a drug product” but includes a number of such costs that might otherwise be considered marketing costs by this definition in the definition of current unit costs of production and distribution, including packaging, labeling, shipping, operating costs, and production costs.³² CMS thus appears to intend to exclude only sales and marketing costs, such as advertising and related costs, from the definition of current unit costs of production and distribution.

After the FDA approves a product, patients may not see the benefit of it unless manufacturers expend resources to educate health care providers (both disease state education and regarding the safety and efficacy of the product itself), on patient support services, and on staff to negotiate with payers for access to the product. These functions are critical to create awareness of the disease and the product’s efficacy so that the product reaches appropriate patients. Excluding marketing costs creates an inaccurate picture of the full costs of production and distribution related to a product.

8. Patient assistance should not be considered a reduction in net price

In the Drug Price Negotiation Program Guidance, CMS proposes to require manufacturers to submit the U.S. commercial average net unit price (effectively the average net unit price to commercial plans for a selected drug) and the U.S. commercial average net unit price—best (effectively the best price to commercial plans for a selected drug) as part of the market data and revenue and sales volume data.³³ These price types “must be net of discounts, chargebacks or rebates, cash discounts, free goods contingent on a purchase agreement, up-front payments, coupons, goods in kind, free or reduced-price services, grants, or other price concessions or similar benefits offered by the [manufacturer].”³⁴ CMS should revise these definitions to exclude those transactions, such as coupons and free goods programs, that benefit patients alone, as such transactions, by definition, do not impact any price from the manufacturer to a plan. CMS has recognized this explicitly in its regulatory definition of best price, which excludes transactions with patients where patients alone receive the benefit of the transaction. Where such transactions are excludable from best price, therefore, they necessarily should be excluded from these price types as well.³⁵ These clarifications are essential to ensure both that CMS is relying on pricing

Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

information that is actually representative of prices offered to payers in the course of price setting and to ensure that manufacturers continue to be incentivized to provide savings to patients.

B. CMS Should Not Reduce the Initial Offer Price If R&D Costs Were Recouped (Section 60.3)

As discussed above, under section 60.3.4, CMS proposes to penalize manufacturers that have recouped their R&D costs. This policy is flawed for two primary reasons. First, it does not reflect the reality of how companies consider their R&D investments. Only one of thousands of potential candidates will ultimately result in an FDA-approved medicine, and less than 12 percent of the candidate medicines that make it into Phase I clinical trials are ultimately approved by the FDA.³⁶ Companies account for these odds when they plan their R&D programs, and the revenues from the few successes are utilized to cover the R&D costs of the many failures across their entire portfolio of medicines, not just those in the same therapeutic class or intended mechanism of action. Accordingly, viewing recoupment of R&D costs on a product-by-product basis does not reflect actual business practices of manufacturers.

Second, manufacturers are constantly evaluating opportunities to make R&D more time and cost efficient. For example, Amgen has invested in Complex Innovative Designs (CID) with respect to clinical trials to: 1) make the most efficient use of clinical trial data to simultaneously inform dose selection, generate adequate and well-controlled evidence on efficacy and quality safety data; 2) reduce the probability of inconclusive trials, and enable early and accurate decision-making; and 3) most importantly, shorten the time to bring new therapies to patients. In fact, an Amgen CID program evaluating a potential treatment for Lupus was evaluated favorably by FDA under its CID Paired Meeting Program.³⁷ Under CMS's proposed policy, Amgen's global investment in CIDs would likely not be reporting as a product-specific R&D cost, yet CMS could use the resulting reduction in clinical trial costs to reduce the MFP of an Amgen product. CMS's proposed policy of penalizing manufacturers that recoup R&D costs creates a disincentive for manufacturers to invest in such innovative development initiatives that both reduce R&D costs and get therapies to patients more quickly.

C. CMS Should Disclose the Non-Manufacturer-Submitted Information on Which It Relied in Making an Offer or Responding to a Counteroffer (Section 60.4)

³⁶ Congressional Budget Office, Research and Development in the Pharmaceutical Industry, <https://www.cbo.gov/publication/57126> (last accessed April 14, 2023).

³⁷ CID Case Study: A Study in Patients with Systemic Lupus Erythematosus, available at <https://www.fda.gov/media/155404/download>.

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

With respect to *non*-manufacturer-submitted information, CMS should commit to disclosing to the manufacturer any information under section 1194(e)(2) of the SSA, including its sources, on which it relied during the price setting process. CMS suggests that it may discuss this information with manufacturers during negotiation meetings after the rejection of a counteroffer,³⁸ but it is critical that CMS commit to sharing this information at each stage of the price setting process. This commitment is essential to supporting a transparent, informed, and good faith price setting process and is consistent with the intent of the Drug Price Negotiation Program.

Specifically, the statute requires CMS to provide a justification for an initial offer that is “based on” the statutorily specified price setting factors including those described in section 1194(e) (2) of the SSA.³⁹ Congress thus intended for an initial offer to be based on such factors and for this limitation to serve as a meaningful boundary to agency discretion, which it can do only where there is a disclosure to the manufacturer of the information on which CMS relied in making the offer. CMS may not “hid[e] or disguise[e] the information that [it] employ[s]” when developing a rule without committing a “serious procedural error;” and it should not do so here for the same reason.⁴⁰

Such transparency will facilitate a more open dialogue during the price setting process. Just as CMS will have the benefit of information from the manufacturer to inform the agency’s initial offer, the manufacturer will have the benefit of information from CMS to inform any manufacturer counteroffer as well as any manufacturer comment on the agency’s response, creating greater parity between CMS and the manufacturer. Ultimately, this approach will reduce the risk that the MFP is set based on flawed information.

D. CMS Should Specify That It Will Consider All Information Submitted by a Manufacturer in Setting the MFP (Section 60.4)

CMS should specify that it will consider *any* information submitted by the manufacturer in support of the price setting process. The statute does not prohibit the manufacturer from voluntarily submitting *additional* relevant information, beyond the information that the statute requires the manufacturer to submit. And CMS has clear authority to consider *all* information submitted by the manufacturer, whether or not tied to a statutorily specified price setting factors, especially given that the statute does not require the agency to justify a response to a counteroffer based on the statutorily specified price setting factors.

³⁸ Drug Price Negotiation Program Guidance § 60.4.3.

³⁹ SSA § 1194(b)(2)(B).

⁴⁰ *Conn. Light & Power Company*, 673 F.2d 525 (D.C. Cir. 1982). Such transparency will also help CMS meet its obligation to implement a “consistent” negotiation methodology and process by serving as a barrier to irregular decision-making. See SSA § 1194(b)(1).

Global Government Affairs & Policy

Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

E. CMS Should Allow a Manufacturer to Submit Additional Relevant Information as It Arises Throughout the Price Setting Process (Section 40.2)

By statute, a manufacturer of a selected drug must submit certain information to inform the price setting process, including certain information regarding non-Federal Average Manufacturer Price (non-FAMP), R&D costs, production and distribution costs, and revenue and sales volume.⁴¹ CMS has also indicated that it will allow manufacturers to submit evidence about alternative treatments.⁴² This information is due by March 1 of the price setting year (or October 2, 2023, for IPAY 2026), i.e., just one month after the selection date.⁴³ Given the exceedingly short time frame to prepare and submit such information, and the real possibility that new information relevant to the price setting process will become available after the submission deadline, CMS should allow a manufacturer to supplement a timely submission as additional relevant information becomes available or otherwise for good cause—not only during a price setting meeting that takes place after the rejection of a counteroffer, as proposed in the Drug Price Negotiation Program Guidance.⁴⁴

By way of example, new data regarding comparative effectiveness could become available, new therapeutic alternatives could come to the market, manufacturers could face unexpected increases in production costs, or manufacturers could need to restate non-FAMP. It is critical that manufacturers be allowed to submit to CMS the most accurate and up-to-date information related to the market conditions of the selected drug to ensure that the MFP is set as appropriately as possible.

F. CMS Should Abandon the Overly Broad Confidentiality Obligations That It Proposes to Impose on Manufacturers (Section 40.2)

CMS should abandon the overly broad confidentiality obligations that it proposes to impose on manufacturers. These requirements are wholly unreasonable and raise significant legal and policy concerns. We echo PhRMA's concerns and comments.

⁴¹ *Id.* §§ 1193(a)(4), 1194(b)(2)(A), (e)(1).

⁴² CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026, at 2 (Jan. 11, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>; see also SSA § 1194(e)(2).

⁴³ We assume that CMS will designate information under section 1194(e)(1) of the SSA as information that is due by March 1 of the negotiation year (or October 2, 2023, for IPAY 2026) under section 1193(a)(4) of the SSA.

Email: gportner@amgen.com
www.amgen.com

G. CMS Should Establish Clear Rules for Its Price Setting Methodology and Enforcement, Without Using Certain Reference Points (Section 60.3)

CMS should implement detailed standards to enforce a consistent and fair methodology as CMS sets the MFP. We appreciate CMS's inclusion of several criteria, such as reviews of existing literature and real-world evidence, conducting internal analytics, and consulting subject matter and clinical experts within the price setting process. However, related to CMS's methodology overall, it will be essential for CMS to provide clear guidance. CMS should not use reference prices (e.g., "cost-optimized alternative", Federal Supply Schedule (FSS), and Big Four [the Department of Veteran Affairs, Department of Defense, the Public Health Service, and the Coast Guard] pricing) which are contextually incongruous foundations for Medicare and will infallibly undervalue any "therapeutic advance." Given the preliminary phase of the ongoing price setting process, the MFP Program will likely pose a considerable resource burden on CMS and manufacturers, with inevitable uncertainties and shortcomings needing exposure through trial and error. Given all of the uncertainties, ceiling prices should be used for the first several IPAYs until the program has been further refined. CMS should also identify standing exceptions where ceiling prices will be the automatic default (e.g., for indications with high unmet need). Most importantly, CMS's assessment should place greater weight on patient/caregiver impacts rather than expounding a simplistic narrative of manufacturer-driven costs.

H. CMS Should Provide a Methodological Framework that is Predictable, Transparent, and Fair to All Stakeholders (Section 60)

The aim of CMS's framework should be a predictable, transparent, and fair process in setting the MFP that ensures patients have timely and uninterrupted access to innovative medicines and that this innovation is rewarded. Establishing clear definitions for the patient population, intervention, comparator, and outcomes will create a structured framework for stakeholders to provide feedback. In addition, CMS should solicit input directly from clinicians, manufacturers, and professional organizations that adhere to a high standard of methodological excellence. Understanding which patients CMS includes in the MFP assessment from an evidence demonstration perspective will be critical. The identification of an appropriate comparator will also be material to this framework, as any discussion on MFP will be relative to existing treatment options. In addition, CMS will need to clarify the governance of the evidence assessment process and price setting. To ensure transparency and fairness, CMS should specify that the two parts of the process be separated and reviewed independently. Finally, identifying patient-important outcomes as part of the initial framework will ensure the MFP reflects value holistically from the patient's perspective. In short, reaching a consensus on the population, intervention, comparator, and outcomes will be a vital part of the MFP process where stakeholder input is essential.

Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

It will be difficult for CMS to enforce this clear and consistent framework if its work is outsourced. For the analysis of therapeutic alternatives, CMS should not contract out the research and should exercise caution in even referencing existing value assessments, most of which are inappropriate for the Medicare population, given that they are Quality-Adjusted Life-Years (QALY)-based and geared towards savings for private payers. Likewise, CMS should ensure that all its methodologies are centered on the patient to avoid collaboration with organizations that do not meet these standards.

I. CMS Should Consider a Broad Array of Patient-Centered Outcomes, Including Elements Most Important to Patients, When Assessing “Therapeutic Advance” (Sections 50.2 and 60.2)

CMS should be more specific in its qualifications for a “therapeutic advance”, and this should be informed by a wide variety of outcomes. These should go beyond clinical endpoints to encompass what matters most to patients and the wider care network—outcomes such as productivity, speed of response, caregiver burden, adherence, long-term persistence, scientific spillover, patient choice, and unmet need. CMS needs to consider broader elements of value, such as individual variation in access to care (e.g., physical, financial, and psychological access that could impact health outcomes across different populations), disease heterogeneity (especially when it comes to safety across different patient subgroups), tolerability, co-morbidities, and societal value (e.g., reduced time in long-term care, avoided/prevented acute events, reduced infection rates). Determining relative health benefit based on a broader set of variables ensures all elements of value, not just those critical to payers, are appropriately incorporated into pricing negotiations. We encourage the inclusion of quality of life and patient preference data, and we recognize CMS’s consideration of not using the QALY metric as mandated by statute. We request that CMS exclude other discriminatory metrics incompatible with Section 1194(e)(2), such as life years gained (LYG) and equal value of life years gained (evLYG). LYG only accounts for the quantity, not quality of life, making it largely unhelpful in the economic evaluation of palliative treatments.⁴⁵ EvLYGs place a ceiling cap on all gains in life years and penalize the most innovative therapies that extend life & improve quality of life.⁴⁶

Additionally, the unique characteristics of each therapeutic area and intervention underscore the importance of contextual flexibility. Obtaining additional evidence in both clinical and real-world evidence is often challenging and fraught with inherent limitations and confounders (e.g., placebo effect just by participating in a trial, lower or higher baseline health in studies that make a placebo

www.amgen.com

arm look better, and patients lost to follow-up in a clinical trial or real-world study). When such evidence is submitted, we believe it should be recognized, as it can provide valuable insights into the patient experience and improve patient outcomes. Therefore, we advocate for additional flexibility to enable the inclusion of diverse sources of evidence and facilitate informed decision-making.

J. CMS Should Choose Appropriate Therapeutic Alternatives Based on Clinical Standards, Not Cost (Sections 50.2 and 60.3)

To align best with real-world clinical practice, CMS should select comparators based on widely accepted clinical guidelines, consultation with manufacturers, and reputable resources founded on high-quality evidence. CMS should clearly outline and justify its choice of comparators and align with stakeholders through meaningful outreach. CMS should never select comparators based on price, as this strategy foregoes clinical accuracy to drive down prices artificially.

K. CMS Should Establish and Adhere to a Clearly Defined Hierarchy of Evidence, Which Gives Significant Weight to Real-World Evidence, Indirect Treatment Comparisons, and Broader Measures of Unmet Need (Section 60)

In framing the evidence requirements, CMS should give clear and consistent guidance on how it will assess the evidence. To ensure CMS's analysis is well-rounded and externally valid, we recommend that CMS give significant weight to high-quality, patient-centered real-world evidence (RWE) and provide clear guidance on which RWE it will accept. CMS must also specify how it will weigh data as well as clear conditions under which indirect treatment comparisons are permissible.

CMS also should address how it will consider different types of evidence (e.g., clinical, economic, and humanistic) to arrive at an MFP. While a typical comparative effectiveness analysis considers clinical and safety information, it ignores a broader range of costs and benefits essential to reaching an MFP. For example, caregiver costs and costs associated with lost productivity are huge potential drivers of the value of innovative medicines. It will be necessary for CMS to clearly outline how it intends to formally bring together and weight the various types of data to inform price negotiations.

Contextualizing unmet need is essential to help define comparators, the patient profile (including patient pathways for existing and new drugs), and outcomes. CMS's proposal to limit unmet need to the number of treatment options is too narrow and should expand to consider gaps in health equity, improvements in adherence, and disease areas where treatments exist but quality of life is lacking. In this way, unmet need provides a vital opportunity to quantify disease impact comprehensively (e.g., caregiver burden, productivity losses, intangible costs).

L. CMS Should Incorporate Meaningful, Transparent, and Predictable Stakeholder Engagement Throughout the Assessment Process (Section 60.4)

Stakeholder engagement is crucial, and CMS should clearly articulate this from the outset. CMS guidance to stakeholders on predictability and transparency in the process and engagement, including adopting a flexible approach, will be essential as its system evolves. At the outset, public announcements on upcoming assessments should be standard, and stakeholders need to be involved in identifying the population, intervention, comparator, and outcomes from an early stage. As the price setting process unfolds, stakeholders must have multiple opportunities for public and private feedback, with sufficient time to respond.

Engagement should be patient-centered, prioritizing the perspectives and needs of patients, their families, and caregivers. Regarding the diversity of Medicare beneficiaries, CMS should work to ensure the translation of complex information for all audiences to understand and engage. Equally, given that different disease populations may include people living with disabilities, CMS should ensure that patients and those in the impacted community can effectively voice their concerns. CMS needs to consider input from a variety of stakeholders carefully and give special consideration to those whom a disease directly impacts. This will help ensure CMS can tailor the engagement process and methodology to the needs of those most affected and will allow CMS to establish a collaborative and inclusive process that promotes trust and transparency. CMS should also commit to reviewing stakeholder engagement not by the number of letters but by how many individuals a given organization represents (e.g., patient advocacy groups or professional medical associations may represent thousands of individuals). Manufacturers should have the opportunity to provide input on other information, alternatives, or comparators put forward by different stakeholders.

IV. RECOMMENDATIONS REGARDING THE PROVISION OF THE MFP (Section 40)

A. CMS Should Finalize Its Proposal Permitting a Manufacturer to Provide Access to the MFP via a Rebate Model and Clarify That the Fourteen-Day Clock for Payment of an MFP Rebate Runs from the Date on Which the Manufacturer Validates Eligibility for the Rebate (Section 40.4)

1. MFP rebate model

Manufacturers must provide the MFP only to:

Global Government Affairs & Policy
601 Thirteenth Street, NW

Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

- “[T]he pharmacy, mail order service, or other dispenser” with respect to a covered unit of a selected Part D drug dispensed to a [prescription drug plan (PDP)] or [Medicare Advantage Prescription Drug plan (MA-PD)] beneficiary; and
- “[H]ospitals, physicians, and other providers of services and suppliers” with respect to a unit of a selected Part B drug furnished to a Part B or [Medicare Advantage (MA)] beneficiary.⁴⁷

In other words, units of a selected drug subject to MFP pricing may not be dispensed or furnished to MFP-ineligible individuals, e.g., commercial patients.

Yet the statute does not provide manufacturers, or CMS, a right to audit pharmacies and providers to ensure that MFP units were not improperly diverted to MFP-ineligible individuals. And there is no statutory dispute resolution mechanism through which manufacturers can recover MFP discounts from pharmacies and providers that dispensed or furnished MFP units to MFP-ineligible individuals. Indeed, the statute affords CMS no means at all to penalize pharmacies and providers for dispensing or furnishing MFP units to MFP-ineligible individuals.

Given these concerns, we appreciate CMS’s proposal to permit a manufacturer to provide access to the MFP via a rebate model.⁴⁸ Absent CMS enabling an MFP rebate model, as proposed, pharmacies and providers will be free to improperly divert MFP units without any statutory consequence.

*To prevent MFP diversion, CMS should finalize its proposal that access to the MFP may be provided by either “ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP” or “providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP,” i.e., through a rebate.*⁴⁹ The statute does not specify the mechanism by which a manufacturer must provide the MFP. And the statute affords CMS broad discretion to “establish[] . . . procedures to carry out [the Drug Price Negotiation Program], as applicable, with respect to [MFP-eligible individuals].”⁵⁰ The proposed rebate model will enable manufacturers to confirm that a unit was dispensed or furnished to an MFP-eligible individual and therefore is entitled to MFP pricing. The proposed rebate model thus will materially reduce the risk of MFP diversion.

⁴⁷ *Id.* §§ 1191(b)(2), 1193(a)(3). The obligation to provide the MFP to a PDP or MA-PD beneficiary at the point-of-sale is discussed in Section V(D).

⁴⁸ Drug Price Negotiation Program Guidance § 40.4.

⁴⁹ *Id.*

⁵⁰ SSA § 1196(a)(3).

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

Notably, the proposed rebate model will not jeopardize Medicare beneficiary access to the MFP-based reduction in cost-sharing.⁵¹ Pharmacies and providers will know at the time a unit of a drug is dispensed or furnished whether a drug is a selected drug and therefore the MFP-based reduction in cost-sharing. Thus, Medicare beneficiaries can readily access MFP-based cost-sharing at the time the unit is dispensed or furnished.

In addition, a rebate model will be familiar to stakeholders given that it is a common model in the commercial sector and under other government programs. The model requires only the minimum Medicare claims data needed to validate eligibility for the MFP and can ensure reasonable time frames for submission of a claim for, and payment of, an MFP rebate.

In contrast, if manufacturers were required to provide the MFP only as an up-front discount at the time of purchase, there would be no mechanism to ensure that an MFP unit is not dispensed or furnished to an MFP-ineligible individual. While a manufacturer or CMS could ask a pharmacy or provider whether an MFP unit was appropriately dispensed or furnished, it would have no statutory recourse if the pharmacy or provider were to refuse to answer or even admit that the MFP unit was improperly diverted to an MFP-ineligible patient. Thus, the MFP that by statute is intended to be provided only with respect to MFP-eligible individuals would effectively be made available with respect to MFP-ineligible individuals too, contrary to the statute's intent.

The 340B Program is generally administered through an up-front discount, but, there, manufacturers at least have a statutory right to audit a 340B covered entity for improper diversion of 340B units as well as a statutory right to subject a dispute to a dispute resolution process.⁵² Moreover, the Health Resources and Services Administration (HRSA), the agency responsible for administering the 340B Program, has statutory authority to audit 340B covered entities and terminate them from the 340B Program for program non-compliance.⁵³ These compliance authorities have not proven sufficient to prevent 340B diversion,⁵⁴ but the Drug Price Negotiation

⁵¹ *Id.* §§ 1847A(b)(1)(B) (providing that Part B reimbursement for a selected drug is based on the MFP such that cost-sharing is based on the MFP as well); 1852(a)(1)(B)(iv)(VII) (specifying that MA cost-sharing for a selected drug may not exceed Part B cost-sharing); 1860D-2(d)(1)(D) (specifying the MFP plus any dispensing fee for a selected drug is the maximum Part D negotiated price, on which cost-sharing is based).

⁵² Public Health Service Act (PHSA) § 340B(a)(5)(C), (d)(3).

⁵³ *Id.*

⁵⁴ For example, the Government Accountability Office (GAO) reports that HRSA typically is not issuing audit findings for diversion consistent with its patient definition guidance on the grounds that it has limited authority to enforce such guidance. GAO, HHS Uses Multiple Mechanisms to Help Ensure Compliance with 340B Requirements (Dec. 2020), available at <https://www.gao.gov/assets/gao-21-107.pdf>. In addition, the GAO has noted that “weaknesses in HRSA’s audit process . . . impede its oversight of covered entities’ compliance with 340B Program requirements at contract pharmacies.” GAO, Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement (Jun. 2018), available at <https://www.gao.gov/assets/gao-18-480.pdf>.

Global Government Affairs & Policy

Email: gportner@amgen.com
www.amgen.com

Program does not even provide for such a nominal mechanism, making a rebate model that much more imperative when it comes to preventing MFP diversion.

Congress could not have intended to leave manufacturers and CMS with no means of enforcing the prohibition against MFP diversion. To avoid that perverse result and promote program integrity, we strongly urge CMS to finalize its proposal to permit a manufacturer to provide the MFP via a rebate.

2. Fourteen-day period to pay an MFP rebate

In the Drug Price Negotiation Program Guidance, CMS proposes to give manufacturers fourteen days to provide retrospective reimbursement to providers or pharmacies.⁵⁵ But the agency is silent as to when the fourteen-day clock starts to run. CMS should clarify that the clock runs from the date on which the manufacturer validated that the unit is eligible for an MFP rebate, based on the Medicare claims data submitted by the provider or pharmacy.

If the clock instead were to run from the date on which the provider or pharmacy requested the MFP rebate, it would completely undermine the point of allowing a rebate model. Providers and pharmacies would have no incentive to submit validating data. This approach would be contrary to the intent of Congress, which did not intend to require the MFP to be offered to MFP-ineligible individuals. CMS should clarify that the fourteen-day clock starts only after a manufacturer has validated eligibility for an MFP rebate.⁵⁶

B. CMS Should Adopt an Enforceable Mechanism to Identify 340B-Purchased Units to Prevent MFP/340B Duplicate Discounts Under Medicare Parts B, C, and D (Section 40.4)

The statute prohibits duplicate discounts on MFP-purchased and 340B-purchased drugs. In short, a manufacturer of a selected drug cannot be required to offer both the MFP and the 340B price on the same unit and instead need only offer the lower of these two prices.⁵⁷ It is critical that CMS adopt a mechanism to enable a manufacturer to avoid MFP/340B duplicate discounts— but the Drug Price Negotiation Program Guidance provides for none. In this regard, we support PhRMA's proposal for implementation of one of two different models (the "default payment" or "point of sale" options) to avoid the duplicate discounts that Congress wanted to avoid.

⁵⁵ Drug Price Negotiation Program Guidance § 40.4.

⁵⁶ In the alternative, CMS could specify that a manufacturer must pay an MFP rebate within thirty days of receipt from the provider or pharmacy of all necessary validating Medicare claims data, tolled during the pendency of a reasonable dispute resolution process.

⁵⁷ SSA § 1193(d).

Global Government Affairs & Policy

Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

For drugs reimbursed under Part B, CMS has already established such a mechanism under which, starting January 1, 2024, all 340B covered entities that submit Part B claims must use certain claims modifiers to identify 340B units.⁵⁸

There is no comparable mechanism for Part D drugs or Part B drugs reimbursed under MA. For these drugs, CMS should adopt a mechanism well in advance of the start of IPAY 2026. CMS thus should move quickly to require PDPs, MA-PD plans, and MA plans to identify 340B units of drugs using a consistent identifier in PDE or MA Encounter Data.

CMS recently proposed to require the use of a *Part D* 340B identifier in the course of implementing the Part D inflation rebate program, stating that it “believes that requiring that a 340B indicator be included on the [PDE] record is the most reliable way to identify drugs that are subject to a 340B discount that were dispensed under Medicare part D” for purposes of excluding such units from Part D inflation rebates, as required by statute.⁵⁹ We urge CMS to finalize this proposal.⁶⁰

CMS must also address the need for a 340B identifier with respect to *MA* units of Part B drugs, which is currently unaddressed.

But that is not all. To make the mechanism a meaningful one, CMS should also require the use of a *non-340B* identifier, across Medicare Parts B, C, and D, and specify that a claim for reimbursement for a unit of a selected drug under any such Part is not payable unless the claim is accurately accompanied by either a 340B identifier or a non-340B identifier, as applicable.

Even with an audit right (which does not exist in the Drug Price Negotiation Program), HRSA’s authority and ability to enforce the MDRP/340B duplicate discount prohibition is limited.⁶¹ Thus, the risk of MFP/340B duplicate discounts is real, and CMS must establish a meaningful

⁵⁸ CMS, Part B Inflation Rebate Guidance: Use of the 340B Modifiers (Dec. 20, 2022), *available at* <https://www.cms.gov/files/document/part-b-inflation-rebate-guidance340b-modifierfinal.pdf>.

⁵⁹ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum 18 (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>.

⁶⁰ Amgen submitted comments dated March 10, 2023 on this proposal.

⁶¹ For example, GAO reports that HRSA typically is not making audit findings of duplicate discounts “for a failure to follow a state’s Medicaid requirements” on the grounds that it “does not have statutory authority to enforce state Medicaid requirements.” GAO, HHS Uses Multiple Mechanisms to Help Ensure Compliance with 340B Requirements at 15 (Dec. 2020), *available at* <https://www.gao.gov/assets/gao-21-107.pdf>. Compliance with state Medicaid requirements is essential to the MDRP/340B duplicate discount prohibition. See also GAO, Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement, GAO-18-480 (2018), *available at* <https://www.gao.gov/assets/gao-18-480.pdf>; see also PHSA § 340B(a)(5)(A).

Global Government Affairs & Policy

Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

mechanism to address this concern and to avoid nullifying the statutory protection against MFP/340B duplicate discounts.⁶² We urge CMS to move quickly to adopt a mechanism that meaningfully prevents MFP/340B duplicate discounts.

C. CMS Should Continue to Recognize That a Manufacturer Cannot Directly Provide Access to the MFP to a Part D Beneficiary at the Point-Of-Sale (Section 40.4)

CMS should continue to recognize that manufacturers cannot provide the MFP on a covered unit of a selected Part D drug to PDP and MA-PD beneficiaries at the point-of-sale *directly*.⁶³ The statute directs manufacturers to provide the MFP on such drugs to such individuals at the point-of-sale in addition to providing it to pharmacies, mail order services, and other dispensers with respect to such individuals.⁶⁴ But Part D enrollee transactions at the point-of-sale are dictated by arrangements between the enrollee, the pharmacy, and the plan or its pharmacy benefit manager (PBM), not by the manufacturer. Manufacturers are not parties to such transactions and do not even enjoy privity of contract with the point-of-sale pharmacy (and sometimes not even with the plan or its PBM).

Thus, we concur with CMS that the MFP must be passed through to Part D enrollees at the point-of-sale by entities that are parties to the point-of-sale transaction.

V. RECOMMENDATIONS REGARDING CIVIL MONETARY PENALTIES (CMPS) (Section 100)

A. CMS Should Establish Procedural Safeguards That Ensure That CMPs Are Imposed Only After Notice and a Reasonable Opportunity to Cure (Section 100)

By statute, CMS may assess significant CMPs if a manufacturer is found to be out of compliance with certain program requirements.⁶⁵ These include penalties of up to \$1 million per day for a

⁶² See *United States v. Markgraf*, 736 F.2d 1179, 1183 (7th Cir. 1984) (“An administrative agency cannot abdicate its responsibility to implement statutory standards under the guise of determining that inaction is the best method of implementation.”).

⁶³ Drug Price Negotiation Program Guidance § 40.4.

⁶⁴ SSA § 1193(a)(3)(A).

⁶⁵ *Id.* § 1197.

Global Government Affairs & Policy

Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

violation of the terms of the negotiation agreement or \$100 million per day for any piece of false information submitted pursuant to the small biotech exception or biosimilar delay provision.⁶⁶

Given the magnitude of these penalties, Amgen supports the imposition of additional safeguards. Specifically, Amgen supports the comments of both PhRMA and BIO in this respect.

VI. OTHER RECOMMENDATIONS

A. CMS Should Establish a Transparent, Predictable, and Reasonable Process for Meaningful Price Setting (Section 60)

By statute, CMS must “develop and use a consistent methodology and process” to negotiate the MFP.⁶⁷ Further, CMS must “specify the process for renegotiation,” which “to the extent practicable, [shall] be consistent with the methodology and process” for initial price setting.⁶⁸

CMS is proposing a price setting process under which CMS would meet with the manufacturer only if the agency rejects a counteroffer.⁶⁹ CMS would then cap the number of meetings at three: the initial meeting and potentially two additional meetings, one requested by the manufacturer and one requested by CMS.⁷⁰

CMS should instead commit to real dialogue throughout the price setting process, without arbitrary limit. This approach is eminently reasonable given that only a limited number of drugs will be negotiated each year.⁷¹ Meaningful price setting requires CMS to engage in continuous manufacturer-specific dialogue, much as a commercial payer would, as opposed to implementing a rote paper-based process. This approach will promote a more transparent and better-informed process for price setting.

CMS’s proposal would defeat this objective by arbitrarily limiting the direct engagement between CMS and the manufacturer to the period after the rejection of a counteroffer—which affords no opportunity for real dialogue at the initial offer stage, which could help the parties avoid any need to consider a counteroffer—and to a maximum of three meetings—which deprives the process of additional insight that the parties may want, which could result in a more informed MFP.

⁶⁶ *Id.* § 1197(a)–(e).

⁶⁷ *Id.* § 1194(b)(1).

⁶⁸ *Id.* § 1194(f)(2), (4)(A), (B). The renegotiation process does not start until 2028. *Id.* § 1194(f)(1).

⁶⁹ Drug Price Negotiation Program Guidance § 60.4.3.

⁷⁰ *Id.*

⁷¹ See SSA § 1192(a)(4).

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

Throughout the price setting process, CMS should permit as many meetings as the parties agree would be productive and take meetings before the initial offer stage so that the initial offer is informed by discussions with manufacturers of selected drugs.

VII. RECOMMENDATIONS REGARDING NOTICE AND COMMENT

A. CMS Should Propose and Solicit Comment on the Content of the Agreement It Will Utilize Well in Advance of the Date on Which the First Set of Manufacturers Must Execute the Agreement (Section 40.1)

In the Drug Price Negotiation Program Guidance, CMS commits only to “mak[ing] reasonable efforts to make the final text of the Agreement [that manufacturers must sign for selected drugs under the Drug Price Negotiation Program] available to the public before the selected drug list for IPAY 2026 is published.”⁷² CMS should commit instead to making the content of that document available for public comment before its finalization, and well before the first selection date.

Manufacturers could be subject to CMPs of \$1 million per day for failure to comply with, or even enter into, agreements with CMS regarding prices under the Program.⁷³ Even without these penalties it would be vital to provide manufacturers an opportunity to learn of and comment on the specific terms of the agreement to which they will be subject, before such terms are finalized. Doing so would increase the chances that manufacturers are able to make preparations that will allow them to comply with the agreements. That is particularly crucial here, in light of the significant penalties that may otherwise result. Moreover, “[i]mpossible requirements imposed by an agency are perforce unreasonable” and therefore arbitrary and capricious.⁷⁴ By providing manufacturers notice of and an opportunity to comment on the specific terms of the agreement that CMS intends to impose on them, CMS reduces the chance that manufacturers, deprived of the ability to prepare, will not be able to comply.

B. CMS Should Consider Comments on All Provisions of the Guidance and Respond to Comments on the Guidance in the Final Guidance

⁷² Drug Price Negotiation Program Guidance § 40.1.

⁷³ SSA § 1197(a)–(e); IRC § 5000D(b)(1)(A).

⁷⁴ *All. for Cannabis Therapeutics v. DEA*, 930 F.2d 936, 940 (D.C. Cir. 1991).

Global Government Affairs & Policy
601 Thirteenth Street, NW
Suite 1100 North
Washington, DC 20005
Phone: 202.585.9649
Email: gportner@amgen.com
www.amgen.com

Notwithstanding its previous statement that it would “prioritize transparency and robust engagement” in implementing the Drug Price Negotiation Program,⁷⁵ CMS has taken the position that it need not accept comments on Section 30. As noted above, Amgen has significant concerns about this position, and would have offered comments on Section 30 if permitted to do so.

Beyond Section 30, Amgen asks that, as CMS finalizes its policies, it meaningfully responds to comments received. A comment period is intended “to allow interested members of the public to communicate information, concerns, and criticisms to the agency.”⁷⁶ It is important for an agency to explain how information, concerns, and criticisms raised by stakeholders factored into CMS’s final decision-making so that the comment process can facilitate a “genuine interchange” of ideas between the agency and stakeholders.⁷⁷ Responding to comments helps ensure the agency is considering the full range of points made by the public and helps explain the agency’s reasoning. “The interchange of ideas between the government and its citizenry provides a broader base for intelligent decision-making and promotes greater responsiveness to the needs of the people.”⁷⁸

Responding to comments is particularly important with respect to the Drug Price Negotiation Program given its significant implications for patients, providers, pharmacies, manufacturers, and other stakeholders across the United States. If the agency’s final decision-making is misinformed, barriers to access to essential therapies could result. CMS thus should seek to maximize transparency by meaningfully responding to stakeholder feedback in its final guidance.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani,

Thank you for inviting comments on the Initial Memorandum on Implementation of Sections 11001 and 11002 of the Inflation Reduction Act. We are pleased to offer the comments set out in what follows. We hope you find them useful in your efforts to implement this important legislation. Our comments are organized to correspond to the outline of the guidance.

Section 30: Identification of Selected Drugs

30. *Definition of a drug for negotiation* Purposes: The Guidance defines a drug as encompassing all products associated with an API. This is a sensible choice. The price of a drug should include all the generic versions in the price estimate. Including the generic version product(s) captures all the volume associated with an API. Failure to do so would overweight brand-name formulations in calculation of the price of a drug.

30.1: CMS should establish a standard that defines the minimum share of the drug at the API level that is subject to generic or biosimilar competition. In small molecule markets with high levels of total spending (over \$500 million) the average generic penetration one year post generic entry is about 65%. Thus, establishing a trigger at 50% to 65% would be based on recent history reflecting the experience of drugs facing true competition from generics.¹ For biosimilar products the initial market shares are considerably lower. Although the evidence is more limited, market shares for biosimilars have been on the order of 20% to 25% a year after entry.² The implication is that if the generic or biosimilar shares of the API fall below the trigger values, the API remains in an uncompetitive market and should remain subject to negotiation.

To estimate generic or biosimilar market share at the API level, a standardized volume measure would need to be applied across dosage forms and strengths. Options include the number of claims (for Part B), standardized prescriptions (for Part D) or defined daily doses. For example, one could

¹ See appendix at the end of the comment for examples of studies offering evidence on this.

² See appendix at the end of the comment.

use Part D claims data to estimate whether more than 50 percent of standardized prescriptions among all the API formulations were dispensed for a generic drug.³

30.1.2 It is not clear if rebates will be incorporated into determining whether a drug has spending below \$200,000,000. Rebates should be included because some drugs have rebates of 80-90% and not including the rebates would yield choices of products that would not reflect true spending by taxpayers.

30.2 *Integration of Rebates Assessment of Spending Exemptions:* It is not clear if rebates will be incorporated into calculations used in the ranking of the 50 negotiation eligible drugs. Footnote 30 attached to point 30 of the guidance suggests that the proposal is to not account for rebates. This works for the selection of the initial 50 negotiation eligible drugs because it makes the data and the selection process transparent. To use rebates in the calculation would disclose rebate data which needs to remain confidential. One possible solution may be that after CMS identifies the top 50 drugs, CMS should exclude any drugs that already have rebates that put their current net price at or close to what would be the maximum fair price ceiling. The statute might provide some flexibility on which one they choose among those that are otherwise eligible.

30.3.1.2 The metrics proposed to assess operational readiness are generally sensible. However, SEC filings about future revenues are nearly always subject to significant caveats around uncertainty and changing market conditions. CMS should consider a more concrete indicator of readiness.

30.3.1.1(3) There is guidance addressing whether there is “bona fide marketing” of the competitor. That review is an important part of the proposal for assessing the legitimacy of potential exclusion of drugs. It could be crafted broadly enough to encompass the type of limited use of a biosimilar as well. It will be necessary to define a “bona fide” competitor. See comment on 30.1 for more information on how to define a “bona fide” competitor.

Section 40: Requirements for Manufacturers of Selected Drugs

40.2 The decision to require the manufacturer to submit data on new and approved NDC-11s or discontinued NDC-11 is appropriate. The provision should ask for the most recent sales for any discontinued NDC-11s.

40.2.2 *Disclosure of Data Used in negotiations and its destruction:* It is not clear what the implications are of an individual engaged in the process disclosing the information to others. The penalties for companies are clear but not for the individuals engaged in the process. People with negotiation information leave companies and the government all the time.

40.2.3 If sales data for specific drugs are available from IQVIA and other claims data sources, why should the volume of sales be treated as confidential? Making it public would allow for independent assessment of the accuracy of reporting.

³ Both CBO and MedPac have standardized prescription sizes in Part D to 30 days’ supply in their published reports.

40.3 *Agreements on negotiation and renegotiation*: It is not clear the specific conditions under which a renegotiation will occur in subsequent years.

40.4 The negotiated drug should get favorable placement by the PBM/PDP. This will lower Medicare and Medicare beneficiary spending and give the drugs in the same therapeutic class the incentive to lower their prices. Medicare should prohibit spread pricing for these drugs.

Section 50: Negotiation Factors

50.1 The reporting of whether a pharmaceutical manufacturer recouped its costs should be subject to comparison with a CMS analysis of the individual components of data items related to R&D costs reported by the manufacturer and in SEC filings. This is because the assessment of whether costs were recouped is subject to a variety of arbitrary allocation and discounting assumptions that may not be applied by manufacturers in a fashion that is consistent with the public interest or best practices.

50.1 In considering prior federal financial support CMS might consider tax credits provided through the Orphan Drug program and similar subsidies in addition to grants and contracts that seem to be implied by this section.

50.2 Other countries conduct and compile comparative effectiveness studies. The negotiation process would benefit from review of the and the findings of these comparative effectiveness studies and the methods used by these countries. CMS should also examine the prices in these countries. The guidance should clarify whether studies conducted in other countries can be used in comparative effectiveness assessments.

50.2 CMS should specify how the comparative effectiveness of two drugs would be considered. If one drug is a cure and another drug requires ongoing treatment. For example, the price of a drug that is used to treat a chronic condition (arthritis) that is used continuously over years should be treated differently than the price of a drug that is used for a short period of time and then never again because a cure has been achieved (Hepatitis C drugs). The comparative effectiveness measure should examine the lifetime cost and effectiveness of both treatments.

50.2 The guidance notes that CMS will use FDA approved prescribing information in the negotiation process. The information that is contained on the product labels should guide CMS in defining a drug's use.

50.2 There are well-developed alternatives to QALYs that are not subject to concerns about disadvantaging older adults or disabled people, including "equal value life year gained" (evLYG). They have been employed in numerous settings for reasons precisely consistent with Congressional intent. In addition, metrics such as the Health Years in Total (HYT) and the Global Risk Adjusted QALY (GRA-QALY) address potential discriminatory features of QALYs and in some cases create a unique advantage for people with disabilities.

Section 60: Negotiation Process

60.1 *Establishment of a single price:* Some drugs are taken for a certain number of months while others are taken the full year. How will this be translated into 30-day equivalents. For example, if a drug needs to be taken for only four months during the year, how will that be translated into 30-day equivalents? In such cases, annual spending levels are appropriate.

60.1 The use of a single price is sensible and consistent with the definition of a drug set forth in Section 30.

60.1 In discussing the determination of a single price, the Guidance uses the term cost (second paragraph under 60.1). That is imprecise because the data being referred to may be either payments or prices and not costs.

60.3 Therapeutic class

- a. Some brand name drugs are the only option to treat a disease, while others have one or more brand name alternatives available. The PDPs have more negotiating power when there is one or more different brand name drugs that can address the same condition.
- b. The challenge is to define the therapeutic categories that define the competing brand name drugs. One commonly used product was developed by US Pharmacopeia, but there are others including the Veterans Affairs (VA) classification code, Medi-Span Generic Product Identifier (GPI), or the IQVIA Uniform System of Classification (USC) that has been used by the Centers for Disease Control and Prevention (CDC).
- c. Each of these efforts define a therapeutic category somewhat differently and these differences result in different combinations of drugs in the therapeutic category. Some of the factors explaining the differences include therapeutic category, pharmacology (mechanism of action), chemical structure, and indication.
- d. The Guidance should recognize that differing approaches across products are likely to best serve balancing market and clinical issues and having all the different ways to measure therapeutic alternatives available. CMS would be well served to commission a study of the different ways to measure therapeutic class and the strengths and weaknesses of the different existing products. This will help CMS respond to the statements by the drug companies that a drug has brand name competitors according to some measure.
- e. It is therefore likely that the best approach to analysis will be drug specific.

60.3 The Part D net price for the alternative therapeutic drugs should include the rebates. Additional data should be collected on the alternative therapeutic drug in addition to price. So that the true market context for establishing transaction prices is considered by CMS in its negotiating position.

60.3.2 It should be made clear that generic drugs will be included in the drugs that are considered therapeutic alternatives in making the initial price offer by CMS.

60.3.2 In adjusting starting prices using comparative effectiveness analysis, it is important to consider how the differences in effectiveness among alternatives would translate into price differentials. This will need to be done on a drug-by-drug basis depending on the circumstances of the negotiated drug and the other drugs in the therapeutic class.

60.3.3.1 The discussion of the effectiveness of therapeutic alternatives proposes to use health outcomes, patient experience, etc. This is appropriate. The Guidance should distinguish clearly how these differ from QALYs (see 50.2 above).

60.4.4 The process set out in this section is appropriate. The evidence on negotiation processes from collective bargaining and other structured negotiations shows that key ingredients are 1) holding informal meeting to discuss issues and identify key pressure points; 2) regular communication; and 3) transparency with respect to how each side is using information. The process outlined in this section might benefit from allowance for additional, less formal meetings or some other channel for communication. Also, establishing some further guidance in the future on how data will be used may further promote reaching agreements in the negotiations. This can be specified after the first round of negotiations.

An issue not discussed in the Guidance – it is unclear if indication-based pricing will be permitted. Indication pricing should be taken into account, but those prices should be combined into the one composite price.

Thank you for your attention to these comments.

Sincerely,

Gerard Anderson and Richard G. Frank

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

As Founding CEO of Anticipate Biosciences I appreciate the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

2.3 million women annually worldwide are diagnosed with breast cancer - 80% are estrogen receptor positive. Despite remarkable improvements to treat these cancers over decades of drug development, many women will die from recurrence of their disease. The standard of care for recurrent or metastatic ER+ disease is endocrine therapy. However, these cancers eventually progress, often due to the acquired mutations of the estrogen receptor in the form of ESR1 mutations. A novel drug class, called ErSO, provides a unique mechanism of action by binding to the estrogen receptor and invoking cancer cell death in a manner that is independent of estrogen and is therefore not a form of endocrine therapy but instead utilizes a novel mechanism against the anticipatory stress pathway that is unique to ER+ cells, either ESR1mutant or not. The optimized molecule of this drug class, ErSO-02, is planned to enter clinical trials in 2024 and has the potential to transform therapy in breast cancer patients who no longer respond to existing treatments.

I have been fundraising for a Series A to support our clinical trials and since the passage of the IRA have noticed a distinct change in the appetite of investors for small molecule drug development. Curious as to what caused this change, I conducted a personal grassroots survey online of nearly 100 biotech investors and CEOs. What I found is deeply disturbing for the future of oncology drug development. Six of every seven investors have already moved away from funding small molecule drug development programs for the elderly and large populations because of the passage of IRA and the inability to sustain investment with the nine-year negotiation clock for small molecules and other NDA-path medicines. The results can be found here: <https://www.nopatientsleftbehind.org/publications/ira-impact-on-small-molecule-development>

I am aware that CMS is not soliciting comments on Section 30 but I am including the comments that would have been made had comments been permitted.

Comments: Section 30.1 Medicare negotiation for NDA-path drugs at nine-years post-launch

As mentioned above, six of every seven biotech investors that I surveyed are already moving away from funding small molecule drug development for the elderly or large populations as a result of the IRA. This is a disaster for small biotech companies such as Anticipate Bioscience. Nine years is not adequate time for investors to make back their investment. It's much shorter than the average 14-years of exclusivity typically afforded by patent protection. Furthermore, small molecule drug development is equally risky to biologicals, and of the programs that enter human clinical trials, in oncology less than 10% actually become approved drugs.

In both neurodegenerative diseases (Alzheimer's, Parkinson's, etc.) and cancer brain metastases, small molecules are the weapon of choice over biologics given their ability to penetrate the blood brain barrier. If I make a biologic and it kills off all cancer cells in the body but cannot cross the blood brain barrier, the cancer will come back with a vengeance with lethal brain metastases. We need both small molecules and biologics weapons in our toolkit. We need 13 years for small molecules, as we have for biologics, in order for investors to continue supporting this area.

Comments: Section 30.1.1: To be considered for the orphan drug exclusion, the drug or biological product must (1) be designated as a drug for only one rare disease or condition under section 526 of the FD&C Act and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition.

The damage from IRA's treatment of orphan drugs could be mostly alleviated by creating small- and large-molecule parity for negotiation at 13 years (see Section 30.1 above).

In oncology we try to focus our development efforts initially on a small cancer area, where we will see the most likely and strongest benefit. For Anticipate Biosciences it is a genomically defined subset of ER+ metastatic breast cancer, which would be an orphan drug area based on overall numbers. However, after that we would seek to attack cancers for all ER+ breast cancer and likely also unmet needs in ovarian and endometrial cancers. However, the IRA disincentivizes us from expanding beyond this initial population because we would lose our Orphan Drug exemption to the negotiation process.

Comments: Section 50.2: CMS' processes for determining the Maximum Fair Price for individual medicines as well as the relevance of "therapeutic alternatives" to the drugs it selects for negotiation.

To the extent that CMS wants to appreciate the value that a medicine brings to society before it decides how aggressively to lower its price (particularly in the case of NDA-path drugs that experience negotiation far sooner than they would have gone generic), CMS should broadly account for a medicine's value elements, using a dynamic stacked cohort model that accounts for value to patients, to caregivers, and to the rest of the population whose risk is reduced by having the drug (i.e., if it's going to do CEA, do generalized CEA, not conventional over-simplified CEA).

CMS should consider key product attributes like efficacy, safety, and ease-of-use in determining relevant "therapeutic alternatives" (the basis for CMS' opening bid).

Comments: Section 40.2.2. CMS prohibitions on data disclosure and destruction of related documents.

I believe that CMS should be transparent in its processes for determining value and cost-effectiveness, versus the gag order and document destruction that are proposed today. It should be able to defend what it considers to be a "fair price," in the same way that I publicly have to defend my clinical trial data as part of the NDA approval process.

I am also concerned that this prohibition violates my company's First Amendment rights. I will need to be able to disclose to my board and investors what occurred in the negotiation process.

I appreciate your consideration of my comments as you develop Drug Price Negotiation Program policy. I look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact me by telephone at (858) 442-5896 or by e-mail at spotts23@anticipate.bio if you have any questions regarding our comments.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Arcutis Biotherapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

By way of background, Arcutis is a small, publicly-traded (Nasdaq: ARQT) biotechnology firm focused on the development of innovative therapies for dermatological conditions. We currently have one FDA-approved product, and multiple other products currently in development.

- I. We oppose the discriminatory treatment afforded to small molecules compared to large molecules as established in the IRA and as outlined in Section 30.1, triggering Medicare negotiations for NDA-path drugs at nine years post-launch versus thirteen years post-launch for BLA-path drugs. The cost to develop a small molecule and a large molecule are roughly comparable, and the risk of failure for small molecules is if anything higher than for large molecules, so the financial risks are at least as great if not greater for small molecules, and there is no valid economic rationale for disadvantaging small molecule therapeutics. Rather, we believe that small and large molecules should be treated equally for the purposes of Medicare price negotiations.
- II. We do not agree with the CMS proposal that the orphan drug exclusion should only apply to therapies that are (1) designated as a drug for only one rare disease or condition under section 526 of the FD&C Act and (2) are approved by the FDA only for one or more indications within such designated rare disease or condition. CMS should look to only active orphan drug designations for the purposes of determining eligibility for the orphan drug exclusion (not including withdrawn orphan drug designations). Furthermore, the “bona fide marketing” standard is extra-statutory in nature with no basis in the law, which defines the standard simply as “marketed”. The proposed standard is ambiguous and subjective. The appropriate test, as specified in the IRA, is an objective, point-in-time determination of whether a drug has been “marketed,” which can be determined by reference to the “market date” reported by the manufacturer to the Medicaid Drug Rebate Program. It is defined as the date on which the

drug is first sold in the US, and is the standard that CMS is using to determine whether a drug is marketed for purposes of the MDRP, the Part D inflation rebate guidance, and ASP (where the standard is articulated slightly different as the "first sale date.")

- III. We are concerned by the provisions contained in Section 50.2 regarding Maximum Fair Price. The cost-effectiveness models employed by ICER exclude many demonstrable benefits of medicines, resulting in extreme under-estimations of the value of new medicines. CMS should broadly account for a medicine's value elements, using a dynamic stacked cohort model that accounts for value to patients, to caregivers, and to the rest of the population whose risk is reduced by having the drug. Additionally, we believe CMS should consider key product attributes like efficacy, safety, and ease-of-use in determining relevant "therapeutic alternatives" for "Maximum Fair Price" determinations.
- IV. We are also concerned by the provisions contained within section 90.4 regarding determination of generic or biosimilar competition. The proposed standard of "bona fide" competition is unnecessarily and insupportably vague, and could give rise to situations where innovator products are subject to both generic competition and CMS price negotiations. This provision could perversely reduce generic competition, ultimately leading to higher prices generic drugs across society.
- V. We are alarmed by the prohibitions on data disclosure contained in section 40.2.2. CMS's process for determining value and cost-effectiveness should be transparent, and CMS should publicly defend what it considers to be a "fair price." Furthermore, this prohibition violates the First Amendment rights of companies covered by the CMS negotiations. Companies subject to the negotiation process need to be able to disclose to their boards and their investors what occurred in the negotiation process.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact me by telephone at 805-418-5006 or by e-mail at tfw@arcutis.com. If you have any questions regarding our comments.

Sincerely,

Frank Watanabe

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure and Deputy Administrator Seshamani:

argenx US, Inc. ("argenx") thanks the Centers for Medicare and Medicaid Services ("CMS" or the "Agency") for the opportunity to submit comments on the Agency's Initial Memorandum on the Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026 (hereinafter, "Medicare Drug Price Negotiation Program Guidance" or "Guidance"), under Section 11001 of the Inflation Reduction Act ("IRA").¹

argenx is a global immunology company committed to improving the lives of people suffering from severe autoimmune diseases. argenx partners its antibody engineering capabilities with leading academic researchers to collaborate on breakthrough research and publications to create potential new treatment options. We have a robust pipeline that starts with strong science and is aimed at translating immunology breakthroughs into differentiated medicines. We engineer first-in-class therapies for rare diseases – where underserved patients need breakthrough therapies and the healthcare community needs viable options.

Our first approved product, VYVGART® (efgartigimod alfa-fcab) is indicated for the treatment of generalized myasthenia gravis ("gMG") in adult patients who are anti-acetylcholine receptor ("AChR") antibody positive, who represent 85% of the total gMG population. gMG is a rare and chronic neuromuscular disease characterized by debilitating and potentially life-threatening muscle weakness. VYVGART, designated as an orphan drug, is the first and only FDA-approved neonatal Fc receptor ("FcRn") blocker and the first approved therapy designed to reduce pathogenic IgGs. Our pipeline includes studies targeting diseases, including orphan diseases, in neurology, hematology, rheumatology, dermatology, and nephrology.

It is with this experience and on behalf of the Medicare patient populations we serve that argenx respectfully submits the following comments.

Executive Summary

As further detailed below argenx requests that CMS consider the following:

- work with Congress to expand the definition of orphan drugs to include drugs that may be designated as a drug for one *or more* rare diseases or conditions, rather than drugs that are designated for *only one* rare disease or condition.
- clarify that obtaining additional indications for a small molecule or biologic within the same orphan disease will not exclude the drug from the orphan designation exception.

¹ See Medicare Drug Price Negotiation Program Guidance, available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

- if a question arises regarding whether a drug or biological is a fixed combination drug, argenx urges CMS to look to the FDA regulatory communications and databases to identify active ingredients or moieties.
- provide updated guidance clarifying that new formulations refers only to drugs approved under the *same* NDA or BLA, and not drugs approved under separate NDAs or BLAs.

I. Orphan Drugs

The Orphan Drug Act (“ODA”) was enacted by Congress to help spur investment and discovery in the rare disease space. The incentives provided by the ODA have enabled companies to bring innovative and lifesaving treatments to the rare disease community. However, this successful multi-decade policy needs continuous support to further the vital research and contribution to vulnerable patient populations. Under the IRA, orphan drugs are not qualifying single source drugs.² The statute defines an orphan drug, in this section, as “[a] drug that is designated as a drug for only one rare disease or condition under section 526 of the Federal Food, Drug, and Cosmetic Act and for which the only approved indication (or indications) is for such disease or condition.” As CMS states in the Guidance, orphan drugs are excluded from the IRA’s Medicare Drug Negotiation Program if the drug or biological product is (1) designated as a drug for only one rare disease or condition under section 526 of the Food, Drug & Cosmetic Act and (2) approved by the FDA only for one or more indications within such designated rare disease or condition.³

At argenx, we innovate by developing drugs against fully novel target biology with the aim to open up new routes of treatment for patients; including indications that previously have been underserved. Through this approach, our compounds are typically able and have been specifically designed to address unmet need in multiple orphan indications. For example, we continue to study efgartigimod alfa-fcab (which has been approved by the FDA and received orphan designation for its first indication gMG) in multiple other indications including other rare diseases. We are concerned that the one orphan disease designation requirement of the orphan designation exemption may unintentionally stifle innovation by creating a tradeoff of unmet need of one patient group over another, instead of fostering benefit for the broadest possible patient population.

argenx appreciates CMS’s understanding of the value of orphan drug development and the Agency’s consideration to take additional actions to “best support orphan drug development.”⁴ Accordingly, argenx strongly encourages CMS to:

- work with Congress to expand the definition of orphan drugs to include drugs that may be designated as a drug for one *or more* rare diseases or conditions, rather than drugs that are designated for *only one* rare disease or condition; and
- clarify that obtaining additional indications for a small molecule or biologic within the same orphan disease will not exclude the drug from the orphan designation exception.

In addition to the above, we refer CMS to the comment submitted by Rare Disease Company Coalition (“RDCC”) on April 14, 2023. We fully support the recommendations made by RDCC regarding how CMS can mitigate the impact of the IRA’s orphan drug exclusion.

II. New Formulations

We are concerned that CMS’s approach of “us[ing] data aggregated across dosage forms and strengths of the drug, including new formulations of the drug, such as an extended release formulation, and not based on the specific formulation, package size, or package type” would extend to products approved under different NDAs or BLAs.⁵ This position is in direct conflict with the plain language of the statute. CMS therefore has no authority to adopt or implement it.

² *Id.* at § 1192(e)(3).

³ Guidance at 10.

⁴ *Id.* at 11.

⁵ *Id.* at 7-8.

The statutory language clearly identifies and defines “qualifying single source drugs” as drugs approved under a new NDA or BLA.⁶ Further, a negotiation-eligible drug is a “qualifying single source drug” that is determined to be a high-spend drug under Part D or Part B, meaning the qualifying single source drug is among the 50 drugs with “the highest total expenditures” under Part D or Part B.⁷ Finally, a selected drug must be among the “negotiation-eligible drugs.”⁸ Accordingly, a selected drug *must* be a “qualifying single source drug,” which is a drug approved under a BLA or NDA. The new formulation language does not permit CMS to ignore the plain language of the statute that identifies each drug approved under an NDA or BLA as a separate qualifying single source drug. We urge CMS to issue updated guidance clarifying that new formulations refers only to drugs approved under the *same* NDA or BLA, and not drugs approved under separate NDAs or BLAs.

III. Fixed Combination Drugs

argenx supports the Guidance’s conclusion that fixed combination drugs with two or more active moieties / active ingredients should be considered as distinct products from a product containing only one (but not both) of the active moieties / active ingredients that is offered by the same NDA/BLA holder for the purpose of identifying qualifying single-source drugs.⁹ In other words, argenx agrees with the Guidance position that such combination products will not be aggregated with the formulations of the individual active ingredients of the fixed combination drug and will be considered a separate potential qualifying single source drug from the component moieties. CMS references FDA regulations to define “fixed combination drugs.” We further request that CMS codify this guidance into regulation.

We agree with CMS’s reliance on FDA to define what is meant by a fixed combination drug. We further understand that CMS will rely on FDA’s determination of active ingredients or moieties, as included in a drug’s communications with FDA and the applicable databases.¹⁰ FDA has the appropriate experience and expertise to identify what components of a drug or biologic are considered an active ingredient or moiety and CMS should defer to such experience and expertise. If a question arises regarding whether a drug or biological is a fixed combination drug, argenx urges CMS to look to the FDA regulatory communications and databases to identify active ingredients or moieties.

⁶ Inflation Reduction Act of 2022, Pub. L. No. 117-169, SSA § 1192(e)(1)(A)-(B) (defined as “A drug—(i) that is approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act and is marketed pursuant to such approval” or “[a] biological product—“(i) that is licensed under section 351(a) of the Public Health Service Act and is marketed under section 351 of such Act”).

⁷ *Id.* at § 1192(d)(1).

⁸ *Id.* at § 1192(b).

⁹ Guidance at 9.

¹⁰ See e.g., FDA, Drugs@FDA listing “Active Ingredients,” available at <https://www.accessdata.fda.gov/scripts/cder/daf/index.cfm>.

At argenx we are working every day to put forward new innovations in drug therapies that will transform the lives of patients living with rare and debilitating disease. We recognize the important part that policymakers play in market access and how our therapies can get to the patients that need it most. We appreciate this opportunity to comment on the Guidance. If you have any questions about these comments, please do not hesitate to contact me at wrichards@argenx.com.

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure,

Thank you for the opportunity to offer public comment on the initial guidance regarding the Drug Price Negotiation Program under the Inflation Reduction Act of 2022 (IRA) issued by the Centers for Medicare & Medicaid Services (CMS) on March 15, 2023.

My name is Joan Koerber-Walker. I have the privilege to serve as the President & CEO of the Arizona Bioindustry Association (AZBio). Our community represents Arizona's health innovation sector including patient groups, biotech and medtech companies of all sizes, Arizona's universities and community colleges, research institutes, and healthcare institutions. AZBio member organizations employ over 300,000 Arizonans.

On a personal note, my training and education is in economics. During a career spanning over four decades, I have had the opportunity to work in both the for profit and nonprofit sectors. My career experience includes executive leadership, distribution and value chains, organizational systems design, and economic modeling. Today, I am 62 years of age. In just a few short years, I will be a Medicare Beneficiary.

The Inflation Reduction Act (IRA) of 2022 (P.L. 117-169) includes significant and much needed improvements to Medicare coverage that will provide our senior citizens with more opportunity to access the medicines they need. Capping the out-of-pocket cost of insulin to \$35 will make life better for a growing number of seniors who depend on this life saving medicine. Establishing a yearly cap (\$2,000 in 2025) on out-of-pocket prescription drug costs in Medicare will be a welcome relief to seniors who rely on medicines to maintain their health or manage disease. For some, even this amount will be too high, but it is an improvement. Expansion of the low-income subsidy program (LIS or "Extra Help") under Medicare Part D to 150% of the federal poverty level starting in 2024 will address affordability for more seniors. Finally, providing access to recommended adult vaccines without cost-sharing will hopefully encourage more of our seniors to proactively protect their health by avoiding the burden of preventable

diseases. In addition to the patient benefit, these improvements should have a positive impact on our nation's growing levels of Cost-related Non-adherence (CRN).

Improved medical adherence lowers overall health care costs. When people are able to better manage their health and health conditions, they can avoid CRN related complications. A 2018 studyⁱ reported increased costs related to poor adherence to medications for common chronic conditions like diabetes, heart failure, high cholesterol, and hypertension resulted in an estimated annual cost of drug-related morbidity and mortality resulting from nonoptimized medication therapy was \$528.4 billion, equivalent to 16% of total US health care expenditures in 2016.

Reducing the rising costs of healthcare is essential. By 2030, all Baby Boomers will be age 65 or older. At that time, the 65 and older population is projected to be over 71 million. The 75 and older population is projected to be over 33 million.ⁱⁱ Providing quality health services to this population is Medicare's charter and responsibility. A goal of the IRA is to manage/lower the cost of doing so.

The previously discussed provisions to improve a patient's ability to afford their medicines and lower overall rates of CRN will support this goal.

Other provisions of the IRA create challenges that may undermine achieving this the goal. Due to advancements in medical science, we are living longer and living better. Yet, with all of our progress, we still lack the ability to prevent, cure, or even effectively treat some of our greatest health challenges. Health innovations related to significant Medicare cost drivers must be priority. These include, but are not limited to, heart disease and stroke, cancer, diabetes, arthritis, and Alzheimer's disease.

Medicare Drug Price Negotiation

Your summary states: "Medicare will be able to negotiate directly with drug manufacturers to lower the price of some of the costliest single-source brand-name Medicare Part B and Part D drugs. This means that people with Medicare will have increased access to innovative, life-saving treatments, and the costs will be lower for both them and Medicare"ⁱⁱⁱ

In the short term, Medicare's ability to negotiate directly with drug manufacturers to lower the price of some of the costliest single-source brand-name Medicare Part B and Part D drugs will reduce costs, but it is also already beginning to create adverse effects in the health innovation ecosystem.

These adverse effects are changing the risk/reward calculation that investors use to make decisions on which small health innovation companies they will invest in. When the risks are high, as they are in drug development, and the rewards decline, so will investment. Investors have many options beyond health innovation. If the investment dollars shift to other innovation sectors, people with Medicare will have reduced access to innovative, life-saving treatments, and the costs for Medicare will continue to increase due to the projected demographics.

Congress created the IRA. CMS through its rule making will implement it. The Biotechnology Innovation Organization (BIO) has separately submitted extensive comments on its concerns and points of consideration relative to implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026. Having reviewed these comments, we are in full agreement. These recommendations will support implementation without expanding on the Congressional intent.

Since the IRA was signed in August of 2022, AZBio has consulted with our patient groups, health innovators, and the investment community. A major theme originating from these discussions was the essential need to not slow the progress of future treatments and cures. These create hope for Medicare Beneficiaries and our best opportunity to reduce the overall cost of healthcare in the long term. The rules you finalize can minimize potential disruption of the innovation process or aggravate it. We sincerely hope that you will give serious consideration to BIO's comments.

The following example demonstrates why this is so important. It uses one Arizona health innovation that is under development to address one of Medicare's major health challenges. Similar examples are available for other conditions.

The Health Challenge: Alzheimer's Disease

According to the Alzheimer's Association, "with the aging of the baby boomers, the number of Americans aged 65 and older with Alzheimer's is expected to dramatically escalate."^{iv}

- Today, an estimated 5.8 million Americans aged 65 and older are living with Alzheimer's disease.
- By 2050, there are projected to be nearly a million new cases every year, with another American developing Alzheimer's every 33 seconds.
- The number of Americans living with Alzheimer's will nearly triple by 2050 to 13.8 million if nothing changes.
- Costs will also expand in lockstep. By 2050, combined Medicare and Medicaid spending on people with Alzheimer's will skyrocket to \$777 billion (in 2020 dollars)
- In 2050, Medicare spending on people with Alzheimer's will total \$584 billion—an increase of 278% from today's spending levels. This will represent more than 1 in every 3 dollars of total estimated Medicare spending.
- Medicaid spending on people with Alzheimer's will increase 278% between now and 2050, as costs will reach \$194 billion in 2050.

Developing Health Innovation

Currently an Arizona small business (Company) has a vision to prevent, halt and cure neurodegenerative diseases. The Company has begun clinical trials on a regenerative treatment for Alzheimer's Disease and other neurodegenerative diseases. They believe this health innovation has the potential to not only halt but to reverse the disease's progression. It is currently undergoing a Phase 2b study in patients with mild Alzheimer's Disease. Significant support from both government and philanthropic partners helped the company to progress to its current stage. To undertake the final studies, private investment will be essential. Drug development for Alzheimer's disease has a long history of highly publicized and expensive clinical failures. Attracting private investment for even the most promising drug candidates is a challenge. Due to the significant size of the patient population, the clinical trials will need to be extremely large to prove statistical significance. This makes the regulatory timeline longer and drives the cost much higher than other investment options an investor may be considering. These are significant risk factors in the risk/reward calculation.

The IRA has raised new challenges:

- The company's drug candidate is classified as a small molecule. As such it will only be exempt from negotiation for 9 years from its FDA-approval or licensure date as compared with the 13-year exemption available for biological products.
- If the Company's health innovation achieves its clinical milestones and receives FDA approval, its products will be in high demand. It is likely that it will be on the list for price negotiation as soon as it is eligible. This effectively reduces the investors perceived reward. With a such a "high risk"

investment, any reduction on the reward side of the equation makes fundraising more of a challenge and takes longer to accomplish.

- Longer fundraising cycles delay the clinical trial process while patients continue to suffer, and costs continue to climb.

This is just one Arizona example. Today, our health innovators are working to deliver better treatment options for patients with cancer, diabetes, cardiovascular and pulmonary diseases, autoimmune diseases, and neurological diseases.

Summary

In conclusion, the IRA contains provisions that reduce patient out-of-pocket costs, relieve some of the financial burdens patients face, and hopefully will reduce costs through lowering CRN levels. This alone will not be enough to bend the healthcare cost curve that is being driven ever higher due to our aging population demographic.

While price negotiation will provide some relief, even this will not be enough to bend the cost curve enough to balance the increasing costs of acute and chronic disease for a growing Medicare population.

Health innovation, in the form of new treatments that can prevent, treat, and cure, is our best cost containment strategy and presents new hope for patients.

CMS, through the rule making process, can help to minimize the disruption that the IRA is creating in the health innovation ecosystem by giving careful consideration to the recommendations provided by BIO and other members of the health innovation community.

Thank you for taking the time to review my comments. I appreciate this opportunity to provide feedback to CMS on the Initial Guidance. Should you have any questions, please do not hesitate to contact me at jkw@azbio.org or at (480)332-9636.

Sincerely,

Joan Koerber-Walker

April 14, 2023

Chiquita Brooks-LaSure, Administrator
Centers for Medicare and Medicaid Services
Hubert H. Humphrey Building
200 Independence Avenue, S.W.
Washington, D.C. 20201

Dear Administrator Brooks-LaSure:

Arnold Ventures welcomes the opportunity to provide comments to the Centers for Medicare and Medicaid Services (CMS) on the following guidance issued on March 15, 2023:

- *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments*

Arnold Ventures is a philanthropy dedicated to investing in evidence-based policy solutions that maximize opportunity and minimize injustice. Our work within the health care sector is driven by the recognition that the system costs too much and fails to adequately care for the people it serves. Our work spans a range of issues including commercial-sector prices, provider payment incentives, prescription drug prices, clinical trials, Medicare sustainability, and complex care.

We thank you for the opportunity to provide comments on the Medicare negotiation process. This letter is organized into 6 sections as follows:

1. Preventing Product Line Extensions from Undermining the Negotiation Framework, which includes comments on the following:
 - *Section 30 - Identification of Selected Drugs for Initial Price Applicability Year 2026*
 - *Section 60.5.1 Application of the MFP to New NDAs/BLAs or NDCs*
 - *Section 90.4 - Monitoring for Bona Fide Marketing of Generic or Biosimilar Product*
 - *Section 120 - Application of Medicare Part B and Part D Prescription Drug Inflation Rebate Programs to Selected Drugs*
2. Bringing Market Competition into the Negotiation Process, which includes comments on the following:
 - *Section 60.3.2 - Developing a Starting Point for the Initial Offer*
 - *Section 60.3.4 - Considerations of Manufacturer-Specific Data*
3. Assessing Research and Development Costs and Returns, which includes comments on the calculation of total research and development costs for selected drugs outlined in Appendix C.
4. Balancing Needs for Confidentiality with Public Interest in Transparency, which includes comments on the following:
 - *Section 60.6.1 - Explanation for the MFP*
5. Delay in Negotiations for Certain Biologics with High Likelihood of Biosimilar Entry, which include comments on the following:
 - *Sections 30.3.1.1 to 30.3.1.4 Delay in the Selection and Negotiation of Certain Biologics with High Likelihood of Biosimilar Entry*

6. Other Provisions in the Guidance that help to Strengthen the Negotiation Framework, which include comments on the following:
- Section 50.2 - Evidence About Therapeutic Alternatives for the Selected Drug
 - Section 60.3.3.1 - Analysis for Selected Drugs with Therapeutic Alternative(s)
 - Section 60.4 Negotiation Process
 - Section 60.5 Application of the MFP Across Dosage Forms and Strengths
 - Section 80 – MFP Eligible Individuals

We want to thank you and CMS staff for your important and expeditious work implementing the prescription drug provisions of the Inflation Reduction Act (IRA) and for the opportunity to provide input. We recognize the difficulty of the task you face.

Section 1. Preventing Product Line Extensions from Undermining the Negotiation Framework

Section 30 - Identification of Selected Drugs for Initial Price Applicability Year 2026

Arnold Ventures strongly supports the process for selecting drugs for negotiation outlined in Section 30. Importantly, the guidance includes the following provisions that are critical to blocking new formulations of selected drugs from delaying negotiations indefinitely by shifting utilization toward modified versions:

- Defining a qualifying single source drug as all dosage forms and strengths of the drug with the same active moiety (or active ingredient in the case of biologics) marketed by the same manufacturer.
- Determining the time that the qualifying single source drug has been on the market using the earliest date of approval or licensure for the active moiety/active ingredient across all NDA and BLA applications.

Section 60.5.1 Application of the MFP to New NDAs/BLAs or NDCs

CMS is seeking comment on the methodology to set Maximum Fair Prices (MFP) for new dosage forms of selected drugs that already have an MFP. Arnold Ventures recommends that CMS establish a methodology that ensures that the weighted average MFP across all dosage forms and strengths—including the new dosage form or strength of a selected drug—does not change from what it would have been had the new dosage form/strength not been introduced. This will prevent product line extensions from increasing the average MFP paid for the selected drug. This policy would also encourage manufacturers to introduce improved versions of their products earlier in the product's life cycle.

Section 90.4 - Monitoring for Bona Fide Marketing of Generic or Biosimilar Product

It is critical that CMS ensure that a competitive market is present to maximize savings from negotiation for patients and taxpayers. Arnold Ventures strongly recommends that generic market share be assessed at the active moiety/active ingredient level when determining when to lift the MFP from a selected drug with meaningful generic or biosimilar competition.

The Secretary could apply a threshold generic market share at the active moiety/active ingredient level that is consistent with the literature on competitive generic markets.¹ This would be at least half of the market for small molecule drugs and at least quarter of the market for biosimilars.

Prescriptions could be standardized (such as a 30-day supply in Part D) to accurately estimate the market share of the generic product relative to the total volume dispensed to Medicare beneficiaries for the active moiety/active ingredient. The formula that determines generic market share would be calculated as the number of standardized prescriptions dispensed for the generic product divided by the number of standardized prescriptions dispensed for the selected drug aggregated across all dosage forms and strengths, plus the number of standardized prescriptions dispensed for the generic product.

Section 120 - Application of Medicare Part B and Part D Prescription Drug Inflation Rebate Programs to Selected Drugs

When CMS lifts the MFP from a selected drug with meaningful generic or biosimilar competition, the IRA requires that the base period used to calculate the drug's inflation penalty be reset. It is unclear how the MFP factors into the inflation rebate formula once the base period is reset, particularly whether it will be factored into the reset for Part D drugs.

Arnold Ventures recommends that manufacturer sales at the MFP be factored into the benchmark prices used to calculate inflation rebates in both Part B and Part D after the reset occurs for drugs that are no longer selected drugs. That would allow the reset to put downward pressure on prices consistently for previously selected Part B and Part D drugs. Otherwise, it is possible that the reset would put downward pressure on net prices in Part B but allow net prices in Part D to increase.

CMS is seeking comment on whether guidance should be issued for the inflation rebates in the Part B program for selected drugs before 2028. Arnold Ventures thinks it is important for CMS to issue additional guidance to ensure that stakeholders understand how MFPs will be factored into the inflation rebate calculations for selected drugs under both the Part D and Part B programs within the next year.

In sum, this section outlines Arnold Ventures' concerns about the amount that Medicare will pay for drugs after the MFP is lifted. If CMS were to choose a weaker definition of "robust and meaningful generic competition" then it would be even more important to implement the inflation rebate reset in a manner that is consistent with the intent of the IRA: that the reset of the inflation

¹ H.G. Grabowski, et al., "Updated Trends in US Brand-Name and Generic Drug Competition," *Journal of Medical Economics*, 19(9), April 2016, pp. 836-844; and R.G. Frank and R.S. Hartman, "The Nature of Pharmaceutical Competition: Implications for Antitrust Analysis," *International Journal of the Economics of Business*, 22(2), 2015, p.p. 301-343; R.G. Frank, T.G. McGuire, and I. Nason, "The Evolution of Supply and Demand in Markets for Generic Drugs," *Milbank Quarterly* 99(3):828-852 September published on-line June 1, 2021; Ariel Dora Stern et al. rebate for previously selected drugs put downward pressure on the net prices paid for drugs by Medicare.

Section 2. Bringing Market Competition into the Negotiation Process

Section 60.3.2 - Developing a Starting Point for the Initial Offer

CMS proposed a methodology to develop a starting point price that could enable the Secretary to negotiate an MFP that is below the ceiling price. Arnold Ventures recommends that within the group of therapeutic alternatives used to establish the starting point price for the initial offer, that (1) those with higher-than-average net prices that do not offer any additional clinical benefits be dropped from the group before calculating a weighted average starting point price, and (2) generic and biosimilar therapeutic alternatives be included in the calculation.

Using the net prices in Part D (which include manufacturer rebates) is a helpful first step in bringing market competition into the negotiation process, but how CMS defines the group of therapeutic alternatives used to determine that starting point price is critical. For example, the Secretary should give greater weight in his initial offer to generics or biosimilars in the therapeutic group that are as effective as the selected drug.

When a selected drug has no therapeutic alternatives, CMS proposes to use Federal Supply Schedule (FSS) or Big 4 prices as the starting point price. These prices are tied to the lowest prices paid in the commercial sector. An issue with using recent FSS/Big 4 prices as the starting point price is that this will put upward pressure on those prices if the amount that Medicare pays is tied to them in some way.² An alternative domestic price reference for drugs with no therapeutic alternatives is the inflation adjusted FSS price or BIG4 price at launch.

Section 60.3.4 Considerations of Manufacturer Specific Data

As discussed in the guidance, Arnold Ventures supports lowering the initial offer if the manufacturer has recouped research and development costs, if federal funding supported the discovery or development of the drug, if there are multiple unexpired patents that will continue to protect the drug from generic or biosimilar competition for a number of years, or if the initial offer would otherwise exceed the average net price to the commercial sector.

Section 3. Assessing Research and Development Costs and Returns

CMS will include a portion of spending on “abandoned and failed” projects related to the same therapeutic area as the selected drug in its calculation of total research and development costs for the selected drug (Appendix C). While CMS should work to protect incentives for manufacturers to innovate, it also needs to ensure its policy is one that does not undermine the incentive to continue improving the efficiency of the research and development (R&D) process.

² For example, when Medicaid net prices were tied to FSS prices through the best price provision, FSS prices increased ([HRD-91-139 Medicaid: Changes in Drug Prices Paid by VA and DOD Since Enactment of Rebate Provisions \(gao.gov\)](#)). And this policy could also have similar effects to Medicaid’s best price provision which increased the prices paid by commercial payers ([1996doc20.pdf \(cbo.gov\)](#)).

CMS should clarify how large that portion is of total R&D costs and how far back in time the brand manufacturer may reach when considering “abandoned and failed projects.” Arnold Ventures recommends the following for CMS’s calculation of R&D costs and returns for selected drugs:

- Include spending on basic research for failed projects that occurred no more than 5 years before the basic research began.
- Post investigational new drug investments in abandoned and failed projects should be considered only if they occurred no more than 5 years before these types of investments began for the selected drug.
- Do not include spending on “abandoned and failed” projects that occurred after the selected drug was approved in the calculation of development costs.

If CMS were to choose to include investments in failed projects outside these timeframes, Arnold Ventures recommends that CMS adjust downward the portion of such costs that are counted toward R&D spending. That is because spending that occurred on failed projects long before the development of the selected drug began is less likely to be directly related to the development of the selected drug.

The portion of such spending that CMS chooses to allocate toward R&D costs could vary depending on how broadly the manufacturer reports these costs. The definition may be challenging to apply consistently across drugs and across manufacturers. Arnold Ventures recommends adjusting that portion depending upon how broadly the manufacturer has defined these types of costs (a broader definition would imply a lower portion).

The guidance states that spending on post-marketing clinical trials that were never completed will be included in R&D costs (Appendix C). Arnold Ventures does not believe that such costs should be included in estimated R&D costs if the deadline for completing those studies has passed. For example, manufacturers frequently do not complete post-marketing studies for drugs that receive accelerated approval in a timely manner. This behavior should not be rewarded by including the costs of post-marketing studies where the results are long overdue and incomplete as part of drug development costs considered under the negotiations framework. Arnold Ventures also recommends that only post-marketing studies that support Food and Drug Administration (FDA) approvals for new indications or new dosage forms be included in reported R&D costs.

CMS will need to collect data on R&D costs and returns on an annual basis to estimate the capitalized costs of R&D and the present discounted value of returns. Arnold Ventures also recommends including the cost of clinical trials in R&D costs only if those trials have been included in the clinicaltrials.gov database.

Section 4. Balancing Needs for Confidentiality with Public Interest in Transparency

Section 60.6.1 Explanation for the MFP

To support the integrity of the negotiation process, CMS needs to report to the public clearly the factors used to determine the MFP, which can be either at or below the statutory ceiling price. However, we recognize the challenge in doing so while preserving the confidentiality of the information manufacturers submit to CMS and of the negotiation process itself. Arnold Ventures recommends that CMS publish the following:

- Therapeutic alternatives used to formulate the starting point price/
- Relevant comparative effectiveness studies that adjusted the starting point price upward or downward.
- Directionally whether the Secretary was able to negotiate below the ceiling price.
- How much returns to R&D exceeded costs of R&D

CMS could publish a summary report covering all negotiated drugs in a cohort. This would enable CMS to provide more information to the public while protecting the confidentiality of data at the individual drug level. For example, CMS may be able to discuss in aggregate the following:

- How often the MFP is below the ceiling price.
- The MFP's average percentage reduction off the ceiling price.
- How much returns to R&D exceeded the costs of R&D.

The greater the transparency, the more confidence the public and key stakeholders will have in the negotiation process.

Additionally, CMS could acquire SSR Health and IQVIA data to estimate returns from marketing the drug. CMS could publish the present discounted value of the returns to marketing at the individual drug level based on these data (whereas using data submitted by manufacturers could have confidentiality issues). This would both be informative for the public and help CMS to verify the sales data submitted by the manufacturer.

Section 5. Delay in Negotiations for Certain Biologics with High Likelihood of Biosimilar Entry

Sections 30.3.1.1 to 30.3.1.4 Delay in the Selection and Negotiation of Certain Biologics with High Likelihood of Biosimilar Entry

Arnold Ventures supports the guidance on the implementation of the delay of negotiations related to biosimilar entry. Importantly, the provisions proposed by CMS in the guidance apply to the first cohort of selected drugs in 2023. These provisions make it more likely that 10 brand-name drugs will have an MFP in 2026 because fewer drugs will have dropped out during the negotiation process following biosimilar entry.

Arnold Ventures strongly recommends that CMS request additional information from the biosimilar manufacturer beyond what is listed in the guidance. It is imperative that CMS have the best available information to determine whether biosimilar entry is likely, and negotiations be delayed.

According to the guidance, CMS will determine that biosimilar entry is likely (and negotiations will be delayed) if there is a settlement agreement in place permitting biosimilar entry before September 1, 2025. CMS will not grant a delay in negotiations if there is ongoing patent litigation. The IRA and the guidance state that CMS will rely on settlement agreements submitted to the Federal Trade Commission (FTC) related to patent litigation as well as information submitted to the Securities and Exchange Commission (SEC) regarding business plans to make determinations regarding the likelihood of biosimilar entry.

The IRA gives the Secretary the ability to request additional information from the biosimilar manufacturer to help make this determination, but the guidance does not specify any additional information that CMS plans to request from the biosimilar manufacturer beyond that reported to the FTC, the FDA, and the SEC. For CMS to accurately assess when a biosimilar will enter the

market, Arnold Ventures strongly recommends that CMS use its authority under the IRA [1992(f)(1)(B)(ii)] to request the following additional information from the biosimilar manufacturer:

1. Whether it is part of ongoing litigation with respect to a patent covering the reference product.
2. All settlement agreements with the brand-name manufacturer of the reference biologic or other biosimilar manufacturers—whether they have been reported to the FTC or not.
 - This will help CMS to determine whether a settlement agreement has been reached that allows biosimilar entry to occur within the window and whether there are any agreements in place with anti-competitive provisions. The terms of any “covenant not to sue” received from the brand manufacturer with respect to any unexpired patent should also be reported to CMS.
3. If there is no ongoing litigation reported, and if no settlement agreement exists specifying a date of entry during the window, the biosimilar manufacturer should identify any unexpired patents that are preventing its entry and when those patents will expire.
4. If the biosimilar manufacturer officially exchanged patent information with the brand manufacturer after filing its application with the FDA (that is, engaged in a “patent dance”), the results of that information exchange should be shared with CMS.³

Finally, Arnold Ventures recommends that if a delay request has been submitted by a biosimilar manufacturer, that CMS obtain from the FTC all settlement agreements that are related to the reference biologic (including those that involve other biosimilar manufacturers) to help determine whether biosimilar entry is likely.

Section 6. Other Provisions in the Guidance That Help to Strengthen the Negotiation Framework

Arnold Ventures supports CMS’s guidance outlined in the following sections:

1. *Section 40 – Entering into Agreements with Manufacturers of Selected Drugs.*
2. *Section 50.2 - Evidence About Therapeutic Alternatives for the Selected Drug.* We support CMS’s consideration of evidence on therapeutic substitutes, clinical effectiveness, and cost effectiveness that values all lives equally submitted from all public sources including academics and clinicians.
3. *Section 60.3.3.1 - Analysis for Selected Drugs with Therapeutic Alternative(s),* which outlines the qualitative approach to use information on comparative effectiveness to adjust the starting point price.
4. *Section 60.4 Negotiation Process,* which includes process steps (initial offer from CMS, response from manufacturer followed by up to 3 meetings), final written offer by CMS, and then acceptance or rejection by manufacturer.
5. *Section 60.5 Application of the MFP Across Dosage Forms and Strengths,* which specifies the methodology to apply MFPs across dosage forms and strengths for drugs selected for negotiation in 2023. In future years, CMS could consider using Average Manufacturer Prices (AMPs) (actual transaction prices that are close to list prices and reported to CMS under the Medicaid rebate program) in the formula to apply the MFP across dosage forms and strengths rather than Wholesale Acquisition Cost (WAC) prices. While it is unclear

³ Robin Feldman, *Purple Is the New Orange* (forthcoming ILLINOIS L. REV.)

whether manufacturers would engage in this practice, current and future WAC prices can be more easily manipulated by the manufacturer than the AMPs.

6. *Section 80 – MFP Eligible Individuals*, which clarifies that the MFP applies to physician administered drugs taken by beneficiaries in Medicare Advantage Plans

Conclusion

Arnold Ventures is prepared to assist with any additional information needed. Comments were prepared by Anna Anderson-Cook, Ph.D. with assistance from Andrea Noda, MPP, Vice President of Health Care at Arnold Ventures and Mark E. Miller, Ph.D., Executive Vice President of Health Care at Arnold Ventures.

Please contact Andrea Noda at anoda@arnoldventures.org or Mark E. Miller, Ph.D. at mmiller@arnoldventures.org with any questions. Thank you again for the opportunity to comment and for your important work to lower prescription drug prices for the Medicare program and its beneficiaries.

Sincerely,

Andrea Noda

RE: Solicitation of Comments; Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani,

The Association for Accessible Medicines (AAM) and its Biosimilars Council appreciates the opportunity to provide comments in response to the *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments*.

AAM is the nation's leading trade association for manufacturers of generic and biosimilar prescription medicines. AAM's core mission is to improve the lives of patients by advancing timely access to affordable, FDA-approved generic and biosimilar medicines. The Biosimilars Council works to increase patient access to lifesaving, high-value biosimilar medicines. Over the last ten years, generic and biosimilar medicines have provided more than \$2.6 trillion in savings to U.S. patients and the healthcare system. In 2021 alone, these medicines provided more than \$373 billion in savings, including more than \$119 billion in savings for the Medicare program.¹ Because of their low cost and high value, generic and biosimilar medicines today account for more than 91% of all prescriptions dispensed in the US but only 18% of drug spending.

We are concerned by several key aspects of the approach outlined in the Initial Memorandum. These concerns, and suggested alternative approaches, are described below:

CMS Should Determine Marketing Status of Generic Drugs or Biosimilar Biological Products Based on Marketing, Not Sales [Section 30 – Identification of Selected Drugs for Initial Price Applicability Year 2026]

¹ Association for Accessible Medicines. (September 2022). "2022 Generic and Biosimilar Medicines Savings Report." Accessible at: <https://accessiblemeds.org/resources/reports/2022-savings-report>

Under the Inflation Reduction Act (“IRA”), a product is not considered a “qualifying single-source drug” if a generic or biosimilar product is approved and *marketed*.

The IRA does not include any statutory definitions for the term “marketing.” For the initial selection year, CMS is proposing to use Part D Prescription Drug Event (“PDE”) data for the 12-month period beginning August 16, 2022, and ending August 15, 2023, to assess whether a generic drug or biosimilar product meets the “marketing” requirement. CMS further states it will seek to determine that the manufacturer of the biosimilar or generic has “engaged in bona fide marketing.”² We are concerned that this approach ignores practical challenges associated with relying solely on PDE data and is inconsistent with the statutory language within the IRA.

PDE Data would be Insufficient to Identify Generic or Biosimilar Marketing, in part, due to Part D Policies that Limit Adoption of New Generics and Biosimilars

There are numerous barriers in place throughout the Part D program design, the competitive landscape, and product safety and handling requirements that initially limit volume for generics and biosimilars as they enter a market. The proposal to use PDE data ignores these market and policy realities that can delay generic and biosimilar adoption.

For instance, some generics and biosimilars commonly face a slower adoption curve, especially in markets covering chronic diseases. In fact, many observers have pointed out that while a biosimilar adalimumab is in on the market today, and more are slated to launch this summer, there are a series of naturally occurring factors that point to why biosimilar adoption in that market may not ramp up until next year.³

Moreover, previous AAM research demonstrates how Part D formularies often delay coverage of “first generics”⁴, calling into question the proposal to exclusively rely on PDE data in order to determine whether a generic or biosimilar is “marketed. Furthermore, Part D policies do not currently permit plan sponsors to substitute reference biological products with newly launched biosimilars on their formularies at the mid-year point as a maintenance change. This represents an additional barrier for biosimilars as they seek to gain market share and bring lower costs to the healthcare system, especially within the art D program.

In June 2022, the Federal Trade Commission (“FTC”) released an enforcement policy statement outlining the legal authorities that may apply when dominant drug companies pay rebates and fees to middlemen

³ Matrix Global Advisors (February 2023) Near-Term Expectations for Adalimumab Biosimilars in the United States. Accessible at: https://getmga.com/wp-content/uploads/2023/02/Adalimumab_Biosimilars.pdf

⁴ Association for Accessible Medicines (July 2021) New Evidence Shows Medicare Part D Plans Continue to Fail to Get New Generics to Seniors. Accessible at: <https://accessiblemeds.org/sites/default/files/2021-07/AAM-New-Generics-Are-Less-Available-in-Medicare-2021.pdf>

that foreclose competition from less expensive generic and biosimilar alternatives.⁵ This very principle identified by the FTC is at the heart of why PDE data will not be reliable in this case. Until CMS or the FTC act to eliminate anti-competitive rebate contracts that give maximum market power to high-cost, brand drugs, PDE data cannot be exclusively used to determine if a biosimilar or generic launch meets the statutory criteria that the product is “marketed.”

Determining Marketing Status Based on Volume of Sales is Inconsistent with the IRA

To assess whether a generic or biosimilar is marketed, CMS plans to use PDE data to determine whether the generic or biosimilar has engaged in “bona fide marketing”. This implies that CMS will make the determination based on specific levels of generic or biosimilar market adoption. However, the IRA only requires a generic or biosimilar to be “marketed” and does not require that the generic or biosimilar have achieved a certain level of market penetration, either in the Medicare program or in the broader U.S. pharmaceutical environment. A requirement for “bona fide marketing” is therefore new and not found in the IRA. As such, this new requirement should not be implemented. The formal notice and comment process could have provided the agency with meaningful stakeholder input noting the inconsistency of a “bona fide marketing” requirement with the statute and helped the agency to craft a workable approach to measure “marketing” in line with the statutory requirements.

The new requirement for “bona fide marketing” appears to be an attempt to give CMS discretion to continue negotiating a brand drug’s price even after a generic or biosimilar is on the market, even though this authority was not provided by Congress. While we understand that CMS may be concerned about attempts to game the system, the statutory language is clear and such concerns are not supported by historical trends or currently available evidence. Generic and biosimilar manufacturers work aggressively to launch products quickly and successfully. During the early years of the generic market, there were similar concerns that the Hatch-Waxman Act, which established the legal framework for generic submissions, would incentivize generic manufacturers to limit the volume of products launched. But this has not been the case. Whereas pre-Hatch-Waxman only 35% of the top selling drugs had a generic available, generics now represent 91% of all prescriptions dispensed.^{6, 7}

CMS Should Use Multiple Data Sources to Determine Marketing Status

Multiple existing federal and non-federal resources already exist to answer the question of whether a generic or biosimilar is available in the marketplace. For instance, the National Institutes of Health (NIH) DailyMed publishes product marketing dates, information that is then used by CMS for Average Sales Price (“ASP”) submission verification. Furthermore, first generic applicants must notify the FDA of the date on which they commence commercial marketing.⁸

⁸ The FDA has the primary jurisdiction over regulating product launches and has issued regulations that include a clear and workable definition of marketing consistent with the IRA. **21 CFR § 314.3(b)** defines “commercial

In fact, it may be that there will be no single perfect source. Therefore, we encourage CMS to take a multi-faceted approach including (1) use of existing resources (market compendia such as Micromedex's RED BOOK, First Databank, Medispan, or Gold Standard; or federal sources such as DailyMed, FDA NDC directory) for marketing status, (2) allowing generic or biosimilar manufacturers to certify marketing status to the Agency on a rolling basis (including the opportunity to appeal a CMS marketing determination), and (3) as necessary, consultation of broader datasets reflecting the full U.S. pharmaceutical market, such as IQVIA, to identify sales.

As noted, this should include the opportunity for generic or biosimilar manufacturers to certify to the Agency that a generic or biosimilar has been "marketed" and to appeal a marketing determination through provision of information demonstrating that the product is available for purchase. Such an approach is consistent with the language in Appendix C of the memorandum, where the Agency specifies "marketing" is defined as the introduction or delivery for introduction into interstate commerce of a drug product.

If CMS seeks to determine information available regarding sales activity, reliance on PDE data would inappropriately narrow the opportunities for confirmation. Accordingly, any such confirmatory analysis of sales should use a broader data set, such as data from IQVIA®, IDB or other data sources, that capture near real-time transactions involving generic and biosimilars in the market as a whole.

CMS Should Allow for a "Rolling" Determination of Generic or Biosimilar Marketing

We note that the memorandum does not address when the Agency will determine whether a generic or biosimilar is marketed once the negotiation process has already started. The memorandum is clear that a selected drug will be removed from the negotiation process once the Agency determines there is generic or biosimilar availability on or after the selected drug publication date and during the negotiation period for an initial price applicability year. However, the memorandum does not outline when or how this determination will be made. For example, if a generic or biosimilar is marketed during the negotiation process (e.g., one day or three months after CMS announces the selected drugs), how and when will CMS make this determination? Creation of a pathway for generic or biosimilar manufacturers to certify marketing status is one way to immediately make a marketing determination and, if applicable, remove the reference product from the negotiation process.

CMS Should Use Alternative Data Sources to Confirm Marketing and Sales

As noted, we believe the statutory language is clear that the marketing determination does not allow for consideration of levels of adoption as a requirement. However, when verifying details of marketing through reporting generated by generic and biosimilar manufacturers, there may be no individual source that is sufficiently comprehensive. AAM urges CMS to clarify that the Agency will closely adhere to the statutory requirements outlined in the IRA with respect to making a determination of whether a

marketing" as "the introduction or delivery for introduction into interstate commerce of a drug product described in an ANDA, outside the control of the ANDA applicant, except that the term does not include transfer of the drug product for investigational use under part 312 of this chapter or transfer of the drug product to parties identified in the ANDA for reasons other than sale. Commercial marketing includes the introduction or delivery for introduction into interstate commerce of the reference listed drug by the ANDA applicant."

product is a single-source drug and will not impose additional requirements related to market share minimums. Specifically, CMS should clarify that listing in pharmaceutical compendia or in Federal resources (NIH DailyMed), a certification of marketing from the generic or biosimilar manufacturer, or the presence of *any* sales of a biosimilar and generic drug in PDE files and/or a real-time transaction data source will satisfy the IRA's statutory requirement to demonstrate that a generic or biosimilar has been marketed. We urge CMS not to impose a different, more demanding standard than what is required by statute.

CMS Should Maintain An Updated Part D Dashboard To Allow For Appropriate Evaluation Of Drug Expenditures [30.3.1.1 Requirements for Granting an Initial Delay Request for Initial Price Applicability Year 2026]

The memorandum encourages stakeholders to rely on publicly available information including the Medicare Part D Drug Dashboard to determine which products may be selected for negotiation. We would note that the most recent data available from the CMS Part D Drug Dashboard was published March 2023 using 2021 data. This represents a significant lag that undermines biosimilar developers' ability to forecast likely products for selection and submit appropriate requests for delay. Accordingly, AAM requests that the Agency update the dashboard on a more frequent timeframe or provide more recent information related to the top 50 Part D products. Alternatively, if CMS believes that other reliable data sources exist, we encourage them to identify those publicly. This will enable stakeholders, including generic and biosimilar manufacturers, to prepare for potential delay applications and ensure the Agency is aware of products that have been approved and marketed.

CMS Should Expand the Criteria for the Two-Year Delay [Section 30.3.1.2 High Likelihood]

The IRA guidance provides biosimilar applicants with only two options to demonstrate “high likelihood” of marketing, both of which require resolution of any patent disputes, either by a court decision or an agreement with the reference product sponsor, no later than May 22, 2023. This approach is unduly narrow for several reasons.

First, this approach would disqualify any 351(k) BLAs submitted after May 22, 2023 from eligibility, as patent litigation cannot commence—much less be resolved—until after application submission (*See id.* § 271(e)(2)(C)).

Applications submitted by May 22, 2023 do not fare much better, as CMS's requirements do not appropriately address the practicalities of patent litigation and the statutory requirements governing these disputes. To the extent that it is used, the “patent dance” takes approximately 250 days—and that is just before the first wave of litigation. Accordingly, for litigation to even have commenced by May 22, 2023, the biosimilar applicant must have *already* submitted its 351(k) BLA by September 14, 2022.

Second, ongoing patent litigation may be irrelevant to biosimilar launch. If, for example, a biosimilar applicant carves out the relevant patented indication from its labeling—a common practice in the biosimilar space—it may never be sued by the reference product sponsor consistent with applicable law. CMS's limited criteria provide no basis for the biosimilar applicant to demonstrate a “high likelihood” in that circumstance—despite the fact that there are no barriers precluding the biosimilar manufacturer from entering the market.

Separately, CMS's view that "active litigation" disqualifies a biosimilar manufacturer from satisfying the "clear and convincing evidence"⁹ standard is inconsistent with the statutory intent of the IRA biosimilar delay provision, and it will ultimately lead to less aggressive patent challenges. Patent litigation is inherently uncertain, fast-moving and should not be indicative of approval or marketing of a biosimilar. Under CMS' current standard, a biosimilar manufacturer that overwhelmingly establishes at trial that the relevant patents are invalid and/or not infringed upon would be ineligible for the delay—even if the decision from the district court was a mere few days away. Moreover, multiple biosimilars on the market today have launched 'at risk' during ongoing litigation, and this type of aggressive commercialization is a goal that CMS should seek to support.¹⁰

Furthermore, establishing a de facto standard that ongoing litigation disqualifies a biosimilar from receiving a two-year delay grants brand manufacturers too much control over this process, as they would have the ability to keep litigation active regardless of the willingness of a biosimilar manufacturer to launch at risk.

The IRA Includes Safeguards for Taxpayers if the Biosimilar Fails to Launch within Two Years

It is important to keep in mind that the IRA is intended to encourage generic and biosimilar competition, and that, furthermore, it provides a safeguard for situations in which a biosimilar delay is granted, but the biosimilar is not marketed. Under the IRA, if a delay is granted and a biosimilar is not subsequently marketed, a brand manufacturer will be required to pay a rebate for the years during which they would have provided access to a Maximum Fair Price (MFP). Accordingly, since there is already a defined safeguard in place to protect the negotiation program and taxpayers if a biosimilar is not launched, it is appropriate to expand the criteria for biosimilars to be eligible to receive the two-year delay. This approach will reduce uncertainty for biosimilar manufacturers as they invest in development, increase competition, and reduce prices for patients and the Medicare Program.

AAM urges CMS to alter this standard to allow biosimilars with ongoing litigation but no adverse court decision to be eligible to receive the two-year delay. Moreover, CMS could permit biosimilar manufacturers to submit explanations detailing why market entry is likely that could then be evaluated by the agency, rather than resorting to an overly restrictive test that undermines biosimilar competition.

CMS Should Ensure the Information Provided During the Biosimilar Initial Delay Request Process Remains Confidential [Section 40.2.1 Confidentiality of Proprietary Information]

CMS proposes to maintain proprietary information submitted to inform the negotiation process confidential in accordance with statutory requirements. AAM agrees that this nonpublic information should remain undisclosed. Thus, we urge CMS to clarify that information submitted as part of the Biosimilar Initial Delay Request will be exempt from Freedom of Information Act (FOIA) requests or other disclosures.

¹⁰ The following products were launched at-risk and are currently available on the market: Kanjinti (trastuzumab-anns) [July 2019], Inflectra (infliximab-dyyb) [November 2016], Fulphila (pegfilgrastim-jmdb) [June 2018], Mvasi (bevacizumab-awwb) [July 2019]

CMS Should Clarify Appropriate Maximum Fair Price and Administrative Fees [Section 40.4 Providing Access to the MFP]

The memorandum notes that, in addition to MFP-eligible individuals, manufacturers are also required to ensure that pharmacies, mail order services, and other dispensers are also able to access the selected drug at the MFP. Specifically, CMS intends to require a Primary Manufacturer to reimburse a pharmacy, mail order service, or other dispenser within 14 days if the entity does not have access to the MFP. The memorandum specifies that manufacturers or contracted entities may not charge any transaction fee for this process. We encourage CMS to also prohibit pharmacy benefit managers (PBMs) or Part D plan sponsors from charging any additional transaction or administrative fees from manufacturers or pharmacies in connection with the MFP or the selected drug dispensing process. PBMs or Part D plan sponsors should not be able to generate revenue from pharmacies or manufacturers complying with the requirements of the IRA or subsequent program rules. We have urged the agency in the past to ensure patients receive the benefit of all rebates, discounts, and direct and indirect remuneration at the pharmacy counter, and we continue to encourage CMS to ensure this occurs for products subject to the MFP as well as for all other Part D products.

CMS Should Provide Greater Clarity on the Determination of the Maximum Fair Price [Section 50 - Evidence Regarding Therapeutic Alternatives]

Although the IRA seeks to protect generic and biosimilar competition by removing a reference product from negotiation if a generic or biosimilar is approved/licensed and marketed, the framework nonetheless creates significant uncertainty that, without greater clarity from CMS, will harm future generic and biosimilar development. Generic and biosimilar manufacturers make decisions on how to direct capital investments, in relation to a reference product's market activity, years before loss of exclusivity is imminent and years before CMS will begin the negotiation process. Currently, generic and biosimilar manufacturers rely on current, publicly accessible trends in commerce and free market economics to govern how they direct their operations in bringing affordable medicines to the US healthcare system. However, the market uncertainty created by this guidance could undermine their decision to invest the \$100-\$250 million and 8-12 years necessary to bringing the lower-cost options to market in key areas such as complex generics and biosimilars. We are concerned that not providing concrete information on pricing that allows stakeholders to operate with predictability would harm long-term opportunities for greater savings through the market-based competition that biosimilars and generics offer. Accordingly, it is important for CMS to establish a predictable and transparent method for determining the MFP that allows generic and biosimilar developers to reasonably forecast the market in their investment decisions.

For instance, section 50.2 of the memorandum discusses the requirement under section 1194(e)(2) of the Act that the Secretary consider evidence regarding alternative treatments. AAM encourages CMS to provide clarity on how it will determine what constitutes a "therapeutic alternative." For instance, does CMS intend to consider the selected drug's overall place in therapy? Does CMS intend to consider drugs in other categories or classes such as those included in treatment guidelines? In considering indications for the selected drugs, does CMS intend to use a process similar to the evaluation for Medically Accepted Indication within Part D?

Likewise, the memorandum appears to envision a high degree of privacy in the actual price setting process. This is not in the public interest and will undermine the ability of generic and biosimilar

developers to reasonably support costly future development. We encourage CMS to continue to refine its approach to provide greater predictability and transparency.

Patients deserve access to more high-quality products, rather than fewer, and payers will be able to save in an environment with more competition rather than less. The uncertainty and subjectivity inherent in the approach CMS outlined in this guidance will make the process of investment in biosimilars and generics more uncertain, and risks leaving many Medicare beneficiaries and the health care system overall worse off with fewer options for care and higher costs.

CMS Should Clarify Intent of “Robust and Meaningful” Competition [Section 90.4 - Monitoring for Bona Fide Marketing of Generic or Biosimilar Product]

CMS also proposes “to monitor whether robust and meaningful competition exists in the market once it makes such a determination... [including whether it is] consistently available for purchase through the pharmaceutical supply chain.”² As noted previously, structures within the Medicare program have inhibited the increased adoption of generics and biosimilars. The intent of this provision is unclear, especially since the IRA clearly demonstrates the negotiation process is intended to encourage competition and the use of generics and biosimilars. Further, the metrics outlined for consideration within the guidance do not reflect the most appropriate method of evaluation. For instance, specialty products may not, and likely will not, be readily available in community pharmacies. And because PDE data implies formulary access and a product’s market share, this measure could be heavily weighted on factors such as long-standing branded rebate agreements with PBMs that have little to do with the effort, resources, or ability of a generic or biosimilar company to launch successfully. We encourage CMS to align coverage and payment policies with the statutory intent of the IRA by promoting approaches that increase overall adoption.

It is important to bear in mind that, as noted previously, the IRA only refers to “marketing,” not “robust and meaningful competition.” Moreover, the IRA does not include a provision for the re-introduction of a product for negotiation after a determination has been made that a biosimilar or generic has been launched and marketed nor does it include a market share threshold related to “robust and meaningful competition”. It is essential to robust and competitive biosimilar and generic markets that manufacturers have clarity on the anticipated requirements and that additional regulatory difficulties are not introduced that increase uncertainty in the launch, marketing, and introduction of new products.

Overall, we encourage CMS to exercise flexibility and collaboration during the ongoing development and implementation of the program. We look forward to continuing to engage with HHS and CMS on improving competition, care, and access for America’s patients.

Sincerely,

Craig Burton

**Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial
Price Applicability Year 2026, and Solicitation of Comments**

Dear Dr. Seshamani:

Astellas Pharma US, Inc. (Astellas) provides the following comments to the Centers for Medicare & Medicaid Services (CMS) regarding the above-referenced March 15, 2023 Initial Guidance on the Medicare Drug Price Negotiation Program (Guidance).

Astellas is an innovator company with global headquarters in Tokyo, Japan. Astellas is committed to creating innovative drugs with cutting-edge science that can address areas of high unmet medical needs. We aim to help patients who have no treatment options, or do not respond adequately to existing treatments. Astellas supports the comments of our trade association, the Pharmaceutical Research and Manufacturers of America (PhRMA), and we share PhRMA's concern that the Guidance, if finalized, would heighten the substantial risks already posed by the drug pricing provisions of the Inflation Reduction Act (IRA): curbing biopharmaceutical innovation and eroding patients' access to new therapies. We write separately to emphasize a few points of particular importance about suggestions to help mitigate the risks associated with the initial guidance. We urge CMS to work to implement the IRA's drug price-setting provisions in a way that mitigates the IRA's risks to patients, without departing from the statute's text.

Our specific comments on the Guidance can be summarized briefly as follows:

- CMS should remove tax credits from the proposed definition of prior "Federal financial support." Unlike forms of public support that CMS intends to consider when determining the preliminary price leading up to a maximum fair price (MFP), tax credits are not "Federal support" but a tool that Congress

uses to channel private investment into public policy priorities, without disbursing government funds. By using tax credits as the basis for a downward adjustment in the preliminary price, CMS would disincentivize innovation and reduce the effectiveness of tax credits as a policy tool to encourage and shape manufacturers' R&D investments.

- The revised Guidance should clarify that if prior Federal financial support is a factor that results in CMS considering a downward adjustment in a selected drug's preliminary price, any such adjustment will not exceed an amount proportional to the amount of the prior Federal financial support as a share of the total research and development investments related to the selected drug.
- To protect and promote research and development, CMS should consider an upward shift of the preliminary price for a drug with unexpired patents or exclusivities. Applying a downward adjustment would reduce the value of intellectual property rights and cause a decline in innovation, hindering critical scientific and medical advances.
- In the initial years of implementing the new MFP program, CMS should proceed carefully, with a view to reducing potential risks from the program, and set the MFP for selected drugs at or near the ceiling price to limit disruption from significant and sudden marketplace changes. After the initial period, CMS should rely on independent, consensus-driven clinical experts to assess whether a drug represents a therapeutic advance and to evaluate the comparative effectiveness of therapeutic alternatives.
- CMS should revise the Guidance to provide that CMS will publicly identify potential therapeutic alternatives to selected drugs at the earliest possible opportunity, to maximize the opportunity for all appropriate stakeholder feedback, including from manufacturers as well as clinicians who use CMS' identified alternatives in patient care.
- Consistent with the IRA targeting "single source" drugs for price-setting, and to reduce the possibility of new generics or biosimilars having to compete with MFP-priced selected drugs, CMS should remove a selected drug from the MFP program if an approved generic or biosimilar is marketed at any point before the start of the initial price applicability year (including after the

statutory “negotiation period” but before the start of the initial price applicability year).

- Finally, CMS should determine when a generic or biosimilar product is “marketed” using the commonly understood meaning of that term, instead of limiting what counts as “marketing” based on concepts at odds with the IRA and the ordinary meaning of “marketing.”

1. CMS Should Not Discourage Innovation and Reduce the Effectiveness of Tax Credits By Categorizing Them as “Federal Financial Support” (Section 50.1; Appendix C).

The IRA lists five groups of “manufacturer-specific” data elements that manufacturers of selected drugs must submit to CMS, one being “prior Federal financial support for novel therapeutic discovery and development with respect to the drug.”¹ The Guidance proposes that CMS would consider “the extent to which the Primary Manufacturer benefitted from Federal financial support,” and in particular “may consider adjusting the preliminary price downward if funding for the discovery and development of the drug was received from federal sources.”² CMS would define “prior Federal financial support for novel therapeutic discovery and development” referring to “tax credits, direct financial support, grants or contracts, and any other funds provided by the federal government that support discovery, research, and/or development related to the selected drug.”³

This definition goes beyond “prior Federal support for novel therapeutic discovery and development” with respect to the selected drug. To align with the statutory language, CMS should limit consideration to funding that directly resulted in a patent application containing a Government Interest Statement and/or research where a patent assignee was a U.S. government agency. At a minimum, though, CMS should remove tax credits from the definition.

Using prior tax credits as a basis for considering a downward adjustment in a selected drug’s preliminary price is a patently misguided policy that may have the unintended effect

¹ Social Security Act (SSA) § 1194(e)(1)(C).

² Guidance at 53.

³ Guidance at 87-88.

of limiting the impact of future tax credits—reducing the effectiveness of a key tool that Congress uses to encourage manufacturers to use their own funds in a way that advances critical public policy goals, such as investing in the research and development of new therapies to treat life-threatening and otherwise serious diseases, including therapies to treat rare diseases and, thus, address unmet patient needs. CMS' proposal would essentially undo incentives that Congress had purposely put into place. It would be counterproductive for CMS to use its MFP authority to take away explicit statutory incentives for companies to invest in medical advances.

Moreover, unlike the other specific categories that CMS proposes including in its definition of “prior federal financial support,” tax credits are not “Federal support” at all. They are in no way equivalent to government funding. Congress has long used tax credits to spur companies to increase their own investment in areas of research that may not otherwise be sustainable or otherwise would be carried out at a level inadequate to meet public health goals. Just as the IRA uses tax credits to incentivize energy-efficient purchases that consumers may not otherwise buy, Congress similarly employs tax credits to channel private sector funds into the development of therapies and cures that may not otherwise be developed. By using tax credits as part of its calculus to adjust preliminary MFPs downward, CMS would be diluting the effectiveness of this tool for boosting private spending on important medical innovations. Accordingly, we urge CMS to remove tax credits from its definition of “prior federal financial support.”

2. CMS Should Not Disproportionately Weigh Federal Financial Support In Developing Offers (Section 50.1).

As noted above, the Guidance provides that CMS will consider “the extent to which the Primary Manufacturer benefitted from Federal financial support” and “may consider adjusting the preliminary price downward if funding for the discovery and development of the drug was received from federal sources.”⁴ Other than referring to “the extent to which the Primary Manufacturer benefitted from Federal financial support,” the Guidance does not discuss how much weight CMS might give to prior Federal financial support.

We recommend that CMS look at Federal financial support in the context of the total R&D costs incurred for the selected drug and consider – at most – a proportional adjustment in the preliminary price. For example, if prior federal financial support represented 1% of the total investment required to develop a new drug, to the extent CMS considers adjusting the

⁴ Guidance at 53.

preliminary price downward as a result of such funding, it should do so in a proportional manner by adjusting the preliminary price downward by no more than 1%.

3. CMS Should Not Penalize Manufacturers for Patents and Exclusivities (Section 50.1; Appendix C).

As currently proposed, CMS “intends to consider the length of the available patents and exclusivities before the drug may no longer be single source” and may consider adjusting the preliminary price downward if the drug has patents and exclusivities that will last for a number of years.⁵ We strongly believe this proposal is ill-advised, and we urge CMS to refrain from penalizing manufacturers for patents and exclusivities. Patents and exclusivities encourage and incentivize research and development and other investment in new drugs and therapies. Post-approval R&D that could result in additional patients and exclusivities can improve patients' lives via meaningful improvements in existing therapies. Instead of undermining manufacturers' intellectual property rights and reducing motivation to improve existing therapies and/or develop groundbreaking therapies, CMS should take exactly the opposite approach.

The important role of patents in promoting scientific advancement is long-established and recognized on our Constitution. Article I of the U.S. Constitution provides for Congress “[t]o promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.”⁶ By proposing to adjust a preliminary price downward because a product has available patent rights and exclusivities, CMS would penalize manufacturers for innovation and – again – undo incentives that Congress created intentionally and for important reasons. Intellectual property rights have helped to fuel the country's leadership in global innovation for over 200 years and by using those rights as a trigger to reduce the preliminary price of a selected drug, CMS would be directly reducing the value of those intellectual property rights. This would set a troubling precedent -- contravening long-standing policies stated in our Constitution to promote intellectual property rights and spur scientific advancement.

To encourage future research and innovation, and to ensure that development continues to take place domestically, CMS should reconsider its Guidance and instead should adopt a

⁵ Guidance at 53.

⁶ U.S. Constitution, Article I, Section 8, Clause 8.

policy of rewarding innovation and adjusting the preliminary price upward for a selected drug with unexpired patents or exclusivities.

4. CMS Should Set the MFP at or Near the Ceiling Price at the Start of the Program and In Later Years Should Rely on Independent Medical Experts to Determine A Drug’s Relative Therapeutic Value (Section 60).

Given the novelty and complexity of the MFP program, and the consequences it may have across the healthcare system, CMS should proceed carefully and set the MFP for selected drugs at or near the ceiling price for at least the first several “initial price applicability years” (IPAYs). To do otherwise—on such a short timeframe and without previous experience in operating a program like this—will risk undervaluing critical drugs and potentially harming patients. To reduce risks of harm in the program’s early years, it will be important for CMS to set MFPs of selected drugs at or very close to their ceiling price, which already reflects a substantial discount on a selected drug’s pricing.

In later years, CMS should follow the guidance and experience of third-party clinical experts when considering “[t]he extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives” as required by SSA § 1194(e)(2)(A). In the area of oncology, an important third-party expert organization is the National Comprehensive Cancer Network (NCCN). The NCCN is a not-for-profit alliance of 33 leading cancer centers devoted to patient care, research, and education that is dedicated to improving and facilitating quality, effective, equitable, and accessible cancer care so all patients can live better lives.⁷ For the past 15 years, the NCCN Drug and Biologics Compendium has been relied on as an authoritative, scientifically based source for providers when evaluating patients’ treatment options. When CMS considers evidence about alternative treatments to a selected cancer drug, including the extent to which the selected drug represents a therapeutic advance and the comparative effectiveness of the selected drug and its therapeutic alternatives, it is critical that CMS defer to experts, like the NCCN, to evaluate advances in cancer care.

The NCCN Drug and Biologics Compendium is updated on a regular basis to reflect currently available evidence. The Compendium categorizes drugs and biologics into four

⁷ See National Comprehensive Cancer Network. “About,” available at <https://www.nccn.org/home/about>; National Comprehensive Cancer Network. “NCCN Drugs & Biologics Compendium,” available at <https://www.nccn.org/compendia-templates/compendia/drugs-and-biologics-compendia>.

categories by evaluating each treatment's efficacy and patient safety.⁸ The highest potential recommendations contained in the NCCN Drug and Biologics Compendium are defined as follows:

- Category 1: Based upon high-level evidence, there is uniform NCCN consensus that the intervention is appropriate; and
- Category 2A: Based upon lower-level evidence, there is uniform NCCN consensus that the intervention is appropriate.

Oncology drugs (and biologics) that receive a recommendation of either Category 1 or 2A from the NCCN represent a significant therapeutic advance given that such treatments are supported by strong clinical evidence and the support of respected oncology experts. Relying on NCCN recommendations to determine “[t]he extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives” will help to ensure that CMS’ decision making is based on sound and consensus-driven science and that manufacturers are incentivized to continue developing oncology drugs that meet the criteria to be considered a Category 1 or 2A therapy, promoting efficacy and patient safety. CMS should recognize an oncology drug that achieves one of these ratings as a significant therapeutic advance, and accordingly should set the MFP for drugs that receive these designations in the NCCN Compendium at their statutory ceiling price.

5. CMS Should Defer to Experts In Determining Therapeutic Alternatives, and Publicly Identify All Therapeutic Alternatives Considered when Setting the MFP (Section 60)

In determining the therapeutic alternatives to a selected drug, CMS should rely on clinicians with disease-specific expertise, manufacturers, and independent, widely respected experts. These groups are best positioned to know which products are potential therapeutic equivalents to a selected drug that are appropriate for consideration. For example, when CMS identifies therapeutic alternatives to a selected cancer drug, CMS should consult oncologists, the NCCN Drug and Biologics Compendium, and relevant manufacturers of oncology drugs.

Moreover, to ensure transparency, and to allow for feedback from clinicians with disease-specific and other relevant expertise, including manufacturers and independent, widely

⁸ See National Comprehensive Cancer Network. “Definitions for NCCN Categories,” available at <https://www.nccn.org/guidelines/guidelines-process/development-and-update-of-guidelines>.

respected experts, CMS should publicly identify all therapeutic alternatives to a selected drug as early as possible in the process. Given the specialized knowledge and experience required to identify appropriate therapeutic alternatives to oncology drugs in particular, CMS should ensure that it will timely receive input from all relevant stakeholders, and that it structures its MFP-setting process so as to create multiple opportunities for stakeholders with expertise to provide feedback to CMS on therapeutic alternatives.

6. CMS Should Revise the Guidance to Remove a Selected Drug From the Program After the Negotiation Period If a Generic or Biosimilar is Approved and Marketed Before the Start of the IPAY (Section 70).

Under the IRA, a selected drug will not be subject to an MFP if CMS determines that the generic or biosimilar for the product is approved and “marketed” before the end of the statutory “negotiation period.”⁹ Given the obvious purpose of this provision—to take out of the MFP program drugs and biologics that face competition from a generic or biosimilar before their MFPs take effect, as they no longer represent “qualifying single source drugs”—CMS should also remove a selected drug from the MFP program if marketing of the approved generic or biosimilar begins after the “negotiation period” ends but before the start of the IPAY (i.e., between August 1, 2024 and December 31, 2025, for IPAY 2026).

Congress intended that the program allow for price setting for single source products. If CMS does not remove a selected drug from the program even in a case where a generic drug or a biosimilar is approved and marketed before MFPs take effect (at the start of the IPAY), this could have the unintended effect of forcing a generic drug or a biosimilar to compete with an MFP-priced listed or reference product for a year—distorting competition and undermining the program. The MFP may set a price below the level of economic viability for the generic or biosimilar competitor and undercut the ability of the generic or biosimilar to establish a stable footing in the marketplace. But under the Guidance, a generic or biosimilar that is approved and marketed during the 18-month period after the end of the “negotiation period” (ending August 1, 2024) and before the start of IPAY 2026 (January 1, 2026) would face an MFP-priced listed or reference drug for all of 2026. To avoid this outcome and the detrimental impact it could have on competition, we urge CMS to remove a selected drug from the MFP program if a generic or biosimilar for the drug is approved and marketed at any point prior to the start of IPAY, even if marketing of the generic or biosimilar product begins after the statutory “negotiation period” has ended.

⁹ See SSA § 1192(c)(2).

7. The Concept of “Bona Fide Marketing” Is Inconsistent with the IRA and Should be Removed From the Guidance (Section 90.4).

In the Guidance, CMS introduces a concept of “bona fide marketing” that is not mentioned in the statute and runs contrary to the statute. Further, this approach provides no predictability about when CMS would determine that a drug is “marketed.”

The statute defines a qualifying single source drug (QSSD) in relevant part as a drug lacking a generic or biosimilar product that is approved and “marketed.”¹⁰ The Guidance instead creates a new term -- “bona fide marketing” -- and states that “for the purpose of identifying [QSSDs] for [IPAY] 2026, CMS will review PDE [prescription drug event] data for a given generic drug or biosimilar biological product during the 12-month period beginning August 16, 2022 and ending August 15, 2023, using PDE data available on August 16, 2023, and will consider a generic drug or biosimilar biological product to be marketed when that data reveal that the manufacturer of that drug or product has engaged in bona fide marketing of that drug or product.”¹¹ The addition of the term “bona fide” -- like the plan for CMS to base its determination of whether a generic or biosimilar is marketed solely on Part D PDE data, apparently shutting out all other evidence of marketing -- are new limitations that do not appear in the IRA and conflict with the ordinary meaning of “marketed.” The Guidance also states that after CMS makes a determination that an approved generic or biosimilar is marketed, CMS “intends to monitor whether robust and meaningful competition exists in the market.” Guidance at 67. This “monitoring of competition” function also is not mentioned in the IRA and should be eliminated from the CMS guidance.

In fact, in Appendix C to the Guidance (“Definitions for Purposes of Collecting Manufacturer-Specific Data”), CMS defines “marketing” as “the introduction or delivery for introduction into interstate commerce of a drug product.”¹² This definition is consistent with the ordinary meaning of “marketing.” In its recent Part D Inflation Rebate Guidance, for example, CMS stated that “the date that the drug is first marketed would be the date that the manufacturer reports for the drug as its ‘market date’ to the Medicaid Drug Rebate Program,”¹³ which

¹⁰ SSA § 1192(e)(1)(A)-(B).

¹¹ Guidance at 10 (emphasis added).

¹² Guidance at 82.

¹³ CMS February 8, 2023 Part D Inflation Rebate Guidance at 15 n.18. See also id. at 19 (“to identify the ‘first marketed’ date [for a new drug], CMS intends to use the market date that the manufacturer is required to report under [SSA] section 1927(b)(3)(A)(v)”).

defines a “marketed” drug as a drug that “is available for sale by a manufacturer in the states.”¹⁴ Further, the definition in Appendix C and in the Medicaid rebate guidance aligns with FDA’s use of the term “marketing.” For example, in the context of 180-day exclusivity for first generic applicants, the Food, Drug, and Cosmetic Act (FDCA) provides that FDA shall not make effective a subsequent generic application until “180 days after the date of the first commercial marketing of the drug . . . by any first applicant.”¹⁵ FDA regulations define the term “commercial marketing” (which is more narrow than “marketing”) as “the introduction or delivery for introduction into interstate commerce of a drug product described in an ANDA.”¹⁶ Similarly, for purposes of FDCA section 506l on marketing status reports, FDA considers a product’s marketing status to depend on whether the product is distributed by the application holder, i.e., whether the product is available for sale.¹⁷ Dictionary definitions of marketing reflect the same understanding of this term.¹⁸ Thus, FDA’s definitions and CMS’ own definitions -- in its Medicaid rebate program guidance, in its inflation rebate guidance, and in Appendix C to this Guidance -- and dictionary definitions all reflect the generally accepted ordinary meaning of “marketing” a pharmaceutical product, and thus the meaning of “marketed” that Congress intended in the context of the IRA.¹⁹ By contrast, the reference in the Guidance to “bona fide” marketing, and its description of how

¹⁴ Medicaid National Drug Rebate Agreement, Section (I)(1).

¹⁵ 21 U.S.C. § 355 (j)(5)(B)(iv)(I).

¹⁶ 21 C.F.R. § 314.3.

¹⁷ FDA, Guidance for Industry, [Marketing Status Notifications Under Section 506l of the Federal Food, Drug, and Cosmetic Act; Content and Format](#), at 3 (Aug. 2020) (describing the discontinuation of marketing a product as ceasing distribution).

¹⁸ For example, Merriam-Webster’s dictionary defines “market” (transitive verb) as “to expose for sale in a market” or “sell.” Merriam-Webster.com. 2023. <https://www.merriam-webster.com> (April 9, 2023). Black’s Law Dictionary similarly defines marketing as “the act or process of promoting and selling, leasing, or licensing products or services.” Black’s Law Dictionary (11th ed. 2019).

¹⁹ See, e.g., *Asgrow Seed Co. v. Winterboer*, 513 U.S. 179, 187–88 (1995) (holding that where the statute at issue did not define “marketing,” the term’s “ordinary meaning” -- “the act of holding forth property for sale, together with the activities preparatory thereto” -- should apply because it is consistent with the dictionary definition, and noting that the “word [marketing] does not require that the promotional or merchandising activities connected with the selling be extensive”); see also, e.g., *U.S. v. Lopez*, 590 F.3d 1238 (11 Cir. 2009) (explaining that “[w]hen a statutory term is undefined, courts give it its ‘ordinary meaning’ or ‘common usage,’” and that “[t]o ascertain ordinary meaning, courts often turn to dictionary definitions for guidance”) (internal citations omitted).

CMS plans on determining whether a generic or biosimilar is marketed (i.e., by focusing exclusively on Part D PDE data) have no statutory foundation.

The statute does not require or authorize CMS to consider PDE data in assessing the marketing status of a generic or biosimilar, let alone allow CMS to ignore all other sources of marketing information. Relying exclusively on PDE data to determine when a generic or biosimilar is marketed is inappropriate. PDE data only reflects Part D claims: Part D plans are a subset of payors, which themselves are a subset of the larger biopharmaceutical marketplace, and a subset that pays for newly-approved drugs later than other segments of the pharmaceutical marketplace. And Medicare Part D plans are “notably slower than commercial plans in coverage of first generics. . . . For the 2021 Medicare Part D plan year, on average, only 21% of first generics that launched in 2020 were covered by plan formularies.”²⁰ Further, the same analysis by the Association for Accessible Medicines found that “it takes nearly three years before first generics are covered on more than half of Medicare Part D formularies.”²¹ This delayed utilization pattern is consistent with the fact that CMS allows Part D plans’ Pharmacy and Therapeutics Committees a lengthy period to review new drugs and decide whether to place them on formulary.²² In short, relying solely on PDE data to determine when a new generic or biosimilar is marketed is an arbitrary and irrational approach that inevitably will miss most of the evidence on marketing and determine an incorrect date for when marketing of the product began.

CMS should remove the concept of “bona fide marketing” and the planned reliance on PDE data from the Guidance. CMS should determine whether a product is “marketed” based on the common understanding of that term, not based on a strangely narrow concept of marketing that would shut out all evidence of marketing activities except whatever PDE data may “reveal.” CMS’ Part D Inflation Rebate Guidance suggests a simple way to determine when a drug is marketed: “the date that the drug is first marketed would be the date that the

²⁰ Association for Accessible Medicines (AAM), New Generics are Less Available in Medicare than Commercial Plans: New Evidence Shows Medicare Part D Plans Continue to Fail to Get New Generics to Seniors (July 2021).

²¹ AAM, New Generics are Less Available in Medicare than Commercial Plans: New Evidence Shows Medicare Part D Plans Continue to Fail to Get New Generics to Seniors, supra.

²² Medicare Prescription Drug Benefit Manual, chap. 6, section 30.1.5 (Part D plans’ P&T committees should generally make a “reasonable effort” to review a newly-approved drug within 90 days and decide whether to add the drug to the plan formulary within 180 days, or provide a “clinical justification” for not meeting this timeframe); section 30.2.5 (even for new drugs in the Part D six protected classes, plan P&T committees have 90 days to review the new drug and add it to the plan’s formulary).

manufacturer reports for the drug as its 'market date' to the Medicaid Drug Rebate Program."²³ We urge CMS to rely on that simple approach, which is consistent with defining marketing as "the introduction or delivery for introduction into interstate commerce of a drug product"²⁴ in accordance with its ordinary meaning.

* * *

We thank CMS for the opportunity to comment on this very important matter. We hope that CMS will take our feedback, as well as that of PhRMA, into consideration as it revises the Guidance to ensure it conforms with the statute and ultimately provides the best environment for patients to access novel medicines. If you have any questions, please do not hesitate to contact Emily Baron at emily.baron@astellas.com.

Sincerely,

A handwritten signature in cursive script that reads "Emily Baron".

**RE: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price
Applicability Year 2026, and Solicitation of Comments**

Dear Deputy Administrator Seshamani,

AstraZeneca is a global, science-led biopharmaceutical company that focuses on the discovery, development and commercialization of prescription medicines, primarily for the treatment of diseases in three therapy areas – Oncology, Cardiovascular, Renal & Metabolism (CVRM) and Respiratory & Immunology. AstraZeneca operates in over 100 countries and its innovative medicines are used by millions of patients worldwide.

AstraZeneca appreciates the opportunity to submit comments in response to the above captioned guidance (the “Guidance”) setting forth the Centers for Medicare & Medicaid Services' (CMS's) proposed policies for implementing the Medicare Drug Price Negotiation Program (Negotiation Program) for initial price applicability year (IPAY) 2026. We have provided comments regarding the Guidance in a section-by-section format, below. Our key areas of focus can be summarized as follows:

- **AstraZeneca appreciates CMS's recognition of Congressional intent to exclude orphan drugs from the Negotiation Program as well as CMS's request for feedback about how to best preserve the orphan drug development pipeline. AstraZeneca urges CMS to support orphan drug development by clarifying that, in the context of an orphan drug, the 7- or 11-year period that must elapse before a drug can be considered for negotiation begins upon the date that the orphan drug exclusion no longer applies.** CMS should issue additional guidance to clarify that the orphan drug exclusion entirely insulates a product (including any revenues) from the IRA's negotiation provisions for the entire duration the exclusion applies. Notably, the orphan drug exclusion constitutes a threshold exclusion from the definition of a QSSD. It must follow from this structural placement that the 7- or 11-year pre-negotiation period that would otherwise apply to a QSSD is *tolled* until the first day after the orphan drug no longer meets the requirements of the orphan drug exclusion. This approach will better enable innovator

companies to initially pursue orphan indications by initiating the pre-negotiation period only upon a subsequent approval for a distinct disease or condition. We appreciate CMS's focus on the importance of orphan drugs to the patients who need them and support CMS implementing policies that recognize and considers the individual contributions of each orphan indication as it evaluates Medicare spending and other negotiation factors.

- **To preserve the incentive structure established by the Orphan Drug Act (ODA), AstraZeneca also asks CMS to exclude from negotiation any product for which all indications, in the aggregate, treat fewer than 200,000 patients in the United States.** The express purpose of the ODA is to encourage the development of innovative pharmaceutical products to treat diseases and conditions with very small patient populations, defined by Congress as those affecting fewer than 200,000 persons in the United States. While the IRA includes an orphan drug exclusion, evincing a clear intent to preserve Congress' longstanding support and incentives for drugs treating small patient populations, namely populations of fewer than 200,000 patients, CMS's proposed approach to implementing this exception fundamentally disrupts this purpose by leaving unprotected rare disease therapies that treat fewer than 200,000 patients even across multiple indications.
- **AstraZeneca supports CMS's approach to ranking and selecting drugs based on Total Expenditures.** We support the approach laid out in Section 30.2 for identifying the 50 qualifying drugs with the highest Total Expenditures during the applicable 12-month period and the approach under Section 30.3 for selecting the 10 highest-ranking negotiation-eligible drugs for negotiation in rank order.
- **AstraZeneca urges CMS to take a multi-faceted approach to considering a selected drug's clinical value.** While AstraZeneca appreciates that CMS is required by statute to take into consideration certain manufacturer-specific factors in setting the maximum fair price (MFP) for a selected drug, we note that such factors are to be considered only "as applicable to the drug" and not all of the statutory negotiation factors must be weighted equally. An unbalanced reliance on specific factors may result in an arbitrary pricing methodology. We recommend that CMS replace its proposed approach with one that is multifaceted and accounts for the clinical value of a product using 5 key principles (outlined below). We also encourage CMS to implement an MFP methodology that provides the MFP ceiling price for medicines that either treat conditions with an unmet need or represent a significant therapeutic advance.
- **AstraZeneca urges CMS to provide a more detailed framework regarding how the agency intends to consider therapeutic alternatives and evaluate comparative effectiveness, and to engage manufacturers of selected drugs regarding the selection of therapeutic alternatives.** While CMS outlines a flexible approach to considering therapeutic alternatives and evaluating comparative effectiveness, there are numerous open

questions that warrant CMS engaging the selected drug manufacturer regarding the methodology.

- **AstraZeneca supports CMS’s policy of not considering QALYs for purposes of the Negotiation Process, which is consistent with the plain statutory language of the IRA.** We similarly support the agency's scrutiny of any comparative effectiveness research that may rely on QALYs for its conclusions.

Below, we describe each of the above comments in greater detail, in the order they appear in the guidance, and offer additional recommendations for CMS’s consideration:

I. Section 30: Identification of Selected Drugs for Initial Price Applicability Year 2026

AstraZeneca understands that CMS is issuing Section 30 of the Guidance in final form without an opportunity to comment. However, AstraZeneca is concerned that CMS is moving forward with policies that significantly reshape the way drugs are priced in the Medicare program without providing the public with the opportunity for comment, particularly because some of the policies described in Section 30 exceed the agency's statutory authority, and others pose significant policy or operational concerns that the agency may not have considered. AstraZeneca is therefore submitting comments on Section 30 and urges CMS to consider these comments as the Agency implements the Negotiation Program.

A. CMS's “qualifying single source drug” definition is overly broad and not supported by the statute. (Section 30.1)

CMS is defining the term “qualifying single source drug” (QSSD) broadly to include all dosage forms and strengths of the drug with the same active moiety (or for biologics, active ingredient) and the same holder of the New Drug Application (NDA) (or for biologics, Biological License Application (BLA)), inclusive of products that are marketed pursuant to different NDAs or BLAs.

CMS’s QSSD definition is overly broad and not supported by the statute. Section 1192(e)(1) of the Act outlines the definitional criteria for QSSDs. For both small-molecule drugs and large-molecule biological products, the statute unambiguously anchors the QSSD definition to the *singular* approval by the Food and Drug Administration (FDA) under which the product is marketed.¹ The statute in no way authorizes CMS to convert the statute's focus on a *singular* FDA

¹ For drugs to be a QSSD, section 1192(e)(1) of the Act requires only that the drug be “approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act and is marketed pursuant to such approval.” Likewise for biological products, section 1192(e)(2) requires only that the biological product be “licensed under section 351(a) of the Public Health Service Act and is marketed under section 351 of such Act.” Canons of statutory construction suggest that a legislative drafter writes precisely and in accordance with the rules of grammar. *See, e.g.,* *Arcadia v. Ohio Power Co.*, 498 U.S. 73, 79 (1990) (“In casual conversation, perhaps, such absent-minded duplication and omission are possible,

approval to a definition that sweeps in products with multiple separate FDA approvals through the addition of an “active moiety/ingredient” test. As such, the term QSSD should be defined no more broadly than the NDA/BLA, which is the approval under which the product is originally marketed.

CMS’s reliance on section 1192(d)(3)(B) of the Act to support its aggregation of NDA/BLAs in identifying QSSDs is misplaced because it ignores sequential placement of the QSSD definition relative to the “total expenditures” calculation. Section 1192(d)(3)(B) of the Act describes the aggregation of *dosage forms and strengths* for purposes of calculating Parts B and D total expenditures to determine whether a drug that is *already* a QSSD qualifies as a “negotiation-eligible” drug. Section 1192(d)(3)(B) does not govern the identification of the underlying QSSD. Stated differently, section 1192(d)(3)(B) applies *after* the QSSD is identified and ensures that the different dosage forms and strengths of a QSSD are incorporated into the total expenditure calculation. This requirement is intended to account for the common circumstance where a single NDA/BLA, and even a single supplemental NDA/BLA, can have multiple dosage forms and strengths.

Additionally, CMS’s aggregate approach to defining QSSD may stymie innovation and limit patient access to new therapies that could improve their health outcomes. Pursuing FDA approval for a new product affords patient access to new scientific advances, including products that are easier to administer, have fewer side effects, or treat new indications.² However, obtaining such approval involves a significant expenditure of resources, even if the new product shares the same active ingredient/moiety with an existing therapy. If CMS aggregates separate NDAs/BLAs into a single QSSD, manufacturers will be deterred from making investments that would otherwise advance the scientific understanding of disease states and bring new scientific applications to bear for patients.

- B. AstraZeneca supports CMS’s proposal that a generic/biosimilar for “any of the strengths or dosage forms of the potential qualifying single source drug” would disqualify the drug/biological product from the QSSD definition. (Section 30.1)

CMS states that “[i]f any strength or dosage form of a potential qualifying single source drug is the listed drug or reference product, as applicable, for one or more generic or biosimilar biological products that CMS determines are approved and marketed . . . the potential qualifying

but Congress is not presumed to draft its laws that way.”) Thus, Congressional reference to only a singular approval should be given weight. *See, e.g., Niz-Chavez v. Garland*, 141 S. Ct. 1474, 1480 (2021) (emphasizing the use of “the singular article ‘a’” to conclude that the statute referred to a singular term).

² For instance, we received NDA approval from FDA in 2014 for LYNPARZA (Olaparib) capsules, which had a recommended dosage of 8 capsules per day. Following subsequent research and development, we received a separate NDA approval from FDA in 2017 for LYNPARZA (olaparib) tablets, which formulation reduced the recommended dosage to 2 tablets per day. As another example, CALQUENCE launched a new formulation in 2022, which now allows for co-administration with proton-pump inhibitors. And FASENRA launched a new method of administration in 2019—an autoinjector that can be administered by a patient or caregiver following proper training and if the healthcare provider deems it appropriate.

single source drug will not be considered a qualifying single source drug for initial price applicability year 2026.”³

While AstraZeneca opposes CMS’s QSSD definition, to the extent CMS proceeds with such an overly expansive interpretation, AstraZeneca would support CMS’s policy position in relation to the impact of generic/biosimilar competition on a QSSD. Specifically, since CMS’s QSSD definition is so broad, it is necessary (as a limiting principle) that a generic/biosimilar for *any* of the branded product’s strengths and/or dosage forms is a sufficient condition to disqualify the potential QSSD, particularly because generic/biosimilar manufacturers may not seek approval for all of the strengths or dosage forms of the branded product. However, we have some concerns regarding CMS’s proposal with respect to confirming the presence of “bona fide” marketing of the generic or biosimilar product, as outlined in greater detail in our comments in response below to Section 90.4.

C. CMS should support orphan drug development and access. (Section 30.1.1)

CMS proposes to interpret the orphan drug exclusion under section 1192(e)(3)(A) of the Act as applying to a drug or biological product that must (1) be designated as a drug for only one rare disease or condition under section 526 of the Food, Drug & Cosmetics (FD&C) Act and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition.⁴ As described in the Guidance, all dosage forms and strengths and different formulations of the QSSD must meet the criteria for the exclusion.⁵ CMS would then use the FDA’s Orphan Drug Product designation database and approvals on the FDA website to identify a qualifying orphan drug. Importantly, CMS states that it is “considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development.”⁶

As described below, developing drugs for orphan diseases and rare cancers is an exceedingly challenging proposition and many orphan diseases still lack an approved therapy. It is therefore essential that CMS implement the IRA’s orphan drug exclusion in a manner that encourages the continued development of orphan therapies, consistent with the intent of the Orphan Drug Act.

- i. *Developing drugs for orphan diseases is an exceptionally costly effort that poses unique challenges, but often paves the way for therapeutic advance.*

While each rare disease affects a relatively limited patient population, in the aggregate, rare diseases affect a significant number of Americans. There are approximately 30 million

³ Guidance at 10.

⁴ Guidance at 11.

⁵ *Id.*

⁶ *Id.* at 11.

people living with over 7,000 rare diseases (including rare cancers) in the United States, including millions of Medicare beneficiaries.⁷ Many of these rare diseases are debilitating and costly, negatively affecting the quality of life not only for the patients but their families and caregivers.⁸ Rare cancer conditions, which are further subdivided into many orphan sub-types, are particularly devastating and are estimated to represent a quarter of all cancer deaths.⁹ Further, supporting orphan drug development is a health equity issue. According to the National Institutes of Health, Black Americans have higher death rates for many cancer types, Hispanic and Black women have higher rates of cervical cancer, and American Indians/Alaska Natives have higher death rates from kidney cancer.¹⁰

Although there has been a significant increase in the number of drugs approved to treat rare diseases since the ODA was enacted 40 years ago, over 90 percent of known rare diseases still do not have a treatment. This is due, in part, to circumstances unique to rare diseases that further complicate the extremely costly¹¹ and high-risk¹² drug-development process.

The FDA Oncology Center for Excellence (OCE) has outlined some of the challenges to developing drugs to treat rare cancers.¹³ For example, it can be challenging to enroll a sufficient number of patients in clinical trials for rare diseases given small patient numbers, uneven distribution of disease across populations, and heterogeneity of diseases (e.g., subtype, states, and exposure to prior treatment). It is similarly challenging to design clinical trials for rare disease populations given difficulties designating an appropriate comparator, validating novel endpoints, and obtaining sufficient data from small patient populations. Obtaining the high-quality data necessary to evaluate the clinical trial outcomes for orphan diseases is also a challenge given diversity in clinical presentation, disease progress, and other patient characteristics. In addition, there may be limited or lack of timely access to molecular testing to determine eligibility for treatment with targeted therapies.

Meanwhile, because many rare disease drugs are the first and/or only products for a given disease, rare diseases lend themselves to being a starting point in the translation of new scientific

discoveries to clinical medicine. As data emerge, drug manufacturers sometimes identify promising new uses for existing orphan therapies – in many cases for additional orphan indications. In addition to identifying patient needs and scientific pathways, there needs to be a business case for making this investment since the exploration of new indications requires significant resources. Indeed, one of the challenges OCE highlights with respect to the development of drugs for rare cancers is “[d]ecreased financial incentives for drug development.”¹⁴

- ii. *We appreciate CMS’s focus on the importance of orphan drugs to patients who need them and support CMS implementing policies that recognize and evaluate the individual contributions of each orphan indication as it evaluates Medicare spending and other negotiation factors for orphan products. AstraZeneca believes that CMS can take additional actions to “best support orphan drug development” as it relates to the implementation of the orphan drug exclusion, including by excluding drugs from the Negotiation Program that treat indications with a collective total of fewer than 200,000 patients to preserve the incentives for orphan drug development created by Congress in the Orphan Drug Act.*

The stated purpose of the ODA, as enacted by Congress in 1983, is to “provide financial incentives” to manufacturers for diseases and conditions “which affect such small numbers of individuals residing in the United States.”¹⁵ Specifically, the express purpose of the ODA is to encourage the development of innovative pharmaceutical products to treat diseases and conditions with very small patient populations, defined by Congress as those affecting fewer than 200,000 persons in the United States.¹⁶ The FDA, the agency with direct oversight of this program, recognizes this clear purpose, noting that it is challenging to create treatments and cures for rare diseases, including “...the complex biology and the lack of understanding of the natural history of many rare diseases. The inherently small population of patients with a rare disease can also make conducting clinical trials difficult.”¹⁷

In passing the IRA, Congress included orphan drugs as one of just three exclusions from the QSSD definition, evincing a clear intent to preserve Congress’ longstanding support and incentives for drugs treating small patient populations, namely populations of fewer than 200,000 patients.¹⁸

¹⁴ *Id.*

¹⁵ Orphan Drug Act of 1983, Pub. L. 97–414, §1(b), Jan. 4, 1983, 96 Stat. 2049.

¹⁶ The ODA defines the term “rare disease or condition” to mean “any disease or condition which (A) affects less than 200,000 persons in the United States, or (B) affects more than 200,000 in the United States and for which there is no reasonable expectation that the cost of developing and making available in the United States a drug for such disease or condition will be recovered from sales in the United States of such drug.” See 21 U.S.C. § 360bb(a)(2).

“Rare Diseases at FDA,” Available at <https://www.fda.gov/patients/rare-diseases-fda> (Accessed April 7, 2023).

CMS's proposed approach to implementing Congress's exemption, however, fundamentally disrupts this purpose by leaving unprotected rare disease and rare cancer therapies that treat fewer than 200,000 patients even across multiple indications. When designating a drug as an orphan drug, FDA pays careful attention to the 200,000 patient prevalence limit. Further, FDA acknowledges that a drug may show promise even in multiple, different rare diseases. Such drugs may be eligible for multiple orphan designations because FDA considers the prevalence within each disease or condition.

By way of example, in 2014 the FDA approved AstraZeneca's LYNPARZA® (olaparib) as an oral orphan-designated monotherapy for patients with deleterious or suspected deleterious germline BRCA mutated (as detected by an FDA-approved test) advanced ovarian cancer who have been treated with three or more prior lines of chemotherapy.¹⁹ AstraZeneca has since continued to invest in advanced clinical research to refine and bring the clinical benefits of LYNPARZA to other patient populations: recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer (in 2017),²⁰ human epidermal growth factor receptor 2 (HER-2)-negative metastatic breast cancer (in 2018),²¹ gBRCAm metastatic pancreatic adenocarcinoma (in 2019),²² and somatic homologous recombination repair (HRR) gene-mutated metastatic castration-resistant prostate cancer (mCRPC) (in 2020).²³ Using the highest U.S. prevalence numbers available, the current total estimated disease prevalence across all four conditions is estimated to be less than 50,000 patients,²⁴ still far fewer than the 200,000 patient size contemplated by Congress in enacting the ODA. Yet, under CMS' proposed interpretation of the IRA's orphan drug exclusion, the 2018 approval of LYNPARZA for metastatic breast cancer likely would have resulted in the loss of the orphan drug exclusion for LYNPARZA from 2014 for advanced ovarian cancer, at a time when the therapy was approved for a small patient combined population.

LYNPARZA and other rare oncology products are often approved in late-stage treatment before data becomes available in front-line and adjuvant treatment trials. Furthermore, long-term follow-up on overall survivability can take five or more years and comes at significant cost. Moving forward, if a manufacturer knows further investment in an oncology product is running against a negotiation clock, companies may delay launch of or choose to not move forward in advancing research to learn whether a particular drug might also treat other conditions.

As is clear, CMS's approach will have the effect of including in the Negotiation Program orphan drugs treating patient populations well below the 200,000 threshold Congress sought to protect in the ODA, undermining the ODA's purpose and disturbing a carefully crafted framework

²⁴ Analysis conducted based on disease prevalence numbers reported in the National Organization for Rare Disorders' Rare Disease Database (available at <https://rarediseases.org/rare-diseases>).

that has been remarkably successful in bringing new lifesaving treatments to patient populations that may otherwise have lacked access to any therapy for their rare condition.

In light of these significant concerns, we strongly urge CMS to exclude from negotiation any drug that, in aggregate, treats indications for which there are fewer than 200,000 patients.

- iii. *The 7- or 11-year period that must elapse before a drug or biological can be subject to negotiation should begin on the date a drug loses eligibility for the orphan drug exclusion.*

In the case of a drug that initially qualifies for the orphan drug exclusion from inclusion in a QSSD as outlined above, CMS should clarify that the 7- or 11-year period prior to negotiation eligibility begins to run only upon the loss of the orphan drug exclusion.

As discussed above, pursuant to section 1192(e) of the Act, a drug can only be classified as a QSSD (and hence be subject to negotiation) once “*at least 7 years...since the date of such approval [under section 505(c)]*” or “*at least 11 years...since the date of such licensure [under section 351(a)]*” have elapsed. This language must be read in the context of the orphan drug exclusion, which provides that: “[T]he term ‘qualifying single source drug’ does not include any of the following . . . [a] drug that is designated as a drug for only one rare disease or condition under section 526 of the [FDCA] and for which the only approved indication (or indications) is for such disease or condition.”²⁵

Under CMS’s guidance, a drug that initially qualifies for the orphan drug exclusion would lose this exclusion, and could potentially be classified as a QSSD, following the approval, with respect to the same active moiety, of a non-orphan indication or a new orphan indication for a distinct disease or condition. CMS’s guidance, however, does not address *when* such a drug could potentially be classified as a QSSD and hence becomes eligible for negotiation.

CMS should issue additional guidance to clarify that the 7- or 11-year pre-negotiation period would commence only upon the date a drug loses eligibility for the orphan drug exclusion. This outcome is supported by the statute’s plain language and scheme. Notably, the orphan drug exclusion constitutes a threshold exclusion from the definition of a QSSD.²⁶ It must follow from this structural placement that the 7- or 11-year pre-negotiation period that would otherwise apply to a QSSD is *tolled* until the first day after the orphan drug no longer meets the requirements of the orphan drug exclusion. Indeed, any other approach would defeat the intent of excluding relevant orphan drugs from the QSSD definition, including the statutory sub-elements. (Consider,

²⁵ See SSA § 1192(e)(3)(A).

²⁶ See SSA § 1192(e)(3)(A) (“Exclusions.—In this part, the term [QSSD] does not include any of the following...(A) Certain Orphan Drugs.”)

by contrast, the small-biotech exclusion, which was specifically inserted as an exclusion to the definition of a “*negotiation-eligible drug*” under section 1192(d)(2) of the Act.)²⁷

By issuing guidance that sets forth the interaction between the orphan drug exclusion and the QSSD definition in this way, CMS will be following the plain text of the statute. Additionally, we believe that CMS should interpret the Medicare Negotiation program in a way that supports and safeguards the important progress the ODA has achieved in sharing the benefits of medical innovation with patients with orphan diseases. The approach outlined here better enables innovator companies to pursue orphan indications by initiating the pre-negotiation period only upon a subsequent approval for a distinct disease or condition.

- iv. *CMS should carve out the original orphan drug exclusion-eligible indication when a product becomes QSSD eligible*

Under CMS’s guidance, a drug that initially qualifies for the orphan drug exclusion would lose this exclusion, and could potentially be classified as a QSSD, following the approval, with respect to the same active moiety, of a non-orphan indication or a new orphan indication for a distinct disease or condition. In the case of a drug that initially qualifies for the orphan drug exclusion from inclusion in a QSSD as outlined above, CMS should carve out the original approval(s) under the original orphan designation of the active moiety or active ingredient (and associated Total Expenditures) from the resulting QSSD which includes the subsequent or supplemental approvals of the active moiety or ingredient which do not qualify for the orphan drug exclusion.

As also above, pursuant to section 1192(e) “the term ‘qualifying single source drug’ does not include. . . [a] drug that is designated as a drug for only one rare disease or condition under section 526 of the [FDCA] and for which the only approved indication (or indications) is for such disease or condition.” By carving out the initial exclusion eligible use of the product, CMS can preserve the intent of Congress to protect the development of orphan drugs while maintaining the ability to negotiated expanded uses of the same active moiety or ingredient otherwise identified as a QSSD.

- D. CMS should clarify that it will consider only 12 months of claims data to assess the applicability of the low-spend Medicare drug exclusion from the QSSD definition, and should exclude beneficiary cost sharing from such calculation. (Section 30.1.2)

For IPAY 2026, CMS states that it will identify low-spend Medicare drugs with less than \$200,000,000 in combined Part B and D expenditures (inclusive of beneficiary cost sharing) and exclude them from the QSSD definition pursuant to section 1192(e)(3)(B) of the Act by considering PDE and Part B claims data for dates of service between June 1, 2022, and May 31,

²⁷ See SSA § 1192(d)(2) (stating that “term ‘negotiation-eligible drug’ shall not include... a qualifying single source drug that meets [the listed criteria]”).

2023. However, CMS states that “[t]o allow a reasonable amount of time” for Part D plan sponsors and Part B providers/suppliers to submit the necessary data, CMS will consider claims submitted by June 30, 2023.

AstraZeneca requests that CMS clarify that the additional 30-day period is merely a “grace period” for submission of claims with a date of service that falls within the 12-month timespan, and any claims with a date of service before or after that 12-month period, including those with a date of service that falls within the 30-day grace period, will not be considered for purposes of applying the low-spend Medicare drug exclusion. If, on the other hand, CMS were to cost data beyond 12 months, this could improperly reduce the number of drugs excluded as low-spend and accelerate a given drug’s inclusion in the Negotiation Program.

Furthermore, we request CMS reconsider its proposed policy of including beneficiary cost sharing in determining whether a prospective QSSD falls below the low-spend Medicare drug exclusion threshold of \$200,000,000. Because beneficiary cost sharing amounts are not costs paid by Medicare, these amounts should not be considered “total expenditures under Parts B and D” for the purposes of applying the low-spend Medicare drug exclusion.

- E. CMS should publicly disclose the methodology for calculating total expenditures and create a process to engage manufacturers to address potentially incorrect total expenditure data. (Section 30.2)

CMS states that it will identify “negotiation-eligible” Part D drugs for IPAY 2026 based on reviewing PDE data for the 12-month applicable period.²⁸ After calculating total expenditures for each drug, CMS will remove drugs that satisfy the exclusions provided in statute (e.g., small biotech drugs) and then identify the 50 QSSDs that have the highest total expenditures under Part D.²⁹ AstraZeneca supports this approach. CMS does not indicate that its calculations will be made public.

AstraZeneca supports the modified definition of “gross prescription drug costs” that CMS finalized as part of the CY 2024 Part C & D Policy and Technical rulemaking.³⁰ However, we urge CMS to publish (1) the rankings of negotiation-eligible drugs, (2) the total expenditures corresponding to each selected drug, and (3) the methodology the agency used to calculate total expenditures. CMS should also provide manufacturers of selected drugs with an opportunity to review and propose corrections to total expenditure data and/or methodological errors prior to the publication of this information. We believe that this transparent approach would improve the operation of the Negotiation Program by establishing accountability and transparency.

²⁸ Guidance at 12.

²⁹ *Id.*

³⁰ CY 2024 Policy and Technical Changes to the Medicare Advantage Program, Medicare Prescription Drug Benefit Program, Medicare Cost Plan Program, and Programs of All-Inclusive Care for the Elderly, Final Rule (88 Fed. Reg. 22,120 (April 12, 2023))

F. CMS takes a reasonable approach to ranking and selecting drugs based on Total Expenditures (Sections 30.2 & 30.3)

AstraZeneca supports the approach laid out in Section 30.2 for identifying the 50 qualifying drugs with the highest Total Expenditures under Part D of Title XVIII for QSSDs during the applicable 12-month period using Part D prescription drug event (PDE) data for each qualifying single source drug for dates of service beginning June 1, 2022, and ending May 31, 2023. As CMS clarifies in footnote n.3 of this initial guidance, Total Expenditures under Part D of Title XVIII are defined in section 1191(c)(5) as total gross covered prescription drug costs (as defined in section 1860D-15(b)(3)), and further defined in the Part D regulations at 42 CFR § 423.308 as amended in the CY 2024 Part C & D Policy and Technical Rule.³¹ This approach removes any ambiguity and applies Congressional intent in ranking negotiation-eligible drugs based on total gross drug spending in Medicare Part D.

CMS also clarifies in Section 30.3, after removing any biological products that qualify for delayed selection for biosimilar market entry, the agency will select the 10 highest-ranking negotiation-eligible drugs for negotiation in rank order. AstraZeneca supports this approach as it provides for the greatest amount of clarity and predictability for all stakeholders and complies with a clear reading of sections 1192(a) and 1192(b) of the statute.

II. Section 40: Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

A. CMS should not limit the Medicare Drug Price Negotiation Agreement (the “Agreement”) to the Primary Manufacturer as the Primary Manufacturer may not always be in the best position to negotiate with CMS. (Section 40)

AstraZeneca strongly disagrees with CMS's rigid approach to determining with which manufacturer it will sign an Agreement. To the extent that one or more manufacturers meet the statutory definition of a “manufacturer” under the Negotiation Program, CMS states that it intends to enter into an Agreement only with the Primary Manufacturer of a selected drug, and the agency does not intend to enter into an Agreement with any Secondary Manufacturer. CMS intends to designate the entity that holds the NDA(s)/BLA(s) for the selected drug to be the Primary Manufacturer.

As discussed above, co-commercialization agreements are extremely common in the development and marketing of pharmaceutical products. AstraZeneca is concerned that CMS's approach would force manufacturers to potentially share with each other competitively sensitive information that they would not otherwise share pursuant to the terms of the co-commercialization agreement. This is because CMS's approach effectively requires the Primary Manufacturer—the holder of the NDA(s)/BLA(s)—to serve as the intermediary for information that might be pertinent

³¹ *Id.*

only to the secondary manufacturer. For example, the statute requires CMS to consider “current unit costs of production and distribution of the drug” and “market data and revenue and sales volume.” While the sharing of this information may not necessarily amount to an antitrust violation, it may represent competitively sensitive information that the parties would not otherwise share, even in their co-commercialization agreements. At a minimum, CMS should make available a process to allow Secondary Manufacturers to share information directly with CMS where: (a) the Primary Manufacturer is by statute, regulation or contract prohibited from sharing such information held by the Secondary Manufacturer; and/or (b) sharing of information by the Secondary Manufacturer to the Primary Manufacturer could have an anticompetitive effect.

In the absence of a process whereby CMS permits the submission of data from Secondary Manufacturers (and imposes some burden of compliance on the Secondary Manufacturer), CMS's approach would require manufacturers to revisit their co-commercialization arrangements and revise them to fit CMS's inflexible mold as much as possible. While CMS may believe that contracting with only one manufacturer is administratively simple, AstraZeneca believes that as CMS progresses through the negotiation process itself, it will become increasingly apparent that CMS will not be able to obtain all the necessary information from the holder of the NDA(s)/BLA(s) that is needed to effectively negotiate, particularly if CMS proceeds with aggregating different NDAs/BLAs into a single QSSD. For example, under CMS's overbroad approach to defining a QSSD, there could be multiple NDA/BLA holders and thus multiple Primary Manufacturers for any given QSSD.

CMS's approach would also unfairly expose the Primary Manufacturer to liability for violations to the Agreement perpetrated by the Secondary Manufacturer that are beyond the control of the Primary Manufacturer. Holding the Primary Manufacturer liable for non-compliance of a Secondary Manufacturer is not only unsupported by the statute, it is also an inefficient approach to ensuring compliance. AstraZeneca doubts that it will be administratively burdensome for CMS to require any relevant Secondary Manufacturer to sign what will effectively be a boilerplate Agreement, or at the very least, a shorter agreement that legally obligates the Secondary Manufacturer to comply with the statute's requirements and submit information directly to CMS. Even if there is some administrative burden, such burden is substantially outweighed by the benefits of an approach where CMS is able to independently and separately hold each manufacturer liable for their own non-compliance.

- B. CMS should permit the submission of data on a rolling basis and provide manufacturers with the opportunity to review information prior to publication to ensure that there is no competitively sensitive information disclosed. (Section 40.2)

CMS states that the Primary Manufacturer of a selected drug must submit data to inform the negotiation process by October 2, 2023.³² Data elements will include: information on the non-Federal average manufacturer price (non-FAMP) and any information that CMS requires to carry

³² Guidance at 27-28.

out negotiation, including the manufacturer-specific negotiation factors (e.g., research and development costs, prior federal financial support, data on pending and approved patent applications).³³ Given the vague and broad nature of these data elements, and the limited time to compile them, AstraZeneca requests that CMS consider using its enforcement discretion to allow manufacturers of selected drugs to submit these data on a rolling basis, as long as a more limited set of data are reported by the October 2 deadline.

Between the time that a manufacturer is formally made aware that their drug has been selected for negotiation on the selected drug publication date (September 1) and the deadline that CMS would impose for the submission of negotiation data (October 2), only 30 days will have elapsed. It will be extremely difficult for manufacturers to collect all of the necessary data within this 30-day period, especially if CMS proceeds with its approach of requiring only the “Primary Manufacturer” to submit all necessary information. Indeed, given that securing competitively sensitive information from Secondary Manufacturers may impact existing regulatory or contractual protections of specific data elements, complying with the 30-day timeline for information held by Secondary Manufacturers and others may be an impossibility.

CMS should permit manufacturers to submit additional information after the October 2 deadline on a rolling basis with a final submission deadline at a later date.

CMS should also provide advance notice to manufacturers of drugs likely to be included on the selected drug list prior to the September 1 selected drug publication date to allow adequate time for data collection. Advanced notice will also provide manufacturers with the opportunity to engage with CMS and collect data in a manner and format that will be most helpful to the agency and the negotiation process.

Finally, AstraZeneca is concerned that CMS intends to treat only certain elements of the submitted data as proprietary information, protected from disclosure under Exemption 4 of the Freedom of Information Act (FOIA) and only available for use by CMS and the Comptroller General.³⁴ At a minimum, CMS should provide manufacturers of selected drugs with the opportunity to review data in advance of publication, including the explanation for the MFP as required under section 1195(a)(2) of the Act, to ensure that no competitively sensitive information is disclosed to the public.

C. CMS should reconsider the breadth of the destruction of data requirements proposed for Primary Manufacturers and impose parallel data destruction requirements on itself. (Section 40.2.2.)

CMS intends to impose certain requirements on the Primary Manufacturer related to the use, disclosure, and destruction of data and other information received during the negotiation

³³ *Id.*

³⁴ *Id.* at 29.

process.³⁵ This includes a prohibition on the Primary Manufacturer conducting audio or video recording of any oral conversation between CMS and the Primary Manufacturer.³⁶ All information that the Primary Manufacturer receives during the negotiation period from CMS must also be destroyed within 30 days of a determination that the drug or biologic is no longer a selected drug.³⁷

AstraZeneca is concerned that CMS's imposition of a destruction of data requirement on manufacturers is overly broad and could undermine the smooth operation of the Negotiation Program. We anticipate that some manufacturers may be “repeat” selected drug manufacturers due to the nature of their drug portfolios and Medicare spending patterns. Indeed, the lack of any limit to the number of drugs subject to future negotiation (subject only to the Low-Spend Medicare Drug Exclusion) means that it is virtually inevitable that multiple drugs of a single manufacturer will be subject to selection and negotiation over time. In such situations, it would be in the interest of the Negotiation Program for that manufacturer to have access to past learnings and negotiation processes to enable their incorporation into business practices that support the manufacturer’s future participation in the Negotiation Program. As an example, Primary Manufacturers will need to develop detailed workflows and procedures for the processing of data for submission to CMS, and such processes should not be undone as a result of an overbroad data destruction policy.

At the very least, CMS should clarify that, when it notes “all information...receiv[ed] during the negotiation period from CMS shall be destroyed,” this excludes any work product produced by the Primary Manufacturer (as opposed to *received* from CMS) during the negotiation process.³⁸ For example, AstraZeneca does not believe that written notes of the process itself and relevant issues (e.g., why some R&D data is not acceptable/relevant) should be subject to destruction. Manufacturers should be able to maintain any manufacturer-created documents, including policies and procedures, as a matter of internal record, even if such documents are a reflection of learnings from the negotiation process.

If CMS moves forward with the overly broad data destruction policy proposed in the Guidance, AstraZeneca believes that CMS should hold itself to the same data-destruction requirements in the interest of public accountability and fairness. Nowhere in the Guidance does CMS discuss the agency's own use of the same information exchanged during the negotiation process, suggesting that CMS will be able to keep all information it receives and/or share such information as it pleases, including information *received* from a Primary Manufacturer, even after the selected drug status of the drug or biological product in question terminates. AstraZeneca does not believe that CMS should be able to retain such information in perpetuity, particularly while CMS imposes one-sided data destruction requirements on the Primary Manufacturer.

³⁵ Guidance at 30.

³⁶ *Id.*

³⁷ *Id.*

³⁸ *Id.*

D. CMS should establish a mechanism to allow dispensers access to the MFP at the point-of-sale, similar to the existing Part D Coverage Gap Discount Program. (Section 40.4)

CMS intends to require the Primary Manufacturer to ensure that entities that dispense drugs to MFP-eligible individuals, including pharmacies, mail order services, and other dispensers, have access to the MFP for the selected drug, meaning that the dispensing entity must pay no greater than the MFP for the selected drug.³⁹ CMS will allow Primary Manufacturers to comply with this requirement in one of two ways: (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP (point-of-sale access); or (2) providing retrospective reimbursement for the difference between the entity's acquisition cost and the MFP within 14 days.⁴⁰ A Primary Manufacturer would be required to retain, for at least ten years from the date of sale, any records relating to sales of the selected drug to entities that dispense the selected drug to MFP-eligible individuals, including pharmacies, mail order services, and other dispensers for units of selected drug.⁴¹

We do not believe option (1) presents a practical method for providing the MFP to MFP-eligible individuals. As pharmaceutical products are not designated for a specific patient at the point of sale by a dispensing entity from the wholesaler or distributor, no mechanism currently exists in the supply chain to ensure that products purchased at MFP would be dispensed to an MFP-eligible individual. Further, most drug purchases by dispensing entities are from wholesalers and specialty distributors; accordingly, effectuating a patient-based purchasing price model would depend on the cooperation of wholesalers and specialty distributors themselves, who are not held directly liable for non-compliance with the requirement to offer the MFP. Additionally, AstraZeneca believes that these types of models would lead to significant diversion of drugs purchased at MFP to non-MFP eligible patients.

In addition, while we support the concept of providing retrospective reimbursement to effectuate the MFP, existing retrospective reimbursement mechanisms are not designed to provide payment from a manufacturer directly to a dispensing entity, nor do current systems support a payment window as short as 14 days. Rather, these payments are made (after a minimum of 30 days) to large Group Purchasing Organizations or Pharmacy Benefit Managers, who are then responsible for the pass-through of those discounts to their member entities. Existing models also would not presently ensure that MFP-related retrospective reimbursements would be passed through to the dispensing entity itself. Existing infrastructure does not support the exchange of dispensing data from the pharmacy to the manufacturer, nor do manufacturers store payment data for each individual pharmacy to allow for direct reimbursement. Any such exchange of data would almost certainly exceed a 14-day period of time and therefore render CMS's approach operationally unfeasible.

³⁹ *Id.* at 31-32.

⁴⁰ *Id.* at 32.

⁴¹ *Id.*

AstraZeneca therefore supports the industry’s recommended approach, as outlined by PhRMA and BIO, to implement the MFP along the lines of the current Part D Coverage Gap Discount Program (CGDP), which facilitates manufacturer price concessions at the point-of-sale (POS) for Part D beneficiaries. Under the current CGDP, CMS relies on a third-party administrator (TPA) to aggregate Part D data, distribute invoices to manufacturers, reconcile disputes, and reimburse Part D plans for “advancing” access to the manufacturer discount at the point-of-sale. This current process could easily accommodate access to the MFP at the point-of-sale, ensuring that dispensers receive the full benefit of the MFP at the time of dispensing of an MFP-eligible drug, rather than relying on a lengthy reimbursement methodology. CMS could also impose requirements on Part D sponsors to validate that a drug is a selected drug offered to an MFP-eligible individual, and to ensure there are no multiple discounts (e.g., 340B discounts, discounts provided under the new Manufacturer Discount Program).

AstraZeneca also opposes CMS’s requirement that the Primary Manufacturer retain for at least ten years from the date of sale any records relating to sales of the selected drug to entities that dispense the selected drug to MFP-eligible individuals. Maintaining such detailed data for ten years is extraordinarily burdensome and costly. AstraZeneca recommends that CMS reduce the required timeframe to 6 years, consistent with the statute of limitations for the False Claims Act⁴².

- E. CMS should separately require the Secondary Manufacturer of any selected drug to make the MFP available to MFP-eligible individuals and entities rather than hold the Primary Manufacturer responsible for behavior beyond their control. (Section 40.4)

CMS states that Primary Manufacturers would be responsible for ensuring that the MFP is made available to pharmacies, mail order services, and other dispensers that dispense the selected drug to MFP-eligible individuals, including to ensure that the MFP is available for units of the selected drug for which there is a Secondary Manufacturer.⁴³

As stated above, we do not believe it is appropriate for CMS to hold Primary Manufacturers liable for any and all violations of Secondary Manufacturers with respect to making the MFP accessible to eligible entities. We further do not see any impediment to CMS directly binding Secondary Manufacturers to these same requirements via separate agreements, particularly if CMS adopts such a broad approach to defining a QSSD under which the manufacturer marketing a particular product may or may not be the Primary Manufacturer. The statute does not distinguish between “Primary” and “Secondary” manufacturers, and while CMS may believe this distinction contributes to administrative simplicity, as soon as legal obligations and consequences (e.g., civil monetary penalties) attach to the agency’s administrative decisions, such decisions must be supported by the statute. Absent clear statutory authorization, CMS cannot impose legal liability on one manufacturer for the violations of a different manufacturer; the agency must directly impose the consequences of any violation on the violating entity.

⁴² 31 U.S.C. § 3731(b)(1).

⁴³ Guidance at 32.

III. Section 50: Negotiation Factors

AstraZeneca supports CMS's solicitation of information from patients and Medicare beneficiaries to inform the negotiation process and urges CMS to give substantial weight to the patient voice. We further support CMS's policy of not considering quality-adjusted life years (QALYs) for purposes of the Negotiation Program and the agency's close scrutiny of any comparative effectiveness research that may rely on QALYs for its conclusions. However, we urge CMS to allow for manufacturer input regarding the selection of therapeutic alternatives, and to develop a more detailed framework for how the agency will consider therapeutic alternatives and comparative effectiveness data based on five core principles.

A. AstraZeneca supports CMS's solicitation of information from patients and Medicare beneficiaries and urges CMS to give substantial weight to the patient voice (Section 50.2).

As described in the Guidance, CMS will consider therapeutic alternative and comparative effectiveness data submitted by Medicare beneficiaries, academic experts, clinicians, and other interested members of the public.¹⁹ We strongly support this solicitation, and we note the patient voice is often ignored, even in the comparative effectiveness research that purports to assess the best treatments for patients. This is particularly true for minority and underserved people living with rare diseases, who face additional disparities in access to care, including differences in health care utilization, delayed or missed care due to a lack of transportation or work flexibility, and a lack of representation in clinical trials and research. AstraZeneca therefore urges CMS to give substantial weight to the patient experience in CMS's evaluation of therapeutic alternatives and comparative effectiveness. Factors such as patient convenience due to route of administration, caregiver burden, and improvements in quality of life not otherwise measured by endpoints in a clinical trial nevertheless represent a significant benefit to the patient experience. Such a seemingly innocuous benefit can directly impact other health outcome metrics, such as medication adherence and patient self-sufficiency, through an improved ability to consistently engage in gainful employment. We urge CMS to not only take into account the beneficiary and caregiver experience, but to prioritize it when evaluating the value of a drug product.

B. CMS should develop a more detailed framework for how the agency will consider therapeutic alternative and comparative effectiveness data based on five core principles (Section 50.2)

As described in the Guidance, CMS will consider therapeutic alternative and comparative effectiveness data submitted by Medicare beneficiaries, academic experts, clinicians, and other interested members of the public.²¹ Improved clinical outcomes for patients should be a shared objective between CMS and pharmaceutical manufacturers and multifaceted consideration of a selected drug's clinical value should be the basis of any evaluation. AstraZeneca supports a framework for assessment of clinical value that considers the following five core principles:

1. The process of clinical value assessment should be transparent. Using scientific principles, consistent methodology, and appropriate evidence, various stakeholders should be able to come to similar conclusions.

2. While adhering to consistent methodology, clinical value assessments should consider contextual factors associated with the disease in question. This is particularly important for diseases associated with high unmet need. Aside from the obvious recruitment challenges in rare disease clinical trials, the basic pathophysiology of many rare diseases is less well understood compared to more common diseases. Because of this, clinical trials for rare disease treatments may be non-comparative and often use endpoints that are not specifically developed to capture the full impact of the rare disease or its treatment. Further, cancer is not one disease but rather a cohort of related diseases that requires a range of treatments with different goals and outcomes that can vary over the course of the disease. Relevant trial endpoints therefore also vary according to cancer type (e.g., solid or blood cancers) and staging (I-IV), intent of treatment (e.g., curative vs. palliative) and feasibility, which is the likelihood of capturing relevant endpoint data (e.g., tumor growth and spread, quality of life assessments from people with cancer) within time and cost constraints.

It's also important to consider whether a drug was approved for a disease when there was no available or adequate therapy available, recognize progress against hard-to-treat illnesses, curative potential, impact to public health, and the impact of a product on health disparities and improved outcomes for underserved or historically marginalized groups.

3. Appropriate therapeutic alternatives must be assessed, based on clinical, not economic factors. Therapeutic alternatives should be licensed and approved for the disease in question and there should be sufficient data to make a valid assessment of each alternative's clinical value feasible. For many rare diseases with existing treatments, there may be only one appropriate therapeutic choice. And, as noted above, the manufacturer should have input regarding the identification of therapeutic alternatives.

4. The perspective of clinical value assessment should be multifaceted and inclusive of factors related to health equity. The assessment must include not just short-term efficacy endpoints used in clinical trials, but safety, long-term health outcomes, patient experience factors such as route and frequency of administration, impacts on population health equity, health system resource use, and societal impacts outside the healthcare system as well. A study conducted by the EveryLife Foundation²³ concluded that 55 percent of the total burden of rare diseases is experienced outside of the healthcare system. Importantly, these impacts are still very much part of the lived experience of rare disease patients.

In assessment of cancer treatment effect, particularly for early-stage cancer, consideration should be given to oncology-relevant endpoints other than overall survival (OS) which have intrinsic value for decision-making. In early-stage cancer OS data takes time to mature or may not be possible to collect in the longer term. Indication, intent of treatment, and feasibility of measuring patient-relevant outcomes (e.g., disease-free survival, relapse-free survival, delay or avoidance of

subsequent treatments, QoL) within a reasonable timeframe should be evaluated when considering oncology-relevant endpoints in value assessments to allow patients to benefit from innovative treatments.

Health equity deserves additional consideration. The Centers for Disease Control and Prevention defines health equity as, “the state in which everyone has a fair and just opportunity to attain their highest level of health.” Equity of access for cancer patients is vital, as the benefits are only seen if people with cancer are aware of treatment options, and able to access and adhere to treatment. A study in the *Journal of the American Medical Association* found in disadvantaged neighborhoods, a lack of physicians and healthcare resources, weak referral systems, poor social support networks, and barriers to travel for initial and ongoing care negatively impact outcomes for people with cancer.⁴⁴ Access to treatment options for these patients may address a disproportionately higher unmet medical need. Drugs targeting chronic conditions may present additional benefits to undertreated populations or minority groups disproportionately impacted by disease. For example, two recent clinical trials with sodium glucose co-transporter-2 (SGLT2) inhibitors, demonstrated a reduction in heart failure (HF) hospitalization or cardiovascular mortality risk in patients with HF and reduced ejection fraction (HFrEF) and signaled a potentially greater effect in Black and Asian patients randomized to treatment compared to other groups.⁴⁵ Health equity is also important in chronic diseases, such as COPD, where socioeconomic, occupational, and environmental factors, as well as access to healthcare, impacts prevalence and outcomes in different patient groups.⁴⁶

5. Data used to inform a clinical value assessment will need to come from a wide variety of sources. Appropriate data sources should include, but should not be limited to, clinical trials, patient registries, and other real-world data. Patient registries and other real-world data have been important sources of data to demonstrate the certain kinds of treatments that are hard to evaluate in clinical settings. Real-world data is also needed to assess some endpoints not easily measured in clinical trial settings, such as caregiver burden and non-medical costs. Data collected from patients via patient-reported outcomes (PROs) including quality of life, should be routinely and consistently incorporated into value assessments, along with the value components that are already used relating to safety and efficacy.

Finally, CMS should consider setting the MFP for selected drugs at the ceiling price for those products that meet the FDA’s definition of unmet need, evaluated across a product’s lifecycle; and products that represent a significant therapeutic advance. CMS’s definition of “unmet need” is narrower than the FDA definition and may dampen industry interest in the post-

⁴⁵ Morris AA *et al*, Sodium-Glucose Cotransporter-2 Inhibitors in Heart Failure: Racial Differences and a Potential for Reducing Disparities. *Circulation*, 2021.

⁴⁶ [Pleasant RA, Riley IL, Mannino DM. Defining and targeting health disparities in chronic obstructive pulmonary disease. *Int J Chron Obstruct Pulmon Dis*. 2016

approval research that often leads to additional indications for conditions or sub-populations with significant unmet need. Further, CMS could leverage the existing New Technology Add-On Pathway (NTAP) definition for “substantial clinical improvement” which provides the agency with an established measure for evaluating the value of certain products.

- C. AstraZeneca supports CMS’s policy of not considering QALYs in applying comparative effectiveness research, and urges CMS to give substantial weight to the patient voice and experience in its assessment of a selected drug’s comparative effectiveness. (Section 50.2)

As required by statute, CMS will assess a selected drug’s comparative effectiveness as compared to “therapeutic alternatives.”⁴⁷ In so doing, CMS stated the agency will not use evidence from comparative clinical effectiveness research that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill, including quality-adjusted life years (QALYs).⁴⁸ To the extent studies regarding comparative effectiveness employ QALYs in its analysis, CMS will not consider it unless it is able to separate such evidence.⁴⁹ AstraZeneca supports CMS’s policy of not considering QALYs for purposes of the Negotiation Process, which is consistent with the plain statutory language of the IRA. We similarly support the agency’s scrutiny of any comparative effectiveness research that may rely on QALYs for its conclusions.

- D. CMS should allow for manufacturer input on the selection of therapeutic alternatives and on the development of a more detailed framework for how the agency will identify therapeutic alternatives and evaluate comparative effectiveness. (Section 50.2)

AstraZeneca further urges CMS to allow for manufacturer input into the selection of therapeutic alternatives in applying comparative effectiveness research as part of the Negotiation Program. In the Guidance, CMS outlines a flexible approach to considering therapeutic alternatives and evaluating comparative effectiveness. We note that AstraZeneca has serious concerns that certain studies have drawn improper comparisons across therapies (e.g., comparing targeted novel treatment to chemotherapy, etc.). As a result, we have a number of open questions including, for example: Will CMS consider products that treat the same disease area, or that treat the same specific indication, as therapeutic alternatives? How will CMS distinguish between different mechanisms of action or routes of administration, even when the drugs under consideration treat the same disease area or specific indication? How will CMS consider comparative effectiveness research in light of demonstrable differences in heterogeneous patient populations where what may work for one patient may not work for another, thereby confounding the comparability of comparative effectiveness comparisons? How does CMS intend to resolve conflicting evidence as it relates to a selected drug’s comparative effectiveness?

⁴⁷ *Id.* at 36.

⁴⁸ *Id.*

⁴⁹ *Id.*

Given these significant uncertainties, at a minimum, AstraZeneca urges CMS to provide manufacturers with an opportunity to engage with CMS and review CMS's methodology for the selection of therapeutic alternatives, before CMS makes such a determination. We also urge CMS to consider only on-label indications in selecting therapeutic alternatives, as off-label indications have not been approved by FDA and have significantly less robust data regarding safety and efficacy, relative to on-label uses.

IV. Section 60: Negotiation Process

A. CMS should consider a selected drug's multi-faceted clinical value, rather than narrowly focusing on R&D spend and recoupment.

As described in Section 60 of the Guidance, CMS is proposing a four-step process to determine an initial offer and counteroffer for a selected drug. Specifically, CMS intends to: (1) identify indications for the selected drug and therapeutic alternative(s); (2) use as a starting point the Part D net price for Part D drug therapeutic alternative(s) and/or Part B average sales price for Part B therapeutic alternative(s); (3) evaluate clinical benefits of the selected drug to adjust the starting point; and (4) further adjust the preliminary price through consideration of manufacturer-specific data (e.g., R&D costs; current unit costs of production and distribution) to determine the initial offer price. While AstraZeneca supports CMS's proposal to prioritize the consideration of clinical benefits, we are concerned that CMS may be putting undue weight on certain manufacturer-specific factors.

AstraZeneca appreciates that CMS is required by statute to take into consideration certain factors—including R&D costs—in setting the maximum fair price (MFP) for a selected drug. However, such factors are to be considered only “as applicable to the drug” and not all of the statutory negotiation factors must be weighted equally. The manufacturer-specific factors—including R&D costs—are difficult to categorize, and decoupling specific costs for assets does not represent the full cost or value of a given drug. Overreliance on these factors could thus result in an arbitrary pricing methodology.

As also noted in our comments regarding Section 60.3.4 of the Guidance, AstraZeneca urges CMS to instead prioritize the clinical statutory negotiation factors. Specifically, CMS should focus on whether a selected drug demonstrates a clinical benefit and addresses an unmet need in calculating the MFP. This approach would best preserve incentives for innovation, establish a clear and predictable methodology for determining drug pricing, and enable CMS to meet its statutory obligations under the IRA.

B. CMS should allow for manufacturer input on the selection of therapeutic alternatives for purposes of identifying the “starting point” for the initial MFP offer calculation.

As described above, CMS is proposing a four-step process to determine an initial offer and counteroffer for a selected drug. While AstraZeneca broadly agrees with this framework, we have some concerns regarding how it might be implemented.

For instance, as to this first step, as described in response to our comments to Section 50.2, above, manufacturers should be given an opportunity to weigh in regarding CMS's selection of therapeutic alternatives as certain studies have drawn improper comparisons across therapies. In addition, an off-label product is priced for use in its licensed indication, making its price an unsuitable starting point for negotiations.

C. CMS should provide a clearer framework for the directional adjustments it would make when evaluating clinical benefit relative to therapeutic alternatives. (Section 60.3.3.1)

After identification of therapeutic alternatives for purposes of establishing a starting point for negotiations, CMS intends to adjust the starting point based on the clinical benefit that the selected drug confers as compared to its therapeutic alternatives. CMS will broadly evaluate the body of clinical evidence through a CMS-led literature review, and CMS may also analyze Medicare claims data or other pharmaceutical drug datasets for utilization patterns, clinical data, or other information relevant to the selected drug and its therapeutic alternatives. CMS's adjustments to the starting point will be referred to as the "preliminary price."

While AstraZeneca appreciates that CMS is establishing a flexible methodology for adjusting a selected drug's starting point based on clinical benefit, we believe CMS should provide clearer guidance on both specific elements that will be evaluated, the weight applied to any one individual element, and the directional adjustments CMS would make based on its evaluation of such elements and their relative weight. For example, how will CMS weigh the fact that the selected drug in question was the *first* in class among all therapeutic alternatives? This type of innovation should invariably result in an upward adjustment to the starting point (if the starting point is below the statutory ceiling). In short, CMS should provide a framework that clearly indicates what factors and qualitative evidence could result in a selected product achieving a preliminary price at or near the ceiling price and/or an initial offer at or near the relevant ceiling price.

In addition, we recommend if a selected drug's statutory ceiling price is the net price (vs a percentage of non-FAMP), then the MFP should be set at the ceiling price (the net price) for the selected drug. This approach is appropriate because brand-to-brand competition has already resulted in substantial price reductions. This approach is operationally feasible as CMS has access to the necessary price data to determine the ceiling price based on net price.

D. CMS should apply special considerations when evaluating selected drugs, such as orphan drugs due to their unique circumstances. (Sections 60.3.3.2)

AstraZeneca appreciates CMS’s thoughtful approach and analytical framework for adjusting the starting point of a selected drug without therapeutic alternatives based on unmet need. CMS intends to adjust the starting point based on whether the selected drug fulfills an unmet medical need, a determination that will be made based on the “totality of relevant information and evidence submitted and gathered through the agency's analysis . . .”⁵⁰

However, as a leader in rare disease and rare cancer treatment development, we are deeply interested that CMS’s clinical benefit assessment for selected drugs without therapeutic alternatives is appropriately calibrated to account for the unique characteristics of rare disease. We appreciate that CMS has, elsewhere in the Guidance, recognized the need to work with stakeholders to “support orphan drug development.”⁵¹

As recommended above, CMS should begin at the statutory ceiling price for any selected drugs for which there are no therapeutic alternatives—which would include many rare disease therapies—rather than the FSS or “Big Four Agency” pricing. This would recognize the inherent value of a therapy that addresses an unmet need.

Additionally, regardless of whether it identifies therapeutic alternatives, CMS should apply upward adjustments for drugs with orphan indications, drugs that represent a significant therapeutic advance, and drug which addressed unmet need(s). In particular, determination of unmet medical need must explicitly include a framework for weighing the patient and caregiver voice, in addition to clinical factors.

- E. Manufacturer-specific factors should not be used, or should have a limited impact on pricing, for drugs that represent a therapeutic advance or address an unmet need (Section 60.3.4).

As to the fourth step in the process, AstraZeneca urges CMS to prioritize the clinical negotiation factors. Specifically, CMS should focus on whether a selected drug demonstrates a clinical benefit and addresses an unmet need in calculating the MFP. Under these circumstances, CMS should apply little to no weight to the manufacturer-specific factors. This approach would best preserve incentives for innovation, establish a clear and predictable methodology for determining drug pricing, and enable CMS to meet statutory obligations of the IRA.

V. Section 70: Removal from Selected Drug List Before or During Negotiation, or After an MFP is in Effect

- A. CMS should establish a grace period to account for situations where a generic/biosimilar is approved prior to the end of the negotiation period but marketed shortly after the negotiation period ends.

⁵⁰ *Id.* at 52.

⁵¹ *Id.* at 11.

Under section 1192(c) of the Act, a selected drug will no longer be subject to the negotiation process if FDA has approved a generic drug or licensed a biosimilar product that identifies the selected drugs as its reference product and CMS determines that the generic drug or biosimilar product is marketed pursuant to such approval or licensure. CMS will consider an approved generic drug or licensed biosimilar biological product to be marketed when the PDE data reveals that the manufacturer of the generic drug or biosimilar biological product has engaged in bona fide marketing of that drug or product.⁵² If CMS makes a determination regarding generic drug or biosimilar biological product market availability on or after the selected drug publication date, and before or during the negotiation period for an initial price applicability year, the selected drug will not be subject to the negotiation process for the negotiation period, and an MFP will not be established.⁵³

AstraZeneca urges CMS to establish a “grace period” when a generic/biosimilar to a selected drug receives FDA approval/licensure before the end of the negotiation period. Specifically, CMS should consider marketing data for a specified period *after* the negotiation period ends (e.g., 30 days) to determine whether a generic/biosimilar is in fact being marketed. As some generic/biosimilar manufacturers may encounter unexpected challenges during the marketing ramp-up period, we believe it is appropriate for CMS to exercise some flexibility to consider this marketing data so long as the product was approved/licensed *before* the conclusion of the negotiation period. Allowing this grace period will enable the biosimilar to better compete once it actually enters the market without having the reference product subject to an MFP.

The generic/biosimilar manufacturer would have the burden of submitting such data to CMS. For instance, in the case of IPAY 2026, CMS would consider marketing data between August 1, 2024, and September 1, 2024 so long as the generic/biosimilar is approved/licensed prior to August 1.

CMS should also consider an interpretation of the law that allows a reference product to exit the Program if a generic or biosimilar product is marketed after the “negotiation period” but before the IPAY begins. Such reading aligns with the statutory definition of a “qualifying single source drug” (QSSD)—a threshold requirement for a drug to be subject to price setting. The statute defines a QSSD “with respect to an initial price applicability year,” indicating that a product’s status as a QSSD should still exist as of the first day of the IPAY. Thus, a product that has become multisource before the IPAY should not be subjected to price setting. This approach would ultimately preserve market incentives for generic/biosimilar resources and avoid spending agency time/resources negotiating a product which will have meaningful generic/biosimilar competition before an IPAY begins.

VI. Section 80: MFP Eligible Individuals

⁵² *Id.* at 62.

⁵³ *Id.*

- A. CMS should clarify that the term “MFP eligible individual” excludes an individual receiving services in a Part A hospital stay. (Section 80)

CMS states that in the case of a selected drug that is furnished to an individual enrolled under Medicare Part B (including an individual enrolled in an MA Plan) by a hospital, physician or other provider, the individual must be provided access to the MFP “*if payment may be made under Part B for such selected drug.*”⁵⁴ This mirrors the underlying statutory definition of an MFP eligible individual, which with respect to a selected drug:

*in the case such drug is furnished or administered to the individual by a hospital, physician, or other provider of services or supplier, an individual who is enrolled under part B of title XVIII, including an individual who is enrolled in an MA plan under part C of such title, if payment may be made under part B for such selected drug.*⁵⁵

AstraZeneca requests that CMS clarify that manufacturers are not obligated to provide access to the MFP for a Medicare patient in a Part A stay. Notably, the statute makes no reference to Medicare Part A. In addition, while the statute requires only that “payment may be made under Part B,” this does not loop in Part A utilization, which is administered in the inpatient setting and therefore not eligible for payment under Part B. This language is instead a clear reference to Medicare Advantage utilization, which involves payment under Part C for a drug that would otherwise be paid for under Part B. While we believe this position is supported by the plain text of the statute, we would appreciate CMS explicitly confirming our understanding to avoid the diversion of MFP-purchased drugs beyond the statutory scope of the Negotiation Program.

VII. Section 90: Manufacturer Compliance and Oversight

- A. CMS should issue guidance to assist manufacturers with compliance and establish an enforcement policy to prevent diversion and duplicate discounts. (Section 90.2)

During a price applicability period, a Primary Manufacturer must provide MFP-eligible individuals with access to the MFP for a selected drug at the pharmacy, mail-order service, or other dispenser at the point-of-sale.⁵⁶ Additionally, the Primary Manufacturer must provide the pharmacy, mail-order service, or other dispenser with access to the MFP for the selected drug. In the Guidance, CMS proposes that Primary Manufacturers must establish safeguards to ensure that MFP-eligible individuals, pharmacies, mail-order services, and other dispensers can access the MFP on units of the selected drug for which there are Secondary Manufacturers.⁵⁷ CMS also

⁵⁴ *Id.* at 63 (emphasis added).

⁵⁵ SSA, § 1191(c)(2)(B).

⁵⁶ Guidance at 64.

⁵⁷ *Id.*

proposes to establish procedures for reporting violations related to MFP access for MFP-eligible individuals enrolled in PDPs or MA-PDs.⁵⁸

AstraZeneca is concerned that CMS's proposed approach puts responsibility on the Primary Manufacturer for activity well beyond its control and does not address the possibility of diversion. As discussed above in section II.A of our comments, we do not see any administrative challenges with CMS separately requiring Secondary Manufacturers to sign near-identical agreements that directly obligate them to comply with the various requirements relating to the Negotiation Program that are directly under their control, including but not limited to, ensuring access to the MFP for selected drugs that they distribute to, or on behalf of, MFP-eligible individuals. Relatedly, we do not believe that Primary Manufacturers should face potential liability for the pharmacy or provider failing to provide the MFP to MFP-eligible individuals.

AstraZeneca additionally requests that CMS issue guidance to assist manufacturers with compliance (e.g., by outlining verification measures manufacturers may employ to confirm that a particular selected drug was in fact dispensed to an MFP-eligible individual, and to confirm that the drug was not subject to a 340B duplicate discount). CMS should also establish (i) an enforcement policy to take action against the diversion of selected drugs purchased at MFP by dispensing entities, and (ii) a dispute resolution process to adjudicate disputes regarding 340B duplicate discounts, in addition to a patient's or dispensing entity's claim to MFP pricing.

B. CMS's proposed requirement that there must be “robust and meaningful” competition by the generic/biosimilar to exclude the branded drug from being a QSSD is not supported by statute. (Section 90.4)

CMS states that, if it identifies a generic or biosimilar to a selected drug, the agency will additionally require that “robust and meaningful competition exists in the market” prior to concluding that the drug no longer qualifies as a QSSD subject to the Negotiation Program. CMS intends to make this determination based on the monitoring of PDE data and may “include whether the generic drug or biosimilar biological product is regularly and consistently available for purchase through the pharmaceutical supply chain, and whether it is available for purchase by community retail pharmacies in sufficient quantities from their wholesale suppliers.”⁵⁹

In adopting this policy, CMS relies on sections 1192(e)(1)(A)(iii) and 1192(e)(1)(B)(iii) of the Act for drug products and biological products, respectively.⁶⁰ While these provisions require that a generic or biosimilar be “marketed” in order for the branded product to lose its QSSD status, the term “marketed” is best understood consistent with its ordinary meaning, which is to “expose

⁵⁸ *Id.*

⁵⁹ *Id.* at 68.

⁶⁰ *Id.* 67-68.

for sale in a market”⁶¹ or “to offer products for sale to buyers.”⁶² Nothing about the “ordinary meaning” of the term “marketed” suggests that sellers must sell the product in a “robust and meaningful” manner.⁶³ CMS should not operate beyond the statute by establishing a separate “robust and meaningful competition” standard. The availability of the generic/biosimilar for purchase should be sufficient to make a determination that the product is “marketed” as required by the statute. At the very least, a single sale of the generic/biosimilar product should suffice.

To our knowledge, CMS does not apply a “robust and meaningful” standard to any other aspect of its administration of the Medicare program. There are many issues that could arise in the exercise of such a standard for which CMS cannot adequately account. We are concerned that this standard is too vague for CMS to implement in a non-arbitrary manner, and it deprives manufacturers of regulatory predictability regarding the treatment of their products under the Medicare program.

VIII. Section 100: Civil Monetary Penalties

- A. CMS should provide manufacturers with an opportunity to cure potential deficiencies in providing access to the MFP, in addition to generally providing more transparency regarding its enforcement policies.

CMS will impose civil monetary penalties (CMPs) on a Primary Manufacturer of a selected drug that enters into an Agreement but does not provide access to a price less than or equal to the MFP for MFP-eligible individuals, pharmacies, mail-order services, other dispensers, hospitals, physicians, or other providers or suppliers.⁶⁴ CMPs may also be levied for the provision of false information as it relates to various aspects of the Negotiation Program.⁶⁵

AstraZeneca requests that CMS provide an opportunity for manufacturers to cure any suspected deficiencies identified by CMS prior to the imposition of CMPs. Moreover, we request that CMS provide more transparency regarding how it intends to assess and track potential violations. Specifically, CMS should create a mechanism for notification and engagement around potential concerns about the provision of MFP to MFP-eligible individuals and entities,

⁶¹ Definition of “Marketed”, Merriam-Webster Online Dictionary (last accessed March 25, 2023), <https://www.merriam-webster.com/dictionary/marketed>.

⁶² Definition of “Marketed”, Cambridge Dictionary Online (last accessed March 25, 2023), <https://dictionary.cambridge.org/us/dictionary/english/market?q=marketed>.

⁶³ Indeed, in other contexts in the Medicare program, CMS has interpreted the term “marketing” to simply be the date a technology becomes available on the U.S. market. *See* 79 Fed. Reg. 49854, 49931 (Aug. 22, 2014). For example, under the New Technology Add-on Payment Program, CMS can look to the market entry date of a new technology to determine the time period for which this additional payment applies. Consistently, the agency has rejected arguments from applicants related to low volume following FDA approval, stating in part, “we do not believe that case volume is a relevant consideration for making the determination as to whether a product is “new.”” *See* 82 Fed. Reg. 37990, 38111 (Aug. 14, 2017).

⁶⁴ Guidance at 68.

⁶⁵ *Id.* at 70.

compliance with the Negotiation Agreement, and/or concerns about the veracity of manufacturer-submitted information.

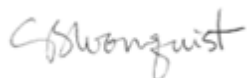

IX. Section 110: Part D Formulary Inclusion of Selected Drugs

Within the guidance CMS restates the statutory requirement that any drug selected for negotiation, with an MFP in effect, must be covered on all Part D formularies. We believe CMS should consider additional steps to ensure that patient access to a selected drug remains in place after the product is negotiated. The entrance of negotiated products into the Part D market will undoubtedly impact payer incentives and their approach to formulary and benefit design. Therefore CMS should institute guardrails and monitoring to ensure patients retain access to negotiated products and robust formulary designs capable of providing options which continue to meet patients' needs. In particular, we recommend that CMS closely monitor plans' tiering decisions, cost-sharing levels, and patient OOP exposure for both drugs subject to an MFP and potential class alternatives in order to evaluate impacts on the quality of benefits and access.

X. Conclusion

AstraZeneca thanks you for the opportunity to submit comment regarding the Guidance and look forward to continuing to engage with CMS as it implements the Negotiation Program for IPAY2026 and beyond. I can be reached at 202-350-5542 or christine.bloomquist@astrazeneca.com with any questions.

Sincerely,

Christie Bloomquist

RE: Initial guidance on the Medicare Drug Price Negotiation Program

Dear Administrator Brooks-LaSure and Deputy Administrator Seshamani:

ATI Advisory is pleased to submit comments on CMS' initial guidance regarding implementation of the Medicare Drug Price Negotiation Program for Initial Price Applicability Year 2026.

The Medicare negotiation provision of the Inflation Reduction Act promises to save approximately \$100 billion over the next ten years. CMS' comprehensive and detailed initial guidance represents the critical first step towards successful implementation of this new program. We offer the following comments, which respond broadly to several topics covered in CMS' initial guidance, including:

- Handling of new NDAs/BLAs
- Managing information submitted by manufacturers
- Managing and evaluating data on therapeutic alternatives
- Developing price offers
- Monitoring bona fide marketing
- Guiding Part D formulary management of selected drugs

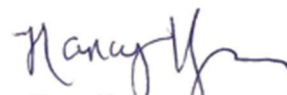

We appreciate your consideration of our input.

Sincerely,

Anna Kaltenboeck

Head

Nancy Yu

Senior Advisor

Prescription Drug Reimbursement Practice
ATI Advisory

Section 30. Identification of Selected Drugs for Initial Price Applicability Year 2026

Although CMS is not accepting comments on Section 30, we applaud the decision to determine whether a drug is a Qualifying Single Source Drug (QSSD) based on the first NDA or BLA for its active moiety or active ingredient. The alternative, to treat each NDA or BLA as a separate entity, would effectively result in the availability of substitute products that are not subject to the MFP. Because this would allow manufacturers to shift patients to a substitute product, savings to Medicare and its beneficiaries would be limited. CMS' approach appears to be consistent with assumptions made by the Congressional Budget Office (CBO) in its estimate of savings of nearly \$100 billion over the next 10 years.¹ It also provides clarity and predictability to market participants, including manufacturers, Part D plans, and providers.

Section 30.1.3. Plasma-Derived Product Exclusion from Qualifying Single Source Drugs

We also support CMS' interpretation of the exclusion from negotiation of plasma-derived products, such as immunoglobulins and clotting factors, and note that this exclusion should not extend to other products that utilize human tissue, such as cell and gene therapies. Blood products have different economics from other prescription drugs and treatments because they rely on the harvesting of blood from donors. This makes them uniquely sensitive to variable costs and uncertainties in supply, such as infectious disease.² The cost of producing other prescription products is more stable and predictable, as well as generally lower, than those of plasma-derived products. The statutory price ceilings in negotiation are above or in line with the effects of generic and biosimilar competition for such products over time, which ensures that negotiated prices do not fall below the margins required to maintain their production.

Section 60.5.1. Application of the MFP to New NDAs/BLAs or NDCs

We strongly support CMS' determination that formulations of a selected drug marketed under a new NDA or BLA will be subject to the MFP in Sec. 60.5.1. Doing so ensures that savings from negotiation are not undermined by the availability of direct substitutes to a selected drug that are not subject to the MFP.

Because new NDAs and BLAs are often associated with reformulation strategies, we anticipate that some manufacturers will argue that this decision discourages the development of new formulations of products for the treatment of new indications, which could not be accomplished through older formulations. This argument ignores two important realities. One is that the level of scientific innovation and risk of developing older products for new indications is substantially lower than developing a new active ingredient or moiety. The other is that, in making an exemption for new formulations intended for new indications, CMS would be disadvantaging the development of older formulations for new

¹ Congressional Budget Office. Estimated Budgetary Effects of Public Law 117-169. Available from: https://www.cbo.gov/system/files/2022-09/PL117-169_9-7-22.pdf. Accessed 4/10/2023.

² Hartmann J, Klein HG. Supply and demand for plasma-derived medicinal products - A critical reassessment amid the COVID-19 pandemic. *Transfusion*. 2020 Nov;60(11):2748-2752. doi: 10.1111/trf.16078. Epub 2020 Sep 9. PMID: 32856742; PMCID: PMC7460929.

indications, which can be equally valuable for patients. In fact, the number of NDAs and BLAs for a particular active ingredient or moiety makes a poor measure of most aspects of a branded drug's life cycle. Manufacturers can and do market multiple brands of an active ingredient or moiety under the same NDA or BLA, as well as multiple formulations and indications. However, they also do the same under multiple NDAs and BLAs.

Recommendation: Maintain the decision under Section 60.5.1 to apply a selected drugs' MFP to any of its new NDAs and BLAs

We strongly urge CMS to maintain the decisions it has made with respect to its treatment of multiple NDAs and BLAs. We believe that the proposed policy is in line with Congress' intent to negotiate what Medicare pays for older drugs, including their various reformulations and new indications added later in their life cycle on the market.

Managing information submitted by manufacturers

Section 40. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

CMS requests comments on its proposed policy for confidentiality of proprietary manufacturer data in Section 40.2.1, to treat as proprietary any information submitted by manufacturers that cannot be found publicly.

Recommendation: Revisit the classification and handling of proprietary data in coming years

Although we acknowledge the need for confidential handling of sensitive data from manufacturers, we are concerned that this creates a lack of transparency, and limits the ability for public and Congressional oversight. At a minimum, we encourage CMS to revisit this approach in coming years, and to re-evaluate whether this approach should be applied to a more narrow set of data elements.

Recommendation: Require word-limited executive summaries of submissions

To facilitate its review of manufacturer data, we suggest that CMS require an executive summary of data and materials to be included in manufacturer submissions, subject to a pre-specified word limit. CMS should set expectations that this summary may be audited against the underlying data after negotiation is completed. CMS should also specify that the executive summary must accurately represent the underlying data in the manufacturer's submission, and that misrepresentations may constitute a violation of Sec. 1193(a)(4)(B) of the Act, and thus subject to Civil Monetary Penalties under Sec. 1197(b).

Recommendation: Verify proprietary data using public sources

We also urge CMS to consider public sources to verify the manufacturers' submissions. Publicly traded companies, for example, disclose R&D expenditures in SEC filings and earnings releases. They also include details of other economic transactions that factor in R&D expenses, such as mergers and acquisitions and licensing fees. Although this information may not break down to the level of an individual drug, it may offer a sense of the upper bound of R&D investment for a particular drug, against which manufacturer numbers may be gauged.

Recommendation: De-emphasize distribution costs

We suggest that CMS de-emphasize distribution costs in the information it receives from manufacturers. Costs of distribution to the manufacturer are both small and difficult to quantify. Companies sell their products (frequently at a discount) to wholesalers and distributors, who then mark up the drug and sell it to pharmacies or other purchasers. As a result, distribution costs are generally borne by purchasers through spread pricing and are not paid for directly by the manufacturers. We also note that, although manufacturing costs are borne directly by the manufacturers and are more straightforward to quantify, they are generally a small percentage of sales for the top-selling mature products that are likely to be candidates for negotiation.

Managing and evaluating data on therapeutic alternatives

Summarizing data

CMS can expect to receive a substantial amount of data, both from manufacturers entering into agreements under Sec. 1193 of the Act, and other stakeholders providing input on therapeutic alternatives per Section 50.2 of the guidance. It is unlikely that the agency will be able to fully review and interpret each piece of information it receives through these channels before negotiations begin.

Recommendation: Require word-limited executive summaries of submissions

As with manufacturer submissions, CMS should require a word-limited executive summary for any submissions by the public on therapeutic alternatives, to assist in rapidly processing and prioritizing the underlying information.

A heuristic for evaluating submitted data

Recommendation: Systematically prioritize and weigh evidence according to its quality and likelihood of bias

In order to process the data CMS receives from manufacturers and the general public in the requisite amount of time, we strongly recommend that CMS prioritizes its review of submissions with the lowest likelihood of bias and the highest quality of evidence. CMS should consider established standards for evidence evaluation in developing a means of prioritizing information received. A significant body of work exists for evaluating evidence quality, and covers a variety of study types, including clinical trials, observational studies, and systematic reviews and meta-analyses. As a starting point for developing a systematic means of weighing the importance of specific types of data, CMS should consider the Grading of Recommendations, Assessment, Development, and Evaluations (GRADE) framework, which promulgates best practices for grading evidence, and the Institute for Clinical and Economic Research Evidence Rating Matrix.^{3,4}

To implement a systematic process in time to develop an offer, we also recommend that CMS add several requirements for data submitted by manufacturers and the public, or state that they will

³ BMJ Best Practice. What is GRADE? Available from: <https://bestpractice.bmj.com/info/us/toolkit/learn-ebm/what-is-grade/#:~:text=GRADE%20has%20four%20levels%20of,data%20starts%20at%20low%20quality>. Accessed 4/13/2023.

⁴ Institute for Clinical and Economic Review. ICER Evidence Rating Matrix: A User's Guide. Available from: <https://icer.org/wp-content/uploads/2020/10/Rating-Matrix-User-Guide-UPDATED-06.30.17.pdf>. Accessed 4/14/2023.

prioritize submissions that meet certain reporting requirements documenting the likelihood of bias and quality of evidence that they contain.

Likelihood of bias

Recommendation: Require disclosure of financial conflicts of interest for stakeholders submitting evidence

In order to evaluate bias, CMS should require conflict of interest information from individuals or groups submitting information per Section 50.2 of the guidance or announce that it will prioritize submissions with such disclosures. Research suggests that financial and other conflicts of interest can have a considerable effect on how individuals perceive, interpret, and present information.⁵ This is well known in the scientific community, and is why all leading peer-reviewed journals require authors to disclose conflicts of interest. However, the problem is not limited to scientific studies, and has been found to extend to provider prescribing behavior as well as patient advocacy positions.^{6,7}

Requiring disclosure of conflicts of interest will allow CMS to gauge the probability and direction of bias in the development and selection of the submitted evidence.

Evidence quality

Recommendation: Align submission standards with established data reporting guidelines

We anticipate that data on therapeutic alternatives submitted to CMS will come from multiple different types of studies, each of which with their considerations and potential sources of bias. CMS can simplify the process of evaluating this evidence by drawing on several frameworks that provide valuable insight about signifiers of scientific rigor and sources of bias for different types of research.

The Consolidated Standards of Reporting Trials (CONSORT) and Standard Protocol Items: Recommendations for Interventional Trials (SPIRIT), for example, provide guidelines for the reporting of clinical studies, including randomized controlled trials.⁸ Similarly, Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) guidelines are available for observational studies.⁹

CMS will likely also receive submissions that include literature reviews and meta-analyses. When done systematically and according to best practices, such reviews can provide valuable insights, such as

PMID: 18064739.

whether results are replicable across different clinical trials.¹⁰ However, like clinical studies, reviews and meta-analyses can also vary in quality and suffer from biases, which are particularly difficult to assess because of the large number of studies that may be included or excluded. To address this concern, the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework a systematic means of documenting and interpreting systematic literature reviews and meta-analyses.¹¹

Each of these frameworks, and others like them, are accompanied by check lists that can be filled out by researchers to succinctly describe how their studies are designed and to document potential sources of bias. To facilitate the rapid evaluation of evidence quality and bias, we strongly recommend that CMS either require submissions of studies on therapeutic alternatives to include completed checklists, or indicate that it will prioritize its review of submissions containing completed checklists.

Recommendation: CMS should prioritize evidence of direct health benefits to patients

In addition to considering evidence quality and bias, CMS should prioritize evidence that describes the extent to which a given treatment improves health outcomes. Recent years have seen a significant push to consider additional measures of treatment benefit in health technology assessment (HTA). Proponents of this work contend that existing approaches do not capture all elements of a drug's value, such as benefits to caregivers, variations in risk acceptance among different patients (e.g., "the value of hope"), scientific spillover effects, and other possible domains of value, many of which are now described in what has become known as the "ISPOR value flower".¹²

We anticipate that CMS will receive a significant amount of input in this vein, and recommend that it be disregarded or de-prioritized relative to direct measures of health benefits. This is for two reasons. The first is that most, if not all, of the proposed additional measures of value can be achieved through means other than pharmaceutical treatment. Including them therefore opens the door to considering non-pharmacological and even non-medical interventions. For example, productivity could also be achieved through investment in education or transportation. However, these types of intervention do not fall within CMS' decision-making authority or remit. Considering such a measure would, in our view, be inappropriate in this context. Secondly, assigning value to prescription drugs in addition to their health benefits creates scenarios in which drugs that have no meaningful health benefits can nevertheless demand high prices. Healthcare systems, however, are meant to pay for treatments that work.¹³ CMS, which pays for treatments that are "reasonable and necessary" should be no exception.

Recommendation: Consider cost-benefit and cost-effectiveness analyses, particularly for drugs with no therapeutic alternatives

As the guidance notes, CMS will not use the Quality Adjusted Life Year (QALY), and CMS seeks input on what other measures that might treat the life of an older person, someone who is disabled, and someone who is terminally ill as of lower value than that of a healthy peer.

We view these concerns as misplaced, particularly in the context of negotiation, which will have the effect of increasing such patients' access to drugs. Selected drugs cannot be excluded from formularies, and reductions in what Medicare and its beneficiaries pay for them further increase access and affordability. There are powerful safeguards in place to ensure that negotiations will not result in loss of coverage for selected drugs. These include ceiling prices calibrated on generic and biosimilar competition, as well as concrete measures of manufacturer costs described in Sec 1194(e), which will prevent CMS from making offers below the point of a drug's economic viability. Perhaps more importantly, manufacturers can credibly threaten to withdraw their drugs from all Federal programs if they cannot profitably continue to offer a selected drug under Medicare coverage. In fact, the CBO considers this threat to be such a challenge to Medicare's negotiating leverage that it has historically estimated that negotiation proposals without consequences for manufacturers would result in no savings.¹⁴

Given this context, we believe that there is virtually no risk that negotiation will diminish access to selected drugs or their alternatives, and thus no risk to patients with health disadvantages in considering systematic measures of health benefits. There are substantial advantages to considering systematic measures such as Equal Value of Life Years Gained (evLYG) or Disability-Adjusted Life Years (DALYs), which is that they efficiently encapsulate multiple types of health benefits into one summary measure. As such, we strongly recommend that CMS consider cost-effectiveness and cost-benefit analyses that use summary measures such as the evLYG or DALY.

Developing price offers

Recommendation: Develop starting and counteroffers for drugs without therapeutic alternatives based on cost-effectiveness and what would occur under competition

In 60.3.2, CMS outlines plans to use as a starting point the net prices for drugs with one therapeutic alternative, and prices achieved by the Big Four Price as the starting point for drugs without therapeutic alternatives. We support the use of net prices in the case of a therapeutic alternative because plans have the ability to use competition between drugs to demand a lower price. However, we recommend against using Big Four prices as an offer benchmark for drugs without therapeutic alternatives. This is because the negotiating power of the Big Four relies not on their ability to make drugs compete, but on their ability to exclude them from formularies. Because Medicare covers significantly more beneficiaries than the Big Four, we expect that manufacturers of drugs with no therapeutic alternatives will become less willing to offer significant price concessions to the Big Four, as it would erode their starting point in negotiation with CMS. We suggest that instead, CMS consider studies of net price reductions that occur with the introduction of competition, such as from generics, biosimilars, or new therapeutic

¹⁴ Congressional Budget Office. RE: Negotiation Over Drug Prices in Medicare. Available from: <https://www.cbo.gov/system/files/2019-05/55270-DrugPricesMedicare.pdf>. Accessed 4/12/2023.

alternatives. Estimates from these studies can be used to impute what the price of a selected drug would be if it had competition. Alternatively, or in addition, CMS could consider estimates of the drug's cost-effectiveness or cost-benefit, using measures such as the evLGY, setting a threshold for an acceptable cost-benefit ratio and imputing the price at which the drug would meet the threshold.

Recommendation: Do not treat small molecules and biologics differently in negotiation

Pharmaceutical industry stakeholders have argued that the structure of the Act disadvantages small molecules relative to biologics because they may be selected sooner. We anticipate that they will propose policies to favor small molecules in negotiation, such as limiting offers to the statutory price ceilings for small molecules or delaying their renegotiation as they qualify for extended and long monopolies.

We strongly urge CMS to disregard these proposals. There is no support for such distinctions in the Act, which is consistent with a long history of Congressional decisions to treat these two types of drugs differently, including patent and exclusivity protections set forth in Hatch-Waxman and the Biologics Price Competition and Innovation Act (BPCIA).^{15,16} Abuses of these protections have contributed significantly to lengthy delays in generic and biosimilar entry, leading to high and rising prices for the older drugs that are likely to be selected for negotiation. The question of whether to treat small molecules and biologics at parity across the different laws that do not is one that can only be answered by Congress.

Monitoring bona fide marketing

We strongly support CMS' policy of monitoring uptake of generic and biosimilar to verify that marketing of these products is bona fide and will result in savings to Medicare and its beneficiaries, and offer several recommendations to strengthen this approach.

Recommendation: Require manufacturers to attest or provide proof of full market entry

CMS should require manufacturers of the selected drug and its generic or biosimilar demonstrate that they have not entered into an agreement to allow for limited marketing of the generic or biosimilar.

This could take the form of requiring them to attest that they have not entered into any agreements that would limit the market share of the generic or biosimilar products, either implicitly or explicitly. In addition, CMS could require manufacturers to submit all agreements provided to the Federal Trade Commission (FTC), as they would under a biosimilar delay request, which would allow CMS to evaluate the terms directly.

In addition, CMS should include terms requiring the submission of such manufacturer agreements under Section 1193(a)(5) of the Act as part of Medicare requirements to administer the program and monitor it for compliance.

¹⁵ Pub.L. No. 98-417.

¹⁶ Pub. L. No. 111-148.

Recommendation: CMS should monitor generic/biosimilar uptake across all US payers

To ensure that generic and biosimilar uptake of a selected drug is not being limited, CMS should also monitor uptake across the US market more broadly and compare these rates with those being achieved by Medicare.

In general, this exercise will be more straightforward for generics, which have a long enough history on the market to have been studied extensively. CMS could consider a drug to have been effectively marketed, for example, if its market share is demonstrably within a standard deviation of the mean for a given period of time since market entry, and/or if it is at or above the mean of uptake at the point of CMS having to make a decision about whether the branded drug remains selected.

Guiding Part D formulary management of selected drugs

CMS should consider requiring that Part D plans place selected drugs on lower or equivalent tiers than their competitors and limit utilization management strategies such as prior authorizations or step edits for selected drugs, unless plans achieve lower net prices on competitor products, or competitor products reduce their list prices to below a selected drug's MFP. This has the benefit of encouraging competition among therapeutic alternatives to selected drugs, which Part D plans are well positioned to manage. It also aligns with existing formulary rules promulgated by CMS, such as required coverage of protected classes of drugs, and rules for generic and specialty tiers. These requirements set an important precedent for the policy we suggest here, which is that they have not been deemed violations of the non-interference clause.

Re: Medicare Drug Price Negotiation Program Guidance: Initial Memorandum, Implementation of Section 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Seshamani,

As the world's leading nonprofit organization dedicated to autoimmune disease advocacy, awareness, education, and research, the Autoimmune Association appreciates the opportunity to respond to the Centers for Medicare and Medicaid Services' initial draft guidance detailing the requirements and parameters for the new Medicare Drug Negotiation Program.

People living with autoimmune diseases face unique challenges in their day-to-day lives and depend on novel and innovative treatments to successfully manage their conditions. The Inflation Reduction Act's drug pricing provisions will have wide-ranging implications for not only Medicare beneficiaries, but all autoimmune patients who stand to benefit from innovative therapies that are currently on the market, as well as those in the development pipeline.

As the agency moves to implement this and future program guidance, we urge policymakers to remain vigilant of potential unintended consequences that could jeopardize future patient access to these therapies.

We would like to call your attention to the following components of the draft guidance which are of particular concern to us.

The Medicare Drug Price Negotiation Program should consider patient access beyond coverage requirements.

Coverage is only one component of access. As an organization dedicated to advancing policies that improve the health and well-being of people living with autoimmune disease, the Autoimmune Association is particularly attuned to the impacts of payer-imposed access barriers on patients. Through our Let My Doctors Decide initiative, we recently rolled out a national scorecard assessing the extent to which insurers – including Medicare Advantage and Part D prescription drug plans – and their pharmacy benefit managers restrict access to medications to manage some of the most common autoimmune diseases affecting an estimated 15.9 million Americans.¹ The scorecard looked at three types of utilization management tactics employed by payers: step therapy, prior authorization, and restrictive formulary placement.

The results were not promising. Few – if any – plan types received a “A” grade under our criteria. Across all conditions, nearly half of all Medicare Advantage and Part D plans achieved a failing score and nearly 9 in 10 plans scored a C or worse.

With close to half of all Medicare beneficiaries now enrolled in a Medicare Advantage plan, and approximately 47% enrolled in a standalone Part D plan, changes to how the Medicare program pays for prescription drugs will have major implications for this subset of the Medicare population.

¹ Health Insurance Access Barriers: A National Scorecard. January 2023. Let My Doctors Decide. Accessed: <https://autoimmune.org/healthplanscorecard/>

As it implements this and future guidance, we encourage CMS to consider the impact of payer benefit design on patient access in addition to requiring coverage for treatments within the Drug Price Negotiation Program.

CMS definition of “unmet medical need” is too narrow

In section 1194(e)(2) of the IRA legislation, CMS is required to consider the extent to which a drug fulfills an “unmet medical need” as part of the negotiation process. However, in the guidance, CMS states its intention to define unmet medical need as treating “a disease or condition in cases where **very limited or no other treatment options exist.**”

We believe CMS’ interpretation of unmet medical need is too narrow and may not be entirely consistent with how it is referenced in 1194(e)(2): “The extent to which the selected drug and the therapeutic alternative to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed **adequately** by available therapy.”

“Adequacy” in this context of unmet medical need is a much broader concept than the mere availability of a treatment option. **We recommend CMS adopt a broader definition of unmet medical need that reflects the diversity of patient preferences and needs.** This was the approach taken in the authorizing statutes of the Patient-Centered Outcomes Research Institute which established a more comprehensive approach to evaluating unmet medical needs that included the consideration of “needs, outcomes and preferences” of patients.²

For example, a person living with an autoimmune condition might prefer a treatment with fewer side effects or that is easier or more conveniently to administer over one with a slightly higher clinical benefit. To this patient, the quality-of-life improvement from reduced side effects and/or not having to frequently travel to receive a more invasive treatment may weigh heavier in their personal calculation of value than the availability of another treatment. CMS’ current definition of unmet medical need in the guidance is not reflective of this heterogeneity of preferences which will have major ramifications for how it will evaluate treatments in the negotiation process.

The implementation of program guidance must be more inclusive of patients, families and caregivers.

CMS has stated intention to include the “patient experience” in the development of program guidance and has signaled a willingness to solicit and consider feedback from a wide range of stakeholders in implementing the Medicare Drug Negotiation Program.

But the short, 30-day timeframes allotted for stakeholders to respond to this and future guidance documents renders this process difficult and severely limits the opportunity for the patient community to meaningfully engage.

We urge the agency to allow for more time for community feedback throughout the implementation of this program moving forward. We believe expanded opportunities for public comment will enhance future program development and could potentially help the agency avoid unintended consequences that could undermine patient access to needed therapies.

Thank you for your consideration and for the opportunity to weigh in on this draft guidance document. Please contact Christian Miller at christian@autoimmune.org should you have any further questions.

Sincerely,

Christian Miller

Subject: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani,

Bayer US (“Bayer”) appreciates the opportunity to offer its input to the Centers for Medicare and Medicaid Services (CMS) initial memorandum issued March 15, 2023, regarding the drug price setting program implementing provisions of the Inflation Reduction Act.

Bayer is a global enterprise with core competencies in the Life Science fields of health care and agriculture with nearly 25,000 employees in 300 sites across the United States. Our products and services are designed to benefit people and improve their quality of life. At the same time, we aim to create value through innovation and are committed to the principles of sustainable development and to our social and ethical responsibilities as a corporate citizen.

Certainly, there are many unanswered questions about the implementation of the Inflation Reduction Act (IRA). The drug price program has significant implications for the future of innovation in the United States, heightening the importance of the implementation of these provisions. Thus, the application of administrative discretion as allowed under the statute is essential in ensuring that the program is implemented in a manner that avoids unintended consequences and preserves innovation for critical medical conditions, including new treatments for patients with cancer or rare medical conditions to those chronic diseases for which new medical treatments are needed.

www.bayer.com

The enactment of Medicare Part D in 2003 ushered in an era of meaningful gains in life expectancy and quality of life for older Americans. Yet today's Medicare patients continue to face unmet medical needs. With more than 400 medicines under development for leading chronic diseases impacting older Americans, it is vital that implementation of the IRA's negotiation provisions allows innovation to continue.¹

We address several topics of particular importance to Bayer in this letter. The comments are offered in the hope of ensuring better access to important new treatments to patients.

Comment Overview: Following is a summary of our feedback provided in this document.

Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

- I. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Primary v Secondary Manufacturers (40.):** We support an approach that confirms the proposed obligation that a Primary Manufacturer be responsible for a Secondary Manufacturer *only exists* when there is contractual understanding and commitment between the two entities. We request confirmation of this interpretation.
- II. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Manufacturer Agreements (40.1):** We are concerned about a 5-day review time for a manufacturer agreement and point to other approaches used for initiation of programs, such as the agreement for the Medicare Part D Coverage Gap. Furthermore, we believe manufacturers should have ample opportunity to review and comment on a draft version of the Agreement.
- III. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Confidentiality of Proprietary Information (40.2.1; 50.1; Appendix C):** We support CMS using Exemption 4 of the Freedom of Information Act (FOIA) related to confidential information from manufacturers. Furthermore, we believe manufacturers should be allowed to designate its information as confidential to the extent that it cannot legally be found publicly. In addition, the guidance should not override the full range of other potentially applicable privacy and confidentiality laws, including but not limited to the Trade Secrets Act and the Tax Reform Act.
- IV. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Data Use Provisions and Limitations (40.2.2):** We have several reservations about the provisions of this section as they pertain to data use and limitations that should be addressed and revised by CMS. This includes concerns about the 5-day review of an Agreement governing those limitations without an opportunity for input. Furthermore, we find the proposed approach largely one-sided in which CMS would be allowed to disclose certain data shared as part of the process, but the manufacturer would not be allowed to respond based on information considered during the discussions of the set price. Also, once

¹ PhRMA. Fact Sheet: *Addressing the Unmet Medical Needs of Older Americans*. Accessed April 3, 2023 at: <https://phrma.org/-/media/Project/PhRMA/PhRMA-Org/PhRMA-Refresh/Fact-Sheets/A-C/Addressing-the-Unmet-Medical-Needs-of-Older-Americans-2.pdf>

the selected drug status no longer applies, we believe a 30-day requirement to destroy all data pertaining to a negotiation is unworkable.

- V. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Providing Access to the MFP (40.4):** CMS lays out requirements for manufacturers to ensure the MFP for a selected drug is available to pharmacies, mail order services, and other dispensers with respect to MFP-eligible individuals under Part D in a 14-day period. This should be clarified so the 14 days do not begin until the claim is verified and adjudicated as a “clean claim.” We also recommend that CMS use an approach similar to the Medicare Part D Coverage Gap discount program, inclusive of using a third-party administrator, to implement these provisions.

Negotiation Factors

- VI. Manufacturer-Specific Data: Data Elements and Consideration of Manufacturer-Specific Data (50.1; 60.3.4):** As a general matter, we believe that the submission of data by manufacturers to CMS should not be limited to a one-time submission. Manufacturers should be able to amend their submissions to CMS as additional relevant information becomes available. In addition, we offer several recommendations pertaining to data for research and development (R&D) costs, information on pending and approved patent applications, regulatory exclusivities, a net price calculation and tax credits.
- VII. Manufacturer-Specific Data: Evidence About Therapeutic Alternatives for the Selected Drug (50.2):** We believe identification of therapeutic alternatives must be done by CMS in a public manner allowing for comments from the manufacturer and other key stakeholders. We also offer recommendations for the determination of a therapeutic advance or a medication addressing an unmet medical need based on examples from the Food and Drug Administration, the Medicare New Technology Add-on Payment (NTAP) and guidelines from the National Comprehensive Cancer Network (NCCN).

Negotiations

- VIII. MFP Ceiling Price (60.2):** We believe there are several instances in which CMS should consider a maximum fair price (MFP) that is set no lower than the ceiling price. The first approach is for small molecules at least up until their 13th year post-approval to ensure adequate time for these treatments to generate sufficient revenues to incentivize ongoing research. In addition, we recommend a ceiling price minimum for medications deemed as offering a significant therapeutic advance or addressing an unmet medical need inclusive of noted examples from the FDA, NTAP program or NCCN.
- IX. Negotiation Process (60.4):** We recommend CMS define its approach to meetings for which a 3-meeting limit is proposed. To that end, an approach comparable to that used by the FDA should be considered in which there are tiers of meetings described. For purposes of application by CMS, only the highest-level meetings would be recognized as counting toward the limit during which time specific information to support an offer or counteroffer discussion would apply.

Compliance and Penalties

- X. Manufacturer Compliance and Oversight (90):** We appreciate that CMS is looking to establish a robust and fair process for reporting of violations. For the process to be fair and equitable, we believe that such a reporting process should be developed hand in hand with a robust dispute resolution process. CMS should undertake notice and comment rulemaking to establish such reporting of violations and dispute resolution, similar to the process that was used in establishing the recent 340B Program's dispute resolution process.
- XI. Civil Monetary Penalties (100):** We believe the excessive penalties provided in Section 1197 that authorizes extraordinarily high CMP penalties equal to \$100 million for each item of false information and \$1 million per day for failing to provide the information required under section 1193(a)(4) warrant notice-and-comment rulemaking prior to Agency implementation. In addition, as part of the dispute resolution process, the manufacturer should be able to raise as a defense, that the violation at issue was committed by a third party and not by the manufacturer. We urge CMS not to impose CMPs on drug manufactures for unrelated third-party non-compliance. Given the excessive fines and penalties that may be imposed, we strongly urge CMS to adopt the 'actual knowingly' standard, which would eliminate doubt as to the intent and awareness of the party performing the act.

#

Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

I. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Primary v Secondary Manufacturers (40.)

The CMS definition of a "Primary Manufacturer" refers to a description where "...more than one entity meets the statutory definition of Manufacturer for a selected drug..." CMS goes on to state that it, "...intends to refer to any other entity that meets the statutory definition of manufacturer for a drug product included in the selected drug and that either (1) is listed as a manufacturer in an NDA or BLA for the selected drug or (2) markets the selected drug pursuant to an agreement with the Primary Manufacturer." Entities falling into category 2 are defined as "Secondary Manufacturers" and would be impacted by negotiation if the Primary Manufacturer is selected.

We understand that the application of the term "Secondary Manufacturer" could be applied to an authorized generic manufacturer, repackager or relabeller of a selected drug. In this instance, it is the Primary Manufacturer that is responsible for engaging in negotiation and meeting CMS requirements, including requirements for any Secondary Manufacturers. We note the definition cited above mentions an agreement, and concur that a Primary Manufacturer could *only* be responsible for other entities if an agreement exists between the Primary Manufacturer and these other entities. Thus, we are seeking to confirm our understanding of the situation as

responsibility for the requirements for the Primary Manufacturer outlined in this section would be impossible to enforce without such an agreement.

We agree and urge CMS to support an approach that confirms the obligation being imposed upon a Primary Manufacturer *only exists* when such a contractual understanding and commitment exists between a Primary Manufacturer and a Secondary Manufacturer. Any other obligation beyond those terms would be impossible for a Primary Manufacturer to compel or enforce.

II. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Manufacturer Agreements (40.1)

CMS notes in section 40.1 that it intends to enter into an Agreement with manufacturers of selected drugs for the initial price applicability year (2026), with a deadline of October 1, 2023. It is noted that manufacturers will have 5 days following publication of the selected drug list to sign an Agreement with CMS. This will include all names, titles and contact information for representatives authorized to execute the Agreement who are “...legally authorized to bind the Primary Manufacturer to the terms and conditions of the Agreement.” At least one of the representatives must sign the agreement using the CMS HPMS. In addition, CMS indicates it “...does not intend to enter into an Agreement with any Secondary Manufacturer of a selected drug,” and further that “...CMS intends to include in the Agreement with the Primary Manufacturer several requirements pertaining to Secondary Manufacturers of the selected drug.”

CMS states it “...will make reasonable efforts to make the final text of the Agreement available to the public before the selected drug list for initial price applicability year 2026 is published.” However, it is not clear when or if this effort will be achieved prior to the publication date.

Failure to adhere to the provisions of the IRA come with significant statutory penalties, inclusive of severe excise taxes. Given the magnitude of the penalties, it is critical to understand whether and how they would apply regarding the signing of this manufacturer Agreement. For example, what if the Primary Manufacturer is unable to meet the 5-day deadline with respect to itself or its Secondary Manufacturers? It is important to note that October 1, 2023, is a Sunday. Thus, this potentially shortens the review time to just 3 or 4 days, for a major corporate decision, potentially involving outside entities like Secondary Manufacturers, on an Agreement for which they had no opportunity to review. Further clarity on the timing and opportunity for review of a draft agreement, and consideration of a grace period at least in the program’s first year, would be helpful from the agency.

Current approaches to price-related contracting by the government are instructive.

National Drug Rebate Agreement: As an example, the Federal Medicaid National Drug Rebate Agreement (NDRA) has no specific time to enter into an Agreement.² Manufacturer medications are not covered until an Agreement is signed. Once signed, the labeler codes become mandatorily covered on the first day of the calendar quarter that begins more than 60 days after the date of the completed and signed NDRA. States can optionally cover drugs based on the date the NDRA is signed. As noted, the last date on which a new manufacturer's rebate Agreement can be accepted to establish the mandatory state coverage date each quarter (in a non-leap year) is as follows:

For a Mandatory Effective Date of:	The Rebate Agreement Must Be Received and Accepted by CMS by:
1st Quarter (i.e., January 1st)	November 1
2nd Quarter (i.e., April 1st)	January 30
3rd Quarter (i.e., July 1st)	May 1
4th Quarter (i.e., October 1st)	August 1

The penalty for not signing the NDRA is failure to require coverage of medications for a manufacturer. However, with the Medicare program, the penalty could ultimately be an excise tax valued at approximately 1,900 percent.

Medicare Part D Coverage Gap Discount: Section 423.2315(c) of the Medicare Coverage Gap Discount Program regulations specified timing requirements for the program. In addition, CMS and manufacturers worked together, well in advance, on the Agreement for the program. By the time the program launched in 2011, manufacturers were familiar with the terms of the Agreement. The language in the rule is as follows:

§ 423.2315 Medicare Coverage Gap Discount Program Agreement.³

(c) Timing and length of agreement.

- (1) For 2011, a manufacturer must enter into a Discount Program Agreement not later than **30 days** after the date of establishment of the model Discount Program Agreement. [emphasis added]
- (2) For 2012 and subsequent years, for a Discount Program Agreement to be effective for a year, a manufacturer must enter into a Discount Program Agreement not later than January 30th of the preceding year.
- (3) Unless terminated in accordance with § 423.2345, the initial period of a Discount Program Agreement is 24 months and the agreement is automatically renewed for a 1-year period on January first each year for a period of 1 year thereafter.

² Centers for Medicare and Medicaid Services. *Medicaid National Drug Rebate Agreement (NDRA)*. Accessed March 27, 2023 at: <https://www.medicare.gov/medicaid/prescription-drugs/medicaid-drug-rebate-program/medicaid-national-drug-rebate-agreement-ndra/index.html>

³ 42 C.F.R. 423.2315 Accessed March 27, 2023 at: <https://www.ecfr.gov/current/title-42/chapter-IV/subchapter-B/part-423/subpart-W>

Veterans Affairs and the Federal Supply Schedule: The Department of Veterans Affairs (VA) manages the pharmaceutical portion of the Federal Supply Schedule (FSS) for the General Services Administration (GSA). Contracting is based on the submission of offers by manufacturers. Under this program, there is no set timetable for the submission of offers as noted by the Vendor Response Document.^{4,5}

Summation: We recognize that the programs discussed above are different and unique in the context of the IRA drug price negotiation process. Irrespective, the processes in use for other programs, in the very least suggests the need for a longer review time than 5 days. Thus, availability of at least a draft version of the Agreement is important in the proper implementation of this program moving forward.

III. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Confidentiality of Proprietary Information (40.2.1; 50.1; Appendix C)

Overall, section 1193(c) of the Inflation Reduction Act (IRA) specifies Congress' intent to protect from public release any confidential information provided by manufacturers to HHS in the context of maximum fair price negotiations. This was the subject of multiple discussions with key officials in IRA negotiations and is a central feature of the statute, not an afterthought.

The statute provides the following:

(c) CONFIDENTIALITY OF INFORMATION.—Information submitted to the Secretary under this part by a manufacturer of a selected drug that is proprietary information of such manufacturer (*as determined by the Secretary*) shall be used only by the Secretary or disclosed to and used by the Comptroller General of the United States for purposes of carrying out this part.

While the statute grants the Secretary authority to determine whether specific information is proprietary, it does not waive other applicable laws that would protect manufacturer information from disclosure. Thus, the Secretary must implement section 1193(c) considering existing law, practices, and procedures. Of note, both CMS and the Food and Drug Administration (FDA) routinely make determinations about proprietary information release already, under processes established through notice and comment rulemaking. These approaches supplement the overarching HHS procedures found at 45 C.F.R. Part 5.^{6,7,8}

⁷ 21 C.F.R. Part 20 – Public Information. Accessed March 31, 2023 at: <https://www.ecfr.gov/current/title-21/chapter-I/subchapter-A/part-20>

⁸ 45 C.F.R. Part 5 – Freedom of Information Regulations. Accessed April 6, 2023 at: <https://www.ecfr.gov/current/title-45/subtitle-A/subchapter-A/part-5>

The negotiation process requires manufacturers of selected drugs to submit extensive information, including information not currently compiled today and certainly not public. We are pleased that CMS notes an intention to treat much of these data as proprietary, with a reference to Exemption 4 of the Freedom of Information Act (FOIA). However, we note a desire of CMS to “strike an appropriate balance between (1) protecting the highly sensitive information of manufacturers and ensuring that manufacturers submit the information CMS needs for the Negotiation Program, and (2) avoiding treating information that does not qualify for such protection as proprietary.”⁹ This test raises some questions given long-standing protections for confidential information in the hands of government officials and government employees. We question whether it is needed or appropriate.

We support a test of information being proprietary if the information cannot be found publicly, and we are pleased to see a test like this adopted in the guidance. We would like to clarify that manufacturers would have the opportunity to designate its information as proprietary or confidential, and then the responsibility for proving that information is public would sit with CMS. We also would like to clarify that nothing in the guidance overrides the full range of other potentially applicable privacy and confidentiality laws.

In addition to FOIA, the Trade Secrets Act is a criminal statute that prohibits government disclosure of information that “concerns or relates to the trade secrets, processes, operations, style of work, or apparatus, or to the identity, confidential statistical data, amount or source of any income, profits, losses, or expenditures of any person, firm, partnership, corporation, or association.”¹⁰ In addition, the Tax Reform Act establishes confidentiality of tax returns and return information, with few limitations.¹¹

Manufacturers have a long track record of information sharing with the US Food and Drug Administration (FDA) that would be a reasonable model here. With the FDA, a manufacturer can designate part or all the information it provides as proprietary and is therefore exempt from disclosure.¹² Such a designation is made at the time of the data submission or within a reasonable time thereafter. Upon receipt of information designated as confidential, the FDA initiates a regulatorily-defined process for determining whether the information, indeed, falls within an exemption.¹³

Whereas information in the hands of FDA tends to be clinical in nature, and more likely to become public over the normal course of a drug’s patented lifecycle, CMS is requesting detailed, research, operational and sales data that have never been requested or publicized. For example, under R&D expenses, CMS mentions personnel expenses (compensation), which is proprietary.

¹³ 21 C.F.R. 20.61. Accessed March 27, 2023 at: <https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfcfr/CFRSearch.cfm?fr=20.61>

Unit costs of production and distribution would not be the type of information that FDA requests, but it goes to the very heart of business strategy and cost allocations and would never be appropriate for public release. In some cases, the public release of information could violate a manufacturer's agreement with a supplier, such as the price paid for raw ingredients or contracted packaging and shipping costs.

Should CMS decide to proceed with the guidance as drafted, we would raise an additional concern about the lack of protections for some of the data in non-proprietary categories identified by CMS, such as tax credit information included in the definition of prior Federal funding. This information is not public per the Tax Reform Act. Unless CMS can find it lawfully published or made publicly available, it should be protected from public release.

IV. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Data Use Provisions and Limitations (40.2.2)

We understand CMS is proposing requirements on Primary Manufacturers pertaining to the submission of data and the use, disclosure, and destruction of data and other information received during the negotiation process. The fact that CMS intends to require a Primary Manufacturer to agree to the terms set forth in the agreement regarding these provisions further bolsters the need to share a draft of the agreement as part of this process with ample opportunity to review and provide feedback to CMS. Anything short of this becomes an accept without change or reject approach that fails to maintain any remnant of a voluntary negotiation.

The approach currently proposed is largely one-sided in which CMS would be allowed to disclose certain data shared as part of the process (section 40.2.1), but the manufacturer would not be allowed to respond based on information considered during the discussions of the set price. On the contrary, if erroneous information is disclosed by CMS as part of its required statement of justification for the maximum fair price (MFP), the manufacturer should be allowed to clarify, for the record, a different point of view on the negotiation. While it is not likely in the best interests of the manufacturer to disclose specifics of prices considered in the negotiation, the ability to share appropriate information, or to correct the record, particularly about justifications should be allowed.

In addition, we are concerned about a requirement to destroy all data within 30 days of a determination by CMS that a drug or biologic no longer qualifies as a selected drug. On the surface, this potentially limits a manufacturer's ability to retain records that to the best of our knowledge may be subject to a legal proceeding or is needed for further internal consideration of future negotiations to which the company may be a part.

We recommend that CMS clarify that the exception to the 30-day destruction rule for state and federal law requirements also encompasses information that may be retained in response to or anticipation of judicial proceedings. Furthermore, we note that the destruction requirement also impairs the retention of institutional knowledge about the rationale for company decisions to be considered in the context of future investments in our ongoing operations.

As a practical matter, it will be difficult for a manufacturer to faithfully produce a “Certificate of Destruction.” The broad and complex scope of modern business communication and the way such communication is internally retained makes it nearly impossible to certify that everything has been destroyed in such a short timeframe (i.e., 30 days). In the case of holding Secondary Manufacturers accountable, if applicable, it is even more difficult.

Finally, we regard these requirements to remain silent in response to disclosures from CMS, while destroying all evidence that may assist in a forensic review of the record, as clearly prejudicial against a manufacturer.

Thus, we believe these provisions need to be revised to address the concerns as described.

V. Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026: Providing Access to the MFP (40.4)

In this section, CMS lays out requirements for manufacturers to ensure the MFP for a selected drug is available to pharmacies, mail order services, and other dispensers with respect to MFP-eligible individuals under Part D. We also understand that Part D plan sponsors will ultimately need to ensure MFP-eligible individuals will receive access to the MFP at the point of sale as a basis for cost sharing.

14-Day Reimbursement: Of note is the requirement that the Primary Manufacturer be responsible for ensuring the entities are reimbursed in a timely manner for the differential between their acquisition cost for the selected drug and the MFP within 14 days in the case of the use of a retrospective reimbursement approach. We believe the use of a retrospective reimbursement approach is the preferred mechanism to prevent diversion of Medicare prices to non-eligible individuals. We also question the timing of access to the MFP to occur within 14 days, as written. We expect the process to be incredibly challenging, regardless of the approach. However, the 14-day deadline may be achievable if the deadline occurs after the claim is verified and adjudicated as a “clean claim” prior to adjusting the payment. Any other approach would essentially be impossible, therein shutting down the retrospective option, opening diversion risk under a prospective approach.

We believe that the method currently used to operate the Medicare Part D coverage gap (created under provisions implementing the Patient Protection and Affordable Care Act (ACA) in March 2010) is an effective model that CMS could use in this instance for manufacturers using a retrospective system for implementation.¹⁴ Palmetto GBA serves as a third-party administrator under the program, and has been in that role meeting the requirements under the ACA,¹⁵ since the beginning of the Part D program.

¹⁴ Social Security Act § 1860D-14A. Accessed March 31, 2023 at: https://www.ssa.gov/OP_Home/ssact/title18/1860D-14A.htm

¹⁵ Social Security Act § 1860D-14A(d). Accessed March 31, 2023 at: https://www.ssa.gov/OP_Home/ssact/title18/1860D-14A.htm

Under the approach, the pharmacy claim is processed while a Part D patient is in the coverage gap without any interference to the patient's experience with the program. The manufacturer's coverage gap discount is applied to the pharmacy's reimbursement by the plan sponsor. As described in a Technical Guide from CMS on the Coverage Gap Discount Program (CGDP), the following process keeps all stakeholders whole in the process:¹⁶

- CMS makes prospective payments to Part D Sponsors, enabling them to extend the coverage gap discounts to their beneficiaries at the POS.
- On a quarterly basis, Invoice Reports containing coverage gap PDE data are generated and distributed to Drug Manufacturers and Part D Sponsors via the CGDP Direct Payment Process (DPP) Portal.
- Drug Manufacturers then make payments to Part D Sponsors for the invoiced coverage gap PDE amounts. If applicable, Part D Sponsors also reimburse Drug Manufacturers for any negative amounts invoiced as a result of adjusted or deleted PDEs that were previously invoiced to a Drug Manufacturer.
- On a quarterly basis, CMS offsets subsequent prospective payments to Part D Sponsors by the amount invoiced to Drug Manufacturers.

We believe this approach serves as a model for the implementation of the process for making the MFP available as required under the IRA.

Under our current chargeback systems, payment adjustments typically take at least 14 days to complete with wholesalers and distributors. In that instance, we have full verification of the wholesalers' or distributors' claims being made against the sales. However, reconciliation at the retail level brings the process to a whole new level of complexity. Similarly, section 1927(b)(1)(A) of the Social Security Act (the Act) and the terms of the National Medicaid Drug Rebate Agreement, require manufacturers to pay a rebate to each state within 30 days of the manufacturer's receipt of the state invoice.

Currently, wholesalers process chargebacks that apply to all the manufacturers' sales of the contracted customer. The entire chargeback processing infrastructure is fully automated with very limited human intervention. This allows for a 14-day processing that would cover the process of claims submission, verification, chargeback approval, and subsequent transmission. However, under the MFP the price is owed on each individual eligible purchase. Retail pharmacies do not currently have the system infrastructure to allow fully automated chargeback processing. And wholesalers currently do not have access to data allowing the processing of claims-level chargebacks. A 14-day completion of the payment process is practically impossible without extensive build out of system infrastructures. Pharmacies would need to begin reporting claims-level data to wholesalers electronically in a fully automated system, a burdensome new reporting requirement. Wholesalers would need to be given access to portions of Part D Prescription Drug Event (PDE) data to obtain claims-level data necessary to bill manufacturers for chargebacks correctly.

¹⁶ Centers for Medicare & Medicaid Services. *Coverage Gap Discount Program. Technical Guide. Version 1.0.* August 2021. Accessed March 31, 2023 at: https://www.hhs.gov/guidance/sites/default/files/hhs-guidance-documents/Coverage_Gap_Discount_Program_Technical_Guide_08.2021.v1.pdf

Another challenge with the proposal from CMS is a requirement that the MFP be made against an acquisition cost. Validation of such a charge is complex and costly.

The actual acquisition cost (AAC) for an individual prescription is hard to track and is currently unknown to entities outside the pharmacy. Pharmacies typically purchase medicines from multiple wholesalers at different prices depending on mark-ups, and the quantity purchased can vary significantly. Individual prescriptions can be comprised of a quantity taken from bottles purchased from different wholesalers at different prices depending on the available inventory at the pharmacy. Because of this, only the dispensing pharmacy would be able to know the AAC for a prescription dispensed to an MFP-eligible beneficiary.

Furthermore, manufacturers have no control over the mark-ups a dispenser may pay as part of the distribution network. Those charges are within the purview of the dispenser and its wholesaler or other distributor based on charges for a service.

We believe the manufacturer discount, based on the MFP, should be a function of the wholesale acquisition cost (WAC), which reflects the list price from the manufacturer. Furthermore, this comprises the drug cost portion of the medication charge and not fees associated with other distribution costs assessed to pharmacies and others.

If implemented as proposed, this has the potential to create an incentive that could increase overall system costs. As proposed, the incentive could be to increase fees on pharmacies with the presumption manufacturers would offset those costs as part of the MFP payment. This creates a potential spillover of these fees to the commercial market, Medicaid, and other non-Medicare programs, for which the fees are applied across the board. Thus, this incentive needs to be eliminated.

Negotiation Factors

VI. Manufacturer-Specific Data: Data Elements and Consideration of Manufacturer-Specific Data (50.1; 60.3.4)

CMS notes that manufacturer-specific data is to be reported by the Primary Manufacturer, including any Secondary Manufacturer data, by October 2, 2023. Key factors to be reported include:

- R&D costs for the selected drug and the extent to which the costs have been recouped;
- Current unit costs of production and distribution of the selected drug;
- Prior Federal financial support for novel discovery and development of a selected drug;
- Data on pending and approved patent applications, exclusivities recognized by the FDA; and
- Market data, revenue and sales data in the United States.

In addition, Appendix C provides additional information about the types of information that will be expected early in the MFP negotiation process.

As this process moves forward, we recommend that CMS not limit the timeframe for submission of data to a one-time-only submission of data. Manufacturers should be allowed an opportunity to provide additional information for consideration by CMS as it becomes available.

Furthermore, we have some questions about some of the information to be considered. In addition, it should be recognized that some information will be difficult to provide under the deadline sought.

Research and Development Costs: The challenges for provision of data are especially important as it pertains to research and development (R&D) costs. A submission of this type raises multiple questions as to how to account for the R&D costs for a specific drug and other drugs over time. Furthermore, we are concerned about the lack of scope in what is considered. Thus, while requirements for submission should be limited to specific costs for an individual drug, manufacturers should be given latitude to provide and for CMS to consider other costs related to R&D.

We observe that R&D costs related to new indications or formulations under development but not yet approved seem to be excluded from consideration. However, this is important research in the development of new and existing treatments for patients that may have implications for the use of those treatments. Moreover, to the extent the manufacturer obtains patents related to the development of new indications or formulations, CMS intends to consider adjusting downward the preliminary price. Given the MFP will apply to any new indication or formulation approved after the MFP has been set, those R&D costs, if known at the time, should be considered in the R&D cost calculation. In addition, any adjustments of the preliminary price should also accommodate new R&D costs necessary to the development of the new indications or formulations.

Furthermore, the exclusion of acquisition costs and those pertaining to ongoing basic clinical research, clinical trials and pending approvals from the definition of R&D seems overly simplistic. It is easy to envision a relatively late-stage acquisition of a molecule in which the cost paid to acquire the asset in part reflected pre-acquisition R&D costs. Additionally, many products that reach commercialization were not the initial asset or molecule pursued, but rather reflect learnings from the failures of earlier attempts. The rate at which this occurs is expected to increase with additional exploration of precision and cell and gene therapies. To the extent such costs are knowable, they should not be categorically excluded just because of how and when the costs were borne by the manufacturer, or the ultimate holder of the New Drug Application (NDA) or the Biologics License Application (BLA) holder.

Beyond the descriptors of R&D costs in Appendix C, we believe there should be a further assessment of other identifiable R&D costs as deemed appropriate by the manufacturer. Prior research suggests the complexity of factors that might be important to consider as appropriate

(see “Table 7”).¹⁷ As contemplated in the guidance, only research and development costs associated with a selected drug are used in the evaluation. However, the revenues from the few successful products are utilized to cover the R&D costs across the entire portfolio of medicines, not just those in the same therapeutic class or intended mechanism of action. Of the thousands of potential candidates, only a few may ultimately result in an FDA approved medicine. As such, limiting research and development costs to the selected product only may have the unintended consequence of limiting research to more commercially viable disease states under the IRA’s concept of R&D recoupment. We urge CMS to take a global view of R&D costs and consider additional information that a manufacturer may provide regarding R&D costs.

Table 7.
Impact of total capitalized cost per approved new drug due to changes in individual cost drivers (current study factor effect relative to prior study cost).

Factor Category	Factor
Direct cash outlays	
	Out-of-pocket clinical phase costs
	Pre-human / clinical cost ratio
	Overall out-of-pocket costs
Risk	
	Clinical approval success rate with prior study distribution of failures
	Distribution of failures with prior clinical approval success rate
	Overall risk profile: clinical approval success rate plus distribution of failures

Pending and Approved Patent Applications: The definitions adopted by CMS create considerable confusion about the patent-related data manufacturers must submit. They also require the submission of data that is irrelevant for the purposes of the Negotiation Program. To promote clarity and efficiency, CMS should use terminology and standards for relevance that are consistent with other federal laws and regulations governing the submission of biopharmaceutical patent information to federal agencies, such as 21 CFR 314.53.

Section 1194(e)(1) of the Act specifies that manufacturer-specific data includes “[d]ata on pending and approved patent applications.” CMS considers this to include “all pending and approved patent applications, including expired and non-expired approved patents, submitted, sponsored, licensed, and/or acquired by the Primary Manufacturer relating to the selected drug....” The guidance refers to both “approved patent applications” and “approved patents,” where it is

¹⁷ DiMasi JA, Grabowski HG, Hansen RW. Innovation in the pharmaceutical industry: new estimates of R&D costs. *Journal of Health Economics*. 2016;47:20-33.

apparent Congress intends to mean issued patents. As these terms do not accurately describe issued patents,¹⁸ CMS should simply define “approved patent applications” to mean “patents.”¹⁹

Relevant patents and patent applications include those “relating to the selected drug.” The guidance also describes patents “linked to the selected drug.” It is unclear if CMS intends the phrases to carry different meanings. The guidance is silent on how manufacturers should determine whether patents and patent applications are sufficiently “related to” or “linked to” the selected drug. We request clarification of the standard for relevance of patents and pending patent applications.²⁰

According to the guidance, a “pending patent application” is defined as “any provisional or nonprovisional patent application submitted to the United States Patent and Trademark Office (USPTO) for which a patent number(s) has not been issued.” This definition does not include international applications²¹ designating the United States, which are neither provisional nor nonprovisional applications and which are not necessarily filed with the USPTO. CMS should clarify whether relevant pending patent applications include international applications designating the United States.

The definition of “pending patent application” is also imprecise because it includes abandoned patent applications,²² which are clearly not pending.²³ CMS should clarify that pending patent applications do not include abandoned patent applications.

The definitions of “pending patent application,” “approved patent application,” and “expired patent” all describe the issuance of a patent number as representing a change in status of an application from “pending” to “approved.” It should be noted, however, that patent numbers are not “issued” at the time of patent grant; rather, they are assigned before grant after a fee is paid. The distinction is important because an application may, in fact, have a patent number assigned yet never actually issue as a patent.²⁴ Therefore, assignment of a patent number is not an appropriate indicator that a patent has issued from a patent application.

In addition to lacking clarity, the definitions provided for patent-related data are also overbroad. Under the proposed definitions, manufacturers are required to collect and analyze a significant amount of information about patents and patent applications, including those owned by third parties, which incur considerable time and expense. Given the limited resources we expect

¹⁸ As a technical matter, applications are “allowed” rather than “approved.” *See* 37 CFR 1.311; Manual of Patent Examining Procedure, § 203.04 (9th ed., 2022). Patent applications are also distinct from the patents that issue from them—i.e., an allowed or “approved” patent application is not a patent. *See* 37 CFR 1.314.

¹⁹ The Code of Federal Regulations contains over 2000 references to “patent” or “patent application”; there are zero references to “approved patent application.”

²⁰ The appropriate standard for relevance should be consistent with the purpose for which the data is required. This is discussed in further detail below.

²¹ International applications are commonly filed after a provisional application and become a nonprovisional application only upon entering the national stage in the United States. *See* 37 CFR 1.9(a)(3).

²² Abandoned patent applications have been submitted to the USPTO and have not been assigned a patent number.

²³ *See* 37 CFR 203.05 (“An abandoned application ... is removed from the Office docket of pending applications”)

²⁴ There are various reasons why the USPTO may, after a patent number has been assigned, withdraw an application from issue. *See* 37 CFR 1.313.

will be available to CMS to evaluate this and other manufacturer-specific data, we believe CMS did not intend to require the submission of much of the patent-related data covered by its guidance. Therefore, we ask that the definitions of relevant patents and patent applications include only what is needed to accomplish the purpose for which the data is required.²⁵

For example, the guidance indicated that relevant patent data includes “patents linked to the selected drug where the Primary Manufacturer is not listed as the assignee/applicant (for example, for a joint venture product)” Absent any clarity about what is meant by “linked to,” the proposed definition potentially encompasses numerous third-party patents connected in some way to the selected drug. Third parties routinely obtain patents related to approved drugs covering manufacturing processes, formulations, unapproved uses, different salts or crystalline forms, and combination therapies.²⁶ All of these can be considered to be “linked to” a selected drug.

The required data also includes “all patent applications, pending²⁷ and approved, for which a claim of patent infringement could reasonably be, or has been, asserted against a person engaged in the unlicensed manufacture, use, or sale of the selected drug in any form.” Again, the proposed definition includes patents and patent applications supporting not only claims of infringement by the manufacturer but also claims by third parties.²⁸

Patents and patent applications that are not under the control of the manufacturer by assignment, license, or some contractual obligation should not be considered “Manufacturer-specific data” under Section 1194(e)(1) of the Act. The manufacturer only has data on such third-party patents and patent applications that are already publicly available.²⁹ The guidance also suggests the manufacturer must analyze patents and pending applications for possible claims of infringement. A determination of whether a claim of infringement is reasonable requires information relevant to enforceability. The manufacturer would not have access to this information for third-party patents. The manufacturer must also consider infringement of the selected drug “in any form.” Performing such an extensive analysis for all third-party patents and pending patent applications places an undue burden on the manufacturer.³⁰

According to the guidance, CMS intends to use the data on patents and pending patent applications “to consider the length of the available patents ... before the selected drug may no

²⁵ See Section 60.3.4, Consideration of Manufacturer-Specific Data.

²⁶ For example, as of April 3, 2023, there are 183 granted patents not assigned to Merck that reference the drug sitagliptin by name in their claims. This number does not include patents that reference the drug by chemical name, structure, class, or functional language.

²⁷ Strictly speaking, there can be no infringement of a pending patent application, only issued patents. See 35 U.S.C. 271 § (2023). The claims of pending applications are routinely amended during examination, and applications are frequently abandoned. Therefore, it would be premature for CMS to make determinations about the exclusionary effect of a pending application until it issues as a patent.

²⁸ In addition to the 183 granted patents mentioned in footnote 26, as of April 3, 2023, there are 593 published patent applications that refer to sitagliptin in their claims.

²⁹ Data regarding provisional and unpublished patent applications for which a claim of infringement could reasonably be asserted may not be publicly available because under federal law the applications are kept in confidence by the USPTO. 35 U.S.C. § 122 (2023).

³⁰ One estimate places the cost of performing an infringement opinion at \$7,500 to \$25,000 or more for one patent. Brown & Michaels Budget Estimator for Patents, Brown & Michaels, PC. Accessed April 3, 2023 at: <https://www.bpmlegal.com/content/patfees>.

longer be single source.”³¹ Yet much of the patent-related information the manufacturer is required to submit is irrelevant to this consideration. For example, abandoned patent applications and expired patents can have no effect on a selected drug’s length of exclusivity. Likewise, third-party patents and applications for which the manufacturer has no control over enforcement cannot be used to maintain exclusivity in the market. Many types of patents related to pharmaceutical products are unlikely to prevent generic and biosimilar competition. These include patents covering manufacturing processes and intermediates, different polymorphs and other forms of the active ingredient, metabolites, unapproved uses, and different formulations and dosage forms, which have been deemed by Congress and FDA to not be worthy of listing in the Orange Book and cannot give rise to a 30-month stay of generic approval.³²

New definitions of relevant patent data are unnecessary for the purposes of the Negotiation Program. There already exist standards for the submission of patent-related information to FDA that have been developed from over 20 years of experience. Manufacturers are required to provide such information for listing under section 351(k)(9) of the Public Health Service Act and section §505(j)(7) of the Federal Food, Drug, and Cosmetic Act.³³ CMS should adopt the definitions for relevant patents associated with these requirements. Doing so will improve predictability in the Negotiation Program and minimize the significant burden to manufacturers and CMS of collecting and analyzing irrelevant data. Alternatively, CMS may rely upon the information already submitted by manufacturers found in the Orange and Purple Books. Manufacturers need only supplement the information already available to CMS with data about pending patent applications.

In considering data on patents and regulatory exclusivities, the guidance suggests “if the selected drug has patents and exclusivities that will last for a number of years, CMS may

³¹ Section 60.3.4 (Consideration of Manufacturer-Specific Data).

³² See 68 FR 36676 (June 18, 2003), Final Rule, Food and Drug Administration. “Applications for FDA Approval to Market a New Drug: Patent Submission and Listing Requirements and Application of 30-Month Stays on Approval of Abbreviated New Drug Applications Certifying That a Patent Claiming a Drug Is Invalid or Will Not Be Infringed.”

³³ See 42 U.S.C. § 262(l)(3)(A):

(i) a list of patents for which the reference product sponsor believes a claim of patent infringement could reasonably be asserted by the reference product sponsor, or by a patent owner that has granted an exclusive license to the reference product sponsor with respect to the reference product, if a person not licensed by the reference product sponsor engaged in the making, using, offering to sell, selling, or importing into the United States of the biological product that is the subject of the subsection (k) application; ...

and 21 C.F.R. 314.53(b)(1):

An applicant described in paragraph (a) of this section must submit to its NDA the required information, on the required FDA declaration form, set forth in paragraph (c) of this section for each patent that claims the drug or a method of using the drug that is the subject of the NDA or amendment or supplement to it and with respect to which a claim of patent infringement could reasonably be asserted if a person not licensed by the owner of the patent engaged in the manufacture, use, or sale of the drug product. For purposes of this part, such patents consist of drug substance (active ingredient) patents, drug product (formulation and composition) patents, and method-of-use patents For patents that claim a drug product, the applicant must submit information only on those patents that claim the drug product, as is defined in § 314.3, that is described in the pending or approved NDA. For patents that claim a method of use, the applicant must submit information only on those patents that claim indications or other conditions of use for which approval is sought or has been granted in the NDA.

consider adjusting the preliminary price downward.”³⁴ We strongly urge CMS to reconsider and reject this proposal. An approach that penalizes manufacturers for successful innovation would be truly extraordinary. Patents are awarded for inventions that are new, useful, and nonobvious “[t]o promote the Progress of Science and useful Arts.”³⁵ Congress has sought to correct distortions and inefficiencies in pharmaceutical research and development through incentives that *extend* patent term.³⁶ Experience has shown this legislation to be vital to the development and use of safe and effective drugs.³⁷ Adjusting preliminary price downward because there is patent term remaining conflicts with the congressional intent behind these statutory mechanisms. Patents and term extensions awarded to manufacturers are the fruits of innovation and lifesaving research. To penalize manufacturers for obtaining them is to disincentivize this important work.

Second, any attempt to determine the ability of patents to maintain exclusivity often includes a high degree of uncertainty.³⁸ It necessarily includes drawing conclusions about the ability of third parties to avoid or “design around” what is protected by patent. Both technological and regulatory factors are relevant. A generic or biosimilar applicant that has received FDA approval may still launch “at-risk” even if there are patents remaining.³⁹ Opinions of counsel, benefiting from access to a manufacturer’s information and personnel and the investment of hundreds of hours of research and analysis, are still often full of assumptions and caveats. The reality is that biopharmaceutical patent litigation involves considerable uncertainty and risk. In part for this reason, most litigations involving ANDAs are resolved by a settlement between the parties.⁴⁰

For these reasons, it would be inappropriate to use remaining patent term as a justification to penalize manufacturers. In fact, CMS should consider adjusting a preliminary price upward if data about patents and pending patent applications demonstrate innovation that should be encouraged, similar to considerations about whether the selected drug fills an unmet medical need.

Regulatory Exclusivities: Similar to the patent-related incentives discussed above, Congress has frequently used regulatory exclusivities recognized by FDA to incentivize research

³⁴ Section 60.3.4 (Consideration of Manufacturer-Specific Data).

³⁵ U.S. Const. art. I, § 8, cl. 8; 35 U.S.C. §§ 101, 102, 103 (2023).

³⁶ *See, e.g.*, 35 U.S.C. § 156 (extending the term of patents covering approved drug products to compensate for term lost during regulatory review); 21 U.S.C. § 355a(b)(1)(B) (extending the term of patents listed in the Orange Book by six months in return for conducting pediatric studies).

³⁷ *See, e.g.*, U.S. Food and Drug Administration. *The Pediatric Exclusivity Provision, January 2001 Status Report to Congress*. Accessed April 3, 2023 at: <https://www.fda.gov/media/99580/download> (“The pediatric exclusivity provision has done more to generate clinical studies and useful prescribing information for the pediatric population than any other regulatory or legislative process to date.”)

³⁸ This uncertainty is even more true of pending patent applications. As described above, the claims of pending applications are almost always amended during examination and applications frequently are abandoned for various reasons. Therefore, it would be particularly improper for CMS to rely on pending patent applications to adjust a preliminary price downward.

³⁹ *See* Drake, KM et al. No Free Launch: At-risk Entry by Generic Drug Firms. NBER Working Paper No. 29131, August 2021. National Bureau of Economic Research. Available at: https://www.nber.org/system/files/working_papers/w29131/w29131.pdf.

⁴⁰ *See* Swaroop, S et al. Recent Trends in ANDA Litigation. pharmaphorum.com (December 19, 2016) Accessed April 10, 2023 at <https://pharmaphorum.com/views-and-analysis/recent-trends-anda-litigation> (finding that nearly 60% of ANDA result in a settlement).

and development. These include exclusivities associated with orphan drugs, qualified infectious disease products, new clinical studies, and pediatric studies. Penalizing a manufacturer for succeeding in this research would be antithetical to these statutory incentives and section 1194(e)(2) of the Act, which requires CMS to consider evidence about the extent to which the selected drug addresses unmet medical needs and treats specific populations, including children.

Net Price Calculation: There are several places where measures, such as rebates, discounts, and chargebacks, appear to be excluded from net price or revenue calculations. We agree this is important but note there does not appear to be a consideration of distribution costs, such as fees and other charges paid to pharmacy benefit managers (PBMs), group purchasing organizations (GPOs) or other entities that add to distribution costs, thus influencing the net cost of the medication. We believe these costs need to be considered as well.

We also note that guidance seems to require global revenues be used in pricing calculations, but expenses and other discounts to be considered are US centric. This results in an apples to oranges calculation that disadvantages the manufacturer. If CMS adopts a global revenue number, the global discounts and expenses need to be reflected fully as well.

Adding to the overall costs manufacturers face, but excluded from the guidance currently, are government compliance and coverage-related evidence generation costs. There is precedent for considering compliance costs elsewhere in government programs. For example, this approach was used in the treatment of the health insurer tax in health plan medical loss ratio calculations. We believe options for a fair approach to this issue in the MFP context would be to subtract the costs from revenues or via an addition to the costs of production and distribution. Since global sales are being considered in the revenue definition, it seems appropriate that the cost of generating evidence to get coverage in other countries should, likewise be included in the assessment.

Certainly, the defining unit costs are complex, inclusive of investments at many levels across the research, development, and production process. If CMS is committed to weighting input costs in its negotiation process, it is important that manufacturers be given an opportunity to fully represent their costs, including costs that CMS might not have envisioned.

Tax Credits: Inclusion of tax credits in the definition of federal financial support is concerning to us. First, tax returns and information are confidential under the Tax Reform Act and should not be requested by CMS. Additionally, these credits exist for public policy reasons. Congress wanted to incentivize behaviors that drive innovation for manufacturing in the United States. Conversely, if tax information is going to be used as a rationale to drive down CMS's offered prices (thus, inflating the federal support factor), tax payments of all types (global, U.S., tariffs, state and local, user fees, the ACA industry fee) clearly are operational costs and should be deducted from any revenue calculation.

VII. Manufacturer-Specific Data: Evidence About Therapeutic Alternatives for the Selected Drug (50.2)

The guidance lays out a series of critical issues essential to the process of considering medications and alternatives to treatments that may be subject to the establishment of a price by CMS and those that may be considered an alternative treatment. In the evaluation by CMS, it intends to:

- Consider whether a selected product represents a therapeutic advance compared to the therapeutic alternatives;
- Evaluate FDA-approved prescribing information among comparable products;
- Consider comparative effectiveness research, inclusive the of the implications for “specific populations”; and
- Assess the extent to which a treatment addresses an unmet medical need.

Therapeutic Alternatives: To identify potential therapeutic alternatives for the indications of a selected drug, CMS intends to use data submitted by the Primary Manufacturer and the public, FDA-approved indications, indications included in CMS-approved Part D compendia, widely-accepted clinical guidelines, and peer-reviewed studies. However, a key question for this section pertains to what constitutes a therapeutic alternative. Without this definition, the comparisons sought are not possible. How therapeutic alternatives are defined tends to vary by payer and is neither readily available nor standardized. It is primarily a function of drug reviews conducted by the pharmacy and therapeutics (P&T) committee of a plan or other drug management entity, inclusive of the opinions of the members and support staff of the committees. Much of this information is kept from public view.

Often, when these types of considerations are made, it is implicit that the medications could be easily substituted for one another via therapeutic interchange. However, this is not generally supported without the prescribing practitioner’s approval or collaborative protocols. Statements espousing that position include those from the Academy of Managed Care Pharmacy (AMCP),⁴¹ the National Association of Boards of Pharmacy (NABP),⁴² American College of Cardiology Foundation,⁴³ and the American Medical Association (AMA).⁴⁴

The approach being discussed is not a matter of switching, although the ultimate impact may be to influence access to certain medications, via some form of interchange or financial incentives to patients. Hence, in considering supposed therapeutic alternatives, an approach for

⁴¹ AMCP. *Therapeutic Interchange*. June 1, 2019. Accessed March 28, 2023 at: <https://www.amcp.org/policy-advocacy/policy-advocacy-focus-areas/where-we-stand-position-statements/therapeutic-interchange-0>

⁴³ Holmes DR, Becker JA, Granger CB, et al. ACCF/AHA 2011 Health policy statement on therapeutic interchange and substitution. *Circulation*. 2011;124:1290-1310.

⁴⁴ American Medical Association. *Drug Formulary and Therapeutic Interchange H-125.991*. Year Last Modified: 2020. Accessed March 28, 2023 at: <https://policysearch.ama-assn.org/policyfinder/detail/Drug%20Formularies%20and%20Therapeutic%20Interchange%20H-125.991?uri=%2FAMADoc%2FHOD.xml-0-227.xml>

CMS' consideration of the term is a definition used by the American Society of Health System Pharmacists set forth as follows:⁴⁵

Therapeutic Alternatives. Drug products with different chemical structures but of the same pharmacologic or therapeutic class and usually have similar therapeutic effects and adverse-reaction profiles when administered to patients in therapeutically equivalent doses.

Certainly, clinically appropriate comparisons are essential. Furthermore, there are multiple publications that differentiate medications, grouping them in a manner that attempts to meet this definition. These publications include, but are not limited to the *American Hospital Formulary Service (AHFS) Drug Information*, and the *United States Pharmacopeia-Drug Information*. However, differences exist among publications and the classification approach. In practice, there are reasons why one grouping may be more appropriate than another, depending on the application.

Another consideration beyond the definition of “therapeutic alternative” would be the clinical appropriateness of the alternative, as directed by guidelines, compendia, and other evidence-based research. We strongly encourage CMS to incorporate clinician guidance as well as evidence-based guidelines as part of the qualifying documentation to drive its decision-making process regarding therapeutic alternatives.

Irrespective of the initial approach used, we believe that the identification of therapeutic alternatives must be done by CMS in a public manner that allows for comments from the manufacturer and other key stakeholders. This should consider both clinical and non-clinical benefits for patients. Furthermore, we believe manufacturers of selected products be allowed to offer their recommended grouping of medications, inclusive of the justification for consideration by CMS during the price setting process.

Therapeutic Advance / Unmet Medical Need: The determination of a therapeutic advance depends on the perspective of who is making the determination and can mean different things to different people. There are currently different approaches in existence that are well known. Following are three examples which should serve as a starting point for consideration.

Food and Drug Administration: The FDA sets forth important criteria for the determination of fast-track approvals, breakthrough therapy, accelerated approval and priority reviews.⁴⁶ As described by FDA, the high-level standards include the following:

- **Fast Track:** Fast track is a process designed to facilitate the development, and expedite the review of drugs to treat serious conditions and fill an unmet medical need.

⁴⁵ Sanders GD, Neumann PJ, Basu A, et al. Recommendations for conduct, methodological practices, and reporting of cost-effectiveness analyses. Second panel on cost-effectiveness in health and medicine. *JAMA*. 2016;316(10):1093-1103.

⁴⁶ U.S. Food and Drug Administration. *Fast Track, Breakthrough Therapy, Accelerated Approval, Priority Review*. Content current as of February 23, 2018. Accessed March 28, 2023 at: <https://www.fda.gov/patients/learn-about-drug-and-device-approvals/fast-track-breakthrough-therapy-accelerated-approval-priority-review>

- Breakthrough Therapy: A process designed to expedite the development and review of drugs which may demonstrate substantial improvement over available therapy.
- Accelerated Approval: These regulations allowed drugs for serious conditions that filled an unmet medical need to be approved based on a surrogate endpoint.
- Priority Review: A Priority Review designation means FDA's goal is to take action on an application within 6 months.

We believe each of these FDA designations represent a minimum standard for a therapeutic advance. However, this should not be the only basis for such a designation.

For example, newer medications in a treatment class may offer critical advances in therapy regarding the adverse event profile, ease of administration (e.g., oral versus intravenous) or impact on a patient's quality of life or overall survival. All of these must be considered in the evaluation of a therapeutic advance.

Specifically, concerning the determination of an unmet medical need, we reference the FDA guidance document further addressing expedited programs. In this document, the definition of an unmet medical need is as follows:⁴⁷

An unmet medical need is a condition whose treatment or diagnosis is not addressed adequately by available therapy. An unmet medical need includes an immediate need for a defined population (i.e., to treat a serious condition with no or limited treatment) or a longer-term need for society (e.g., to address the development of resistance to antibacterial drugs).

1. Where There Is No Available Therapy

If there is no available therapy for a serious condition, there is clearly an unmet medical need.

2. Where There Is Available Therapy

When available therapy exists for a condition, a new treatment generally would be considered to address an unmet medical need if the treatment:

- Has an effect on a serious outcome of the condition that is not known to be influenced by available therapy (e.g., progressive disability or disease progression when the available therapy has shown an effect on symptoms, but has not shown an effect on progressive disability or disease progression)
- Has an improved effect on a serious outcome(s) of the condition compared with available therapy (e.g., superiority of the new drug to available therapy when either used alone or in combination with available therapy (i.e., as demonstrated in an add-on study))
- Has an effect on a serious outcome of the condition in patients who are unable to tolerate or failed to respond to available therapy
- Can be used effectively with other critical agents that cannot be combined with available therapy
- Provides efficacy comparable to those of available therapy, while (1) avoiding serious toxicity that occurs with available therapy, (2) avoiding less serious toxicity that is common and causes discontinuation of treatment of a serious condition, or (3) reducing the potential for harmful drug interactions

⁴⁷ US Department of Health and Human Services. Food and Drug Administration. Center for Drug Evaluation and Research (CDER). Center for Biologics Evaluation and Research (CBER). *Guidance for Industry – Expedited Programs for Serious Conditions – Drugs and Biologics*. May 2014 – Procedural. OMB Control No. 0910-0765.

- Provides safety and efficacy comparable to those of available therapy but has a documented benefit, such as improved compliance, that is expected to lead to an improvement in serious outcomes
- Addresses an emerging or anticipated public health need, such as a drug shortage.

In some disease settings, a drug that is not shown to provide a direct efficacy or safety advantage over available therapy may nonetheless provide an advantage that would be of sufficient public health benefit to qualify as meeting an unmet medical need. For example, in a condition for which there are approved therapies that have a modest response rate or significant heterogeneity in response, a drug with a novel mechanism of action (but comparable safety and effectiveness) could have the potential to provide an advantage over available therapy in some patients. In such a case, the novel mechanism of action should have a well-understood relationship to the disease pathophysiology. In addition, there should be a reasonable basis for concluding that a significant number of patients may respond differently to the new drug compared with available therapy. Thus, mechanistic diversity, even without a documented efficacy or safety advantage, could be advantageous in disease settings in which drugs become less effective or ineffective over time.

For example, infectious disease drugs or targeted cancer therapies with novel mechanisms of action, although appearing to have efficacy similar to available therapy across the disease population, could benefit patients who no longer respond to available therapy. Accordingly, FDA intends to consider a range of potential advantages over available therapy beyond those shown in head-to-head comparisons.

3. Where the Only Available Therapy Was Approved Under the Accelerated Approval Program Based on a Surrogate Endpoint or an Intermediate Clinical Endpoint and Clinical Benefit Has Not Yet Been Verified

As discussed in sections VII and III.B., FDA recognizes, as a general matter, that it is preferable to have more than one treatment approved under the accelerated approval provisions because of the possibility that clinical benefit may not be verified in postapproval confirmatory trials. FDA will therefore consider products as addressing an unmet medical need if the only approved treatments were granted accelerated approval based on a surrogate endpoint or an intermediate clinical endpoint and clinical benefit has not been verified by post approval studies.

With this FDA definition as a starting place, we believe the definition needs to be broadened for purposes of what else should be considered by CMS as an unmet medical need.

New Technology Add-on Payment (NTAP): The Medicare Inpatient Prospective Payment System (IPPS) includes an approach for a new “add-on payment” for “new technologies” known as the NTAP.⁴⁸ This may present another set of considerations for the determination of a therapeutic advance or achieving an unmet medical need. As noted in the related regulations, the medical service or technology must demonstrate a substantial clinical improvement over new technology.

⁴⁸ Centers for Medicare and Medicaid Services. *New Medical Services and New Technologies: Overview of the New Technology Add-on Payment*. Accessed March 30, 2023 at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech>

CMS describes the criteria for such a “substantial clinical improvement” as follows:⁴⁹

To qualify for a new technology add-on payment, the technology must represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. CMS assesses the following in its evaluation of whether a technology meets the substantial clinical improvement criterion for the purposes of the NTAP:

1. The new technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments.
2. The new technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods. There must also be evidence that the use of the new medical service or technology to make a diagnosis affects the management of the patient.
3. The use of the new medical service or technology significantly improves clinical outcomes relative to services or technologies previously available.

Specifically, the eligibility criteria are as follows:⁵⁰

Eligibility criteria. For discharges occurring on or after October 1, 2001, CMS provides for additional payments (as specified in § 412.88) beyond the standard DRG payments and outlier payments to a hospital for discharges involving covered inpatient hospital services that are new medical services and technologies, if the following conditions are met:

- (1) A new medical service or technology represents an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.
 - (i) The totality of the circumstances is considered when making a determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries.
 - (ii) A determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries means one of the following:
 - (A) The new medical service or technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments.
 - (B) The new medical service or technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable, or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods and there must also be evidence that use of the new medical service or technology to make a diagnosis affects the management of the patient.
 - (C) The use of the new medical service or technology significantly improves clinical outcomes relative to services or technologies previously available as demonstrated by one or more of the outcomes described in paragraphs (b)(1)(ii)(C)(I) through (7) of this section.
 - (1) A reduction in at least one clinically significant adverse event, including a reduction in mortality or a clinically significant complication.
 - (2) A decreased rate of at least one subsequent diagnostic or therapeutic intervention.
 - (3) A decreased number of future hospitalizations or physician visits.
 - (4) A more rapid beneficial resolution of the disease process treatment including, but not limited to, a reduced length of stay or recovery time

⁴⁹ Centers for Medicare and Medicaid Services. *New Medical Services and New Technologies: Overview of the New Technology Add-on Payment*. Accessed March 30, 2023 at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech>

⁵⁰ 42 C.F.R. 412.87 (b) Accessed March 30, 2023 at: <https://www.ecfr.gov/current/title-42/chapter-IV/subchapter-B/part-412/subpart-F/subject-group-ECFR5703923263fedba/section-412.87>

- (5) An improvement in one or more activities of daily living
- (6) An improved quality of life
- (7) A demonstrated greater medication adherence or compliance.
- (D) The totality of the information otherwise demonstrates that the new medical service or technology substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.
- (iii) Evidence from published or unpublished information sources from within the United States or elsewhere may be sufficient to establish that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries. Information source may include the following:
 - (A) Clinical trials;
 - (B) Peer reviewed journal articles;
 - (C) Study results;
 - (D) Meta-analyses;
 - (E) Consensus statements;
 - (F) White papers;
 - (G) Patient surveys;
 - (H) Case studies;
 - (I) Reports;
 - (J) Systematic literature reviews;
 - (K) Letters from major healthcare associations;
 - (L) Editorials and letters to the editor; and,
 - (M) Public comments.
 - (N) Other appropriate information sources may be considered.
- (iv) The medical condition diagnosed or treated by the new medical service or technology may have a low prevalence among Medicare beneficiaries.
- (v) The new medical service or technology may represent an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of a subpopulation of patients with the medical condition diagnosed or treated by the new medical service or technology.

NCCN Guidelines: The National Comprehensive Cancer Network (NCCN) utilizes a distinct process for the evaluation and development of recommendations for interventions to prevent, diagnose and manage cancers at their different stages.⁵¹ The approach uses a careful analysis of available evidence about various treatments for cancer and preferences for approaches to treatments. As part of the process, the quality of the evidence and the consensus of panels reviewing the evidence come together to assess the level of appropriateness for a treatment for a specific type of cancer.

For example, the highest NCCN rating among four levels is Category 1, which is granted to those for which there is high-level evidence and a uniform NCCN consensus on the appropriateness of the intervention.⁵² The next level – Category 2A – represents treatments, based on lower-level evidence, that have a uniform NCCN consensus based on appropriateness of the intervention. These two categories must reach an 85% majority support among the panelists for a treatment to achieve one of these ratings. Furthermore, NCCN includes categories of preference

⁵¹ National Comprehensive Cancer Network. *Development and Update of Guidelines*. Accessed May 31, 2023 at: <https://www.nccn.org/guidelines/guidelines-process/development-and-update-of-guidelines>

⁵² National Comprehensive Cancer Network. *Development and Update of Guidelines*. Accessed May 31, 2023 at: <https://www.nccn.org/guidelines/guidelines-process/development-and-update-of-guidelines>

in their reviews. The three categories are: 1) Preferred intervention; 2) Other recommended intervention; and 3) Useful in certain circumstances.⁵³

These evaluations give a sense of medical need in the oncology space for medications and their appropriateness in the treatment of specific cancer variations. Thus, CMS should consider these evaluations further as a basis for consideration of significant therapeutic advance and unmet medical need.

Therapeutic Advance / Unmet Medical Need Summation: Each of these assessments represent examples of important evaluations that influence the use and access to treatments for patients. They serve as a minimal basis for measures of assessing a therapeutic advance or unmet medical need. However, these should not be the only factors CMS considers in this regard. Other considerations should include items, such as the removal or reduction of a significant adverse event that may be related to other alternative treatments, or advances the ability for patients to remain out of a hospital or other institution, thereby helping to reduce health system costs while improving patient quality of life. Furthermore, factors pertaining to improvements in care for disadvantaged groups and overcoming health disparities should be considered.

This is a starting point from which CMS needs to take a longer view when deciding the price for a medication in the Medicare program.

Negotiations

VIII. MFP Ceiling Price (60.2)

Overall, there are at least two main scenarios for which we believe the ceiling price should be set at a level at the maximum ceiling price. Our perspectives follow.

Newer Medications: As the IRA rolls out, small molecule drugs will potentially face price determinations being applied as soon as 9 years after approval. In the case of a biologic, price determinations would not be applied before 13 years. This short timeline for small molecules creates a significant and disproportionate disincentive for manufacturers to continue to develop new indications for a treatment being brought to market.

In our experience, all indications are not submitted for approval immediately. Often, the approach is to bring new treatment options to the market as quickly as possible, such as those for cancer. The delays for certain indications are often beyond the manufacturers' control. Contributing factors such as the available number of trial participants for a trial in question, the time it takes to recruit patients, the time to ensure appropriate regulatory agency guidance is incorporated, or available resources to pursue all potential avenues at one time, to name a few. Thus, there have been important new indications we have seen emerge and continue to be sought following the initial approval of a new medication. This may result in a new indication being approved years after the approval of the first indication.

⁵³ National Comprehensive Cancer Network. Development and Update of Guidelines. Accessed May 31, 2023 at: <https://www.nccn.org/guidelines/guidelines-process/development-and-update-of-guidelines>

This situation creates a dilemma for manufacturers pursuing multiple indications. On the one hand, the goal is to make a treatment available to patients in need as soon as possible. However, by doing so without pursuing approval for all conceivable indications, the manufacturer would be giving up valuable resources that may be used to invest in ongoing research. As an example, this is particularly important as efforts are undertaken to determine the effectiveness of a particular treatment for other types of cancer for which additional treatments are surely needed. Without that research, critical information on the risk-benefit and appropriate use of a medication may not be available.

To help minimize this situation, we recommend CMS take a stance of maximizing the MFP within the limits of the ceiling price. This approach could be done in a way that maintains that maximum ceiling price at least up until the first 13 years post approval. The approach also would help limit the disadvantage of bringing a small molecule to market versus a biologic. While this approach still raises significant concerns, even within the context of the ceiling price, it at least creates some level of certainty that the set price will not be lower than the ceiling, helping to lower the potential risk assessment.

Significant Therapeutic Advances & Unmet Medical Need: In our prior discussion in this letter pertaining to the identification of therapeutic advances and addressing unmet medical needs, we raised several ways to make a determination of these advances.⁵⁴

To recount, this includes recommendations from:

- Food and Drug Administration: The FDA sets forth important criteria for the determination of fast-track approvals, breakthrough therapy, accelerated approval and priority reviews.⁵⁵ Designations pertaining to review status may include Fast Track approvals, Breakthrough Therapy designations, Accelerated Approval status, and Priority Review status: We believe each of these FDA designations represent a minimum standard for a therapeutic advance. An unmet medical need is a condition whose treatment or diagnosis is not addressed adequately by available therapy. An unmet medical need includes an immediate need for a defined population (i.e., to treat a serious condition with no or limited treatment) or a longer-term need for society (e.g., to address the development of resistance to antibacterial drugs). When such a status is granted, these medications should receive no lower than the ceiling price.
- New Technology Add-on Payment (NTAP): The Medicare Inpatient Prospective Payment System (IPPS) includes an approach for a new “add-on payment” for “new technologies” known as the NTAP.⁵⁶ For treatments

⁵⁴ See VII. Manufacturer-Specific Data: Evidence About Therapeutic Alternatives for the Selected Drug (50.2)

⁵⁵ U.S. Food and Drug Administration. *Fast Track, Breakthrough Therapy, Accelerated Approval, Priority Review*. Content current as of February 23, 2018. Accessed March 28, 2023 at: <https://www.fda.gov/patients/learn-about-drug-and-device-approvals/fast-track-breakthrough-therapy-accelerated-approval-priority-review>

⁵⁶ Centers for Medicare and Medicaid Services. *New Medical Services and New Technologies: Overview of the New Technology Add-on Payment*. Accessed March 30, 2023 at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech>

meeting this standard of achieving a therapeutic advance or achieving an unmet medical need, the medical service or technology must demonstrate a substantial clinical improvement over new technology. Thus, this designation should result in a ceiling price being granted for these treatments.

- **NCCN Guidelines:** The National Comprehensive Cancer Network (NCCN) utilizes a distinct process for the evaluation and development of recommendations for interventions to prevent, diagnose and manage cancers at their different stages.⁵⁷ The approach utilizes a careful analysis of available evidence about various treatments for cancer and preferences for approaches to treatments. As part of the process, the quality of the evidence and the consensus of panels reviewing the evidence come together to assess the level of appropriateness for a treatment for a specific type of cancer. In addition, medications receiving a Category 1 or 2A rating should be granted a price at the ceiling price.

In addition, we encourage CMS to consider additional factors that help achieve other measures of unmet medical need and achieve therapeutic advances beyond these measures, as previously discussed.

Overall, it is our opinion that products that offer significant medical advances and treat unmet medical needs should result in a price that does not drop below the established ceiling price. Factors, among others, should include the engagement of clinicians and the expertise of the manufacturers responsible for the respective medications.

IX. Negotiation Process (60.4)

Meetings Between CMS and Manufacturers: CMS describes a process through which a price will be determined in setting the MFP. Of particular interest is the potential for “up to three possible in-person or virtual negotiation meetings between the Primary Manufacturer and CMS...” One of our concerns pertains to how a meeting is ultimately defined.

We recommend an approach where CMS assigns a level to different types of meetings, with only the highest level being recognized as counting toward the limit established by CMS. The highest-level meeting would be reserved to discuss specific information to support an offer or counteroffer being made in the price-establishment process. At the time of scheduling such a meeting, it should be noted to the manufacturer the level of meeting being set and whether it counts against the limit. Should it be determined there is a disagreement in the level being set, the manufacturer should be granted the option to decline the meeting until such time further discussions are warranted.

We envision other potential meetings as being informational in nature. For example, a request to discuss specific information sought by CMS, clarity on completing forms issued by

⁵⁷ National Comprehensive Cancer Network. *Development and Update of Guidelines*. Accessed May 31, 2023 at: <https://www.nccn.org/guidelines/guidelines-process/development-and-update-of-guidelines>

CMS, or clarification on an offer from CMS or the manufacturer, might be considered a lower-level meeting that would not count against the formal process.

The FDA has a more complex approach that helps to serve as a precedent for establishing a similar process by CMS.⁵⁸ As with the FDA guidance, there should be CMS guidance for good meeting management practices (GMMPs) and standardized procedures for requesting, preparing, conducting, and documenting formal meetings. As FDA notes:

Each year, FDA review staff participate in many meetings with requesters who seek advice relating to the development and review of investigational new drugs and biologics, and drug or biological product marketing applications. Because these meetings often represent critical points in the regulatory process, it is important that there are efficient, consistent procedures for the timely and effective conduct of such meetings. The GMMPs in this guidance are intended to provide consistent procedures that will promote well-managed meetings and to ensure that such meetings are scheduled within a reasonable time, conducted efficiently, and documented appropriately.

In a similar manner, key meetings with CMS indicate critical points in the establishment of a price. Thus, standards should be established for these meetings.

Compliance and Penalties

X. Manufacturer Compliance and Oversight (90)

In accordance with section 1196(a)(3)(A) of the Act, CMS intends to establish procedures for reporting violations related to access to the MFP under Part D of title XVIII or MA-PD plan under Part C. CMS would also expect manufacturers and other stakeholders to report instances in which a dispenser was not passing through the MFP to an MFP-eligible individual, or a dispenser was extending the MFP to non-MFP-eligible individuals. CMS is seeking comment on how such a process would operate most effectively, including suggestions on ways that CMS could provide technical assistance to entities to ensure they are able to provide the MFP to MFP-eligible individuals and ways to ensure that MFP-eligible individuals whose cost-sharing was not consistent with MFP are made whole.

We appreciate that CMS is looking to establish a robust and fair process for reporting of violations. We further believe that such a reporting process for potential violations should be developed hand in hand with a robust dispute resolution process for the process to be fair and equitable. CMS should go through a notice and comment rulemaking process to establish such reporting of violations and dispute resolution process similar to the process that was used in establishing the recent 340B Program's dispute resolution process.

Among the issues that must be addressed in establishing a fair violations reporting process are: (1) equal access to the process by all parties; (2) competence and independence of the investigators receiving and acting on the reported violations; (3) clear parameters of what can be reported as violations; (4) defined process for how a report should be received, handled,

⁵⁸ US Department of Health and Human Services, Food and Drug Administration, Center for Drug Evaluation and Research (CDER), Center for Biologics Evaluation and Research (CBER). *Formal Meetings Between the FDA and Sponsors or Applicants of PDUFA Products: Guidance for Industry. (DRAFT GUIDANCE)*. December 2017, Procedural.

communicated, and resolved. As the reported violations may result in non-compliance and potential Civil Monetary Penalties (CMP), a robust dispute resolution process and fair hearing process must be established. We strongly encourage CMS to do this through the notice and comment rulemaking process.

XI. Civil Monetary Penalties (100)

The guidance in Section 100 addresses the Civil Monetary Penalties (CMP) set forth in section 1197 of the SSA (the Program-related CMPs). CMS provided the “procedures” CMS intends to follow to impose these CMPs on manufacturers. We believe that CMS can only implement these CMPs in a manner that conforms to the statute through a notice and comment rulemaking process. ***Section 1197 authorizes extraordinarily high CMP penalties equal to \$100 million for each item of false information and \$1 million per day for failing to provide the information required under section 1193(a)(4) warrant notice-and-comment rulemaking prior to Agency implementation.***

Due to the complexities and many ambiguities that exist in the program, there will be implementation gaps and shortcomings that may potentially cause undue harm to a manufacturer and unfair administration of the determination of a violation and resulting penalties. To safeguard against this, we strongly request CMS to develop the implementation rules for this CMP section through the notice-and-comment rulemaking process before seeking to impose any Program-related CMPs on a manufacturer. The rulemaking process should address the following issues:

- (1) Scope: Specific identification by CMS of violations that would qualify for a Section 1197 CMP and the amounts that correspond to the specific violation;
- (2) Transparency: Detailed procedures for the determination of violations and imposition of the Section 1197 CMPs;
- (3) Review and Appeal Process: Clear process for reviewing and appealing a Section 1197 CMP to provide the manufacturer due process and ensure fairness.

Section 100.4 of the proposed guidance state that CMS will provide manufacturers that violate any of the provisions with a notice regarding the CMP, in accordance with section 1128A of the Act. The notice will include the option to either pay the CMP or to request a hearing as outlined in section 1128A. The CMP notice will include the (1) basis for the CMP; (2) CMP amount due; (3) deadline for the manufacturer to respond with a hearing request or submit the CMP payment; (4) method to submit CMP payment(s); and (5) Information on the right to request a hearing. We believe that a hearing to contest the CMP amount should not be the only recourse of the manufacturer. Prior to sending a CMP Notice, manufacturers should be allowed to appeal the finding of non-compliance and violation. CMP assessments and notifications should be stayed pending result of the appeal. Should an appeal confirm that a manufacturer is in violation of the provisions that warrant CMPs, a final opportunity for a hearing related solely to the CMP, as described by the CMS guidance should be available to the manufacturer.

Non-Compliance by Third Parties Unrelated to Manufacturer: As part of the dispute resolution process, the manufacturer should be able to raise as a defense, that the violation at issue was committed by a third party and not by the manufacturer. We urge CMS to not impose CMPs on drug manufactures for unrelated third-party non-compliance.

We oppose CMS' intention to hold a "Primary Manufacturer" responsible for certain acts and omissions of a "Secondary Manufacturer" or other third parties. The primary manufacturer has no control over the acts and omission of an unrelated third party. Therefore, acts and omissions by an unrelated secondary manufacturer or third party should not be attributed as a violation by the primary manufacturer. We are deeply concerned that CMS, without a proper dispute resolution process, could impose \$1 million-per-day CMPs on a Primary Manufacturer for acts or omissions by third parties unrelated to the primary manufacturer.

In addition, we strongly oppose any interpretation of the statute that would seek to impose CMP liability on manufacturers of selected drugs due to the acts or omissions of any unrelated third party. CMS has proposed to hold Primary Manufacturers ultimately responsible for ensuring access to the MFP. There are many components and entities involved in making a drug's discounted price available to the patient at the time of purchase or through a rebate process. The pharmacy must have the proper infrastructure in place to administer and process a discount and 'chargeback' the MFP discount to a wholesaler or distributor. A wholesaler or distributor must need to have the proper infrastructure in place to process the MFP discount to the appropriate drug manufacturer. The primary manufacturer cannot control how these pharmacies, wholesalers and distributors run their businesses. It would be unfair to attribute all the failures of a supply chain network of these entities to the primary manufacturer.

Knowingly Standard Should be Limited to Actual Knowledge: The guidance uses the "knowingly standard" for determining noncompliance of various requirements. In Section 1197(c) of the SSA, a manufacturer that knowingly submits such information is subject to a CMP equal to \$100 million for each item of false information. In Section 100.2 of the Guidance, CMS states that a manufacturer would be out of compliance if it knowingly submits false information required under the agreement between the manufacturer and CMS and subject to a CMP equal to \$1 million per day of a violation under section 1197(c).

We believe that noncompliance should only occur if the manufacturer has actual knowledge of a violation instead of merely 'knowingly' committed or omitted certain acts that result in a violation. The term 'knowingly' is not defined in section 1128A of the SSA, which is incorporated by reference into the Program-related CMPs. Nor is the term "knowingly" defined in Part E of Title XI of the SSA. There is no legally binding definition of 'knowingly'. The plain meaning of the term 'knowingly' requires one to act "in a way that suggests one has secret knowledge or awareness."⁵⁹ An act that suggests awareness or secret knowledge is not sufficient to establish guilt. Actual awareness and actual knowledge should be established before a liability attaches. ***Given the excessive fines and penalties that may be imposed, we strongly urge CMS to adopt the 'actual knowingly' standards. Such actual knowledge standard eliminates doubt as to the intent and awareness of the party performing the act.***

Dear Ms. Brooks-LaSure and Dr. Seshamani,

Thank you for the opportunity to comment on the initial guidance for implementing the Medicare drug price negotiation provisions of the Inflation Reduction Act.

In considering how to proceed, it would be well to remember the adage: "First, do no harm." While the issue of making drugs more affordable is well outside the scope of the Bayh-Dole Coalition, one factor stood out to us as posing a very real danger to our ability to continue to lead the world in the creation of life-saving therapies. That is the idea that those who commercialize federally-funded inventions have received some sort of advantage that should be used against them when negotiating drug prices. This is a serious fallacy which can do irreparable harm to the most innovative system in the world. And NIH should know this better than most.

Before 1980, the government took inventions away from their creators. When President Johnson asked the Comptroller General why no drugs were created from the billions of taxpayer dollars funding NIH research, the answer was that the incentives needed for the private sector to undertake the tremendous risk and expense of development had been destroyed. That finding eventually led to the passage of the Bayh-Dole Act, which restored the incentives of our patent system needed for effective public/private sector partnerships. Those alliances make the United States the unquestioned leader in the life sciences.

While partnerships between our academic research institutions, federal laboratories, and the private sector are critical, industry is assuming the risk. Those risks are particularly heavy on the small companies which drive innovation, especially when it comes to developing new drugs. The U.S. is the only country in the world where small companies routinely play crucial roles in creating breakthrough drugs.

Despite the tremendous successes of our system, those who want to return us to the pre-Bayh-Dole era claim that the government is "derisking" inventions it helps to create, giving developers an unfair advantage. That is demonstrably false.

Government discoveries are embryonic, more like ideas than products. That is particularly true for developing new drugs. A new [study](#) "The Relative Contributions of NIH and Private Sector Funding to the Approvals of New Biopharmaceuticals" examined the investment of NIH and industry in 18 FDA-approved

therapies, which cited NIH-supported inventions. NIH provided \$0.670 billion in funding against \$44.3 billion from private industry. And even that can be misleading, as the vast majority of new therapies fail in the development pipeline. Industry eats those costs.

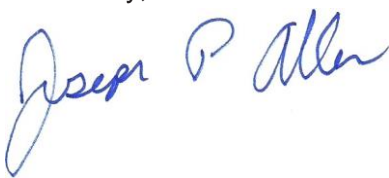

The other fallacy is that companies are lined up to partner with NIH or academic research centers. As those running your programs will attest, most times, it is very difficult to find even one company willing to assume the burden of taking a government-funded invention to market. That's particularly true for drug development because of the enormous costs, decades of research required, and uncertainties in obtaining FDA approval. No company gets an "express lane" because they are working on a government-supported invention.

One of America's key advantages over our foreign competitors is that our system provides the authorities and incentives for entrepreneurial companies to develop government-funded inventions. That makes federal programs more effective at no cost to taxpayers. Companies assume this burden knowing the odds are stacked against them. If we want to continue to be the innovation wonder of the world and the source of new drugs and other therapies, the last thing we should do is make those burdens even heavier.

For these reasons, I urge you not to use the fact that a company beat the odds and made it across the finish line against them in negotiating Medicare drug prices. Any benefits in short-term price reduction will be massively offset by those walking away from working with NIH and our research universities in the future.

That's a price we simply cannot afford to pay.

Sincerely,

Joseph P. Allen
Executive Director
Bayh-Dole Coalition

Subject: Medicare Drug Price Negotiation Program Guidance

Dear Honorable Brooks-LaSure:

Bellus Health Inc. appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance). At Bellus Health, we are working to better the lives of patients suffering from persistent cough, starting with the development of camlipixant (BLU-5937) for the treatment of refractory chronic cough. As a relatively small biotech, we are solely focused on developing pharmacologic innovations that address unmet needs for patients. Although we acknowledge the previously stated CMS position that guidance in the CMS Medicare Drug Price Negotiation Program is final, we consider key provisions within Section 30 and other sections to be concerning and hinder our ability as a company and industry to continue to provide patients in need of solutions with medical innovations.

In particular, we would like to draw attention to the following provisions:

- I. Section 30.1 Medicare negotiation for NDA-path drugs at nine-years post launch
 - a. Bellus Health, Inc. is currently developing camlipixant (BLU-5937) for the treatment of refractory chronic cough, to which there is currently no indicated treatment available for patients. Reducing our ability to recover investment before eligibility to NDA-path negotiations in 9-years inhibits our ability to fuel further discovery and development. This directly disincentivizes investment in and steers funding away from such small molecule innovations like camlipixant (BLU-5937) and across the industry, even though the development costs and risks have not changed. We ask that you strongly consider changing the timing for NDA-path negotiations from 9-years to the same 13-year period as that for BLA-path drugs. While this is still less than the typical 14-years of marketing exclusivity afforded by patent protection, this adjustment is more logical, allowing investment to recalibrate slightly to one less year as opposed to 5 years.

BellusHealth.com

- II. Section 50.2 CMS' process for determining the Maximum Fair Price for individual medicines as well as the relevance of "therapeutic alternatives" to the drugs it selects for negotiation
- a. As a company focused on the patient, we are concerned that patient-centric outcomes are not adequately weighted in traditional cost-effectiveness analyses. Cost-effectiveness approaches embraced by ICER in the US and formal HTA bodies outside of the US exclude many demonstrable benefits of medical innovations, resulting in considerable underestimation of the true value of medicines. To the extent that CMS intends to consider the value that medical innovations bring to society before determining how aggressively to lower the price, CMS should include more comprehensive value elements, such as using a dynamic stacked cohort model that includes value to patients, caregivers, and the population whose risk are reduced by including the innovation. Choosing not to do so would result in applying over-simplified math that inherently undervalues innovations, signaling to investors that the value of new innovations will be underestimated and not reward development costs and risks.

We appreciate your consideration of our comments as you develop the Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact the undersigned by telephone at +1 (450) 680-4551 or by e-mail at rbelini@bellushealth.com if you have any questions regarding our comments.

Sincerely,

/s/-

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Submitted electronically

Dear Administrator:

Biocom California appreciates the opportunity to offer comments on the initial guidance issued by the Centers for Medicare and Medicaid Services (CMS) for the implementation of the Medicare Drug Price Negotiation Program (“Negotiation Program”)¹.

Biocom California is the largest, most experienced leader and advocate for California’s life science sector, which includes biotechnology, pharmaceutical, medical device, genomics and diagnostics companies of all sizes, as well as research universities and institutes, clinical research organizations, investors and service providers. With more than 1,700 members dedicated to improving health and quality of life, Biocom California drives public policy initiatives to positively influence the state’s life science community in the research, development, and delivery of innovative products. California’s life sciences industry generates over \$375 billion in annual economic activity, supports 435,000 jobs, and increases labor income by \$115 billion per year².

While Biocom California supports the Inflation Reduction Act’s (IRA) establishment of a \$2,000 cap on out-of-pocket patient spending and the restructuring of the Medicare Part D benefit program, we have continuously raised strong concerns about the Medicare Negotiation provisions which will have a devastating impact on current and future biotechnology innovation. We believe that the IRA does not balance promoting patient affordability and the role of the biomedical community in bringing innovative medicines to market. As the advocate for California’s life science sector, we understand the importance for stakeholders to inform and guide the establishment of the Negotiation Program and we offer our comments below:

¹ Federal Register, 87 FR 30963, pp. 30963-30966, May 20, 2022.

² Biocom California 2022 Economic Impact Report Databook. <https://www.biocom.org/eir/>

Biocom California is disappointed by the agency’s decision not to accept comments on Section 30, *Identification of Selected Drugs for Initial Price Applicability Year 2026*. We believe stakeholders should have the opportunity to provide feedback on all aspects of this program. This initial approach to developing the framework sets an unfavorable precedent of limited communication and a lack of transparency between CMS and stakeholders. **We encourage the agency to consider comments on all sections of this initial guidance in order to prioritize transparency and engagement with stakeholders. We respectfully submit the following comments on Section 30 and request consideration:**

Identification of Qualifying Single Source Part D Drugs for Initial Price Applicability Year 2026

The guidance states that CMS will identify a potential qualifying single source drug by “all dosage forms and strengths of the drug with the same active moiety and the same holder of a New Drug Application (NDA), inclusive of products that are marketed pursuant to different NDAs.” For biological products, CMS will consider “all dosage forms and strengths of the biological product with the same active ingredient and the same holder of a Biologics License Application (BLA) inclusive of products that are marketed pursuant to different BLAs.”

Biocom California disagrees with CMS’s approach to identifying a qualifying single source drug and its dosage forms and strengths by its common active moiety and common active ingredient for drugs and biologics, respectively. Instead, we suggest that CMS identify drugs and their dosage forms and strengths by referencing an NDA or BLA. The Food and Drug Administration’s (FDA) application-based framework should act as a reference and be adopted such that a product approved or licensed under a new NDA or BLA (as opposed to a product approved or licensed under a supplement to an existing NDA or BLA) is a distinct qualifying single source drug. Utilizing this framework to distinguish products would be consistent with industry practice and incentivize innovation; unlike CMS’s current definition of a “qualifying single source drug” which combines drug products by common active moiety and biological products by common active ingredient. Furthermore, utilizing FDA’s application-based framework would enable CMS to more easily identify relevant dosage forms and strengths when aggregating Medicare expenditures and this would allow manufacturers to track the seven- or eleven-year “qualifying single source drug” clock more readily.

Orphan Drug Exclusion from Qualifying Single Source Drugs

In section 30.1.1, CMS explains that certain orphan drugs will be excluded when identifying qualifying single source drugs: “CMS will exclude a drug or biological product that is designated as a drug for only one rare disease or condition under section 526 of the [Food, Drug, and Cosmetics] FD&C Act and that is approved for only an indication (or indications) for such disease or condition.” The limited scope of the orphan drug exclusion risks disincentivizing orphan drug research and development (R&D) and will impact a manufacturer’s decision to continue follow-on R&D to expand a drug’s indications to include additional rare diseases. The initial guidance also states, “CMS is considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development.” **Biocom California urges CMS to consider ways to expand the orphan drug exclusion to allow orphan drugs and biological products with multiple rare disease indications to qualify for the exclusion.** By expanding the scope of orphan drug exclusion, CMS would continue to support and incentivize the development of orphan drugs and rare disease R&D.

Additionally, in situations where an approved indication falls within the scope of an orphan drug designation but there is no corresponding orphan exclusivity, CMS cannot rely on FDA's databases as they track orphan exclusivity, rather than a designation, to determine eligibility for orphan drug exclusion. **Biocom California suggests that CMS establish a process that enables manufacturers to submit evidence demonstrating that an indication falls within an orphan drug designation in situations where the agency is unable to determine eligibility for the exclusion based on FDA's databases.** We encourage CMS to establish this process in a timely manner so that manufacturers can gather evidence supporting eligibility for the orphan drug exclusion in advance of the first selected drug publication date.

Furthermore, under FDA regulations, a manufacturer may voluntarily withdraw a requested or granted orphan drug designation at any time and the withdrawal is publicized. **We ask CMS to clarify that, when determining eligibility for the orphan drug exclusion, the eligibility will be based on orphan drug designation *at the time of selection* and will not reference any prior designation that has been withdrawn.** This practice would continue to protect the scope of orphan drugs eligible for the exclusion.

Lastly, Biocom California asks CMS to clarify that, where an orphan drug loses eligibility for the orphan drug exclusion, the seven- or eleven-year "qualified single source drug" clock runs from *the date on which the drug lost eligibility for the exclusion*. An orphan drug that loses eligibility for the orphan drug exclusion due to an expansion of indications for a second rare disease could be immediately eligible for negotiations. **This would further disincentivize drug developers from investing in rare disease R&D and we ask CMS to clarify these details in order to mitigate the risk that the Negotiation Program will deter necessary orphan drug development.**

Exception for Small Biotech Drugs

Per the IRA, a drug is exempt from negotiation for initial price applicability years 2026, 2027, and 2028 if the drug meets the exception for small biotech drugs ("Small Biotech Exception"). For initial price applicability year 2026, wherein only Part D drugs will be selected for negotiation, this exception requires that in 2021, "the Total Expenditures under Part D for the qualifying single source drug (1) were equal to or less than one percent of the Total Expenditures under Part D for all covered Part D drugs; and (2) were equal to at least 80 percent of the Total Expenditures under Part D for all covered Part D drugs for which the manufacturer of the drug had a [Coverage Gap Discount Program] CGDP agreement in effect during 2021."

The Small Biotech Exception is a critical protection that recognizes the need for small biotech drugs to be exempt from negotiation. Therefore, Biocom California asks CMS to make the Small Biotech Exception permanent and to release transparent and predictable guidance that assists small biotech companies in applying for the exception. CMS has indicated that the current Small Biotech Exception information collection request (ICR) is focused only on initial price applicability in the year 2026 and the agency has not publicly announced which 2021 total expenditure data it will utilize to determine eligibility for the exception. **Without this information, it is challenging for small biotech manufacturers to determine whether a submission will be needed in the current or future years, and we suggest that CMS clearly state the specific criteria manufacturers should reference when determining whether to apply for the Small Biotech Exception. For initial price applicability year 2026, we recommend that manufacturers who believe they qualify for the Small Biotech Exception should apply and be approved for this exception this year regardless of whether the drug meets the test of a high spend drug under Sec. 1192 (d)(1)³.** This will benefit small biotech manufacturers who have a limited number of products on the market.

³ Social Security Act § 1192(d)(1)

Section 30.2.1 of the guidance states: “To receive consideration for the Small Biotech Exception for initial price applicability year 2026, the Submitting Manufacturer must submit the Small Biotech Exception Information Collection Request Form using the CMS Health Plan Management System (HPMS) by the deadline established by CMS; CMS anticipates that this deadline will be in June 2023 but will publish a specific deadline on the CMS IRA website in the future. This due date will be in advance of the date on which CMS is required to publish the list of selected drugs for initial price applicability year 2026 and will allow sufficient time for CMS to consider whether the qualifying single source drug qualifies for the Small Biotech Exception.”

Biocom California appreciates the agency’s transparency in providing an anticipated date for the deadline to submit for the Small Biotech Exception. **We ask that CMS publish the specific June 2023 deadline date on the IRA website as soon as possible so manufacturers can have adequate notice of the ICR form submission date and can plan their efforts accordingly. Additionally, we ask CMS to clearly specify the review and response timelines (in situations where the agency does and does not grant the exception) for submitting manufacturers as far in advance of September 1, 2023, as possible.** If a negative determination is granted, CMS’s response should include 1) a rationale in sufficient detail explaining how the determination was made and 2) information regarding which expenditure data was referenced that led to a negative determination.

We also encourage the agency to develop a dispute resolution process that enables manufacturers to respond to and appeal a negative determination. As part of this process, CMS should engage in a dialogue and small biotech companies should have the opportunity to provide additional data to support their application for the exception before CMS provides a final determination. **If a manufacturer has previously received the Small Biotech Exception and there has been no significant change in the manufacturer’s circumstances, Biocom California asks that manufacturers need not reapply for the Small Biotech Exception in subsequent years and, instead, inform CMS annually that no changes have occurred.**

Lastly, Biocom California would like to underscore the importance of maintaining the confidentiality of proprietary information; especially when submitted as part of the Small Biotech Exception ICR. **We ask that CMS provide more specific information regarding its approach for publicly sharing which small biotech drugs qualify for the exception. In order to promote transparency and consistency, we recommend the agency publish a summary list of the small biotech drugs and manufacturers that qualify each year.** Any additional information detailing how or why a specific manufacturer’s drug qualified should only be released with the manufacturer’s consent as this will ensure proprietary information remains protected.

Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

In section 40.1, CMS states that it “will make reasonable efforts to make the final text of the Agreement available to the public before the selected drug list for initial price applicability year 2026 is published.” **Biocom California requests that CMS publicly release and provide an opportunity to comment on the text of the Negotiation Program Agreement as soon as possible, and well in advance of September 1, 2023, when CMS publishes the selected drug list.** It is imperative that manufacturers have an adequate opportunity to review the agreement and understand their specific obligations since they are subject to civil monetary penalties (CMPs) if in violation of the agreement’s terms. Furthermore, advanced notice of the agreement is necessary for manufacturers to establish new processes in order to comply with the terms of the agreement.

Confidentiality of Proprietary Information

In section 40.2.1, CMS explains that it “intends to implement a confidentiality policy that is consistent with existing requirements for protecting proprietary information, such as Exemption 4 of [the Freedom of Information Act] FOIA.” The guidance states that R&D costs and recoupment, unit costs of production and distribution, pending patent applications, market data, revenue and sales volume data will be considered proprietary. Conversely, data on prior Federal funding, approved patent applications, exclusivities, and FDA applications and approvals will be considered non-proprietary since this data is publicly available. **Biocom California acknowledges and agrees with the information that will be considered proprietary versus non-proprietary. However, we believe there is a need for CMS to further explain how it intends to protect a manufacturer’s confidential information and establish more robust safeguards to ensure that the agency is adequately handling proprietary information submitted as part of the negotiation process. We suggest that CMS focus on developing data privacy and security protection protocols that include robust storage and controls that limit access to confidential information to CMS staff on a “need-to-know” basis.**

Furthermore, the initial guidance outlines that “CMS is required to publish the explanation for the MFP [maximum fair price] by March 1, 2025, for initial price applicability year 2026 (see section 60.6.1 of this memorandum). In this public explanation and any other public documents discussing the MFP, CMS intends to make high-level comments about the data submitted to CMS, without sharing any proprietary information reported to CMS under section 1193(a)(4) for purposes of the negotiation.” **Biocom California appreciates CMS’s discretion and intention to only make high-level comments regarding the submitted data. However, the possibility of inadvertently disclosing confidential information is possible. In order to avoid such a disclosure, we suggest CMS allow manufacturers the opportunity to review a draft explanation of the MFP prior to its publication and dispute any confidentiality concerns. This will ensure that manufacturers are comfortable with the information disclosed and no proprietary information is inadvertently released.**

In section 40.2.2, the Primary Manufacturer is barred from disclosing “any information in the initial offer or any subsequent offer by CMS, the ceiling price contained in any offer, or any information contained in any concise justification provided with an offer,” as well as “any information exchanged verbally during the negotiation period.” CMS also proposes to require that manufacturers destroy information if the drug or biologic no longer qualifies as a selected drug. However, Congress, through the IRA, did not authorize CMS to impose these mandatory non-disclosure and information-destruction provisions. These provisions violate manufacturers’ rights to free speech and are not necessary to administer or monitor compliance with the Negotiation Program. Moreover, this practice would put manufacturers at an unnecessary disadvantage that hinders the program’s administration, efficiency, and consistency. **In order to facilitate a fair and transparent negotiation process, we ask CMS to remove the non-disclosure and information-destruction provisions.**

Providing Access to the MFP

In section 40.4, CMS details the ways in which a Primary Manufacturer may provide access to the MFP by either “(1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP” within 14 days. **Biocom California supports CMS’s proposed MFP rebate approach and appreciates the agency’s flexibility for manufacturers. In order to facilitate access to the MFP, we ask that CMS make available the necessary datasets for manufacturers to ensure that the MFP discount is being provided on an MFP-eligible product to an MFP-eligible patient.**

Additionally, the initial guidance does not specify when the 14-day retrospective reimbursement timeframe begins, and **we ask CMS to confirm that the proposed 14-day period begins on the date on which the manufacturer has validated the eligibility of an MFP-eligible individual. We also urge the agency to lengthen this timeframe and seek additional stakeholder input to determine a more appropriate timeline. Given the new processes that still need to be developed as part of the Negotiation Program, we ask CMS for maximum flexibility to ensure program compliance.**

Manufacturer Specific Data

Section 50.1 of the initial guidance outlines the selected drug data requirements to be reported by the Primary Manufacturer to CMS by October 2, 2023. These elements include 1) “research and development costs of the Primary Manufacturer...and the extent to which the Primary Manufacturer has recouped those costs;” 2) “current unit costs of production and distribution...averaged across the Primary Manufacturer and any Secondary Manufacturer(s);” 3) “prior Federal financial support for novel therapeutic discovery and development with respect to the selected drug;” 4) “data on pending and approved patent applications, exclusivities recognized by the FDA, and applications and approvals under section 505(c) of the FD&C Act or section 351(a) of the PHS Act;” and 5) “market data and revenue and sales volume data for the selected drug in the United States for the Primary Manufacturer and any Secondary Manufacturer(s) (with the exception of costs related to the acquisition of the selected drug, which would be reported only for the Primary Manufacturer).”

While we appreciate CMS outlining the exact manufacturer-specific data required, it is unclear what the agency’s expectations are regarding data quality and how it intends to assess these factors without standardizing each element. For example, R&D costs related to the selected drug may have been incurred via disease-specific research programs that evaluated multiple drugs with varying indications. It would be difficult for a manufacturer to calculate the exact R&D costs for a selected drug that was part of a larger disease research program. **In an effort to provide clear data that aligns with the relevant information CMS requires, we suggest that the agency allow manufacturers to 1) submit the information which they believe is most relevant and aligns with these required elements and 2) provide a justification for the manufacturer-specific data they submitted.**

Moreover, we urge CMS to reconsider its proposal that if the selected drug has patents and exclusivities that will last for several years, CMS may consider adjusting the preliminary price downward. This proposal, which the agency did not provide a rationale for, will likely discourage innovation by penalizing innovators from obtaining patents. Additionally, the proposal fails to consider a key value of the patent right as a patent is a quid pro quo situation. In exchange for the right to exclude for a limited period of time, the inventor must fully disclose their invention such that the public can benefit from it and expand on it. Therefore, a patented product creates an economic value derived from its improved technological features and social value through its public disclosure. **We recommend CMS consider the value associated with a patented product and urge the agency not to use patent coverage as a downward adjustment factor.** Further, the CMS proposal may be inconsistent with the United States’ obligation under the Trade-Related Aspects of Intellectual Property Rights (TRIPS) agreement⁴. Specifically, Article 30 of the TRIPS agreement requires that each member state “not unreasonably conflict with a normal exploitation of the patent and ... not unreasonably prejudice the legitimate interests of the patent owner.” Adjusting a price downward in view of patent coverage appears to be inconsistent with this TRIPS requirement.

⁴ Agreement on Trade-Related Aspects of Intellectual Property Rights, Apr. 15, 1994, Marrakesh Agreement Establishing the World Trade Organization, Annex 1C, 1869 U.N.T.S. 299, 33 I.L.M. 1197 (1994)

Lastly, Biocom California also asks CMS to clarify how it intends to consider pending patent applications as a negotiation factor when determining a preliminary price. We discourage the agency from utilizing pending applications as a factor to downward-adjust prices since these may not always mature into a full patent and do not guarantee protection for the product.

Evidence about Clinical Benefit for the Selected Drug

As noted in section 50.2, CMS will “consider evidence about alternative treatments to the selected drug, as available, including:

1. The extent to which the selected drug represents a therapeutic advance compared to existing therapeutic alternatives for the selected drug and the costs of such existing therapeutic alternatives;
2. FDA-approved prescribing information for the selected drug and its therapeutic alternatives;
3. Comparative effectiveness of the selected drug and its therapeutic alternatives, including the effects of the selected drug and its therapeutic alternatives on specific populations (including individuals with disabilities, the elderly, the terminally ill, children, and other patient populations, herein referred to as “specific populations”); and
4. The extent to which the selected drug and the therapeutic alternatives to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy.”

Additionally, CMS will not use “evidence from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill” and certain uses of quality-adjusted life-years (QALYs) will not be used in the negotiation process. Furthermore, in section 60.3 *Methodology for Developing an Initial Offer*, when developing a starting point for the initial offer, CMS proposes to utilize the net price for identified therapeutic alternatives and, after the review of the clinical evidence, adjust this price to develop a “preliminary price.” At this point, CMS will then consider the manufacturer-specific data to adjust the preliminary price upward or downward. When there is no therapeutic alternative CMS would adjust the starting point based on how the selected drug fills an unmet medical need.

Biocom California supports CMS’s proposed approach of prioritizing a selected drug’s therapeutic benefit and negotiation factors related to therapeutic alternatives, comparative effectiveness, and unmet need. Ensuring such evidence is appropriately weighted in the MFP will more appropriately reward products that have enhanced patient care and will help maintain the investment in promising R&D and clinical programs. **Since CMS proposes to adjust the starting point for the initial offer based on its review of clinical benefit evidence, Biocom California encourages an approach that places a greater emphasis on a range of high-quality robust evidence, including real-world evidence (RWE), and prioritizes information submitted by manufacturers with expertise in their therapeutic areas.** We suggest the agency provide additional clarifying information about how it will evaluate alternative treatment evidence from different stakeholders and how that data will be considered when determining the MFP. Lastly, in order to promote a transparent negotiation process, we ask CMS to provide manufacturers with details regarding the agency’s evaluation of evidence related to therapeutic alternatives and discuss this analysis with manufacturers before CMS’s initial offer in February 2024.

Negotiation Process

In section 60, CMS outlines the methodology and negotiation process that it intends to use to “achieve the lowest maximum fair price for each selected drug.” After the written initial offer from CMS is presented to the Primary Manufacturer, the negotiation process would begin as described in section 60.4 of the initial guidance. As part of this process, the Primary Manufacturer may provide an optional written counteroffer (if CMS’ written initial offer is not accepted) that must be submitted no later than 30 days after the date of receipt of the written initial offer. CMS may then provide a written response to the optional written counteroffer and, if the Primary Manufacturer’s counteroffer is not accepted by the agency, up to three possible in-person or virtual negotiation meetings may take place. At the conclusion of these meetings between the Primary Manufacturer and CMS, the agency will provide a final written offer to the manufacturer, and they must either accept or reject this final offer before the end of the negotiation period.

Biocom California encourages an open and transparent dialogue between CMS and the Primary Manufacturer when determining the MFP. As part of the Negotiation Process, we believe CMS should begin at the MFP ceiling price instead of negotiating upwards from the lowest MFP. We also suggest the agency consider circumstances when drugs should be priced as close as possible to the MFP ceiling in order to avoid imperiling patient access. Additionally, to facilitate a transparent negotiation process, we ask CMS to provide 1) a meaningful justification of its initial offer, 2) its response to any counteroffer, and 3) afford the manufacturer a legitimate opportunity to comment on the response before the MFP is set. As part of this justification, we would ask the agency to provide a rationale as to how it arrived at the offer or response, including an explanation of how the decision is supported by the negotiation factors, how those factors were considered and weighted, and any additional information that was utilized as a part of the decision. Disclosing the basis of an offer or response would promote a robust and effective dialogue that informs more targeted discussions during the negotiation process.

Lastly, the initial guidance specifies that, only in the case where CMS rejects a counteroffer, the agency will extend an invitation for a negotiation meeting within 30 days of receipt of the counteroffer. **Biocom California asks that the agency fulfill its commitment to responding to counteroffers within 30 days and allow the Primary Manufacturer at least 30 days to comment on CMS’s response before the MFP is set.** These actions would further support a consistent and transparent negotiation process and prevent the MFP from being finalized based on an error or lack of information.

Removal from the Selected Drug List Before or During Negotiation, or After an MFP is in Effect

In section 70, CMS explains that a drug will be removed from the selected drug list and no longer subject to the negotiation process when the agency determines that “(1) the FDA has approved a generic drug under section 505(j) of the FD&C Act that identifies as its reference listed drug a product that is included in the selected drug, or the FDA has licensed a biosimilar biological product under section 351(k) of the PHS Act that identifies as its reference product a product that is included in the selected drug; and, (2) the generic drug or biosimilar biological product, as applicable, is marketed pursuant to such approval or licensure.” CMS intends to review prescription drug event (PDE) data to determine whether a generic drug or biosimilar biological product is approved and marketed. The agency will consider a generic or biosimilar to be marketed when PDE data reveals that the manufacturer has engaged in bona fide marketing of that drug or product.

Biocom California disagrees with the agency’s use of “bona fide marketing” as this is a subjective assessment of “robust and meaningful competition” and the initial guidance lacks objective, clear criteria defining this standard. We suggest CMS abandon “bona fide marketing” and, instead, consider a product’s market date as the date on which a generic or biosimilar is marketed and the date on which CMS *determines* that a generic or biosimilar has been marketed.

Per CMS’s Medicaid Drug Rebate Program (MDRP) Data, “market date” is defined as “the earliest date the drug was first marketed under the application number by any labeler⁵.” The MDRP “market date” is a familiar term for both CMS and manufacturers and would allow for a consistent application and less burdensome adoption of this standard as part of the Negotiation Program.

Furthermore, the use of PDE data raises timing concerns as there will be a delay between the actual date of marketing and the date of CMS’s determination that a product has been marketed since some time is required for sales to be reflected in this data. Furthermore, when a new product is available and actively marketed, it takes time for the widespread adoption of the product by providers and for patients to transition to the generic or biosimilar. During this uptake period, this information will not be immediately reflected in the PDE data once a generic or biosimilar is on the market.

Manufacturer Compliance and Oversight

In section 90.2, *Monitoring of Access to the MFP*, the initial guidance explains that “CMS intends to require that the Primary Manufacturer establish safeguards to ensure the MFP is available to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers on units of the selected drug for which there are Secondary Manufacturers, as described in section 40.4 of this memorandum.” Additionally, CMS explains that “each component of the pharmaceutical supply chain may have a role in making the MFP available to MFP-eligible individuals, but it is ultimately the Primary Manufacturer’s responsibility to ensure access to the MFP.”

Biocom California is concerned with the large responsibility placed on the Primary Manufacturer to ensure that entities across the entire supply chain have made the MFP available to MFP-eligible individuals. When there are multiple Secondary Manufacturers involved such as repackers and relabelers, it is unrealistic to hold the Primary Manufacturer solely responsible for the compliance of these entities. Furthermore, Primary Manufacturers do not have visibility into a Secondary Manufacturer’s information, thus making this policy nearly impossible to comply with. The initial guidance explains that a manufacturer who does not comply with certain Negotiation Program deadlines and requirements could be subject to excise tax liability or CMPs. **We do not believe that Primary Manufacturers should be penalized due to a lack of data access and business practices that they cannot enforce. We strongly suggest that CMS not hold a Primary Manufacturer responsible for ensuring the compliance of Secondary Manufacturers and, instead, Secondary Manufacturers should be held responsible and subject to CMPs themselves if they do not provide access to the MFP. Lastly, we ask CMS to require other stakeholders (i.e., providers, health plans, etc.) to make data available so that manufacturers can comply with the MFP effectuation.**

⁵ CMS, MDRP Data Guide § 5.15 (Apr. 2022).

Biocom California comments on the Medicare Drug Price Negotiation Program

We appreciate the opportunity to provide feedback on behalf of our members and thank you for your time and diligence in examining our comments. Please contact Biocom California's Associate Manager of Regulatory Policy, Zoe Bilis, at zbilis@biocom.org for additional information or questions. We look forward to continuing to work with you on this matter.

Sincerely,

A handwritten signature in black ink, appearing to read "Joe D. Panetta". The signature is fluid and cursive, with the first name "Joe" and last name "Panetta" being more prominent.

Joe Panetta

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

The Biotechnology Innovation Organization (BIO) appreciates this opportunity to comment on the initial guidance regarding the Drug Price Negotiation Program (Negotiation Program) under the Inflation Reduction Act of 2022 (IRA) issued by the Centers for Medicare & Medicaid Services (CMS or Agency) on March 15, 2023 (Initial Guidance).¹

BIO is the world’s largest trade association representing biotechnology companies, academic institutions, state biotechnology centers, and related organizations across the United States and in more than thirty other nations. BIO’s members develop medical products and technologies to treat patients afflicted with serious diseases, delay the onset of such diseases, or prevent them in the first place. As a result, our members’ novel therapeutics, vaccines, and diagnostics not only have improved health outcomes but also have reduced health care expenditures due to fewer physician office visits, hospitalizations, and surgical interventions. BIO’s members include biologic and vaccine manufacturers, which have worked closely with stakeholders across the spectrum, including the public health and patient advocacy communities, to support policies that help ensure access to innovative and life-saving medicines and vaccines for all individuals.

BIO appreciates the steps the agency has taken to establish a dialogue with key stakeholders about the Negotiation Program and other elements of the IRA, but we have significant concerns about the Initial Guidance and the limitations on comments CMS has imposed.

We also believe it’s imperative to underscore our views on the IRA. We have long supported a Medicare Part D out-of-pocket cap and the ability for patients to spread these costs throughout the year. These

¹ CMS, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (Mar. 15, 2023), *available at* <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

are essential patient protections. At the same time, we believe that patient out-of-pocket costs will never be truly addressed unless the broken rebate system – which benefits pharmacy benefit managers (PBMs) over patients – is addressed. PBMs continue to leverage their size and market influence to ensure they can rake in enormous profits, and they do so at the expense of vulnerable patients.

In addition, we are very concerned about the significant and negative impacts the IRA will have on companies' investments in research and development, which in turn will harm beneficiary access to future treatments and cures, particularly for rare, hard-to-treat diseases and those areas with high unmet need. We continue to urge CMS to consider these impacts as the agency works to update this proposed guidance based on stakeholder feedback.

We also note our strong disappointment that key aspects of this guidance have been issued as final without soliciting comment, which is a concerning step backward from CMS's stated commitment to transparency. BIO strongly urges the Agency to consider stakeholder comments on all aspects of the Initial Guidance. Notably, despite previously committing to "prioritiz[ing] transparency and robust engagement" in its implementation of the Negotiation Program,² the Agency solicits comment on only certain policies, and finalizes other policies with no opportunity for comment—specifically, the foundational policies set forth in Section 30 of the Initial Guidance.³ The Agency's own stated goals of transparency and engagement require immediate reconsideration of this ill-advised start to the Agency's stewardship of the Negotiation Program.

BIO and our members have long argued that the underlying structure of the negotiation program, as set forth by the statute and implemented here by CMS, is legally flawed. In review of the punishing penalties for non-compliance, and the general inflexibility of the process for product selection and maximum fair price (MFP) implementation, these legal flaws cannot be overcome through general guidance clarity at this stage. Nevertheless, we provide herein several suggestions for CMS to consider that might be helpful in the transparency objective of the Agency as it implements this program. None of these resolve the more fundamental legal infirmities of the overall program, nor could they.

We outline below how the implementation of the Negotiation Program would materially benefit from two-sided engagement on all topics, including both a full opportunity for stakeholders to submit comments on proposed policies and meaningful responses to such comments that demonstrate the Agency's consideration of the points made and reveal the reasoning underlying the Agency's final

² CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 (Jan. 11, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>.

³ While BIO understands that the policies set forth in Section 30 of the Initial Guidance are final and that CMS is not soliciting comment on such policies, BIO sets forth herein for the record the comments that it would have made had CMS solicited comment.

decision-making. Such an approach would fulfill the purpose of a comment period: to enable “[t]he interchange of ideas between the government and its citizenry[, which] provides a broader base for intelligent decision-making and promotes greater responsiveness to the needs of the people.”⁴ The need for such a fulsome process is especially acute here, given the novelty and complexity of the Negotiation Program; the vast ramifications that the program will have for patients, providers, pharmacies, manufacturers, and countless other stakeholders; and the potentially profound negative repercussions for patient access to needed therapies that could follow from errors, misunderstandings, or gaps in understanding. In these circumstances, the Agency should maximize transparency and engagement in its decision-making process, including by both affording a full opportunity for comment and meaningfully responding to stakeholder feedback.

This includes ensuring the negotiation process is transparent, predictable, and fair, with CMS providing necessary accountability to stakeholders and clarifying how it will consider and utilize the broad set of information it will collect and review related to the negotiation factors. Further, we continue to urge CMS to emphasize factors that are critical for patients, specifically factors related to clinical benefit and unmet medical need and de-emphasize manufacturer specific data elements such as cost of production and research and development costs.

We also urge CMS to eliminate its proposed, one-sided requirement that manufacturers destroy all records related to the negotiation process and submit a Certificate of Data Destruction to CMS certifying that all information received from CMS during the negotiation period and potential renegotiation period(s) was destroyed. Basic due process mandates that manufacturers be given the ability to maintain records related to negotiation proceedings. Moreover, BIO opposes the blanket prohibition on manufacturers from disclosing or otherwise publicizing information “in the initial offer, including the ceiling price, or the concise justification from the Secretary or any subsequent offer of concise justification, nor information derived from those justifications or offers...”. This one-sided information control heightens the ultimate public complaint that the entirety of the “negotiation” process is anything but actual “negotiation.” BIO disagrees with this approach and recommends CMS abandon it.

We also recommend that CMS finalize the Initial Guidance well in advance of the selected drug publication date for initial price applicability year (IPAY) 2026 to ensure that all stakeholders have ample time before such date to fully digest the contents of the finalized guidance and conform their actions accordingly. Similarly, CMS should solicit comment on proposed guidance applicable to IPAY 2027 and IPAY 2028 (the first IPAY applicable to Medicare Part B drugs) as soon as reasonably possible and well in advance of the selected drug publication dates for such IPAYs.

⁴ *Buschmann v. Schweiker*, 676 F.2d 352, 357 (9th Cir. 1982) (internal quotation marks and citations omitted).

Below please find an overview of our recommendations; our more detailed comments follow.

Regarding the definitions of qualifying single source drugs and negotiation eligible drugs:

- BIO strenuously disagrees with CMS's approach to identifying a qualifying single source drug by reference to common active moiety (drugs) or common active ingredient (biologics). Both law and policy dictate that a qualifying single source drug be identified by reference to its NDA or BLA.
- CMS should clarify the scope of the orphan drug exclusion in a manner that maximizes protections for orphan drugs.
- CMS should take steps to make the process to qualify for the small biotech exception more transparent and predictable.

Regarding the selection, and delayed selection, for negotiation, CMS should:

- Provide for a pre-selection process where, well in advance of the selected drug publication date, CMS would notify each manufacturer of each drug that it intends to select for negotiation and afford each manufacturer a dispute process.
- Improve the process by which a biosimilar manufacturer may request a delay in the selection of a reference product for negotiation due to anticipated biosimilar market entry. This includes providing a meaningful opportunity to request a delay, allowing for a dispute resolution process, and considering all information submitted by a biosimilar manufacturer.

In implementing the negotiation process, CMS should:

- Provide for robust and meaningful engagement and dialogue between the Agency and the manufacturer throughout the negotiation process.
- Allow manufacturers to supplement timely submissions where a post-submission development arises or there otherwise is good cause.
- Provide a meaningful justification of its initial offer and its response to any counteroffer and afford the manufacturer a meaningful opportunity to comment on the response the MFP is set.
- Provide more fulsome safeguards to ensure that the Agency is adequately protecting the confidentiality of all proprietary information submitted to CMS as part of the negotiation process.
- Withdraw its overly broad confidentiality obligations imposed on manufacturers.

In setting the MFP, CMS should:

- Impose on itself bright-line limitations that mitigate the negative effect of the MFP on patient access and on therapeutic innovation.
- Commit to setting the MFP at a price that will not imperil patient access.

- Ensure that the MFP is not set below the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.
- Ensure that the MFP is not set below the MFP ceiling during any year of the price applicability period into which patent protection extends.
- Ensure that the MFP is set at the MFP ceiling until at least the first year during the price applicability period that starts after the date on which the most recently approved indication is thirteen years post-approval.
- Ensure the MFP is not set below the MFP ceiling for vaccines recommended by the Advisory Committee on Immunization Practices (ACIP) at the Centers for Disease Control (CDC).
- Ensure predictable, transparent engagement with manufacturers regarding how the MFP was set.

In utilizing the negotiation factors, CMS should:

- Ensure a transparent, fair, and predictable process.
- Emphasize factors related to clinical benefit and unmet need and de-emphasize manufacturer specific data elements such as cost of production and research and development costs.
- Utilize a more robust definition of unmet medical need.
- Clarify how it will evaluate the evidence about alternative treatments by different stakeholders and how different evidence will be considered in setting the MFP.
- Ensure that a robust, comprehensive set of information submitted by manufacturers– with any necessary supplemental material – will be accepted and considered by CMS.
- Allow manufacturers to use reasonable assumptions regarding the information they submit on the manufacturer-specific data.
- Reject approaches that would reduce the preliminary price when a drug has available patents and exclusivities.
- Eliminate reporting and other requirements under the Primary Manufacturer/Secondary Manufacturer Construct.

In establishing the MFP Ceiling, CMS should:

- Abandon its proposal to create a new price point calculated based on the four quarters of a calendar year, and instead simply adopt the existing annual Non-FAMP.
- Establish an exceptions process to account for restatements and anomalies.
- Confirm if the time period for determining whether a selected drug is an extended- or long-monopoly drug runs to the start of the applicable IPAY or the selected drug publication date.
- Calculate the MFP ceiling for Part D drugs exclusive of manufacturer price concessions unless they are passed through at the point of sale.

Regarding the requirement that manufacturers provide access to the MFP, CMS should:

- Finalize its proposal that access to the MFP may be provided through an MFP rebate model.
- Utilize a CMS-established third-party administrator (TPA) or clearinghouse.
- Clarify that the proposed fourteen-day period during which an MFP rebate must be paid runs from the date on which the manufacturer has validated eligibility for the rebate.
- Condition payment of a claim for reimbursement for a unit of a selected drug on the accurate use claims modifiers.
- Finalize its proposals that access to the MFP by Part D beneficiaries at the point of sale will be effectuated through plans, not manufacturers.
- Define the MFP discount using a publicly reported metric, such as wholesale acquisition cost (WAC).
- Simplify its approach for applying the MFP across dosage forms and strengths and address concerns with its proposed methodology.
- Abandon its bona fide marketing standard and instead adopt a standard that consistently designates the MDRP “market date” as both the date on which a generic or biosimilar is marketed and the date on which CMS determines that a generic or biosimilar has been marketed.

In addition, we recommend that CMS:

- Clarify that selected drugs are not subject to an inflation rebate.
- Amend its regulatory definition of “unit” to exclude MFP units from the ASP calculation.
- Proceed with caution on the implementation of CMPs and allow manufacturers a reasonable time period to cure deficiencies before CMPs are imposed.
- Ensure that the text of the Negotiation Program Agreement is made available for public comment at least sixty days in advance of the first selected drug publication date.
- Abandon its “Primary Manufacturer” and “Secondary Manufacturer” construct as part of the Agreement as it is impracticable and has no legal basis.
- Protect beneficiary access to needed therapies, including selected drugs, and implement safeguards to ensure such access.

I. Qualifying Single Source Drugs and Negotiation-Eligible Drugs

A. Background

Section 1192(e) of the Social Security Act (SSA) generally defines “qualifying single source drug” to mean:

- A drug product approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act (FDCA) and marketed pursuant to such approval where at least seven years have elapsed since the date of such approval and there is no approved and marketed generic for such product;⁵ and
- A biological product approved under section 351(a) of the Public Health Services Act (PHSA) and marketed pursuant to such licensure where at least eleven years has elapsed since the date of such licensure and there is no licensed and marketed biosimilar for such product.⁶

The statute provides for certain exclusions from the definition of “qualifying single source drug” — certain orphan drugs,⁷ plasma-derived products,⁸ and certain low Medicare spend drugs.⁹

Section 1192(d) generally defines “negotiation-eligible drug” to mean, with respect to an IPAY:

- Each of the top fifty qualifying single source drugs by Medicare Part D expenditures over a specified twelve-month period; and
- Starting with IPAY 2028, each of the top fifty qualifying single source drugs by Medicare Part B expenditures over a specified twelve-month period.¹⁰

The statute provides for the exclusion of a “small biotech drug” from the definition of “negotiation-eligible drug” for IPAYs 2026, 2027, and 2028.¹¹ Section 1192(d)(2) generally defines “small biotech drug” to mean a qualifying single source drug for which:

- The drug’s 2021 Part B or D expenditures are equal to or less than one percent of all drugs’ 2021 Part B or D expenditures; and
- The drug’s 2021 Part B or D expenditures are equal to or more than eighty percent of its manufacturer’s drugs’ 2021 Part B or D expenditures.¹²

The statute provides for the exclusion of “[a] new formulation, such an extended release formulation” from the definition of “small biotech drug.”¹³

⁵ SSA § 1192(e)(1)(A) (the seven years are counted to the selected drug publication date with respect to the applicable IPAY).

⁶ *Id.* § 1192(e)(1)(B) (the eleven years are counted to the selected drug publication date with respect to the applicable IPAY).

⁷ *Id.* § 1192(e)(3)(A).

⁸ *Id.* § 1192(e)(3)(C).

⁹ *Id.* § 1192(e)(3)(B).

¹⁰ *Id.* § 1192(d)(1).

¹¹ *Id.* § 1192(d)(2). The statute also provides for a Maximum Fair Price (MFP) floor for a “small biotech drug” for IPAYs 2029 and 2030. *Id.* § 1194(d).

¹² *Id.* § 1192(d)(2)(A).

¹³ *Id.* § 1192(d)(C).

B. Distinguishing among qualifying single source drugs and dosage forms and strengths of such drugs

It is imperative that CMS reconsider its approach to identifying a qualifying single source drug and its dosage forms and strengths by reference to common active moiety (drugs) or common active ingredient (biologics), and instead identify such a drug and its dosage forms and strengths by reference to common New Drug Application (NDA) or Biologics License Application (BLA).¹⁴

In the Initial Guidance, CMS states that it will treat products as the same qualifying single source drug where, for drug products, they share the same active moiety or, for biological products, they share the same active ingredient, and the same manufacturer holds all applicable NDAs or BLAs.¹⁵ This policy is irreconcilable with the statute.

The statute requires products to be treated as the same qualifying single source drugs only where they share the same NDA or BLA. This necessarily follows from the plain text of section 1192(e)(1). As set forth above, “qualifying single source drug” is defined for products approved under an NDA by reference to whether seven years has elapsed since “such approval;”¹⁶ likewise, the term is defined for products licensed under a BLA by reference to whether eleven years has elapsed since “such licensure.”¹⁷

Congress’s use of “such license” and “such approval” in the statute is intentional, unambiguous, and must be given effect. Congress used this language to denote that a qualifying single source drug is distinguished by a distinct approval or licensure—i.e., a distinct NDA or BLA. CMS has no authority to rewrite the plain language of the statute by inventing an ultra vires distinction between qualifying single source drugs based on their applications. Where “Congress has been unambiguous, neither the Agency nor [a] court may diverge from that intent.”¹⁸

Although the plain language of the statute is dispositive, BIO notes that other canon of statutory construction confirm Congress’s unambiguous intent to distinguish qualifying single source drugs based on distinct NDAs or BLAs and to mandate that drug and biologic products would not be subject to price controls unless a sufficient time has elapsed since “such approval” (7 years) or “such licensure” (11 years).¹⁹ Of particular note, the statute defines “qualifying single source drug” by express reference to

¹⁴ For a discussion of the related and equally critical concern with CMS’s “bona fide marketing” standard, please see section VI.F.

¹⁵ Initial Guidance at 8.

¹⁶ SSA § 1192(e)(1)(A).

¹⁷ *Id.* § 1192(e)(1)(B).

¹⁸ *Cabazon Band of Mission Indians v. Nat’l Indian Gaming Comm’n*, 827 F. Supp. 26, 29 (D.D.C. 1993), *aff’d*, 14 F.3d 633 (D.C. Cir. 1994).

¹⁹ See *Chevron v. Nat’l Res. Def. Council*, 467 US 837, 843 n.9 (1984) (in addition to the plain text, the traditional tools of statutory construction are used to ascertain the intent of Congress).

the FDCA and PHSA. It is well understood that a statute should be interpreted in the manner “most compatible with the surrounding body of law into which the provision must be integrated.”²⁰

CMS should therefore look to the well-established framework under the FDCA and PHSA for distinguishing among products. Under this framework, drug and biological products generally may be marketed only if approved or licensed by FDA,²¹ and manufacturers seeking such approvals or licensures must meet stringent requirements bearing on safety, effectiveness, and other considerations.²² In implementing this framework, FDA has spoken directly to the circumstances under which a change to an existing product is so significant that it yields a new product warranting a new NDA or BLA is, as well as the circumstances under which a change to an existing product is not.²³ It is manifestly reasonable and appropriate to rely on such FDA standards here, such that a product approved or licensed under a new NDA or BLA is a distinct qualifying single source drug.

There are immeasurable benefits to giving effect to the statute as written and, as Congress intended, adopting FDA’s application-based framework for distinguishing products (as opposed to CMS’s newly invented, statutorily unmoored scheme for doing so). First, and most critically, doing so would avoid exacerbating the disincentive to develop next-generation therapies inherent in the Negotiation Program to the point of suffocating all such innovation, to the detriment of patients in need. The sheer breadth of CMS’s “qualifying single source drug” definition—which amalgamates drug products by common active moiety and biological products by common active ingredient—leaves no incentive for therapeutic advancement and will have significant, negative impacts on innovation for years to come.

Biopharmaceutical innovation is incremental, relying on sustained and continuous improvements to molecules, pathways, and modes of administration to achieve maximum clinical benefit for patients. Researchers cannot take significant leaps and develop new active moieties with each generation of treatment. By combining drugs at the active moiety or active ingredient level, CMS is harming investments into new therapies, including for orphan and hard to treat diseases. For the sake of pharmaceutical and biotechnology innovation, and patient access to needed therapies, CMS’s current framework cannot stand.

²⁰ *Green v. Bock Laundry Machine Co.*, 490 U.S. 504, 528 (1989) (Scalia, J., concurring); cf. *Erlenbaugh v. United States*, 409 U.S. 239, 243–44 (1972) (under the rule of *in pari materia*, it is generally “assume[d] that whenever Congress passes a new statute, it acts aware of all previous statutes on the same subject”).

²¹ 21 U.S.C. § 355(a); 42 U.S.C. § 262(a)(1)(A).

²² 21 U.S.C. § 355(c), (d); 21 C.F.R. §§ 314.105, 314.125 (NDA requirements); 42 U.S.C. § 262(a)(2)(C); 21 C.F.R. §§ 601.2(a), 601.4(a) (BLA requirements).

²³ FDA, Guidance for Industry: Submitting Separate Marketing Applications and Clinical Data for Purposes of Assessing User Fees (Dec. 2004), available at <https://www.fda.gov/media/72397/download>. For example, a new active ingredient (e.g., a different salt, ester, or complex of an approved moiety) should be approved under a new application. *Id.* at 3. In contrast, a new strength generally should be approved under a supplement. *Id.* at 4. The same is true for a new container size or package type of the same indication and route of administration. *Id.* Certain changes in dosage form and route of administration should be approved under a supplement, but others should be approved under a new application. *Id.* at 3.

Second, an application-based framework would create an easily administrable bright line rule based on a familiar standard, to the benefit of both CMS and manufacturers. A bright line rule would enable CMS to more readily identify relevant dosage forms and strengths for purposes of aggregating Medicare expenditures and applying the MFP.²⁴ And a bright line rule would enable manufacturers to more confidently track the seven- or eleven-year “qualifying single source drug” clock, and thereby make more informed decisions about research and development.

For these reasons, BIO strenuously disagrees with CMS’s approach to identifying a qualifying single source drug by reference to common active moiety (drugs) or common active ingredient (biologics). Both law and policy dictate that a qualifying single source drug be identified by reference to its NDA or BLA.

Notably, it necessarily follows from the identification of a qualifying single source drugs by reference to its NDA or BLA that the dosage forms and strengths of such a drug (across which Medicare expenditures are aggregated and the MFP is applied) also must be identified by reference to the NDA or BLA of the drug. With respect to a qualifying single source drug, the statute requires CMS to aggregate Medicare expenditures “us[ing] data that is aggregated across dosage forms and strengths of the drug, including new formulations of the drug, such as an extended release formulation, and not based on the specific formulation or package size or package type of the drug.”²⁵ Similarly, with respect to a qualifying single source drug that is a selected drug, the statute requires CMS to “establish[] . . . procedures to compute and apply the maximum fair prices across different strengths and dosage forms of [the] drug and not based on the specific formulation or package size or package type of such drug.”²⁶ Accordingly, Medicare expenditures are to be aggregated, and the MFP is to be applied, across only dosage forms and strengths of the qualifying single source drug. As set forth above, a qualifying single source drug must be identified by reference to its NDA or BLA; it necessarily follows that the dosage forms and strengths of such a drug also must be identified by reference to the NDA or BLA of the drug.²⁷

It is imperative that CMS immediately rescind the approach set forth in the Initial Guidance—under which Medicare expenditures are aggregated, and the MFP is applied, across dosage forms and

²⁴ See SSA §§ 1192(d)(3)(B), 1196(a)(2).

²⁵ *Id.* § 1192(d)(3)(B) (emphasis added).

²⁶ *Id.* § 1196(a)(2) (emphasis added).

²⁷ The references to “formulations” in the statutory text do not change the analysis. In context, such formulations are plainly limited to formulations of the dosage forms and strengths of the qualifying single source drug. See, e.g., A. Scalia & B. Garner, *Reading law: The interpretation of Legal texts* 199, 203-132–33 (2012) (“[T]he verb to include introduces examples, not an exhaustive list.”). We note that formulations of dosage forms and strengths may be approved under the same NDA or BLA. See FDA, Guidance for Industry: Submitting Separate Marketing Applications and Clinical Data for Purposes of Assessing User Fees 3–4.

strengths of products that share the same active moiety (drugs) or the same active ingredient (biologics)—and instead specify that, for purposes of aggregation of Medicare expenditures and application of the MFP, dosage forms and strengths are also identified by reference to the NDA or BLA of the qualifying single source drug, consistent with the requirements of the statute.²⁸

C. Orphan drugs

BIO urges CMS to clarify the scope of the orphan drug exclusion in a manner that maximizes protection for orphan drugs.

A drug is categorically ineligible for selection for negotiation if “designated as [an orphan drug] for only one rare disease or condition . . . and . . . the only approved indication (or indications) is for such disease or condition.”²⁹ It is imperative that CMS implement the orphan drug exclusion to be maximally protective of orphan drugs, in recognition of the unique need to maintain incentives for developing new therapies targeting rare diseases.

The Negotiation Program poses special risks to patient populations awaiting the development of new orphan drugs. By definition, orphan drugs target diseases affecting less than 200,000 people in the United States.³⁰ As such, such drugs are particularly susceptible to the chilling effect of factors that discourage research and development. On average, the development of a single drug takes anywhere from ten to fifteen years and costs upwards of \$2.6 billion in research and development³¹—and the development of an orphan drug, often takes even longer and costs even more. Limited patient populations make it inherently more challenging for the developers of orphan drugs to recoup this investment, especially because orphan drug developers are overwhelmingly small emerging companies: Start-ups and emerging biotechnology companies are responsible for fully 85% of all orphan-designated products in development.³²

²⁸ Regardless of the “qualifying single source drug” definition adopted by the Agency, CMS must consistently apply such definition. As such, if CMS were to maintain that products that share the same active moiety (drugs) or the same active ingredient (biologics) are the same qualifying single source drug, BIO agrees that the market entry of a generic or biosimilar to any such product would disqualify all such products from treatment of a qualifying single source drug. See Initial Guidance at 10. Any other approach would be irreconcilable with CMS’s stated “qualifying single source drug” definition. See, e.g., *Nat’l Credit Union Admin. v. First Nat. Bank & Tr. Co.*, 522 U.S. 479, 501–02 (1998) (a basic canon of interpretation is that similar or identical language “be accorded a consistent meaning”).

²⁹ SSA § 1192(e)(3)(A) (such drugs are categorically ineligible for selection for negotiation because they are excluded from the definition of “qualifying single source drug”).

³⁰ See 21 C.F.R. § 316.10(d)(8)(ii).

³¹ T. Sullivan, A Tough Road: Cost to Develop One New Drug Is \$2.6 Billion, Policy & Med., <https://www.policymed.com/2014/12/a-tough-road-cost-to-develop-one-new-drug-is-26-billion-approval-rate-for-drugs-entering-clinical-de.html> (Mar. 21 2019).

³² D. Thomas & C. Wessel, 2019 *Emerging Therapeutic Company Trend Report*, BIO Industry Analysis 40 (2019), available at <http://go.bio.org/rs/490-EHZ-999/images/BIO%202019%20Emerging%20Company%20Trend%20Report.pdf>.

As such, it is vitally important that CMS take special steps to protect development of and access to orphan drugs. The stakes could not be higher for patients. There are over 7,000 known rare diseases, and approximately thirty new ones are identified each year.³³ While each rare disease affects only a relatively small number of patients, collectively, over thirty million Americans are affected by a rare disease, with an estimated cost to society in excess of \$1 trillion annually.³⁴ Further, 95% of rare diseases currently have no approved medical treatment.³⁵ According to a 2020 IQVIA/National Organization for Rare Diseases report examining trends in rare disease innovation, “there are [only] 447 drugs with orphan-only indications, with 104 drugs approved for two or more orphan indications.”³⁶ As such, there is a pressing need to maintain strong incentives for continuing orphan drug development.

Research and development regarding the application of existing therapies to rare diseases is one way to chip away at this disparity. The orphan drug exclusion, however, discourages precisely such scientific discovery. Therefore, as the Agency “consider[s] whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development,”³⁷ BIO urges the Agency to implement, at a minimum, the following recommendations to better support ongoing development of and access to drugs targeting patients living with rare diseases.

First, CMS should establish a process that enables manufacturers to submit evidence that an indication falls within an orphan drug designation to account for situations where CMS is unable to determine eligibility for the orphan drug exclusion based on a review of FDA’s orphan drug databases.

As set forth above, the orphan drug exclusion is based on whether a drug has an orphan drug designation for a single rare disease, and whether its approved indications are for such rare disease.³⁸ In many cases, CMS will be able to readily determine whether a drug meets such

³³ BIO, Rare Diseases & Orphan Drugs, <https://www.bio.org/policy/human-health/rare-diseases-orphan-drugs> (last visited Feb. 28, 2023).

³⁷ Initial Guidance at 11.

³⁸ SSA § 1192(e)(3)(A).

criteria using publicly available information. This is because FDA maintains various databases containing relevant information.³⁹

But there are situations where an approved indication falls within the scope of an orphan drug designation but there is no corresponding grant of orphan exclusivity.⁴⁰ In such situations, CMS cannot rely on FDA's databases, as the Agency states in the Initial Guidance it will do,⁴¹ to accurately determine eligibility for the orphan drug exclusion—because those databases principally track orphan exclusivity, rather than orphan drug designation.⁴²

To account for such situations, CMS should create a process that enables manufacturer to provide evidence that an indication falls within an orphan drug designation, where such fact is not ascertainable from FDA databases alone. Acceptable evidence should include written communications with FDA, whether pre- or post-approval. CMS should also establish this process as soon as possible, so that manufacturers can work with FDA and otherwise develop evidence that their drugs are eligible for the orphan drug exclusion, well in advance of the first selected drug publication date.

Second, CMS should confirm that it will determine eligibility for the orphan drug exclusion based on orphan drug designation *at the time of selection*.

Under FDA regulations, a manufacturer may voluntarily withdraw a requested or granted orphan drug designation at any time.⁴³ Where a manufacturer does so, the withdrawal is publicized, and any benefits associated with the designation cease.⁴⁴ Accordingly, when determining eligibility for the orphan drug exclusion, CMS should confirm that it will look only to orphan designation at the time of selection, and will not look to any prior designation that has been withdrawn. Doing so would help avoid improperly narrowing the universe of protected orphan drugs.

³⁹ Such databases include FDA's orphan drug designation/exclusivity database, the drugs@FDA database, and the Approved Drug Products with Therapeutic Equivalence Evaluations publication (Orange Book).

⁴⁰ There are various circumstances where this can arise. For instance, it can occur in certain circumstances where an orphan drug is approved for the same indication as a previously approved drug, but is not clinically superior to the previously approved drug. In such a circumstances, although the indication falls within the scope of the orphan designation, it does not qualify for orphan exclusivity.

⁴¹ Initial Guidance at 11.

⁴² Orphan exclusivity is, in itself, irrelevant for purposes of the orphan drug exclusion. The orphan drug exclusion is unambiguously based on whether all indications of a drug with a single orphan drug designation fall within the scope of that designation. It is therefore immaterial whether the drug also has (or had) orphan exclusivity.

⁴³ 21 C.F.R. § 316.24(d).

⁴⁴ *Id.*

Third, CMS should clarify that, where an orphan drug loses eligibility for the orphan drug exclusion, the seven- or eleven-year “qualified single source drug” clock runs from *the date on which the drug lost eligibility for the exclusion*.

Doing so would help maximize protection for orphan drugs. Absent such clarification, an orphan drug that loses eligibility for the orphan drug exclusion could be virtually immediately subject to selection for negotiation, simply because it was designated as an orphan drug for a second rare disease or an indication was approved for a second rare disease. CMS’s implementation of the orphan drug exclusion would thereby disincentivize progress in rare disease drug development, which is often predicated upon identification of promising new uses of existing therapies. CMS should act to avoid such a result, as it would further disincentivize developers of orphan drugs from investing in treatments for a second rare disease.

Implementing the above recommendations is necessary to mitigate the risk that the Negotiation Program will deter the development of orphan drugs to treat those suffering from rare diseases. It is also fully consistent with long-standing Congressional policy favoring protection of orphan drugs. Such policy dates back to the early 1980s, when Congress enacted the Orphan Drug Act of 1983 to create various incentives to encourage and facilitate the development of new orphan drugs.⁴⁵ In keeping with Congress’s long-held policy of protecting orphan drugs, CMS should make every effort to ensure that it does not hamper orphan drug innovation as it implements the Negotiation Program and its orphan drug exclusion.

D. Small biotech drugs

Under the IRA, a drug is exempt from negotiation for initial price applicability years 2026, 2027, and 2028 if spending on the medicine comprises: (1) a small percentage of Medicare program spending, and (2) a significant proportional share of a company’s Medicare business. This is referred to as the Small Biotech Exception. This critical protection recognizes that small biotech manufacturers with a single product that represents the vast majority of their Medicare revenue will be disproportionately impacted by negotiation, which could have an immediate and tangible impact on the ability of such manufacturers to invest in future R&D – and in particular, in areas that predominantly affect the Medicare population.

CMS does not address how or when it will notify manufacturers regarding its determination of whether a drug, based on the information the manufacturer submits through the proposed ICR, qualifies for the Small Biotech Exception. **To that end, our comments that follow focus on ensuring predictability and**

⁴⁵ See Orphan Drug Act, Pub. L. No. 97-414, §§ 1, 2, 96 Stat. 2049, 2049–51 (1983), as amended by Pub. L. 98-551, 98 Stat. 2815, 2817 (1984).

transparency for small biotech manufacturers that apply for the exception. This includes the following process attributes:

- Clear process (i.e., who submits, what to submit, when to submit) for applying for or recertifying a drug qualifies for the Small Biotech Exception.
- Appropriate and fair timelines to submit information to qualify.
- Consistency and clear criteria in evaluating submissions to qualify for the Small Biotech Exception.
- Proper and timely notification regarding qualification if the drug meets the Small Biotech Exception requirements.
- Proper and timely notification if the drug does NOT meet the Small Biotech Exception requirements, as well as a clear dispute process for appeal of such decision.
- Clarity regarding the form and manner that CMS will use to notify manufacturers if they meet – or do not meet – the criteria for the Small Biotech Exception.

Submissions for Initial Price Applicability Year 2026. CMS has indicated that the current Small Biotech Exception ICR is focused only on initial price applicability year 2026. However, as discussed further below, given that the agency has not made publicly available the data on which it will rely with regard to total expenditures for the purpose of determining eligibility for the Small Biotech Exception under section 1192 (d)(2,) or whether a drug meets the test of a high spend drug under section 1192 (d)(1), it is impossible for small biotech manufacturers to make a reasonable inference regarding whether a submission is warranted in the current or future years on the basis of the requisite statutory thresholds. We recommend that any company that believes it qualifies for the Small Biotech Exception under section 1192 (d)(2) should be able to apply and be approved for this exception this year regardless of whether the drug meets the test of a high spend drug under section 1192 (d)(1). This will provide important certainty and predictability for small biotech manufacturers. Such certainty is critical as most small biotech manufacturers have only one or a limited number of products on the market. We also believe the statute contemplates such an approach, as the exception in section 1192 (d)(2)(A) refers to a “qualifying single source drug” that meets either the test in section 1192 (d)(2)(A)(i) or section 1192 (d)(2)(A)(ii), and these tests refer to Medicare expenditures in 2021, and the data for any small biotech company is readily available to CMS. To provide additional predictability and mitigate uncertainty for small biotech manufacturers, CMS should also clearly articulate the specific criteria manufacturers should consider in determining whether to apply for the Small Biotech Exception for initial price applicability year 2026.

Clarity on Process and CMS Response to Small Biotech Manufacturer. CMS should specify not only the timeline for when the submission of information by the small biotech manufacturer is due, but also the timeline for CMS review and response to the manufacturer, in situations where CMS grants the

exception as well as situations where CMS does not. To promote certainty for small biotech manufacturers, CMS should commit to responding to each manufacturer as far in advance of September 1, 2023, as possible.

- *Clear Timelines.* We suggest the following as a timeline that would allow for appropriate transparency, clarity, and completion of the process in advance of the September 1, 2023, publication of drugs selected for negotiation:
 - Submission by small biotech manufacturers due June 10, 2023;
 - CMS response to small biotech company (affirmative or negative) due by June 30, 2023;
 - Small biotech company response to negative determination by July 20, 2023;
 - Final CMS response to small biotech company by August 10, 2023.
- *Clarity on Data Source for 2021 Drug Spending and Availability of Data for Manufacturers.* CMS should clarify what data source it will use for identifying 2021 total expenditures for the qualifying single source drug, as the agency has stated that the drug dashboard data published at [cms.gov](https://www.cms.gov) is not being used for the IRA negotiation provisions; we also understand CMS is considering use of Prescription Drug Event (PDE) data. We recommend that CMS provide the data it will be using for 2021 to manufacturers so that this data can be validated by manufacturers that apply for (or will apply for) the Small Biotech Exception.
- *CMS Response and Justification for Decision.* CMS should provide clarity on the form and content of its expected response and notification to small biotech manufacturers applying for the exception, specifically whether the response will be by letter, email, or other form of official communication. Further, if CMS determines that it does not agree that a small biotech drug qualifies for the exception, CMS's response should outline in sufficient detail how such a determination was made, including on which expenditure data the agency relied and other information, as relevant, that led to a negative determination. Further, CMS should indicate if the rationale for the denial is restricted to initial price applicability year 2026 or all years for which the Small Biotech Exception applies.
- *Dispute Resolution.* CMS should provide a dispute resolution process where the manufacturer can respond to and appeal a negative determination by CMS. Specifically, the small biotech manufacturer should have the opportunity to provide additional data or information to the agency to support its application for the Small Biotech Exception.
- *Flexibility.* Given that this is a new program and process, and that only a limited number of small biotech manufacturers will be providing submissions to CMS, we recommend that the agency allow for a flexible approach. For example, if CMS determines that information submitted by the

small biotech manufacturer is incomplete or unclear, we urge CMS to engage in a dialogue with the manufacturer to resolve any outstanding issues to complete their submission. Further, for the first year of the program, we encourage CMS to allow a small biotech manufacturer to submit information after the information submission deadline, such as in good faith circumstances where a small biotech manufacturer may later realize that it should qualify for the exception.

- *One-time Qualification.* We request that manufacturers should not need to reapply in subsequent years if a drug has previously received the Small Biotech Exception and there is no material change in the manufacturer's circumstances. Manufacturers could submit an attestation that nothing in their application has materially changed from the prior year and if there has been a material change the manufacturer could submit an updated form.
- *Clear Definition of "Acquired."* We recommend CMS include a definition for what it means to be "acquired" pursuant to section 1192(d)(2)(B)(ii). CMS should consider defining an acquisition as the transfer of substantially all assets of the manufacturer. Further, CMS should specify whether the acquiring manufacturer meeting the definition of a specified manufacturer will be determined at the time of acquisition. If the acquisition results in a change in eligibility for the small biotech exemption, an updated form should be submitted.
- *Confidentiality of Proprietary Information, Publication of Drugs Qualifying for Small Biotech Exception.* As with all other aspects of the data submitted under provisions of the IRA, CMS must fully protect the confidentiality of all proprietary information submitted in relation to this ICR. At the same time, CMS should outline its approach for sharing with the public information regarding the small biotech drugs the agency determines qualify for the exception. Further, BIO recommends that CMS publish a summary list of the small biotech drugs and manufacturers that qualified. Such information will be important for understanding the impact of this IRA provision and provide further certainty to small biotech manufacturers. We believe that more detail on

how or why a specific manufacturer's drug qualified as a small biotech drug should only be released if that manufacturer chooses to do so.

II. Selection, and Delayed Selection, for Negotiation

A. Background

For each IPAY, the statute directs CMS to publish a list of the drugs that have been selected for negotiation (under statutorily specified parameters) by February 1 of the year that is two years before such IPAY.⁴⁶

The statute provides for a delay in the selection of a biologic for negotiation where, among other things, CMS finds that a biosimilar is highly likely to come to market within two years of what otherwise would be the selected drug publication date.⁴⁷ A first year of delay is granted if the following criteria are met:

- The biologic otherwise would be an extended-monopoly drug;⁴⁸
- The biosimilar manufacturer requests the delay before what would otherwise be the selected drug publication date;⁴⁹
- The biosimilar manufacturer submits specified information and documents;⁵⁰
- CMS finds that the biosimilar is highly likely to be licensed and market within two years of what otherwise would be the selected drug publication date;⁵¹ and
- Certain disqualifying circumstances are not present.⁵²

A second year of delay is granted if the following criteria are met:

- The biologic otherwise would remain an extended-monopoly drug;⁵³
- The biosimilar manufacturer requests the delay before the date that is one year after what would otherwise be the selected drug publication date;⁵⁴ and
- CMS finds that the biosimilar is highly likely to be licensed and marketed within two years of what otherwise would be the selected drug publication date and that, based on clear and

⁴⁶ SSA §§ 1191(b)(3), 1192(a); *see also id.* § 1191(d)(1) (September 1, 2023, for IPAY 2026).

⁴⁷ *Id.* § 1192(f).

⁴⁸ *Id.* § 1192(f)(1)(A); *see also id.* § 1194(c)(4) (defining "extended-monopoly drug").

⁴⁹ *Id.* § 1192(f)(1)(B)(i)(I).

⁵⁰ *Id.* § 1192(f)(1)(B)(ii).

⁵² *Id.* § 1192(f)(2)(D)(iii), (iv).

⁵³ *Id.* § 1192(f)(2)(D)(ii).

⁵⁴ *Id.* § 1192(f)(1)(B)(i)(II).

convincing evidence, the biosimilar manufacturer has made substantial progress toward licensure and marketing;⁵⁵ and

- Certain disqualifying circumstances are not present.⁵⁶

Where a second year of delay is not granted or the biosimilar does not come to market within two years of what otherwise would be the selected drug publication date, the biologic is selected for negotiation, and the biologic manufacturer must pay a specified rebate.⁵⁷

B. Pre-selection process

Well in advance of the selected drug publication date, CMS should notify each manufacturer of each drug that it intends to select for negotiation and afford each such manufacturer a reasonable opportunity to dispute the propriety of each such intended selection.

The process for selecting a drug for negotiation is complex. Eligibility for selection is based on multiple factors, including whether a sufficient number of years have elapsed since approval or licensure;⁵⁸ whether a generic or biosimilar has come to market;⁵⁹ whether the drug is eligible for the orphan drug exclusion;⁶⁰ whether the drug is a plasma-derived product;⁶¹ whether the drug is a small biotech drug;⁶² whether Medicare expenditures are sufficiently low to disqualify the drug from selection;⁶³ and whether Medicare expenditures are sufficiently high to qualify the drug for selection.⁶⁴

The intricate nature of the selection process presents an inherent risk of a selection error. Notably, if a selection error were identified after the selected drug publication date, CMS would de-select the erroneously selected drug but could not select a substitute. By statute, for a given IPAY, all drugs must be selected by February 1 of the year that is two years before the IPAY.⁶⁵

CMS can readily mitigate this concern by adopting a process for soliciting feedback from manufacturers of potential selected drugs before the selected drug publication date. Specifically, CMS should provide notice to each such manufacturer at least thirty days in advance of the selected drug publication date.

⁵⁵ *Id.* § 1192(f)(2)(B)(i), (iii).

⁵⁶ *Id.* § 1192(f)(2)(D)(iii), (iv).

⁵⁷ *Id.* § 1192(f)(2)(B)(ii), (C).

⁵⁸ *Id.* § 1192(e)(1).

⁵⁹ *Id.*

⁶⁰ *Id.* § 1192(e)(3)(A).

⁶¹ *Id.* § 1192(e)(3)(C).

⁶² *Id.* § 1192(d)(2).

⁶³ *Id.* § 1192(e)(3)(B).

⁶⁴ *Id.* § 1192(d)(1).

⁶⁵ *Id.* §§ 1192(e), 1192(a); see also *id.* § 1191(d)(1) (September 1, 2023, for IPAY 2026).

CMS should then afford the manufacturer at least fourteen days to identify to the Agency any basis on which the manufacturer believes the drug is not, in fact, eligible for selection. Such a pre-selection process would serve an important role in identifying selection errors and further the Agency's interests in transparency, efficiency, and informed decision-making.

In addition to providing advance notice to each manufacturer of a drug that the Agency intends to select, CMS should provide advance notice to each manufacturer of at least each of the next five drugs that would be selected if one or more drugs that the Agency intends to select were found to be ineligible for selection. Doing so would promote efficiency by giving each such manufacturer the same opportunity to engage with the Agency regarding potential selection errors. And doing so would impose no additional burden on the Agency because CMS is already required to identify the top fifty qualifying single source drugs by Part D expenditures and, starting with IPAY 2028, the top fifty qualifying single source drugs by Part B expenditures.⁶⁶

In addition, in advance of the deadline by which a biosimilar manufacturer must request a delay in the selection of a reference biologic for negotiation, CMS should enable such biosimilar manufacturer to ascertain whether the reference biologic is among the drugs that the Agency intends to select (or one of at least the next five drugs in line for selection).

As set forth above, a biosimilar manufacturer may request a delay in the selection of a reference biologic for negotiation.⁶⁷ By statute, such a request must be submitted before the selected drug publication date.⁶⁸ This requirement results in a fundamental timing conundrum: A biosimilar manufacturer will not know whether it should request a delay until after the deadline for requesting the delays has passed.

CMS tacitly acknowledges this timing conundrum in the Initial Guidance but fails to meaningfully address it. The Initial Guidance provides only that a biosimilar manufacturer that “think[s]” that a reference biologic “may” be selected for negotiation should submit a delay request.⁶⁹ This approach is inadequate. Requiring a biosimilar manufacturer to guess whether to submit a delay request is deeply inefficient and unreasonable; just as “[i]t is one thing to expect regulated parties to conform their conduct to an agency’s [actions] once the agency announces them; it is quite another to require regulated parties to divine the agency’s [actions] in advance.”⁷⁰

⁶⁶ See *id.* § 1192(d)(1).

⁶⁷ *Id.* § 1192(f).

⁶⁸ *Id.* § 1192(f)(1)(B)(i).

⁶⁹ Initial Guidance at 16.

⁷⁰ *Christopher v. SmithKline Beecham Corp.*, 567 U.S. 142, 158–59 (2012).

To make the delay request provision meaningful, it is essential that CMS instead create a way for a biosimilar manufacturer, with appropriate confidentiality safeguards, to ascertain whether a reference biologic is likely to be selected before the delay request submission deadline. CMS should enable a biosimilar manufacturer to inquire with the Agency starting at least thirty days in advance of such deadline.

C. Delayed selection of a biologic for negotiation on account of anticipated biosimilar market entry

As set forth below, BIO makes a number of recommendations to enhance the implementation of the process by which a biosimilar manufacturers may request a delay in the selection of a reference product for negotiation.

As set forth above, the statute directs CMS to delay the selection of a biologic for negotiation under specified circumstances.⁷¹ BIO makes the following recommendations to enhance the implementation of the delay process:

First, it is vital that CMS afford a biosimilar manufacturer a *meaningful* opportunity to request a delay, reset the delay request submission deadline closer to the selected drug publication date and permit broad supplementation of a timely request.

If CMS does not adopt these recommendations, it will undermine the fidelity of the information on which it relies in making a “high likelihood” determination—and indeed Congress’s objective in providing for a delay request.

With respect to the timing of a delay request, under the Initial Guidance, a biosimilar manufacturer must give notice of its intent to submit a delay request by May 10, 2023.⁷² CMS will then provide a fillable template to complete and access to a Box folder within five business days, i.e., by May 17, 2023.⁷³ The manufacturer must then upload a completed templated and all supporting documentation by May 22, 2023—only three business days later, yet over three months in advance of the selected drug publication date.⁷⁴ There is no justification for such an extraordinarily and needlessly truncated window of time in which to submit a multifactorial request—a concern that is only compounded by CMS’s policy of automatically denying an

⁷¹ SSA § 1192(f).

⁷² Initial Guidance at 21.

⁷³ *Id.*

⁷⁴ *Id.*

incomplete request.⁷⁵ Indeed, such timing constraint works to defeat the Congressional objective in providing for a delay request: By effectively eliminating the additional runway for a biosimilar competitor to come to market, it acts as a barrier to the biosimilar competition that Congress sought to nurture. It is imperative that CMS afford a biosimilar manufacturer a meaningful opportunity to request a delay.

In addition, to ensure that CMS adjudicates a delay request based on the most mature information possible, CMS should (1) set the delay request submission deadline as close as reasonably possible to the selected drug publication date and (2) permit broad supplementation of a timely request with late-breaking information or otherwise for good cause. As noted above, under the Initial Guidance, a biosimilar manufacturer must give notice of its intent to submit a delay request by May 10, 2023—over three months in advance of the selected drug publication date.⁷⁶ And CMS will permit supplementation by the biosimilar manufacturer, beyond supplementation requested by the Agency, only with respect to whether the BLA has been accepted or approved by FDA.⁷⁷

Information bearing on the expected timing of licensure and marketing often rapidly changes. The expected timing of market entry can fluctuate based on a range of factors, including FDA communications regarding the BLA and changes to the manufacturer’s production or distribution arrangements. In order for CMS to make an informed determination regarding eligibility for delayed selection, it is vitally important that the Agency rely on all of the most recent available information that bears on the likelihood of market entry within the requisite time period.

An accurate “high likelihood” determination also reduces administrative burden. If CMS makes an erroneous determination based on outdated or incomplete information, the Agency will be required to administer the payment of a rebate by the reference biologic manufacturer. Such needless inefficiency can be avoided by enabling the Agency to rely on the most recent available information by (1) setting the delay request submission deadline as close as reasonably possible to the selected drug publication date and (2) permitting broad supplementation of a timely request with late-breaking information or otherwise for good cause.

Second, CMS should provide notice of its delay request determination in advance of the selected drug publication date and establish a dispute resolution process.

⁷⁵ *Id.* at 22.

⁷⁶ *Id.* at 21.

⁷⁷ *Id.* at 23.

Under the Initial Guidance, CMS will not inform a biosimilar manufacturer of an unsuccessful delay request until after the selected drug publication date.⁷⁸ This effectively means that the biosimilar manufacturer will have no opportunity to dispute the determination.

The Agency instead should provide notice of an unsuccessful delay request in advance of the selected drug publication date and establish a process by which the biosimilar manufacturer can dispute an erroneous determination. BIO recommends that CMS provide such notice at least fourteen days in advance of the selected drug publication date and afford the biosimilar manufacturer at least seven days to dispute the determination.

Third, CMS should accept and consider all information that the biosimilar manufacturer determines relevant to determining eligibility for delayed selection.⁷⁹

As noted above, there are countless factors that can affect the expected timing of licensure and approval. It follows that CMS should not artificially limit the information that it considers in determining eligibility for delayed selection. Accordingly, it is vital that CMS enable the biosimilar manufacturer—the party closest to the information—to submit all information that it determines relevant to the delay request.⁸⁰

There is clear statutory authority to enable the biosimilar manufacturer to submit such information. The statute provides that the biosimilar manufacturer must submit “information and documents necessary for [CMS] to make [the delayed selection determination], as specified by [CMS]”⁸¹ In addition, the statute provides that, after CMS has reviewed the delay request, the biosimilar manufacturer must submit “any additional information and documents requested by [CMS] necessary to make [the delayed selection determination].”⁸²

CMS therefore has broad discretion in specifying what the biosimilar manufacturer must submit in support of the delay request. The Agency should exercise such discretion and request that the manufacturer submit all relevant information. Doing so would help ensure that CMS has the most pertinent information before it, as the biosimilar manufacturer is the entity best situated to identify the information that bears on the delay request.

⁷⁸ *Id.* at 24.

⁷⁹ See SSA § 1192(f)(1)(B)(ii)(I)(aa) (“information and documents necessary for the Secretary to make determinations under this subsection, as specified by the Secretary”), (II) (“additional information and documents requested by the Secretary necessary to make determinations under this subsection”).

⁸⁰ In the Initial Guidance, CMS enables the submission of only the statutory minimum information. Initial Guidance at 22.

⁸¹ SSA § 1192(f)(1)(B)(ii)(II). The statute goes on to specify that such information “includ[es]” the information specified in section 1192(f)(1)(B)(ii)(III). *Id.*

⁸² *Id.* § 1192(f)(1)(B)(ii)(II).

Notably, CMS also has clear legal authority to consider all such information in making a “high likelihood” determination.

Section 1192(f)(3) sets forth a set of circumstances under which CMS must find a high likelihood of timely market entry—based on a limited set of enumerated information and documents, including information and documents described in section 1192(f)(1)(B)(ii)(III) (subclause (III)).⁸³ Critically, section 1192(f)(3) cannot be interpreted to set forth the only set of circumstances under which CMS may find a high likelihood of timely market entry.

The broader structure of section 1192(f) makes clear that Congress intended that the full range of relevant information and documents be considered by CMS, not only the limited set of information and documents enumerated in section 1192(f)(3). This is because section 1192(f)(1)(B)(ii)(I)(aa) (subclause (I)(aa)) clearly requires the biosimilar manufacturer to submit information and documents necessary to rendering the “high likelihood” determination—“includ[ing]” (but not limited to) the information and documents described in subclause (III).

The necessary implication is that there are information and documents beyond the information and documents described in subclause (III)—which are also “necessary” to rendering the “high likelihood” determination. While the information and documents described in subclause (III) are accounted for in section 1192(f)(3), the remaining information and documents described in subclause (I)(aa) are not—despite being “necessary” to rendering the “high likelihood” determination. Thus, if section 1192(f)(3) were the only set of circumstances under which CMS may find a high likelihood of timely market entry, the language in subclause (I)(aa) requiring broad submission of pertinent information and documents beyond those in subclause (III) would be rendered a nullity.⁸⁴ Because the information and documents described in subclause (I)(aa) serve no other statutory purpose, the only way to give meaning to the entirety of subclause (I)(aa) is to assign it its most natural meaning: Information and documents described in subclause (I)(aa) are “necessary” to rendering the “high likelihood” determination and, thus, CMS may consider all such information and documents submitted in rendering such determination. Accordingly, section 1192(f)(3) does not set forth the only set of circumstances under which CMS may find a high likelihood of timely market entry.

There is every reason to think that Congress intended for CMS to consider all relevant evidence in rendering the “high likelihood” determination. Any other interpretation of the statute would

⁸³ *Id.* § 1192(f)(3).

⁸⁴ See *Duncan v. Walker*, 533 U.S. 167, 175 (2001) (a statute is not to be interpreted in a manner that renders any provision a nullity or otherwise meaningless).

yield an absurd result. Through subclause (I)(aa), Congress clearly granted CMS broad discretion to identify and collect information and documents “necessary” to rendering the determination. If CMS were to refuse to consider such information, it would be tantamount to the Agency acknowledging that it is rendering the determination without considering information and documents that the Agency itself has concluded is essential to doing so. It is hard to imagine more arbitrary and capricious governmental decision-making.⁸⁵ Accordingly, CMS should request all information that a biosimilar manufacturer concludes supports a “high likelihood” determination and consider all such information in rendering such determination.

Fourth, we appreciate CMS’s confirmation that an agreement between a biosimilar manufacturer and a reference biologic manufacturer that permits the biosimilar manufacturer to market the biosimilar is not necessarily an agreement that incentivizes the biosimilar manufacturer to request a delay. But we ask for clarification on the circumstances under which CMS will find a disqualifying agreement to exist.

The statute provides that a delay request may not be granted where, based on specified information,⁸⁶ a biosimilar manufacturer and a reference biologic manufacturer have entered into an agreement that incentivizes (or requires) the biosimilar manufacturer to request a delay.⁸⁷ In the Initial Guidance, CMS correctly acknowledges that an agreement between a biosimilar manufacturer and a reference biologic manufacturer “that permits the Biosimilar Manufacturer to [timely] market the Biosimilar in one or more dosage form(s), strength(s), and indication(s)” not only is not necessarily an agreement that incentivizes the biosimilar manufacturer to request a delay but indeed can be a form of clear and convincing evidence of a high likelihood of timely market entry.⁸⁸ It would be contrary to the statute for CMS to suggest otherwise. This is because the statute clearly directs CMS to consider agreements between the biosimilar manufacturer and the reference biologic manufacturer in rendering the delayed selection determination.⁸⁹ It would nullify this statutory instruction if the mere existence of an agreement between the biosimilar manufacturer and the reference biologic manufacturer were automatically disqualifying. It is well understood that a statute should not be interpreted in a manner that renders text meaningless or otherwise nugatory.⁹⁰

⁸⁵ See 5 U.S.C. § 706(2)(A).

⁸⁶ SSA § 1192(f)(1)(B)(ii)(I)(bb) (“all agreements related to the biosimilar biological product filed with the Federal Trade Commission or the [Department of Justice] pursuant to subsections (a) and (c) of section 1112 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003,” which include agreements between “brand name drug companies” and “generic drug applicants”).

⁸⁷ *Id.* § 1192(f)(2)(D)(iv).

⁸⁸ Initial Guidance at 19.

⁸⁹ SSA § 1192(f)(1)(B)(ii)(I)(bb), (2)(B)(i)(II), (3)(B).

⁹⁰ *United States v. DBB, Inc.*, 180 F.3d 1277, 1285 (11th Cir. 1999) (“A statute should be ‘interpreted so that no words shall be discarded as meaningless, redundant, or mere surplusage.’”) (internal citations omitted).

BIO, however, asks CMS to clarify the circumstances under which the Agency will find a disqualifying agreement to exist. In the Initial Guidance, CMS states only that an agreement may not “impos[e] improper constraints on the Biosimilar Manufacturer.”⁹¹ Yet, despite the absence of meaningful guidance regarding such constraints, CMS will require a biosimilar manufacturer requesting a delay to certify that it has not entered into a disqualifying agreement,⁹² on pain of potential “liability, including under the False Claims Act.”⁹³ To promote market certainty by enabling manufacturers to more confidently make more informed decisions about the arrangements into which they enter, it is imperative that CMS clarify what constitutes an agreement that incentivizes a biosimilar manufacturer to request a delay.

III. Negotiation Process

A. Background

The statute requires CMS to “develop and use a consistent methodology and process” to negotiate the MFP.⁹⁴ In addition, the statute requires the manufacturer to submit specified information by March 1 of the year that is two years before the applicable IPAY.⁹⁵ CMS must make a written initial offer by June 1, which must include a concise justification that considers certain statutorily enumerated negotiation factors.⁹⁶ Within thirty days of receipt, the manufacturer must accept the initial offer or make a written counteroffer, which must include a justification that considers the same statutorily enumerated negotiation factors.⁹⁷ CMS must respond in writing to any counteroffer,⁹⁸ and the negotiation period must end by November 1.⁹⁹

⁹¹ Initial Guidance at 19.

⁹² *Id.* at 77.

⁹³ *Id.* at 80.

⁹⁴ SSA § 1194(b)(1). The renegotiation process must be consistent with the negotiation process to the extent practicable. *Id.* § 1194(f)(1), (4).

B. Negotiation process

BIO asks CMS to adopt its recommendations to improve the proposed negotiation process.

As noted above, the statute mandates that CMS “develop and use a consistent methodology and process” for MFP negotiation.¹⁰⁰ Thus, Congress intended for the negotiation process to be transparent to and predictable for all parties. Although no two negotiations will ever be identical—because the circumstances of each selected drug are unique—all negotiations should be subject to a clear and reasonable framework. A consistent process not only is statutorily required but also helps to ensure that CMS complies with its obligation to treat similarly situated entities in a similar manner, absent a reasoned basis for distinction.¹⁰¹

The Initial Guidance proposes that, only where CMS rejects a counteroffer, the Agency will extend an invitation for a negotiation meeting to take place within thirty days of receipt of such counteroffer.¹⁰² CMS would hold a maximum of three such meetings: an initial meeting and up to one additional meeting at the request of either CMS or the manufacturer.¹⁰³ The Initial Guidance also proposes to allow the parties to discuss new information during such meetings.¹⁰⁴

With respect to justifying an initial offer, the Initial Guidance only recites the statutory requirement of a concise justification based on the statutorily enumerated negotiation factors.¹⁰⁵ The Initial Guidance is silent as to any justification of a response to a counteroffer.

BIO makes the following recommendations to improve the proposed negotiation process:

First, CMS should further enable a negotiation process that allows for meaningful engagement and dialogue between CMS and manufacturers. BIO appreciates that CMS’s recognition that real dialogue (as opposed to a paper-based process) is essential to fulfilling Congress’s intent in establishing a “Negotiation” Program with a mandated process “for negotiations,”¹⁰⁶ which necessarily contemplates meaningful engagement between the Agency and the manufacturer on the unique circumstances presented by each selected drug.¹⁰⁷

¹⁰⁰ *Id.* § 1194(b)(1).

¹⁰¹ *See Bracco Diagnostics*, 963 F. Supp. at 27–28.

¹⁰² Initial Guidance at 55.

¹⁰³ *Id.* at 55–56.

¹⁰⁴ *Id.* at 56.

¹⁰⁵ *Id.* at 54.

¹⁰⁶ SSA § 1194(b)(1).

¹⁰⁷ *See Wheeler v. St. Joseph Hosp.*, 133 Cal. Rptr. 775, 790 (Ct. App. 1976) (differentiating between “negotiated contracts” and contracts of adhesion).

BIO, however, is concerned that the agency is arbitrarily limiting such engagement to (1) the period after the rejection of a counteroffer and (2) a maximum of three meetings. There is no logical reason for such limitations, as (1) such engagement can equally inform an initial offer, potentially sparing the parties the need to consider a counteroffer, and (2) the parties may agree that one or more additional meetings would be helpful and productive in setting the MFP. Accordingly, BIO encourages CMS to revise its proposed negotiation process to (1) enable real dialogue between the parties throughout the negotiation process and (2) specify that, where CMS rejects a counteroffer, additional meetings, beyond those proposed by CMS, may be held without limit where both parties agree to them. We note that such modifications to the negotiation process would be readily manageable given the limited number of drugs subject to such negotiation in any given year.¹⁰⁸

Second, the manufacturer should more generally be permitted to supplement its timely submission where a post-submission development arises or there otherwise is good cause. As set forth above, the statute requires the manufacturer to submit specified information by March 1 of the year that is two years before the applicable IPAY. Inevitably, there will be situations where information relevant to the negotiation arises after the submission deadline has passed. Such late-breaking developments will often be completely unforeseeable at the time of submission but highly relevant to the setting of the MFP. The potential scenarios are virtually limitless: For example, new therapeutic alternatives may come to market; production costs may shift due to ingredient shortages or supply chain issues; or new comparative effectiveness studies may become available.

BIO acknowledges CMS's recognition that it should not blind itself to highly pertinent new information, simply because the submission deadline has passed. But the Agency proposes to limit the presentation of such information to the negotiation meetings during the period after the rejection of a counteroffer. Because such information can equally inform an initial offer, potentially sparing the parties the need to consider a counteroffer, the Agency should more generally permit the manufacturer to supplement its timely submission wherever there is good cause to do so, including when new information relevant to the negotiation process becomes available after the submission deadline.

Permitting supplemental submissions is well warranted. Under the statute, manufacturers are given only one month to prepare a voluminous submission of complex information, including information regarding Non-Federal average manufacturer price (Non-FAMP); research and

¹⁰⁸ See SSA § 1192(a).

development costs; production and distribution costs; federal financial support for discovery and development; pending and approved patent applications, FDA exclusivities, NDAs or BLAs and approvals thereof, market data; and revenue and sales volume data.¹⁰⁹ In some cases, requested data may also not exist in a format required by CMS, such that the manufacturer will need to painstakingly convert raw data from multiple sources into such a format. Manufacturers will assuredly work with utmost diligence to comply with CMS's submission requirements. Still, they may need the flexibility of a supplement to their timely submission for legitimate reasons.

Ultimately, more generally permitting the manufacturer to supplement its timely submission where there is good cause would help ensure that the MFP is set based on the best available information.

Third, CMS should provide a *meaningful* justification of its initial offer and its response to any counteroffer and afford the manufacturer a meaningful opportunity to comment on the response the MFP is set.

As noted above, Congress intended for the MFP to be set via “negotiation,” meaning a bilateral “discussion or process of treaty” between the parties “aimed at reaching an agreement about a particular issue.”¹¹⁰ As with any good faith negotiation, open dialogue will be vital to the success of the MFP negotiation. To this end, BIO asks CMS to specify that its initial offers and its responses to any counteroffers include *meaningful* explanations of how the Agency arrived at the offer or response, including by explaining how the offer or response is supported by the statutorily enumerated negotiation factors and any other information upon which the Agency relied, and how the Agency considered and weighted such factors and information.

As noted above, in the Initial Guidance, CMS states only that the Agency's justification for an initial offer will be “based on” its analysis of statutorily enumerated negotiation factors, but it does not commit to disclosing the details of such analysis.¹¹¹ The Agency does not commit to providing any justification for a response to a counteroffer or an explanation of how it arrived at such response.¹¹²

¹⁰⁹ *Id.* §§ 1193(a)(4), 1194(e)(1).

¹¹⁰ Oxford English Dictionary, Definition of Negotiation, <https://www.oed.com/view/Entry/125879?redirectedFrom=negotiation#eid> (last visited Mar. 2, 2023).

¹¹¹ Initial Guidance at 54.

¹¹² *See id.* at 56–57.

Fully disclosing the bases of both offers and responses to counteroffers would facilitate a more robust—and ultimately more effective—negotiation process. By providing the manufacturer with a meaningful justification for an offer or response, CMS would provide greater opportunity for bilateral dialogue, which would result in more informed and targeted discussions.

BIO also asks CMS to commit to responding to any counteroffer within thirty days. We further ask CMS to commit to affording the manufacturer at least thirty days to comment on the response and considering any such comment before the MFP is set.

This basic procedural protection is essential. Not only would it be consistent with the Agency’s stated interest in “prioritiz[ing] transparency and robust engagement,”¹¹³ but it would also result in more informed and accurate decision-making. It would help prevent the MFP from being set based on an error, a misunderstanding, or a gap in information.

There is ample time in the negotiation schedule for such procedural protection. By statute, an initial offer is made by June 1 (February 1, 2024, for IPAY 2026).¹¹⁴ A counteroffer is made within thirty days of receipt.¹¹⁵ Even if CMS were to wait until June 1 (February 1, 2024, for IPAY 2026) to make the initial offer, and even if the manufacturer were to wait until the thirtieth day after receipt make the counteroffer, there would still be four months remaining in the negotiation schedule (five months for IPAY 2026). Thus, there would be ample time for the recommended additional process.

C. Confidential commercial information

BIO acknowledges CMS’s stated commitment to confidentiality, but recommends that CMS establish more fulsome safeguards to ensure that the Agency is adequately protecting the confidentiality of all proprietary information submitted to CMS as part of the negotiation process. In addition, BIO opposes CMS’s proposed imposition of overly broad confidentiality obligations on manufacturers.

The statute imposes a clear confidentiality requirement: “Information submitted to . . . [CMS] . . . by a manufacturer of a selected drug that is proprietary information of such manufacturer (as determined by . . . [CMS]) shall be used only by . . . [CMS] or disclosed to and used by the Comptroller General of the United States for purposes of carrying out [the Negotiation Program].”¹¹⁶ Congress imposed this

¹¹³ CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 at 1 (Jan. 1, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>.

¹¹⁴ SSA § 1191(d)(5)(A).

¹¹⁵ *Id.* § 1194(b)(2)(B).

¹¹⁶ *Id.* § 1193(c).

confidentiality requirement for good reason. The statute mandates that manufacturers of selected drugs submit highly sensitive information as part of the negotiation process—including, among other things, information regarding Non-FAMP, research and development costs, production and distribution costs, and revenue and sales volume data.¹¹⁷ It would be deeply disruptive to commercial markets if such proprietary information were disclosed or used in violation of the confidentiality requirement. Indeed, the Initial Guidance acknowledges the “highly sensitive” nature of information to be submitted under the program.¹¹⁸ In principle, BIO is therefore encouraged that CMS states that it “intends to implement a confidentiality policy that is consistent with existing requirements for protecting proprietary information, such as Exemption 4 of [the Freedom of Information Act (FOIA)].”¹¹⁹ That said, there is a pressing need for more detailed specification as to how the Agency will safeguard confidential commercial information to ensure that the statute’s robust confidentiality requirement is fully honored.

BIO therefore asks CMS to more fully specify the controls and safeguards that it will implement. We urge CMS to ensure that such controls and safeguards maximize the protection of confidential commercial information to be submitted under the program. This would be fully consistent with the approach taken in other areas of federal law and policy, which have long given special consideration to such highly sensitive information. For nearly forty years, the Supreme Court has made clear that commercial trade secrets are a “property right [] protected by the Taking Clause of the Fifth Amendment.”¹²⁰ Likewise, Congress has repeatedly made clear its expectation that commercially sensitive information be appropriately safeguarded. For example, even beyond FOIA’s long-standing protection of “trade secrets and commercial or financial information that is obtained from a person and is privileged or confidential,”¹²¹ the Defend Trade Secrets Act prohibits the “misappropriation” of trade secrets through public disclosure and established a private cause of action to enable affected parties to sanction such misappropriation.¹²²

BIO recommends the following minimum controls and safeguards to give full meaning to the confidentiality requirement:

First, CMS should confirm that, in “implement[ing] a confidentiality policy that is consistent with existing requirements for protecting proprietary information,”¹²³ it will ensure protections comparable to, not only those under FOIA, but also those under government price reporting law and policy.

¹¹⁷ *Id.* §§ 1193(a)(4), 1194(e)(1).

¹¹⁸ Initial Guidance at 29.

¹¹⁹ *Id.*

¹²⁰ *Ruckelshaus v. Monsanto Co.*, 467 U.S. 986, 1004 (1984).

¹²¹ 5 U.S.C § 552(b)(4); 45 C.F.R. § 5.31(d).

¹²² 18 U.S.C. § 1839(5)(B)(ii)(II).

¹²³ Initial Guidance at 29.

We appreciate CMS’s confirmation that the protections under FOIA, including the prohibition on disclosure of information designated as confidential without providing a pre-disclosure notification and an opportunity to raise objections to disclosure,¹²⁴ will apply to information to be submitted under the program.¹²⁵ We seek confirmation that the protections under government price reporting law and policy will also apply.

In developing the Negotiation Program, Congress did not intend to disrupt the confidentiality requirements under other federal law and policy.¹²⁶ CMS’s confidentiality policy should thus maintain the confidentiality of information protected against disclosure under all other federal law and policy. For example, under MDRP, “information disclosed by manufacturers . . . under [MDRP] . . . is confidential and shall not be disclosed by [CMS] . . . in a form which discloses the identity of a specific manufacturer . . . [or] prices charged for drugs by such manufacturer”¹²⁷ Similarly, Medicare Act provides that “[Average Sales Price (ASP)] information disclosed by manufacturers . . . is confidential and shall not be disclosed by [CMS] in a form which discloses the identity of a specific manufacturer . . . or prices charged for drugs or biologicals by such manufacturer”¹²⁸ Likewise, the 340B Drug Pricing Program (340B Program) generally prohibits disclosures of information submitted by manufacturers under the program.¹²⁹ Where confidential commercial information is protected against disclosure under these or any other federal programs, CMS should safeguard such information against disclosure to at least the same extent.

Second, CMS should implement robust storage and access controls and safeguards to protect the confidentiality of sensitive information. Confidentiality requirements are only as meaningful as the data privacy and security protections that are implemented to safeguard sensitive information against inadvertent or malicious¹³⁰ improper disclosure. Accordingly, CMS should implement robust systems and protocols, including by ensuring that all proprietary information stored in the Health Plan Management System (HPMS) and in electronic

¹²⁴ See 45 C.F.R. §§ 5.41, 5.42.

¹²⁵ Initial Guidance at 29.

¹²⁷ SSA § 1927(b)(3)(D) (subject to certain limited exceptions).

¹²⁸ *Id.* § 1847A(f)(2)(D) (subject to certain limited exceptions).

¹²⁹ Health Res. & Servs. Admin., General Instructions for Completing the Pharmaceutical Pricing Agreement 7 (2019), available at www.hrsa.gov/sites/default/files/hrsa/opa/pharmaceutical-pricing-agreement-example.pdf.

¹³⁰ Malicious third-party cyber activities have increasingly targeted the federal government—in, part, because its databases are repositories of significant amounts of sensitive information. Cf. David E. Sanger, *Russian Hackers Broke into Federal Agencies, U.S. Officials Suspect*, N.Y. Times, <https://www.nytimes.com/2020/12/13/us/politics/russian-hackers-us-government-treasury-commerce.html> (last updated May 10, 2021).

communications with the Agency is secure and accessible only to CMS staff and only where there is a legitimate programmatic need for access to such information.

In doing so, CMS should look to the safeguards it has already establish under MDRP. Under MDRP, CMS has implemented a system with numerous privacy and security protections to safeguard sensitive product and pricing data submitted by manufacturers. For example, the online interface allows a manufacturer to view its pricing data, such as its Baseline Average Manufacturer Price (AMP) data, while disallowing states, which do not have a programmatic need to view such information, from doing likewise.¹³¹ CMS should ensure that similar controls are in place with respect to HPMS, given CMS's intent to transition most information submissions to that system.

CMS should also specify how it will maintain the confidentiality of the subset of information that is required to be submitted via e-mail or Box. With respect to e-mail, CMS should explain, among other things, how it will enforce access security controls. With regard to Box (a third-party commercial platform), BIO asks CMS to specify how submitted information will be kept confidential, including as against misuse by Box personnel.

Third, CMS should establish a process to enable manufacturers to review a draft of the explanation of the MFP in advance of its publication and raise concerns about disclosure of confidential information. By statute, CMS is required to publish an explanation of the MFP.¹³² Such publication inherently poses heightened risk of disclosure of confidential commercial information. BIO appreciates that CMS intends to make only high-level comments regarding submitted data and refrain from sharing proprietary information.¹³³ But this is insufficient to safeguard against inadvertent disclosure of confidential commercial information. Accordingly, BIO asks that the manufacturer be given an opportunity to review the intended explanation in advance of publication, as well as an opportunity to raise concerns. Such precaution is well warranted here, given Congress's special emphasis on the need for safeguards with respect to the public explanation of the MFP, as evidenced by its specific cross-reference to the statute's confidentiality requirement.¹³⁴

BIO opposes CMS's proposed imposition of overly broad confidentiality obligations on manufacturers. BIO urges CMS to eliminate the proposed, one-sided requirement that manufacturers destroy all records related to the negotiation process and submit a Certificate of Data Destruction to CMS certifying that all

¹³¹ CMS, *Medicaid Drug Programs User Manual 1* (Nov. 3, 2021).

¹³² SSA § 1195(a)(2).

¹³³ Initial Guidance at 29.

¹³⁴ SSA § 1195(a)(2); see also *id.* § 1193(c).

information received from CMS during the negotiation period and potential renegotiation period(s) was destroyed. Like CMS, manufacturers are responsible for maintaining records associated with material decisions and must do so to maintain proper and adequate lines of supervision and oversight by boards, shareholders, and other stakeholders. Manufacturers must therefore be permitted to maintain (in a confidential format) reasonable records associated with the negotiation process to meet their oversight obligations, just as CMS will be maintaining its own records from the negotiation process.

Further, basic due process mandates that manufacturers be given the ability to maintain records related to negotiation proceedings. As CMS knows, the statute contemplates penalties of up to \$1 million per day for failing to submit required information. CMS's Initial Guidance further specifies that the Agency will consider a manufacturer that knowingly submits false information to have violated this provision. Especially given the vast magnitude of such penalties, it is imperative that manufacturers be permitted to maintain complete records of all information they believe may be relevant to defending against the erroneous imposition of sanctions.

It would be troubling in the extreme if manufacturers were required by CMS to destroy the very records that could one day be needed to defend against penalties that could reach hundreds of millions of dollars. "[T]he essence of due process is fundamental fairness," and little could be more fundamentally unfair than mandating destruction of the very records needed to verify an entity's innocence as against erroneous enforcement.¹³⁵

Moreover, BIO takes issue with the more specific blanket prohibition on manufacturers from disclosing or otherwise publicizing information "in the initial offer, including the ceiling price, or the concise justification from the Secretary or any subsequent offer of concise justification, nor information derived from those justifications or offers...". As with the broader records destruction provisions discussed above, this prohibition amounts to CMS putting its thumb on the scale of transparency as the only entity involved in the negotiation program who can control and confirm information flows. This one-sided information control heightens the ultimate public complaint that the entirety of the "negotiation" process is anything but. Rather, optically – and in practice – it appears CMS is proposing to control the entirety of the negotiation process, and to stifle any outside public discussion of the negotiation process itself. BIO disagrees with this approach and recommends CMS abandon it.

Further, the blanket "gag" sought in the proposed guidance raises several practical and Constitutional concerns. From a broader regulatory standpoint, certain regulatory agencies (*e.g.* The Securities and Exchange Commission) might well have conflicting standards for materiality determinations in disclosures made by publicly traded companies. We would argue that the exclusion in the guidance

¹³⁵ *Evans v. Wilkerson*, 605 F.2d 369, 371 (7th Cir. 1979).

from the disclosure prohibition based on state and federal law might not go far enough in covering certain regulatory obligations – both at the federal and state level. Particularly when considered in context with the records destruction obligations imbued in the guidance as well.

What is more, CMS appears to be making a more general affront to the protected speech of affected manufacturers. As has been reaffirmed many times before, prior restraints on speech are presumptively unconstitutional.¹³⁶ The government faces a heavy burden in showing a compelling interest in keeping negotiation discussions private, and we fail to see a legitimate reason why the government's interests are so advanced by muzzling private companies in the context of Medicare price negotiation discussions.¹³⁷ In fact, in this instance, any potential disclosure by a manufacturer would likely relate to truthful information that is, at a minimum, of significance to at least a portion of the public involved in the transaction of health insurance and health consumption. As such, we recommend CMS abandon these burdensome and unnecessary confidentiality and anti-disclosure provisions.

D. Special considerations in setting the MFP

It is vital that, in setting the MFP, CMS impose on itself bright-line limitations that mitigate the negative effects of the IRA and the MFP on patient access and on therapeutic innovation. BIO strongly urges CMS to adopt the following limitations.

BIO asks CMS to commit to a policy where it will not set the MFP below a price shown to imperil patient access (or otherwise below the MFP ceiling).

It is basic economics that centralized price-setting risks curtailing access to the supply of medicines.¹³⁸ If the government mandates a price too far below the price that would have been set by the free market, there will be an inevitable and profound mismatch between demand and supply.¹³⁹

BIO urges CMS, in carrying out the Negotiation Program, to be attuned to the risk to patient access if the MFP is set unduly low. The stakes are too high for CMS not to give due weight to such risk. The implication of a supply-demand mismatch is not limited to some economist's spreadsheet. Rather, it

¹³⁶ See, e.g., *Near v. Minnesota* 283 U.S. 697 (1931).

¹³⁷ As has been reaffirmed in many instances by the US Supreme Court, the government must articulate a compelling government need for the negotiation to remain out of the public discourse and must simultaneously introduce a narrowly tailored method for so restricting this discussion. In the context of this guidance, we see no such articulation of either a compelling need nor a narrow restriction. In fact, we see just the opposite. See, e.g., *New York Times Co. v. United States*, 403 U.S. 713 (1971).

¹³⁸ S. Atlas, *How to Reduce Prescription Drug Prices: First, Do No Harm*, 117 *Modern Med.* 14, 14 (2020).

¹³⁹ Rent control is the classic Economics 101 illustration: Price controls on rental stock result in undersupply; the result is a net societal loss of utility relative to the pareto optimal price. See, e.g., E. Glaser & E. Luttmer, *The Misallocation of Housing Under Rent Control*, 93 *Am. Econ. Rev.* 1027, 1027 (2003).

could mean the difference between millions of patients having access to life-saving medicines and empty shelves at the pharmacy counter. Indeed, the House Committee on Ways and Means has estimated that loss of innovation due to price controls could result in as many as “42 million patients without the medicine they need.”¹⁴⁰

The risk to longer-term innovation and development of new medicines is even more profound. One recent study by the University of Chicago concluded that the “mid-range effect” of price controls is 254 fewer new drug approvals; the researchers conservatively estimated that the loss in life from the price controls accordingly is twenty times larger than our country’s losses from the COVID-19 pandemic.¹⁴¹ Another study of the European experience found that a “10% drop in the price of medicines in price-controlled [European Union] markets was associated with . . . an 8% increase in the delay of access to medicines.”¹⁴² Still other studies have demonstrated that government price-setting is associated with dramatic declines in early research, which, of course, is the fundamental precursor to a robust and growing pipeline of new therapies targeting areas of unmet medical need.¹⁴³

Therefore, CMS should commit to a policy under which it will not set the MFP below a price shown to further imperil patient access (or otherwise below the MFP ceiling). This approach would help strike an equitable balance, giving weight to the objective of reducing prices today while also mitigating the risk that price controls will significantly imperil the drug supply or further curtail the development of the transformative medicines of tomorrow.

BIO also asks CMS to commit to setting the MFP at the MFP ceiling where failing to do so would further curtail therapeutic innovation.

It is vital that the Negotiation Program strike an appropriate balance such that blunt reductions in Medicare expenditures do not come at the expense of ongoing innovation that yields new and potentially life-saving medicines. Accordingly, BIO urges CMS to commit to setting the MFP at the MFP ceiling where doing otherwise would imperil therapeutic innovation, including in the following circumstances (not exhaustive):

¹⁴⁰ U.S. House Comm. on Ways & Means, Analysis: Americans Don’t Support Surrendering Innovation, <https://waysandmeans.house.gov/analysis-americans-dont-support-surrendering-innovation-for-democrats-drug-price-controls/> (Aug. 4, 2022).

¹⁴¹ See T. Phillipson & T. Durie, The Evidence Base on the Impact of Price Controls on Medical Innovation 1 (2021) (loss in life estimate was over a ten-year time period), available at https://bfi.uchicago.edu/wp-content/uploads/2021/09/BFI_WP_2021-108.pdf.

¹⁴² D. Schulthess & H. Bowen, *The Historical Impact of Price Controls on the Biopharma Industry*, Vital Transformations (Nov. 22, 2021).

¹⁴³ See T. Abbott & J. Vernon, *The Cost of US Pharmaceutical Price Reductions: A Financial Simulation Model of R&D Decisions*, 28 Managerial & Decision Econ. 293 (2007).

First, for a drug (small molecule), the MFP should not be set below the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

To be selected for negotiation, biologics (large molecules) must be at least eleven years post-licensure, while drugs (small molecules) must be at least seven years post-approval.¹⁴⁴ On account of the approximately two-year time lag between selection for negotiation and application of the MFP, an MFP cannot apply to a biologic until at least approximately thirteen years post-licensure; in contrast, an MFP cannot apply to a drug until at least approximately nine years post-approval. To help preserve small molecule innovation in parity with large molecule innovation, we ask that, for a small molecule, CMS set the MFP at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

Studies show that most products (whether small or large molecules) achieve modest levels of annual sales in their first five years on the market.¹⁴⁵ Thus, manufacturers may seek the economic benefit of an additional four-year shelter from selection for negotiation by focusing research and development on biologics instead of drugs.

Thus, we ask that CMS act to better balance the incentives regarding small molecule drug and biologic development by setting the MFP for a small molecule drug at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

Second, the MFP should not be set below the MFP ceiling during any year of the price applicability period into which patent protection extends.

CMS must consider a number of factors in determining the MFP for a selected drug, including “[d]ata on pending and approved patent applications.”¹⁴⁶ We ask CMS to ascertain whether, based on information submitted by the manufacturer, the selected drug will have any remaining patent protection at the start of the price applicability period and, if so, set the MFP at the MFP ceiling price for any year during such period into which such patent protection extends.

¹⁴⁴ SSA § 1192(e)(1).

¹⁴⁵ QuintilesIMS Inst., *Lifetime Trends in Biopharmaceutical Innovation: Recent Evidence and Implications*, at 2 (Jan. 2017).

¹⁴⁶ SSA § 1194(e)(1)(D).

The statute permits a drug to be subject to an MFP nine years post-approval and a biologic to be subject to an MFP thirteen years post-licensure.¹⁴⁷ By the time the price applicability period for a selected drug begins, the product’s regulatory exclusivity period likely will have expired—but not necessarily its patent protection period.¹⁴⁸ In other words, given that a patent protection period can extend beyond a regulatory exclusivity period, it may very well be the case that there will be remaining patent protection for a selected drug that extends into the price applicability period.

In the Initial Guidance, CMS proposes that, if a selected drug “has patents and exclusivities that will last a number of years,” CMS may adjust the “preliminary price” downward.¹⁴⁹ This is the opposite of what the policy should be. A selected drug’s ongoing patent protection supports a higher “preliminary price”—and, indeed, an MFP equal to the MFP ceiling. This is key to supporting pharmaceutical and biotechnology innovation in developing drugs and biologics that treat serious diseases.

It is a long and expensive process to bring a chemical or biological product from research and development to market, and many candidates do not make it through the process. To encourage innovation by rewarding manufacturers for their research and development investments and efforts, the federal government awards pharmaceutical and biotechnology companies with patent protection for a specified period of time. The patent protection period affords a manufacturer the opportunity to recover its research and development costs—not only for the drug for which the patent was awarded but also for other research and development investments that the manufacturer made. To support continued innovation, CMS should honor any remaining patent protection for a selected drug by specifying that the MFP will be set at the MFP ceiling during any year of the price applicability period into which such patent protection extends.

Third, the MFP should be set at the MFP ceiling until at least the first year during the price applicability period that starts after the date on which the most recently approved indication is thirteen years post-approval.

Innovation should not end with the approval of a first indication. Rather, finding novel uses for existing therapies is “essential for maximizing medicines’ therapeutic utility.”¹⁵⁰ Developers of

¹⁴⁷ *Id.* § 1192(e)(1).

¹⁴⁸ See FDA, Frequently Asked Questions on Patents and Exclusivity, available [here](#) (last accessed Mar. 2023).

¹⁴⁹ Initial Guidance at 53.

¹⁵⁰ B. Sahragardjoonegani et al., Repurposing existing drugs for new uses: A cohort study of the frequency of FDA-granted new indication exclusivities since 1997, 14 J. of Pharmaceutical Policy & Practice 1 (2021).

drugs and biologics therefore devote countless hours and untold capital to research and development of new indications, thereby expanding treatments to additional disease states and patient populations.¹⁵¹

In recent years, new indications have spurred vital medical breakthroughs across countless critical medical conditions. For example, new indications have been vital “to increase the portfolio of available effective cancer chemotherapeutic agents for patients.”¹⁵² Similarly, the repurposing of existing therapies has played a critical role in meeting the otherwise unmet needs of patients with rare medical conditions.¹⁵³

The seven- and eleven-year selection clocks work to extinguish such innovation by actively disincentivizing a manufacturer from making the considerable investment necessary to obtain approval of a new indication, given that such indication would run on the same selection clock. CMS must act to mitigate this concern by committing to setting the MFP at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the most recently approved indication is thirteen years post-approval. Such limitation on the setting of the MFP would provide greater certainty to manufacturers as they consider ongoing investment in research and development of new indications. This could avoid wholesale extinguishment of therapeutic innovation, to the detriment of patients with serious unmet medical needs, on account of the seven- and eleven-year selection clocks.

Fourth, the MFP should not be set below the MFP ceiling for vaccines recommended by the Advisory Committee on Immunization Practices (ACIP) at the Centers for Disease Control (CDC). Vaccination is often cited among the 10 greatest public health achievements of the century. In addition to their societal benefit, vaccines deliver significant benefit to individuals throughout their lifetime and allow older individuals to remain healthier and productive in their later years of life. The importance of vaccines was recognized in the IRA, which eliminated cost sharing for vaccines in Medicare Part D, building on the precedent in Medicare Part B where there was no cost sharing for vaccines. Because of the high value that vaccines confer not only to Medicare beneficiaries but to society as a whole, the MFP for vaccines recommended by the ACIP should not be set below the MPF ceiling.

¹⁵¹ See *id.* at 1–2 (noting the significant time and cost associated with obtaining approval of a new indication).

IV. Negotiation Factors

For purposes of negotiation of the MFP, the statute (SSA 1194 (e)) directs CMS to consider the following factors:

- Manufacturer-specific data (SSA 1194 (e)(1)): Research and development costs and the extent to which the manufacturer has recouped such costs; current unit costs of production and distribution; prior federal financial support for discovery and development; and data on pending and approved patents and exclusivity; and market data and revenue and sales volume data.
- Evidence about alternative treatments (SSA 1194 (e)(2)): the extent to which the drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such alternative; FDA-approved prescribing information for the drug and the alternatives; comparative effectiveness of the drug and the alternatives, including effects on specific patient populations; the extent to which the drug and the alternatives address unmet medical need.

The statute also directs CMS not to use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.

A. **Evidence on therapeutic alternatives and unmet need**

CMS should emphasize factors related to clinical value and unmet need and de-emphasize manufacturer specific data elements such as cost of production and research and development costs.

In developing a starting point for the initial offer, CMS proposes to utilize the net price for identified therapeutic alternatives and then adjust this starting point based on the review of the clinical evidence to develop a “preliminary price.” CMS will then consider the manufacturer specific data under section 1194(e)(2) and may adjust the preliminary price upward or downward. When there is no therapeutic alternative CMS would adjust the starting point based on how the selected drug fills an unmet medical need.

The proposed approach outlined by CMS is vague, and CMS’s intent is unclear. We strongly support an approach that emphasizes factors related to clinical benefit and unmet medical need and de-emphasizes manufacturer specific data elements such as cost of production and research and development costs – CMS should clarify how it will weight these factors in that regard. CMS should consider and prioritize high quality, robust real-world evidence (RWE), evidence provided by clinicians with the necessary expertise, as well as evidence submitted by manufacturers – who have a vast depth and breadth of

clinical and scientific expertise regarding their marketed therapies. CMS should also focus on patient-centered outcomes and the broader societal benefit conferred by a therapy. Further, providing higher relative MFPs to products that have advanced patient care and address unmet medical need will help maintain investment in assets and clinical programs that show scientific promise. At the same time, it is critical that CMS is transparent in its approach in determining therapeutic alternatives to selected drugs and provides a strong justification that the identified therapeutic alternatives are appropriate and are primarily driven by clinical guidelines and patient need versus cost.

It is essential that CMS clarify how it will evaluate the evidence it receives from different stakeholders and how such evidence will be considered in identifying therapeutic alternatives and setting the MFP.

CMS says it would adjust the preliminary price based on the totality of the relevant information and evidence submitted and gathered through the agency's analysis based on the clinical benefit the selected drug provides compared to its identified therapeutic alternatives. We support an approach that considers a wide range of high quality, robust evidence, including RWE. Further, information submitted by manufacturers should be considered a high priority in CMS's review as manufacturers have deep and unique expertise in their therapeutic areas of focus.

CMS should be transparent and provide sufficient detail regarding its framework for how different evidence was used to inform the identification of therapeutic alternatives for a selected drug, as well as the establishment of the preliminary price as well as the initial offer and response to any counteroffer, including what evidence was most impactful in CMS' analysis and why. CMS' review of the evidence should be patient-centered and have a focus on health equity and reducing disparities. To that end, we strongly support CMS's confirmation that evidence that uses discriminatory approaches such as QALYs will not be considered. We also note that other measures that have been often promoted as alternatives to QALYs – such as the Equal Value of Life Years Gained (evLYG) – are also problematic as they limit the value of interventions that both extend life and improve the quality of life – and CMS should similarly reject them. In reviewing the evidence CMS should recognize both the current and future value of therapies and remain flexible to keep pace with innovations in science and technology. Further, evidence on a therapy should be viewed in the context of its benefits to the Medicare program, as well as the overall health care system.

We recommend that CMS provide manufacturers with robust detail regarding its analysis of evidence throughout the negotiation process and provide manufacturers with opportunities for discussion and dialogue, including before CMS's initial offer in February 2024 and in its identification of therapeutic alternatives that will be used in setting the MFO. CMS should also provide a line of sight into its assessment of the evidence for the broader stakeholder community, so as to ensure appropriate

transparency and accountability not just to manufacturers but to Medicare beneficiaries and to providers and other key stakeholders.

We are concerned that CMS’s proposed definition of unmet medical need is too limiting; the agency should use a more robust definition. We recommend that CMS look to the FDA’s definition outlined in its “Guidance for Industry Expedited Programs for Serious Conditions – Drugs and Biologics.”¹⁵⁴ Under the FDA guidance, “An unmet medical need is a condition whose treatment or diagnosis is not addressed adequately by available therapy. An unmet medical need includes an immediate need for a defined population (i.e., to treat a serious condition with no or limited treatment) or a longer-term need for society (e.g., to address the development of resistance to antibacterial drugs).”

B. Submission of Information on Negotiation Factors Related to Therapeutic Alternatives and Unmet Need (Section 1194(e)(2))

CMS’s approach and processes for collecting information on the negotiation factors related to therapeutic alternatives and unmet medical need should ensure that a robust, comprehensive set of information submitted by manufacturers– with any necessary supplemental material – will be accepted and considered by CMS.

The negotiation guidance references the Negotiation Data Elements ICR, which describes how CMS intends to collect data on the negotiation factors. We are concerned that CMS’s approach may be too limiting in practice and will not allow for a robust submission of information - including any supplementary material – by manufacturers. We will be providing more detailed comments on the ICR, but note Questions 40 through 43, which collect information on prescribing data, therapeutic impact and comparative effectiveness, comparative effectiveness in specific populations, and unmet medical needs. The data fields are limited to 1,000-3,000 words, which is insufficient in length. Further, the data fields do not seem to contemplate submission of complementary information, such as charts and tables. We strongly recommend that CMS reconsider its approach and permit manufacturers to submit any information they determine relevant to the negotiation process (including information not related to the negotiation factors enumerated in the statute). Further, CMS should be required to consider all such information, not just the negotiation factors in sections 1194(e)(1) and 1194(e)(2).

¹⁵⁴ <https://www.fda.gov/files/drugs/published/Expedited-Programs-for-Serious-Conditions-Drugs-and-Biologics.pdf>

C. Submission of Manufacturer-Specific Data (Section 1194(e)(1))

We understand that the IRA requires CMS to consider factors under both section 1194(e)(1) and section 1194(e)(2). **However, as noted above, we believe CMS should de-emphasize factors the manufacturer-specific data in section 1194(e)(1) and focus on the factors that matter most to patients – those that are focused on clinical value and unmet need. In addition, to address issues that we highlight below, we recommend that, in lieu of the proposed standardized definitions, CMS allow manufacturers to use reasonable assumptions (with accompanying justifications) regarding the information they submit on the manufacturer-specific data.**

There are important considerations that will make it difficult – if not impossible – for CMS to standardize the definitions for the manufacturer-specific factors. For example, regarding research and development costs, a key issue for CMS to consider is that companies, and investors, invest in research and development for “programs” in a specific disease area, not simply discrete drugs. A program can have many drugs or biologicals at different stages of development each with multiple indications, and all which would factor into the research and development costs for an FDA-approved or licensed therapy. This can include thousands and sometimes millions of compounds that could be screened early in the research and development process, with a success rate of less than 12%.¹⁵⁵

Further, it can be misleading to approximate “value” using research and development costs. Not all companies conduct research and development in the same manner. Some smaller companies might undertake single-therapeutic, high-risk approaches to developing a compound, while many others, often bigger companies, conduct research using the “programs,” as noted. These differences in the way research and development can be conducted could disadvantage companies in negotiation if manufacturer-specific data is too heavily relied upon for “value.”

Looking at research and development costs in the post-market setting can also be misleading because of ongoing costs that are difficult to quantify. For example, the FDA requires post-market safety monitoring, these costs can also be augmented if a manufacturer must utilize FDA-mandated risk evaluation and mitigation strategies (REMS), something to which not every manufacturer is subjected. Another example is costly post-market clinical trials that can take years.

We also are concerned with CMS’s proposed requirement to collect information that is not collected today – once example is net revenue “without patient assistance programs.” It is unclear why CMS would be collecting data in this manner and the underlying implication of patient assistance programs on price.

¹⁵⁵ Biopharmaceutical Research and Development: The Process Behind the Medicines, PhRMA. 2015. Accessed: 03/28/2023. http://phrma-docs.phrma.org/sites/default/files/pdf/rd_brochure_022307.pdf

In other areas, the definitions CMS proposes are unclear, which will make it difficult for manufacturers to comply with submission requirements. For example, regarding data on approved and pending patents, clarifications are required to better define the patents and pending patent applications that must be disclosed. More precision is required where CMS is asking for patents “relating” or “linked to” the selected drug, as it is unclear what CMS means – related or linked how? In this respect, we also note that “patent” and “patent application” are well-understood terms of art that don’t require further definition in the CMS guidance. For example, the CMS guidance definition of a “pending patent application” specifies any patent application “for which a patent number has not been issued.” This definition would plainly include applications that are not, in fact, pending because they have been abandoned. An “approved patent application” presumably means a patent application that has received a notice of allowance, meaning that it is still a pending patent application (and not a “patent”) that does not require a special definition. And a “patent” comes into existence not on the date a patent application is “approved,” but on the date a patent is issued, and the official patent grant is transmitted. We recommend deleting the special definitions of “pending patent application,” “approved patent application,” and “expired patent,” and to change the operative language as suggested in our proposed edits below.¹⁵⁶

Patents, Exclusivities, and Approvals

For the purposes of describing patents, exclusivities, and approvals to be collected for use in the Negotiation Program for the selected drug, as described in section 1194€(1) of the Act and section 50.1 of this memorandum, CMS intends to adopt the definitions described in this subsection.

- *CMS considers patents relevant to this data to include:*
 - *all patent applications pending in the USPTO, international patent applications filed under the Patent Cooperation Treaty that designate the United States, and all U.S. patents, that are owned by, licensed to, or controlled ~~pending and approved patent applications, including expired and non-expired approved patents, submitted, sponsored, licensed, and/or acquired by the Primary Manufacturer relating to the,~~ and that claim the selected drug, a constituent part of the selected drug, or an approved method of using the selected drug as of September 1, 2023;*
 - *U.S. patents ~~linked to~~ that claim the selected drug, a constituent part of the selected drug, or an approved method of using the selected drug where the Primary Manufacturer is not listed as the assignee/applicant but with respect to which the manufacturer has enforcement rights (for example, for a joint venture product); and any patent that is with respect to the selected drug included in a list published under*

¹⁵⁶ Note that the nomenclature of “Primary Manufacturer” is retained in the edits we suggest but we note our comments later in this section that raise concerns with the “Primary Manufacturer” and “Secondary Manufacturer” construct.

Biotechnology Innovation Organization
1201 New York Ave., NW
Suite 1300
Washington, DC, 20005
202-962-9200

section 351(k)(9) of the Public Health Service Act or section §505(j)(7) of the Federal Food, Drug, and Cosmetic Act, ~~patent applications, pending and approved,~~ for which a claim of patent infringement could reasonably be, or has been, asserted against a person engaged in the unlicensed manufacture, use, or sale of the selected drug ~~in any form.~~

More fundamentally, CMS states it will consider the length of available patents and exclusivities and, if such patents and exclusivities will last for a number of years, the Agency may consider reducing the preliminary price downward. BIO strongly opposes such an approach. Rather, remaining patents and exclusivities should only be used to justify an *increase* in the preliminary price.

Regarding data on prior federal financial support in discovery and development, important contextual information should be considered by CMS. The biopharmaceutical industry's role in the U.S. research ecosystem is to undertake the clinical research and development required to advance basic science research by entities such as the National Institutes of Health (NIH) into safe and effective treatments available to patients. In 2018, the biopharmaceutical industry invested \$102 billion in R&D, most of which was focused on clinical research. Meanwhile, the entire NIH budget in 2018 was \$35.4 billion, only 8% of which was focused directly on clinical research.

Of note, of the 23,230 NIH grants in the year 2000 that were linked by NIH supported patents to 41 investigational drugs, only 18 had gained FDA approval by 2020. In fact, total private investment for these 18 approved medicines exceeded NIH funding by substantial orders of magnitude: \$44.2 billion in private investment compared to \$670 million in NIH. These findings are consistent with scholarship describing the complementary roles of public and private R&D funding, and the significant long-term investments shouldered by industry with no guarantee of approval. In fact, just 7.9% of medicines in clinical development are ultimately approved by the FDA.¹⁵⁷

We also note our concern with the proposal to hold a Primary Manufacturer responsible for submitting applicable information concerning a Secondary Manufacturer. A Primary Manufacturer has no inherent legal authority to compel a Secondary Manufacturer to act or not act, including to share such information. It would be fundamentally unfair and legally problematic for CMS to threaten a Primary Manufacturer with significant civil monetary penalties (CMPs) for failure to do the impossible. We note that this same concern pervades the Initial Guidance, given the numerous contexts in which CMS proposes to hold a Primary Manufacturer responsible for the action or inaction of a Secondary Manufacturer.

¹⁵⁷ Clinical Development Success Rates and Contributing Factors 2011-2020. Available at [bio.org](https://www.bio.org).

V. MFP Ceiling

A. Background

The calculation of the MFP ceiling, which represents the maximum possible MFP, is the lowest of three amounts:

- (1) the “applicable percent” of the Average Non-FAMP for 2021 (or, if there is such Non-FAMP, the Average Non-FAMP for the first full year following market entry), as increased by a Consumer Price Index for All Urban Consumers (CPI-U) factor;¹⁵⁸
- (2) the “applicable percent” of the Average Non-FAMP for the year before the year of the selected drug publication date (except for IPAY 2026);¹⁵⁹ or
- (3) (a) for a Part D drug, the sum of each “plan specific enrollment weighted amount” for each prescription drug plan (PDP) or Medicare Advantage prescription drug (MA-PD) plan;¹⁶⁰ or
(b) for a Part B drug, the Part B payment amount for the year before the year of the selected drug publication date.¹⁶¹

The “applicable percent” is 75 percent for “short-monopoly drugs,”¹⁶² 65 percent for “extended-monopoly drugs,”¹⁶³ and forty percent for “long-monopoly drugs.”¹⁶⁴

B. Average Non-FAMP

BIO recommends that, in defining Average Non-FAMP, CMS abandon its proposal to create a new price point calculated based on the four quarters of a calendar year, and instead simply adopt the existing annual Non-FAMP, calculated based on the four quarters of a federal fiscal year, under the Veterans Health Care Act of 1992 (VHCA).

As set forth above, Average Non-FAMP is calculated as part of determining the MFP ceiling.¹⁶⁵ Average Non-FAMP is a statutory term of art meaning “the average of the non-Federal average manufacturer

¹⁵⁸ SSA § 1194(c)(1)(A), (C). The CPI-U adjustment applies from September 2021 (or December of the first full year following market entry) to September of the year before the year of the selected drug publication date.

¹⁵⁹ *Id.*

¹⁶⁰ *Id.* § 1194(c)(1)(A), (B)(i), (2).

¹⁶¹ *Id.* § 1194(c)(1)(A), (B)(ii).

¹⁶² *Id.* § 1194(c)(3)(A) (defining “short monopoly drug” as a selected drug that is not an “extended-monopoly drug” or “long-monopoly drug”).

¹⁶³ *Id.* § 1194(c)(3)(B); *see also id.* § 1194(c)(4) (defining “extended monopoly-drug”).

¹⁶⁴ *Id.* § 1194(c)(3)(C); *see also id.* § 1194(c)(5) (defining “long-monopoly drug”).

¹⁶⁵ *Id.* § 1194(c)(1)(A), (C).

price (as defined in section 8126(h)(5) of title 38, United States Code) for the 4 calendar quarters of the year involved.”¹⁶⁶

The statute does not specify which four quarters are “the 4 calendar quarters of the year involved but notably cross-references 38 U.S.C. § 8126(h)(5), i.e., the VHCA. As such, the statute effectively instructs CMS to calculate Average Non-FAMP by reference to how annual Non-FAMP is calculated under the VHCA.

The VHCA requires manufacturers to calculate and report quarterly Non-FAMPs and an annual Non-FAMP—but does not require manufacturers to calculate and report an “average” Non-FAMP based on the four quarters of a calendar year. Rather, the annual Non-FAMP is calculated based on the four quarters of a federal fiscal year—which runs from October 1 through September 30.¹⁶⁷

As such, the annual Non-FAMP is a stand-alone weighted average calculation based on data from the fourth quarter of a calendar year through the third quarter of the subsequent calendar year (i.e., the four quarters of a federal fiscal year).¹⁶⁸ The most coherent policy would be for CMS to adopt the same approach to calculating Average Non-FAMP for a year under the Negotiation Program. Given that the statute expressly cross-references the VHCA in the course of defining Average Non-FAMP, there is every reason to think that Congress wanted CMS to maximize alignment as between Average Non-FAMP and the annual Non-FAMP under the VHCA, rather than creating an entirely new price point.

In the Initial Guidance, however, CMS does not propose to borrow the established VHCA framework. Rather, CMS proposes to calculate Average Non-FAMP by reference to the four quarter of a calendar year.¹⁶⁹ This approach is inefficient and unnecessarily burdensome for both CMS and manufacturers. Under the proposal, the Agency will be obligated to develop, implement, and oversee a completely new process to facilitate collection of new pricing data, as the Agency cannot benefit from the efficiencies of the well-established process that VA has already put into place—because the VHCA approach is, as noted above, tied to a federal fiscal year, rather than a calendar year. By contrast, if the Agency instead were to borrow the existing VHCA framework, Average Non-FAMP would be equated with a price point that already exists, and all stakeholders would benefit from the resulting efficiencies.

¹⁶⁶ *Id.* § 1194(c)(6).

¹⁶⁷ For example, the data used to calculate the annual Non-FAMP for 2021 cover the period from October 1, 2020, through September 30, 2021.

¹⁶⁸ The annual and quarter 3 Non-FAMPs submitted to the Department of Veterans Affairs (VA) are used to calculate the Federal Ceiling Price (FCP), which caps pricing under VA Federal Supply Schedule contracts. Manufacturers are required to submit quarters 1, 3, and 4 Non-FAMPs, too, but these price points have no impact on the price paid by the federal government. While the data used to calculate these quarterly Non-FAMPs are incorporated into the four quarters of data used to calculate the annual Non-FAMP, these quarterly Non-FAMPs themselves are not used to calculate the annual Non-FAMP.

¹⁶⁹ Initial Guidance at 42–44.

If CMS does not reverse course, BIO agrees that CMS’s framework should be based on a weighted average.¹⁷⁰

A weighted average is consistent with the VHCA framework expressly cross-referenced in the statutory definition of Average Non-FAMP. A such, a weighted average better aligns to Congress’s intent.

More importantly, use of a weighted average will objectively enhance accuracy because it will account for differences in volume across quarters and therefore create the most accurate picture of average wholesaler pricing. Such enhanced accuracy is why Congress has consistently required the use of weighted averages across the various federal pricing programs associated with federal health care programs: VHCA (Non-FAMP), Medicaid (AMP), and Medicare (ASP) all use weighted averages, not simple averages.

Congress has consistently required the use of weighted averages because simple averages are less accurate. Simple averages result in over-valuation of sales in quarters with lower sales volumes, and under-valuation of sales in quarters with higher sales volumes. As such, it is critically important that CMS use a weighted average to ensure more accurate calculations of Average Non-FAMP, and we concur with CMS’s proposal to do so.

The Agency should establish an exceptions process to account for restatements and anomalies.

An exceptions process is vital. There will inevitably be situations where Average Non-FAMP will need to be restated in light of data errors or other issues identified after the fact or where an unusual circumstance will result in an anomalous Average Non-FAMP.

- **Non-FAMP restatements.** CMS must consider how it will address situations in which a Non-FAMP that is used for an MFP calculation is restated by the manufacturer and approved by VA. VA has long recognized the need for manufacturers to be able to restate a Non-FAMP where the reported Non-FAMP is determined to be inaccurate (e.g., sales data flaws, data system problems). The VA experience has demonstrated that restatements are not uncommon, with adjustments of contract pricing facilitated based on restated Non-FAMPs and FCPs. The Agency must expressly account for the need for such restatements—but the Initial Guidance does not do so.

¹⁷⁰ *Id.* at 43.

- **Non-FAMP anomalies.** The VA’s experience reveals a variety of circumstances where an anomalous Non-FAMP can arise due to a misalignment of sales dollars and units. This can occur due to lagged sales, market shortages, or various other factors. VA has developed various exceptions and workarounds for calculating FCPs when there are Non-FAMP anomalies. It is vital that CMS develop its own processes for addressing anomalous Average Non-FAMPs. Any approach adopted by CMS needs to be flexible to account for the wide range of circumstances that can result in an anomalous Average Non-FAMP.¹⁷¹ But the Initial Guidance is silent on any such flexibilities.

BIO encourages CMS to adopt an exceptions process to account for Average Non-FAMP restatements and anomalies. In doing so, CMS should clarify how such process affects the MFP ceiling and, ultimately, the MFP.

C. Extended- and long-monopoly drugs

CMS should clarify whether the time period for determining whether a selected drug is an extended- or long-monopoly drug runs to the start of the applicable IPAY, or to the applicable selected drug publication date.

As set forth above, there are three options for setting the MFP ceiling. Two of these options look to the “applicable percent” of the applicable Average Non-FAMP.¹⁷² By statute, the “applicable percent” varies based on whether the drug is a short-, extended-, or long-monopoly drug.¹⁷³

With limited exceptions, extended monopoly drugs are, “with respect to an initial price applicability year, selected drug[s] for which at least 12 years, but fewer than 16 years, have elapsed since the date of approval . . . or . . . licensure,”¹⁷⁴ and long-monopoly drug are, “with respect to an initial price applicability year, selected drug[s] for which at least 16 years have elapsed since the date of approval . . . or licensure.”¹⁷⁵ Short-monopoly drugs are all other selected drugs.¹⁷⁶

Notably, the statute is silent as to the date to which the twelve- or sixteen-period that defines an extended- or long-monopoly drug runs. In the Initial Guidance, CMS takes inconsistent positions. On the one hand, CMS states that, for IPAY 2026, a delay request may be submitted where a reference

¹⁷¹ For example, in certain cases, it may be prudent for CMS to account for an Average Non-FAMP anomaly by looking to the prior year’s figures; in other cases (e.g., a new product), this may not be possible.

¹⁷² SSA § 1194(c)(1).

¹⁷³ *Id.* § 1194(c)(3).

¹⁷⁴ *Id.* § 1194(c)(4)(A).

¹⁷⁵ *Id.* § 1194(c)(5)(A).

¹⁷⁶ *Id.* § 1194(c)(3)(A).

biologic will have been “licensed for between 12 and 16 years prior to the start of the initial price applicability year on January 1, 2026.”¹⁷⁷ On the other hand, in “Figure 2: Monopoly Types and Applicable Percentage for Initial Price Applicability Year 2026,” CMS conveys that, for IPAY 2026, it will count the 16-year period that defines a long-monopoly drug to September 1, 2023, i.e., the selected drug publication date for IPAY 2026.¹⁷⁸ In other words, CMS is inconsistent as to whether the twelve- or sixteen-year period that defines an extended- or long-monopoly drug runs to the start of the applicable IPAY, or to the applicable selected drug publication date.

BIO asks CMS to clarify its intended interpretation in light of the conflicting language in the Initial Guidance.

D. MFP ceiling for Part D drugs

BIO disagrees with CMS’s intended approach for calculating the MFP ceiling option specific to Part D drugs. CMS must calculate the MFP ceiling under such option exclusive of manufacturer price concessions unless they are passed through at the point of sale, consistent with CMS’s long-standing policy governing the Part D negotiated price.

As set forth above, one of the three options for determining the MFP ceiling with respect to a Part D drug is the sum of each “plan specific enrollment weighted amount” for each PDP or MA-PD plan.¹⁷⁹ Congress specified that the “plan specific enrollment weighted amount” is determined by reference to the Part D negotiated price.¹⁸⁰ As such, Congress made clear that the “plan specified enrollment weighted amount” is to be determined by reference to CMS’s policies governing the Part D negotiated price.

This is not what CMS proposes. In the Part D context, CMS has long defined the Part D negotiated price to be “inclusive of all price concessions from network pharmacies, except those contingent price concessions that cannot reasonably be determined at the point-of-sale”—but not to require inclusion of price concessions from manufacturers.¹⁸¹ Rather, PDPs and MA-PDs may choose to include manufacturer price concessions in the Part D negotiated price to the extent that they are passed through at the point of sale: “Part D sponsors are allowed, but generally not required, to apply rebates

¹⁷⁷ Initial Guidance at 17 (emphasis added).

¹⁷⁸ See Initial Guidance at 45.

¹⁷⁹ SSA § 1194(c)(1) (A), (B)(i).

¹⁸⁰ *Id.* § 1194(c)(2).

¹⁸¹ 42 C.F.R. § 423.100 (emphasis added). CMS has issued a rule that will revise the Part D negotiated price definition effective January 1, 2024. But such revision does not alter the fact that the Part D negotiated price does not require inclusion of manufacturer price. See 87 Fed. Reg. 27,704, 27,899 (May 9, 2022).

and other price concessions at the point of sale to lower the price upon which beneficiary cost-sharing is calculated.”¹⁸²

CMS’s Initial Guidance ignores this long-standing policy defining the Part D negotiated price. For purposes of calculating the MFP ceiling under the option specific Part D drugs, CMS instead proposes to use Direct and Indirect Remuneration (DIR) data—rather than solely PDE data—to calculate the “plan specific enrollment weighted amount.”¹⁸³ Notably, unlike PDE data, DIR data reflect all price concessions, including those received from manufacturers that are not passed through at the point of sale.¹⁸⁴

CMS’s proposed approach is contrary to statute, which makes clear that the MFP ceiling option must be determined by reference to the Part D negotiated price. By choosing expressly to define the MFP ceiling option by reference to the Part D negotiated price, Congress required such option to be calculated in accordance with policy governing the calculation of the Part D negotiated price. Any contrary approach would render meaningless Congress’s express choice to use the Part D negotiated price as the statutory reference point.

In addition to being inconsistent with statutory text and Congressional intent, CMS’s proposal also would create significant unnecessary complexities. It would be more burdensome for the Agency to determine the MFP ceiling for Part D drugs if the Agency were to apply a standard that is inconsistent with the Part D standard. In addition, it would impose a new and unfamiliar approach on pharmacies, plans, pharmacy benefit managers (PBMs), manufacturers, and other stakeholders, and would thereby increase the risk of confusion or error that could result in an erroneous MFP.

BIO urges CMS to abandon this proposal and instead align the Part D drug-specific MFP ceiling option with CMS’s long-standing policy defining the Part D negotiated price, consistent with the requirements of the statute.

VI. Providing Access to the MFP

A. Background

Under the Negotiation Program, the manufacturer of a selected drug must provide access to the MFP to:

¹⁸² 87 Fed. Reg. at 27,835 (the Part D negotiated price is “the price paid to the network pharmacy or other network dispensing provider for a covered Part D drug dispensed to a plan enrollee that is reported to CMS at the point of sale by the Part D sponsor”).

¹⁸³ Initial Guidance at 40.

¹⁸⁴ CMS, Medicare Part D – Direct and Indirect Remuneration (DIR) (Jan. 19, 2017).

- With respect to a Part B drug, “hospitals, physicians, and other providers of services and suppliers with respect to [individuals who are enrolled under Part B, including individuals who are enrolled in an Medicare Advantage (MA) plan, if payment may be made under Part B for the drug, and who are furnished the drug];”¹⁸⁵ and
- With respect to a Part D drug, “[individuals who are enrolled in a PDP or MA–PD plan if the drug is covered under such plan, and who are dispensed the drug,] at the pharmacy, mail order service, or other dispenser at the point-of-sale of such drug (and . . . to the pharmacy, mail order service, or other dispenser, with respect to such . . . individuals who are dispensed such drugs).”¹⁸⁶

MFP-340B duplicate discounts are prohibited: The manufacturer is required to provide access to either the MFP or the 340B price, whichever is lower.¹⁸⁷

B. MFP rebate model

BIO commends CMS for proposing that access to the MFP may be provided through an MFP rebate model and urges the Agency to clarify that the proposed fourteen-day period during which an MFP rebate must be paid runs from the date on which the manufacturer has validated eligibility for the rebate.

CMS proposes that a manufacturer may provide access to the MFP by either (1) ensuring that the price paid when acquiring the drug is no greater than the MFP or (2) providing retrospective reimbursement for the difference between the acquisition cost and the MFP.¹⁸⁸ BIO commends this approach.

Generally speaking, the manufacturer of a selected drug must provide access to the MFP to providers and pharmacies with respect to Part B, MA, and Part D beneficiaries.¹⁸⁹ It follows that the manufacturer has no obligation to provide access to the MFP to providers and pharmacies on units that will be furnished or dispensed to individuals who are not Part B, MA, or Part D beneficiaries (MFP-ineligible individuals).

An MFP rebate model is vital because it enables prospective safeguarding against diversion of MFP units to MFP-ineligible individuals. This is essential because the statute does not provide any retrospective

¹⁸⁵ SSA § 1193(a)(3)(B); *see also id.* § 1191(c)(2)(B).

¹⁸⁶ *Id.* § 1193(a)(3)(A); *see also id.* § 1191(c)(2)(A).

¹⁸⁷ *Id.* § 1193(d).

¹⁸⁸ Initial Guidance at 40.

¹⁸⁹ *Id.* § 1193(a)(3); *see also id.* § 1191(c)(2).

mechanism for doing so. For example, the statute does not provide any post-hoc audit right to either the manufacturer or CMS to validate that providers and pharmacies have appropriately furnished or dispensed MFP units. Nor is there any post-hoc dispute resolution mechanism that enables the manufacturer to contest and recover the MFP discount on units that were improperly furnished or dispensed. Likewise, the statute does not grant CMS authority to impose CMPs or other sanctions, such as termination of access to the MFP, on providers and pharmacies that engage in diversion. Under these circumstances, CMS must establish a means to prospectively prevent diversion of MFP units. Authorizing an MFP rebate model is the most logical and practical means of doing so. It provides a mechanism through which the manufacturer can confirm that a unit was in fact furnished or dispensed to an MFP-eligible individual before providing access to the MFP.¹⁹⁰

Absent an MFP rebate model, there would be no way to mitigate against unlimited diversion of MFP units. And this is not a merely theoretical concern. In contrast to the Negotiation Program, the 340B Program, which is generally administered via upfront discounts, features a statutory audit right, a statutory dispute resolution mechanism, and agency authority to impose sanctions, including termination of access to the 340B price.¹⁹¹ Yet even this constellation of statutory safeguards against diversion has proven deeply inadequate to prevent diversion of 340B units.¹⁹² In the face of this well-documented real world experience, it would be patently unreasonable if CMS were to require upfront MFP discounts with no such safeguards. Indeed, doing so would be impermissible, as it would be tantamount to nullifying the express limitation on the obligation to provide access to the MFP only with respect to MFP-eligible individuals.¹⁹³

A rebate model is also the most administratively straightforward means of providing access to the MFP. The rebate model is commonplace in the commercial sector and under Part D, such that an MFP rebate model can be implemented as seamlessly and efficiently as possible and in a manner well familiar to all

¹⁹⁰ As a manufacturer can confirm when it submits its “process for making the MFP available,” Initial Guidance at 32, the minimum necessary Medicare claims data will be used to validate eligibility for the MFP, and reasonable time frames for submission of a request for, validation of eligibility for, and payment of an MFP rebate will be established. Additionally, providers and pharmacies will know at the time that a unit of a drug is furnished or dispensed that the drug is a selected drug and its associated MFP-based cost-sharing. As such, an MFP rebate model will not interfere with timely access by MFP-eligible individuals to MFP-based cost-sharing.

¹⁹¹ PHSA § 340B(a)(5)(C), (d)(2)(B)(v), (3).

¹⁹² See, e.g., Examining HRSA’s Oversight of the 340B Drug Pricing Program: Hearings Before the Subcomm. on Oversight & Investigations of the H. Comm. on Energy & Commerce, 115th Cong. 2–3 (2017) (noting limited oversight against diversion and that between 63 and 82 percent of audited 340B covered entities have been found to be noncompliant with at least one program requirement) (statement of Rep. Tim Murphy), available at <https://www.congress.gov/115/chrgr/CHRG-115hrg26929/CHRG-115hrg26929.pdf>; T. Okon, *Hospitals and for-profit PBMs are diverting billions in 340B savings from patients in need*, Stat News, <https://www.statnews.com/2022/07/07/for-profit-pbms-diverting-billions-340b-savings/> (June 7, 2022); see also PHSA § 340B(a)(5)(B).

¹⁹³ *Whitman v. Am. Trucking Ass’n, Inc.*, 531 U.S. 457, 484 (2001) (an agency may not implement a statute in a manner that “completely nullifies” an otherwise applicable provision).

stakeholders. And CMS has clear legal authority to permit an MFP rebate model, as the statute does not specify how the manufacturer of a selected drug must provide access to the MFP, and, what is more, the statute grants CMS broad discretion to “establish[] . . . procedures to carry out the provisions of [the Negotiation Program], as applicable, with respect to [MFP-eligible individuals].”¹⁹⁴

To ensure smooth integration of the rebate model, and because only pharmacies know the actual acquisition cost (AAC), BIO recommends CMS define the MFP discount using a publicly reported metric, such as wholesale acquisition cost (WAC).

BIO is concerned with the metric CMS is proposing to use when defining the MFP discount, the AAC. CMS proposes that manufacturers that provide access to the MFP using a rebate model will need to provide the pharmacy a discount equal to the difference between the pharmacy’s acquisition cost, or the AAC, and the MFP. Among others, there are concerns with accessibility of the pharmacy’s AAC as it is currently not known to entities beyond the pharmacy. BIO recommends CMS define the MFP discount using a publicly reported metric, such as wholesale acquisition cost (WAC).

To facilitate a functional rebate model, BIO urges CMS to clarify that the proposed fourteen-day period during which an MFP rebate must be paid runs from the date on which the manufacturer has validated eligibility for the rebate.

CMS proposes that the manufacturers provide retrospective reimbursement within fourteen days. But the Initial Guidance is silent on when the clock begins to run. CMS should clarify that the clock begins to run on the date on which the manufacturer has validated eligibility for the rebate, in accordance with commercial sector conventions. In fact, this is the only rational starting point.

If CMS were instead to suggest that the clock begins to run on the date on which the rebate is requested, there would be insufficient time for the manufacturer to confirm that the unit was in fact furnished or dispensed to an MFP-eligible individual before providing access to the MFP—and, more fundamentally, no incentive for a provider or pharmacy to provide any validating Medicare claims data (including the 340B and non-340B claims modifiers discussed in section VI.C). This would render the rebate model completely nugatory, as such data are essential to the rebate model. Alternatively, we believe CMS should require providers to furnish claims level data such that it is required to process an individual claim, including the 340B or non-340B claims modifier as necessary. As CMS notes in its communication to states entitled, “Best Practices for Avoiding 340B Duplicate Discounts in Medicaid,” manufacturer access to claims level data is likely needed for invoice validation.¹⁹⁵ The rebate model is

¹⁹⁴ SSA § 1196(a)(3).

¹⁹⁵ Best Practices for Avoiding 340B Duplicate Discounts in Medicaid, CMS, January 8, 2020. https://www.hhs.gov/guidance/sites/default/files/hhs-guidance-documents/cib010820_1.pdf.

useful only to the extent that it provides a meaningful opportunity to prospectively safeguard against statutorily prohibited diversion of MFP units to MFP-ineligible individuals. As such, the rebate payment clock must begin ticking only after the manufacturer has verified the propriety of the rebate. Any contrary approach would be both plainly irrational and run directly contrary to the clear intent of Congress, which declined to impose any obligation on the manufacturer to provide access to the MFP with respect to an MFP-ineligible individual.¹⁹⁶

To promote efficiency and program integrity and to minimize the burden on interested parties, CMS should adopt a third-party administrator or clearinghouse rebate model.

Finally, BIO strongly urges CMS to utilize a CMS-established third-party administrator (TPA) for the rebate model. By utilizing a TPA, CMS can ensure prompt payment while promoting efficiency and program integrity and minimizing obligations on stakeholders. The CMS-established TPA would also need to serve as a Medicare claims data clearinghouse. To enable manufacturers that choose the rebate option to validate the propriety of MFP rebate invoices, CMS should require all necessary claims level data be shared with the clearinghouse such that it is required to process an individual claim, including the 340B or non-340B claims modifier. The TPA clearinghouse would also be an effective way to ensure non-duplication between the MFP and the 340B program.

C. MFP-340B Duplicate Discounts

To prevent MFP-340B duplicate discounts, BIO urges CMS to condition payment of a claim for reimbursement for a unit of a selected drug on the accurate use of *either* a 340B or a non-340B claims modifier, across Part B, MA, and Part D.

As set forth above, the statute prohibits MFP-340B duplicate discounts.¹⁹⁷ To make this statutory prohibition meaningful, CMS must establish a mechanism that meaningfully allows manufacturers to avoid MFP-340B duplicate discounts across Part B, MA, and Part D.

With respect to Part B, CMS has already taken steps toward establishing such a mechanism. Effective January 1, 2024, all 340B covered entities that submit a Part B claims must use a 340B claims

¹⁹⁶ In the alternative to requiring payment of an MFP rebate within fourteen days of the date on which the manufacturer has validated eligibility for the rebate, CMS could requirement payment of an MFP rebate either (1) within thirty days of the date on which the provider or pharmacy submits all necessary validating Medicare claims data, to be tolled during the pendency of a reasonable dispute resolution process or (2) within 45 days of the date on which the provider or pharmacy submits all necessary validating Medicare claims data. Notably, if the clock were to begin to run before the submission of such data, it would render the rebate model pointless, as the entire point of the model is to enable the manufacturer to validate eligibility for the rebate.

¹⁹⁷ *Id.* § 1193(d) (the manufacturer is required only to offer the lower of the MFP and the 340B price).

modifiers.¹⁹⁸ With respect to Part D, CMS has similarly proposed to require a 340B identifier in prescription drug event (PDE) file, acknowledging that “requiring that a 340B indicator be included on the [PDE] record is the most reliable way to identify drugs that are subject to a 340B discount that were dispensed under Medicare part D,” for purposes of excluding 340B units from the Part D inflation rebate calculation.¹⁹⁹

BIO appreciates these steps, but CMS must take additional steps to make the prohibition of MFP-340B duplicate discounts meaningful. As a start, CMS must require the use of either a 340B modifier or a non-340B modifier, and condition payment of a claim on the accurate use of the applicable modifier. And CMS must implement the same constellation of essential safeguards with respect to MA units. All such safeguards are necessary to ensure that 340B covered entities are properly incentivized to accurately identify 340B units. And such safeguards must be paired with an MFP rebate model to prospectively guard against MFP-340B duplicate discounts, given the absence of a statutory mechanism for retrospectively doing so.²⁰⁰ Any other safeguards necessary to protect against MFP-340B duplicate discounts should be adopted as well.

The need for such protections is readily apparent in light of the long history of improper duplicate discounts in analogous contexts: There continues to be widespread 340B covered entity non-compliance issues with respect to the MDRP-340B duplicate discount prohibition.²⁰¹ The same risk is present with respect to MFP-340B duplicate discount, and CMS must establish a mechanism to guard against them, as the prohibition against MFP-340B duplicate discounts is meaningful only if CMS does so. “An administrative agency cannot abdicate its responsibility to implement statutory standards under the guise of determining that inaction is the best method of implementation.”²⁰²

D. Providing access to the MFP to Part D beneficiaries at the point of sale

BIO concurs with CMS that a manufacturer is not required to provide access to the MFP to Part D beneficiaries at the point of sale *directly*.²⁰³

¹⁹⁸ CMS, Part B Inflation Rebate Guidance: Use of the 340B Modifiers 1 (Dec. 20, 2022), available at <https://www.cms.gov/files/document/part-b-inflation-rebate-guidance340b-modifierfinal.pdf>.

¹⁹⁹ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum 18 (Feb. 9, 2023), available at <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>.

²⁰⁰ See § VI.B *supra*.

²⁰¹ See, e.g., Government Accountability Office, *Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement* (2018), available at <https://www.gao.gov/assets/gao-18-480.pdf>; see also PHSA § 340B(a)(5)(A).

²⁰² *United States v. Markgraf*, 736 F.2d 1179, 1183 (7th Cir. 1984).

²⁰³ Initial Guidance at 31.

In the Initial Guidance, CMS correctly recognizes that access to the MFP must be provided to Part D beneficiaries at the point of sale through PDPs or MA-PDPs, as opposed to the manufacturer (as a literal reading of the statute might suggest).²⁰⁴ This is because it is impossible for a manufacturers to provide access to the MFP to Part D beneficiaries at the point of sale directly because they are not a party to the transaction at the point of sale. Rather, the point-of-sale transaction is among the Part D beneficiary, the pharmacy, and the plan or its PBM. Not only are manufacturers not a party to the transaction at the point of sale, but they are also typically not even in privity of contract with the point-of-sale pharmacy (and may also not even be in privity of contract with the plan or its PBM). As such, the only rational way to operationalize the statutory directive is for CMS to establish a pathway by which the MFP is passed through to Part D beneficiaries by those that are parties to the point-of-sale transaction. Therefore, BIO concurs with CMS’s clarification that access to the MFP by Part D beneficiaries at the point of sale will be effectuated through plans, not manufacturers.

E. Application of the MFP Across Dosage Forms and Strengths

We request that CMS simplify its proposed approach and address concerns with its proposed methodology.

In section 60, CMS proposes a complicated set of comparisons for purposes of creating a single proposed MFP for each drug for negotiation purposes. BIO understands the agency’s application of the statutory directive to create a “maximum fair price across different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug.” However, the agency’s decision, discussed above to treat products that are the subject of discrete NDAs as the same drug because they have the same active moiety, unnecessarily compounds the complexity of this effort. In many cases, products requiring significantly different routes of administration treat different conditions or have different clinical profiles—which results in a requirement for discrete NDAs to establish that the use of these therapies is safe and effective. In addition, drugs with different routes of administration may have substantially different manufacturing costs.

Thus, while BIO understands what the agency was attempting to accomplish in the system it has proposed for resolving the calculation of MFP across all dosage forms and strengths, the complexity of the system is compounded by CMS’ desire to include, in a single calculation, products with multiple routes of administration that will often be approved under multiple NDAs as separate drugs. The calculation also relies upon standardized concepts of 30-day equivalent supply, which may or may not have a true equivalence, especially for any products with some formulations dosed once via injection to

²⁰⁴ SSA § 1193(a)(3).

last a longer period of time which may not be standardized across all clinical practice—and may differ markedly from oral formulations for the same chemical. The complicated equation CMS has established may not be able to adequately resolve these differences when calculating a standardized MFP across all forms and strengths of particular chemical compounds—and it need not do so for products approved under separate NDAs that should be treated as different drugs for purposes of MFP calculations.

BIO urges CMS to simplify MFP calculations by following the statutory language of the IRA and attempt to create a single MFP only for dosage forms of each drug that are identified by reference to the same NDA or BLA. Products that are separately approved should be treated as separate drugs. This will resolve much of the unnecessary complexity in the agency’s proposed calculations described in section 60.

In addition, BIO is concerned that the last step of the 10-step process CMS has outlined will create an additional round of price cuts on dosage forms and strengths which cost more than other dosage forms and strengths for the same product for purposes of these calculations. By selecting a single ceiling price for the MFP and then comparing it differentially to the NDC9 level ceiling prices for the different dosage form and strengths of products, CMS is effectively undermining its own “single” MFP ceiling. Products which cost more at the NDC9 level than the dosage form and strength level calculated in section 60.2.2 and 60.2.3 would be subjected to two rounds of cuts, one during the process outlined in section 60.5 and again during the negotiation process itself. This undermines the creation of a “single” MFP since the different dosage forms and strengths are not equally subjected to the two rounds of cuts. This could potentially penalize more expensive dosage forms and strengths and undermine the ability of manufacturers to continue to provide these products. Moreover, the differential impact of the CMS methodology across dosage forms and strengths could also result in inequitable patient cost sharing.

In sum, BIO urges CMS to consider ways to simplify its methodology for applying the MFP across different dosage forms and strengths to avoid these distortions. As noted, some of these issues could be mitigated if CMS treats products which are separately approved as separate drugs. In addition, BIO believes that the agency has the authority to apply the MFP using more simplified units of measure than the 30-day equivalent methodology CMS has proposed.

F. The Date on Which a Generic or Biosimilar Is Marketed and the Date on Which CMS Determines That a Generic or Biosimilar Has Been Marketed

It is imperative that CMS abandon its bona fide marketing standard. This standard for determining the date of marketing of a generic or biosimilar is incompatible with the statute and contrary to sound public policy. CMS should instead adopt a standard that consistently designates the MDRP “market

date” as both the date on which a generic or biosimilar is marketed *and* the date on which CMS determines that a generic or biosimilar has been marketed.

The statute anchors multiple important provisions to either (1) the date on which a generic or biosimilar is marketed or (2) the date on which CMS determines that a generic or biosimilar is marketed.

With respect to the former date, a drug or biologic may be selected for negotiation only if, by the selected drug publication date, it is a qualifying single source drug—which excludes a drug or biologic with respect to which a generic or biosimilar is marketed.²⁰⁵ In addition, a biologic subject to a delay in selection for negotiation is rendered ineligible for selection for negotiation if a biosimilar is marketed by the date that is two years what otherwise would have been the selected drug publication date.²⁰⁶ And a biologic may not be subject to such a delay if more than one year has passed since the biosimilar was licensed and the biosimilar is not marketed.²⁰⁷

With respect to the latter date, most notably, a selected drug ceases to be subject to the MFP at the start of the year that is “at least 9 months after the date on which [CMS] determines that at least one generic or biosimilar has been marketed.”²⁰⁸ In addition, a drug or biologic ceases to be subject to negotiation if, by the end of the negotiation period, CMS determines that a generic or biosimilar has been marketed;²⁰⁹ and a non-compliant manufacturer of a selected drug subject to an ongoing excise tax ceases to be subject to such tax on the date on which CMS determines that a generic or biosimilar has been marketed.²¹⁰

In either case, the determination of the date of marketing of a generic or biosimilar is of enormous consequence throughout the program. CMS has stated its intent to use an ill-defined and complicated process to make what is in fact an entirely straightforward determination. CMS intends to review PDE data to determine whether a generic or biosimilar is marketed under a “bona fide marketing” standard that reflects CMS’s subjective assessment of whether the degree of utilization of the generic or biosimilar represents “robust and meaningful competition.”²¹¹

²⁰⁵ *Id.* § 1192(e)(1)(A)(iii); (B)(iii). The statute refers to a generic or biosimilar that is both approved or licensed and marketed. We focus only on the latter because the date of marketing should never fall before the date of approval or licensure.

²⁰⁶ *Id.* § 1192(f).

²⁰⁷ *Id.* § 1192(f)(2)(D)(iii).

²⁰⁸ *Id.* § 1192(c)(1) (emphasis added).

²⁰⁹ *Id.* § 1192(c)(2).

²¹⁰ Internal Revenue Code (IRC) § 5000D(b)(1)(B).

²¹¹ Initial Guidance at 67. BIO notes that, in some cases, the Initial Guidance does not specify whether the Agency intends to use the bona fide marketing standard to determine the date of marketing. In particular, it is unclear whether CMS intends to use such standard with respect to provisions regarding delay in the selection of a biologic for negotiation. If CMS intends to use an alternative standard with respect to such provisions, it should clearly articulate such alternative and subject it to public comment.

CMS’s approach is deeply problematic for myriad reasons. Foremost is that the bona fide marketing standard is contrary to the plain language of the statute: CMS’s standard is not rationally related to the actual date of marketing. As a definitional matter, marketing is “[t]he act[] . . . of bringing or sending a product or commodity to market.”²¹² As such, once the “action of buying or selling” has occurred, a product has necessarily been “marketed.”²¹³

CMS itself has long recognized that the date on which a product is “marketed” is an objective point-in-time determination of the date on which it is made available for sale in the commercial marketplace—including in the course of implementing other provisions of the IRA as well as under the Part D program which will source the data on which CMS intends to rely in effectuating its bona fide marketing standard. Mere months ago, CMS proposed to determine when a product is “marketed” for purposes of the IRA’s Part D inflation rebates by reference to the “market date” that the manufacturer must report under MDRP.²¹⁴ In turn, under MDRP, CMS has long defined the “market date” of a product by reference to the date on which the product entered commercial distribution, consistent with the plain language definition of “marketed.”²¹⁵ And, under the Part D program, which will source the PDE data on which CMS intends to rely in effectuating its bona fide marketing standard, CMS has recognized that the date on which a product is “release[d] onto the market” triggers certain coverage-related obligations²¹⁶—which by necessary implication means that CMS will have already recognized that a product has been released onto market by the time such coverage-related obligations yield PDE data showing utilization of the product.

²¹⁴ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of SSA, and Solicitation of Comments, § 40.3 (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>; FDA, National Drug Code Directory (July 22, 2022), *available at* <https://www.fda.gov/drugs/drug-approvals-and-databases/national-drug-code-directory#:~:text=Marketing%20start%20date%20is%20the,no%20longer%20in%20commercial%20distribution>. With respect to the IRA’s Part B inflation rebate, CMS proposed to determine when a product is “marketed” by reference to the “date of first sale” that the manufacturer must report for ASP purposes, which likewise is an objective point-in-time determination. CMS, Medicare Part B Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1847A(i) of the Social Security Act, and Solicitation of Comments, § 50.3 (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-b-inflation-rebate-program-initial-guidance.pdf>.

²¹⁵ 83 Fed. Reg. 12,770, 12,784 (Mar. 23, 2018) (MDRP National Rebate Agreement); *see also* 42 CFR 447.502.

²¹⁶ CMS requires that Part D plan sponsor P&T committees “make a reasonable effort to review a new FDA approved drug product (or new FDA approved indication) within 90 days of its release onto the market and . . . make a decision on each new FDA approved drug product (or new FDA approved indication) within 180 days of its release onto the market, or a clinical justification will be provided if this timeframe is not met.” Prescription Drug Benefit Manual, ch. 6 § 30.1.5 (emphasis added).

CMS should not supplant wholesale the statute’s objective point-in-time “marketed” standard with an extra-statutory standard based on the Agency’s subjective judgment of sufficiency of utilization.²¹⁷ Such judgment is immaterial to whether a product is in fact marketed—i.e., is available to be bought and sold in the commercial marketplace.

Notably, Congress well knows how to statutorily impose a “bona fide” standard in the drug pricing context. Congress expressly established such a standard when amending the MDRP statute in 2010 to specify that only “bona fide” service fees are exempt from the calculation of AMP.²¹⁸ By contrast, Congress chose not to establish such a bona fide standard here. “[W]here Congress knows how to say something but chooses not to, its silence is controlling.”²¹⁹

CMS’s extra-statutory bona fide marketing standard has vast legal implications. For example, as noted above, the date on which CMS determines that a generic or biosimilar has been marketed determines when the MFP terminates.²²⁰ As such, through the bona fide marketing standard, CMS is effectively claiming for itself limitless discretion to prevent the MFP from timely (if ever) terminating, notwithstanding the fact that a generic or biosimilar has in fact come to market, based on the Agency’s subjective assessment of whether PDE data show that the generic or biosimilar is utilized sufficiently. In addition, CMS is implicitly claiming for itself authority to re-institute an MFP after an MFP has been terminated, if the Agency concludes based on PDE data that utilization of the generic or biosimilar ceases to be “robust and meaningful.”²²¹

Such policies are completely untethered to anything in the text or structure of the statute and run directly contrary to Congress’s intent to allow market-based competition to govern where a generic or biosimilar has come to market to compete with a drug or biologic.²²² The Agency’s approach is therefore patently unlawful. “[N]either federal agencies nor the courts can substitute their policy judgments for those of Congress.”²²³ CMS’s effort to do so here is “effectively the introduction of a whole new regime of regulation,” which “is not the one that Congress established.”²²⁴

The Agency’s unlawful standard also necessarily yields an inaccurate determination of when a generic or biosimilar was marketed. The Agency’s reliance on PDE data guarantees that there will be a time lag

²¹⁷ It is unclear, for example, whether CMS expects a generic or biosimilar to capture and maintain a certain percentage of the market.

²²¹ See Initial Guidance at 67.

²²² See, e.g., SSA § 1192(c)(1).

²²³ *Brown & Williamson Tobacco Corp. v. FDA*, 153 F.3d 155, 176 (4th Cir. 1998), *aff’d*, 529 U.S. 120 (2000).

²²⁴ *MCI Telecomms. Corp. v. Am. Tel. & Tel. Co.*, 512 U.S. 218, 114 (1994).

between the actual date of marketing and the date of CMS's determination because it takes time for sales to be reflected in PDE data. Indeed, CMS's long-standing policy requiring Part D plan sponsors to determine whether to add a newly approved drug to their formulary within 180 days of its release onto the market ensures that the PDE data will not accurately reflect when the drug came to market. Many Part D plan sponsors will not add a newly approved drug to their formulary until the 180-day mark, and, thus, the first six months of PDE data following the market entry of the drug will necessarily reflect only very limited uptake.²²⁵ And some plan sponsors may choose not add the drug to their formulary at all. In addition, even where plan sponsors add the drug to their formulary, widespread uptake of a new product does not occur overnight. After a new product is made available for sale, providers and patients typically transition to such product gradually as they become increasingly familiar with its benefits relative to pre-existing alternatives.²²⁶ Such a product is in fact marketed during this uptake period, but CMS's standard ignores this fact and focuses instead on whether the product is adequately utilized, in contravention of the statutorily mandated standard.²²⁷ Such shifts in utilization patterns over time do not mean that the market is not working as intended.

The Agency compounds these concerns with its intent to review PDE data only once per month for purposes of determining when the MFP terminates.²²⁸ The Agency's approach virtually always ensures that there will be a lag between the actual date of marketing and the date of CMS's determination. This poses a significant concern with respect to when the MFP terminates. If there is a lag of even a single day between the actual date of marketing and the date of CMS's determination, a selected drug can be subject to the MFP for a full additional year. For instance, if, on April 1, a generic or biosimilar is in fact marketed on April 1, but CMS's determination of this fact is deferred until April 2, the selected drug is subject to the MFP for a full year longer than if CMS's determination had not been deferred.

It is imperative that CMS abandon its unlawful and ill-advised standard and instead adopt as its standard the "market date" reported under MDRP. The MDRP "market date" standard should be used for identifying *both* the date on which a generic or biosimilar is marketed *and* the date on which CMS determines that a generic or biosimilar has been marketed.

Under MDRP guidance, "market date" is "the earliest date the drug was first marketed under the application number by any labeler."²²⁹ Manufacturers report this date when reporting MDRP pricing

²²⁵ While plan enrollees may access a non-formulary drug via an exceptions process, access may not be immediate under such process; moreover, exception processes typically yield only a very small volume of utilization.

²²⁶ See A. Lubby, Factors affecting the uptake of new medicines: a systematic literature review, 14 BMC Health Services Research 469 (2014) (describing the various factors that affect early uptake of new medicines).

²²⁷ Other examples of deficiencies in CMS's approach include circumstances where low utilization is driven by uncontrollable factors such as supply shortages.

²²⁸ Initial Guidance at 62.

²²⁹ CMS, MDRP Data Guide § 5.15 (Apr. 2022).

data. As such, the MDRP “market date” is a familiar construct to both CMS and manufacturers, and carries the additional benefit of ensuring consistency across MDRP and the Negotiation Program. And, unlike the “date of first sale” used for ASP reporting purposes, the MDRP “market date” is available for generics and biosimilars without regard to whether they are subject to ASP reporting.²³⁰

It is particularly critical that the Agency equate the date on which CMS determines that a generic or biosimilar has been marketed with the MDRP “market date” because, as noted above, the difference of a single day in the date of CMS’s determination can result in the MFP being extended for a full additional year. Failing to do so would have a dramatic chilling effect on the development of generics and biosimilars. Manufacturers would be seriously disincentivized against investing in the development of such products if there is a risk that they would be forced to compete with the MFP for an unduly extended period of time. This, in turn, would defeat Congress’s objective of encouraging the development of generic and biosimilar market competitors.

For all of these reasons, we strongly oppose CMS’s extra-statutory bona fide marketing standard, and strongly urge CMS instead to adopt the MDRP “market date” as a uniform standard for identifying both the date on which a generic or biosimilar is marketed and the date on which CMS determines that a generic or biosimilar has been marketed.

VII. Other Issues

A. Selected Drugs and Inflation Rebates

BIO urges CMS to clarify that selected drugs are not subject to an inflation rebate.

In its Initial Guidance, CMS solicits comment on the application of Part B and Part D inflation rebates to selected drugs.²³¹ Notably, CMS asserts: “The Part B and Part D inflation rebate programs apply to selected drugs, regardless of the status of the drug as a selected drug. Alternatively said, whether a drug is a selected drug will have no bearing as to whether the drug is also subject to the Part B and Part D inflation rebate programs.”²³² This assertion is incorrect. BIO asks CMS to clarify a selected drug is not subject to an inflation rebate.

²³⁰ The “date of first sale” is reported only for products subject to ASP reporting, and thus may not be available for all generics and biosimilars whose marketing is implicated by the Negotiation Program. By contrast, the “market date” reported under MDRP is more broadly reported and is thus the superior metric to use. See CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of Social Security Act, and Solicitation of Comments, (Feb. 9, 2023), <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>.

²³¹ Initial Guidance at 71.

²³² *Id.*

By statute, the Part B inflation rebate calculation is based in relevant part on the amount by which “106 percent of the amount determined under paragraph (4) of [section 1847A(b) of the SSA] for [a part B rebatable drug] during the calendar quarter . . . exceeds . . . the inflation-adjusted payment amount . . . for such part B rebatable drug during the calendar quarter.”²³³

Importantly, the circumstances under which an amount is “determined” under paragraph (4) is dictated by section 1847A(b)(1) (paragraph (1)).²³⁴ Specifically, paragraph (1) dictates a payment amount of, “in the case of a single source drug or biological . . . , 106 percent of the amount determined under paragraph (4) or in the case of such a drug or biological product that is a selected drug . . . , with respect to a price applicability period . . . , 106 percent of the maximum fair price . . . applicable for such drug and a year during such period.”²³⁵

In other words, the payment amount for a selected drug is determined under paragraph (1), and such payment amount is determined without regard to paragraph (4). Rather, it is only the payment amount for a non-selected drug that is determined under paragraph (4).

It necessarily follows that the Part B inflation rebate calculation has no application to a selected drug. With respect to such a drug, there is no amount “determined under paragraph (4),” and therefore Part B inflation rebates have no applicability.

This is not surprising. There is no policy reason for Congress to apply inflation rebates to selected drugs. A manufacturer should not be obligated to pay an inflation rebate on a selected drug because Medicare expenditures on a selected drug are already constrained by the maximum fair price.²³⁶ Thus, with respect to a selected drug, Medicare is shielded from the increase in expenditures occasioned by a price increase that outpaces inflation that an inflation rebate is intended to address. Medicare does not need to be made whole on account of such a price increase, and, thus, no inflation rebate should be due.

For all of these reasons, CMS should clarify that a selected drug is not subject to an inflation rebate.

²³³ SSA § 1847A(i)(3) (emphasis added).

²³⁴ See *id.* § 1847A(b)(1).

²³⁵ *Id.* § 1847A(b)(1)(B) (emphasis added).

²³⁶ *Id.* §§ 1847A(b)(1)(B); 1860D-2(d)(1)(D).

B. MFP and ASP

BIO urges CMS to amend its regulatory definition of “unit” to exclude MFP units from the ASP calculation.

By statute, MFP units are included in Best Price.²³⁷ Sales included in Best Price are also generally included in ASP.²³⁸ Thus, in the ordinary course, MFP units would be included in the ASP calculation. But the inclusion of MFP units in the ASP calculation would have vast and dire consequences for patient access.

The inclusion of MFP units in the ASP calculation would increasingly deflate ASP over time. As a result, ASP-based provider reimbursement would increasingly become inadequate to cover providers’ acquisition costs. Eventually, providers would be left financially underwater if they were to furnish a selected drug to an MFP-ineligible individual, creating a very real risk that providers would no longer furnish such drugs to such individuals. And this vital threat to patient access to necessary medicines would be far-reaching. ASP is a reimbursement benchmark commonly used by non-Part B payers with respect to Part B drugs. As such, although Part B reimbursement for selected drugs will not be based on ASP, this would negatively affect countless individuals insured by non-Part B payers.

Fortunately, CMS has clear legal authority to prevent this. The ASP statute unambiguously confers on CMS broad authority to define “unit” for purposes of the ASP calculation “as . . . [CMS] determines appropriate.”²³⁹ CMS undoubtedly may exercise such authority to exclude MFP units from the ASP calculation to avoid the patient access concern described above.

The legislative history of the ASP statute makes abundantly clear that Congress intended for CMS to exercise such discretion in this way in precisely this sort of circumstance. When Congress delegated CMS the authority to define “unit” for purposes of the ASP calculation, it specifically stated that it was doing so to allow for the exclusion of “those sales that do not reflect market prices” from ASP.²⁴⁰ By definition, MFP units do not reflect market prices.

There is also clear Agency precedent for excluding units that do not reflect market prices from the ASP calculation. In 2005, CMS carved Competitive Acquisition Program (CAP) units out of the ASP exclusion by excluding such units from the “unit” definition.²⁴¹ In doing so, CMS noted that ASP and CAP prices

²³⁷ *Id.* § 1927(c)(1)(C)(ii)(V).

²³⁸ *See id.* § 1847A(c)(2)(A); *see also* 42 C.F.R. § 414.804(a)(1), (4)(i).

²³⁹ SSA § 1847A(b)(2)(B).

²⁴⁰ *See* H.R. Rep. No. 108-391, at 587–88 (2003).

²⁴¹ 70 Fed. Reg. 39,021, 39,077 (Jul. 6, 2005); *see also* 74 Fed. Reg. 61,738, 61,915 (Nov. 25, 2009).

were “intended to be alternatives to each other” and, thus, CAP units should not be included in the ASP calculation.²⁴²

Identical reasoning supports excluding MFP units from the ASP calculation. MFP units do not reflect market prices: Rather, the MFP is a government-set price. Further, the MFP functions as an alternative to ASP: Part B will reimburse providers based on the MFP in lieu of ASP.²⁴³

For all these reasons, sound policy dictates that CMS exclude MFP units of selected drugs from the ASP calculation. BIO urges CMS to do so well in advance of the first IPAY to avoid any confusion and potential destabilization on non-Medicare markets once MFPs go into effect for the first set of selected drugs.

C. Civil Monetary Penalties (CMPs)

BIO urges CMS to proceed with caution on the implementation of CMPs as proposed given the ambitious timelines in the statute and to allow manufacturers a reasonable time period to cure deficiencies before CMPs are imposed. And in no case should the Agency impose a CMP prior to finalization of relevant regulations.

Under the IRA, CMS can impose CMPs on drug manufacturers for the following infractions related to the Part D Drug Negotiation program:

- **Refusing Access to MFP Price:** CMS will impose a CMP of 10 times the amount equal to number of units of drug furnished multiplied by the difference between the price for such drug made available to MFP-eligible entities on a Primary Manufacturer of a selected drug that has entered into an Agreement with CMS and fails to provide access to a price that is less than or equal to the MFP to MFP-eligible individuals dispensed the selected drug to pharmacies, mail order services, or other dispensers with respect to MFP-eligible individuals who are dispensed the selected drug or to hospitals, physicians, or other providers or suppliers that furnish or administer the selected drug to MFP-eligible individuals.
- **Failure to Comply to Requirements:** Any Primary Manufacturer of a selected drug that has entered into an Agreement with that fails to comply with requirements determined by CMS to be necessary for the purposes of administering the Negotiation Program and monitoring

²⁴² 78 Fed. Reg. at 61,915.

²⁴³ SSA § 1847A(b)(1)(B).

compliance with the Negotiation Program will be subject to a CMP of \$1,000,000 for *each day* of such violation.

- **Provision of False Information:** If CMS determines that any manufacturer knowingly provides false information under the procedures to apply the aggregation rule for the Small Biotech Exception, such manufacturer shall be subject to a CMP equal to \$100,000,000 for each item of such false information. Likewise, if CMS determines that any Biosimilar Manufacturer knowingly provides false information under the procedures to apply the aggregation of the Biosimilar Delay, the manufacturer shall be subject to a CMP equal to \$100,000,000 for each item of such false information.

CMS will provide notice to the manufacturer with information regarding the CMP in accordance with section 1128A of the Act, including the option to either pay the CMP or to request a hearing as outlined in section 1128A. The CMP notice will include: Basis for the CMP; CMP amount due; Deadline for the manufacturer to respond with a hearing request or submit the CMP payment; Method to submit CMP payment(s); and Information on the right to request a hearing

The manufacturer will have 60 days from the date of receipt of the CMP notice to request a hearing—If the manufacturer does not request a hearing within 60 days, the CMP will be considered due on day 60 following the date of receipt of the CMP notice.

BIO urges CMS to proceed with caution on the implementation of CMPs as proposed. By any recognition, the time frames in statute for implementation of myriad sweeping changes in multiple parts of the Medicare program are ambitious. To make analogies to another program, BIO reminds CMS that a final rule to impose CMPs on drug manufacturers as part of the 340B program in 2017 was delayed multiple times. Although the 2017 Final Rule was scheduled to take effect on March 6, 2017, HRSA delayed the implementation of the rule multiple times. The Agency ultimately postponed the effective date of the rulemaking until July 1, 2019, to allow for “necessary time to consider more fully the substantial questions of fact, law, and policy identified by the Department during its review of the rule.”

We similarly urge CMS to proceed cautiously with the imposition of CMPs on drug manufacturers and urge all stakeholders to work in good faith to comply with the statutory requirements of data reporting. To this end, we request that CMS send a notice of intent to impose a CMP and a reasonable period to cure the deficiency and/or to dispute the basis for the CMP, before any imposition of a CMP. The IRA imposes a tremendous amount of data reporting on drug manufacturers and puts them at risk for significant financial penalties. It will take time for manufacturers, especially small manufacturers, to comply in good faith with all the necessary data collection requests in the first years of the Negotiation program. And in no case should the Agency impose a CMP prior to finalization of relevant regulations.

D. Negotiation Program Agreement

BIO urges CMS to ensure that the text of the Negotiation Program Agreement is made available for public comment at least sixty days in advance of the first selected drug publication date. Further, CMS should abandon its “Primary Manufacturer” and “Secondary Manufacturer” construct as part of the Agreement as it is impracticable and has no legal basis.

The Initial Guidance states that the Agency will make “reasonable efforts” to make the final text of agreement available to the public before the first selected drug publication date.²⁴⁴ It is imperative that CMS make the text of the agreement available for public comment and do so well in advance of when manufacturers will be required to execute the agreement.

Advance notice of, and an opportunity comment on, the precise content of the Negotiation Program Agreement is vital because manufacturers are subject to CMPs of \$1 million dollars per day for a violation of a terms of the agreement.²⁴⁵ What is more, manufacturers that decline to enter into the Negotiation Program Agreement are subject to punitive excise taxes, such that manufacturers are effectively compelled to enter into the agreement.²⁴⁶ Under these circumstances, it is imperative that CMS provide advance notice of, and an opportunity to comment on, the exact terms of the Negotiation Program Agreement. Manufacturers must be reasonably apprised of the specific obligations to which CMS proposes they be subject, and have reasonable opportunity to comment thereon, when compliance is enforced via such extraordinary sanction.

Advance notice is necessary at a minimum because manufacturers may need lead time to establish new processes in order to be prepared to comply with the terms of the agreement. CMS cannot put manufacturers in the untenable position of being subject to sanction for failing to comply with requirements that they cannot fulfill because the Agency did not supply adequate advance notice. Courts have long recognized that “[i]mpossible requirements imposed by an agency are performe unreasonable” and therefore arbitrary and capricious.²⁴⁷

We also reinforce our earlier comments regarding CMS’s proposal to hold a “Primary Manufacturer” responsible for submitting applicable information concerning a “Secondary Manufacturer.” CMS also proposes, among other things, to require that “Primary Manufacturers” ensure that “Secondary Manufacturers” make the MFP available to MFP-eligible entities individuals and other entities, and CMS would impose CMPs on “Primary Manufacturers” for noncompliance by “Secondary Manufacturers.” We

Washington, DC, 20005
202-962-9200

urge CMS to abandon its proposed requirements under this “Primary Manufacturer” and “Secondary Manufacturer” construct. A Primary Manufacturer has no inherent legal authority to compel a Secondary Manufacturer to act or not act.

E. Patient Access and Part D Plan Formulary Placement

CMS should take steps to protect patient access to needed therapies in all Medicare Part D Plans.

By statute, Part D plans must place selected drugs on their formularies.²⁴⁸ BIO recommends that CMS clarify how it will ensure robust beneficiary access to needed therapies, including selected drugs, and asks CMS to ensure safeguards that allow for diversity across formularies to meet patient needs. CMS should try to minimize class effects from the MFP process that would result in narrower formularies and provide fewer choices to patients. In addition, CMS should monitor plan coverage and tiering design, clinical appropriateness of utilization management policies, cost-sharing levels, and patient out of pocket exposure. BIO encourages CMS to update its oversight of formulary requirements and to re-examine Part D coverage determinations and appeals as well as tiering exceptions.

BIO appreciates this opportunity to provide feedback to CMS on the Initial Guidance. We look forward to continuing to work with the Agency on these important issues. Should you have any questions, please do not hesitate to contact Crystal Kuntz at 202-962-9200 or Ckuntz@bio.org.

Sincerely,

**Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial
Price Applicability Year 2026, and Solicitation of Comments**

Dear Administrator Seshamani:

Boehringer Ingelheim Pharmaceuticals, Inc. (BI) welcomes the opportunity to submit comments in response to the Centers for Medicare & Medicaid Services' (CMS or the Agency) *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for the Initial Price Applicability Year 2026, and Solicitation of Comments* (Guidance).¹ BI adopts and incorporates by reference the comments submitted on the Guidance by the Pharmaceutical Research and Manufacturers of America (PhRMA). We offer the following comments to elaborate and expand on certain issues raised by the Guidance.

BI is a leading research-driven biopharmaceutical company committed to innovation in areas of high unmet medical need. Accordingly, BI has a significant interest in CMS's implementation of the Inflation Reduction Act (IRA). While BI supports the goal of ensuring patient access to affordable, life-enhancing medicines, it has significant concerns relating to aspects of the Guidance, including concerns that it imposes impracticable—even impossible—deadlines and processes.

1. Both the Administrative Procedure Act and the Medicare Statute Require Notice and Comment Rulemaking on All Aspects of the Guidance.

As an initial matter, CMS was required to go through notice and comment rulemaking in issuing the Guidance. Under both the Administrative Procedure Act (APA) and Medicare statute, the legal effect of the Guidance drives whether notice and comment, and other rulemaking requirements, are required. Under the APA, agency action that “purports to impose legally binding obligations or prohibitions on regulated parties—and that would be the basis for an enforcement action for violations of those obligations or requirements” must be promulgated using notice and comment rulemaking.² Under the Medicare Act, notice and comment is required for any “rule, requirement, or other statement of policy . . . that establishes or changes

¹ Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

² *Nat'l Mining Ass'n v. McCarthy*, 758 F.3d 243, 251 (D.C. Cir. 2014).

a substantive legal standard governing the scope of benefits, the payment for services, or the eligibility of individuals, entities, or organizations to furnish or receive services or benefits under [the Medicare statute].”³ The Supreme Court has made clear that the requirement to undergo notice and comment turns on “the contents of the agency’s action, not [its] label.”⁴ Here, the Guidance easily meets either standard, since it purports to impose legally binding obligations on manufacturers, with noncompliance triggering civil monetary penalties (CMPs) and excise taxes.

The IRA’s references to “guidance” and “program instruction” do not displace these notice and comment requirements.⁵ If Congress wishes to supplant such requirements, it must do so expressly. For example, courts have looked to whether the operative statute “present[s] a specific directive to adopt procedures other than those of the APA” or expressly exempts agency action from the APA.⁶ The IRA does neither. Indeed, the IRA does not say that “guidance” or “program instructions” may be issued notwithstanding any other provision of law. “[W]hen two statutes are capable of co-existence, it is the duty of the courts, absent a clearly expressed congressional intention to the contrary, to regard each as effective.”⁷ Accordingly, CMS has erred by not proceeding via notice and comment rulemaking under the APA and Social Security Act and by dispensing with the safeguards those Acts provide.

CMS’s failing is particularly acute with respect to section 30 on “Identification of Selected Drugs for Initial Price Applicability Year 2026,” which CMS has issued as immediately effective. Not only has that section been issued as final, but CMS has declined, without any adequate explanation, to take comment on that section. Thus, manufacturers have not had, and will never have, an opportunity to be heard before CMS regarding CMS’s position on critical issues with respect to how drugs and biological products will be selected for IPAY 2026. These issues include, but are not limited to:

- CMS’s position that it will identify a “qualifying single source drug” (QSSD) eligible for negotiation by aggregating drugs by active moiety and biological products by active ingredient, inclusive of products that are marketed under different New Drug Applications (NDAs)/Biologics License Applications (BLAs) held by the same company;
- CMS’s position that it will consider a generic drug or biosimilar biological product to be marketed when prescription drug event (PDE) data reveals that the manufacturer has engaged in so-called “bona fide” marketing, despite the fact that the statute lacks the “bona fide” limitation and this position conflicts with the plain meaning of “marketed”;
- CMS’s apparent intent to exclude from the orphan drug exclusion active moieties or ingredients with more than one orphan designation or approved indication outside the designation across the sponsor’s NDAs or BLAs;
- CMS’s narrow view of plasma-derived products that are exempt from the QSSD definition; and

⁷ *Maine Cmty. Health Options v. United States*, 140 S. Ct. 1308, 1323 (2020).

- CMS's position that that ongoing litigation does not "count" to establish a high likelihood of biosimilar market entry, even in the context of a planned at-risk launch; and
- CMS's imposition of deadlines surrounding the biosimilar "pause."

Had CMS provided an opportunity for comment, BI would have commented on these and other issues presented by section 30.

For the same reasons given above, the decision to issue section 30 without going through notice and comment rulemaking is erroneous. Furthermore, CMS has not shown "good cause" to dispense with notice and comment as to section 30.⁸ CMS relies on the statutory deadlines to say notice and comment would be "impracticable."⁹ However, "[s]tatutory language imposing strict deadlines, standing alone, does not constitute sufficient good cause."¹⁰ Moreover, "[g]ood cause cannot arise as a result of the agency's own delay."¹¹ CMS waited nearly seven months following enactment of the IRA to publish Guidance. CMS is also mistaken that notice and comment would be "contrary to the public interest" and "unnecessary."¹² Instead, the public interest weighs heavily in favor of the opportunity to comment and participate on implementation of sections 1101 and 1102 of the IRA, which create a new program that will affect incentives for research and development of new medicines and uses thereof as well as patient access to needed therapies. And the Guidance is anything but "a routine determination, insignificant in nature and impact, and inconsequential to the industry and to the public."¹³ Finally, the complete lack of any notice and comment opportunity raises serious concerns under the Due Process Clause of the Fifth Amendment to the Constitution.

2. CMS's proposed plan to protect confidential manufacturer information does not adequately protect such information (section 40.2.1).

CMS's reliance on Exemption 4 of the Freedom of Information Act (FOIA) to protect confidential manufacturer information is insufficient to achieve the statutory goal to protect sensitive, proprietary information. In the Guidance, CMS states that it "intends to implement a confidentiality policy that is consistent with existing requirements for protecting proprietary information, such as Exemption 4 of FOIA."¹⁴ Yet CMS's focus on information falling within Exemption 4 of FOIA is not rooted in the statute. The IRA goes beyond Exemption 4. The IRA provides that "[i]nformation submitted to [CMS] under this part by a manufacturer of a selected drug that is proprietary information of such manufacturer (as determined by the Secretary) shall be used only by [CMS] or disclosed to and used by the Comptroller General of the United States for purposes of carrying out this part."¹⁵ Thus, CMS should clarify that any "proprietary

⁸ 5 U.S.C. § 553(b)(3)(B); *see also* 42 U.S.C. § 1395hh(b)(2)(C) (incorporating the APA's good cause exception). The Guidance only invokes the good cause exception with respect to section 30. Any attempt to invoke the good cause exception for other aspects of the Guidance would be untenable, given that CMS is in fact taking comment on them.

information” of a manufacturer shall be disclosed to or exclusively used by CMS or the Comptroller General *only* for IRA purposes, and not used or disclosed for any other reason, regardless of whether the requirements of FOIA Exemption 4 (or any other FOIA exemption) are satisfied.

3. CMS should reconsider some of the proposed data use provisions to increase transparency and cooperation with manufacturers (section 40.2.2).

The data use limitations CMS seeks to impose on manufacturers in the program undermine transparency and pose practical challenges for manufacturers. In the Guidance, CMS contends that manufacturers will not be permitted to “disclose to the public any information in the initial offer or any subsequent offer by CMS, the ceiling price contained in any offer, or any information contained in any concise justification provided with an offer.”¹⁶ CMS asserts that restrictions on disclosure of negotiation information are “in furtherance of the statutory instruction that CMS develop a process that aims to achieve the lowest MFP for each selected drug.”¹⁷ The Guidance, however, does not explain how these restrictions would achieve this goal. To the contrary, such a lack of transparency undermines public confidence in the negotiation process. While CMS would permit the disclosure of negotiation information “as may be required by applicable state or federal law,”¹⁸ there are instances where manufacturers will have important business reasons to share such information (e.g., during certain partnership or licensing negotiations). CMS should abandon this proposed restriction.

According to the Guidance, CMS will require manufacturers to destroy “all information the Primary Manufacturer receives during the negotiation period from CMS . . . within 30 days of a determination by CMS that the drug or biologic no longer qualifies as a selected drug.”¹⁹ This requirement is not justified. In the Guidance, CMS asserts that “these policies will increase the chances of effective and successful negotiation in furtherance of the statutory instruction that CMS develop a process that aims to achieve the lowest MFP for each selected drug.”²⁰ Yet, to support this requirement, CMS points to statutory language that “the manufacturer complies with requirements determined by the Secretary to be necessary for purposes of administering the program and monitoring compliance with the program.”²¹ The Guidance does not explain why or how the destruction of negotiation data potentially years after an MFP has gone into effect is “necessary” to administer the program. Accordingly, we urge CMS to withdraw this provision of the Guidance.

Moreover, the Guidance does not address the challenges and costs of complying with these requirements. To comply with contractual obligations to Secondary Manufacturers, Primary Manufacturers may have to share certain data elements. Furthermore, particularly in the early years of the program, manufacturers may need to share information with various external partners, such as consultants, and a wide array of stakeholders within the company to effectively carry out negotiations with CMS. To facilitate the deletion of all information within 30 days, manufacturers may be required to set up costly data rooms or restrict the parties involved in the

¹⁶ Guidance, at 30.

¹⁷ *Id.*

¹⁸ *Id.*

¹⁹ *Id.*

²⁰ *Id.*

²¹ SSA § 1193(a)(5).

negotiation program to a detrimental extent. BI urges CMS to remove the 30-day deadline to destroy information. At the very least, we encourage CMS to create a process where manufacturers can petition for extensions when necessary.

4. CMS should commit to collaborating with manufacturers to provide the MFP to eligible individuals (section 40.4).

The onerous requirements CMS seeks to impose on manufacturers to ensure they are providing the MFP to eligible individuals are unjustified and unworkable. In section 40.4, CMS states that it intends to “require that Primary Manufacturers provide access to the MFP in one of two ways: (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP.” CMS has stated that manufacturers must ensure that dispensing entities “are reimbursed timely for the full amount of the difference between their acquisition cost for the selected drug and the MFP within 14 days.” Finally, CMS will also require a manufacturer “to submit its process for making the MFP available for the selected drug in writing to CMS at least 30 days before the start of the [IPAY].”

These methods and timelines are unnecessary and exceed CMS’s statutory authority. Section 1193 instructs CMS to “determine (and, by not later than the last date of such period, agree to) a maximum fair price for such selected drug of the manufacturer in order for the manufacturer to provide access to such price” to MFP eligible individuals. Nowhere does the statute prescribe *how* manufacturers must provide access to the MFP. We therefore recommend that CMS require that manufacturers provide access to the MFP—not dictate the specific methods for doing so. If manufacturers fail to provide the MFP to eligible individuals, the statute calls for the imposition of civil monetary penalties. These penalties—equal to ten times the difference between the price made available to eligible individuals and the MFP per unit sold—are sufficient deterrents to prevent manufacturers from withholding the MFP. At a minimum, the proposed deadlines are impracticable and manufacturers should be provided at least 90 days to provide reimbursement.

There will be significant challenges associated with verifying the eligibility of patients who are dispensed selected drugs. Since only Medicare beneficiaries are MFP eligible individuals, manufacturers will need a process to verify that they, and only they, receive selected drugs at the MFP. This process is of even greater concern for 340B covered entities who typically provide the 340B ceiling price to any patient. Manufacturers will need to validate that 340B entities are only providing the MFP to eligible individuals. Allowing manufacturers flexibility to verify claims and provide access to the MFP to eligible individuals—particularly in the first few years of the program—would benefit all parties. Thus, CMS should not require particular methods or timelines for providing access to the MFP. Instead, CMS should adopt a collaborative posture and work together with manufacturers to deliver the MFP to eligible patients and dispensers.

5. CMS should reconsider which patents and exclusivities it intends to analyze and how these mechanisms will impact the MFP (section 60.3.4 and Appendix C).

CMS’s approach to considering pending and approved patent applications and exclusivities will stifle innovation and, in some cases, exceeds the Agency’s statutory authority. The Guidance states that “CMS intends to consider the length of the available patents and exclusivities before the selected drug may no longer be single source. For example, if the selected drug has patents

and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward.”²² Using the existence of patents and exclusivities to drive down the preliminary price is inconsistent with the purposes of these mechanisms, which are intended to incentivize and reward development of innovative medicines. In other words, the existence of these protections signals that the therapy is novel, which should counsel in favor of a higher, not lower, MFP. In addition, penalizing a product for remaining patents would deprive manufacturers of part of their value. Because patents are valuable property, and CMS appears to be intentionally considering reducing the value of that property by proposing an inverse relationship between MFP and remaining patent life, CMS’s action may constitute a taking requiring just compensation under the Fifth Amendment’s Takings Clause.²³ CMS should therefore commit not to lower the MFP of a drug due to remaining patent protections or exclusivities.

Moreover, although the statute directs CMS to consider “[d]ata on pending and approved patent applications . . . for the drug,” CMS suggests it will consider a broader swath of patents, e.g., using terminology such as “patents linked to the selected drug where the Primary Manufacturer is not listed as the assignee/applicant.”²⁴ This approach is inconsistent with the statute which, under the heading of “manufacturer-specific data” includes information on “pending and approved patent applications.”²⁵ By expanding its analysis of patents beyond the manufacturer, CMS exceeds its statutory authority. Accordingly, CMS should only examine patents specific to the manufacturer of the selected drug.

6. CMS should not use the price of therapeutic alternatives as the starting point for its initial offer analysis (section 60.3).

Elements of CMS’s method for developing an initial MFP offer are in tension with the text of the statute. Section 1194(b)(1) encourages CMS to “achieve the lowest maximum fair price for each selected drug.” To accomplish this goal, CMS must consider negotiation factors including “the extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.”²⁶ The cost of therapeutic alternatives is, therefore, intended to be a *factor* in the developing the MFP. Yet, CMS grants this one factor an outsized role in the Guidance by stating that the Agency will use Part D net price(s) and/or the Part B ASP of therapeutic alternatives “to determine a starting point for developing an initial offer.”²⁷

The cost of therapeutic alternatives is not a suitable starting point for developing MFP offers. First, this methodology does not comport with the structure of the statute. The statute requires CMS to consider two sets of factors—(1) manufacturer-specific data, and (2) evidence relating to alternative treatments. All enumerated factors should be considered together when setting the MFP. Here, however, CMS is giving one part of one factor—the cost of therapeutic alternatives—outsized influence. We acknowledge that CMS has committed to “adjusting the starting point

²² Guidance, at 53.

²⁴ Guidance, at 88.

²⁵ SSA § 1194(e)(1).

²⁶ *Id.* § 1194(e)(2)(A).

²⁷ Guidance, at 47. If a therapeutic alternative is unavailable, CMS intends to base the initial offer on the Federal Supply Schedule or “Big Four Agency” Price. *Id.*

using the negotiation factors.”²⁸ Nevertheless, the statute requires CMS to consider all factors rather than overweighting one factor and merely “adjusting” the MFP based on an analysis of the others.

Furthermore, such a method does not account for the unique clinical attributes that an individual product might have. Rather than considering each product’s risks and benefits, it bluntly collapses them into categories. It also fails to consider the unique pricing strategies of different products. For example, a recently launched product may provide steep rebates to gain market share in its first few years on the market. Starting the initial offer analysis from this arbitrarily low price would not be a true reflection of the cost of alternatives during the period the selected drug is subject to the MFP.

Instead of using the price of therapeutic alternatives as the default starting point, CMS should develop its initial offer based on the statutorily mandated MFP ceiling. From that point, CMS can conduct a holistic examination of all the relevant negotiation factors that preserves the public health and rewards novel innovations.

7. CMS should adopt a more expansive definition of research and development (R&D) costs (section 60.3.4 and Appendix C).

CMS should consider a wide variety of manufacturer-specific data during the negotiation process. As noted, section 1194(e)(1) requires CMS to consider factors including “[R&D] costs of the manufacturer for the drug and the extent to which the manufacturer has recouped [R&D] costs.” To calculate R&D costs, CMS intends to “compare the [R&D] costs and the global, net revenue reported by the Primary Manufacturer.”²⁹ In Appendix C of the Guidance, CMS explains that it will examine all costs “incurred by the Primary Manufacturer for all FDA-approved indications of a drug.”³⁰ Other R&D costs, such as certain trials, are also limited to those conducted specifically for FDA approval.

Comparing R&D costs directly attributable to FDA-approved indications with global revenue is imprecise, and unduly prejudicial to manufacturers, because it results in an apples-to-oranges comparison. For example, global revenue may take into account indications or presentations of an active ingredient that are not approved by FDA and were supported by separate (including regional) clinical studies. These revenues would “count” under CMS’s approach, whereas the R&D costs needed to generate the supportive data would not, because the relevant approval would not be from FDA. This calculation of R&D costs thus is inaccurate and would always prejudice the manufacturers. CMS should instead adopt a methodology that compares R&D costs and revenues on an appropriate, apples-to-apples basis.

In addition, CMS’s definition of R&D costs for abandoned or failed products is overly restrictive. According to the Guidance, CMS will only consider R&D costs for abandoned and failed products “with the same active moiety / active ingredient or mechanism of action as the selected drug that did not make it to clinical trials.”³¹ This method of accounting for R&D costs does not comport with pharmaceutical industry standards. Rather than looking at costs across active moieties or active ingredients, investments are typically calculated for the particular disease

²⁸ *Id.*

²⁹ Guidance, at 52.

³⁰ *Id.* at 82.

³¹ *Id.* at 84.

state. We therefore encourage CMS to broaden the scope of failed or abandoned drug costs to include all investments in the relevant disease state.

At minimum, if CMS refuses to expand its definition of R&D, the Agency should clearly note its method of calculation in all publications related to specific selected drugs. In particular, CMS should clearly define the various inputs examined in its published explanation for the MFP. In the Guidance, CMS notes that these published explanations may contain “high-level comments about the data submitted to CMS, without sharing any proprietary information,” such as saying that the “manufacturer has recouped its R&D costs.”³² Since CMS’s definition of R&D differs from the industry standard, particularly with respect to calculating abandoned or failed products, we urge CMS to dispel any confusion by publicly stating its definitions of key concepts and noting they may differ from other established ways of calculating R&D recoupment.

8. Monitoring of bona fide marketing after a product has exited the Program is unnecessary (section 90).

CMS’s plan to monitor the bona fide marketing of generics and biosimilars *after* the Agency has determined that such competition exists exceeds statutory authority, and this Guidance content should be deleted. In section 90.4, CMS states that it “intends to monitor whether robust and meaningful competition exists in the market *once it makes such a determination* [that a generic or biosimilar has been approved and marketed].”³³ To carry out this goal, CMS explains that it may examine the availability of the product in the “pharmaceutical supply chain” or the “share of generic drug or biosimilar biological product units identified in Part D PDE data.”³⁴

The purpose of this continued monitoring is unclear. The text of the statute clarifies that a product “shall be referred to as a ‘selected drug’ with respect to such year and each subsequent year beginning before the first year that begins at least 9 months after the date on which the Secretary determines at least one drug or biological product . . . is approved or licensed . . . [and] in marketed pursuant to such approval or licensure.”³⁵ The “determination” that a generic or biosimilar is “approved or licensed” and “marketed pursuant to such approval or licensure” is made at a particular time point, not on a continuous basis. If a generic or biosimilar meets those criteria, the innovator product is removed from the selected drug list. The statute does not contemplate a claw back procedure or continual reassessment of whether the exit criteria are met. Accordingly, CMS’s decision to monitor compliance is puzzling. Given the statute’s provision that the determination is binary, further monitoring beyond the determination serves little purpose. To the extent CMS implies that it can re-list a drug that has been removed, on the basis that “bona fide marketing” has ceased, the statute does not contain any authority for such action. Accordingly, this monitoring serves no practical purpose.

Beyond the evident problems associated with CMS purporting to play the role of a competition authority, such monitoring is both excessive and unauthorized. BI therefore recommends that CMS abandon any plans to monitor the ongoing marketing of generics or biosimilars.

³² *Id.* at 85.

³³ *Id.* (emphasis added).

³⁴ *Id.* at 67-68.

³⁵ SSA § 1192(c)(1).

9. CMS must ensure that selected drugs are not disfavored by Part D plan sponsors (section 110).

As written, section 110 creates perverse incentives for Part D plan sponsors that could undermine the very purpose of the Program. Currently, the Guidance requires that Part D formularies “include each covered Part D drug that is a selected drug . . . during the Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect.”³⁶ This requirement does not go far enough.

Mere inclusion is insufficient to ensure that CMS and Medicare beneficiaries reap the full rewards of the MFP. Certain Part D products that may be selected by CMS for the first round of negotiation treat tens of millions of Medicare beneficiaries with chronic conditions such as heart disease and diabetes. If CMS only requires inclusion of selected drugs on Part D drug plans, plan sponsors would have free rein to disfavor selected drugs by placing them on less favorable formulary tiers or through burdensome utilization management that goes beyond normal safety requirements. As a result, patients may find that out-of-pocket costs for their prescriptions have increased. Despite receiving clinical benefit from and having familiarity with their current medications, some patients may be forced to change products. Many Medicare patients may take multiple products subjected to negotiation which would compound the disruption.

CMS would also be negatively affected by the unfavorable tiering of selected drugs. If Medicare beneficiaries switch to alternative treatments, CMS would be deprived of the savings the IRA was designed to capture. In addition, allowing Part D plans to disfavor selected drugs may complicate the negotiation process, because manufacturers will be unaware of the kinds of rebates they will be able to provide to plan sponsors.

To remedy this problem, CMS should require that Part D plans not penalize selected drugs compared to non-selected drugs in the same therapeutic class. In other words, Part D plan sponsors should be required to provide selected drugs parity with similar non-selected drugs. Parity can be achieved if CMS requires that Part D plans cover selected drugs (1) on the most favorable formulary tier afforded any brand name product in the therapeutic class and (2) without overly burdensome utilization management.

10. The Guidance Fails to Mitigate Constitutional Defects in the IRA and Raises New Constitutional Concerns.

Sections 1101 and 1102 of the IRA raise serious constitutional concerns that are not mitigated (and in some instances are compounded) in the Guidance. As an initial matter, as discussed above, the drug pricing provisions of the IRA raise issues under the Takings Clause of the Fifth Amendment.³⁷ The Supreme Court has recognized that patents are property protected by the Fifth Amendment³⁸ and that government regulation can constitute a taking when it substantially reduces the value of the private property.³⁹ Where the Guidance goes beyond what the statute requires—such as by compelling Secondary Manufacturers to provide Primary Manufacturers with proprietary information—it compounds these takings concerns.

³⁶ Guidance, at 70.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Boundless Bio, Inc. appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance) (collectively referred to herein as, the Negotiation Program).

Boundless Bio is a private biotechnology company founded in 2018 out of innovations in cancer research deepening the understanding of unique cellular structures called extra-chromosomal DNA, or ecDNA, and the role ecDNA plays in driving some of the most aggressive and difficult to treat cancers, oncogene amplified cancers. Like many other diseases, the aging population served by Medicare is also hugely impacted by cancers driven by oncogene amplification. Boundless Bio is committed to applying its deep understanding of ecDNA biology to deliver transformative therapies to these patients.

At Boundless Bio, we are just celebrating the news that our first investigative new drug application (IND) was accepted by the US Food and Drug Administration (FDA) and we are able to bring forward our first ecDNA directed investigational drug (ecDTx) in a human clinical trial

this year; however this excitement is also dampened by our concern that we will be unable to raise enough capital to successfully bring this drug, and other ecDTx in our pipeline, through the development process. The implementation of Section 30.1 of the Negotiation Program will apply government price controls to small molecule drugs like ours within 9 years of launch (v. 13 for biologics), which will disincentivize investments in small molecule programs like ours in favor of biologics.

We recognize that CMS has stated that its guidance on Section 30 is final and it is not seeking or accepting comments on this Section. We are highly concerned by this action given the significance of the topics included in Section 30. Respectfully recognizing that CMS is *not* permitting comments on Section 30, we submit our comments here in the context of what we *would have submitted* had comments on Section 30 been permitted.

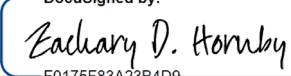

Essentially, it is a very simple story. We are working on the cutting edge of cancer science in a new area of biology, ecDNA, to develop safe and effective medicines to treat very aggressive types of cancer in patients who do not have other effective treatment options and are consigned to an extremely poor survival prognosis. Our ecDTx are orally administered small molecules, which bring many benefits to patients who may be treated at home with a pill and avoid the stress of traveling to outpatient centers and the added cost and discomfort of undergoing infusion procedures to receive their medicine. If our ecDTx drugs, solely due to their status as small molecules, are to be given four years less time on the market than biologics before negotiated prices are applied, Boundless Bio may be unable to continue to attract enough funding to complete development. Research and development funding dollars will be diverted to biologics, which the new rules now afford a greater period of time for market-based pricing. We expect that funding to enable important scientific advances in small molecule cancer treatment, like ours, will simply dry up.

We respectfully request that government price controls for small molecules begin at 13 years, the same time at which government price controls are applied to large molecules. This will remove incentives that will skew research and development funding away from important small molecule drug development innovations, like ours, and allow treatments for patients to be brought forward without arbitrary bias toward large molecules.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact us by e-mail at legal@boundlessbio.com or by telephone at (858) 766-9912 if you have any questions regarding our comments.

Regards,

April 14, 2023

Meena Seshamani, M.D., Ph.D.
CMS Deputy Administrator, Director of the Center for Medicare
Centers for Medicare & Medicaid Services
200 Independence Avenue SW
Washington, DC 20201

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Seshamani,

Bristol Myers Squibb (BMS) appreciates the opportunity to comment on the Centers for Medicare & Medicaid Services (CMS) *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026* (“Guidance”).¹

At BMS, we are inspired by a single vision—transforming patients’ lives through science. We are in the business of breakthroughs—the kind that transform patients’ lives through lifesaving, innovative medicines. Our talented employees come to work every day dedicated to the mission of discovering, developing, and delivering innovative medicines that help patients prevail over serious diseases. We combine the agility of a biotech with the reach and resources of an established pharmaceutical company to create a global leading biopharma company. In oncology, hematology, immunology, and cardiovascular disease—with one of the most diverse and promising pipelines in the industry—we focus on innovations that drive meaningful change.

BMS supports Medicare policies that promote beneficiary access to new and effective medical treatments and help ensure Medicare patients benefit from the innovation that defines the U.S. health care system. That is why we do not support the Medicare “negotiation” and price setting policies contained in the *Inflation Reduction Act (IRA)*. We are extremely concerned by the impact that these policies will have on clinical research and future innovation for patients. BMS believes that, in the absence of full repeal of the IRA’s drug pricing provisions, significant clarity and reforms are necessary in several critical areas.

It is essential for CMS to promote and allow for full transparency and input on IRA implementation. BMS opposes the Agency’s purported “final” Guidance on product scope and selection, in substance and process. As explained below, CMS’ approach in this matter is disappointing, inappropriate, and unlawful, as CMS is using the Guidance to impose new

¹ CMS, “Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments” (March 15, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

substantive requirements on manufacturers and otherwise go beyond the statute and constitutional requirements. The Agency must seek public input on a matter of such public impact and importance, and where private rights are at stake. There is also an overriding constitutional requirement for robust and meaningful engagement on CMS' proposals regarding fundamental issues that have been apparent since the IRA's enactment in August 2022.

BMS appreciates the opportunity to provide the following comments on the Guidance. We intend our input to help CMS improve transparency and clarity of the IRA's price setting program. Our recommendations reflect and are driven by our deep expertise in pharmaceutical innovation, and we offer them to help mitigate against the unintended and negative consequences the Guidance would have on innovation and, most importantly, patients.

Key comments include:

- **Product Scope and Selection:** BMS disagrees with CMS' decision to issue Section 30, Identification of Selected Drugs for Initial Price Applicability Year 2026, as "final." CMS has yet to make any determinations of qualifying single source drugs (QSSDs), which will occur with the first published QSSD selections. In the Guidance, however, CMS is seeking to redefine what qualifies as a QSSD in a way that disregards statutory commands. The Guidance also seeks to impose new substantive obligations without undertaking notice-and-comment rulemaking required by due process. Even beyond those critical legal concerns, given the importance of product scope for eventual selection and price setting, as well as the downstream negative implications to innovation and patient access for years beyond 2026, we urge CMS to meaningfully consider, and respond to, stakeholder feedback on these important topics. (*Section 30*)
- **Price Setting Methodology:**
 - Negotiation Factors and Data Elements: BMS is pleased that CMS is proposing to consider an array of evidence submitted by manufacturers on the selected drug, as well as pertinent evidence submitted by the public on therapeutic alternatives. However, we are deeply concerned by the stringent evidence submission limits and the lack of transparency regarding CMS' process for considering comparative effectiveness evidence and other manufacturer data to inform a Maximum Fair Price (MFP). We appreciate the opportunity to comment on and reiterate the importance of considering a broad perspective when conducting value assessments and urge the Agency to place an emphasis on patient-centric benefits when setting the price. (*Sections 50, 60, and Appendix C*)
 - Establishment of a Single MFP: BMS understands CMS' desire to convert utilization across a medication's dosage forms and strengths into a consistent 30-day equivalent supply. BMS believes the methodology that CMS has proposed, with adequate adjustment to ensure alignment with statutory language, could accomplish the necessary goal of establishing a single MFP. In any event, BMS strongly urges CMS to consult manufacturers of selected drugs on the methodology to be used for determining the MFP for a selected drug. (*Section 60.1*)
 - MFP Calculation: BMS is concerned that the descriptions of the MFP calculations lack sufficient clarity and introduce certain ambiguities that may make it challenging for manufacturers to follow the methodology and accurately replicate calculations for selected products. Notably, CMS proposes to apply the MFP ceiling twice: a first time at the drug level, and a second time at the dosage form or strength level. CMS should not—and, indeed, may not under the statute, as explained below—finalize this proposal. (*Sections 60.2 & 60.5*)
 - MFP Offer Amount: BMS is concerned that CMS' proposed process by which the Agency will determine an offer will de-value pharmaceutical advancements that are currently on the market and result in even greater chilling effects on future innovation. To preserve patient access to lifesaving and quality enhancing medicines, BMS urges CMS to carefully consider situations where a selected drug should be paid fairly at the maximum price. (*Section 60.2*)

- Developing an Initial Offer: BMS strongly objects to the use of the Federal Supply Schedule (FSS) or Big 4 price as a reference point for the initial offer. By also referring to final FSS and Big 4 prices, CMS would be capturing complexities of those calculations that should not apply to IRA price setting. Reference to FSS and Big 4 prices could have the unintended consequence of reducing or eliminating manufacturers' voluntary discounts that lead to lower prices for those government channels. Further, such pricing may be inherently short-term and thus would serve as an inappropriate benchmark for setting a longer-term price. *(Section 60.3.2)*
- **Negotiation Process**: BMS believes that it is essential for CMS to develop and finalize a process for determination of an MFP that is open and transparent, so that stakeholders can reasonably predict how the determination of an MFP will operate in practice. We note that it is *especially* important that CMS be fully transparent regarding the negotiation and renegotiation methodology and process. BMS appreciates CMS sharing initial high-level thoughts in the Guidance, but we believe that additional details are needed, with an opportunity for stakeholders to have full visibility into the methodology and process, as well as the opportunity to provide comment on such forthcoming details to better inform the parameters. *(Section 60)*
 - Initial Offer and Justification: It is critical for manufacturers to have a full understanding of the context and basis for the MFP offer. To increase transparency and further CMS' two-way dialogue with a manufacturer of a selected drug, we urge the Agency to consider releasing a confidential report to the manufacturer alone, alongside the initial offer and justification, to better inform manufacturer counteroffers and subsequent data submissions. *(Sections 60.3 & 60.4)*
 - Negotiation Process After Counteroffer: BMS has serious concerns with CMS' process for interfacing with manufacturers of selected drugs. While we agree with CMS that meetings after any rejection of a manufacturer's counteroffer are necessary and will allow for a more efficient and effective process, initiating meetings with manufacturers only after such rejection is too late. There must be meaningful engagement throughout CMS' process. In our vast experience with negotiating with states and payers, the proposed process would be highly unusual and arbitrary, and would not even approximate a proper negotiation—which, for instance, does not feature limitation on engagement between parties, in contrast with CMS' contemplated limitation to three meetings. *(Section 60.4.3)*
 - Confidentiality: BMS agrees with CMS that the Agency should ensure that confidential commercial information submitted by manufacturers during the negotiation process is protected from disclosure. We believe it is imperative that CMS ensure adequate safeguards to protect manufacturers' trade secret, proprietary, and other confidential commercial information from disclosure, including the opportunity for manufacturers to receive notice of potential disclosure and the opportunity to object to such disclosure. BMS also asks CMS to carefully consider how the Agency intends to keep confidential commercial information confidential within the Agency itself. *(Section 40.2.1)*
- **Effectuating Access to the MFP**: BMS supports efforts to lower patient out-of-pocket costs and appreciates the complexity of providing discounts to Medicare patients at the point-of-sale. To help mitigate operationalization issues, BMS strongly asserts that additional data safeguards are necessary, regardless of the MFP discount effectuation option, to ensure a transparent and administratively efficient operationalization of MFP access (inclusive of ensuring that appropriate patients are gaining access to the MFP). It is critical for stakeholders, including CMS, to have the right information at the right time to ensure compliance. This is especially essential given the lack of a dispute resolution process set forth in the Guidance. *(Section 40.2.2)*
 - 340B Non-Duplication: BMS appreciates the opportunity to comment on 340B non-duplication. CMS needs to provide clarity on how the Agency intends to operationalize this non-duplication provision of the IRA, as the Guidance does not provide adequate specificity to effectuate this provision. *(Section 40.4.1)*

- Diversion and “Spillover”: The statute requires that the MFP the government sets should be accessible to ***MFP-eligible beneficiaries only***. BMS is highly concerned with diversion and appropriation of the MFP beyond the intended Medicare market (*i.e.*, “spillover”) and supports efforts by the Agency to help ensure that the MFP goes only to the beneficiaries for whom the MFP is calculated and intended.
- **Other Considerations:**
 - Transparency and Record Preservation: BMS opposes CMS’ proposals to restrain manufacturer speech in relation to information acquired during the price setting process, including the Agency’s proposal to mandate destruction of manufacturer property under certain circumstances. The proposals violate the First Amendment and run contrary to principles of fairness, transparency, and accountability. (*Section 40.2.2*)
 - Civil Monetary Penalties (CMPs): Especially given the unparalleled magnitude of contemplated CMPs in the novel IRA framework, BMS advocates for CMS to implement strong, special safeguards to protect against erroneous and inappropriate CMP application. Among other things, CMS should provide notice of any perceived deficiency that could result in CMPs and provide at least 30 days to cure any such deficiency. CMS should offer the opportunity for manufacturers to dispute CMS’ findings prior to imposition of CMPs.
 - Dispute Resolution Process: BMS is disappointed that the Guidance does not appear to contemplate a dispute resolution process. BMS strongly believes that the statute’s limitation on administrative and judicial review does not prohibit CMS from establishing a dispute resolution process, and furthermore, there is strong policy and operational rationale for doing so.
 - Part D Formulary Access: While BMS agrees with CMS that Part D formularies must cover a selected drug for which an MFP is in effect, we note that it is critical for health plans to design formularies in ways that promote beneficiary access to all medicines, both MFP and non-MFP medicines. We are disappointed that CMS did not propose additional beneficiary safeguards, in light of longstanding issues of beneficiary access related to certain practices by plans and pharmacy benefit managers (PBMs), and we ask CMS to convey to plans the necessary expectation that they do not engage in measures to disadvantage selected drugs. (*Section 110*)

BMS also generally supports the comments written by the Pharmaceutical Research and Manufacturers of America (PhRMA) and the Biotechnology Innovation Organization (BIO), though we present our BMS-specific views below.

Section 10 – Introduction

BMS disagrees with CMS’ decision to issue Section 30 as “final,” without solicitation of, and opportunity for, public comment. We appreciate the complexity and operationalization that CMS must undertake prior to implementing the goals of the IRA. But anticipated operational challenges do not preclude opportunity and need for public input on critical and fundamental aspects of IRA implementation. The Agency must carefully consider key matters of product scope and selection to help alleviate patient access risks related to the nation’s most relied-upon medicines. Matters such as how to identify a distinct “product” under the statutory framework have been apparent for over half a year. The Agency could have long sought public input on product scope and selection, either in a previously released guidance or in this Guidance. And the Agency should have done so, rather than promulgating as “final” far-reaching Guidance that imposes new substantive obligations, does not reflect the statutory framework, and risks causing a host of concerns—above all, raising further barriers to Medicare beneficiary access to innovative medicines.

The IRA will have vast ramifications for patients, providers, manufacturers, and other stakeholders across the country. BMS is concerned that misinformed, misguided, or unlawful implementation could have sweeping negative

repercussions with respect to Medicare beneficiary access to needed medicines, and, indeed, for *all* patients. It is vital for CMS to make every effort to maximize transparency and fairness, including meaningful consideration of and response to stakeholder feedback on its proposals, and staying within the bounds of statutory and constitutional requirements.

We therefore urge CMS to solicit and consider fully all stakeholder feedback on Section 30 for the initial price applicability year (IPAY) and future years, despite the policies contained in that section being stated in the Guidance as “final.” Further, we urge CMS to continue engaging the public on these critical issues, including through a distinct round of notice-and-comment rulemaking following this Guidance, given the deprivation of comment opportunity and the lengthy amount of time before product selections are published half a year from now.

CMS notes that “this [G]uidance is not subject to the notice-and-comment requirement of the Administrative Procedure Act or the Medicare statute... [and] that notice and public procedure on this [G]uidance would be impracticable, unnecessary, and contrary to the public interest....”² BMS questions CMS’ conclusion as to notice-and-comment requirements, and otherwise strongly disagrees that notice-and-comment is impracticable, unnecessary, and contrary to the public interest. Public input on matters of such public importance is inherently in the public interest—while avoiding public input, as the Agency seems to be doing in its “final” Guidance, is contrary to the public interest, and also compromises private rights that are at stake. Especially given its novel proposals on product scope and selection (many of which conflict with statutory language and practical considerations), stakeholder input is necessary, and the need for it is compelling. It is inappropriate for CMS *not* to seek public feedback on this process, and such omission runs counter to the Agency’s previous statement that it intends to “prioritize transparency and robust engagement among all interested parties”³ in implementing the statute.

As CMS knows, “[t]he purpose of [a] comment period is to allow interested members of the public to communicate information, concerns, and criticisms to the [A]gency.”⁴ Equally important is the Agency’s timely explanation of how such information, concerns, and criticisms factored into its final decision-making. This is what allows the comment process to serve its intended role of facilitating a “genuine interchange” of ideas between the Agency and interested members of the public.⁵ The process of responding to discrete points raised by commenters helps to ensure that the Agency is carefully considering the feedback it received from the public—“the interchange of ideas between the government and its citizenry provides a broader base for intelligent decision-making and promotes greater responsiveness to the needs of the people.”⁶ Further, when an Agency is not interpreting a statute, but instead seeking to impose substantive obligations beyond what the plain text requires, backed by the specter of massive penalties, it cannot rely on guidance or interpretive rules, which are otherwise meant to be non-binding. The imposition of binding legal obligations must instead go through processes designed to allow for public input and ensure accountability.

We ask CMS, in finalizing any proposals, to include its responses to comments received and meaningfully explain the rationale for its decision-making. Naturally, because CMS indicated at present that it is not accepting comments on Section 30, the Agency cannot consider any feedback on Section 30 provided by stakeholders at this stage to represent the full public input it could have solicited, as CMS’ directive inherently has dissuaded stakeholders from voicing their full opinions on these matters, if they venture to voice any opinions at all.

² Guidance at 2.

³ CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 (Jan. 11, 2023), *available here* <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>.

⁴ *Conn. Light & Power Co. v. NRC*, 673 F.2d 525, 530 (D.C. Cir. 1982).

⁵ *Id.*

⁶ *Buschmann v. Schweiker*, 676 F.2d 352, 357 (9th Cir. 1982) (internal quotation marks and citations omitted).

In short, the matters falling under Section 30 deserve a genuine interchange of ideas between the public and the government, and CMS should reissue Section 30 and open the Guidance therein for comment. If CMS were to open Section 30 for public input, for instance, BMS and other stakeholders would be in the position to provide comment on critical issues related to IRA implementation, including but not limited to:

Total Part D Expenditures:

- CMS confirms an interpretation of gross covered prescription drug costs that, in our view, would comport with the statutory meaning of the term.

Identifying Qualifying Single Source Drugs

- CMS states that it will identify “qualifying single source drugs” (QSSDs) at the active moiety/active ingredient level. That approach, however, is contrary to and beyond the scope of the IRA statute, creates unnecessary confusion in the face of statutory clarity, departs from well-established means of identifying products, and will be detrimental to future innovation and patient access to crucial medicines.
- Clear statutory commands may not be disregarded. The statute makes no mention of active moiety or active ingredient and establishes plainly that each single source product must have at least seven or 11 years elapsed after approval to be eligible for selection. The “earliest” approval language in the Guidance has no basis in the statute, but comes from whole cloth, and undermines incentives for innovation in a way not conceived by Congress. The statutory text specifies that a QSSD is defined by reference to each “such approval” or “such licensure” that starts each seven- or 11-year clock. It therefore requires that a distinct QSSD be defined by reference to a distinct approval or licensure. This plain reading of the statute is the beginning and end of the analysis.
- If CMS were to open its policy for public comment, it could consider detailed information on a prudent alternative approach that would be consistent with the statute and that would also provide certainty on key components. For example, an approach that may come from engagement with stakeholders could result in CMS identifying QSSDs by reference to a distinct New Drug Application (NDA) or biologics license application (BLA); aggregating expenditures across dosage forms and strengths within each distinct NDA or BLA; and applying MFP across dosage forms and strengths specific to each such NDA or BLA.
- Such an alternative approach would have many benefits that could be detailed in public comment, including:
 - consistency with the Food and Drug Administration (FDA) approval framework for NDAs and BLAs, a well-settled regulatory landscape that Congress showed no indication of departing from and indeed cross-referenced in the IRA, and which reflects FDA’s established understanding, contrary to CMS’ approach in the Guidance, that certain fundamental changes—not only in active ingredient or moiety—warrant thorough regulatory evaluation of the product as distinct from an already-existing one;
 - consistency with the statutory term “covered Part D drug,” defined by reference to the statutory term “covered outpatient drug” under Section 1927(k)(2) of the Social Security Act, where products are distinguished by NDA approval and BLA licensure;
 - consistency with the IRA statute’s balance between the often-competing interests in encouraging pharmaceutical and biotechnology innovation and reducing prescription drug prices, reflected by, among other things, the establishment of a time period post-NDA approval or post-BLA licensure during which selection for price setting is unavailable; and
 - establishment of a bright-line test for all parties under the price setting process, allowing ready identification of distinct products by CMS and permitting manufacturers to confidently track the seven- or 11-year timeline from the initial NDA/BLA approval date for selection eligibility and make research and development decisions accordingly.

- Ultimately, though, what remains clear is that the Guidance takes an approach that Congress did not intend, and the Agency should solicit public comment to ensure that it does not disregard statutory commands and otherwise risk constitutional concerns.

Determining Generic/Biosimilar Competition

- BMS has serious concerns with CMS' policy to consider a generic drug or biosimilar product to be "marketed" when the Prescription Drug Event (PDE) data substantiates that "the manufacturer of that drug or product has engaged in bona fide marketing of that drug or product." Those serious concerns are doubled by CMS' suggestion that it will continue to "monitor" marketplace sales to evaluate whether there is "robust and meaningful competition" from a generic or biosimilar, in determining whether a selected drug remains ineligible for price setting. "Bona fide marketing" and "robust and meaningful competition" are not phrases or concepts included in the statute, and CMS' attempt to create such standards is *ultra vires*.
- Had this matter been opened for public comment, BMS and other stakeholders could have explained how this policy is contrary to the plain language of the IRA statute, *e.g.*:
 - Under the statute, a selected single source product can no longer be defined as "selected drug" after the Secretary's determination that at least one generic drug or biosimilar has been approved or licensed, as applicable, and "is marketed pursuant to such approval or licensure." Although Congress gave the Secretary responsibility for the *determination* that such approval or licensure and marketing has occurred, the statute's plain words establish the objects of that determination.
 - At a threshold level, price setting applies only to a *single source* product, meaning that if a *different* source exists (*i.e.*, a generic or biosimilar), the product categorically cannot come from a single source. Further, the plain meaning of the statutorily unqualified term "marketed" reveals that Congress did not contemplate extra-statutory concepts related to degree of utilization or "robust and meaningful" competition.
 - Both CMS and FDA have long determined a product to have been marketed based on a point-in-time standard. For instance, CMS has long used this concept in the Medicaid Drug Rebate Program (MDRP), where "market date" has been defined in guidance to mean "the earliest date the drug was first marketed under the application number of any labeler,"⁷ and where "marketed" is defined under the National Drug Rebate Agreement to mean the date on which the product was first "available for sale by a manufacturer in the states."⁸ Congress would have understood this common-sense, established approach in drafting the IRA provisions.
- Interposing subjective, indefinite criteria in the determination of when a generic is "marketed" is inappropriate, subject to abuse, *ultra vires*, and inconsistent with the terms of the statute. It also risks introducing a number of practical complexities and drawbacks, including unnecessary lag with respect to termination of MFP and concomitant adverse effects on generic/biosimilar competition, contrary to what Congress has sought to promote.
- BMS therefore supports CMS taking a position that aligns with the "market date" reported under the MDRP because it presents an established, uniform standard that would help ensure that manufacturers are not inappropriately subject to selection, negotiation, application of an MFP, or an excise tax. Adopting this standard would also help ensure clarity and consistency in the identification of these key dates under Medicare price setting. BMS urges CMS to use this standard for identifying both: (1) the date on which a generic or biosimilar is first marketed; and (2) the date on which CMS determines that to be the case (which, ideally, should be the same as the actual marketing date to prevent complexities involving potential inappropriate delay in removal from "negotiation" or MFP applicability).

⁷ CMS, MDRP Data Guide § 5.15 (Apr. 2022).

⁸ National Drug Rebate Agreement § I(l), 83 Fed. Reg. 12,770 (Mar. 23, 2018).

Orphan Drugs

- CMS should take care not to implement price setting in any way that could risk undermining the patient-centric incentives at the core of the Orphan Drug Act (ODA). In the last 40 years, the ODA framework has supported the development, approval, and distribution of products that meet pressing, often unmet, public health needs, and otherwise might not ever be available.
- If CMS were to accept comment on Section 30, BMS and other stakeholders could provide detailed input relevant to application of the orphan drug exclusion. For instance, CMS should be aware that consulting relevant databases noted in the Guidance is ultimately insufficient. The databases may not always reflect the fact that a drug indication is within the scope of the orphan drug designation, in which case CMS should allow manufacturers to provide evidence that it does so. CMS should also consider other statutorily consistent practices, such as looking at orphan designation at the time of selection (and not looking to any previous designation that has been withdrawn) and promoting orphan drug development by clarifying that the seven- or 11-year clock for identifying QSSD status of an orphan drug starts on the date an orphan drug loses its status as an excluded orphan drug.

Plasma-Derived Products

- CMS has announced a two-step approach for identifying excluded plasma-derived products: (1) referring to product information on FDA's Approved Blood Products website, and (2) referring to FDA's Online Label Repository to verify if the product is derived from human whole blood or plasma, with FDA consultation "as needed."⁹
- Had CMS solicited comment on this practice, BMS and other stakeholders could have identified flaws in this approach and emphasized that the statutory exclusion of plasma-derived products should be applied based on the facts and circumstances of each product, applying the words of the statute itself. Instead, CMS has purportedly finalized an approach that risks sweeping into the IRA framework a statutorily excluded plasma-derived product.
- CMS should apply the statutory plasma-derived products exclusion to encompass all products falling under this provision. Further, the possibility that some products may not be captured in the two-step approach CMS has envisioned here underscores the need for CMS to provide advance notice of potential selection of a product for "negotiation," should this or any other statutory exclusion apply.

Product Selection

- CMS has purportedly finalized the process for selection of drugs for IPAY 2026. Had the Agency sought comment on this part of the Guidance, BMS and other stakeholders could have provided full comment on important related considerations. For instance, CMS should bear in mind that while the Agency has discretion to determine which particular drugs are selected, Congress has not delegated discretion to redefine what drugs qualify for selection.
- Hence, there is an inherent risk that, without appropriate engagement with manufacturers, CMS could engage in *ultra vires* selection of a drug, such as publishing a drug statutorily ineligible for selection, or take action that raises constitutional concerns related to equal protection given to the selection of particular drugs for particular manufacturers. The Agency could mitigate against such risks by engaging with stakeholders to confirm that its approach comports with the statute and the discretion granted to the Agency under the statute. Further, the Agency should provide advance notice to applicable manufacturers of drugs *anticipated* for selection and offer those manufacturers the opportunity to raise concerns before ultimate selection.

⁹ Guidance at 11.

- To help ensure lawful and appropriate selection, the Agency could also consider, among other measures: (1) providing at least one quarter of such advance notice to manufacturers of drugs anticipated for selection; (2) providing the same such advance notice to the manufacturers of the next five drugs (should drugs anticipated for selection be determined ineligible); and (3) providing biosimilar manufacturers the opportunity to inquire as to whether a particular reference biologic is among the drugs anticipated for selection. If advance notice conflicts with CMS' final determination of delay for certain biologics, CMS could explain in such advance notice that a delay request has been submitted and is being actively considered.

Biosimilar Special Delay Requests

- CMS has purportedly finalized substantial guidance related to the biosimilar manufacturer special delay request process. Had CMS solicited comment, BMS and other stakeholders could have offered many relevant suggestions and ideas for consideration to inform Agency policy.
- For instance, CMS refers to the statutory unavailability of a delay request where an agreement exists between a biologic manufacturer and a biosimilar manufacturer that imposes "improper constraints"¹⁰ on the biosimilar manufacturer but does not identify the contours of such an agreement that would give rise to such improper constraints in the view of the Agency. Consistent with the statute, the Agency should determine an agreement is disqualifying *only* when the agreement explicitly requires submission of an initial delay request. As the Agency recognizes, certain agreements could inform whether "high likelihood" exists of biosimilar entry in a specified period. Presuming "improper constraints" in an agreement, rather than looking to the language of the contract itself, risks nullifying the statute's contemplation of these other agreements informing "high likelihood" determinations.
- Relatedly, BMS and other stakeholders could provide valuable insight on the "high likelihood" determination itself. If comment were open, we would encourage CMS to reasonably make such a determination based on the best available information and consider further information that could help inform whether high likelihood exists (e.g., FDA's views of data and information submitted in the BLA, FDA communications about BLA status, the biosimilar manufacturer's production and distribution arrangements and progress, and information the biosimilar manufacturer concludes to be relevant to the determination). The statute permits the Agency to consider such other information and could also permit a biosimilar manufacturer supplementation through a timely request based on recent information or otherwise for good cause.
- BMS and other stakeholders could also provide insight on the biosimilar delay process, including the submission deadline. Setting a deadline as close as reasonably possible to selection would help ensure the best available information for consideration of the request, whereas the date established without stakeholder input creates a very tight timeframe that could result in critical information not being considered. The Agency could also notify the reference biologic manufacturer of a request and delay selection and price while the Agency evaluates all information submitted, and also provide notice of determination in advance of the selected drug publication date, allowing the biosimilar manufacturer to bring any error or other concern to CMS' attention before such date.

As of now, however, we understand from the Guidance that CMS is not accepting any comment on Section 30. We therefore hope that CMS will consider our points above and limited examples for the narrow yet important purpose of reissuing Section 30 with an opportunity for full public input on these and other critical matters.

¹⁰ *Id.* at 19.

Section 40 – Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

CMS notes that the Agency intends to sign an Agreement with the Primary Manufacturer of each selected drug and does not intend to enter into an Agreement with any Secondary Manufacturer(s) of a selected drug. CMS also indicates that the Primary Manufacturer is responsible for collecting and reporting the Secondary Manufacturer's information as well as ensuring that the Secondary Manufacturer(s) make(s) the MFP available to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers.

BMS does not agree with this approach, which is found nowhere in the statute and, at the very least, could not be imposed without proper rulemaking procedures. It is also impractical. "Primary Manufacturers" have no ability to attest to, nor would it be appropriate for them to opine on, the data of another manufacturer or ensure that other manufacturers are making the MFP available to the respective parties. CMS has elsewhere understood "the challenges of obtaining pricing information from unrelated manufacturers," including "concerns about data sharing with competitors," which has the potential to raise antitrust concerns.¹¹ CMS should recognize the same concerns in this context and should ensure that undue liability is not placed on Primary Manufacturers to report information that is practically and legally unavailable to them.

40.1 Entrance into an Agreement with CMS

CMS notes that it will "make reasonable efforts to make the final text of the Agreement available to the public before the selected drug list for [IPAY] 2026 is published."¹² BMS contends that CMS must allow manufacturers to review the "Agreement," with all proposed terms, well in advance of the drug selection date. Otherwise, manufacturers will see such terms for the first time when they must execute the Agreement. The specific terms greatly matter, given the private rights at stake and the prospect of enormous CMPs associated with violations of such terms. Manufacturers also need lead time to establish or modify compliance systems or protocols, so that they can be prepared to be in compliance when they execute the Agreement.

BMS believes the Agreement into which a manufacturer must enter should include certain key components and safeguards and align strictly with statutory requirements. BMS agrees with the flexibility CMS intends to give to a manufacturer in providing access to the MFP for eligible individuals, including through a rebate, and the document's plain terms should establish that flexibility. As further discussed in our comments to Section 40.4 of the Guidance, the Agency should also commit to ensuring providers report a "minimally necessary"¹³ data set to the manufacturer or its vendor to be entitled to access the MFP and for validating their right to access in a timely manner, according to standard business practices and consistent with non-duplication requirements. The Agency should also set forth sufficient and robust provisions to ensure the protection of a manufacturer's confidential and proprietary information, as the statute requires. Finally, with respect to penalty provisions, the Agency should provide for pre-sanction dispute resolution and the opportunity to cure and/or dispute before any penalty may be imposed or publicly disclosed.

Manufacturers must submit to CMS all names, titles, and contact information for representatives authorized to execute the Agreement and conduct the negotiation just five days after CMS publishes the list of selected drugs. If CMS publishes the selected drug list, as directed, on September 1, 2023, that would be the Friday prior to the Labor Day holiday. We are concerned that it might be difficult to reach the Agency during this critical time should we have a product selected

¹¹ 81 Fed. Reg. 5,169, 5,266, 5,271 (Feb. 1, 2016).

¹² Guidance at 27.

¹³ HHS, "Does the Privacy Rule permit health plans to disclose protected health information to pharmaceutical manufacturers for the adjudication of drug rebate contracts?" (June 2003), available at <https://www.hhs.gov/hipaa/for-professionals/faq/455/does-hipaa-permit-health-plans-to-disclose-information-to-pharmaceutical-manufacturers/index.html>.

and need assistance with said Agreement. We therefore seek clarification that CMS intends to have staff available over the Labor Day holiday to assist with issues pertaining to this task. CMS has also indicated that one of the persons must be legally authorized to bind the Primary Manufacturer to the terms and conditions contained in the Agreement and access the CMS Health Plan Management System (HPMS) to sign the agreement; we would appreciate CMS' clarification in advance as to which employee(s) would be legally authorized and recommend against a C-suite representative. BMS also asks that CMS update manufacturers on the approximate timing for when HPMS will be updated with the respective changes needed to facilitate the Agreement and data elements.

40.2.1 Confidentiality of Proprietary Information

BMS agrees with CMS that the Agency should ensure that confidential commercial information submitted by manufacturers during the negotiation process is protected from disclosure, as any inappropriate disclosure or use of manufacturer sensitive business information would raise considerable Fifth Amendment takings concerns. It is imperative that CMS ensure adequate safeguards to protect manufacturers' trade secrets, proprietary, and other confidential commercial information from disclosure. In addition, we urge CMS to afford manufacturers the ability to proactively identify information as proprietary for the Agency's consideration, as well as allow manufacturers the ability to review any public facing documents related to the MFP prior to sharing publicly.

BMS also asks CMS to carefully consider how the Agency intends to keep confidential commercial information confidential within CMS. We have related concerns over CMS' potential use of the information as a market participant, as opposed to strict use for the purposes of IRA "negotiation" and price controls, and insufficient protections against disclosure of information as part of the public MFP explanation, given the private rights at stake for the manufacturer. CMS must implement additional procedures to ensure confidentiality, including the following.

Determination of Confidential Commercial Information: BMS thanks CMS for proposing to adopt a familiar standard to protect proprietary and confidential information. Notably, under Exemption 4 of FOIA, a manufacturer may designate submitted information as trade secret, proprietary, or otherwise confidential, and CMS may not disclose such information without providing adequate notice to the manufacturer of its intent to do so and a reasonable opportunity for the manufacturer to object.¹⁴ In the Guidance, CMS does not contemplate an opportunity for manufacturers to designate submitted information as trade secret, proprietary, or otherwise confidential and/or how the Agency will provide adequate notice for disclosure of information. If CMS were to allow such an opportunity for manufacturers, however, there would be an opportunity for the Agency to have a greater understanding of which data are public or not. For example, under FDA's regulations, the existence and status of a pending application, in addition to information contained in a pending NDA or BLA, generally are protected from public disclosure.¹⁵ Only once a decision on an application is final will some, but not all, information regarding the application be subject to disclosure. We ask CMS to clarify these safeguards and urge the Agency to provide the maximum amount of transparency and flexibility. If nothing else, we ask CMS to consider ensuring confidentiality standards consistent not only with what is required under FOIA, but also under government drug price reporting programs, like the MDRP.

¹⁴ See 45 C.F.R. §§ 5.41, 5.42.

¹⁵ See 21 C.F.R. §§ 314.430(b) ("FDA will not publicly disclose the existence of an application...before an approval letter...or tentative approval letter is sent to the applicant..., unless the existence of the application...has been previously publicly disclosed or acknowledged."); id. § 314.430(c) ("If the existence of an unapproved application or abbreviated application [for a small molecule drug] has not been publicly disclosed or acknowledged, no data or information in the application or abbreviated application is available for public disclosure."); id. § 601.51(b) ("The existence of a biological product file will not be disclosed by [FDA] before a biologics license application has been approved unless it has previously been publicly disclosed or acknowledged."), id. § 601.51(c) ("If the existence of a biological product file has not been publicly disclosed or acknowledged, no data or information in the biological product file is available for public disclosure."); see also 39 Fed. Reg. 44,602, 44,634 (Dec. 24, 1974) ("The existence of a pending NDA constitutes confidential commercial information where the existence of clinical testing has not previously been publicly disclosed or acknowledged.").

Stringent Storage and Access Requirements: CMS should also confirm that all trade secret, proprietary, and other confidential commercial information will be stored in a secure manner, accessible only by CMS staff who have a program-based need to access such information, and accessible only when needed for work involving the program. CMS already implements such protections with product and pricing data submitted by manufacturers participating in the MDRP. For example, under the MDRP, data is uploaded to an online interface that both states and manufacturers access. Functionality of the interface, however, is limited by the user's role: state users do not have the ability to view quarterly or monthly pricing records or all product information because "some of this information is confidential (*e.g.*, Baseline Average Manufacturer Price (AMP) data)."¹⁶ This important level of protection will minimize the risk of inadvertent disclosure of highly confidential data submitted by manufacturers and encourage greater transparency between CMS and manufacturers. Thus, CMS should adopt and specify safeguards with respect to storage and the platform through which program information will be submitted.

Confidentiality Safeguards with Respect to the Public Explanation of the MFP: BMS notes that it benefits all parties—including CMS—if the Agency openly discloses the informational assumptions that it relies upon in developing offers and responses. By disclosing the informational bases of such offers and responses, CMS will facilitate a more open and transparent dialogue during the negotiation process. For example, manufacturers will be able to better understand CMS' positions and rationales and thereby tailor more appropriate counteroffers and replies. Furthermore, open disclosure of the non-manufacturer-submitted information upon which CMS relies will reduce the risk of CMS' offers and responses being viewed as a misunderstanding or misinterpretation of such information—because manufacturers will be in a position to raise any such errors or misapprehensions to the Agency's attention.

While supportive of transparency in MFP offers and counteroffers, BMS is concerned about the potential for improper disclosure of confidential commercial information when CMS publishes the statutorily-required explanation of the MFP for a selected drug.¹⁷ Given that the MFP will likely be based at least in part on drug pricing and other confidential commercial information, it is critical that CMS prevent disclosure of such information as part of this explanation, including through redaction or omission of data. In fact, the statute explicitly requires such protection of confidential information with respect to the MFP explanation, by cross-reference to the general duty of confidentiality identified above.¹⁸ We ask that CMS expressly confirm that, in publishing the explanation for the MFP, it will ensure that trade-secret, proprietary, and other confidential commercial information will not be directly or indirectly disclosed.

Furthermore, BMS believes that a manufacturer should be permitted to identify for CMS any way in which the intended explanation of the MFP would reveal confidential commercial information. To help ensure that such information will not be inadvertently disclosed, we ask CMS to afford the manufacturer a reasonable opportunity to review and raise confidentiality concerns regarding CMS' intended explanation of the MFP, in advance of its publication.

40.2.2 Data Use Provisions and Limitations

BMS joins PhRMA in its comments with respect to this section of the Guidance. We oppose CMS' proposals to restrain manufacturer speech in relation to information acquired during the negotiation process. We also oppose the proposal to mandate destruction of manufacturer property (*i.e.*, the "destruction of data"). Among other things, these unprecedented proposals violate the First Amendment and run contrary to principles of fairness, transparency, and accountability. The proposals should be withdrawn, and CMS should engage stakeholders regarding appropriate and lawful measures to impose in connection with data use.

¹⁸ *Id.*

40.4 Providing Access to the MFP

BMS supports efforts to lower patient out-of-pocket costs and appreciates the complexity of providing discounts to Medicare patients at the point-of-sale. BMS is pleased that CMS is proposing to allow manufacturers to have flexibility to provide access to the MFP through an up-front discount or retrospective reimbursement (herein referred to as “a rebate”), and we appreciate the opportunity to comment on this topic. However, to help ensure a transparent and administratively efficient operationalization of the MFP, BMS strongly asserts that additional data safeguards are necessary, regardless of the MFP discount effectuation option. It is critical for stakeholders, including CMS, to have the right information at the right time to ensure compliance. This is especially essential given the lack of a dispute resolution process.

Concerns with Diversion: Under the law, manufacturers must provide access to the MFP for a selected drug to:

1. Maximum fair price eligible individuals “enrolled in a prescription drug plan under [Medicare] part D... or [a Medicare Advantage (MA)-prescription drug (PD)] plan under [Medicare] part C... if coverage is provided under such plan for such selected drug” or to “the pharmacy, mail order service, or other dispenser” with respect to such individuals, and
2. “[H]ospitals, physicians, and other providers of services and suppliers with respect to maximum fair price eligible individuals” who are “enrolled under [Medicare] part B... , including an individual who is enrolled in an MA plan under [Medicare] part C... , if payment may be made under part B for such selected drug.”¹⁹

Units of a selected drug purchased at the MFP, therefore, may only be dispensed to MFP-eligible individuals. Despite this clear statutory limitation, the Guidance does not explain how CMS will help prevent providers and pharmacies from administering or dispensing MFP-purchased units of selected drugs to MFP-*ineligible* individuals. Absent clear indications of how CMS intends to help uphold the statutory requirements, manufacturers must have flexibility to provide access to MFP-eligible individuals only as required, without risk of CMPs.

Necessity for System Changes, and Challenges with Supporting MFP Effectuation and Mitigating Diversion: Both discount mechanisms that CMS acknowledges (chargebacks and rebates), as they operate today, fall short of the operational capability to enable manufacturers to accurately provide access to the MFP. To adapt either mechanism to provide access to the MFP, significant enhancements or a redesign must occur, which will require time and coordination among stakeholders—particularly those that do not work together currently. CMS should make clear that it expects providers to submit MFP validation data, which will encourage the types of system changes necessary to support the smooth adoption of MFP.

- **Chargeback System Challenges:** Chargebacks support discounts when a dispensing outlet is eligible to purchase at a single, validated, up-front discounted price for all patients. The U.S. chargeback system is based upon saleable packages, but the MFP is extended based upon an eligible patient, provider, and claim. The current chargeback data set is thus inadequate to support the MFP validation. Specifically, new connections to different stakeholders would need to be built to capture additional fields such as payer information, prescription level data, etc. These types of significant changes may face stakeholder pushback within the given timeframe unless CMS establishes this MFP validation data expectation as a requirement.
- **Rebate System Challenges:** Rebates in the U.S. are customarily paid after validation of claims data, which makes the rebate mechanism appropriate for extending a discount that depends on patient-level information (such as the MFP). However, adjustments to existing rebate data elements and how dispensers

¹⁹ SSA §§ 1191(b)(2), 1193(a)(3).

would be paid the rebate would need to occur to accommodate the MFP. Additional data elements would need to be added to the existing rebate system to ensure alignment with the nonduplication provision, which is discussed in our response to section 40.4.1.

Concerns with Unclear Timing Expectations: BMS is concerned with the lack of clarity in CMS’ statement that it “intends to require that a Primary Manufacturer ensure that pharmacies, mail order services, and other dispensers as well as intermediate entities, such as wholesalers, as applicable, are reimbursed timely for the full amount of the difference between their acquisition cost for the selected drug and the MFP within 14 days.”²⁰ This sentence has unclear meaning. For example, “within 14 days” could refer to a multitude of events, each of which with significant meaning for manufacturers (*e.g.*, within 14 days of the dispensing date may be too short of an interval, and therefore operationally infeasible, especially given the 340B complications addressed in Section 40.4.1). And, as noted below, this imposition of timing, however construed, is otherwise unrealistic.

Recommended CMS Actions: CMS should make clear that providers seeking to benefit from the MFP must report a minimally necessary data set to the manufacturer or its vendor for the purposes of MFP discount validation in a timely manner, according to standard business practices, and in alignment with non-duplication requirements. CMS should expressly acknowledge that manufacturers may establish, receive, review, and, as necessary, audit MFP validation data to ensure MFP access in accordance with the statute. Additionally, CMS cannot expect manufacturers to provide access to the MFP and respond “to CMS requests within specified timeframes with documentation demonstrating compliance”²¹ unless the manufacturer has the necessary MFP validation data, in the timeframe needed, to demonstrate its compliance. Access to and use of this validation data is also pivotal to CMS’ enforcement of the statute, which we address further in section 90.2.

Specifically, it is BMS’ strong belief that CMS should clarify and lengthen the 14-day timeframe, given the new processes that need to be developed to make this work and the 340B complexity. The Agency could instead clarify that timeframes for data submission and validation will be determined by the manufacturer, in conjunction with and with input from stakeholders, and shared with CMS in December 2025 as outlined in the Guidance.

BMS urges CMS to further clarify its intention to define “providing access to the MFP” as ensuring that the amount paid by the dispensing entity for the selected drug is no greater than the MFP. If a provider disregards the standard business practices associated with the MFP validation data (*e.g.*, does not submit the data, submits incomplete data, submits data outside of the timeframe, etc.), the amount paid by the dispensing entity for the selected drug might be greater than the MFP, but through no fault of the manufacturer. To address that circumstance, CMS should clarify that providers have a responsibility to follow standard business practices when requesting the MFP.

Although it may be helpful for CMS to solicit feedback on a standard, mandatory MFP validation data set, a claims clearinghouse, and a process by which manufacturers may receive PDE data, it would be understandably challenging for CMS to arbitrate such data elements given the variety of products and different manufacturer business approaches. CMS should instead affirm that providers are expected to submit MFP validation data and then provide flexibility for manufacturers to establish the appropriate data set and process, given the individual product and channel. This approach should achieve a result that could be more easily adjusted over time than a solely CMS-directed mechanism and would relieve the Agency from complex administrative responsibilities. CMS should also acknowledge that the MFP validation data elements, if submitted pursuant to health care operations purposes, would not need to be de-identified for HIPAA purposes. Taking that step would provide better transparency than if providers were required to rely on third

²⁰ Guidance at 32.

²¹ *Id.* at 26.

party vendors to deidentify data, and it would likely result in quicker resolution of potential disputes among stakeholders. Each manufacturer would notify CMS in writing by December 2, 2025, of the method the manufacturer intends to use to provide access to the MFP.

CMS should clarify its statement that manufacturers or their contracted entities shall not charge any transaction fee for “this process.”²² BMS agrees that patients should not be charged a transaction fee; however, transactional fees among intermediaries are standard practice (*e.g.*, switch fees, administrative fees, etc.). Because the MFP effectuation mechanism is not yet determined, it is premature for CMS to disallow standard business practice fees among intermediaries. If CMS interferes with intermediary fees, it may introduce contractual complexity or could disincentivize intermediaries from prioritizing or offering Medicare services, disrupting the effectuation process. It is also unclear that CMS has the authority to regulate fee-charging among private parties through this Guidance, or at all.

While BMS appreciates CMS confirming that it intends to provide flexibility in the discount mechanism, BMS urges CMS to make clear that providers seeking to benefit from the MFP must report a minimally necessary data set to the manufacturer or its vendor for the purposes of MFP discount validation in a timely manner, according to standard business practices, and in alignment with non-duplication requirements. CMS should expressly acknowledge that manufacturers may establish, receive, review, and as necessary, audit MFP validation data to ensure manufacturers have provided MFP access in accordance with the statute.

40.4.1 Nonduplication with 340B Ceiling Price

BMS appreciates the opportunity to comment on 340B non-duplication, as, by statute, a manufacturer of a selected drug cannot be required to offer both the MFP and the 340B price on the same unit.²³ BMS is seeking specific clarity from CMS on how the Agency intends to operationalize this non-duplication provision of the IRA, as the Guidance does not provide adequate specificity to effectuate this provision. BMS agrees with Secretary of Health and Human Services (HHS) Xavier Becerra’s comments during a recent House Energy & Commerce Health Subcommittee hearing on the HHS Fiscal Year 2024 Budget Request, when the Secretary stated that the 340B program does not have the transparency the program needs to be successful, and that compliance and transparency are two critical reform areas.²⁴ In this section, we provide suggestions for CMS to take steps aligned with Secretary Becerra’s comments. Clarity from CMS is essential on this topic, as the responsibility of the manufacturer to provide access to the MFP depends upon the 340B status of the patient and provider in some circumstances, and adequate transparency is also essential for CMS to oversee and enforce compliance.

Size/Scope of the MFP-340B Overlap: The Medicare-340B overlap is significant—according to a new all-market analysis by IQVIA, for example, the estimated 340B overlap in Part D is 40.1% and in Part B is 36.3%, meaning that \$34.0B to \$37.5B of sales may be at risk for MFP-340B duplicate discounts.²⁵ This is a sizeable problem that CMS cannot ignore, especially given the statutory non-duplication mandate.

Root Cause of MFP-340B Complexity: Chargebacks and Replenishment: As a root cause issue, 340B is extended via a chargeback model. That is demonstrably problematic because chargebacks are used to extend discounts at the provider/outlet level based on saleable package sizes, but 340B discount eligibility depends on the provider, patient, and

²² *Id.* at 32.

²³ SSA § 1193(d).

²⁴ See House Energy & Commerce Committee Health Subcommittee Hearing, “Fiscal Year 2024 Department of Health and Human Services Budget” (March 29, 2023), available at <https://energycommerce.house.gov/events/health-subcommittee-hearing-fiscal-year-2024-department-of-health-and-human-services-budget>.

²⁵ IQVIA, “Can 340B Modifiers Avoid Duplicate Discounts in the IRA?” (February 21, 2023), available at <https://www.iqvia.com/locations/united-states/library/white-papers/can-340b-modifiers-avoid-duplicate-discounts-in-the-ira>.

covered outpatient drug status (in practice, on a claims basis). This mismatch has contributed to the complex and extra-statutory 340B replenishment model that attempts to compile and connect the 340B eligibility (claims) information and reconcile it to the 340B purchasing (chargeback) information, but it has faced challenges and resulted in program integrity concerns.^{26,27} Because the requirement for a manufacturer to provide access to the MFP is conditional on the Medicare-coverage status of the patient, 340B-patient eligibility status, and 340B and MFP prices of a drug, 340B transparency must be addressed.

How MFP Validation and Provision Is Tied to 340B: There are two key points of connection between the decision to extend the MFP discount and the 340B program:

- **Calculating the MFP discount amount to reimburse a provider is currently tied by CMS to actual acquisition cost (AAC), and AAC is tied to 340B in some situations.** CMS is proposing to require a manufacturer to reimburse the provider “the full amount of the difference between *their acquisition cost for the selected drug* and the MFP within 14 days,”²⁸ but the complicated 340B replenishment/chargeback model obscures the fundamental data point needed for a manufacturer to accomplish this task: the *acquisition cost*. The manufacturer would be left to compute a mathematical equation to extend the MFP, but the key variable (AAC) is missing. In the 340B replenishment/chargeback model, the inventory identity, and thus the corresponding AAC, is transformed from 340B to wholesale acquisition cost (WAC) and from WAC to 340B in a non-transparent manner after a claim has been dispensed. Further complicating this situation, not all patients of a 340B entity are 340B eligible, so a manufacturer cannot assume that if 340B is lower than the MFP, that it should extend 340B automatically. The National Council for Prescription Drug Programs (NCPDP) describes this issue in its Reference Guide:
 - “In many cases it is impossible at the point of a claim submission to know that Section 340B drugs will be used and therefore pharmacies would be *unable to submit the 340B acquisition cost*.”²⁹
 - “The processes used by a covered entity to determine whether Section 340B drugs will be used *are prerequisites to any exchange of information* concerning section 340B drugs, and if applicable, *associated pricing*.”³⁰
- **The current open-ended timeframe for 340B determination is like a swinging gate—which will drag CMS, manufacturers, and providers back and forth through it—disrupting the non-duplication provision and ultimately resulting in disorderly MFP extension and CMS enforcement.** Adding further complexity, the timeframe for these non-transparent inventory/AAC status decision changes from WAC to 340B and from 340B to WAC, as NCPDP states, “varies greatly... and can be as brief as same day or as long as never... [or] as long as infinity.” That will prevent CMS from policing abuses, because the MFP access decision is tied to a 340B decision

³⁰ *Id.*

that changes according to the entity's own timeframe and "requirements for determining patient eligibility to use Section 340B drugs."³¹

Recommended CMS Actions: BMS recommends that CMS take the same action needed to support the MFP access provision: CMS should make clear that providers seeking to benefit from the MFP must report a minimally necessary data set to the manufacturer or its vendor for the purposes of MFP discount validation in a timely manner, according to standard business practices, and in alignment with non-duplication requirements. CMS should expressly acknowledge that manufacturers may establish, receive, review, and as necessary, audit MFP validation data to ensure manufacturers have provided MFP access in accordance with the statute. Without this CMS support, the statute cannot be faithfully implemented, and manufacturers will be left in an impossible position of not knowing how to comply with the statutory requirements, all while under the threat of penalty for perceived non-compliance.

CMS Precedent for MFP Validation Data Submission: CMS has already recognized the importance of claims data in publications regarding Medicaid and 340B, and these recommendations are also germane for Medicare. We agree with CMS' specific statements and suggest CMS apply its own guidance for the MFP: "When states provide claims level data to manufacturers, we would expect there to be a reduction in number of disputes due to more accurate information being provided.... Manufacturers likely need claims level data for true invoice validation purposes... [and] If claims level data is provided, this may reduce the state's administrative burden and expense of researching manufacturer dispute issues."³² Additionally, the statute clearly states that manufacturers must provide access to the MFP based upon MFP-eligible individuals, and data would support that provision.

CMS Should Support Transparent Data Provision: How MFP validation data is supplied is a critical component to support marketplace transparency. In the 340B landscape, "black box" approaches have been attempted—where there is reliance on a vendor to take deidentified data sets and match them in a black box. These models are not transparent, and they are complicated and difficult to audit. Incomplete data inputs lead to incomplete outcomes, and voluntary processes that allow partial data submissions or rely on inaccurate input data ultimately do not provide the needed transparency. Importantly, the minimally necessary data set that could be used for MFP discount validation falls under the health care operations exception under HIPAA, so de-identification would not be required. CMS should acknowledge that addressing these transparency challenges in a manner that ensures visibility of the MFP validation data is critical to successful MFP operationalization. It would also be helpful for CMS to clarify that a final 340B eligibility determination at the point-of-sale aligns with CMS' 340B modifier mandates, which would help resolve the MFP-340B complexity.

In summary, it is not necessary for CMS to solve the 340B non-duplication complexity itself by creating datasets or business rules. CMS should and need only make clear that providers seeking to benefit from the MFP must timely report a minimally necessary data set to the manufacturer or its vendor for the purposes of MFP discount validation according to standard business practices, and in alignment with non-duplication requirements. CMS should expressly acknowledge that manufacturers may establish, receive, review, and as necessary, audit MFP validation data to ensure manufacturers have provided MFP access in accordance with the statute. If CMS does not require this, providing access to the MFP in the non-duplicated manner required becomes infinitely challenging, if not impossible.

Section 50 – Negotiation Factors

BMS is pleased that CMS is proposing to consider an array of evidence submitted by manufacturers and the public on the selected drug and therapeutic alternatives as part of its effort to "negotiate" MFPs. However, we are deeply

³¹ *Id.*

³² CMS, "Best Practices for Avoiding 340B Duplicate Discounts in Medicaid" (Jan. 2020), *available at* https://www.hhs.gov/guidance/sites/default/files/hhs-guidance-documents/cib010820_107.pdf.

concerned by the stringent evidence submission limits as outlined in the Guidance, as well as the Negotiation Data Elements Information Collection Request (ICR), including the lack of transparency regarding CMS' process for considering comparative effectiveness evidence and other manufacturer data to inform an initial MFP.

BMS urges CMS to finalize a consistent, standardized format for the submission of manufacturer-specific data, with the flexibility to permit reasonable assumptions and submit additional data to account for the distinctive qualities of the treatment selected for negotiation. While we understand that CMS will be undertaking a significant exercise in reviewing data submitted by manufacturers and other stakeholders on comparative effectiveness information, we are concerned that the text data format and rigid word limits proposed will constrain the ability of manufacturers to share important evidence on the values of our medications. When submitting a dossier to the Agency, there should neither be limitations on file sizes nor transmission options.

CMS must acknowledge that it is impossible to capture the full value of a treatment in a “one-size-fits-all” approach to data submissions and must provide manufacturers the ability to submit additional relevant data. Attempting to shoehorn countless varying technologies, business practices, and circumstances into a single framework without necessary context would inevitably result in less useful and incomplete information being considered by CMS.

BMS asks CMS to reconsider its proposal in order to ensure that any information collection process allows manufacturers to submit a comprehensive evidence package in the Academy of Managed Care Pharmacy (AMCP) dossier format, which is a widely used dossier submission format. In BMS' view, the AMCP dossier is the gold standard in both requiring and receiving clinical information from manufacturers for value assessment purposes. In addition, most manufacturers and payers have experience using the AMCP dossier format, which furthers feasibility, consistency, and transparency in the value assessment process.

In addition, we recognize that this value assessment process will be a significant, and novel, undertaking for CMS. It is for this reason that BMS believes that broad stakeholder input is critical to ensuring that value assessments are robust, accurate, and transparent—not the least of which being manufacturer input. As the entity responsible for developing the treatment from the discovery phase all the way to post market surveillance and beyond—a process that can span 20+ years—manufacturers have unique insight, data, and perspective about the health, economic, and societal impact that is critical to the value story of that treatment. On an annual basis, for example, BMS conducts over 500 studies (in addition to developing clinical trials). We strongly support an open dialogue between manufacturers and CMS during the value assessment process.

50.1 Manufacturer-Specific Data

BMS urges CMS also to specify that the Agency will consider any information submitted by manufacturers, even if that information is not tied to a specific statutory factor. This approach is consistent with the plain language of the statute. Like CMS “offers,” manufacturer “counteroffers” must be justifiable based on the statutorily enumerated factors. Nothing precludes manufacturers from voluntarily providing additional information to CMS that may also bear on the Agency's decision-making.³³ BMS notes that CMS has clear authority to consider all information submitted by manufacturers, whether or not tied to a statutory factor, and that the Agency should consider all information submitted by a variety of stakeholders. In addition, unlike justifications for offers or counteroffers, CMS' responses to counteroffers need not be justified by reference solely to the statutorily enumerated negotiation factors.³⁴ Please refer to BMS'

³³ See SSA § 1194(b)(2)(C)(ii)(II).

³⁴ Compare *id.* § 1194(b)(2)(B) and (C)(ii)(II) (justifications for offers and counteroffers must be based on statutorily enumerated negotiation factors), with *id.* § 1194(b)(2)(D) (no similar requirement for responses to counteroffers).

comments on Appendix C for further recommendations on manufacturer specific data submissions and PhRMA recommendations to limit required data on manufacturer specific factors to data already in the public domain.

50.2 Evidence About Therapeutic Alternatives for the Selected Drug

BMS is encouraged by the body of evidence that CMS intends to consider on the selected drug and alternative treatments, including, but not limited to, real world evidence (RWE), clinician expertise, and methodologically rigorous/scientifically sound studies. As selected drugs will be assessed in the middle of their lifecycle, there will be many complexities to consider with multiple indications and comparative effectiveness evidence that has accrued over time. We also note the challenges that lie ahead in developing a review process that captures the complete and long-term value of a treatment with full manufacturer buy-in and support. We appreciate the opportunity to comment on the data elements that will be used to complete the value assessment and **strongly assert that value assessments should include certain good practice principles that encourage a broad perspective of value.**

In a qualitative assessment, CMS has an opportunity to consider medication value broadly and holistically. This holistic consideration should go beyond rigid health care costs and health outcomes to consider the impact of medicines on society—such as improvements to patients’ and caregivers’ lives, efficiency and quality in the health care system, and equity across populations. Pricing and access decisions, like the proposed IRA price setting scheme, result in a share of the total benefit of a medication (the societal surplus) being distributed among the manufacturer, health care systems, and patients. **As CMS embarks on precedent-setting value assessments and pricing decisions, BMS believes explicit discussion around the share of the societal surplus with multiple stakeholders is critical to protect patient access to innovative treatment.**

CMS has indicated that it will conduct internal analytics as part of the evidence assessment process. BMS supports the use of indirect treatment comparisons, as these techniques compare the performance of treatment alternatives across trials or in real-world datasets, linking treatments via shared comparator arms. In addition, we encourage CMS to utilize techniques like match-adjustment to help address potential bias. BMS also supports the use of predictive modeling approaches that build on meta-analyses and indirect treatment comparisons, as modeling can synthesize data across clinical trials, real-world data, and priors to project future benefit for patients and health systems. BMS believes that a proper value assessment should be a collective process with manufacturer buy-in and support. To that end, should CMS generate RWE and/or employ modeling techniques, **BMS reiterates that it is critical for manufacturers to have the opportunity, and ample time, to review and comment on the underlying assumptions and approaches to support a good-faith, transparent value assessment.**

CMS indicates that priority will be given to studies focusing on special populations (including individuals with qualifying disabilities, patients with End-Stage Renal Disease (ESRD), and Medicare-aged populations) over studies for which these populations were not the primary focus. While BMS agrees that benefits and risks to these special populations are critical to assess, the smaller sample sizes of related studies may not be sufficient to draw definitive conclusions. **We recommend that evidence from these studies be considered of equal priority to evidence from larger studies that are better powered to draw comparative effectiveness conclusions. We also encourage CMS to consider evidence in other subpopulations, including patients with comorbidities and different ethnicities, when data is available.**

Use of Discriminatory Metrics in Value Assessment: BMS is encouraged that CMS has proposed to not consider quality-adjusted life years (QALYs) in comparative effectiveness research when used in association with life extension to avoid treating the life of an individual who is elderly, disabled, or terminally ill as lower value than another younger, non-disabled, and terminally ill individual. However, we are concerned that when submitting evidence, stakeholders may continue to submit reports that use cost effectiveness analysis with QALY, as CMS suggests its willingness to consider

select evidence from reports with QALY metrics. **We ask CMS to provide greater clarity to stakeholders in this area. In particular, we request CMS to specify that stakeholders must redact any and all references to cost per QALY analysis in ICR text submissions** to reduce the likelihood that CMS assessors could be exposed to such metrics, hopefully reducing the risk of biasing their qualitative decisions. In addition, as noted elsewhere, BMS strongly supports the ability for manufacturers to validate CMS' evidence evaluations, which would provide further safeguards against discriminatory metrics being used to assess and determine value of important medicines.

CMS has also solicited comments on other metrics, in addition to QALYs, that may treat extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill. **BMS is concerned that use of alternative cost effectiveness analysis (CEA) methods like cost per Equal Value Life Year Gained (evLYG), a metric anchored to the QALY paradigm, could also effectively disadvantage these special populations as they would involve value-for-money comparisons to arbitrary thresholds.** Simply put, most methodological and ethical limitations of the QALY (*e.g.*, health equity, measurement of health states, non-health effects, severity etc.) still apply to the evLYG with the exception of Ageism and Disability discrimination.³⁵ In the UK, the National Institute for Health and Care Excellence (NICE) has set a higher threshold for patients with a life expectancy of two years or less after “a groundswell of public opinion and some evidence that society places extra value on the weeks and months at the end of life for terminally ill patients.”³⁶ Current NICE thresholds are about twice as high for end-of-life treatments and 5-10x higher for very rare diseases.³⁷ In developing a process for value assessment in the U.S., it is important for CMS to recognize that experienced HTA markets (*e.g.*, Germany, France, UK, Canada) with long established frameworks extend greater flexibilities related to value assessments, such as indication-specific assessments, unlimited word count on manufacturer dossiers, and transparency in the decision-making process. As it stands, CMS' proposal does not demonstrate fluidity in these areas where other markets, with longstanding value assessment experience, do offer these cooperative procedural elements. While new methods like generalized CEA are being explored to account for differential value of health improvement in different contexts, there is no consensus yet on the ability of these methods to adequately address health equity considerations for special populations. Further, CMS has not sought public comment from patients and other stakeholders on willingness to pay and appropriate cost effectiveness thresholds for IRA value assessments in general. **Therefore, BMS strongly recommends that CMS not anchor value assessments for selected drugs on CEA.** Any consideration of CEA should merely be a part of a broader and holistic assessment of value.

Stakeholder Input: Additionally, BMS supports CMS' proposal to consider evidence about therapeutic alternatives submitted by members of the public, particularly additional information that is not captured in the manufacturer's value dossier submission, with some modifications and safeguards. Active engagement with appropriate and relevant stakeholder groups throughout the value assessment process is very important. All relevant stakeholders (*e.g.*, patients, caregivers, health care professionals, regulators, and manufacturers) should have the opportunity to participate in the value assessment process, including the opportunity to comment on the methodology, the sources of evidence, and the draft assessment. **At minimum, CMS should seek feedback from patients, caregivers, and clinicians at key points through a formal meeting process (as the ICR process will not be sufficient to collect this type of feedback) to help ensure that the Agency selects appropriate therapeutic comparators, and understands benefits, unmet needs, and evidence to determine value. Additionally, stakeholders should be privy to the extent to which the Agency considered these value elements and how they impacted the MFP of a selected drug.** As the entity most familiar with a selected drug, BMS believes that manufacturers should be able to verify information submitted in relation to their product(s).

³⁷ *Id.*

Section 60 – Negotiation Process

BMS believes that it is essential for CMS to develop and finalize a process for price setting that is open and transparent, so that stakeholders can reasonably predict how price setting will operate in practice. We note that it is especially important that CMS be fully transparent regarding the negotiation and renegotiation methodology and process. BMS appreciates CMS' sharing initial high-level thoughts in the Guidance document, but believes additional details are needed, with an opportunity for stakeholders to have full visibility into the methodology and process, as well as opportunity to provide comment to better inform the parameters. This visibility and opportunity for comment in advance of IPAY 2026, so that both manufacturers and CMS are adequately prepared going into the first round of price setting negotiations, is vital.

Congress specifically constructed the MFP setting process as a Drug Price *Negotiation* Program.³⁸ In doing so, Congress clearly intended there to be a process of meaningful engagement with opportunity for real dialogue.³⁹ Meaningful engagement and real dialogue can only occur through full transparency regarding stakeholders' comments and CMS' interpretation and evaluation of such comments. BMS urges CMS to commit to engaging in a process of meaningful engagement with opportunity for real dialogue, without arbitrary limitation on the scope of such dialogue (*e.g.*, through limitation of meetings). Not only is such commitment necessary to effectuate Congress's intent, but it will also promote greater transparency and information sharing. We also believe it will be readily manageable for the Agency, given the limited number of drugs subject to negotiation in any given year.

60.1 Establishment of a Single Proposed MFP for Negotiation Purposes

BMS understands CMS' desire to convert utilization across a medication's dosage forms and strengths into a consistent 30-day equivalent supply. While this methodology may yield a meaningful metric for certain Part D drugs which are exclusively in tablet form, taken at a consistent rate through the entire course of therapy, not approved for varying regimens to treat different indications, and not prescribed uniquely to each patient based on their own individual body weight or other personal characteristics, it is important for CMS to recognize that many products do not meet all of these criteria, which will preclude establishment of a single price that can be applied meaningfully to all national drug codes (NDCs).

Moreover, at a threshold level, CMS' calculation methodology takes an additional, unnecessary step that is contrary to the statutory requirement of the Agency to "establish[] procedures to compute and apply the [MFP] across different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug."⁴⁰ Specifically, CMS proposes to apply the MFP ceiling twice—a first time at the drug level, and a second time at the dosage form or strength level. CMS should not—and, indeed, may not—finalize this proposal.

The statute defines both the MFP and the ceiling price as a price determined at the drug level. Nowhere does the statute contemplate the application of the ceiling price at the dosage form or strength level. The statute directs CMS to establish a process to apply the MFP—which already has been capped by the ceiling price—to each dosage form and strength of the selected drug, and it does not authorize the application of the ceiling price a second time. And as a factual matter, such double application could cause the MFP of some dosage forms and strengths of a selected drug to be reduced a second time. A WAC ratio for a dosage form or strength higher than 1.0 could generate a dosage

³⁸ See SSA § 1192(a)(3) (requiring CMS to engage in *negotiation*).

³⁹ See, *e.g.*, *Wheeler v. St. Joseph Hosp.*, 133 Cal. Rptr. 775, 790 (Ct. App. 1976) (distinguishing "negotiated contracts" from contracts of adhesion).

⁴⁰ SSA § 1196(a)(2).

form/strength-level MFP that is above the dosage form/strength-level ceiling price—and thus a dosage form/strength-level MFP that is doubly capped. This double capping would unfairly penalize dosage forms and strengths with a higher WAC ratio, even though such higher WAC ratio could merely reflect a difference in utilization, such as a difference in dosing regimen or a higher Part D utilization.

Beyond the threshold statutory issue with CMS' proposed calculation methodology, additional notable challenges with using a 30-day equivalent supply for pricing include:

- **Weight-based Dosing:** Many drugs (*e.g.*, certain IV drugs) have weight-based dosing that presents unique challenges to determining a 30-day equivalent supply. To apply this methodology, CMS would need to assume an average weight of the patients receiving weight-based dosing of a selected drug. There may be challenges with collecting data to accurately inform the average weight.
- **Dosing Variation Across Indications:** Some drugs have different dosing across indications, which also presents challenges to determining a single 30-day equivalent supply. For selected drugs that have different dosing across indications, CMS would need to determine the average 30-day supply for each indication, then calculate a weighted average based on relative use of the drug in each indication. There may be challenges with determining relative use across indications, especially if this changes over time. This also presents a significant complexity in an already convoluted approach.
- **Dosing Titration/Loading Doses/Changes in Dosing Over Course of Treatment:** Selected drugs with dosing titration, loading doses, or other changes in dosing throughout the course of treatment present challenges to determining a 30-day equivalent supply. CMS would need to develop a methodology for accommodating these changes in dosing.

The issues in calculating a 30-day equivalent supply mentioned above would also preclude meaningful comparisons to therapeutic equivalent products in many cases. For instance, many products are prescribed in combination with other drugs, which may be produced by other manufacturers. In this situation, comparisons of one manufacturer's drug to a single drug from another manufacturer would be further obscured, as neither reflects a complete course of therapy, and neither can simply be substituted for the other within that course of therapy.

In order for CMS to better understand and address the unique challenges in calculating a 30-day equivalent supply for a selected drug, CMS may want to consider adding questions to Appendix C regarding the drug's utilization (*e.g.*, approved regimens for each indication, loading doses and/or interruptions in dosing, titration over course of therapy, combination regimens, etc.). Given the significant limitations of the 30-day equivalent methodology, BMS also strongly urges CMS to consult manufacturers on the methodology to be used for a selected drug prior to the Initial Offer to better ensure any limitations are appropriately addressed and accounted for in the Initial Offer. With greater information, and in consultation with the manufacturer, CMS would be able to gain a better understanding of the drug's usage and determine how to make meaningful comparisons to therapeutic equivalents.

Recognizing that this 30-day equivalent methodology is new and unprecedented, we encourage CMS to consider alternatives where prior precedence exists, such as proposing prices at the NDC-11 level consistent with the FSS or at the NDC-9 level consistent with Medicaid.

In addition to the 30-day equivalent methodology, CMS also describes the steps for calculating the Ceiling for the MFP in Section 60.2.1, the Sum of Plan Specific Enrollment Amounts in Section 60.2.2, the Average Non-FAMP Price in Section 60.2.3, the Selection and Application of the Ceiling for the MFP in Section 60.2.4, and the Application of the MFP Across Dosage Forms and Strengths in Section 60.5. BMS is concerned that the descriptions of those calculations lack sufficient clarity and introduce certain ambiguities that may make it challenging for manufacturers to follow the methodology and

accurately replicate calculations for selected products. To provide greater clarity, we urge CMS to provide example calculations for illustrative drugs. These calculations should be representative of the complex situations described earlier, such as weight-based dosing or dosing variations across indications. The calculations will help ensure there is sufficient predictability in how CMS will interpret and apply these complex methodologies.

60.2 Limitations on Offer Amount

BMS is concerned that policies contained within Section 60, Negotiation Process, including but not limited to the process by which CMS will determine an offer, will de-value pharmaceutical advancements that are currently on the market and also result in even further chilling effects on future innovation. Given the novelty of this price setting program, CMS will face exceptional challenges in establishing the initial infrastructure to collect data and set prices.

To preserve patient access to innovation, BMS generally believes that the MFP should always be at or near the MFP ceiling—that is, the higher of the sum of the plan specific enrollment weighted amounts or the applicable percent of the non-FAMP—for each selected product. BMS also urges CMS to carefully consider situations where issues of patient access or preservation of incentives for innovation demand that a selected drug should be paid at the MFP ceiling. To help preserve patient access and engage in a fair and transparent process, BMS recommends that, at a minimum, CMS set all MFPs at the MFP ceiling price for IPAY 2026. Should CMS choose *not* to set prices at the MFP ceiling price, we offer several situations for CMS to consider below which we believe warrant special consideration.

- **MFP at Ceiling Price when Patient Access Imperiled:** In negotiating the MFP, there may be particular instances where a manufacturer demonstrates that setting the MFP below a particular price would imperil patient access to the selected drug. Research has shown that government-imposed pricing restrictions can discourage innovation and impede patient access to needed therapies.⁴¹ We urge CMS to ensure that patient access is a paramount consideration in negotiations with manufacturers when setting the MFP. In doing so, CMS should give significant weight to any evidence offered by a manufacturer that the setting of an MFP below a particular price would hinder patient access, and specify that, in such cases, the MFP will not be set below the lower of such price or the MFP ceiling price.
- **MFP at Ceiling Price for Initial Years into which Patent Protection Exists:** CMS should not set the MFP for selected drugs below the MFP ceiling price into which patent protection extends. BMS disagrees with CMS' position that it might adjust the price downward if the selected drug has patents or exclusivities that will last for a number of years. We ask CMS to place significant weight on whether, based on information submitted by the manufacturer, the selected drug will have any remaining patent protection at the start of the price applicability period. Given that a patent protection period can extend beyond a regulatory exclusivity period, we note that it may very well be the case that there will be remaining patent protection for a selected drug that extends into the price applicability period. To support continued innovation, we ask CMS to honor any remaining patent period for selected drugs by specifying that the MFP will not be set below the MFP ceiling price for any year of the price applicability period into which the drug's patent protection period extends. In this regard, we note that the Guidance suggests that an extended patent protection could serve as a reason to revise the "preliminary price" downward. That, too, would intrude upon patent protection in a way that Congress did not envision.

⁴¹ D. Schulthess and H. Bowen, "The Historical Impact of Price Controls on the Biopharma Industry," *Vital Transformations* (Nov. 22, 2021); see, e.g., D. Acemoglu & J. Linn, Market Size in Innovation: Theory and Evidence from the Pharmaceutical Industry, *Q. J. OF ECON.*, Vol. 119 (2004); see T. Abbott & J. Vernon, The Cost of US Pharmaceutical Price Reductions: A Financial Simulation Model of R&D Decisions, 28 *MANAGERIAL & DECISION ECON.* 293 (2007).

- **MFP at Ceiling for a Small Molecule Parity:** To help preserve small molecule innovation in parity with large molecule innovation, CMS should set the MFP for a drug (small molecule) at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval. We are concerned that the nine- and 13-year distinction arbitrarily promotes large molecule biologic innovation to the detriment of small molecule drug innovation. Disincentivizing manufacturers from investing in small molecule drugs presents serious risk to patient access to effective treatment. CMS should promote small molecule drug development to the greatest extent possible by counterbalancing the incentives that place a disproportionate emphasis on biologics development at the expense of small molecule drug development.
- **MFP at Ceiling for Preference on Medical Guidelines:** If a medication is listed as a preferred choice in medical guidelines for any indication, CMS should default to the ceiling price in recognition of the innovation, based on scientific rigor, that that product brings to patients and the health care system. Clinical practice guidelines are developed through a systematic review of evidence and careful consideration of a treatment's benefits/disadvantages compared to alternative therapies. Guidelines are developed by "a knowledgeable, multidisciplinary panel of experts and representatives from key affected groups" and take care to consider a thorough and wide range of perspectives as recommendations are developed.⁴² Additionally, guidelines committees reconsider and re-evaluate recommendations whenever new evidence is brought forward, assuring the medical community that patient care is held to the highest, safest, most evidence-based standards.
- **MFP at Ceiling for States Referencing MFP:** Multiple states have proposed or enacted legislation that would (or could) result in the state using a selected drug's MFP as a reference point in setting a pricing or payment limit that would apply to commercial or other non-Medicare markets.⁴³ Extending the MFP beyond Medicare markets would fundamentally disrupt the careful balance under the price setting program. Congress did not intend for this program to grind the wheels of medical innovation to a halt, and the scope of the MFP is limited accordingly. CMS should recognize the importance of protecting incentives for innovation by mitigating the harmful impact of the expansion of the MFP beyond the Medicare market and, thus, outside of that contemplated under the statute. To mitigate these serious concerns (and consistent with the statutory requirement to consider research and development costs as part of price setting), CMS should specify that the MFP will not be set below the MFP ceiling price where the manufacturer shows that the MFP will be used as a reference point in setting a pricing or payment limit outside of the Medicare market under state law, regulation, or policy.

60.2.2 Sum of Plan Specific Enrollment Weighted Amounts

In calculating the sum of plan specific enrollment amounts for selected drugs, CMS intends to use Part D PDE and Direct and Indirect Remuneration (DIR) data reported by plan sponsors.

As a preliminary matter, BMS asks CMS to clarify that the "plan specific enrollment weighted amount" does not include price concessions from manufacturers unless passed through at the point-of-sale. This clarification is necessary to align section 1194(c) with CMS' long-standing policy regarding the Part D negotiated price. Congress specifically defined "plan

⁴² Ernesto Guerra-Farfan et. al. "Clinical practice guidelines: The good, the bad, and the ugly" (Jan. 29, 2022), available at [https://www.sciencedirect.com/science/article/abs/pii/S0020138322000778#:~:text=Clinical%20practices%20guidelines%20\(CPGs\)%20play,in%20a%20time%20efficient%20manner](https://www.sciencedirect.com/science/article/abs/pii/S0020138322000778#:~:text=Clinical%20practices%20guidelines%20(CPGs)%20play,in%20a%20time%20efficient%20manner).

⁴³ See, e.g., S.B. 967, Va. Gen. Assembly (2023) (providing that the prescription drug affordability board "may adopt the Medicare maximum fair price ... for a prescription drug product as the upper payment limit amount"); H.F. 17, Minn. Leg., 93rd Sess. (2023) ("When setting an upper payment limit for a drug subject to the Medicare maximum fair price under United States Code, title 42, section 1191(c), the board shall set the upper payment limit at the Medicare maximum fair price.").

specific enrollment weighted amount” by reference to the “negotiated price” of the drug under Part D.⁴⁴ In turn, CMS regulations define the Part D “negotiated price[]” to be “inclusive of all price concessions from *network pharmacies*, except those contingent price concessions that cannot reasonably be determined at the point-of-sale,” but, notably, does **not** include price concessions from manufacturers.⁴⁵ Accordingly, there is no requirement that this price reflect price concessions from non-pharmacy third-parties, such as manufacturers.⁴⁶ Rather, PDPs and MA-PDs “may” choose whether to include manufacturer price concessions in the Part D negotiated price, to the extent they are made available at the point-of-sale. As CMS puts it: “Part D sponsors are allowed, but generally not required, to apply rebates and other price concessions at the point of sale to lower the price upon which beneficiary cost-sharing is calculated.”⁴⁷

Further, BMS notes that it does not have access to these data sources, and we request that CMS provide access to enable manufacturers to independently verify and reproduce calculations of plan specific enrollment weighted amounts for selected drugs.

While BMS appreciates CMS’ analysis of monthly Part D plan enrollment changes during 2022 to identify months with the lowest enrollment fluctuations (*e.g.*, December) for purposes of computing the sum of plan specific enrollment weighted amounts, we encourage the Agency to consider enrollment data encompassing the totality of calendar year to account for any significant fluctuations in the overall enrollment (*e.g.*, Medicare enrollees may change their prescription drug coverage at multiple points throughout the year, such as through Open Enrollment, as newly-eligible beneficiaries, or if utilizing the low income subsidy). As CMS is evaluating the PDE records for the full calendar year, we believe that the enrollment input should match that same period. Therefore, given the multiple opportunities for member enrollment changes throughout the year, it would be more appropriate for the Agency to use the full calendar year as an input in the sum of plan specific enrollment weighted amounts to avoid unnecessarily skewing the results.

60.2.3 Average Non-Federal Average Manufacturer Price

BMS notes that the statute defines extended-monopoly and long-monopoly drugs by reference to whether 12 or 16 years have elapsed since the initial FDA approval, but the statute is silent as to whether manufacturers should count 12 or 16 years to (1) the selected drug publication date; or (2) the start of the IPAY (which is generally 2 years after the selected drug publication date). In its Guidance, CMS appears to also be inconsistent on this point and seems to apply the length of time one way when describing the Initial Delay Request made by a biosimilar manufacturer (*i.e.*, to the start of the IPAY)⁴⁸ and another when determining the monopoly type as well as applicable percent specified for the purposes of establishing a ceiling price (*i.e.*, to selected drug publication date).⁴⁹ BMS requests that CMS provide clarity and consistent application that allows for transparency and planning.

⁴⁴ SSA § 1194(c)(2).

⁴⁵ 42 C.F.R. § 423.100 (emphasis added). CMS has recently promulgated a rule that will revise the definition of “Part D negotiated price” effective January 1, 2024. However, the revisions do not alter the fact that manufacturer price concessions are excluded from the Part D negotiated price. The new definition will require that the Part D negotiated price made available at the point of sale “include[] all price concessions ... from network pharmacies or other network providers,” including performance-based price concessions from pharmacies that may not be confirmed at the point of sale. 87 Fed. Reg. 27,704, 27,899 (May 9, 2022) (emphasis added).

⁴⁶ See also 87 Fed. Reg. at 27,835 (the Part D negotiated price is “the price paid to the network pharmacy or other network dispensing provider for a covered Part D drug dispensed to a plan enrollee that is reported to CMS at the point of sale by the Part D sponsor”).

⁴⁷ *Id.* at 27,835.

⁴⁸ See Guidance at 17 (“As such, Biosimilar Manufacturers may submit an Initial Delay Request for initial price applicability year 2026, provided that the Reference Drug named in the request will have been licensed for between 12 and 16 years prior to the start of the initial price applicability year on January 1, 2026.”).

⁴⁹ See *id.* at 45 (“The first approval date under section 505(c) of the FD&C Act or the first licensure date under section 351(a) of the PHS Act, as applicable, associated with the initial FDA application number for the active moiety / active ingredient (or fixed combination drug) must be on or before September 1, 2007.”).

Specifically, on CMS' proposed process in 60.2.3, we seek the following clarifications and recommendations:

- In steps 1 through 11, we ask CMS to clarify when "unit" refers to the non-FAMP unit (e.g., tablets) versus the PDE unit (e.g., milligrams). We also ask CMS to clarify when "non-FAMP" price refers to the entire NDC-11 package, one non-FAMP unit, or one PDE unit. We find that step 9 is particularly unclear on this.
- BMS appreciates CMS' clarification that no selected drug would be considered an extended-monopoly drug for purposes of negotiation prior to initial applicability year 2030. BMS understands that such drugs or biologics will be treated as short-monopoly drugs for the purposes of applying the applicable percent specified in section 1194(c)(1)(C) of the Act (that is 75% of non-FAMP).⁵⁰
- In addition to adjusting non-FAMP for CPI growth for the 12 months ending September 2022,⁵¹ CMS should also adjust for CPI growth for the 12 months ending September 2023. September 2023 CPI will be released on October 12, 2023. While this will be after the October 2, 2023, deadline for manufacturer data submission, it will be available for CMS' use in generating the ceiling price.

60.3.1 Identifying Indications for the Selected Drug and Therapeutic Alternatives for Each Indication

BMS supports CMS' decision to consider FDA-approved resources when identifying indications for a selected drug as well as the body of information that will be considered (manufacturer/public data, clinical guidelines, peer reviewed studies) when identifying therapeutic alternatives. As CMS prepares to examine a large volume of evidence across multiple indications and multiple therapeutic alternatives within each indication and conduct several simultaneous assessments, **BMS strongly recommends that CMS plan for additional dialogue with manufacturers, who have the most expertise with the selected drug, or at minimum, issue advance notice about the possible selection and the therapeutic alternatives that are likely to be considered by the Agency.**⁵² BMS also requests the opportunity to submit comparative effectiveness evidence data *after* CMS has identified indications and therapeutic alternatives.

In ex-U.S. countries, value assessments are typically conducted for a single indication and pricing and access mechanisms are subsequently applied behind the scenes to account for the differential benefit of each indication. But these mechanisms often have data collection and financial flow issues.⁵³ CMS should expect similar operational challenges to translate varying indication values to a single MFP—for example, oncology therapies can have dozens of indications, and the value story across these indications is unique given unique patients' needs; and for fixed-dose combinations, as well as single agents used in combination, value assessments have additional complexity. The consequences of inaccurate value determination can lead to restricted patient access to combination therapies. To prepare for this unprecedented task within a short amount of time with essentially no framework or examples on which to rely, **BMS recommends that CMS plan for additional consultation with stakeholders.**

60.3.2 Developing a Starting Point for the Initial Offer

BMS strongly objects to the use of the FSS or Big 4 price as a reference point for the initial offer. CMS' use of non-FAMP in section 60.2.3 already leverages the basic calculations underlying FSS and Big 4 prices. By also referring to final FSS and Big 4 prices, CMS would be capturing complexities of those calculations that should not apply. For instance, FSS and Big 4 prices can be heavily influenced by short-term commercial discounts and thus would serve as an inappropriate benchmark for setting a longer-term price. Further, reference to FSS and Big 4 prices in the final Guidance could have

⁵⁰ *Id.* at 44.

⁵¹ *Id.*

⁵² For example, in Germany, the Gemeinsamer Bundesausschuss (G-BA) offers pharmaceutical companies the opportunity of consultation prior to the beginning of benefit assessment procedures, relating to the appropriate comparator and the documents and studies to submitted.

⁵³ Office of Health Economics, "The Debate on Indication-Based Pricing in the U.S. and Five Major European Countries" (May 2018), available at <https://www.ohe.org/wp-content/uploads/2018/05/OHE-IBP-Final-Report-May-2018-Revised.pdf>.

the unintended consequence of reducing or eliminating manufacturer voluntary discounts that lead to lower prices for those government channels.⁵⁴

BMS is also concerned that the language for describing when CMS would leverage FSS and Big 4 prices is very unclear. As currently written, one of the three situations which would lead to use of these prices as the starting point for the initial offer is “if there is a single therapeutic alternative with a price above the statutory ceiling.”⁵⁵ It seems that this would always be likely to occur and would further signify that the statutory ceiling has *already* been reduced to a more competitive price than the therapeutic alternative. This would make referencing FSS or Big 4 price unjustified.

CMS proposes to begin developing a starting point for the initial offer by identifying therapeutic alternatives within the same drug class based on properties such as chemical class, therapeutic class, or mechanism of action before considering other classes. This broad Guidance could potentially allow inclusion of outdated technologies and generic drugs as therapeutic alternatives. BMS strongly objects to the inclusion of generics and biosimilars in the basket of therapeutic alternatives and notes that if CMS determines a generic to be the appropriate therapeutic alternative to a drug, then *de facto* that drug should not be considered single sourced for the purposes of drug selection criteria.

60.3.3 Adjusting the Starting Point Based on Clinical Benefit

BMS appreciates CMS’ decision to broadly evaluate the body of clinical evidence submitted by manufacturers and the public to determine the clinical benefit of a selected drug and therapeutic alternatives. We commend CMS’ intent to use a qualitative approach to preserve flexibility to consider nuanced differences. To ensure the proper consideration of information between a selected drug and alternatives, **manufacturers should have insight into CMS’ literature review and the opportunity to comment on the accuracy of the proposed value capture.**

When considering evidence about alternative treatments and added benefits of a selected medicine, BMS also encourages CMS to consider several critical elements in order to capture the full- and long-term value of a treatment, including: clinical outcomes, medical association guidelines, and health equity and subpopulation benefits. **Equally important as the clinical benefits are the non-clinical health outcomes and benefits**, including but not limited to, reduction in burden to the health care system, patient preferences, treatment adherence, and scientific spillover. **Non-clinical benefits should be weighted heavily when determining the starting point for the MFP offer.** Also, important to consider is situations in which medicines treat conditions with a limited number of treatment alternatives, as well as the innovation and societal progress that is achieved in treating serious medical conditions, including incremental success achieved to address unmet needs and provide hope for patients.

60.3.3.1 Analysis for Selected Drugs with Therapeutic Alternative(s)

BMS supports CMS’ intent to analyze a full body of qualitative information when reviewing the clinical benefit and encourages CMS to go beyond outcomes and safety profiles of the selected drug and therapeutic alternatives to deeply consider a robust body of information when assessing a selected drug’s impact on unmet need and therapeutic advance.

CMS intends to define unmet need as treating a disease or condition in cases where very limited or no other treatment options exist. This is an unduly restrictive definition of unmet need. As CMS will assess medications in the middle of their lifecycles, BMS recommends that unmet need be considered from initial approval to the time of assessment. Additional value should be particularly considered for those medications that treat serious medical conditions, including those that

⁵⁴ CMS may remember a similar situation that occurred after the creation of Best Price in the MDRP that resulted in market distortions, unintended consequences, and the need for additional federal legislation. See Nicholas C. Fisher, The 340B Program: A Federal Program in Desperate Need of Revision After Two-And-A-Half Decades of Uncertainty, 22 J. Health Care L. & Pol’y 25 (2019).

⁵⁵ Guidance at 49.

make incremental steps toward curative goals. Further, unmet need should be viewed from the perspective of patients and providers. Unmet need should accordingly encompass a spectrum of characteristics, such as: alternative dosing regimens; route of administration; reduction of side effects; and shorter treatment periods.

60.3.3.2 Analysis for Selected Drugs Without Therapeutic Alternatives

As conveyed elsewhere, BMS strongly disagrees with CMS' proposal in 60.3.2 to determine the starting point of a selected drug with no therapeutic alternative based on the FSS or Big Four price if they are below the statutory ceiling. BMS believes unmet need warrants a starting price of the ceiling price in these situations.

60.4.1 Provision of an Initial Offer and Justification

It is critical for manufacturers to understand the context and basis for the MFP offer. To increase transparency and further CMS' two-way dialogue with a manufacturer of a selected drug, we urge the Agency to consider releasing a confidential report for the manufacturer alone alongside the initial offer and justification to better inform manufacturer counteroffers and subsequent data submissions. Given the anticipated submissions from members of the public, including academic experts and clinicians, CMS will have a significant amount of information on a selected drug, as well as latitude in determining what is included in an initial concise justification. Manufacturers are unlikely to have enough context to effectively address potential evidence gaps in the initial offer, which would impact manufacturers' abilities to craft an appropriate, evidence-based counteroffer. **We therefore ask the Agency to provide a confidential report to manufacturers with details on the Agency's assessment of a selected product, as well as the evidence which was deemed relevant and appropriate from stakeholder submissions.** The concise justification and report should, at a minimum, include the following information: (1) evidence sources CMS considered, including third-party assessments the Agency may have formally or informally considered; (2) how each factor was weighted in CMS' MFP determination; (3) how patients and other stakeholders engaged in the process and influenced CMS' decision-making; and (4) benefits and impacts that CMS considered.

60.4.3 Negotiation Process After Manufacturer Counteroffer

BMS has serious concerns with CMS' process for interfacing with manufacturers of selected drugs. As set forth in the Guidance, manufacturers may have up to three meetings with CMS—all occurring *after* the initial MFP is set by the Agency. While we agree with CMS that meetings occurring after CMS rejects a manufacturer's counteroffer is necessary and will allow for a more efficient and effective process, starting meetings only after rejection of the manufacturer counteroffer is too late. In our vast experience negotiating with states and payers, the proposed process is highly unusual and arbitrary.

BMS strongly believes that CMS should meet with the manufacturer of a selected medicine at *multiple points* during the "negotiation" process to allow manufacturers to address questions and provide additional commentary on the value of these medicines. **At a minimum, we urge CMS to meet with manufacturers during six discrete periods in the value assessment process—but without limitation on the number of meetings deemed necessary by the parties:** (1) prior to drug selection; (2) after drug selection but prior to initiation of the "negotiation" process; (3) immediately after manufacturer data and evidence submissions; (4) prior to CMS presenting initial MFP offer; (5) after CMS presents the initial offer; and (6) after a counteroffer is made.

60.5 Application of the MFP Across Dosage Forms and Strengths

Regarding how CMS intends to apply the MFP across dosage forms and strengths, BMS finds Steps 1 through 10, describing the process to apply final MFPs to NDC-11s, to be very unclear. Similar to comments on 60.2.3, we believe the term "unit" sometimes refers to non-FAMP unit (e.g., tablets) and sometimes refers to PDE unit (e.g.,

milligrams).⁵⁶ Where Steps 1 through 4 refer to NDC-9, we believe the intent is NDC-11.⁵⁷ The term “dosage form and strength” appears to refer to the NDC-9 level in step 1, but the NDC-11 level in step 10.⁵⁸ Additional clarity will be needed to understand this section.

60.5.1 Application of the MFP to New NDAs/BLAs or NDCs

We seek to reiterate our strong opposition to CMS’ policy at 30.1 to identify “qualifying single source drugs” at the active moiety/active ingredient level. BMS believes that this policy is contrary to and beyond the scope of the IRA statute, creates unnecessary confusion in the face of statutory clarity, departs from well-established means of identifying distinct products, and will be detrimental to future innovation.

Section 80 – MFP Eligible Individuals

BMS seeks clarification on the definition of “MFP Eligible Individuals” in Section 80, particularly as it relates to Part D enrollees. For drugs furnished under Part B, an MFP-eligible individual is one who is enrolled under Part B (and applicable Part C plans) and if *payment* may be made under Part B for such selected drug.⁵⁹ For drugs furnished under Part D, an MFP-eligible individual is one who is enrolled under Part D (and applicable Part C plans) and if *coverage* is provided by a Part D plan for such selected drug.⁶⁰ We also interpret coverage to mean that a selected drug was billed.

We note that the subtle difference in CMS’ language—payment versus coverage—matters. Take, for example, a situation in which a Part D patient opts *not* to use insurance for a selected drug. The drug is covered and provided to the patient, and based on CMS’ proposed definition, we take this to mean that a manufacturer would still have to provide the MFP on that drug because the patient would be an eligible individual. Manufacturers need certainty, such as through claims data, to verify that MFP eligible individuals are receiving MFP drugs at the MFP. This gap in CMS’ definition makes it more difficult for stakeholders to ensure accuracy and operational success.

BMS asks CMS to modify and/or clarify the definition of a Part D-eligible individual to be consistent with the approach for Part B, specifically, an individual who is enrolled under Part D and if *payment* is provided under Part D for such selected drug. In effect, this could mean that in order for a manufacturer to offer the MFP for a selected drug, that drug must be billed as a Part D (or applicable Part C) product. We look forward to CMS clarifying this topic in its updated Guidance.

Section 90 – Manufacturer Compliance and Oversight

90.2 Monitoring of Access to the MFP

BMS encourages CMS to support manufacturers in providing access to the MFP by mandating that providers seeking to benefit from the MFP must report a minimally necessary data set to the manufacturer or its vendor for the purposes of MFP discount validation in a timely manner, according to standard business practices, and in alignment with non-duplication requirements. CMS should expressly acknowledge that manufacturers may establish, receive, review, and as necessary, audit MFP validation data to ensure manufacturers have provided MFP access in accordance with the statute. CMS should also mandate that providers submit MFP validation data. As mentioned in our comments to section 40.4

⁵⁶ *Id.* at 44.

⁵⁷ *Id.*

⁵⁸ *Id.*

⁵⁹ *Id.* at 63 (emphasis added).

⁶⁰ *Id.*

and 40.4.1, it would be otherwise impossible for the manufacturer, much less CMS, to ensure access to the MFP consistent with statutory requirements.

Relatedly, CMS also acknowledges that “CMS intends to leverage existing mechanisms to ensure that ... the MFP for a selected drug is provided only to MFP-eligible individuals.”⁶¹ CMS notes that each Medicare Part D plan has a unique processor identification number (RxBIN)/processor control number (PCN), which will ensure that the pharmacy is able to identify at the point-of-sale whether the individual is an MFP-eligible individual.⁶² BMS requests similar access to this type of standard information in its requests for data to validate the discount extension. CMS need not prescribe the data set; rather, the Agency should provide the manufacturer with the flexibility to determine the data necessary to validate the MFP discount. Regarding the example included in the Guidance, the manufacturer would be unable to validate that the individual was an MFP-eligible individual, as no data is provided to the manufacturer through the chargeback system to validate such an MFP transaction.

CMS also acknowledges that “the private sector may make modifications to these existing mechanisms [chargeback or rebate] to effectuate access to the MFP.”⁶³ Such changes are not only possible, but they would be absolutely necessary, as the current chargeback system does not contain the proper data elements to accurately and appropriately extend the discount. BMS therefore urges CMS to make clear that providers must submit the reasonable data requested by a manufacturer, consistent with the data manufacturers would request under standard business practices.

CMS also solicits feedback on a process by which stakeholders could report to CMS instances of failure to provide MFP access.⁶⁴ CMS should consider the paramount role of data to support its efforts. Absent transactional data, CMS will be challenged to accurately “investigate reports of potential noncompliance, and if appropriate, impose CMPs on the... manufacturer.”⁶⁵ It is unclear what CMS believes the Agency will use to investigate and impose fines, absent an expectation for providers to submit data, and absent CMS’ access to that data. Additional rationale for CMS’ role in clarifying its expectation for providers to submit MFP validation data is provided in response to sections 40.4 and 40.4.1

BMS requests clarification regarding what CMS intends by stating: “Should it subsequently be determined that the 340B ceiling price is lower than the MFP for the selected drug, the manufacturer would have to provide to the covered entity the difference between the MFP and the 340B ceiling price.”⁶⁶ Because the ceiling price is calculated quarterly, the only time a ceiling price is “subsequently determined” to be a different price than its quarterly price is pursuant to a pricing restatement. We presume that is the context for CMS’ statement, but seek confirmation on this point. CMS should confirm that it is not using the “subsequently determined” language to attempt forcing an extra-statutory obligation on a manufacturer to offer 340B discounts pursuant to a 340B replenishment model for an infinite period of time in the future.

90.4 Monitoring for Bona Fide Marketing of Generic or Biosimilar Product

BMS opposes this proposal of continued monitoring for whether “robust and meaningful competition exists in the market” for a given drug. This approach is found nowhere in the statute and would violate the statute’s clear command as to exclusion from drug selection.

⁶¹ *Id.* at 65.

⁶² *Id.*

⁶³ *Id.*

⁶⁴ *Id.* at 66.

⁶⁵ *Id.*

⁶⁶ *Id.*

The IRA “negotiation” framework applies only to a single source product, meaning that if a different source exists (i.e., a generic or biosimilar), the product categorically cannot come from a single source. Further, the plain meaning of the statutorily unqualified term “marketed” reveals that Congress did not contemplate extra-statutory concepts related to degree of utilization or “robust and meaningful” competition.

Both CMS and FDA, in established contexts Congress would have understood, have long determined a product to have been marketed based on a point-in-time standard. For instance, CMS has long used this concept in the MDRP, where “market date” has been defined in guidance to mean “the earliest date the drug was first marketed under the application number of any labeler,”⁶⁷ and where “marketed” is defined under the National Drug Rebate Agreement to mean the date on which the product was first “available for sale by a manufacturer in the states.”⁶⁸

Interposing subjective, indefinite criteria in the determination of when a generic is “marketed” is inappropriate, subject to abuse, ultra vires, and inconsistent with the terms of the statute. BMS therefore supports CMS taking a position that aligns with the “market date” reported under the MDRP because it presents an established, uniform standard that would help ensure that manufacturers are not inappropriately subject to selection, negotiation, application of an MFP, or an excise tax. Adopting this standard would also help ensure clarity and consistency in the identification of these key dates under Medicare price setting.

BMS urges CMS to use this standard for identifying both: (1) the date on which a generic or biosimilar is first marketed; and (2) the date on which CMS determines that to be the case.

Section 100 – Civil Monetary Penalties

While dictated by statute, the CMPs associated with the IRA “negotiation” framework are virtually unparalleled in magnitude and strongly warrant CMS implementing special safeguards against erroneous and inappropriate application. BMS asks that CMS provide manufacturers with notice of any preliminarily identified deficiency and at least 30 days to cure such deficiency before any sanction is imposed. In addition, CMS should provide manufacturers with a reasonable opportunity to dispute CMS’ findings prior to the imposition of any sanction to better ensure that sanctions are not imposed based on legal or factual errors by the Agency.

First, the raw magnitude of the penalties under the statute warrant implementation of such pre-sanction procedural safeguards. It is vital that CMS rely on penalties as an enforcement mechanism only when doing so is clearly warranted, and not for minor mistakes or inadvertent errors. As such, penalties should be imposed only if they are found to be appropriate following the completion of a reasonable dispute resolution process, and if deficiencies persist after a manufacturer has been given a reasonable opportunity (at least 30 days post-notice) to cure the alleged deficiencies.

Further, pre-sanction procedural safeguards play a critical role in reducing the risk of erroneous deprivations of property. CMPs could be in the hundreds of millions of dollars, raising fundamental concerns of due process of law if CMS were to impose penalties of this enormity without any mechanism for meaningful pre-deprivation review.⁶⁹

Pre-sanction procedural safeguards are also warranted in light of the complexity and newness of the price setting program. It is inevitable that there will be significant ambiguity with respect to program requirements, especially in the

⁶⁷ CMS, MDRP Data Guide § 5.15 (Apr. 2022).

⁶⁸ National Drug Rebate Agreement § I(I), 83 Fed. Reg. 12,770 (Mar. 23, 2018).

⁶⁹ See generally *Matthews v. Eldridge*, 424 U.S. 319 (1976) (factors for evaluating when due process requires a pre-deprivation hearing include the nature and magnitude of the private interest affected and the risk of an erroneous deprivation, along with any implicated governmental interest).

early years of implementation. As such, manufacturers will necessarily be seeking to comply with requirements in a landscape of marked uncertainty. In these circumstances, it would be patently unreasonable if, for example, CMS began imposing vast monetary penalties (e.g., \$1 million per day) due to inadvertent technical mistakes or innocent misunderstandings.

Additionally, it bears noting that there is ample precedent for CMS establishing similar safeguards in analogous contexts. For example, just recently, CMS established a multi-layered dispute resolution process under the new Medicare Part B discarded drug refund process. That process is specifically intended to allow for resolution of issues *before* the issuance of any final invoice. In implementing this process, CMS acknowledged that, while not expressly required by statute, “proactively establishing such a process [would] aid in the successful implementation of [the law].”⁷⁰

CMS has the legal authority to implement the requested safeguards. CMS has broad discretion with respect to implementing mechanisms to “monitor compliance by a manufacturer with the terms of a [Drug Price Negotiation Program] agreement.”⁷¹ The pre-sanction dispute resolution and notice-and-cure processes are both types of compliance monitoring mechanisms that CMS has clear statutory authority to implement.

Section 110 – Part D Formulary Inclusion of Selected Drugs

BMS agrees with CMS that the statute requires a selected drug, for which an MFP is in effect, to be on all Part D formularies. We note that it is critical for CMS to recommend, and health plans to design, formularies that promote beneficiary access to *all* medicines, both MFP and non-MFP medicines.

BMS is concerned with how onerous formulary management policies may impede access to care, particularly in light of government price setting, and we are disappointed that CMS did not address how price setting might have unintended downstream consequences for the Part D program, including plan competition dynamics and increased utilization management (UM), and, most of all, for patients. We urge CMS to critically examine these impacts and prioritize shared decision-making between patients and providers, not health plans, on appropriate treatment plans.

In general, BMS supports public policies that ensure that health plan UM techniques follow clinical guidelines, provide timely and transparent responses to patients, and allow for physician/patient choice based on individual patient medical needs and desired outcomes. While UM techniques, such as step therapy and prior authorization policies, are purportedly designed to manage drug costs, these UM practices can lead to medication adherence issues, delayed access to medications, negative health outcomes for patients, and increased administrative burden. Delays in effective treatment can increase costs to the health care system and cause patients to suffer unnecessarily.⁷² Excessive UM hurdles can also result in delays in access, increase administrative burden, diminish clinical autonomy, lower job satisfaction, and exacerbate feelings of burn-out for health care providers.⁷³

UM techniques also disproportionately impact communities of color, further exacerbating existing health disparities. In a survey of over 3,600 patients, majorities of Hispanic Americans (64%) and Black Americans (55%) report being subject to

⁷⁰ 87 Fed. Reg. 69,404, 69,731 (Nov. 18, 2022).

⁷² See Strand V, Tundia N, Song Y, Macaulay D, Fuldeore M. Economic Burden of Patients with Inadequate Response to Targeted Immunomodulators for Rheumatoid Arthritis. *J Manag Care Spec Pharm*. 2018 Apr;24(4):344-352 and Avalere Health, Step Therapy Can Lead to Higher OOP Costs for Crohn’s Disease Patients (October 2020), available at <https://avalere.com/insights/step-therapy-can-lead-to-higher-oop-costs-for-crohns-disease-patients>.

⁷³ AMA, 2021 AMA prior authorization (PA) physician survey, available at <https://www.ama-assn.org/system/files/prior-authorization-survey.pdf>.

at least one UM barrier to accessing medicines, compared to 44% of White Americans.⁷⁴ Many physicians of color also recognize the impact of UM on their minority patients; in a survey by the Association of Black Cardiologists, physicians agree “very much” that prior authorization contributes to delays in care (61%), higher patient confusion (50%), increased medication discontinuation (45%), reduction in medication adherence (32%), and worse outcomes (16%).⁷⁵

While not contemplated in the Guidance, we also urge CMS to think critically about how Part D redesign will affect patient access to MFP and non-MFP medicines. In fact, BMS asserts that reforms to UM are even more critical in light of Part D redesign; for these new Part D redesign changes to produce the desired outcome for enhanced patient access, the Part D program must maintain its competitive, market-based structure. As health plans assume significantly greater liabilities as a result of the IRA, BMS is concerned they may employ more aggressive UM techniques to restrict patient access to medically necessary care. Historically, plans have used creative formulary design, onerous prior authorization schemes, and step therapy delays to limit plan liabilities, all of which adversely affect enrollees’ access to medicines. BMS is concerned that without appropriate guardrails and patient protections against UM, many of these trends may be exacerbated under the new Part D benefit design, which would run counter to the intent of the redesign policy.

BMS urges CMS to critically consider the potential downstream impacts of government price setting on Part D plan dynamics and patient access. We assert that it is necessary for the Agency to contemplate these issues further in future guidance and rulemaking processes.

Section 120 – Application of Medicare Part B and Part D Prescription Drug Inflation Rebate Programs to Selected Drugs

CMS Should Clarify That a Selected Drug is Not Subject to an Inflation Rebate: CMS asserts: “The Part B and Part D inflation rebate programs apply to selected drugs, regardless of the status of the drug as a selected drug. Alternatively said, whether a drug is a selected drug will have no bearing as to whether the drug is also subject to the Part B and Part D inflation rebate programs.”⁷⁶ This assertion, however, is incorrect, and we ask CMS to clarify a selected drug is not subject to an inflation rebate.

By statute, the Part B inflation rebate calculation is based in relevant part on the amount by which “106 percent of the amount determined under paragraph (4) of [section 1847A(b) of the SSA for [a part B rebatable drug] during the calendar quarter... exceeds [] the inflation-adjusted payment amount... for such part B rebatable drug during the calendar quarter.”⁷⁷ Notably, the circumstances under which an amount is “determined” under paragraph (4) is dictated by section 1847A(b)(1) (*i.e.*, paragraph (1)).⁷⁸ Specifically, paragraph 1 dictates a payment amount of, “in the case of a single source drug or biological... , 106 percent of the amount determined under paragraph (4) or in the case of such a drug or biological product that is a selected drug... , 106 percent of the amount determined under paragraph (4) or in the case of such a drug or biological product that is a selected drug... , 106 percent of the maximum fair price... applicable for such drug and a year during such period.”⁷⁹ In other words: a *selected* drug’s payment amount is determined under paragraph (1), which amount is determined without regard to paragraph (4). It is only the payment amount for a *non-selected* drug that is determined under paragraph (4). It necessarily follows that the Part B inflation rebate calculation has no application to a selected drug, as, with respect to such a drug, there is no

⁷⁴ PhRMA, “Covered By Insurance But Still Exposed: Barriers to Care for Insured Americans,” available at https://phrma.org/-/media/Project/PhRMA/PhRMAOrg/PhRMA-Org/PDF/P-R/PES-Report-2_final.pdf.

⁷⁶ Guidance at 71.

⁷⁷ SSA § 1847A(i)(3).

⁷⁸ See *id.* § 1847A(b)(1).

⁷⁹ *Id.* § 1847A(b)(1)(B).

amount “determined under paragraph (4).” By the plain terms of the statute, a selected drug cannot be subjected to a Part B inflation rebate.

This is not surprising. A manufacturer should not be obligated to pay an inflation rebate on a selected drug because Medicare expenditures on a selected drug are constrained by the MFP. Thus, with respect to a selected drug, Medicare is shielded from the increase in expenditures occasioned by a price increase that outpaces inflation that an inflation rebate is intended to address. For these reasons, CMS should clarify that a selected drug is not subject to an inflation rebate.

Other Considerations

Diversion and “Spillover”

MFP Spillover Risks: BMS believes (and the statute requires) that the MFP that the government sets should be available to Medicare-eligible beneficiaries only, given that this policy is a Medicare policy intended to reduce prescription drug costs for Medicare patients. BMS, however, is highly concerned with how the scope of the MFP could potentially be expanded beyond the intended Medicare market (“spillover”).

The MFP risks spillover beyond Medicare in two ways: (1) diversion, where Medicare patient status is not established at purchase, risking MFP discount diversion to ineligible individuals; and (2) unintended reimbursement consequences, when commercial payers may seek to adjust to MFP-based reimbursement for non-MFP-eligible individuals, thus compromising patient access to therapies. Spillover risk is also present at the state level.

Diversion to Non-MFP Eligible Individuals: BMS supports the use of a method to effectuate the MFP that gives meaning to the MFP access provision by enabling manufacturers to confirm that a particular unit was in fact used for an MFP eligible individual and therefore in fact entitled to the MFP. To ensure transparency, it is even more important to have a robust mechanism for discount eligibility verification in place due to the lack of administrative and judicial review.

Unintended Reimbursement Consequences: BMS is concerned that due to financial and operational challenges related to utilizing MFP products, unintended reimbursement consequences will likely occur, resulting in treatment switches to non-MFP products, which could also jeopardize patient access to medicines.

We look forward to reengaging the Agency on this topic to ensure that providers remain financially whole, and patients receive the medicines that they need.

Rationale for Exclusion of MFP Units from Average Sales Price (ASP) Calculation: To protect patient access to critical medicines in non-Medicare markets, BMS urges CMS to exclude MFP units from the definition of “unit” for purposes of the ASP calculation. Although Medicare reimbursement for an MFP-eligible Part B medicine will not be based on ASP, non-Medicare payers commonly rely on ASP as a metric for setting reimbursement rates for such drugs. BMS is highly concerned that due to this dynamic, over time, the MFP will increasingly lower the ASP, and as a result, ASP-based reimbursement rates of non-Medicare payers will be increasingly insufficient to make providers whole for their acquisition cost of the selected drug. Moreover, there is real risk that patients insured by non-Medicare payers will not have access to these drugs. BMS asserts, therefore, that it is critical that CMS act to exclude MFP units from ASP to protect patient access to critical medicines in non-Medicare markets.

Fortunately, CMS has clear authority to avoid this serious concern by excluding MFP units from ASP. The ASP statute defines “unit” for ASP purposes to mean:

[W]ith respect to each National Drug Code (including package size) associated with a drug or biological, the lowest identifiable quantity (such as a capsule or tablet, milligram of molecules, or grams) of the drug or biological that is dispensed, exclusive of any diluent without reference to volume measures pertaining to liquids. **For years after 2004, the Secretary may establish the unit for a manufacturer to report and methods for counting units as the Secretary determines appropriate to implement this section.**⁸⁰

The statute expressly delegates broad authority to CMS to define “unit” for ASP purposes—and, notably, the legislative history of the statute reveals that Congress specifically intended the exclusion of “those sales that do not reflect market prices” from ASP.⁸¹ CMS has also previously exercised this authority to exclude specified units from ASP. For example, CMS has defined “unit” for ASP purposes to exclude Competitive Acquisition Program (CAP) units from ASP: CMS’ ASP regulations provide that “[t]he method of counting units excludes units of CAP drugs... sold to an approved CAP vendor... for use under the CAP....”⁸² By excluding CAP units from ASP, CMS excluded from ASP units with prices negotiated by vendors under a federal program that it rightly determined did not reflect market prices, thereby honoring Congressional intent. In doing so, CMS noted that ASP and CAP prices were “intended to be alternatives to each other” and, thus, CAP units should not be included in ASP.⁸³

BMS asserts that MFP units should not be included in ASP—namely, because the MFP is available only with respect to the Medicare market, under certain circumstances. MFP eligible individuals do not include non-Medicare beneficiaries, and, thus, BMS believes that the MFP does not reflect a market price that should be reflected in ASP. In addition, the MFP is an alternative to ASP—it is used in place of ASP to establish Medicare reimbursement rates for MFP-eligible Part B products. For this reason, too, CMS should exclude MFP units from ASP, as it did with CAP units.

To preserve provider reimbursement and ultimately patient access, BMS strongly urges CMS to exercise its authority to define “unit” for purposes of ASP to exclude MFP units from the ASP calculation.

Dispute Resolution Process

Despite stating that the Guidance would include a “dispute resolution process for specific issues that are not exempt from administrative and judicial review under section 1198,”⁸⁴ we are disappointed that CMS does not appear to contemplate such a process. BMS strongly believes that the statute does not prohibit CMS from establishing a dispute resolution process, and furthermore, there is strong policy and operational rationale for doing so.

Given the complexity of implementing a novel price setting program under exceedingly short timelines, as contemplated throughout our comments, there is a high likelihood that errors and disputes will occur, especially within the initial IPAYs. A process for rectifying disputes—including correction of errors in data and evidence interpretation—is therefore critical. To further transparency and accuracy, BMS urges CMS to not only create a dispute resolution process but do so in advance of the September 1, 2023, drug selection date.

Appendix C – Definitions for Purposes of Collecting Manufacturer Specific Data

Although the Guidance enumerates various manufacturer specific data that CMS “must” consider,⁸⁵ the Agency does not address with specificity how these factors will be considered to establish the MFP or adjust the preliminary price. BMS is highly concerned that the data elements that CMS has proposed to establish the MFP do not adequately capture the value of a drug on patients and the broader health care system. Furthermore, BMS continues to urge CMS to specify that the Agency will consider any information submitted by manufacturers as part of the price setting process, even if that information is not tied to a specific statutory factor.

Consistent across Appendix C, BMS recommends that CMS utilize a uniform starting point, and annually thereafter, across all data collections (*e.g.*, January 1, 2020), and *not* mandate information prior to this point absent manufacturer provision of such information. Said differently, BMS believes it is impractical for CMS to select arbitrary dates and timelines for reporting and urges the Agency to reconsider utilizing the nearest month or quarterly cutoff. We are concerned that without a firm date for a look-back period, it could disadvantage and unfairly penalize manufacturers for previous pricing practices and data collection before the law went into effect. Our comments on specific sections of Appendix C follow.

(a) Research and Development (R&D) Costs

Definitions for 1. R&D: Basic Pre-Clinical Research Costs

Based on CMS’ proposal, we believe that the Agency is not considering a full and complete appreciation for pharmaceutical development and has identified irrelevant and inappropriate factors for consideration. Compiling and calculating R&D costs for a drug that has been on the market for over a decade is a complicated process that is not easily reduced to a finite set of specific considerations, factors, or other items. BMS requests CMS to utilize an individual calendar year as a starting point for all manufacturers’ selected drug. We note that it is inappropriate to create a framework that not only considers historical or “lifetime”⁸⁶ data reflective of early research but also assumes that the manufacturer can access information that was not required to be captured and reported. Furthermore, requesting manufacturers to retrospectively collect asset-level pre-clinical data is not feasible. We urge CMS to consider a more precise method.

BMS seeks clarification on the data elements that would satisfy CMS’ inquiry on costs associated with “preparing the selected drug for clinical trials.”⁸⁷ Additional context is needed to determine if this requirement refers to manufacturing costs or costs associated with the drug development process, as CMS’ request is vague. Furthermore, in inquiring about costs tied to personnel, BMS believes it would be pertinent to present costs associated with both internal and external function service providers that are necessary in conducting the various studies associated with the selected drug. It is vital that CMS assess these costs in totality when determining the initial MFP price and consider all direct and indirect costs that the manufacturer incurs throughout the life cycle of the selected drug.

Definitions for 2. Post-Investigational New Drug (IND) Application Costs

Repeatedly, CMS refers to “personnel”⁸⁸ in Appendix C. BMS requests that CMS define “personnel” and explicitly consider both the internal and external function service providers that support and are directly associated with the study. Additionally, BMS encourages CMS to further clarify what the Agency means in reference to “preparing the

⁸⁵ Guidance at 52.

⁸⁶ *Id.* at 82.

⁸⁷ *Id.* at 84.

⁸⁸ *See id.* at 83, 84, 85, 87.

selected drug for clinical trials.”⁸⁹ We believe this phrasing is vague, and we are unclear if this includes the costs of the manufacturing and costs of developing the processes.

Definitions for 3. R&D: Completed U.S. Food and Drug Administration (FDA)-Required Phase IV Trials

BMS is concerned that CMS continues to demonstrate a lack of full understanding of pharmaceutical development and research. There are different types of clinical trials conducted post-FDA approval, and CMS needs to account for these factors.

Definitions for 4. R&D: Post-Marketing Trials

CMS needs to clarify the scope of post-marketing trials and specifically address if it includes investigator sponsored studies (ISR) and real-world data gathering. Typically, these are under the purview of medical generation evidence, also referred to as “post-marketing trials,” and BMS encourages CMS to further clarify its intent. Additionally, CMS must recognize and consider scenarios in which the manufacturer does not operate the study. BMS also asks CMS to provide guidance on how the Agency will consider alliances or co-development arrangements, and subsequently, how it intends for the manufacturer to consider this for reporting purposes.

BMS notes that CMS does not appear to fully recognize the additional costs directly associated with running clinical trials, and BMS urges CMS to explicitly identify and consider these costs, specifically the purchase of third-party assets, such as combination or comparator assets. BMS urges CMS to recognize and consider ongoing expenses post approval; for certain therapeutic areas, often oncology and hematology, there are costs related to continued follow-up and data generation. CMS must recognize the ongoing investment in and value of these products. Another factor that CMS should consider is the promotional costs to educate physicians on the benefit of the product, both U.S. and ex-U.S.

Definitions for 5. R&D: Abandoned and Failed Drug Costs

BMS strongly asserts that *all* clinical trials conducted by the manufacturer need to be considered by CMS, not only those that were approved. “Failed” clinical trials require significant capital from manufacturers and frequently can contribute to new discoveries—simply because a trial did not have a successful readout does not mean that the manufacturer did not incur expenses to develop the asset or make important scientific discoveries along the way. BMS urges CMS to consider the totality of the investment, including failed and approved clinical trials.

BMS urges CMS to recognize the tremendous financial burden that manufacturers will incur to report the overwhelming number of molecules and targets that do not proceed to Phase I or IND. Additionally, BMS requests clarification on how to report failed clinical trials.

Definitions for 6. R&D: All Other R&D Costs

BMS requests CMS to explicitly define “all other R&D costs.”

(b) Current Unit Costs of Production and Distribution of the Drug

Supplemental to BMS’ concerns in response to “Definitions for 1. R&D: Basic Pre-Clinical Research Costs,” CMS must consider removing data reporting elements for product and development costs at the asset level prior to a specific date. To reiterate, there may be instances where the manufacturer does not possess nor have access to such information due to previous reporting and tracking guidelines.

⁸⁹ *Id.* at 84.

Additionally, CMS requires the reporting of “allocated shared operating and other indirect costs (such as capitalized production facility costs, benefits, generalized and administrative costs, and overhead expenses) specific to each NDC-9 based on unit volume,”⁹⁰ but needs to also consider the other overhead expenses that are not allocated, like freight, global quality, and the supply chain organization.

BMS also requests that CMS consider expenses associated with non-manufacturing facilities that contribute to the cost of developing and marketing a selected drug.

(c) Patents, Exclusivities, and Approvals

BMS supports protection of intellectual property (IP) rights and believes that an effective IP framework is essential for the viability of the biopharmaceutical industry and efforts to deliver innovations that address unmet patient needs. The discovery and development of new medicines is a long, complex, and rigorous process. BMS is concerned that CMS’ proposals could contradict the framework that was intended to protect and encourage innovation, and strongly disagrees with CMS’ position that it may adjust the MFP downward if the selected drug has patents or exclusivities that “will last for a number of years.”⁹¹ As stated above, BMS believes that CMS should not set the MFP for selected drugs below the MFP ceiling price into which patent protection extends.

CMS requests that “all pending and approved patent applications, including expired and non-expired approved patents submitted, sponsored, licensed, and/or acquired the Primary Manufacturer relating to the selected drug as of September 1, 2023”⁹² be submitted. BMS believes that any request for patent information should be limited to information that pertains to U.S patents or applications submitted, licensed, and/or acquired directly by the Primary Manufacturer that claim or cover the selected drug as it is currently used in the commercial product. BMS requests that CMS clarify the intended meaning of “related to” and “sponsor” as the terminology seems too broad. For example, if a Primary Manufacturer provides a drug to be used by a third party in a clinical trial, and that third party files a patent application, the Primary Manufacturer might not have knowledge of such patent application or any rights to it. Additionally, BMS recommends that the Agency remove “expired” approved patents as this does not pertain to the selected drug.

Similarly, BMS requests further clarification on “patents linked to the selected drug where the Primary Manufacturer is not listed as the assignee/applicant....”⁹³ BMS believes that, as currently drafted, this request is too broad. First, the meaning of “linked to” is unclear. Second, this request would place a burden on manufacturers to search the public domain for any patent (U.S. or foreign) that may relate to the drug owned by third parties who have no relation to the Primary Manufacturer—and not to mention, something on which the Primary Manufacturer would not be fully knowledgeable. We ask CMS to remove patent reporting requirements for patents or patent applications that are not directly tied to the Primary Manufacturer as this information is not relevant for establishing the MFP and can also be compiled from the public domain without the added burden on manufacturers. If maintained, this request should be limited to U.S. patents.

With respect to exclusivity, BMS has concerns with CMS’ proposal to require reporting of “Reference Product Exclusivity for Biological Products.”⁹⁴ BMS recommends removing the associated reporting requirements, as this data element

⁹⁰ *Id.* at 87.

⁹¹ *Id.* at 53.

⁹² *Id.* at 88.

⁹³ *Id.*

⁹⁴ *Id.* at 89.

should not be provided unless the FDA has made an affirmative determination that the product is entitled to an exclusivity period. Currently, as BMS understands the process, the FDA does not make this determination at the time the biologic is first approved and only makes this determination if there is a regulatory necessity.

(d) Prior Federal Financial Support

BMS believes that the only prior federal financial support that should be reported is funding that directly resulted in a patent application containing a Government Interest Statement and/or research where a patent assignee was a U.S. government agency.

(e) Market Data and Revenue and Sales Volume Data

BMS is concerned with how vague CMS' phrasing of timeframes is throughout the Guidance, and particularly so in the "Market Data and Revenue and Sales Volume Date" section. BMS believes that the lack of consistency, coupled with broad time ranges, could inadvertently lead to discrepancies in data reporting. To minimize potential errors and create a more efficient reporting system, BMS urges CMS to consider revising its proposal to provide firm dates. For instance, CMS should clarify the definition for the "quarterly total U.S. unit volume,"⁹⁵ and provide a specific quarter on which the manufacturer to report, including which specific quarter in the past five years. Furthermore, as noted elsewhere, we assert that "lifetime" data is too broad, not relevant, and could result in inefficiencies for the manufacturer and for CMS. Finally, BMS seeks clarification on CMS' definition of net revenue—specifically what is meant by "free contingent on a purchase agreement."⁹⁶

BMS appreciates the opportunity to comment on the Guidance. We would be pleased to discuss these comments in further detail. Should you have any questions or concerns, please contact Caroline Tucker, Director, Executive Branch Strategy, at caroline.tucker@bms.com.

Sincerely,

/s/

Re: Comments on *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026*

Dear Dr. Seshamani:

California Life Sciences (CLS) appreciates the opportunity to comment on the recent guidance by the Centers for Medicare and Medicaid Services (CMS), the *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026*. As President & CEO of CLS, I welcome the chance to provide feedback on the implementation of the *Inflation Reduction Act* (IRA) and to highlight policies we believe are critical to consider when implementing this new law. While I thank you for your continued engagement with CLS, we remain concerned about the effects of this law on California's life science ecosystem and our companies' abilities to bring new, lifesaving medicine to patients.

CLS is proud to represent almost 1,200 companies and organizations across California and to advocate for the whole breadth of our state's life sciences sector, with a membership spanning biotechnology, biopharmaceutical, medical device and technology, and diagnostic companies, venture capital firms, and research hospitals and universities. California's life sciences industry generates more than 1.1 million direct and indirect jobs¹ and over \$191 billion in annual revenue², and there are more than 1,300 therapies in the development pipeline³. Maintaining a robust life science ecosystem benefits patients nationally.

The process of therapeutic development is a high risk and long-term prospect. Life sciences leaders are inspired to take on this challenge by their desire to improve the lives and health of patients and their community. CLS strongly supports policies that ensure that these products are affordable and accessible to all Americans. CLS believes that, in implementing this law, policymakers can focus on ensuring Medicare beneficiaries benefit from reduced cost sharing and broader access, while also protecting the robust life sciences ecosystem in the United States that holds the promise of new breakthrough medicines for current patients and future generations.

General overview

How CMS implements this new law will have serious repercussions for the entire life science ecosystem and will affect the innovation of medicine, with ramifications well beyond the drugs that are selected for negotiation. Decisions by CMS will have long reaching effects into future investment in small molecules, orphan conditions, and biosimilars, just to name a few areas. To ensure that these decisions are made with a complete understanding of the implications and repercussions, CLS believes a robust stakeholder process will most effectively inform the

agency's key decision points. To that end, CLS encourages CMS to continue to convene stakeholder panels to provide information, feedback, and help inform these decisions. CMS should systematize ongoing opportunities for patients and stakeholders to provide meaningful feedback on the agency's analyses and on the observed impact of the negotiation program's implementation. Particularly in discussions that involve therapeutic alternatives and therapeutic benefit to patients and society, patient voices are critical to understanding the real-world implications of these policy decisions.

CMS should engage with patient groups, physician groups, and other stakeholders in a more robust, open exchange without the rigidity of Information Collection Requests (ICR). CMS must proactively engage these stakeholders rather than hope for comments through ICRs. CMS's decisions will acutely affect those groups with fewer resources to expend on this process, and without more flexibility and engagement from the agency, the agency's decision will be suboptimal.

Maximum Fair Price (MFP) Considerations

The IRA statute directs the Secretary to develop and use "a consistent methodology and process that aims to achieve the lowest [MFP] for each selected drug," which must include consideration of certain specified manufacturer-specific factors, including research and development, distribution, factors related to therapeutic alternatives, and the statutory ceiling prices. As CMS works to establish this methodology, we believe the agency must create a process that maintains incentives to invest in innovations that can deliver meaningful benefits to patients as well as lower costs to beneficiaries. The process for setting the ceiling price and MFP can have significant impact on the investment in future therapeutic research and development, and CLS encourages CMS to consider the importance of driving value for patients in limiting the negotiation program's impact on the sector. Additionally, a drug should be valued for its elements over the lifetime of its use, rather than at the moment of time in the CMS offers the MFP.

To encourage innovation that benefits the patients most in need of treatment, CLS encourages CMS to establish MFPs at the ceiling price for selected products that address unmet needs or significantly advance patient care. CLS also encourages the agency to only consider manufacturer-specific data in cases where the product is held to provide fewer benefits than therapeutic alternatives.

We also believe that CMS should ensure an inclusive definition of costs – for example, research and development costs should include research costs of failures where a drug did not come to market, the cost of ongoing studies, acquisition costs for both marketed and failed drug candidates, and partnering and licensing agreements. Implementing an MFP that is reflective of the complete costs of bringing a product to market will be critical to ensure companies have the ability to continue to invest in new innovation.

As the top ranked state in National Institutes of Health funding, CLS is also concerned about the requirement for CMS to consider the use of prior federal funding in the calculation of MFP. If this could further lower the price ceiling, it may discourage the use of federal funds for drug research moving forward, and, critically for small and emerging companies, cause hesitation to invest in companies that have used such funds, particularly as there is a lack of clarity in what constitutes prior financial support. We urge CMS to ensure a balanced approach to including the use of federal funds that will not undermine the future of public-private partnerships. Additionally, we also believe CMS's suggestion that tax credits should be included goes against their intended purpose of advancing innovation in medicine and seems punitive, particularly for small and emerging companies.

Negotiation Process and Submission and Use of Manufacturer Data

CLS remains concerned about the extremely tight timeframe of 30 days that manufacturers have to submit all the required information to CMS. The information required by CMS is exhaustive and complex and will ultimately limit the amount of information a company is able to submit. We would request that CMS allow manufacturers to have a rolling data submission throughout the negotiation process, thus ensuring that CMS has complete information that will better inform negotiation between the manufacturers and the agency.

CMS has also proposed an abbreviated and restrictive negotiation process by setting a maximum of meetings, and only one at the request of the manufacturer. Given the importance of these negotiations and the complexity of the data, particularly for companies who are going through this process for the first time, we believe it is important to have a more flexible process.

Public trust in this program is essential to its success. CLS encourages CMS to establish robust safeguards to protect proprietary information from manufacturers. CLS also urges the agency to provide appropriate transparency into analyses and evaluations of selected medicines and to allow for stakeholder feedback on its assessments.

Orphan Drugs

CLS requests that CMS carefully consider the implementation of the negotiation program on drug development for rare and orphan conditions. The [law says](#) that CMS must exclude from negotiation a drug “for only one rare disease or condition and for which the only approved indication (or indications) is for such disease or condition” (Section 1191(e)(3)(A)). First, CLS believes that further clarification is needed around how “disease or condition” will be defined for the exemption and criteria that CMS will use to determine “conditions” from separate “indications.”

We remain concerned that the exemption for only one disease or condition could limit opportunities for additional research and development for indications to other rare and orphan diseases. As most of this work in additional therapeutic areas happens years after a drug is approved, if the drugs are no longer exempt, we are concerned that companies will no longer have the incentive or the ability to invest further in these products. Another area we believe needs clarification and consideration is when the timeline for negotiation eligibility would begin for a product that no longer qualifies for an orphan exemption. CMS’s interpretation of the statute and initial guidance indicates that the eligibility timeline would be based on the date of approval for the first approved indication, not approval for the additional indication. We believe that CMS should clarify that the negotiation clock only begins for an orphan drug upon approval for another condition, which will preserve researchers’ ability to pursue orphan drug candidates and continue ongoing innovations with existing drugs.

Generic and Biosimilar Markets

A robust market for generic and biosimilar drugs provides patients, Medicare, and other payers with significant savings, while encouraging ongoing therapeutic innovation. Safeguarding the incentives for generic and biosimilar development is vital for CMS to maintain long-term savings for the Medicare program and for the health care system generally. To that end, CLS encourages CMS to clarify that a selected drug will be removed from the negotiation program if a generic or biosimilar launches after the negotiation period but before the Initial Price Applicability Year begins. CLS also encourages CMS to not implement a robust and meaningful competition standard, since the *Inflation Reduction Act* statute specifically defines a qualifying single source drug as one without a marketed generic or biosimilar competitor.

Small Biotech Drug Exemption

In recognition of the potential hardships to small and emerging companies who likely do not have significant reserves or multiple products on the market or in the pipeline, the IRA exempted small biotech drugs from negotiation until 2029. However, it is critical that CMS implement this Small Biotech Exemption (SBE) in a way that is workable for the small companies it was created to support.

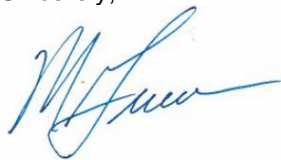

First, we believe it is imperative that CMS implement a predictable and transparent process for small biotech manufacturers applying for this exemption. This includes a clear process for how to apply for an exemption, appropriate timelines to submit information, consistent criteria for evaluating submissions, timely and clear notification if a drug meets or does not meet the SBE requirements, and a transparent dispute process for an appeal of the decision.

Second, given that this is an exemption for small biotech companies and a new program, we ask that CMS provide flexibility in its discussions with the companies and maintain a dialogue with companies throughout the process to ensure complete and accurate data submissions. Additionally, if a drug has received an SBE, and the manufacturer's circumstances have not changed in a material way, the manufacturer should not have to re-apply in subsequent years. We also believe that CMS must protect the confidentiality of the proprietary information that is submitted by a manufacturer. We support a published list of drugs that receive the SBE, but any additional information should only be released by the manufacturer, if they decide to do so.

Finally, CLS believes CMS should include a definition for what it means to be "acquired" pursuant to Sec. 1192(d)(2)(B)(ii). We believe that CMS should define an acquisition as the transfer of substantially all assets of the manufacturer. CMS should also specify whether then an acquiring manufacturer will be determined at the time of acquisition, and the acquisition results in a change in eligibility for the SBE, then an updated form should be submitted.

Thank you again for the opportunity to comment on this guidance. CLS welcomes further discussion of our comments and will happily answer any questions.

Sincerely,

Mike Guerra

Subject: Medicare Drug Price Negotiation Program Guidance

Dear Deputy Administrator Seshamani,

On behalf of the 1.5 million active members, retirees, and their dependents that the California Public Employees' Retirement System (CalPERS) represents, we thank you for the opportunity to provide comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198. CalPERS applauds the administration's efforts under the Inflation Reduction Act to negotiate directly with drug manufacturers to lower the price of some of the costliest Medicare Part D, and eventually Part B, medications. Medicare is the backbone of CalPERS' retiree health benefits, so we appreciate your ongoing efforts to protect the long-term health of the Medicare Trust Fund and ensuring that our Medicare members will pay lower costs for these medically necessary drugs.

CalPERS is the largest purchaser of public employee health benefits in California and the second largest purchaser in the nation after the federal government. Our high-quality, comprehensive health plan offerings include health maintenance, preferred provider, and exclusive provider organization (HMO, PPO, and EPO) plans. In 2021, CalPERS spent an estimated \$10.2 billion purchasing health benefits for our members and employers. Of that, \$2.3 billion, approximately 23% of our total health care spend, was spent on pharmacy benefits post rebates, including \$934 million on Medicare members, with \$369 million of that coming from CMS Part D subsidies and \$574 million paid by CalPERS. While Medicare members only make up approximately 22% of our entire membership, they account for close to half of CalPERS overall pharmacy spend.

To provide these high-quality offerings, CalPERS relies on Medicare Advantage plans, and especially Employer Group Waiver Plans (EGWPs), because they offer enhanced value-based benefits at a lower premium than traditional Medicare. Our members include California's active and retired state and local government, school employees, and their family members, most of whom have fixed incomes.

CalPERS fully supports the elements outlined in the Medicare Drug Price Negotiation Program released March 15, 2023, particularly CMS's commitment to consider factors such as clinical benefit and unmet medical need. We also understand that CMS is not taking specific comments on Section 30 - Identification of Selected Drugs for Initial Price Applicability Year 2026 of the document. However, we have attached the top 30 most expensive Part D drugs for CalPERS Medicare population post-rebates, in case it is informative as CMS continues to refine its process for the negotiation of the Top 10 Part D drugs for 2026. We did not remove all the drugs that will be excluded from negotiation, as we thought it might be helpful to see those as well.

Thank you for the opportunity to respond to this important notice. As you move through this process, we are happy to be a resource for you, so please do not hesitate to reach out. We look forward to working with the administration to ensure the best possible options and benefits for public sector retirees.

Sincerely,

A handwritten signature in dark ink, appearing to read 'Don Moulds', with a stylized flourish at the end.

the campaign for **SUSTAINABLE Rx PRICING**

April 14, 2023

The Honorable Chiquita Brooks-LaSure
Administrator
Centers for Medicare and Medicaid Services
Department of Health and Human Service
200 Independence Avenue, Southwest
Washington, DC 20201

RE: Medicare Drug Price Negotiation Guidance

Dear Administrator Brooks-LaSure:

The Campaign for Sustainable Rx Pricing (CSRxP) is a nonpartisan coalition of organizations committed to fostering an informed discussion on sustainable prescription drug pricing. Our members represent organizations including consumers, hospitals, physicians, nurses, pharmacists, employers, pharmacy benefit managers and insurance providers. We are committed to developing bipartisan, market-based solutions that promote competition, transparency, and value to improve affordability while maintaining appropriate patient access to innovative prescription drugs that can improve health outcomes and save lives.

Prescription drug prices are out of control and continue to grow at unsustainable rates. Twenty-one cents of every health care dollar go toward prescription drugs – with drugs contributing more to health care costs than any other type of health care service.¹ Big Pharma increased prices on at least 350 drugs at the beginning of 2023 even though many Americans already cannot afford their needed medications.² These price increases follow years of unsustainable price increases that often greatly exceed inflation. During the period of July 2021 to July 2022, for example, drug makers raised prices in excess of inflation for 1,216 drugs, with an average price increase of 31.6 percent.³ The average price increase was nearly \$150 per drug (10.0 percent) in January 2022 and was \$250 (7.8 percent) in July 2022.⁴

Despite efforts from the pharmaceutical industry to suggest otherwise, drug manufacturers – and drug manufacturers alone – are the drivers of the unsustainable growth in prescription drug prices and the needlessly high spending on drugs that consumers, taxpayers, and businesses face today.

Drug makers set high list prices at launch and increase their prices every year they are on the market. Spending on high-priced drugs places significant strain on patients, federal health programs, and taxpayers. High-priced drugs also substantially burden the many small businesses and large employers who seek to offer affordable health insurance to their employees because, as prescription drug

⁴ *Ibid.*

the campaign for **SUSTAINABLE Rx PRICING**

expenditures increase, cost-sharing and premium costs also rise.⁵ Far too often patients experience the unfortunate and unfair choice of purchasing the medications they need to get well and stay healthy or paying for other necessities like food or rent. Patients simply should never be presented with such a choice.

The Inflation Reduction Act (IRA) of 2022 took major steps toward holding drug manufacturers accountable for their egregious pricing practices and the escalating costs to beneficiaries and taxpayers of unjustifiably high-priced drugs covered by Medicare. The IRA is lowering prescription drug prices for the millions of Americans who face financial uncertainty affording their medications, in part through adopting policies long advocated by CSRxP including keeping drug companies' price hikes for Medicare-covered drugs at rates below inflation and capping Part D out-of-pocket costs for beneficiaries.

CSRxP thanks CMS for efforts in soliciting public comment and input from a wide variety of stakeholders on key elements of the implementation of the Inflation Reduction Act, including the Medicare Drug Price Negotiation Guidance, and appreciates this opportunity to submit comments on this Guidance.

Indeed, pharmaceutical manufacturers already have made billions of dollars off of drugs that will be selected for negotiation in the Program, earning profits far in excess of the research and development costs they incurred to bring these drugs to market. These drug companies have set unsustainable and out-of-control prices based on "what the market will bear" with little to no consideration of what patients actually can afford. Put simply, drug manufacturers set excessively high prices for these drugs at launch many years ago and have raised those prices at unsustainable rates far in excess of inflation for years, in some cases for decades.

With this background, CSRxP respectfully offers the following comments on the Medicare Drug Price Negotiation Guidance:

1. **Identification of Qualifying Single Source Drugs Part D Drugs for Initial Price Applicability Year 2026 (30.1):** CSRxP supports the approach to treat all dosage forms and strengths of the same active moiety as a qualifying single source drug under the Program and to treat all dosage forms and strengths of a biological product with the same active ingredient as a qualifying single source drug under the Program.
2. **Negotiation Factors Regarding Therapeutic Alternatives to a Selected Drug (50):** CSRxP supports the approach to allow any interested party to submit data to CMS for the agency's consideration of evidence regarding therapeutic alternatives to drugs selected for negotiation. We agree that having access to as much information as possible will place CMS in the best position to negotiate with manufacturers the lowest possible Maximum Fair Price (MFPs) for selected drugs for negotiation.
3. **Evidence about Therapeutic Alternatives to Drugs Selected for Negotiation (50.2):** CSRxP supports the approach for CMS to consider evidence about therapeutic alternatives to drugs selected for negotiation, which includes comparative clinical effectiveness data from the selected drug's Primary Manufacturer and members of the public, including other

⁵ American Academy of Actuaries. "[Prescription Drug Spending in the U.S. Health Care System](#)." March 2018.

the campaign for **SUSTAINABLE Rx PRICING**

manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties. As part of this work, we urge CMS to utilize non-discriminatory drug value assessments that will help ensure Medicare pays more for drugs that offer high value and less for drugs that do not offer the same value.

4. **Identification of Indications for the Selected Drug and Therapeutic Alternatives for Each Indication (60.3.1):** CSRxP supports the approach for CMS to identify each indication approved by the Food and Drug Administration (FDA) for a drug selected for negotiation and therapeutic alternatives for each indication. We support the use of FDA-approved indications in identifying therapeutic alternatives, as well as off-label uses of therapeutic alternatives identified in evidence-based, nationally-recognized guidelines.
5. **Starting Point for an Initial Price Offer for a Selected Drug with Therapeutic Alternative(s) (60.3.2):** CSRxP supports the proposed use of the therapeutic alternative(s)' Part D net price(s) and/or Average Sales Price (ASP)(s) as the starting point for the agency's development of the Maximum Fair Price for the selected drug unless the net price/ASP of the therapeutic alternative is greater than the statutory ceiling. This approach reflects the competitive prices generated in the market and also allows for inclusion of Part D net price(s) and/or ASP(s) of therapeutic alternatives in the development of the initial MFP offer when they otherwise may not be available. Further, in the event that there are multiple therapeutic alternatives for a selected drug, CSRxP urges CMS to use the lowest Part D net price or ASP available amongst the various therapeutic alternatives as the starting point for the initial offer.
6. **Starting Point for an Initial Offer for a Selected Drug without Therapeutic Alternative(s) (60.3.2):** CSRxP supports use of the Federal Supply Schedule (FSS) or "Big Four Agency" price as the starting point for an initial offer for a drug selected for negotiation without a therapeutic alternative or if there is a single therapeutic alternative priced above the statutory ceiling.
7. **Adjusting the Starting Point for an Initial Offer Based on Clinical Benefit (60.3.3):** CSRxP supports CMS adjusting the starting point price for the initial offer based on assessment of clinical benefit. For selected drugs with therapeutic alternative(s), we urge CMS to consider both qualitative and quantitative approaches to clinical benefit assessment where practical and appropriate in a manner that does not discriminate against the elderly, disabled, or terminally ill. For selected drugs without therapeutic alternatives, we support the approach to consider the unmet medical need of the population the selected drug is intended to treat.
8. **Consideration of Manufacturer-Specific Data in CMS' Development of a Preliminary Price (60.3.4):** CSRxP particularly supports the approach to compare the research and development (R&D) costs to the global, net revenue reported by the Primary Manufacturer to determine the extent to which the Primary Manufacturer has recouped its R&D costs. We also strongly support the agency's approach to consider the extent to which the Primary Manufacturer benefitted from Federal financial support when developing the preliminary price for the selected drug, which is consistent with statute. We recommend that CMS establish a clear process for validating the accuracy and completeness of manufacturer-submitted data.

9. **Public Explanation of the Maximum Fair Price (60.6):** CSRxP supports the inclusion of the information CMS intends to make public with respect to the process and data used to support the development of the MFP. CSRxP respectfully urges CMS to provide as much information as possible in the public explanation of the MFP. The more transparency that CMS can provide over the process and price, the greater the confidence the public and stakeholders will have that the Maximum Fair Price represents the lowest possible price the agency can justify.
10. **Monitoring for Bona Fide Marketing of a Generic or Biosimilar Product (90.4):** To protect against gaming by brand manufacturers, CSRxP supports close monitoring by CMS to determine: (1) whether a manufacturer(s) of a generic or biosimilar has engaged in “bona fide” marketing of a generic or biosimilar product that can provide competition to the selected drug; and (2) whether “robust and meaningful competition exists” if CMS indeed determines that the introduction of generic drug or biosimilar product in the marketplace has made a selected drug no longer eligible for negotiation.
11. **Part D Formulary Inclusion of Selected Drugs (110):** CSRxP urges CMS to clarify that while plans are required to cover selected drugs subject to the Drug Negotiation Program, they are not obligated to treat those selected drugs as preferred drugs and are still allowed to employ formulary tiering and utilization management tools, while at the same time ensuring that meaningful, appropriate beneficiary protections are in place.

CSRxP’s comments of the Medicare Drug Price Negotiation Program Guidance reflect our strong desire to continue working with CMS to improve prescription drug affordability while at the same time preserve access to innovative therapies that enable patients to get well and stay healthy. Without major actions, Medicare beneficiaries and taxpayers will continue to face unsustainable growth in drug prices and spending.

1. Identification of Qualifying Single Source Drugs Part D Drugs for Initial Price Applicability Year 2026 (30.1)

CSRxP supports the agency's approach to treat as a qualifying single source drug under the Program all dosage forms and strengths of the same active moiety and the same holder of a New Drug Application (NDA), inclusive of products that are marketed pursuant to different NDAs. Similarly, CSRxP supports the approach of treating all dosage forms and strengths of a biological product with the same active ingredient and the same holder of a Biologics License Application (BLA), inclusive of products that are marketed pursuant to different BLAs, as a single drug under the Program.

This approach to identifying qualifying single source drugs eligible for negotiation under the Program meaningfully helps minimize the chances of manufacturers gaming the negotiation process and finding inappropriate ways to exclude from the Program drugs that otherwise would be eligible. As a result, this approach best ensures Medicare beneficiaries can fully benefit from access to the negotiated Maximum Fair Price of the drug regardless of strength, dosage form, branding, or indications. Further, we do not anticipate that this approach will discourage innovation. Given the size of the Medicare patient population, we expect that manufacturers have sufficient incentives to engage in research and development of new therapies and new indications of existing therapies, leading to future innovations in treatment.

2. Negotiation Factors Regarding Therapeutic Alternatives to Drugs Selected for Negotiation (50)

CSRxP supports the approach to allow any interested party to submit data and evidence to CMS about therapeutic alternatives to drugs selected for negotiation as negotiation factors for consideration. Information and evidence from members of the public, including manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties will meaningfully help to inform the agency's negotiating position. With access to as much information as possible, CMS will be in the best position to negotiate effectively to arrive at the lowest possible Maximum Fair Price for selected drugs.

3. Evidence About Therapeutic Alternatives to the Selected Drugs (50.2)

CSRxP supports the approach that CMS to review and assess comparative clinical effectiveness research about therapeutic alternative(s) to the selected drug as part of the agency's work in developing an initial price offer to the selected drug's Primary Manufacturer. Having access to comparative clinical effectiveness data from the Primary Manufacturer and members of the public, including other manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested will give CMS important evidence and data to make an informed initial price offer that ultimately aimed to result in the lowest possible Maximum Fair Price for the selected drug under negotiation in the Program.

As part of this overall work, CSRxP particularly urges CMS to review drug value assessments submitted by interested parties. Use of drug value assessments that incorporate both clinical evidence and cost will best ensure that Medicare pays pay more for drugs that offer high value to Medicare beneficiaries and less for drugs that do not offer that same level of value to beneficiaries. Consistent with requirements in the IRA, we agree and believe that assessments CMS considers as part of this overall

process should reflect the rights and needs of all Medicare beneficiaries and must not discriminate against the disabled, elderly, or terminally ill. However, CSRxP believes there are health measures that do not violate the IRA statutory prohibition; these non-discriminatory drug value assessments are an extremely valuable source of information and CSRxP strongly supports using as much of such research as possible in the negotiation process. Further, CSRxP strongly supports the agency's intent to consider studies that clearly separate prohibited evidence from other evidence that this relevant to the negotiation process.

4. Identification of Indications for Selected Drugs and Therapeutic Alternatives for Each Indication (60.3.1)

CSRxP supports the proposal for CMS to identify each FDA-approved indication for a drug selected for negotiation under the Program and for CMS to identify therapeutic alternative(s) for each indication of the selected drug. We strongly support the notion that indications of therapeutic alternative(s) for comparison should include both FDA-approved indications *and* off-label uses of drugs identified in evidence-based, nationally-recognized guidelines as therapeutic alternative(s). By including both on-label and off-label indications in the scope of therapeutic alternative(s) to the drug selected for negotiation, CMS will have a greater number of comparators to use in the development of the lowest possible Maximum Fair Price that the agency can justify.

5. Starting Point for CMS' Initial Price Offer for a Selected Drug with Therapeutic Alternative(s) (60.3.2)

CSRxP supports use of a therapeutic alternative(s)' Part D net price(s) and/or ASPs as the starting point for the development of the Maximum Fair Price for a selected drug – unless the net price/ASP of the therapeutic alternative is greater than the statutory ceiling. This approach importantly reflects the competitive prices generated in the marketplace and also allows for inclusion of Part D net price(s) and/or ASP(s) of therapeutic alternatives in the development of the initial MFP offer; other approaches under consideration by CMS would not necessarily allow for the inclusion of potentially lower net prices and/or ASPs of therapeutic alternatives in the development of the initial price offer.

Furthermore, in the event that there are multiple therapeutic alternatives for a selected drug, CSRxP urges CMS to use the lowest Part D net price or ASP available amongst the various therapeutic alternatives to serve as the starting point for the initial offer. Utilization of the lowest Part D net price or ASP of all possible therapeutic alternatives as the starting point for the initial offer importantly will best ensure that the ultimate Maximum Fair Price represent the lowest possible price CMS can justify for a drug selected for negotiation.

6. Starting Point for CMS' Initial Offer for a Selected Drug without Therapeutic Alternative(s) (60.3.2)

CSRxP supports the use of the Federal Supply Schedule (FSS) or "Big Four Agency" price as the starting point for an initial offer for a drug selected for negotiation without a therapeutic alternative. CSRxP also supports use of the FSS or "Big Four Agency" price in the case where there is a single therapeutic alternative priced above the statutory ceiling. Both pricing approaches – the FSS and "Big Four Agency" price – reflect prices negotiated by the federal government for other federal health programs and

therefore represent appropriate starting points for CMS' development of an initial offer for a selected drug without therapeutic alternatives.

7. Adjusting the Starting Point for an Initial Offer Based on Clinical Benefit (60.3.3)

CSRxP supports CMS adjusting the starting point for the initial price offer of selected drugs with therapeutic alternative(s) based on assessment of clinical benefit. Without reflecting relative clinical benefit, the Maximum Fair Price will not reflect the value of the selected drug to Medicare beneficiaries and subpopulations of interest.

Further, CSRxP recognizes that CMS wants to preserve flexibility in adjusting the starting point for the initial offer based on clinical benefit by using a qualitative approach to such adjustment. We appreciate that nuanced differences exist amongst different therapeutic options that CMS should consider as it determines potential adjustments to the initial price offer. However, CSRxP respectfully recommends that CMS also employ a quantitative approach to the extent possible and appropriate when making adjustments to the initial price offer based on clinical benefit. Quantitative approaches that appropriately consider value without discriminating against the elderly, terminally ill, and disabled can help CMS ultimately to arrive at the lowest possible Maximum Fair Price the agency can justify.

Additionally, for selected drugs without therapeutic alternatives, CSRxP supports the approach to consider the unmet medical need of the population the selected drug is intended to treat. Patients with unmet medical needs meaningfully benefit from access to treatments and therapies that can improve their overall health and well-being.

8. Consideration of Manufacturer-Specific Data in CMS' Development of a Preliminary Price (60.3.4)

CSRxP supports the overall process CMS outlines in the Guidance for consideration of the Primary Manufacturer's submitted data in developing the preliminary price for the selected drug. The process described generally aligns with statutory requirements. In particular, CSRxP strongly supports the agency's preferred approach to compare the Primary Manufacturer's R&D costs to its reported global, net revenue in order to determine the extent to which the Manufacturer has recouped its R&D costs. Use of global sales, rather than only U.S. sales, appropriately reflects the actual profit to the Manufacturer of developing, marketing, and selling the drug over time.

CSRxP also strongly supports the agency's approach to consider the extent to which the Primary Manufacturer benefitted from Federal financial support when developing the preliminary price for the selected drug. Section 1194(e) of the IRA specifically directs the HHS Secretary to consider factors from manufacturer-submitted data on "[p]rior Federal support for novel therapeutic discovery and development with respect to the drug."⁶

Further, to ensure data submitted by Primary Manufacturers are accurate and complete as possible, CSRxP strongly encourages CMS to develop a stringent process for validating Manufacturer-submitted data used in price negotiations. A clearly established data process will best ensure that CMS has the most complete and accurate information available as it engages in negotiations with manufacturers to

⁶ IRA Section 1194(e)(1)(C)

the campaign for **SUSTAINABLE Rx PRICING**

reach the lowest possible Maximum Fair Price for a selected drug that the agency can justify. Additionally, as CMS evaluates ways to ensure the long-term success of the Negotiation Program, we recommend considering research and partnership with external stakeholders to gather unbiased data on manufacturer R&D costs that can help validate the accuracy and completeness of the data submitted by Manufacturers and help inform the negotiation process in future years.

Finally, while it is helpful to have information on the Primary Manufacturer's R&D costs, CSRxP recommends that CMS should exercise caution in attributing significant weight in negotiations process to this information given the lack of external, non-biased resources to help verify manufacturer R&D cost data – even with a data validation process in place as suggest. We strongly believe that CMS should place greater weight on other data, primarily drug value assessments that provide information on the clinical benefit and cost of therapeutic alternatives. In so doing, CMS will best ensure that the Maximum Fair Price represents the lowest possible price that can be attained for Medicare beneficiaries and taxpayers.

9. Public Explanation of the Maximum Fair Price (60.6)

The Guidance states that CMS intends to publish on its website:

- the selected drug, the initial price applicability year,
- the MFP file (which would be updated annually to show the inflation-adjusted MFP for a selected drug),
- and the explanation for the MFP, including a summary of how relevant negotiation factors were considered during the negotiation process and those that had the greatest influence on determining the MFP, among other information.

CSRxP appreciates and supports all of the information CMS intends to make available to the public regarding the Maximum Fair Price for a drug selected for negotiation under the Program. To the maximum extent possible, we respectfully urge CMS to provide as much information as possible to the public. With a high level of transparency, Medicare beneficiaries, taxpayers, and other stakeholders will have appropriate confidence that the Maximum Fair Price amount represents the lowest possible price CMS can justify for a selected drug.

10. Monitoring for Bona Fide Marketing of a Generic or Biosimilar Product (90.4)

The IRA requires CMS to remove a selected drug from negotiation eligibility in the Program if that drug becomes subject to competition from either a generic drug or biosimilar biological product. CSRxP strongly supports the agency's approach to closely monitor whether or not the selected drug actually faces competition and thus no longer is eligible for, or subject to, negotiation under the Program. We specifically support the overall process for CMS to determine: (1) whether a generic and/or biosimilar manufacturer(s) has engaged in "bona fide" marketing of a generic drug or biosimilar biological product that can provide competition to the selected drug; and (2) whether "robust and meaningful competition exists" if CMS indeed determines that the introduction of generic drug or biosimilar product in the marketplace has made a selected drug no longer eligible for negotiation. CMS' monitoring approach will help protect against gaming by manufacturers of drugs that otherwise should be eligible for negotiation.

11. Part D Formulary Inclusion of Selected Drugs (110)

the campaign for **SUSTAINABLE Rx PRICING**

CSRxP urges CMS to clarify that, while plans are required to cover selected drugs subject to the Drug Negotiation Program, they are not obligated to treat those selected drugs as preferred drugs and are still allowed to employ formulary tiering and other utilization management tools. Maintaining the ability to use these tools will best ensure that plans can negotiate effectively with pharmaceutical companies to lower overall prescription drug costs and spending for Medicare beneficiaries and taxpayers, while at the same time ensuring that meaningful, appropriate beneficiary protections are in place.

Conclusion

In conclusion, CSRxP again wishes to thank CMS for the opportunity to comment on the Medicare Drug Price Negotiation Guidance. Prescription drug prices are out-of-control and are only getting higher. Medicare beneficiaries and taxpayers simply cannot continue to pay for needlessly high-priced drugs that increase the profitability of Big Pharma at the expense of patients and taxpayers. CSRxP looks forward to our continued work with the Administration to make prescription drugs more affordable for all American patients and their families while at the same time maintaining access to the treatments that can improve health outcomes and save lives.

Sincerely,

Lauren Aronson

Filed electronically at IRAREbateandNegotiation@cms.hhs.gov

Dear Deputy Administrator Seshamani:

The undersigned organizations representing cancer patients, health care professionals, researchers, and caregivers appreciate the opportunity to comment on the Initial Memorandum for Implementation of the Medicare Drug Price Negotiation Program. The negotiation of drug prices may have substantial effects on cancer patients, and we offer advice below regarding actions that the Centers for Medicare & Medicaid Services (CMS) can take to ensure that the advice of cancer patients, cancer care providers, and other cancer stakeholders is obtained and fully considered during the negotiation process.

For cancer patients and their cancer care teams and families, a cancer diagnosis begins a complex and difficult journey. Many cancer patients have benefited greatly from advances in screening, diagnosis, and treatment advances, and as a result the cancer journey is a long one. For some, the journey ends in cure and for others a good life even without a cure.¹ Cancer patients often find treatment a complicated process, with the need to manage not only their treatment but also the side effects of cancer and cancer treatment, including physical symptoms, psychosocial issues, employment issues, and financial toxicities. Cancer patients, even when faced with a life-changing diagnosis, are required to plan and manage their care and their lives. All too often, they become expert at addressing both expected and “unintended” consequences of cancer and cancer treatment.

¹ The cancer death rate has declined by 33 percent since 1991, due to treatment and screening advances and less smoking. Siegel, et al. Cancer Statistics, 2023. CA: A Cancer Journal for Clinicians. January 12, 2023.

Cancer survivors and cancer advocates, because of their cancer experiences, are well-qualified to offer advice about the drug price negotiation process and to recommend options for monitoring the possible unintended consequences of price negotiation.

Input Regarding Clinical Benefit

In the guidance document, CMS generally describes a process through which it will seek information about the clinical effectiveness of a selected drug and the drug's therapeutic alternatives. Cancer patients are, as we describe above, well-prepared to offer advice about clinical effectiveness of selected drugs. CMS notes that it is interested in real-world evidence about selected drugs, and cancer patients can supply that evidence, including about drugs' side effects and tolerability. They can offer detailed real-world perspectives on selected drugs and therapeutic alternatives. In these comments we focus on the input of cancer survivors but believe that health care professionals, including those involved in the development of evidence-based practice guidelines, should be part of the process for evaluating clinical benefit and comparing therapeutic alternatives.

In recent years, the Center for Medicare & Medicaid Innovation (CMMI) at CMS has sought and received the advice of cancer patient advocates related to alternative payment and delivery models, including the Oncology Cancer Model and the Enhancing Oncology Model. Patient advocates have found CMMI open and transparent in the consultation process, in some circumstances agreeing to attend meetings convened by advocacy organizations to receive those advocates' advice.

We urge that a process or procedures be established to solicit the advice of patients about selected drugs and that the advice be solicited and evaluated in timely fashion. Some have suggested that there be something akin to an ombudsman as the central point for engagement with patients, with the Patient Affairs Office at the Food and Drug Administration cited as a model. Others have suggested a standing panel of patient stakeholders to be consulted by CMS. We do not reject these suggestions but are concerned that these structures or processes may not result in timely advice from patients, which we define as advice about clinical benefit and therapeutic alternatives during the negotiation process.

We want to avoid a situation where patients provide valuable advice about clinical benefit, but that advice is received at the end of the negotiation process, essentially serving as commentary on a completed process. Even when federal agencies have good intentions regarding patient input, they sometimes solicit and receive that advice "after the fact" of a dynamic public policy process.

Public notice to patient advocates about an ongoing negotiation process, alerting them to a meeting to discuss a selected drug and an opportunity to submit written comments, might be an efficient way to obtain patient advice. Because the price negotiation process is being implemented through sub-regulatory guidance, the agency has some flexibility regarding notice

and invitation to advocates and convening of panel meetings and acceptance of advice. The insights of patients are critical to the drug price negotiation process, and we look forward to flexibility and transparency from CMS in how it seeks and evaluates that research. CMS states in the initial guidance that the statute, “requires that CMS not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.” We appreciate that CMS has, throughout the initial guidance, underscored the statutory limits on the use of QALYs and its intention to honor those limits.

Unintended Consequences of Drug Price Negotiation

As we have noted above, many cancer survivors have benefited tremendously from cancer research advances. When we talk about the expertise of cancer survivors across the continuum of care, that encompasses expertise about research and development of new therapies. Advocates are quite sophisticated about the drug development pipeline and will be monitoring the possible impact of drug price negotiation on investment in research and development. We urge CMS to regularize and formalize its efforts to ascertain the potential unintended consequences of price negotiation.

Pharmaceutical company representatives are raising alarms to patient advocates that their investment in research on supplemental indications of approved drugs will be significantly adversely affected by the price negotiation process. We are concerned about this assertion from the pharmaceutical industry, and research on supplemental indications will be among those research endeavors that the advocacy community will closely monitor.

Additional Efforts to Address Affordability of Drugs

We end our comments with observations and advice about other drug affordability issues. We realize that the issue of advice regarding the implementation of the “smoothing” of beneficiary cost-sharing responsibilities is outside the scope of this guidance. However, this issue is critically important to patients, and we look forward to implementation decisions regarding smoothing soon.

Clearly outside the scope of this guidance are additional efforts to address the affordability of drugs, including insurance reforms and limits on utilization efforts. We will pursue such reforms, as they are a critical complement to any relief that patients may see from drug price negotiation. We simply want to acknowledge that, whatever benefits are realized from drug

price negotiation, they will not fully address the drug affordability issues that are crippling for some cancer patients.

We appreciate the opportunity to offer our input regarding the drug price negotiation initial guidance.

Sincerely,

CareSet Comments on the Medicare Drug Price Negotiation Program Initial Guidance

These comments are in response to the guidance found here:

<https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

Under the Inflation Reduction Act (IRA), Centers for Medicare and Medicaid Services (CMS) will negotiate fair pricing for high-cost medications. CMS will also have to decide which data and evidence it receives from drug manufacturers during this negotiation process will be released to the public.

This negotiation must balance two opposing goals. First, Medicare beneficiaries deserve to pay reasonable prices for the medications they need, and second, pharmaceutical companies must be allowed to sustain profits that justify access to the financial capital they need to create new medications. This policy balance is embodied within the law with the concept of the Maximum Fair Price (MFP).

CareSet is a healthcare research and data journalism organization, as well as a data vendor. There are two general categories of interest to CareSet within this guidance.

- What information should be considered proprietary?
- What types of evidence should CMS accept when it evaluates the performance of medications?

Achieving the right balance on these issues will allow researchers, journalists, and members of the public to measure the effectiveness of the law, related regulations and guidance, and the government's performance in negotiating lower medication costs.

What information should be considered proprietary?

CMS will publish portions of the information that was submitted by the pharmaceutical company as part of the negotiation process. CMS has requested feedback regarding what information should be regarded as proprietary to avoid “treating information that does not qualify for such protection as proprietary.”

CMS has also requested feedback on what components of the negotiation process itself should be private and the degree to which that privacy should be permanent.

The IRA instructs the Secretary to determine what information will be considered proprietary [42

[U.S.C 1320f-2\(c\)](#)].

CMS has a responsibility to demonstrate the effectiveness of its IRA implementation

The central mandate from Congress to CMS is to create “a consistent methodology and process” that achieves “the lowest maximum fair price for each selected drug”.

FOIA exists to inform the public about the actions of its government and to provide citizens with political choices. It mandates the release of materials that are “likely to add to the fund of information that citizens may use in making vital political choices”. Given the unprecedented nature and political controversy of the IRA, the public being informed of the success of the IRA and its implementation will likely be of great importance to FOIA courts.

CMS must not create a commitment to the industry that data will be proprietary

CMS should not embed any specific promises, in regulation, that certain information is proprietary to medication manufacturers. Doing so creates an expectation that an exemption to FOIA should apply where none is warranted and means that information might be permanently withheld from public scrutiny. It should be the responsibility of the drug manufacturers to assert what should be private and then CMS should evaluate those assertions. There is no reason for CMS to proactively protect any specific information by making promises in regulation that will be enforced even after they have become out-of-date.

FOIA Exemption 4 governs evaluation of the proprietary status of information submitted to the government.

The first component of evaluating whether information is proprietary under Exemption 4, post-*Argus*, considers whether data is “customarily kept private, or at least closely held”.

The second component is whether the government provided an assurance that information would be kept confidential.

Prices should not be proprietary

The central mission of this negotiation program is to use the volume of patients covered under Medicare to negotiate a favorable rate for the purchase of medications. It is only comparison

with the non-FAMP (i.e. the prices charged outside of Medicare) and Plan Specific Enrollment Weighted Amounts (i.e. prices charged within Medicare Part D) that allows for the public to be able to evaluate whether this program is working.

The CMS guidance only conceptualizes information as “proprietary” or “already public”. However, this ignores the “industry arcana” effect, where an industry excludes outsiders from information, while ensuring that everyone in the industry is well-informed.

Manufacturers cannot argue that prices are kept private, when an entire industry exists that relies on perfect or near-perfect knowledge of pricing. Data vendors sell medication pricing information regularly to third parties, which is how the manufacturers know what their competitors are charging for their products.

This knowledge hardly qualifies as proprietary, since at least three parties know the price of all large payor transactions, given that prices are negotiated by Pharmacy Benefit Managers (PBMs). Therefore, multiple parties are “in” on the financial details of nearly every medication price negotiation.

However, the industry still excludes Congress, researchers, and journalists from the data they need to understand if a market is functioning correctly. Given that PBMs are now connected with both pharmacies and insurance companies, this knowledge is well-disseminated. In short, the only people who are not aware of medication industry pricing are those entities that would seek to hold the medication industry accountable for those prices. CMS should never consider information that the majority of an industry knows to be “private”, and should therefore consider the wide commercial availability of data that they choose to label as “proprietary”. This principle applies centrally to prices, but is also relevant to other types of information.

A rule of thumb: if a pharmaceutical manufacturer cannot demonstrate that their “confidential” data is not well-known by their competitors, then CMS should ensure that this data is fully open to the public.

To illustrate this point - If Medicare is currently paying a manufacturer \$100 for a pill and the new negotiated MFP is \$90, this might seem like a victory for CMS. However, if the public was aware that the going rate for the medication to other payers is \$70, it would be clear that taxpayers are overpaying. Without the “going rate” information it will be impossible to tell whether CMS is actually successful in its negotiations.

If CMS is unwilling to provide this transparency, then CMS must clearly delineate the manner in which it will demonstrate to Congress and the public that its program is calculating the right price.

Process should not be entirely private

CMS asks for feedback on the currently secretive negotiation process. The process includes rounds of negotiations with evidence being passed back and forth between a manufacturer and CMS, most of which is held private until it is ultimately deleted.

We understand that at least some parts of the negotiation should be private. However, CMS should avoid policies which block transparency forever. CMS should consider methods to enable partial transparency. For instance, CMS should insist that all efficacy and cost-effectiveness research that is used by the manufacturer during the negotiation be listed publicly. CMS should publish a list of which evidence was referenced by both CMS and the manufacturer, during each step of the negotiation process, including research on medications that are in competition with the medication under negotiation.

CMS should further consider releasing the full negotiation records 5-10 years after the patent coverage for a medication expires, rather than mandating that they be destroyed.

Generally, CMS should be embracing a multi-pronged approach in protecting the vital trade secrets of manufacturers, as well as providing the marketplace with open data and evidence on whether a specific medication is worth its costs. If these suggestions are not workable, then CMS should consider other mechanisms to inform the marketplace of relevant data to ensure long-term competition to lower prices across many different medication classes and diseases.

What drug performance data should be considered as part of ongoing negotiations?

CMS will also be required to gather and evaluate evidence regarding the effectiveness of medications. CMS should accept data of various types and not only those currently in vogue for real-world evidence. This includes:

- Evidence that is not released as articles in medical journals, including alternative evidence containers such as whitepapers and data dashboards.
- Aggregated patient experiences, including those from patient data registries.

CMS evaluations of evidence (both from manufacturers and from third parties), should be fully transparent. If CMS does not think evidence is relevant, it should clearly state why for each evidence submitted. Journalists and researchers should be able to easily quantify and analyze the evidence evaluation process to determine if CMS is preferring certain types of evidence, researchers, or research approaches.

April 14, 2023

Meena Seshamani
Deputy Administrator and Director
Centers for Medicare & Medicaid
7500 Security Boulevard
Baltimore, Maryland 21244-1850

Dear Director Seshamani,

On behalf of The Center for Medicine in the Public Interest (CMPI), I am writing in regard to the initial implementation guidance for the Inflation Reduction Act's "Medicare Drug Price Negotiation Program" for initial price applicability year 2026.

CMPI is a nonprofit, nonpartisan organization, committed to advancing the discussion and development of patient-centered health care.

Collectively, we are concerned that the Centers for Medicare and Medicaid Services (CMS) guidance could stifle medical innovation, discourage biosimilar manufacturers from entering the market, and put patients in jeopardy of losing the medicines they need.

First, the timeframe provided by CMS to respond to this initial guidance is insufficient. A thirty day-window restricts the capacity of interested stakeholders' to review the sections in question and provide meaningful input. Small life sciences companies, physicians, and patients are particularly at risk of not having their voice heard.

As for the content of the guidance, the detailed standards for price setting only compound our concerns with the statute itself.

In order to determine the maximum fair price (MFP) of a drug for the Negotiation Program, CMS plans to use therapeutic reference pricing as a guideline. Therapeutic reference pricing involves comparing a drug to a therapeutic alternative -- one that is chemically different but, in theory, provides similar clinical outcomes.

In practice, this reference pricing is arbitrary and fails to consider critical differences in patient needs and preferences. For example, if a patient is unable to receive an intravenous form of medication -- due to an immunodeficiency that leaves them susceptible to infection -- an

alternative medication that is taken in pill form may be the most effective way to treat their condition.

Using therapeutic reference pricing as the basis for MFP price-setting would result in clinically inappropriate decisions that disregard such variations in patient needs.

As part of the guidance, CMS also proposed that a decidedly narrow definition of unmet need be taken into consideration during the price-setting process. The agency's definition of unmet need is reserved for certain diseases with very limited or no alternative treatment options. CMS will "adjust the starting point for the initial offer" for drugs that meet these criteria.

This severely limited definition would undercut the value of critical medicines for a range of serious conditions that have alternate treatment options. Patients benefit from continued innovation of new therapeutics that address differences in preferences and needs. Proceeding down this path would only disincentive such innovation.

Relatedly, the price-setting guidelines CMS put forth in the guidance fail to convey how medical research and development will be protected with the proposed conditions in place. The predictable outcome of price controls is the significant disincentivization of the research and development system that makes America the world leader in medical innovation.

Developing medicines is already a risky business. It costs, [on average](#), nearly \$3 billion over 10 to 15 years for each approved new medicine. That's partly due to the direct expense of the research and development activity itself -- and partly because [only 12%](#) of potential medicines entering Phase I clinical trials ultimately win final FDA approval. Private investors are only willing to take such risks because a successful drug has the potential to make up for the cost of failures and then some.

President Biden has previously [claimed](#) that under a price control regime, "drug companies will still do very well." In fact, price controls could reduce the revenue of the innovative biopharmaceutical industry by [\\$1.5 trillion](#) over the next decade. Biopharmaceutical companies, on average, dedicate nearly one-fifth of revenue to research and development.

Simple math suggests that price controls will force innovative firms to slash R&D spending by hundreds of billions of dollars. A [past analysis](#) of a policy similar to the IRA found that price controls could lead to 56 fewer new drugs -- including 16 lost cancer treatments.

Some estimates are even more worrying. [A review](#) led by University of Chicago economist Tomas Philipson concluded that price control legislation would reduce industry revenue by 12% through 2039 and R&D activity by 18.5%, or \$663 billion. Philipson estimated the result would be 135 fewer medications being developed in that period -- a crippling shortfall that will also be measured in lives lost.

Whether the number of lost drugs is 56, 135, or somewhere in between, the reality is clear: Under CMS' new guidance, which reinforced misguided policies in the IRA, breakthroughs in cancer, Alzheimer's disease, ALS, heart disease, and many other illnesses are in serious jeopardy.

Setting artificially low prices will drive away investors, given that they will no longer have the surety of being able to recoup their innovative investments. Indeed, a recent survey revealed that almost two thirds of companies plan to shift R&D efforts away from small molecule medicines. Meanwhile 95% of the surveyed companies anticipated major cutbacks on research into new uses for their medicines given the limited time before government price setting kicks in.

CMS' guidance exacerbates this R&D concern by stating that if drugs have existing patents or exclusivities that protect their innovation "for a number of years," the agency has the right to adjust the initial offer price downward.

The proposed policy could penalize companies that obtained patent rights before FDA approval. However, it could entirely upend the pursuit of costly post-approval R&D, which often yields meaningful and inventive benefits for patients.

Consider cancer treatments, for example. Nearly 40% of Americans will be diagnosed with cancer in their lifetime. And these patients rely on post-approval R&D -- underpinned by patent and exclusivity protections -- to bring new treatment uses, formulations, dosage flexibilities, and more to the table. In fact, among oncology drugs that were granted approval a decade ago, 60% went on to receive further approvals.

As it stands, CMS' guidance could leave these patients, and countless others, worse off.

Even biosimilar manufacturers face increasing unpredictability in the wake of CMS' guidance. Per Congress, the "Special Rule," is supposed to enable manufacturers to request delayed selection for price-setting for select reference biological products.

However, the steps and criteria listed to obtain a delay in price negotiation, in addition to the timeline surrounding the process, creates further confusion. This needless uncertainty could cause biosimilar manufacturers to reconsider whether they'll enter the market.

That, in turn, could lead to a major loss in patient savings. Biosimilars are instrumental in providing cost-effective treatments to patients. According to one study, biosimilars are projected to save Americans over \$38 billion in drug costs between 2021 and 2025.

CMS' initial guidance, as well as the IRA itself, rely on a troubling misunderstanding of the drug development pipeline, and the role the federal government plays in it. Many policymakers seem to believe that pharmaceutical innovation is [primarily driven](#) by the National Institutes of Health, the federal medical research organization. But that has simply never been true.

A study in the journal *Health Affairs* by two Columbia University scholars analyzed mounds of historical data to reveal the real role the NIH serves in drug development. This study definitively [concluded](#) that fewer than 10 percent of drugs are covered by a public sector patent. And this slice of drugs only accounts for 2.5 percent of total annual drug sales. Drugs that relied on federal funds for development, meanwhile, comprise only about a quarter of sales.

In reality, the primary engine of drug innovation is private industry, which [spends tens of billions](#) of dollars annually on research and development. The NIH, while important, focuses on basic research -- that is, the study of fundamental aspects of organic phenomena without regard to specific medical applications.

The innovative private biopharmaceutical industry, on the other hand, directs most of its efforts toward practical, clinical research. These firms' work is centered on the actual development of new medicines.

Both the NIH and private firms play a role in financing the important research that happens at academic institutions. But the reality is that private industry employs most of the scientists that take part in hands-on drug development. In sum, drug development is a team effort and is too often mischaracterized by politicians, pundits, and agenda-driven advocates who aim to pit the federal government and private industry against one another.

Lastly, the new guidance seems to double-down some policymakers' misleading and inappropriate focus on a drug's "list price" while largely ignoring the pernicious market dynamics actually responsible for many access and affordability issues.

In many cases, the list price of a medicine is meaningless to patients. When Americans with health insurance say that their drugs are too expensive, what they often mean is that their copays and coinsurance rates are too high. But those rates aren't set by pharmaceutical companies. They're actually the domain of the pharmacy benefit managers and insurance companies. During the last few years, pharmaceutical spending has increased by 38% while the average individual health insurance premium has increased by 107%. During the same period, rebates, discounts, and fees paid by the biopharmaceutical industry to insurers and pharmacy benefit managers have risen from \$74 billion to \$166 billion. That's equal to 37% of our nation's entire drug spending. Government policies should encourage these rebate dollars to flow back to patients, not to the pockets of middlemen who don't invent or manufacture a single drug.

Worse still, the rebates that manufacturers pay to pharmacy benefit managers are often tied to drugs' placement on restrictive formularies. This creates a destructive incentive for entrenched middlemen to give formulary space only to the manufacturers who can offer the biggest rebates - even if such large rebates require astronomically high list prices. This perverse model, coupled with constantly escalating cost-sharing requirements, harms patients and reduces access to life-saving medicines.

Allowing pharmacy benefit managers to continue with business-as-usual makes it impossible to build a health care ecosystem based on competitive, predictable, free-market principles.

CMPI's concerns with CMS' initial guidance ultimately boil down to a responsibility we have to advocate for patient-centered health care. Given the limited window to respond to its troubling components, this guidance has the potential to disrupt future medical innovation and impede optimal patient outcomes.

We hope that you take into consideration our concerns, as well as those of other affected parties, and revise this guidance accordingly.

Thank you.

Respectfully,

Peter Pitts

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Cerebral Therapeutics' appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Cerebral Therapeutics is a clinical-stage biopharmaceutical company taking forward small molecules for central nervous system, or CNS, disorders for patients and diseases with serious unmet need. The company uses its expertise in direct to CNS therapies and therapy development, including in preclinical, clinical and neuromodulation commercial execution to enable the development of medications and therapies to effectively bypass the Blood Brain Barrier. CT's approach achieves higher local doses in the brain where it is needed, lower systemic doses which avoid many systemic adverse events along with the precision medicine along with the ability to administer and sample serially safely from the CSF within the brain. CT's approach has the potential to transform critical areas of unmet need in CNS drug development.

We recognize that CMS has said they are not accepting comments, in particular regarding Section 30. Nevertheless, we are providing comments including for Section 30 as Section 30 is concerning. Our concern is that the proposed legislation will create economic conditions which will substantially limit drug development for non-biologic agents which we hope is an unintended consequence as it is likely to negatively impact our society. Please see below.

I. [Section 30.1 Comments] Considered together as a single source from a pricing perspective, a single drug for multiple individual diseases, substantially enhances the barrier to developing new therapies for patients with unmet medical needs. Given the complexity costs and timeline for each new indications the 9-year negotiation limit will essentially mean that development can only be feasible for at most one disease per molecule as development has to happen sequentially in not in parallel if one drug can be used in more than one disease because of FDA processes and cost and requirements to focus on a single indication for approval. This section of the legislation will have the consequence of drastically limiting CNS drug development for small molecules. This is deeply unfortunate as it will make many CNS diseases with unmet need we are considering

Cerebral Therapeutics, Inc.

12635 Montview Boulevard, Suite 137, Aurora, CO 80010 // 3510 Hopkins Place N, Building 4, Oakdale, MN 55128

no longer feasible. A feasible way to mitigate the harm to society is to consider the timeline for drug pricing for each disease on its own independently. The impact of this problem alone is significant but compounded with the problem in the next section is very significant.

II. [Section 30.1.1 Comments] As a developer of small molecule orphan drugs for severe CNS disease, this part of the legislation will have the result of drastically curtailing development of therapies for follow-on rare diseases. Rare diseases already struggle with funding due to low patient numbers, but this approach will make many rare disease programs unfeasible. For example, we currently are looking at bundling several rare diseases together using a single therapy that individually would not be financially feasible due to the complexity, costs and regulatory processes for therapies like ours. A feasible way for CMS to mitigate the harm is to change the timing to 13 years for the NDA path for small molecules/ non-biologics with active orphan designations. The impact of this problem alone is significant but when compounded with the problem in the previous section is very significant.

III. [Section 50.2 Comments] Cost effectiveness calculations embraced by ICER as they currently operationalize their mission underestimate the impact of meaningful human improvement from debilitating disease. This is particularly important in the CNS disorders that my company addresses as inappropriately constrained to measures of cost effectiveness are prone underestimate the value of drug therapies thereby discouraging drug development that may make a meaningful difference in patients lives with CNS disease. The proposed ICER approach could be substantially improved for companies like ours that treat complex CNS diseases by broadening ICER criterion to include value elements that more accurately reflect the true impact of the therapy rather than an narrowed consideration of patient impact which is not thoughtfully enough considered.

IV. [Section 40.2.2 Comments] As CMS is responsible for policies that are government driven and impact a broad part of the population, the CMS process for determining value should be transparent. This is critical for small drug development companies like ours which are accountable to board and investors to know that there is an open and equitable rules-based system. Furthermore, the therapies that we develop, are complex and address unmet needs for Central Nervous System Disorders are continuously being clarified and refined as science progresses. An open transparent process facilitates partnership and learning and is important to companies like ours as well as the patients we serve who may wish to help CMS understand unmet need. This relative transparency has allowed bureaucratic systems like FDA to be thoughtful in how they iterate their internal concepts and approaches. An open and transparent process will allow a continuing system of learning as new therapies and new unmet needs are addressed so that they are appropriately compensated by CMS and CMS is part of the societal solution and not a barrier to therapy development.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact Monica Davis by telephone at 303 547 3448 or by e-mail at monica.davis@cerebraltherapeutics.com if you have any questions regarding our comments.

Sincerely,

Daniel J. Abrams, MD

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Electronically Submitted via
IRAREbateandNegotiation@cms.hhs.gov

Dear Dr. Seshamani,

Thank you for the opportunity to provide comment on initial guidance implementing the Medicare Drug Price Negotiation Program of the Inflation Reduction Act.

The Chronic Care Policy Alliance (CCPA) is a network of state and regional advocacy organizations advancing public policy that improves the lives of those living with chronic conditions and diseases. Dedicated to achieving better access to quality, affordable health care, CCPA brings together advocates who share common goals and lends its experience in legislative action and public policy creation to support statewide and regional networking development.

1. Introduction – Guaranteeing A Patient-Centered Process

Ensuring that health programs and policies are patient-centered is paramount in producing the best outcomes for patients. Patients depend on access to care and treatments, and this is especially true for patients living with chronic diseases. According to the Centers for Disease Control and Prevention, 6 in 10 American adults live with a chronic disease, and 4 in 10 live with two or more.¹ For these patients, new therapies can have a life-changing impact – and importantly, for those patients still waiting on a “miracle” treatment for their condition, any policy that might delay that scientific achievement or create new barriers to accessing those treatments is a problem for patients.

While we understand that much of the Medicare Drug Price Negotiation Program’s initial guidance memorandum focuses on the interaction between the Centers for Medicare and Medicaid Services (CMS) and pharmaceutical manufacturers, the input of patients and the holistic impact on their care and availability of future treatments must be considered for this program to truly maintain a patient-centered orientation.

¹ <https://www.cdc.gov/chronicdisease/pdf/infographics/chronic-disease-in-america-H.pdf>

Recently, CCPA and 35 patient organizations sent a letter to CMS and Congress urging that the implementation of the Negotiation Program include patient voices in both the implementation and execution of the law – that letter is attached to these comments. We hope that CMS recognizes the broad support within the patient community for ensuring our voices are heard and that patients remain the focus of improving the health care system.

With that patient-centered orientation in mind, CCPA offers the following comments on the Negotiation Program’s initial guidance memo.

2. Patients Should Have a Role in Drug Selection

In Section 30 of the initial memorandum, CMS proposes to implement section 1192(a) of the Social Security Act by generating a list of the top 50 highest spend Negotiation-Eligible Drugs and then simply selecting the top 10 for negotiation.

However, we believe that the statute gives the Secretary flexibility in how to select the 10 drugs and that the statute does not require selecting the top drugs in descending order. Rather the statute directs the Secretary to “select from” the drugs with the “highest such rankings.”² CCPA believes that the Secretary should exercise this discretion to have a more thoughtful approach in the selection of drugs for negotiation.

CCPA is disappointed that CMS chose to issue Section 30 as final guidance, instead of as initial guidance open for comment as with the rest of the memorandum; patients must be afforded the opportunity to have their perspectives and views heard and incorporated into this process. We recommend that CMS use its authority to revise this section of the initial guidance memorandum to “open for comment.”

CCPA believes that the selection of drugs for negotiation should have public and patient input, and there should be a more nuanced and thoughtful process for selecting drugs for negotiation. Using a spending-only approach for selection ignores ongoing research for additional indications or new formulations for existing products that could have additional benefits such as greater adherence or reduced side effects. It also ignores the potential for unintended consequences of selecting a drug without considering other factors such as anticipated supply shortages. This rigid and inflexible approach has the potential to create unintended consequences by shackling the decision-making of CMS and limiting the ability of the agency to change course when problems arise.

Patients should have the ability to comment and have their input considered. Patients should be able to convey their views on what manufacturers are saying about ongoing research into new indications for drugs eligible for negotiation. For example, if a manufacturer is conducting ongoing research into a new indication for an existing product and the manufacturer indicates that negotiation may jeopardize that research, patients with that condition have an obvious interest in ensuring that continues.

² Social Security Act §1192(b)(1)(B) [42 USC §1320f-1(b)(1)(B)]

The Negotiation Program should be about what is best for patients – not what is simply best for the federal government’s financial considerations. At the end of the day, patients must be at the center of decision-making in Medicare.

3. During Negotiations, Patient Input Should Be Considered in a Broader Way

In Section 50.2 of the memorandum, CMS notes how patients and other stakeholders may provide input on alternative treatments and comparative effectiveness research of a drug selected for negotiation.

CCPA believes that CMS should solicit patient input beyond simply commentary on comparative effectiveness research and alternative treatments. CMS should hear direct patient impact statements, such as how a drug has made a meaningful difference in their life and well-being. Only considering sterile and anodyne research ignores the human factor in determining what is best for patients. While we value considering information in a data-driven, systematic way, other entities within the federal government charged with making scientific and policy-driven decisions understand the need to also evaluate patient impact. They routinely hear direct testimony from patients. These are not anecdotes replacing data – these are patients speaking truth to power. For example, advisory committees convened by the Food and Drug Administration routinely hear public comments as part of their meetings. This testimony supplements, not supplants, the data-driven and scientific considerations made by these advisory committees.

Only by factoring in patient narratives about the impact of a treatment can CMS fully grasp the value a product provides to treat chronic conditions and diseases. This is an important pillar of our nation’s drug development ecosystem – patients want products to be rewarded for their value, because this underpins the development of new treatments. Patients want the robust incentives for drug development that have brought thousands of new products to market over the last 30 years to continue.

4. Patients Should Be Protected Through Part D Plan Requirements

In Section 110 of the memorandum, CMS details requirements on Part D plans for negotiated products. CCPA believes that CMS must create requirements on Part D plans related to both the negotiated product and non-negotiated products with the same indication.

A. Negotiated Products

In Section 110 of the memo, CMS will require Part D plans to cover negotiated products. This is a good first step. CMS should also require that all plans cover these products 1) on the tier of their formulary most favorable to patients; 2) without prior authorization; and 3) without other utilization management requirements, or with requirements that match other products for the same indication.

A risk with the Medicare Drug Price Negotiation Program is that Part D plans will favor negotiated products over non-negotiated products. Patients for whom a non-negotiated product is the best option for them and potentially the only option, as determined by their physician, should not be

inadvertently disadvantaged by plans clustering coverage around a negotiated product. Not all patients have the ability to switch products, even among products for the same indication. In some cases, transitioning between products can have detrimental effects. Ensuring patients are able to continue using their existing products without facing higher cost-sharing or new hurdles is important.

B. Non-Negotiated Products for the Same Indication

For non-negotiated products for the same indication as a negotiated product, CMS should utilize its authority to ensure patient access is prioritized. While there are numerous forms this could take, one step we recommend is that CMS prioritize ensuring there is a robust and meaningful appeals process for beneficiaries who need an alternative product other than the negotiated product.

Ensuring parity between negotiated and non-negotiated products will prevent disruptions or new expenses for patients. This is especially important for patients with chronic conditions that are well-managed with a specific treatment and fear being pushed (by cost or coverage policy) into a different treatment.

5. Conclusion

Again, thank you for the opportunity to provide comment on the initial guidance memorandum. CCPA hopes that opportunities to provide comment will continue throughout the implementation and negotiation process. CCPA urges CMS to consider other avenues for patient input, such as through listening sessions, roundtables, or other forums. We view patient-advocacy as an ongoing dialogue, and we hope to continue having opportunities to represent the views of patients with chronic diseases.

For patients, health care policies should not be made “about us, without us” – patients must have a seat at the table and have their voices heard.

Sincerely,

Liz Helms

Attachment

In a letter to Congress and the Centers for Medicare & Medicaid Services (CMS), the Chronic Care Policy Alliance (CCPA) was joined by 35 organizations urging Congress and the Administration to ensure that patient advocates have a seat at the table throughout the implementation of the Inflation Reduction Act's health policies. CCPA and its partners want to protect patient interests and avoid any unintended consequences by asking for patient input in the planning phase before implementation. Read the full letter:

Dear Congress/CMS:

As patient representatives, we advocate on behalf of patient interests and interpret how certain policies will positively or negatively affect them. Patients know firsthand the benefits of a strong health care system that provides access to new and groundbreaking treatments. In recent years, we have seen great strides in the treatment of ALS, cancer and Alzheimer's disease that have increased lifespan, slowed the ravage of disease and improved the quality of lives.

Last year, Congress passed significant policies within the Inflation Reduction Act (IRA) focused specifically on patient costs. We were especially pleased by the improvements to Medicare Part D that included adding an out-of-pocket cap, establishing a \$35 limit on monthly insulin costs, and eliminating cost sharing for vaccines. These policies will provide immediate relief to patients. Thank you.

However, other policies around prescription drug prices faced significant debate during the legislative process. Policymakers must keep in mind the unknown long-term impacts on the development of new treatments – especially those for complex and rare diseases – and patients' ability to access those new therapies.

Now it is time for the real work as the Administration begins the lengthy process of implementing IRA's policies. We urge Congress to continue oversight throughout the implementation process and insist that patient voices are heard.

The Medicare Drug Price Negotiation Program contained in the law seeks to establish negotiated rates, or the Maximum Fair Price (MFP), for medications. While focused on reducing drug costs, the unintended negative consequences for drug coverage, formulary priority, access and further research and development could harm patients. For example, as new prices are determined, payors may favor products on their formularies that have a negotiated price. This could ultimately make other medications more difficult to access as payors encourage use of these negotiated price medications and discourage others. Payors already utilize cost saving measures that negatively impact patients such as restrictive formularies, step therapy and strict prior authorizations. Patients need access to the correct treatments, or they will suffer. The addition of products with artificially lowered prices is likely to create yet another restrictive process for patients.

We urge Congress to ensure that regulators at CMS create specific opportunities for patient advocates to participate in the regulatory process.

Our specific recommendations include:

- **Host regional roundtables to solicit feedback from patients.** We strongly recommend that CMS create a structure similar to that used to implement the Affordable Care Act (ACA) and utilize the CMS regional staff to hold patient-centered roundtable discussions throughout the country to ensure that patients have the opportunity to share their experiences and insights directly with CMS, regardless of their physical location. Providing regional opportunities is

particularly important in the patient community where resources may make participation at the federal level more of a challenge than in their state and local communities.

- **Release draft guidance, solicit written comments.** We are pleased that CMS has announced that it will issue draft guidance that seeks public input on key provisions of the MFP program. We hope that the draft guidance includes and seeks feedback on the process, including the methodology CMS uses to determine the MFP. Soliciting written comments from the public is critical.
- **Develop patient-centered criteria.** CMS should also develop, with significant input from patients, patient-centered criteria that must be adhered to as CMS implements the drug pricing provisions. This will ensure patient perspectives are heard and patient needs are prioritized. The ACA required that the Center for Medicare and Medicaid Innovation develop similar criteria.
- **Meaningfully engage patients in determining the MFP for each drug.** Patient advocates can offer both substantial and critical perspectives as CMS considers what a price should be for a specific drug. CMS should create a process through which it will consistently and meaningfully engage with patients determining each drug's price, and ensure they have a say in the outcome.
- **Study the impact of the drug pricing provisions on patients.** CMS should study the impact that negotiation has on patients prior to negotiation, focusing on issues related to access to current and future therapies. For example, CMS should study the impact of the drug pricing provisions on Medicare Part D coverage, including formulary placement and utilization management.

Should you have any questions or comments, please contact Liz Helms, Founding Director, CCPA at lizh@chroniccarealliance.org. Thank you for your time and attention to these critical issues.

Sincerely,

**Re: Medicare Drug Price Negotiation Program Guidance: Initial Memorandum,
Implementation of Section 1191-1198 off the Social Security Act for Initial Price
Applicability Year 2026, and Solicitation of Comments**

To Whom It May Concern:

The Cigna Group welcomes the opportunity to respond to the Medicare Drug Price Negotiation Guidance Initial Memorandum ("Initial Guidance"). Cigna appreciates the Centers for Medicare and Medicaid Services' (CMS) efforts to improve prescription drug affordability for Medicare beneficiaries. We provide detailed feedback on key areas of the Initial Guidance below.

The Cigna Group is a global health services organization committed to improving health and vitality. Our Cigna Healthcare and Evernorth Health Services divisions are major providers of medical, pharmacy, dental, and related products and services, with over 190 million customer relationships in the more than 30 countries and jurisdictions in which we operate. Within the United States, Cigna provides medical coverage to approximately 14.9 million Americans in the commercial group health plan market, predominantly in the self-insured segment. For 2023, we will be providing coverage in the individual Affordable Care Act insurance segment in sixteen states, both on- and off-Exchange, to more than 770,000 people. Additionally, we serve approximately 4.4 million people through our Medicare Advantage (MA), Medicare Prescription Drug Program and Medicare Supplemental products. In all of the segments we serve, Cigna is focused on working to deliver health care that is affordable, predictable, and simple – so people can live healthier, more vibrant lives.

Overall, Cigna thanks CMS for its approach to providing both this Initial Guidance with solicitation for comments, as well as the timeline CMS has publicized for its Inflation Reduction Act (IRA) implementation efforts. Cigna supports the transparent nature of CMS's effort to provide a roadmap for its IRA implementation work. By sharing the anticipated steps CMS plans to take, stakeholders will be better able to provide meaningful comments that will ultimately enable CMS to improve the Medicare Drug Price Negotiation program. Cigna looks forward to working collaboratively with CMS as IRA implementation proceeds.

We have three main comments on the Initial Guidance that we would like to raise. First, Cigna encourages CMS to confirm that Part D plan sponsors continue to possess the ability to use utilization management and formulary management tools as appropriate, to promote clinically sound, cost-effective medication therapy, and positive therapeutic outcomes. Second, we are concerned that CMS's approach to identifying potential qualifying single source drugs (QSSDs) is overly broad and may result in unintended consequences for patient access. CMS's approach would aggregate drug products with different modes of administration into a single potential QSSD and we are concerned regarding the considerable cost variation among drug products that may result. Third, Cigna is supportive of the development and marketing of biosimilars to generate competition within the market and is concerned that the requirements for an Initial Delay Request may discourage biosimilar development.

Consistent with these concerns, Cigna offers the following key recommendations:

- CMS should confirm that Part D plan sponsors are permitted to use utilization management tools and formulary management tools as appropriate, to promote clinically sound, cost-effective medication therapy, and positive therapeutic outcomes associated with selected drugs.
- Drugs with the same active ingredient, but different modes of administration should not be included in the definition of a potential QSSD.
- The requirements that must be met for an Initial Delay Request for biologics should be more objective and less subjective in nature; consideration should be given to how stringent those requirements are and whether they could increase barriers to entry for biosimilars.

Cigna's detailed recommendations are provided below in their corresponding Initial Guidance sections.

Section 30 – Identification of Selected Drugs for Initial Price Applicability year 2026

Section 30.1. Identification of Qualifying Single Source Part D Drugs for Initial Price Applicability Year 2026

Under the Initial Guidance, CMS intends to include all dosage forms and strengths of the drug with the same active moiety and the same holder of a New Drug Application (NDA) or Biologics License Application (BLA) as a single potential QSSD.

Cigna Comments: While Cigna recognizes that Section 30 is final without comment solicitation, we would like to take this opportunity to address the potential unintended consequences of the approach to identifying QSSDs. We understand that CMS is attempting to prevent gamesmanship around patents and follow-on products, but Cigna believes that this definition is overly broad. By using this broad approach, CMS may be increasing the risk of unintended consequences associated with its negotiated pricing, simply because more drug products with varied characteristics will be swept into a single potential QSSD. This broad approach may present issues for patient access to the extent that prices may not be viable for some manufacturers, causing some products to be discontinued. We urge CMS to consider this issue and its effects for patient care. In particular, Cigna is concerned regarding CMS's approach to products with the same active ingredient, but different modes of administration. To this end, we offer the following recommendations.

Drugs with the same active ingredient, but different modes of administration should not be included in the definition of potential QSSD. Price applicability year 2026 is limited to Part D drugs, which are typically self-administered. However, there are instances in which one product has several different modes of administration, such as oral, subcutaneous, or infused. These different modes of administration could lead to CMS to have to identify separate Part D and Part B products as a single product, despite the first year being limited to Part D drugs.

Additionally, Cigna believes there is substantial cost variation associated with the mode of administration and nothing in statute requires CMS to aggregate a single drug across modes of administration. We recommend that CMS treat each mode of administration as its own QSSD to ensure that the cost associated with each mode is accurately reflected in the MFP.

Section 30.3.1. Delay in the Selection and Negotiation of Certain Biologics with High Likelihood of Biosimilar Market Entry

In accordance with statute, CMS outlines the seven requirements that must be met in order for the agency to grant an Initial Delay Request, including that: the request must be made by the biosimilar manufacturer; the biosimilar manufacturer cannot be the same as the reference manufacturer; a request cannot be made if a year has elapsed since the biosimilar was licensed, but no marketing has commenced; and CMS must determine that there is a high likelihood that the biosimilar will be licensed and marketed before the date that is two years after the selected drug publication date.

The Initial Guidance also stipulates that in order for an Initial Delay Request to meet the high likelihood threshold, CMS will determine if the following are met:

- An application for licensure under section 351(k) of the Public Health Service (PHS) for the biosimilar has been accepted or approved by the Food and Drug Administration (FDA); and
- There must be clear and convincing evidence that the biosimilar will be marketed before September 1, 2025, based on information submitted to CMS.

Such information includes demonstrating that the patents related to the reference product are unlikely to prevent the biosimilar from being marketed and that the biosimilar manufacturer will be operationally ready to market the biosimilar. CMS notes that these were selected as they are the two primary contributing factors to delay in marketing biosimilars approved in the United States. As part of this process, CMS must also evaluate if there is ongoing litigation related to the licensure and marketing of the biosimilar.

Cigna Comments: Cigna believes that CMS's approach to identifying forthcoming biosimilar competition is overly stringent and subjective in nature. While CMS identifies numerous factors in which it will assess the high likelihood requirements against, it does not provide a clearly defined threshold that biosimilar drugs must meet to demonstrate its high likelihood. Cigna recommends that the benchmark CMS utilizes to trigger the delay or removal from negotiations be more transparent and objective.

Additionally, as written, these requirements create reporting standards that are more burdensome than what is required of selected drugs and could create an additional barrier for biosimilar drug development. If CMS wants to support biosimilar development and therefore greater competition in the pharmaceutical market, the agency should ease the threshold burden for biosimilar manufacturers to obtain an Initial Delay. For example, a biosimilar manufacturer's submission of a marketing plan should be weighed heavily as a factor toward the high likelihood threshold.

Cigna is also concerned with CMS's proposed use of litigation as a qualifying factor in the high likelihood threshold. The requirement to evaluate litigation may result in reference manufacturers engaging in additional litigation. It is far too easy to file a complaint that would yield substantial benefit for manufacturers of reference products.

Finally, Cigna would like to express support for requiring that the biosimilar manufacturer differ from the reference manufacturer for the initial delay request to be granted. Cigna also supports not granting an initial delay request if more than one year has elapsed since the licensure of the biosimilar and marketing of the biosimilar has not commenced. We believe this aligns with the intent of the law to delay or remove biologics that will be subject to meaningful competition at the time of price applicability.

Section 40 – Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

CMS intends to designate the manufacturer that holds the NDA(s)/BLA(s) for the selected drug to be the "Primary Manufacturer." The "Secondary Manufacturer" would include any manufacturers of any authorized generics and any repacker or relabeler of the selected drug that meet these criteria. CMS intends to enter into a Medicare Drug Price Negotiation Program Agreement with the Primary Manufacturer ("Agreement") and not any Secondary Manufacturer. CMS intends to include in the Agreement with the Primary Manufacturer several requirements pertaining to Secondary Manufacturers of the selected drug. Further, CMS intends to require that Primary Manufacturers ensure that any Secondary Manufacturer of a selected drug make the MFP available to Part D plan sponsors and dispensers.

Cigna Comments: Cigna supports holding Primary Manufacturers responsible for requirements pertaining to Secondary Manufacturers. We agree that this approach aligns with the statute's requirement for CMS to determine an MFP with "the manufacturer" of a selected drug. Further, centralizing responsibility for compliance with Primary Manufacturers will allow CMS to operationalize the requirements of the Medicare Drug Price Negotiation Program most efficiently.

40.2 Submission of Data to Inform Negotiation

CMS intends to require the Primary Manufacturer of a selected drug to submit data to inform the negotiation process for initial price applicability year 2026 by October 2, 2023. Data elements will include information on the non-Federal average manufacturer price and any information that CMS requires to carry out negotiation, including research and development costs, current unit costs of production and distribution, prior Federal financial support, data on pending and approved patent applications, and market data and revenue and sales volume data.

CMS intends to treat information on non-Federal average manufacturer price and certain data elements as proprietary information, protected from disclosure under Exemption 4 of the Freedom of Information Act and only available for use by CMS and the Comptroller General of the United States. CMS intends to make high-level comments about the data submitted to CMS, without sharing any proprietary information report to CMS.

Cigna Comments: Cigna thanks CMS for seeking input about the proper balance between the public's interest in transparency and the protection of business information within the context of the Negotiation Program. We agree that non-public data should remain proprietary. However, the provision of "high-level comments" in conjunction with the publication of MFPs is insufficient. Understanding the factors and rationale that serve as the basis for MFP is fundamental for plans and PBMs to negotiate lower prices on behalf of beneficiaries. Cigna urges CMS to disclose, at a minimum, factors that have a material impact on MFP, such as comparative effectiveness analysis.

40.4 Providing Access to the MFP

CMS intends to require that Primary Manufacturers provide access to the MFP to Part D plan sponsors and dispensers (e.g., pharmacies) in one of two ways: (1) ensuring the price paid by the dispenser when acquiring the drug is no greater than MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP. CMS intends to allow access to MFP by Part D plan sponsors and dispensers either at the point of sale or through the provision of retrospective reimbursement for the difference. CMS intends to require that Primary Manufacturers ensure that dispensers as well as intermediary entities, such as wholesalers, are reimbursed timely for the difference between their acquisition cost and the MFP within 14 days. As noted above, CMS intends to require that Primary Manufacturers ensure that any Secondary Manufacturer of a selected drug make the MFP available to Part D plan sponsors and dispensers.

Cigna Comments: Cigna supports the creation of a process for Primary Manufacturers to provide access to the MFP. However, we caution against providing manufacturers with excessive latitude in how to provide access to the MFP. We appreciate that the mechanism under which the Negotiation Program will operate mirrors the Coverage Gap Discount Program (CGDP). This approach ensures eligible Medicare beneficiaries will have access to the MFP at the point of sale and see cost sharing relief.

Consistent with this approach, Cigna recommends that CMS explicitly delineate in final guidance the role of pharmacy benefit managers (PBMs) in facilitating access to the MFP at the point of sale, making PBMs the intermediary in this process. PBMs have the data needed to serve as the appropriate intermediary, protecting beneficiaries from extremes and holding pharmacies harmless. Further, operating MDP and MFP in the same system is the best solution because MFP-priced drugs are excluded from MDP. This has the added benefit of reducing unnecessary manufacturer disputes, if the same TPA is processing both kinds of discounts in the same way, and in the same time frame.

40.4.1 Nonduplication with 340B Ceiling Price

CMS intends to require Primary Manufacturers to provide a 340B covered entity with access to the MFP for a selected drug furnished, administered, or dispensed to an MFP-eligible individual if the MFP is below the 340B ceiling price for the select drug. The Primary Manufacturer would not be required to provide a 340B covered entity with access to the MFP if the 340B ceiling price is lower than the MFP.

Cigna Comments: Cigna understands CMS's concern regarding potential duplication with the 340B Drug Pricing Program. We recommend that CMS consider publishing a database, similar to the [340B Office of Pharmacy Affairs Information System](#), that makes MFPs for selected drugs publicly available or consider working with Health Resources and Services Administration (HRSA) to add MFPs to this existing system.

Section 110 – Part D Formulary Inclusion of Selected Drugs

CMS proposes to require Part D plans to include each covered Part D drug that is a selected drug on formularies during Contract Year 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period.

Cigna Comments: There is no requirement in the IRA regarding how selected drugs are to be included in Part D formularies. Consistent with section 1860D-4(b)(3)(I)(ii) of the Social Security Act, we urge CMS to confirm Part D plans' formulary flexibilities for selected drugs. Part D plans design and manage formularies based on input from Pharmacy and Therapeutics (P&T) committees and scientific evidence to ensure beneficiary access to safe and clinically appropriate access to drug therapies. We also encourage CMS to clarify when the formulary inclusion requirement would not apply, such as when a generic or biosimilar comes to market for a selected drug that is on the formulary.

Conclusion

Thank you for your consideration of these comments as we work together to improve prescription drug affordability for Medicare beneficiaries. Cigna would welcome the opportunity to discuss these issues with you in more detail at your convenience.

Respectfully,

Kristin Julason Damato

Re: “Medicare Drug Price Negotiation Program Guidance.”

Dear Administrator Brooks-LaSure,

On behalf of the more than one million members and supporters of Citizens Against Government Waste (CAGW), I respectfully submit these comments to the Centers for Medicare & Medicaid Services (CMS) in response to its March 23, 2023, solicitation for comments regarding its “initial guidance for implementation of the Negotiation Program for initial price applicability year 2026.”

The CMS guidance is being provided following the enactment of [Inflation Reduction Act](#) (IRA), which was signed into law on August 16, 2022. As CAGW [wrote](#), the Medicare drug negotiation [provisions](#) create [price controls](#) that will dramatically undermine drug research and development and [leave](#) “an [invisible graveyard](#) of patients.” Government price-setting will neither improve access to care nor lower patient costs. And giving the secretary of Health and Human Services (HHS) the authority to set prices at the maximum fair price (MFP) is not a negotiation, it is a mandate.

In their April 13, 2023, [letter](#) to you and HHS Secretary Xavier Becerra, Senate Finance Committee Ranking Member Mike Crapo (R-Idaho), House Energy and Commerce Chair Cathy McMorris-Rodgers (R-Wash.), and House Ways and Means Committee Chairman Jason Smith (R-Ark.) wrote that the initial guidance should be reconsidered because it would impede innovation, weaken intellectual property (IP) protection, and hurt research into new uses for a drug. They also expressed the concerns that the guidance would be a “backdoor mechanism” to implement march-in rights in violation of the Bayh-Dole Act, which was enacted at a time when few inventions or discoveries funded by government grants were being commercialized. The act allowed patents owned by government-funded research entities to be transferred to private companies, which would spend money at their own risk to commercialize the discoveries. “March-in rights” were only permitted if the private sector collaborator failed to commercialize the invention. Undermining Bayh-Dole would further erode IP protection. We agree with these concerns about the initial guidance.

With respect to the time allowed to respond to the initial guidance, most federal agencies provide a 60-day comment period with a 30-day period for reply comments, which has not been

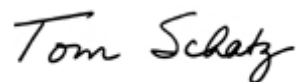

afforded in this proceeding. The impact of the guidance on research and development, intellectual property, drug pricing, government control of the pharmaceutical industry, and the live and death of current and future patients certainly requires more time than CMS has permitted for comments.

The proposed guidance threatens future innovation by setting rules and regulations that further devalue existing patents and IP rights for specific drugs. Research and development after Food and Drug Administration (FDA) approval is necessary to develop future cures. The proposed CMS guidance will disincentivize research and development post-approval and drug manufacturers could potentially be penalized with a lower MFP.

Another objectionable aspect of the proposed guidance is the “gag” rule that would require a drug manufacturer to hide and destroy information related to each individual decision on drug pricing. The proposed restrictions would be contrary to Freedom of Information Act (FOIA) and document retention standards. Hiding the underlying basis for a decision on drug pricing subverts accountability and transparency. It could also be considered as a prior governmental restraint on speech in violation of the First Amendment.

If CMS proceeds with implementation of the proposed guidance, there will be a significant negative impact on drug manufacturers and their ability to develop safe and effective drugs, as well as devastating consequences for patients now and well into the future. CAGW urges CMS to implement a longer comment period and eliminate provisions in the proposed guidance that would have negative implications on research and development, transparency in government, and freedom of speech.

Sincerely,

A handwritten signature in black ink that reads "Tom Schatz". The signature is written in a cursive, slightly slanted style.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026

Dear Administrator Brooks-LaSure:

CLL Society appreciates the opportunity to submit its comments on the Centers for Medicare & Medicaid Services' (CMS') Initial Guidance on implementation of the Drug Price Negotiation Program created under the Inflation Reduction Act of 2022 (IRA).

CLL Society is dedicated to addressing the unmet needs of the chronic lymphocytic leukemia and small lymphocytic lymphoma (CLL/SLL) community through patient education, advocacy, support, and research. Our patients live with a chronic, rare cancer of the immune system. We are the largest nonprofit focused exclusively on the unmet needs of patients living with CLL and SLL.

We strive to fulfill our primary mission of ensuring that patients have access to safe and effective treatment options by informing patients and caregivers about the rapidly changing therapeutic landscape and the importance of clinical trials, supporting, and building patient networks, engaging in research, and educating providers and patients. As an organization, we also recognize that the healthcare landscape extends beyond science, clinical care, and patient support. Legislative, regulatory, and policy initiatives have the potential to exert a considerable and increasing force on equitable access to existing treatments and the development of new therapeutic options.

CLL Society expects that the IRA provisions capping Part D out-of-pocket costs will bring substantial relief to our patient community. Just as importantly, CMS' implementation of a "smoothing" mechanism will allow patients to spread their out-of-pocket costs over the year and avoid the all-too-common scenario of having to base treatment decisions on their financial concerns rather than their medical needs.

While the drug price negotiation program may have a marginal impact on healthcare costs for patients with relatively common conditions, as well as CLL and SLL patients who are not currently receiving active treatment, it will likely have no impact on out-of-pocket costs for patients requiring

active therapy. There is little doubt that the decisions CMS makes now on the price negotiation program will become part of the complex calculations researchers, investors, and drug manufacturers make when determining whether to pursue a particular drug candidate for a specific indication. We fear that without a proactive intent to preserve the fragile cost/benefit balance in small population diseases, CMS will inadvertently tip the scales away from innovation in CLL and SLL as well as other related blood cancers.

Our comments provide a brief background on the disease and focus on the potential impact that the policies and processes within CMS' Initial Guidance might have on our patient community. We urge CMS to exercise its implementation discretion to ensure that our health system continues to welcome the rapid scientific advances in our understanding of disease mechanisms and targeted treatment approaches that have driven hope for blood cancer patients and their families.

Background

CLL is a chronic blood cancer of a type of white blood cell called the B-lymphocyte. In CLL there is a progressive accumulation of too many mature B-lymphocytes. CLL is the most common leukemia in adults in the United States, with around 21,000 cases diagnosed annually. Besides being a type of leukemia, it is also classified as a type of non-Hodgkin's Lymphoma (NHL). So CLL is both leukemia and lymphoma at the same time. SLL is simply a different manifestation of the same disease and is best understood as a different stage of CLL where there are not a significant number of cancer cells yet located in the bloodstream. When the cancer is only found in the lymph nodes it is called SLL. When the cancer is found in the bloodstream and possibly elsewhere, including lymph nodes, it's called CLL.

CLL/SLL is extremely heterogeneous, meaning each person's disease course and progression can be extremely variable. Some experience rapid deterioration due to having an aggressive form of the disease and survive for as little as two years, while some who have a less aggressive form of the disease will never need treatment and can expect to have a normal life expectancy.

Targeted therapies such as BTK inhibitors and the BCL2 inhibitor known as venetoclax offer substantial efficacy against CLL/SLL and have transformed care for our patient community. Patients now have more treatment options compared to just years ago when the standard of care was chemoimmunotherapy. They can take continuous daily oral therapy with a BTK inhibitor, with or without a monoclonal antibody, until their disease progresses. Alternatively, patients can choose a short-term time-limited treatment approach that combines venetoclax and a monoclonal antibody. The latter approach enables dose discontinuation until active monitoring reveals that another treatment is needed.

Although most CLL/SLL patients can expect a response to initial therapy, nearly all current treatment options are palliative and not curative. Most patients will experience one or more

relapses during the course of their disease, and many are forced to either change treatments, take a “drug holiday,” or adjust dosing due to drug intolerance. For patients with relapsed or refractory disease (or treatment intolerance), treatment decisions are highly individualized based on prior therapies, prior response, the reason for discontinuation of previous therapy, comorbidities, biomarker characteristics, patient preference, and therapeutic goals. Patients can experience serial relapses, and many will be treated with all available agents at some point during their disease course.

The unfortunate reality is that despite significant progress in treating CLL/SLL, it remains an incurable cancer. Patients progressing after both BTK and BCL2 inhibitors face a poor prognosis with few treatment options other than PI3K inhibitors. Unfortunately, the use of PI3K inhibitors for hematologic malignancies has recently come under scrutiny due to safety and efficacy concerns. Manufacturers have voluntarily withdrawn indications for idelalisib in both follicular lymphoma (FL) and SLL, and duvelisib in FL. Additionally, umbralisib was completely withdrawn from the market. The FDA’s recent ODAC meeting recommended the withdrawal of duvelisib. If this comes to pass, there will be no available PI3K inhibitor approved as a single agent in CLL, and none at all in SLL.

The experience with PI3K inhibitors in CLL/SLL illustrates the inherent difficulties surrounding studying this disease and the heightened risk manufacturers take on when pursuing new therapeutic candidates. Delays associated with the wait for overall survival data have already dampened research efforts and slowed patient access to potentially life-saving therapies. We have advocated for crossover in clinical trials to save lives, but the strategy inherently compromises the “purity” of survival data. Since CLL/SLL is not an ideal disease state from a research perspective, “new” treatments are often first approved for other cancers and then later approved for CLL/SLL under FDA’s accelerated approval mechanism. Research and development efforts in CLL/SLL could be significantly deterred due to the combination of increased payer hesitance to fully cover and pay for accelerated approval therapies, and the likelihood that a CLL/SLL indication would render an existing drug ineligible for the IRA orphan exclusion to price negotiation, slowing new drug development in CLL/SLL and other rare cancers. We are concerned that this evolving landscape, viewed holistically, poses dire consequences for CLL/SLL patients as they exhaust available treatment options.

CMS should extend the time for stakeholder feedback on the Initial Guidance.

CLL Society has reviewed the complex set of policies within the Initial Guidance with an eye toward identifying concerns within our patient and provider communities and making recommendations to address those concerns. We had hoped that CMS would fulfill its commitment to prioritize transparency and robust engagement in implementing the price negotiation program. Unfortunately, CMS has issued “final” guidance to implement policy decisions we did not anticipate in light of the statutory language, that importantly warrant public input and will likely drive the success or failure of the program. To the extent that CMS reached out to the patient advocacy

community in advance of issuing the Initial Guidance, we were unaware of the approach CMS was considering, much less the opportunity to shape alternative approaches.

We are also concerned that the Agency exposes itself to legal challenges that will inject considerable uncertainty among manufacturers, investors, and even private payers. Uncertainty is a highly disruptive force that can stall or deter access to the resources that fuel innovation. We urge CMS to consider stakeholder feedback received through the 30-day comment process and extend the time for additional comments on the entirety of the Initial Guidance. Going forward, we also respectfully request that CMS develop a review process that allows for a consistent and open dialogue with the patient community. For the countless patients hoping for new treatments and equitable access to existing options, the stakes are too high for CMS to prioritize expedience over inclusion and consideration.

Orphan Drug Exclusion

CLL Society appreciates CMS' interest in stakeholder ideas that might facilitate orphan drug development. We also generally support the Agency's decision to extend the orphan drug exclusion to drugs with a single designation (as opposed to a single indication). The small and emerging biotechnology companies responsible for over 80% of orphan product development are particularly vulnerable to landscape changes that can impact the recoupment of research and development costs.

The risk/benefit analysis is particularly complex within the context of CLL/SLL treatments. As noted above, BTK inhibitors offer considerable improvements in care for our patients but can result in drug intolerance requiring discontinuation. Zanubrutinib is a BTK inhibitor with an orphan designation and approval in the treatment of mantle cell lymphoma (2019) that has demonstrated fewer cases of atrial fibrillation than ibrutinib and no cardiac-related deaths. CLL/SLL patients taking zanubrutinib also have a higher response rate and a longer time to disease progression. The January 19, 2023, announcement that FDA had approved zanubrutinib for both CLL and SLL was particularly significant in that it worked well in patients with difficult-to-treat cancers (i.e., those with a mutated gene called TP53, or a chromosomal alteration known as a 17p deletion). We believe it is unlikely that the manufacturer would have invested in the studies required for this set of approvals if its label expansion would have rendered the drug ineligible for the orphan drug exclusion.

The reduced side effect profile for zanubrutinib will enable patients to remain on treatment longer, but once their disease progresses, they cannot simply switch to one of the other irreversibly binding BTK inhibitors approved for CLL/SLL and expect a response. This is because once a drug within that same drug class has failed the patient, all drugs within that same class will likely fail. The January 27, 2023, accelerated approval of reversibly binding BTK inhibitor pirtobrutinib for the treatment of mantle cell lymphoma was a significant advance in lymphoma treatment, as it is

indicated for relapsed or refractory mantle cell lymphoma (MCL) after at least two lines of systemic therapy, **including a BTK inhibitor**. This treatment has already demonstrated the potential to address a significant unmet need in CLL/SLL patients who have been failed by an irreversibly binding BTK inhibitor. We are pleased that Eli Lilly is moving forward with their clinical trials in CLL, and our patient communities are hopeful that these studies will result in an FDA-approved treatment for patients who have exhausted their existing options. As the drug price negotiation program becomes a tangible reality for manufacturers, however, there is a very real danger that it will drive decisions on the drug candidates and/or indications manufacturers and investors are willing to pursue.

The sets of incentives encouraging the development of treatments for small-population diseases have generally worked well to expand treatment options and improve survival for patients with CLL/SLL and other blood cancers. The IRA's narrow exclusion for orphan drugs, however, creates a landscape in which multiple designations for a promising therapy will negate eligibility for the exclusion, thereby substantially complicating analyses on the potential for favorable return on investment. Manufacturers may face pressures to focus on an orphan indication with the largest patient population rather than the disease state that is most suitable for clinical trials. This could impact the time it takes to move a product from bench to market, increase costs associated with securing a first approval, and deter studies in Waldenström's Macroglobulinemia and other blood cancers with extremely small patient populations.

We are similarly concerned that manufacturers will face considerable tension between their legal and fiduciary obligations to shareholders and their perceived moral obligation to cancer patients. Any decision to invest in research toward an expanded label that could ultimately disqualify the drug from the orphan drug exclusion would appear to be unsupportable if the follow-on indication population is small. Manufacturers may also face difficulties securing approval from their directors, shareholders, and investors to continue confirmatory studies for accelerated approval indications with small addressable populations if withdrawing those indications would make a drug eligible for the orphan drug exclusion. We do not believe Congress or the Administration sought to limit research and development in orphan diseases generally or in rare cancers. Manufacturers secured orphan designations well before the IRA was enacted and could not have considered that a relatively narrow designation would later drive consequences to research and development in other indications.

We believe researchers, investors, and manufacturers should be rewarded, not penalized, for investing in research and development to secure FDA approval for new indications (rather than relying on off-label use). It would be a tremendous tragedy if Congress' efforts to improve healthcare affordability created an environment in which future treatments like Pirtobrutinib would never be indicated for CLL/SLL (or mantle cell lymphoma) despite their potential to transform patient care. These concerns are compounded by the fact that the same considerations exist for other treatments with orphan designations outside CLL/SLL. Zanubrutinib, for example,

was first approved in 2019 for mantle cell lymphoma. Its MCL approvals, as well as the label expansion in relapsed or refractory marginal zone lymphoma (MZL), were granted through the accelerated approval mechanism and remain contingent upon the completion of confirmatory studies. Zanubrutinib's orphan designation is for mantle cell lymphoma, and each additional indication is outside that narrow designation, including the label expansions for CLL/SLL and WM that were secured through FDA's traditional approval mechanism. CLL Society expects that the IRA will make approval histories like that of Zanubrutinib a thing of the past, despite the significant benefit conferred to blood cancer patients from manufacturer-sponsored studies in multiple indications.

CLL Society asks that CMS support and pursue Congressional action to remove the single orphan designation/indication requirement for orphan drug exclusion eligibility. The statutory language as it stands leaves manufacturers with a no-win proposition and jeopardizes patient access to promising therapies without any benefit to the Medicare program or society as a whole. We also urge CMS to implement a stop-gap measure through its demonstration authority that would maintain the status quo with regard to payment mechanisms (e.g., ASP-based), and apply to orphan drugs that do not have annual utilization in any one indication that exceeds 200,000 patients.

In addition, we urge CMS to enable manufacturers to submit evidence demonstrating eligibility for the orphan drug exclusion.

Definition of Qualifying Single Source Drug

CLL Society urges CMS to reconsider its decision to identify a qualifying single source drug, and its dosage forms and strengths, by referring to common active moiety (drugs) or common active ingredient (biologics). The approach that CMS has chosen is not mandated by the statutory language. In fact, the IRA appears to require that products be treated as the same qualifying single-source drug only when they share an NDA or BLA. The determination of negotiation eligibility for products approved through an NDA [or BLA] is based on whether seven [eleven] years have passed since the NDA approval without reference to moiety [ingredient], reference product, or similar indicia of an intent to apply the term as broadly as set forth in the Initial Guidance.

We are also concerned that CMS' implementation creates a substantial set of burdens that were not envisioned when the IRA was enacted. For example, CMS' illustrative scenarios included one for which two manufacturers could be identified as a qualifying single-source drug. One of these manufacturers (the NDA/BLA holder) would be the primary manufacturer responsible for participating in the negotiation process, submitting complete and accurate information, and ensuring access to the maximum fair price (MFP). The primary manufacturer would be responsible for securing information that might be in the possession of, or even confidential to, the secondary manufacturer. The secondary manufacturer has no IRA-related obligations, yet its activities or

omissions could place the primary manufacturer in legal jeopardy in the form of substantial fines and penalties.

Manufacturers could not have foreseen the new landscape CMS' definition of a qualifying single source drug has created, and there may be no recourse available to primary manufacturers unable to comply with CMS' IRA requirements without information and other cooperation from secondary manufacturers. Neither the burden to primary manufacturers nor the substantial leverage that a secondary manufacturer might have in negotiating its compliance have been subjected to the notice and comment usually required when a significant burden is imposed on stakeholders. In fact, CMS did not acknowledge or discuss what, if any recourse it envisions would be available to primary manufacturers in its Initial Guidance.

We urge CMS to reconsider its approach in advance of any legal challenges that might be asserted by manufacturers concerned that they have legal obligations with which they are logistically unable to comply. As noted above, we are concerned primarily with the uncertainty accompanying legal challenges to the implementation of laws designed to benefit patients. This is especially important if CMS' implementation of the new Part D out-of-pocket cost refinements is contingent upon moving forward with the IRA drug price negotiation program, and we ask that CMS inform the patient community that this is not the case.

Conclusion

Once again, we appreciate the opportunity to contribute the perspectives of those within the CLL/SLL patient and caregiver community as CMS implements the drug price negotiation provisions of the IRA. We strongly urge the Agency to expand the window for stakeholder feedback on this important and complex step toward drug selection and negotiation. The patient community has not had sufficient time to determine how the Initial Guidance changes incentives and disincentives, or whether it is more likely to benefit or harm patients. We look forward to a continuing dialogue throughout the IRA implementation process and welcome the opportunity to discuss our comments or the experience of CLL/SLL patients generally.

Thank you for your consideration of these comments. If you have any questions, please feel free to contact me or Saira Sultan, CLL Society's Healthcare Advocacy & Policy Consultant, via email at saira.sultan@connect4strategies.com.

Sincerely,

Brian Koffman, MDCM, MEd

RE: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure,

Cogent Biosciences, Inc. (“we” or “Cogent”) appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

We are a publicly-traded biotechnology company formed in late 2020 that is focused on developing small-molecule precision therapies for genetically defined diseases. Our approach is to design rational, small-molecule precision therapies that treat the underlying cause of disease and improve the lives of patients. Our most advanced program is bezuclastinib, a small-molecule selective tyrosine kinase inhibitor designed to target exon 17 mutations found within the KIT receptor tyrosine kinase, including KIT D816V. We are currently running three global clinical trials to investigate bezuclastinib in patients with two types of Systemic Mastocytosis, Advanced Systemic Mastocytosis and Non-Advanced Systemic Mastocytosis (together, “SM”), and Gastrointestinal Stromal Tumors, a type of cancer with strong dependence on oncogenic KIT signaling (“GIST”). The FDA has granted orphan drug designation to bezuclastinib for the treatment of both SM and GIST. In addition to bezuclastinib, we formed the Cogent Research Team in 2021 and are developing a portfolio of novel targeted therapies to help patients fighting other serious, genetically driven diseases. Our corporate headquarters are located in Waltham, Massachusetts, and our Research Team is located in Boulder, Colorado. We employ approximately 150 individuals across these two locations. We are a development-stage company without any approved products, and we rely on outside investment from institutional investors to fund our development efforts. Most recently, in June 2022, we announced positive initial clinical

data from our APEX clinical trial evaluating bezuclastinib in patients with Advanced Systemic Mastocytosis, and we raised \$161.9 million in net proceeds to help fund the continued development of bezuclastinib. Our current cash runway is expected to fund our operations into 2025, and we will continue to rely heavily on additional outside investment before any prospect of having an approved therapy that could potentially generate revenue. With this in mind, we are significantly concerned by the proposed treatment of NDA-path drugs in the Inflation Reduction Act (“IRA”).

While bezuclastinib would likely be an orphan-exempted small molecule under the IRA, we empathize with our peers at other companies who are working on small molecules that the IRA just made far less attractive to investors. Moreover, the IRA has made any small molecule drug candidates that our Research Team discovers and develops in the future significantly less attractive to investors. It would have been our hope that bezuclastinib, should it ever reach the market, would potentially be combined or sequenced with those other medicines to meaningfully roll back and maybe even cure SM and GIST. We note that there are programs in development, including those earlier in our own pipeline, that might have to choose between development for our orphan indication or another, and the IRA requires them to unfortunately choose instead of developing their drugs to their full potential. We are fortunate that biologics managed to retain 13 years of market-based pricing before having their price impacted by Medicare negotiation (which also spills over into Medicaid), and we urge CMS to reduce the prices of small molecule drugs during the 9-13 year period only as little as required by IRA. Wherever it may be possible to interpret the IRA in such a way as to exempt a small molecule from the IRA, we hope that CMS will.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact me by e-mail at andrew.robbsins@cogentbio.com if you have any questions regarding our comments.

Sincerely,

DocuSigned by:

April 14, 2023

The Honorable Chiquita Brooks-LaSure
Administrator Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Administrator Brooks-LaSure,

Consumer Action for a Strong Economy (CASE) writes today to ensure that the millions of U.S. consumers we represent are heard by urging the Centers for Medicare and Medicaid Services (CMS) to reconsider its initial implementation guidance for the Inflation Reduction Act (IRA).

CASE has been clear from the beginning on the IRA: the prescription drug price controls that this law implements through Medicare “negotiations” could torpedo the incentives for investment into research and development (R&D) for future lifesaving cures. In fact, the law already has. Many important projects have shut down because of the terrible effect that the law’s drug pricing provisions have on R&D.

The initial IRA implementation guidance put forward by CMS does American patients no favors and does not address this fundamental issue with the law. The dangers the IRA poses to future cures and treatments would only be heightened by the disastrous approach taken by this guidance.

The guidance worsens the uncertainty around drug development already created by the IRA. For example, the guidance essentially declares war on our patent system in its proposed implementation of drug price controls. The guidance targets and punishes selected drugs that have longer periods of patent protection left by proposing “adjusting the preliminary price downward.”

Consider the effect that this will have on American intellectual property (IP) protections broadly. Strong IP protections help drive innovation because they incentivize investment in R&D. If you take away that incentive, medical advances could stall. Why invest billions when the government is threatening to step in and thwart any hope for a return on that investment? The damage this could do, especially to post-approval research on existing drugs, is appalling.

This is no surprise. Bad laws like the IRA come about when Americans are not heard by their government. Policymaking in the United States is supposed to be an open process that considers various interests. Instead, this CMS guidance is doubling down on a closed-off, opaque approach. For this initial guidance, CMS only allowed a 30-day comment period to take input from stakeholders. Likewise, CMS is proposing extremely limited avenues for the public to provide input and receive transparency in the selection of drugs considered for price “negotiation.”

CASE urgently requests that the interests of all Americans be considered in the implementation of the IRA’s drug pricing scheme. Do not blaze ahead on implementing this radical agenda while denying patients, consumers, innovators, doctors, and taxpayers their voice.

Sincerely,

Consumer Action for a Strong Economy (CASE)

Deputy Administrator and Director of the Center for Medicare
Center for Medicare & Medicaid Services
7500 Security Blvd.
Baltimore, MD 21244

RE: Medicare Drug Price Negotiation Program Guidance

Submitted electronically to IRAREbateandNegotiation@cms.hhs.gov

Dear Dr. Seshamani:

Thank you for the opportunity to provide comments on the March 15, 2023 memorandum entitled "Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments."

The Council for Affordable Health Coverage (CAHC) has long supported reduced drug costs, greater access to drug therapies and fostering innovation to help treat and cure disease. CAHC (www.cahc.net) is a broad-based alliance with a primary focus: bringing down the cost of health care for all Americans. Our members include employers, medical providers, patient groups, insurers, agents and brokers, technology companies, pharmaceutical manufacturers, and pharmacy benefit managers who collectively represent tens of millions of lives in the private market.

We are submitting comments on two aspects of the Initial Memorandum:

1. The process CMS is using to implement the program is opaque and lacks critical stakeholder input to ensure the principles of good government are followed. This must be improved.
2. The provisions related to Orphan products must be modified to ensure implementation of the Medicare negotiation program does not harm our most vulnerable patients.

Process

While most businesses are seeking to provide more transparency and accountability for their constituents, the Administration's implementation of the Inflation Reduction Act (IRA) moves in the opposite direction. Under Section 1198 of the Inflation Reduction Act, Congress instructed HHS to implement the negotiation law by "program instruction or other forms of program guidance" for 2026, 2027 and 2028. Congress also limited administrative and judicial review.

This is not the regular process established by Congress to encourage citizen participation in a transparent government for the people.

Enacted in 1946, the Administrative Procedures Act ensures citizens have a right to be heard by government, that government responds to their concerns, and that parties harmed by government have access to recourse. The law includes requirements for informing the public of rules and providing for public participation in the rule making process by publishing notices of proposed and final rulemaking in the Federal Register and the opportunity for the public to comment on notices of proposed rulemaking.

While CMS must produce the program guidance as instructed, CMS was not instructed by Congress on the process for seeking out and responding to stakeholder input. We are disappointed that CMS has solicited feedback in limited venues, on limited sections of the law, from a discrete panel of stakeholders who already support the program. A law of this magnitude and complexity should have robust stakeholder feedback, including diverse views from every party impacted. We are concerned to learn that some stakeholders have been told their comments may not even be read, much less responded to.

Additionally, the inclusion of language that bars manufacturers from being transparent about government activities during the negotiation process is an egregious overreach of government censorship. CMS proposes a sweeping policy that would restrain manufacturer speech by placing limits on what a manufacturer can use or disclose from CMS offers, requires a “certificate of data destruction” of any and all material related to the negotiation process- including the manufacturer’s own written notes or emails, and prevents manufacturers from audio or video recording any oral conversations between CMS and the manufacturer. This proposal seriously undermines transparency and the ability to validate information if a conflict arises. The need to shield CMS decision-making process from scrutiny will erode public confidence in the price-setting process and should be removed.

Recommendation: We encourage CMS to open the process up to sunshine by:

- **Making your meetings transparent (with recorded minutes and records of attendees) with any stakeholder willing to participate.**
- **Provide responses to stakeholder questions through the program guidance process. Congress provided \$3 billion in funding to implement the program. We suggest spending some of this money on outreach and response to legitimate concerns and questions. CMS is undermining its credibility by failing to respond to stakeholders.**
- **Work with Congress to change the law to require the program be implemented through the regular rulemaking process. While the guidance route may be expeditious for CMS employees, it undermines citizen trust in the program and the Agency itself. There is little reason to continue using program guidance rather than the normal rulemaking process in the program's second or third year.**
- **Remove the gag clause on manufacturers to destroy all information related to the negotiation process.**

There is nothing in law that precludes CMS from having a more transparent, accountable process. We encourage you to open up the process and commit to the responsible implementation of the law.

Orphan Products

More than 10,000 rare diseases impact more than 30 million people (about the population of Texas) in the United States. Fewer than 5% of these diseases have any FDA-approved therapies. Half of those afflicted with a rare disease are children and thirty percent of them will die before their fifth birthday due to the lack of available treatments. For most of the 1 in 10 Americans with a rare disease, surgeries or other medical procedures will not help – they need prescription drugs to either keep their disease from progressing, to get better, or hopefully with new advancements in drug development, be cured. The rare disease ecosystem is extremely sensitive to changes in policy and incentives that drive investment in these patient populations which are high risk and have unmet needs.

Under the IRA, if a chemical drug has been FDA-approved for at least seven years (at least 11 years for a biological product) it may be eligible for price “negotiation.” There are exceptions. For example, drugs with a generic or a biosimilar substitute are exempt from price limits.

The law states that CMS must exclude from price controls a drug “...for only one rare disease or condition and for which the only approved indication (or indications) is for such disease or condition” (Section 1191(e)(3)(A)).

The intent behind this language was to continue to incentivize drug development for rare diseases, carving out products that treat rare diseases from the damage that price controls will cause to access and innovation where it is needed most. However, drug developers often continue research on approved products for other indications and conditions. Particularly in the rare disease community, where studying potential new uses of repurposed products can lead to faster access and less expensive therapies for diseases in need of treatments, this is especially important. More than 60 percent of oncology medications approved more than a decade ago, for example, received additional approvals to treat new indications in later years. Yet under the IRA, if a product indicated to treat one rare disease was studied and approved for the treatment of another rare disease, the product could be subject to price limits, thereby eliminating the incentive to study approved products on additional patient populations and disease groups.

The IRA makes clear that companies developing orphan drugs are now at increased risk of market failure – the opposite of what the Orphan Drug Act sought to address through tax, market exclusivity, and other incentives. Companies are unlikely to invest in products that could be subject to price limits because they are unlikely to see a return on their investment. Stack that negative incentive on top of others that already make this a difficult landscape for drug development – fewer patients (many of them pediatric), high cost of clinical trials, difficulty designing trials that meet the FDA’s demands and regulatory uncertainty – and it makes the market for orphan products very unfavorable. Faced with this uncertainty, investors and manufacturers are unlikely to develop follow-on treatments for the more than 30 million Americans (and their caregivers) who all share the same desire: to have treatments developed for their diseases.

We are concerned that the March 15th guidance language on the single rare disease or condition indication is even more restrictive than what was intended by Congress and will undoubtedly have a damaging impact on development of rare disease drugs. Resolving the problems created by the orphan drug language in the IRA must be done quickly and transparently.

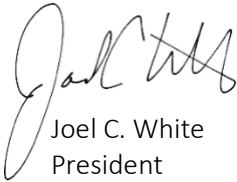

Recommendation: In the program guidance, CMS states the Agency is considering whether there are additional actions it can take to best support orphan drug development. CMS has sufficient flexibility through program guidance in implementing the law to immediately help. Given the limited nature of the exclusion for orphan drugs in the MDPNP, CMS should delay the start of the price negotiation clock for when an excluded orphan product loses its exemption from price controls due to FDA approval of an additional indication until it is proven that the changes do not threaten patient access or innovation. This will help incentivize new research and the discovery of therapies to treat rare diseases. It is pro science and does not conflict with the goal of the law – namely, to reduce prices for products without generic or biosimilar competition.

Conclusion

CAHC encourages CMS to rework the rule to ensure that scientific discovery, product development and patient access are unharmed, and to work with Congress to promote transparency and accountability in rulemaking that will ensure people trust a program of this size and scope is implemented appropriately. While we share your goal of lowering the cost of healthcare, achieving this goal must be approached systemically and not in a way that creates a slew of unintended consequences, namely harming our most vulnerable patients.

If you have questions about these comments, please do not hesitate to contact me.

Dear Ms. Brooks-LaSure and Dr. Seshamani,

The Council for Innovation Promotion (C4IP) appreciates the opportunity to respond to your March 15, 2023, Solicitation of Comments concerning initial guidance on the Inflation Reduction Act's (IRA) Medicare Drug Negotiation Program.

C4IP is a bipartisan coalition chaired by two former U.S. Patent and Trademark Office directors. We are dedicated to supporting a strong and effective patent system that bolsters U.S. innovation, strengthens our nation's economic competitiveness, and fuels investment in technology that improves lives everywhere.

Unfortunately, several aspects of the Centers for Medicare & Medicaid Services (CMS) guidance would needlessly undermine these goals and devalue the IP protections underpinning life-saving and life-improving innovation.

Section 60.3.4 of the memorandum is particularly concerning in this regard. According to that section, the agency "intends to consider the length of the available patents and exclusivities" when determining the price of medicines under the negotiation program. The agency also notes that "if the selected drug has patents and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward."

In effect, under this guidance, the agency would subjectively lower the initial prices for medicines with longer patents and exclusivities. In so doing, CMS would create a significant disincentive for life sciences firms to perform additional research on medicines already approved by the Food and Drug Administration (FDA), thus impeding continued discoveries that benefit patients.

A great deal of valuable research occurs after a drug's initial FDA approval. During this time, innovators can improve its formula, dosage, and delivery mechanism to reduce side effects and boost treatment adherence. They can also investigate whether a particular medicine has additional applications. In the field of oncology, for instance, it is particularly common to discover that a drug approved for one cancer can treat other forms of the disease. And often, these new indications are only found years after the initial FDA approval.

Under CMS' guidance, however, firms would be penalized for making such progress. If a post-approval discovery yields a new patent or exclusivity, the agency will treat those protections as a reason to devalue a medicine's price further. Once follow-on research becomes a financial liability in this way, companies will lose the asset required to justify the investment of time and resources into these vital ventures. The result will be a significant reduction in the number of medical advances generated by post-approval research.

The precedent established by this guidance would also carry broad consequences for IP-driven innovation in all sectors of the U.S. economy. Virtually every step taken to improve science, manufacturing, or technology is incremental -- and follow-on -- as inventors build on their own progress and the progress of others. For instance, U.S. companies in the high-tech and automotive sectors routinely improve existing products and obtain new patents for these improvements.

The very purpose of patents and other IP protections is to incentivize the disclosure of pathbreaking discoveries so that others can build upon them. The IP system grants researchers and inventors exclusive rights to their creations for a limited period of time. But for IP rights to perform this function, innovators' inventions must be appropriately valued. Otherwise, even the most beneficial innovations would fail to recoup their initial investment costs.

The initial guidance -- and the Medicare Drug Negotiation Program more generally -- would compromise patent-based innovation by empowering the government to devalue the IP rights secured by innovators on a massive scale. A pall of uncertainty would be cast over the entire patent system, weakening the incentives for innovation in a wide range of industries.

Frank Cullen, Executive Director

David Kappos, Co-Chair
Judge Paul Michel (Ret.), Board Member
Judge Kathleen O'Malley (Ret.), Board Member

We at the Council for Innovation Promotion urge CMS to thoroughly examine the consequences this guidance will have on America's innovative ecosystem, especially on research into the next generation of medicines and technologies.

Thank you again for the opportunity to comment.

Sincerely,

A handwritten signature in black ink, appearing to read 'Frank Cullen', with a long, sweeping horizontal line extending to the right.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

The Council of State Bioscience Associations (CSBA) is a coalition of independent state and territory based non-profit trade associations, each of which advocates for public policies that support responsible development and delivery of innovative life-sustaining and life-saving biotechnology solutions. Convened by the Biotechnology Innovation Organization (BIO), CSBA's collective voice represents the true grassroots network of innovators, researchers, manufacturers and accelerators across the country. According to a recent industry report, U.S. bioscience industry employment in 2021 reached 2.1 million jobs in more than 127,000 businesses across every state in the U.S. and Puerto Rico. The total economic impact of the bioscience industry on the U.S. economy, as measured by overall output, totaled \$2.9 trillion dollars in 2021.¹ (TEconomy/BIO, 2022)

The majority of CSBA's member companies are research-intensive small and large biotechnology companies working on cutting-edge innovations. Most of these are pre-revenue human health companies that take enormous risks to develop the next generation of biomedical breakthroughs. Their pipelines have the potential to benefit millions of patients suffering from diseases for which there are no cures or treatments.

We are gravely concerned about the impacts the IRA will have on companies' investments in research and development, as well as the downstream impact on beneficiary access to future treatments and cures. We are especially concerned that treatments for rare diseases, complex medical conditions and those areas with high unmet need will be shelved in favor of treatments that are less likely to be subjected to negotiation.

As such, the CSBA Board of Directors writes today to endorse BIO's formal comments on the Medicare Drug Price Negotiation Program, which are appended to this letter.

¹ TEconomy/Biotechnology Innovation Organization. (2022). *The U.S. Bioscience Industry: Fostering Innovation and Driving America's Economy Forward*. <https://www.bio.org/csba-resources-and-reports>

We look forward to continuing to work with the Agency on these important issues. Should you have any questions, please do not hesitate to contact Michele Oshman, Executive Director for CSBA and Vice President of External Affairs at BIO, at 202-215-8140 or moshman@bio.org.

Sincerely,

Michele Oshman (Apr 14, 2023 10:54 EDT)

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

The Biotechnology Innovation Organization (BIO) appreciates this opportunity to comment on the initial guidance regarding the Drug Price Negotiation Program (Negotiation Program) under the Inflation Reduction Act of 2022 (IRA) issued by the Centers for Medicare & Medicaid Services (CMS or Agency) on March 15, 2023 (Initial Guidance).¹

BIO is the world's largest trade association representing biotechnology companies, academic institutions, state biotechnology centers, and related organizations across the United States and in more than thirty other nations. BIO's members develop medical products and technologies to treat patients afflicted with serious diseases, delay the onset of such diseases, or prevent them in the first place. As a result, our members' novel therapeutics, vaccines, and diagnostics not only have improved health outcomes but also have reduced health care expenditures due to fewer physician office visits, hospitalizations, and surgical interventions. BIO's members include biologic and vaccine manufacturers, which have worked closely with stakeholders across the spectrum, including the public health and patient advocacy communities, to support policies that help ensure access to innovative and life-saving medicines and vaccines for all individuals.

BIO appreciates the steps the agency has taken to establish a dialogue with key stakeholders about the Negotiation Program and other elements of the IRA, but we have significant concerns about the Initial Guidance and the limitations on comments CMS has imposed.

We also believe it's imperative to underscore our views on the IRA. We have long supported a Medicare Part D out-of-pocket cap and the ability for patients to spread these costs throughout the year. These

¹ CMS, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (Mar. 15, 2023), *available at* <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

are essential patient protections. At the same time, we believe that patient out-of-pocket costs will never be truly addressed unless the broken rebate system – which benefits pharmacy benefit managers (PBMs) over patients – is addressed. PBMs continue to leverage their size and market influence to ensure they can rake in enormous profits, and they do so at the expense of vulnerable patients.

In addition, we are very concerned about the significant and negative impacts the IRA will have on companies' investments in research and development, which in turn will harm beneficiary access to future treatments and cures, particularly for rare, hard-to-treat diseases and those areas with high unmet need. We continue to urge CMS to consider these impacts as the agency works to update this proposed guidance based on stakeholder feedback.

We also note our strong disappointment that key aspects of this guidance have been issued as final without soliciting comment, which is a concerning step backward from CMS's stated commitment to transparency. BIO strongly urges the Agency to consider stakeholder comments on all aspects of the Initial Guidance. Notably, despite previously committing to "prioritiz[ing] transparency and robust engagement" in its implementation of the Negotiation Program,² the Agency solicits comment on only certain policies, and finalizes other policies with no opportunity for comment—specifically, the foundational policies set forth in Section 30 of the Initial Guidance.³ The Agency's own stated goals of transparency and engagement require immediate reconsideration of this ill-advised start to the Agency's stewardship of the Negotiation Program.

BIO and our members have long argued that the underlying structure of the negotiation program, as set forth by the statute and implemented here by CMS, is legally flawed. In review of the punishing penalties for non-compliance, and the general inflexibility of the process for product selection and maximum fair price (MFP) implementation, these legal flaws cannot be overcome through general guidance clarity at this stage. Nevertheless, we provide herein several suggestions for CMS to consider that might be helpful in the transparency objective of the Agency as it implements this program. None of these resolve the more fundamental legal infirmities of the overall program, nor could they.

We outline below how the implementation of the Negotiation Program would materially benefit from two-sided engagement on all topics, including both a full opportunity for stakeholders to submit comments on proposed policies and meaningful responses to such comments that demonstrate the Agency's consideration of the points made and reveal the reasoning underlying the Agency's final

² CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 (Jan. 11, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>.

³ While BIO understands that the policies set forth in Section 30 of the Initial Guidance are final and that CMS is not soliciting comment on such policies, BIO sets forth herein for the record the comments that it would have made had CMS solicited comment.

decision-making. Such an approach would fulfill the purpose of a comment period: to enable “[t]he interchange of ideas between the government and its citizenry[, which] provides a broader base for intelligent decision-making and promotes greater responsiveness to the needs of the people.”⁴ The need for such a fulsome process is especially acute here, given the novelty and complexity of the Negotiation Program; the vast ramifications that the program will have for patients, providers, pharmacies, manufacturers, and countless other stakeholders; and the potentially profound negative repercussions for patient access to needed therapies that could follow from errors, misunderstandings, or gaps in understanding. In these circumstances, the Agency should maximize transparency and engagement in its decision-making process, including by both affording a full opportunity for comment and meaningfully responding to stakeholder feedback.

This includes ensuring the negotiation process is transparent, predictable, and fair, with CMS providing necessary accountability to stakeholders and clarifying how it will consider and utilize the broad set of information it will collect and review related to the negotiation factors. Further, we continue to urge CMS to emphasize factors that are critical for patients, specifically factors related to clinical benefit and unmet medical need and de-emphasize manufacturer specific data elements such as cost of production and research and development costs.

We also urge CMS to eliminate its proposed, one-sided requirement that manufacturers destroy all records related to the negotiation process and submit a Certificate of Data Destruction to CMS certifying that all information received from CMS during the negotiation period and potential renegotiation period(s) was destroyed. Basic due process mandates that manufacturers be given the ability to maintain records related to negotiation proceedings. Moreover, BIO opposes the blanket prohibition on manufacturers from disclosing or otherwise publicizing information “in the initial offer, including the ceiling price, or the concise justification from the Secretary or any subsequent offer of concise justification, nor information derived from those justifications or offers...”. This one-sided information control heightens the ultimate public complaint that the entirety of the “negotiation” process is anything but actual “negotiation.” BIO disagrees with this approach and recommends CMS abandon it.

We also recommend that CMS finalize the Initial Guidance well in advance of the selected drug publication date for initial price applicability year (IPAY) 2026 to ensure that all stakeholders have ample time before such date to fully digest the contents of the finalized guidance and conform their actions accordingly. Similarly, CMS should solicit comment on proposed guidance applicable to IPAY 2027 and IPAY 2028 (the first IPAY applicable to Medicare Part B drugs) as soon as reasonably possible and well in advance of the selected drug publication dates for such IPAYs.

⁴ *Buschmann v. Schweiker*, 676 F.2d 352, 357 (9th Cir. 1982) (internal quotation marks and citations omitted).

Below please find an overview of our recommendations; our more detailed comments follow.

Regarding the definitions of qualifying single source drugs and negotiation eligible drugs:

- BIO strenuously disagrees with CMS's approach to identifying a qualifying single source drug by reference to common active moiety (drugs) or common active ingredient (biologics). Both law and policy dictate that a qualifying single source drug be identified by reference to its NDA or BLA.
- CMS should clarify the scope of the orphan drug exclusion in a manner that maximizes protections for orphan drugs.
- CMS should take steps to make the process to qualify for the small biotech exception more transparent and predictable.

Regarding the selection, and delayed selection, for negotiation, CMS should:

- Provide for a pre-selection process where, well in advance of the selected drug publication date, CMS would notify each manufacturer of each drug that it intends to select for negotiation and afford each manufacturer a dispute process.
- Improve the process by which a biosimilar manufacturer may request a delay in the selection of a reference product for negotiation due to anticipated biosimilar market entry. This includes providing a meaningful opportunity to request a delay, allowing for a dispute resolution process, and considering all information submitted by a biosimilar manufacturer.

In implementing the negotiation process, CMS should:

- Provide for robust and meaningful engagement and dialogue between the Agency and the manufacturer throughout the negotiation process.
- Allow manufacturers to supplement timely submissions where a post-submission development arises or there otherwise is good cause.
- Provide a meaningful justification of its initial offer and its response to any counteroffer and afford the manufacturer a meaningful opportunity to comment on the response the MFP is set.
- Provide more fulsome safeguards to ensure that the Agency is adequately protecting the confidentiality of all proprietary information submitted to CMS as part of the negotiation process.
- Withdraw its overly broad confidentiality obligations imposed on manufacturers.

In setting the MFP, CMS should:

- Impose on itself bright-line limitations that mitigate the negative effect of the MFP on patient access and on therapeutic innovation.
- Commit to setting the MFP at a price that will not imperil patient access.

- Ensure that the MFP is not set below the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.
- Ensure that the MFP is not set below the MFP ceiling during any year of the price applicability period into which patent protection extends.
- Ensure that the MFP is set at the MFP ceiling until at least the first year during the price applicability period that starts after the date on which the most recently approved indication is thirteen years post-approval.
- Ensure the MFP is not set below the MFP ceiling for vaccines recommended by the Advisory Committee on Immunization Practices (ACIP) at the Centers for Disease Control (CDC).
- Ensure predictable, transparent engagement with manufacturers regarding how the MFP was set.

In utilizing the negotiation factors, CMS should:

- Ensure a transparent, fair, and predictable process.
- Emphasize factors related to clinical benefit and unmet need and de-emphasize manufacturer specific data elements such as cost of production and research and development costs.
- Utilize a more robust definition of unmet medical need.
- Clarify how it will evaluate the evidence about alternative treatments by different stakeholders and how different evidence will be considered in setting the MFP.
- Ensure that a robust, comprehensive set of information submitted by manufacturers– with any necessary supplemental material – will be accepted and considered by CMS.
- Allow manufacturers to use reasonable assumptions regarding the information they submit on the manufacturer-specific data.
- Reject approaches that would reduce the preliminary price when a drug has available patents and exclusivities.
- Eliminate reporting and other requirements under the Primary Manufacturer/Secondary Manufacturer Construct.

In establishing the MFP Ceiling, CMS should:

- Abandon its proposal to create a new price point calculated based on the four quarters of a calendar year, and instead simply adopt the existing annual Non-FAMP.
- Establish an exceptions process to account for restatements and anomalies.
- Confirm if the time period for determining whether a selected drug is an extended- or long-monopoly drug runs to the start of the applicable IPAY or the selected drug publication date.
- Calculate the MFP ceiling for Part D drugs exclusive of manufacturer price concessions unless they are passed through at the point of sale.

Regarding the requirement that manufacturers provide access to the MFP, CMS should:

- Finalize its proposal that access to the MFP may be provided through an MFP rebate model.
- Utilize a CMS-established third-party administrator (TPA) or clearinghouse.
- Clarify that the proposed fourteen-day period during which an MFP rebate must be paid runs from the date on which the manufacturer has validated eligibility for the rebate.
- Condition payment of a claim for reimbursement for a unit of a selected drug on the accurate use claims modifiers.
- Finalize its proposals that access to the MFP by Part D beneficiaries at the point of sale will be effectuated through plans, not manufacturers.
- Define the MFP discount using a publicly reported metric, such as wholesale acquisition cost (WAC).
- Simplify its approach for applying the MFP across dosage forms and strengths and address concerns with its proposed methodology.
- Abandon its bona fide marketing standard and instead adopt a standard that consistently designates the MDRP “market date” as both the date on which a generic or biosimilar is marketed and the date on which CMS determines that a generic or biosimilar has been marketed.

In addition, we recommend that CMS:

- Clarify that selected drugs are not subject to an inflation rebate.
- Amend its regulatory definition of “unit” to exclude MFP units from the ASP calculation.
- Proceed with caution on the implementation of CMPs and allow manufacturers a reasonable time period to cure deficiencies before CMPs are imposed.
- Ensure that the text of the Negotiation Program Agreement is made available for public comment at least sixty days in advance of the first selected drug publication date.
- Abandon its “Primary Manufacturer” and “Secondary Manufacturer” construct as part of the Agreement as it is impracticable and has no legal basis.
- Protect beneficiary access to needed therapies, including selected drugs, and implement safeguards to ensure such access.

I. Qualifying Single Source Drugs and Negotiation-Eligible Drugs

A. Background

Section 1192(e) of the Social Security Act (SSA) generally defines “qualifying single source drug” to mean:

- A drug product approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act (FDCA) and marketed pursuant to such approval where at least seven years have elapsed since the date of such approval and there is no approved and marketed generic for such product;⁵ and
- A biological product approved under section 351(a) of the Public Health Services Act (PHSA) and marketed pursuant to such licensure where at least eleven years has elapsed since the date of such licensure and there is no licensed and marketed biosimilar for such product.⁶

The statute provides for certain exclusions from the definition of “qualifying single source drug” — certain orphan drugs,⁷ plasma-derived products,⁸ and certain low Medicare spend drugs.⁹

Section 1192(d) generally defines “negotiation-eligible drug” to mean, with respect to an IPAY:

- Each of the top fifty qualifying single source drugs by Medicare Part D expenditures over a specified twelve-month period; and
- Starting with IPAY 2028, each of the top fifty qualifying single source drugs by Medicare Part B expenditures over a specified twelve-month period.¹⁰

The statute provides for the exclusion of a “small biotech drug” from the definition of “negotiation-eligible drug” for IPAYs 2026, 2027, and 2028.¹¹ Section 1192(d)(2) generally defines “small biotech drug” to mean a qualifying single source drug for which:

- The drug’s 2021 Part B or D expenditures are equal to or less than one percent of all drugs’ 2021 Part B or D expenditures; and
- The drug’s 2021 Part B or D expenditures are equal to or more than eighty percent of its manufacturer’s drugs’ 2021 Part B or D expenditures.¹²

The statute provides for the exclusion of “[a] new formulation, such an extended release formulation” from the definition of “small biotech drug.”¹³

⁵ SSA § 1192(e)(1)(A) (the seven years are counted to the selected drug publication date with respect to the applicable IPAY).

⁶ *Id.* § 1192(e)(1)(B) (the eleven years are counted to the selected drug publication date with respect to the applicable IPAY).

⁷ *Id.* § 1192(e)(3)(A).

⁸ *Id.* § 1192(e)(3)(C).

⁹ *Id.* § 1192(e)(3)(B).

¹⁰ *Id.* § 1192(d)(1).

¹¹ *Id.* § 1192(d)(2). The statute also provides for a Maximum Fair Price (MFP) floor for a “small biotech drug” for IPAYs 2029 and 2030. *Id.* § 1194(d).

¹² *Id.* § 1192(d)(2)(A).

¹³ *Id.* § 1192(d)(C).

B. Distinguishing among qualifying single source drugs and dosage forms and strengths of such drugs

It is imperative that CMS reconsider its approach to identifying a qualifying single source drug and its dosage forms and strengths by reference to common active moiety (drugs) or common active ingredient (biologics), and instead identify such a drug and its dosage forms and strengths by reference to common New Drug Application (NDA) or Biologics License Application (BLA).¹⁴

In the Initial Guidance, CMS states that it will treat products as the same qualifying single source drug where, for drug products, they share the same active moiety or, for biological products, they share the same active ingredient, and the same manufacturer holds all applicable NDAs or BLAs.¹⁵ This policy is irreconcilable with the statute.

The statute requires products to be treated as the same qualifying single source drugs only where they share the same NDA or BLA. This necessarily follows from the plain text of section 1192(e)(1). As set forth above, “qualifying single source drug” is defined for products approved under an NDA by reference to whether seven years has elapsed since “such approval;”¹⁶ likewise, the term is defined for products licensed under a BLA by reference to whether eleven years has elapsed since “such licensure.”¹⁷

Congress’s use of “such license” and “such approval” in the statute is intentional, unambiguous, and must be given effect. Congress used this language to denote that a qualifying single source drug is distinguished by a distinct approval or licensure—i.e., a distinct NDA or BLA. CMS has no authority to rewrite the plain language of the statute by inventing an ultra vires distinction between qualifying single source drugs based on their applications. Where “Congress has been unambiguous, neither the Agency nor [a] court may diverge from that intent.”¹⁸

Although the plain language of the statute is dispositive, BIO notes that other canon of statutory construction confirm Congress’s unambiguous intent to distinguish qualifying single source drugs based on distinct NDAs or BLAs and to mandate that drug and biologic products would not be subject to price controls unless a sufficient time has elapsed since “such approval” (7 years) or “such licensure” (11 years).¹⁹ Of particular note, the statute defines “qualifying single source drug” by express reference to

¹⁴ For a discussion of the related and equally critical concern with CMS’s “bona fide marketing” standard, please see section VI.F.

¹⁵ Initial Guidance at 8.

¹⁶ SSA § 1192(e)(1)(A).

¹⁷ *Id.* § 1192(e)(1)(B).

¹⁸ *Cabazon Band of Mission Indians v. Nat’l Indian Gaming Comm’n*, 827 F. Supp. 26, 29 (D.D.C. 1993), *aff’d*, 14 F.3d 633 (D.C. Cir. 1994).

¹⁹ See *Chevron v. Nat’l Res. Def. Council*, 467 US 837, 843 n.9 (1984) (in addition to the plain text, the traditional tools of statutory construction are used to ascertain the intent of Congress).

the FDCA and PHSA. It is well understood that a statute should be interpreted in the manner “most compatible with the surrounding body of law into which the provision must be integrated.”²⁰

CMS should therefore look to the well-established framework under the FDCA and PHSA for distinguishing among products. Under this framework, drug and biological products generally may be marketed only if approved or licensed by FDA,²¹ and manufacturers seeking such approvals or licensures must meet stringent requirements bearing on safety, effectiveness, and other considerations.²² In implementing this framework, FDA has spoken directly to the circumstances under which a change to an existing product is so significant that it yields a new product warranting a new NDA or BLA is, as well as the circumstances under which a change to an existing product is not.²³ It is manifestly reasonable and appropriate to rely on such FDA standards here, such that a product approved or licensed under a new NDA or BLA is a distinct qualifying single source drug.

There are immeasurable benefits to giving effect to the statute as written and, as Congress intended, adopting FDA’s application-based framework for distinguishing products (as opposed to CMS’s newly invented, statutorily unmoored scheme for doing so). First, and most critically, doing so would avoid exacerbating the disincentive to develop next-generation therapies inherent in the Negotiation Program to the point of suffocating all such innovation, to the detriment of patients in need. The sheer breadth of CMS’s “qualifying single source drug” definition—which amalgamates drug products by common active moiety and biological products by common active ingredient—leaves no incentive for therapeutic advancement and will have significant, negative impacts on innovation for years to come. Biopharmaceutical innovation is incremental, relying on sustained and continuous improvements to molecules, pathways, and modes of administration to achieve maximum clinical benefit for patients. Researchers cannot take significant leaps and develop new active moieties with each generation of treatment. By combining drugs at the active moiety or active ingredient level, CMS is harming investments into new therapies, including for orphan and hard to treat diseases. For the sake of pharmaceutical and biotechnology innovation, and patient access to needed therapies, CMS’s current framework cannot stand.

²⁰ *Green v. Bock Laundry Machine Co.*, 490 U.S. 504, 528 (1989) (Scalia, J., concurring); cf. *Erlenbaugh v. United States*, 409 U.S. 239, 243–44 (1972) (under the rule of *in pari materia*, it is generally “assume[d] that whenever Congress passes a new statute, it acts aware of all previous statutes on the same subject”).

²¹ 21 U.S.C. § 355(a); 42 U.S.C. § 262(a)(1)(A).

²² 21 U.S.C. § 355(c), (d); 21 C.F.R. §§ 314.105, 314.125 (NDA requirements); 42 U.S.C. § 262(a)(2)(C); 21 C.F.R. §§ 601.2(a), 601.4(a) (BLA requirements).

²³ FDA, Guidance for Industry: Submitting Separate Marketing Applications and Clinical Data for Purposes of Assessing User Fees (Dec. 2004), available at <https://www.fda.gov/media/72397/download>. For example, a new active ingredient (e.g., a different salt, ester, or complex of an approved moiety) should be approved under a new application. *Id.* at 3. In contrast, a new strength generally should be approved under a supplement. *Id.* at 4. The same is true for a new container size or package type of the same indication and route of administration. *Id.* Certain changes in dosage form and route of administration should be approved under a supplement, but others should be approved under a new application. *Id.* at 3.

Second, an application-based framework would create an easily administrable bright line rule based on a familiar standard, to the benefit of both CMS and manufacturers. A bright line rule would enable CMS to more readily identify relevant dosage forms and strengths for purposes of aggregating Medicare expenditures and applying the MFP.²⁴ And a bright line rule would enable manufacturers to more confidently track the seven- or eleven-year “qualifying single source drug” clock, and thereby make more informed decisions about research and development.

For these reasons, BIO strenuously disagrees with CMS’s approach to identifying a qualifying single source drug by reference to common active moiety (drugs) or common active ingredient (biologics). Both law and policy dictate that a qualifying single source drug be identified by reference to its NDA or BLA.

Notably, it necessarily follows from the identification of a qualifying single source drugs by reference to its NDA or BLA that the dosage forms and strengths of such a drug (across which Medicare expenditures are aggregated and the MFP is applied) also must be identified by reference to the NDA or BLA of the drug. With respect to a qualifying single source drug, the statute requires CMS to aggregate Medicare expenditures “us[ing] data that is aggregated across dosage forms and strengths of the drug, including new formulations of the drug, such as an extended release formulation, and not based on the specific formulation or package size or package type of the drug.”²⁵ Similarly, with respect to a qualifying single source drug that is a selected drug, the statute requires CMS to “establish[] . . . procedures to compute and apply the maximum fair prices across different strengths and dosage forms of [the] drug and not based on the specific formulation or package size or package type of such drug.”²⁶ Accordingly, Medicare expenditures are to be aggregated, and the MFP is to be applied, across only dosage forms and strengths of the qualifying single source drug. As set forth above, a qualifying single source drug must be identified by reference to its NDA or BLA; it necessarily follows that the dosage forms and strengths of such a drug also must be identified by reference to the NDA or BLA of the drug.²⁷

It is imperative that CMS immediately rescind the approach set forth in the Initial Guidance—under which Medicare expenditures are aggregated, and the MFP is applied, across dosage forms and

²⁴ See SSA §§ 1192(d)(3)(B), 1196(a)(2).

²⁵ *Id.* § 1192(d)(3)(B) (emphasis added).

²⁶ *Id.* § 1196(a)(2) (emphasis added).

²⁷ The references to “formulations” in the statutory text do not change the analysis. In context, such formulations are plainly limited to formulations of the dosage forms and strengths of the qualifying single source drug. See, e.g., A. Scalia & B. Garner, *Reading law: The interpretation of Legal texts* 199, 203-132–33 (2012) (“[T]he verb to include introduces examples, not an exhaustive list.”). We note that formulations of dosage forms and strengths may be approved under the same NDA or BLA. See FDA, Guidance for Industry: Submitting Separate Marketing Applications and Clinical Data for Purposes of Assessing User Fees 3–4.

strengths of products that share the same active moiety (drugs) or the same active ingredient (biologics)—and instead specify that, for purposes of aggregation of Medicare expenditures and application of the MFP, dosage forms and strengths are also identified by reference to the NDA or BLA of the qualifying single source drug, consistent with the requirements of the statute.²⁸

C. Orphan drugs

BIO urges CMS to clarify the scope of the orphan drug exclusion in a manner that maximizes protection for orphan drugs.

A drug is categorically ineligible for selection for negotiation if “designated as [an orphan drug] for only one rare disease or condition . . . and . . . the only approved indication (or indications) is for such disease or condition.”²⁹ It is imperative that CMS implement the orphan drug exclusion to be maximally protective of orphan drugs, in recognition of the unique need to maintain incentives for developing new therapies targeting rare diseases.

The Negotiation Program poses special risks to patient populations awaiting the development of new orphan drugs. By definition, orphan drugs target diseases affecting less than 200,000 people in the United States.³⁰ As such, such drugs are particularly susceptible to the chilling effect of factors that discourage research and development. On average, the development of a single drug takes anywhere from ten to fifteen years and costs upwards of \$2.6 billion in research and development³¹—and the development of an orphan drug, often takes even longer and costs even more. Limited patient populations make it inherently more challenging for the developers of orphan drugs to recoup this investment, especially because orphan drug developers are overwhelmingly small emerging companies: Start-ups and emerging biotechnology companies are responsible for fully 85% of all orphan-designated products in development.³²

²⁸ Regardless of the “qualifying single source drug” definition adopted by the Agency, CMS must consistently apply such definition. As such, if CMS were to maintain that products that share the same active moiety (drugs) or the same active ingredient (biologics) are the same qualifying single source drug, BIO agrees that the market entry of a generic or biosimilar to any such product would disqualify all such products from treatment of a qualifying single source drug. See Initial Guidance at 10. Any other approach would be irreconcilable with CMS’s stated “qualifying single source drug” definition. See, e.g., *Nat’l Credit Union Admin. v. First Nat. Bank & Tr. Co.*, 522 U.S. 479, 501–02 (1998) (a basic canon of interpretation is that similar or identical language “be accorded a consistent meaning”).

²⁹ SSA § 1192(e)(3)(A) (such drugs are categorically ineligible for selection for negotiation because they are excluded from the definition of “qualifying single source drug”).

³⁰ See 21 C.F.R. § 316.10(d)(8)(ii).

³¹ T. Sullivan, A Tough Road: Cost to Develop One New Drug Is \$2.6 Billion, Policy & Med., <https://www.policymed.com/2014/12/a-tough-road-cost-to-develop-one-new-drug-is-26-billion-approval-rate-for-drugs-entering-clinical-de.html> (Mar. 21 2019).

³² D. Thomas & C. Wessel, 2019 *Emerging Therapeutic Company Trend Report*, BIO Industry Analysis 40 (2019), available at <http://go.bio.org/rs/490-EHZ-999/images/BIO%202019%20Emerging%20Company%20Trend%20Report.pdf>.

As such, it is vitally important that CMS take special steps to protect development of and access to orphan drugs. The stakes could not be higher for patients. There are over 7,000 known rare diseases, and approximately thirty new ones are identified each year.³³ While each rare disease affects only a relatively small number of patients, collectively, over thirty million Americans are affected by a rare disease, with an estimated cost to society in excess of \$1 trillion annually.³⁴ Further, 95% of rare diseases currently have no approved medical treatment.³⁵ According to a 2020 IQVIA/National Organization for Rare Diseases report examining trends in rare disease innovation, “there are [only] 447 drugs with orphan-only indications, with 104 drugs approved for two or more orphan indications.”³⁶ As such, there is a pressing need to maintain strong incentives for continuing orphan drug development.

Research and development regarding the application of existing therapies to rare diseases is one way to chip away at this disparity. The orphan drug exclusion, however, discourages precisely such scientific discovery. Therefore, as the Agency “consider[s] whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development,”³⁷ BIO urges the Agency to implement, at a minimum, the following recommendations to better support ongoing development of and access to drugs targeting patients living with rare diseases.

First, CMS should establish a process that enables manufacturers to submit evidence that an indication falls within an orphan drug designation to account for situations where CMS is unable to determine eligibility for the orphan drug exclusion based on a review of FDA’s orphan drug databases.

As set forth above, the orphan drug exclusion is based on whether a drug has an orphan drug designation for a single rare disease, and whether its approved indications are for such rare disease.³⁸ In many cases, CMS will be able to readily determine whether a drug meets such

³³ BIO, Rare Diseases & Orphan Drugs, <https://www.bio.org/policy/human-health/rare-diseases-orphan-drugs> (last visited Feb. 28, 2023).

³⁷ Initial Guidance at 11.

³⁸ SSA § 1192(e)(3)(A).

criteria using publicly available information. This is because FDA maintains various databases containing relevant information.³⁹

But there are situations where an approved indication falls within the scope of an orphan drug designation but there is no corresponding grant of orphan exclusivity.⁴⁰ In such situations, CMS cannot rely on FDA's databases, as the Agency states in the Initial Guidance it will do,⁴¹ to accurately determine eligibility for the orphan drug exclusion—because those databases principally track orphan exclusivity, rather than orphan drug designation.⁴²

To account for such situations, CMS should create a process that enables manufacturer to provide evidence that an indication falls within an orphan drug designation, where such fact is not ascertainable from FDA databases alone. Acceptable evidence should include written communications with FDA, whether pre- or post-approval. CMS should also establish this process as soon as possible, so that manufacturers can work with FDA and otherwise develop evidence that their drugs are eligible for the orphan drug exclusion, well in advance of the first selected drug publication date.

Second, CMS should confirm that it will determine eligibility for the orphan drug exclusion based on orphan drug designation *at the time of selection*.

Under FDA regulations, a manufacturer may voluntarily withdraw a requested or granted orphan drug designation at any time.⁴³ Where a manufacturer does so, the withdrawal is publicized, and any benefits associated with the designation cease.⁴⁴ Accordingly, when determining eligibility for the orphan drug exclusion, CMS should confirm that it will look only to orphan designation at the time of selection, and will not look to any prior designation that has been withdrawn. Doing so would help avoid improperly narrowing the universe of protected orphan drugs.

³⁹ Such databases include FDA's orphan drug designation/exclusivity database, the drugs@FDA database, and the Approved Drug Products with Therapeutic Equivalence Evaluations publication (Orange Book).

⁴⁰ There are various circumstances where this can arise. For instance, it can occur in certain circumstances where an orphan drug is approved for the same indication as a previously approved drug, but is not clinically superior to the previously approved drug. In such a circumstances, although the indication falls within the scope of the orphan designation, it does not qualify for orphan exclusivity.

⁴¹ Initial Guidance at 11.

⁴² Orphan exclusivity is, in itself, irrelevant for purposes of the orphan drug exclusion. The orphan drug exclusion is unambiguously based on whether all indications of a drug with a single orphan drug designation fall within the scope of that designation. It is therefore immaterial whether the drug also has (or had) orphan exclusivity.

⁴³ 21 C.F.R. § 316.24(d).

⁴⁴ *Id.*

Third, CMS should clarify that, where an orphan drug loses eligibility for the orphan drug exclusion, the seven- or eleven-year “qualified single source drug” clock runs from *the date on which the drug lost eligibility for the exclusion*.

Doing so would help maximize protection for orphan drugs. Absent such clarification, an orphan drug that loses eligibility for the orphan drug exclusion could be virtually immediately subject to selection for negotiation, simply because it was designated as an orphan drug for a second rare disease or an indication was approved for a second rare disease. CMS’s implementation of the orphan drug exclusion would thereby disincentivize progress in rare disease drug development, which is often predicated upon identification of promising new uses of existing therapies. CMS should act to avoid such a result, as it would further disincentivize developers of orphan drugs from investing in treatments for a second rare disease.

Implementing the above recommendations is necessary to mitigate the risk that the Negotiation Program will deter the development of orphan drugs to treat those suffering from rare diseases. It is also fully consistent with long-standing Congressional policy favoring protection of orphan drugs. Such policy dates back to the early 1980s, when Congress enacted the Orphan Drug Act of 1983 to create various incentives to encourage and facilitate the development of new orphan drugs.⁴⁵ In keeping with Congress’s long-held policy of protecting orphan drugs, CMS should make every effort to ensure that it does not hamper orphan drug innovation as it implements the Negotiation Program and its orphan drug exclusion.

D. Small biotech drugs

Under the IRA, a drug is exempt from negotiation for initial price applicability years 2026, 2027, and 2028 if spending on the medicine comprises: (1) a small percentage of Medicare program spending, and (2) a significant proportional share of a company’s Medicare business. This is referred to as the Small Biotech Exception. This critical protection recognizes that small biotech manufacturers with a single product that represents the vast majority of their Medicare revenue will be disproportionately impacted by negotiation, which could have an immediate and tangible impact on the ability of such manufacturers to invest in future R&D – and in particular, in areas that predominantly affect the Medicare population.

CMS does not address how or when it will notify manufacturers regarding its determination of whether a drug, based on the information the manufacturer submits through the proposed ICR, qualifies for the Small Biotech Exception. **To that end, our comments that follow focus on ensuring predictability and**

⁴⁵ See Orphan Drug Act, Pub. L. No. 97-414, §§ 1, 2, 96 Stat. 2049, 2049–51 (1983), as amended by Pub. L. 98-551, 98 Stat. 2815, 2817 (1984).

transparency for small biotech manufacturers that apply for the exception. This includes the following process attributes:

- Clear process (i.e., who submits, what to submit, when to submit) for applying for or recertifying a drug qualifies for the Small Biotech Exception.
- Appropriate and fair timelines to submit information to qualify.
- Consistency and clear criteria in evaluating submissions to qualify for the Small Biotech Exception.
- Proper and timely notification regarding qualification if the drug meets the Small Biotech Exception requirements.
- Proper and timely notification if the drug does NOT meet the Small Biotech Exception requirements, as well as a clear dispute process for appeal of such decision.
- Clarity regarding the form and manner that CMS will use to notify manufacturers if they meet – or do not meet – the criteria for the Small Biotech Exception.

Submissions for Initial Price Applicability Year 2026. CMS has indicated that the current Small Biotech Exception ICR is focused only on initial price applicability year 2026. However, as discussed further below, given that the agency has not made publicly available the data on which it will rely with regard to total expenditures for the purpose of determining eligibility for the Small Biotech Exception under section 1192 (d)(2,) or whether a drug meets the test of a high spend drug under section 1192 (d)(1), it is impossible for small biotech manufacturers to make a reasonable inference regarding whether a submission is warranted in the current or future years on the basis of the requisite statutory thresholds. We recommend that any company that believes it qualifies for the Small Biotech Exception under section 1192 (d)(2) should be able to apply and be approved for this exception this year regardless of whether the drug meets the test of a high spend drug under section 1192 (d)(1). This will provide important certainty and predictability for small biotech manufacturers. Such certainty is critical as most small biotech manufacturers have only one or a limited number of products on the market. We also believe the statute contemplates such an approach, as the exception in section 1192 (d)(2)(A) refers to a “qualifying single source drug” that meets either the test in section 1192 (d)(2)(A)(i) or section 1192 (d)(2)(A)(ii), and these tests refer to Medicare expenditures in 2021, and the data for any small biotech company is readily available to CMS. To provide additional predictability and mitigate uncertainty for small biotech manufacturers, CMS should also clearly articulate the specific criteria manufacturers should consider in determining whether to apply for the Small Biotech Exception for initial price applicability year 2026.

Clarity on Process and CMS Response to Small Biotech Manufacturer. CMS should specify not only the timeline for when the submission of information by the small biotech manufacturer is due, but also the timeline for CMS review and response to the manufacturer, in situations where CMS grants the

exception as well as situations where CMS does not. To promote certainty for small biotech manufacturers, CMS should commit to responding to each manufacturer as far in advance of September 1, 2023, as possible.

- *Clear Timelines.* We suggest the following as a timeline that would allow for appropriate transparency, clarity, and completion of the process in advance of the September 1, 2023, publication of drugs selected for negotiation:
 - Submission by small biotech manufacturers due June 10, 2023;
 - CMS response to small biotech company (affirmative or negative) due by June 30, 2023;
 - Small biotech company response to negative determination by July 20, 2023;
 - Final CMS response to small biotech company by August 10, 2023.
- *Clarity on Data Source for 2021 Drug Spending and Availability of Data for Manufacturers.* CMS should clarify what data source it will use for identifying 2021 total expenditures for the qualifying single source drug, as the agency has stated that the drug dashboard data published at [cms.gov](https://www.cms.gov) is not being used for the IRA negotiation provisions; we also understand CMS is considering use of Prescription Drug Event (PDE) data. We recommend that CMS provide the data it will be using for 2021 to manufacturers so that this data can be validated by manufacturers that apply for (or will apply for) the Small Biotech Exception.
- *CMS Response and Justification for Decision.* CMS should provide clarity on the form and content of its expected response and notification to small biotech manufacturers applying for the exception, specifically whether the response will be by letter, email, or other form of official communication. Further, if CMS determines that it does not agree that a small biotech drug qualifies for the exception, CMS's response should outline in sufficient detail how such a determination was made, including on which expenditure data the agency relied and other information, as relevant, that led to a negative determination. Further, CMS should indicate if the rationale for the denial is restricted to initial price applicability year 2026 or all years for which the Small Biotech Exception applies.
- *Dispute Resolution.* CMS should provide a dispute resolution process where the manufacturer can respond to and appeal a negative determination by CMS. Specifically, the small biotech manufacturer should have the opportunity to provide additional data or information to the agency to support its application for the Small Biotech Exception.
- *Flexibility.* Given that this is a new program and process, and that only a limited number of small biotech manufacturers will be providing submissions to CMS, we recommend that the agency allow for a flexible approach. For example, if CMS determines that information submitted by the

small biotech manufacturer is incomplete or unclear, we urge CMS to engage in a dialogue with the manufacturer to resolve any outstanding issues to complete their submission. Further, for the first year of the program, we encourage CMS to allow a small biotech manufacturer to submit information after the information submission deadline, such as in good faith circumstances where a small biotech manufacturer may later realize that it should qualify for the exception.

- *One-time Qualification.* We request that manufacturers should not need to reapply in subsequent years if a drug has previously received the Small Biotech Exception and there is no material change in the manufacturer's circumstances. Manufacturers could submit an attestation that nothing in their application has materially changed from the prior year and if there has been a material change the manufacturer could submit an updated form.
- *Clear Definition of "Acquired."* We recommend CMS include a definition for what it means to be "acquired" pursuant to section 1192(d)(2)(B)(ii). CMS should consider defining an acquisition as the transfer of substantially all assets of the manufacturer. Further, CMS should specify whether the acquiring manufacturer meeting the definition of a specified manufacturer will be determined at the time of acquisition. If the acquisition results in a change in eligibility for the small biotech exemption, an updated form should be submitted.
- *Confidentiality of Proprietary Information, Publication of Drugs Qualifying for Small Biotech Exception.* As with all other aspects of the data submitted under provisions of the IRA, CMS must fully protect the confidentiality of all proprietary information submitted in relation to this ICR. At the same time, CMS should outline its approach for sharing with the public information regarding the small biotech drugs the agency determines qualify for the exception. Further, BIO recommends that CMS publish a summary list of the small biotech drugs and manufacturers that qualified. Such information will be important for understanding the impact of this IRA provision and provide further certainty to small biotech manufacturers. We believe that more detail on

how or why a specific manufacturer's drug qualified as a small biotech drug should only be released if that manufacturer chooses to do so.

II. Selection, and Delayed Selection, for Negotiation

A. Background

For each IPAY, the statute directs CMS to publish a list of the drugs that have been selected for negotiation (under statutorily specified parameters) by February 1 of the year that is two years before such IPAY.⁴⁶

The statute provides for a delay in the selection of a biologic for negotiation where, among other things, CMS finds that a biosimilar is highly likely to come to market within two years of what otherwise would be the selected drug publication date.⁴⁷ A first year of delay is granted if the following criteria are met:

- The biologic otherwise would be an extended-monopoly drug;⁴⁸
- The biosimilar manufacturer requests the delay before what would otherwise be the selected drug publication date;⁴⁹
- The biosimilar manufacturer submits specified information and documents;⁵⁰
- CMS finds that the biosimilar is highly likely to be licensed and market within two years of what otherwise would be the selected drug publication date;⁵¹ and
- Certain disqualifying circumstances are not present.⁵²

A second year of delay is granted if the following criteria are met:

- The biologic otherwise would remain an extended-monopoly drug;⁵³
- The biosimilar manufacturer requests the delay before the date that is one year after what would otherwise be the selected drug publication date;⁵⁴ and
- CMS finds that the biosimilar is highly likely to be licensed and marketed within two years of what otherwise would be the selected drug publication date and that, based on clear and

⁴⁶ SSA §§ 1191(b)(3), 1192(a); *see also id.* § 1191(d)(1) (September 1, 2023, for IPAY 2026).

⁴⁷ *Id.* § 1192(f).

⁴⁸ *Id.* § 1192(f)(1)(A); *see also id.* § 1194(c)(4) (defining "extended-monopoly drug").

⁴⁹ *Id.* § 1192(f)(1)(B)(i)(I).

⁵⁰ *Id.* § 1192(f)(1)(B)(ii).

⁵¹ *Id.* § 1192(f)(2)(A).

⁵² *Id.* § 1192(f)(2)(D)(iii), (iv).

⁵³ *Id.* § 1192(f)(2)(D)(ii).

⁵⁴ *Id.* § 1192(f)(1)(B)(i)(II).

convincing evidence, the biosimilar manufacturer has made substantial progress toward licensure and marketing;⁵⁵ and

- Certain disqualifying circumstances are not present.⁵⁶

Where a second year of delay is not granted or the biosimilar does not come to market within two years of what otherwise would be the selected drug publication date, the biologic is selected for negotiation, and the biologic manufacturer must pay a specified rebate.⁵⁷

B. Pre-selection process

Well in advance of the selected drug publication date, CMS should notify each manufacturer of each drug that it intends to select for negotiation and afford each such manufacturer a reasonable opportunity to dispute the propriety of each such intended selection.

The process for selecting a drug for negotiation is complex. Eligibility for selection is based on multiple factors, including whether a sufficient number of years have elapsed since approval or licensure;⁵⁸ whether a generic or biosimilar has come to market;⁵⁹ whether the drug is eligible for the orphan drug exclusion;⁶⁰ whether the drug is a plasma-derived product;⁶¹ whether the drug is a small biotech drug;⁶² whether Medicare expenditures are sufficiently low to disqualify the drug from selection;⁶³ and whether Medicare expenditures are sufficiently high to qualify the drug for selection.⁶⁴

The intricate nature of the selection process presents an inherent risk of a selection error. Notably, if a selection error were identified after the selected drug publication date, CMS would de-select the erroneously selected drug but could not select a substitute. By statute, for a given IPAY, all drugs must be selected by February 1 of the year that is two years before the IPAY.⁶⁵

CMS can readily mitigate this concern by adopting a process for soliciting feedback from manufacturers of potential selected drugs before the selected drug publication date. Specifically, CMS should provide notice to each such manufacturer at least thirty days in advance of the selected drug publication date.

⁵⁵ *Id.* § 1192(f)(2)(B)(i), (iii).

⁵⁶ *Id.* § 1192(f)(2)(D)(iii), (iv).

⁵⁷ *Id.* § 1192(f)(2)(B)(ii), (C).

⁵⁸ *Id.* § 1192(e)(1).

⁵⁹ *Id.*

⁶⁰ *Id.* § 1192(e)(3)(A).

⁶¹ *Id.* § 1192(e)(3)(C).

⁶² *Id.* § 1192(d)(2).

⁶³ *Id.* § 1192(e)(3)(B).

⁶⁴ *Id.* § 1192(d)(1).

⁶⁵ *Id.* §§ 1192(e), 1192(a); see also *id.* § 1191(d)(1) (September 1, 2023, for IPAY 2026).

CMS should then afford the manufacturer at least fourteen days to identify to the Agency any basis on which the manufacturer believes the drug is not, in fact, eligible for selection. Such a pre-selection process would serve an important role in identifying selection errors and further the Agency's interests in transparency, efficiency, and informed decision-making.

In addition to providing advance notice to each manufacturer of a drug that the Agency intends to select, CMS should provide advance notice to each manufacturer of at least each of the next five drugs that would be selected if one or more drugs that the Agency intends to select were found to be ineligible for selection. Doing so would promote efficiency by giving each such manufacturer the same opportunity to engage with the Agency regarding potential selection errors. And doing so would impose no additional burden on the Agency because CMS is already required to identify the top fifty qualifying single source drugs by Part D expenditures and, starting with IPAY 2028, the top fifty qualifying single source drugs by Part B expenditures.⁶⁶

In addition, in advance of the deadline by which a biosimilar manufacturer must request a delay in the selection of a reference biologic for negotiation, CMS should enable such biosimilar manufacturer to ascertain whether the reference biologic is among the drugs that the Agency intends to select (or one of at least the next five drugs in line for selection).

As set forth above, a biosimilar manufacturer may request a delay in the selection of a reference biologic for negotiation.⁶⁷ By statute, such a request must be submitted before the selected drug publication date.⁶⁸ This requirement results in a fundamental timing conundrum: A biosimilar manufacturer will not know whether it should request a delay until after the deadline for requesting the delays has passed.

CMS tacitly acknowledges this timing conundrum in the Initial Guidance but fails to meaningfully address it. The Initial Guidance provides only that a biosimilar manufacturer that “think[s]” that a reference biologic “may” be selected for negotiation should submit a delay request.⁶⁹ This approach is inadequate. Requiring a biosimilar manufacturer to guess whether to submit a delay request is deeply inefficient and unreasonable; just as “[i]t is one thing to expect regulated parties to conform their conduct to an agency’s [actions] once the agency announces them; it is quite another to require regulated parties to divine the agency’s [actions] in advance.”⁷⁰

⁶⁶ See *id.* § 1192(d)(1).

⁶⁷ *Id.* § 1192(f).

⁶⁸ *Id.* § 1192(f)(1)(B)(i).

⁶⁹ Initial Guidance at 16.

⁷⁰ *Christopher v. SmithKline Beecham Corp.*, 567 U.S. 142, 158–59 (2012).

To make the delay request provision meaningful, it is essential that CMS instead create a way for a biosimilar manufacturer, with appropriate confidentiality safeguards, to ascertain whether a reference biologic is likely to be selected before the delay request submission deadline. CMS should enable a biosimilar manufacturer to inquire with the Agency starting at least thirty days in advance of such deadline.

C. Delayed selection of a biologic for negotiation on account of anticipated biosimilar market entry

As set forth below, BIO makes a number of recommendations to enhance the implementation of the process by which a biosimilar manufacturers may request a delay in the selection of a reference product for negotiation.

As set forth above, the statute directs CMS to delay the selection of a biologic for negotiation under specified circumstances.⁷¹ BIO makes the following recommendations to enhance the implementation of the delay process:

First, it is vital that CMS afford a biosimilar manufacturer a *meaningful* opportunity to request a delay, reset the delay request submission deadline closer to the selected drug publication date and permit broad supplementation of a timely request.

If CMS does not adopt these recommendations, it will undermine the fidelity of the information on which it relies in making a “high likelihood” determination—and indeed Congress’s objective in providing for a delay request.

With respect to the timing of a delay request, under the Initial Guidance, a biosimilar manufacturer must give notice of its intent to submit a delay request by May 10, 2023.⁷² CMS will then provide a fillable template to complete and access to a Box folder within five business days, i.e., by May 17, 2023.⁷³ The manufacturer must then upload a completed templated and all supporting documentation by May 22, 2023—only three business days later, yet over three months in advance of the selected drug publication date.⁷⁴ There is no justification for such an extraordinarily and needlessly truncated window of time in which to submit a multifactorial request—a concern that is only compounded by CMS’s policy of automatically denying an

⁷¹ SSA § 1192(f).

⁷² Initial Guidance at 21.

⁷³ *Id.*

⁷⁴ *Id.*

incomplete request.⁷⁵ Indeed, such timing constraint works to defeat the Congressional objective in providing for a delay request: By effectively eliminating the additional runway for a biosimilar competitor to come to market, it acts as a barrier to the biosimilar competition that Congress sought to nurture. It is imperative that CMS afford a biosimilar manufacturer a meaningful opportunity to request a delay.

In addition, to ensure that CMS adjudicates a delay request based on the most mature information possible, CMS should (1) set the delay request submission deadline as close as reasonably possible to the selected drug publication date and (2) permit broad supplementation of a timely request with late-breaking information or otherwise for good cause. As noted above, under the Initial Guidance, a biosimilar manufacturer must give notice of its intent to submit a delay request by May 10, 2023—over three months in advance of the selected drug publication date.⁷⁶ And CMS will permit supplementation by the biosimilar manufacturer, beyond supplementation requested by the Agency, only with respect to whether the BLA has been accepted or approved by FDA.⁷⁷

Information bearing on the expected timing of licensure and marketing often rapidly changes. The expected timing of market entry can fluctuate based on a range of factors, including FDA communications regarding the BLA and changes to the manufacturer’s production or distribution arrangements. In order for CMS to make an informed determination regarding eligibility for delayed selection, it is vitally important that the Agency rely on all of the most recent available information that bears on the likelihood of market entry within the requisite time period.

An accurate “high likelihood” determination also reduces administrative burden. If CMS makes an erroneous determination based on outdated or incomplete information, the Agency will be required to administer the payment of a rebate by the reference biologic manufacturer. Such needless inefficiency can be avoided by enabling the Agency to rely on the most recent available information by (1) setting the delay request submission deadline as close as reasonably possible to the selected drug publication date and (2) permitting broad supplementation of a timely request with late-breaking information or otherwise for good cause.

Second, CMS should provide notice of its delay request determination in advance of the selected drug publication date and establish a dispute resolution process.

⁷⁵ *Id.* at 22.

⁷⁶ *Id.* at 21.

⁷⁷ *Id.* at 23.

Under the Initial Guidance, CMS will not inform a biosimilar manufacturer of an unsuccessful delay request until after the selected drug publication date.⁷⁸ This effectively means that the biosimilar manufacturer will have no opportunity to dispute the determination.

The Agency instead should provide notice of an unsuccessful delay request in advance of the selected drug publication date and establish a process by which the biosimilar manufacturer can dispute an erroneous determination. BIO recommends that CMS provide such notice at least fourteen days in advance of the selected drug publication date and afford the biosimilar manufacturer at least seven days to dispute the determination.

Third, CMS should accept and consider all information that the biosimilar manufacturer determines relevant to determining eligibility for delayed selection.⁷⁹

As noted above, there are countless factors that can affect the expected timing of licensure and approval. It follows that CMS should not artificially limit the information that it considers in determining eligibility for delayed selection. Accordingly, it is vital that CMS enable the biosimilar manufacturer—the party closest to the information—to submit all information that it determines relevant to the delay request.⁸⁰

There is clear statutory authority to enable the biosimilar manufacturer to submit such information. The statute provides that the biosimilar manufacturer must submit “information and documents necessary for [CMS] to make [the delayed selection determination], as specified by [CMS]”⁸¹ In addition, the statute provides that, after CMS has reviewed the delay request, the biosimilar manufacturer must submit “any additional information and documents requested by [CMS] necessary to make [the delayed selection determination].”⁸²

CMS therefore has broad discretion in specifying what the biosimilar manufacturer must submit in support of the delay request. The Agency should exercise such discretion and request that the manufacturer submit all relevant information. Doing so would help ensure that CMS has the most pertinent information before it, as the biosimilar manufacturer is the entity best situated to identify the information that bears on the delay request.

⁷⁸ *Id.* at 24.

⁷⁹ See SSA § 1192(f)(1)(B)(ii)(I)(aa) (“information and documents necessary for the Secretary to make determinations under this subsection, as specified by the Secretary”), (II) (“additional information and documents requested by the Secretary necessary to make determinations under this subsection”).

⁸⁰ In the Initial Guidance, CMS enables the submission of only the statutory minimum information. Initial Guidance at 22.

⁸¹ SSA § 1192(f)(1)(B)(ii)(II). The statute goes on to specify that such information “includ[es]” the information specified in section 1192(f)(1)(B)(ii)(III). *Id.*

⁸² *Id.* § 1192(f)(1)(B)(ii)(II).

Notably, CMS also has clear legal authority to consider all such information in making a “high likelihood” determination.

Section 1192(f)(3) sets forth a set of circumstances under which CMS must find a high likelihood of timely market entry—based on a limited set of enumerated information and documents, including information and documents described in section 1192(f)(1)(B)(ii)(III) (subclause (III)).⁸³ Critically, section 1192(f)(3) cannot be interpreted to set forth the only set of circumstances under which CMS may find a high likelihood of timely market entry.

The broader structure of section 1192(f) makes clear that Congress intended that the full range of relevant information and documents be considered by CMS, not only the limited set of information and documents enumerated in section 1192(f)(3). This is because section 1192(f)(1)(B)(ii)(I)(aa) (subclause (I)(aa)) clearly requires the biosimilar manufacturer to submit information and documents necessary to rendering the “high likelihood” determination—“includ[ing]” (but not limited to) the information and documents described in subclause (III).

The necessary implication is that there are information and documents beyond the information and documents described in subclause (III)—which are also “necessary” to rendering the “high likelihood” determination. While the information and documents described in subclause (III) are accounted for in section 1192(f)(3), the remaining information and documents described in subclause (I)(aa) are not—despite being “necessary” to rendering the “high likelihood” determination. Thus, if section 1192(f)(3) were the only set of circumstances under which CMS may find a high likelihood of timely market entry, the language in subclause (I)(aa) requiring broad submission of pertinent information and documents beyond those in subclause (III) would be rendered a nullity.⁸⁴ Because the information and documents described in subclause (I)(aa) serve no other statutory purpose, the only way to give meaning to the entirety of subclause (I)(aa) is to assign it its most natural meaning: Information and documents described in subclause (I)(aa) are “necessary” to rendering the “high likelihood” determination and, thus, CMS may consider all such information and documents submitted in rendering such determination. Accordingly, section 1192(f)(3) does not set forth the only set of circumstances under which CMS may find a high likelihood of timely market entry.

There is every reason to think that Congress intended for CMS to consider all relevant evidence in rendering the “high likelihood” determination. Any other interpretation of the statute would

⁸³ *Id.* § 1192(f)(3).

⁸⁴ See *Duncan v. Walker*, 533 U.S. 167, 175 (2001) (a statute is not to be interpreted in a manner that renders any provision a nullity or otherwise meaningless).

yield an absurd result. Through subclause (I)(aa), Congress clearly granted CMS broad discretion to identify and collect information and documents “necessary” to rendering the determination. If CMS were to refuse to consider such information, it would be tantamount to the Agency acknowledging that it is rendering the determination without considering information and documents that the Agency itself has concluded is essential to doing so. It is hard to imagine more arbitrary and capricious governmental decision-making.⁸⁵ Accordingly, CMS should request all information that a biosimilar manufacturer concludes supports a “high likelihood” determination and consider all such information in rendering such determination.

Fourth, we appreciate CMS’s confirmation that an agreement between a biosimilar manufacturer and a reference biologic manufacturer that permits the biosimilar manufacturer to market the biosimilar is not necessarily an agreement that incentivizes the biosimilar manufacturer to request a delay. But we ask for clarification on the circumstances under which CMS will find a disqualifying agreement to exist.

The statute provides that a delay request may not be granted where, based on specified information,⁸⁶ a biosimilar manufacturer and a reference biologic manufacturer have entered into an agreement that incentivizes (or requires) the biosimilar manufacturer to request a delay.⁸⁷ In the Initial Guidance, CMS correctly acknowledges that an agreement between a biosimilar manufacturer and a reference biologic manufacturer “that permits the Biosimilar Manufacturer to [timely] market the Biosimilar in one or more dosage form(s), strength(s), and indication(s)” not only is not necessarily an agreement that incentivizes the biosimilar manufacturer to request a delay but indeed can be a form of clear and convincing evidence of a high likelihood of timely market entry.⁸⁸ It would be contrary to the statute for CMS to suggest otherwise. This is because the statute clearly directs CMS to consider agreements between the biosimilar manufacturer and the reference biologic manufacturer in rendering the delayed selection determination.⁸⁹ It would nullify this statutory instruction if the mere existence of an agreement between the biosimilar manufacturer and the reference biologic manufacturer were automatically disqualifying. It is well understood that a statute should not be interpreted in a manner that renders text meaningless or otherwise nugatory.⁹⁰

⁸⁵ See 5 U.S.C. § 706(2)(A).

⁸⁶ SSA § 1192(f)(1)(B)(ii)(I)(bb) (“all agreements related to the biosimilar biological product filed with the Federal Trade Commission or the [Department of Justice] pursuant to subsections (a) and (c) of section 1112 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003,” which include agreements between “brand name drug companies” and “generic drug applicants”).

⁸⁷ *Id.* § 1192(f)(2)(D)(iv).

⁸⁸ Initial Guidance at 19.

⁸⁹ SSA § 1192(f)(1)(B)(ii)(I)(bb), (2)(B)(i)(II), (3)(B).

⁹⁰ *United States v. DBB, Inc.*, 180 F.3d 1277, 1285 (11th Cir. 1999) (“A statute should be ‘interpreted so that no words shall be discarded as meaningless, redundant, or mere surplusage.’”) (internal citations omitted).

BIO, however, asks CMS to clarify the circumstances under which the Agency will find a disqualifying agreement to exist. In the Initial Guidance, CMS states only that an agreement may not “impos[e] improper constraints on the Biosimilar Manufacturer.”⁹¹ Yet, despite the absence of meaningful guidance regarding such constraints, CMS will require a biosimilar manufacturer requesting a delay to certify that it has not entered into a disqualifying agreement,⁹² on pain of potential “liability, including under the False Claims Act.”⁹³ To promote market certainty by enabling manufacturers to more confidently make more informed decisions about the arrangements into which they enter, it is imperative that CMS clarify what constitutes an agreement that incentivizes a biosimilar manufacturer to request a delay.

III. Negotiation Process

A. Background

The statute requires CMS to “develop and use a consistent methodology and process” to negotiate the MFP.⁹⁴ In addition, the statute requires the manufacturer to submit specified information by March 1 of the year that is two years before the applicable IPAY.⁹⁵ CMS must make a written initial offer by June 1, which must include a concise justification that considers certain statutorily enumerated negotiation factors.⁹⁶ Within thirty days of receipt, the manufacturer must accept the initial offer or make a written counteroffer, which must include a justification that considers the same statutorily enumerated negotiation factors.⁹⁷ CMS must respond in writing to any counteroffer,⁹⁸ and the negotiation period must end by November 1.⁹⁹

⁹¹ Initial Guidance at 19.

B. Negotiation process

BIO asks CMS to adopt its recommendations to improve the proposed negotiation process.

As noted above, the statute mandates that CMS “develop and use a consistent methodology and process” for MFP negotiation.¹⁰⁰ Thus, Congress intended for the negotiation process to be transparent to and predictable for all parties. Although no two negotiations will ever be identical—because the circumstances of each selected drug are unique—all negotiations should be subject to a clear and reasonable framework. A consistent process not only is statutorily required but also helps to ensure that CMS complies with its obligation to treat similarly situated entities in a similar manner, absent a reasoned basis for distinction.¹⁰¹

The Initial Guidance proposes that, only where CMS rejects a counteroffer, the Agency will extend an invitation for a negotiation meeting to take place within thirty days of receipt of such counteroffer.¹⁰² CMS would hold a maximum of three such meetings: an initial meeting and up to one additional meeting at the request of either CMS or the manufacturer.¹⁰³ The Initial Guidance also proposes to allow the parties to discuss new information during such meetings.¹⁰⁴

With respect to justifying an initial offer, the Initial Guidance only recites the statutory requirement of a concise justification based on the statutorily enumerated negotiation factors.¹⁰⁵ The Initial Guidance is silent as to any justification of a response to a counteroffer.

BIO makes the following recommendations to improve the proposed negotiation process:

First, CMS should further enable a negotiation process that allows for meaningful engagement and dialogue between CMS and manufacturers. BIO appreciates that CMS’s recognition that real dialogue (as opposed to a paper-based process) is essential to fulfilling Congress’s intent in establishing a “Negotiation” Program with a mandated process “for negotiations,”¹⁰⁶ which necessarily contemplates meaningful engagement between the Agency and the manufacturer on the unique circumstances presented by each selected drug.¹⁰⁷

¹⁰⁰ *Id.* § 1194(b)(1).

¹⁰¹ See *Bracco Diagnostics*, 963 F. Supp. at 27–28.

¹⁰² Initial Guidance at 55.

¹⁰³ *Id.* at 55–56.

¹⁰⁴ *Id.* at 56.

¹⁰⁵ *Id.* at 54.

¹⁰⁶ SSA § 1194(b)(1).

¹⁰⁷ See *Wheeler v. St. Joseph Hosp.*, 133 Cal. Rptr. 775, 790 (Ct. App. 1976) (differentiating between “negotiated contracts” and contracts of adhesion).

BIO, however, is concerned that the agency is arbitrarily limiting such engagement to (1) the period after the rejection of a counteroffer and (2) a maximum of three meetings. There is no logical reason for such limitations, as (1) such engagement can equally inform an initial offer, potentially sparing the parties the need to consider a counteroffer, and (2) the parties may agree that one or more additional meetings would be helpful and productive in setting the MFP. Accordingly, BIO encourages CMS to revise its proposed negotiation process to (1) enable real dialogue between the parties throughout the negotiation process and (2) specify that, where CMS rejects a counteroffer, additional meetings, beyond those proposed by CMS, may be held without limit where both parties agree to them. We note that such modifications to the negotiation process would be readily manageable given the limited number of drugs subject to such negotiation in any given year.¹⁰⁸

Second, the manufacturer should more generally be permitted to supplement its timely submission where a post-submission development arises or there otherwise is good cause. As set forth above, the statute requires the manufacturer to submit specified information by March 1 of the year that is two years before the applicable IPAY. Inevitably, there will be situations where information relevant to the negotiation arises after the submission deadline has passed. Such late-breaking developments will often be completely unforeseeable at the time of submission but highly relevant to the setting of the MFP. The potential scenarios are virtually limitless: For example, new therapeutic alternatives may come to market; production costs may shift due to ingredient shortages or supply chain issues; or new comparative effectiveness studies may become available.

BIO acknowledges CMS's recognition that it should not blind itself to highly pertinent new information, simply because the submission deadline has passed. But the Agency proposes to limit the presentation of such information to the negotiation meetings during the period after the rejection of a counteroffer. Because such information can equally inform an initial offer, potentially sparing the parties the need to consider a counteroffer, the Agency should more generally permit the manufacturer to supplement its timely submission wherever there is good cause to do so, including when new information relevant to the negotiation process becomes available after the submission deadline.

Permitting supplemental submissions is well warranted. Under the statute, manufacturers are given only one month to prepare a voluminous submission of complex information, including information regarding Non-Federal average manufacturer price (Non-FAMP); research and

¹⁰⁸ See SSA § 1192(a).

development costs; production and distribution costs; federal financial support for discovery and development; pending and approved patent applications, FDA exclusivities, NDAs or BLAs and approvals thereof, market data; and revenue and sales volume data.¹⁰⁹ In some cases, requested data may also not exist in a format required by CMS, such that the manufacturer will need to painstakingly convert raw data from multiple sources into such a format. Manufacturers will assuredly work with utmost diligence to comply with CMS's submission requirements. Still, they may need the flexibility of a supplement to their timely submission for legitimate reasons.

Ultimately, more generally permitting the manufacturer to supplement its timely submission where there is good cause would help ensure that the MFP is set based on the best available information.

Third, CMS should provide a *meaningful* justification of its initial offer and its response to any counteroffer and afford the manufacturer a meaningful opportunity to comment on the response the MFP is set.

As noted above, Congress intended for the MFP to be set via “negotiation,” meaning a bilateral “discussion or process of treaty” between the parties “aimed at reaching an agreement about a particular issue.”¹¹⁰ As with any good faith negotiation, open dialogue will be vital to the success of the MFP negotiation. To this end, BIO asks CMS to specify that its initial offers and its responses to any counteroffers include *meaningful* explanations of how the Agency arrived at the offer or response, including by explaining how the offer or response is supported by the statutorily enumerated negotiation factors and any other information upon which the Agency relied, and how the Agency considered and weighted such factors and information.

As noted above, in the Initial Guidance, CMS states only that the Agency's justification for an initial offer will be “based on” its analysis of statutorily enumerated negotiation factors, but it does not commit to disclosing the details of such analysis.¹¹¹ The Agency does not commit to providing any justification for a response to a counteroffer or an explanation of how it arrived at such response.¹¹²

¹⁰⁹ *Id.* §§ 1193(a)(4), 1194(e)(1).

¹¹⁰ Oxford English Dictionary, Definition of Negotiation, <https://www.oed.com/view/Entry/125879?redirectedFrom=negotiation#eid> (last visited Mar. 2, 2023).

¹¹¹ Initial Guidance at 54.

¹¹² *See id.* at 56–57.

Fully disclosing the bases of both offers and responses to counteroffers would facilitate a more robust—and ultimately more effective—negotiation process. By providing the manufacturer with a meaningful justification for an offer or response, CMS would provide greater opportunity for bilateral dialogue, which would result in more informed and targeted discussions.

BIO also asks CMS to commit to responding to any counteroffer within thirty days. We further ask CMS to commit to affording the manufacturer at least thirty days to comment on the response and considering any such comment before the MFP is set.

This basic procedural protection is essential. Not only would it be consistent with the Agency's stated interest in "prioritiz[ing] transparency and robust engagement,"¹¹³ but it would also result in more informed and accurate decision-making. It would help prevent the MFP from being set based on an error, a misunderstanding, or a gap in information.

There is ample time in the negotiation schedule for such procedural protection. By statute, an initial offer is made by June 1 (February 1, 2024, for IPAY 2026).¹¹⁴ A counteroffer is made within thirty days of receipt.¹¹⁵ Even if CMS were to wait until June 1 (February 1, 2024, for IPAY 2026) to make the initial offer, and even if the manufacturer were to wait until the thirtieth day after receipt make the counteroffer, there would still be four months remaining in the negotiation schedule (five months for IPAY 2026). Thus, there would be ample time for the recommended additional process.

C. Confidential commercial information

BIO acknowledges CMS's stated commitment to confidentiality, but recommends that CMS establish more fulsome safeguards to ensure that the Agency is adequately protecting the confidentiality of all proprietary information submitted to CMS as part of the negotiation process. In addition, BIO opposes CMS's proposed imposition of overly broad confidentiality obligations on manufacturers.

The statute imposes a clear confidentiality requirement: "Information submitted to . . . [CMS] . . . by a manufacturer of a selected drug that is proprietary information of such manufacturer (as determined by . . . [CMS]) shall be used only by . . . [CMS] or disclosed to and used by the Comptroller General of the United States for purposes of carrying out [the Negotiation Program]."¹¹⁶ Congress imposed this

¹¹³ CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 at 1 (Jan. 1, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>.

¹¹⁴ SSA § 1191(d)(5)(A).

¹¹⁵ *Id.* § 1194(b)(2)(B).

¹¹⁶ *Id.* § 1193(c).

confidentiality requirement for good reason. The statute mandates that manufacturers of selected drugs submit highly sensitive information as part of the negotiation process—including, among other things, information regarding Non-FAMP, research and development costs, production and distribution costs, and revenue and sales volume data.¹¹⁷ It would be deeply disruptive to commercial markets if such proprietary information were disclosed or used in violation of the confidentiality requirement. Indeed, the Initial Guidance acknowledges the “highly sensitive” nature of information to be submitted under the program.¹¹⁸ In principle, BIO is therefore encouraged that CMS states that it “intends to implement a confidentiality policy that is consistent with existing requirements for protecting proprietary information, such as Exemption 4 of [the Freedom of Information Act (FOIA)].”¹¹⁹ That said, there is a pressing need for more detailed specification as to how the Agency will safeguard confidential commercial information to ensure that the statute’s robust confidentiality requirement is fully honored.

BIO therefore asks CMS to more fully specify the controls and safeguards that it will implement. We urge CMS to ensure that such controls and safeguards maximize the protection of confidential commercial information to be submitted under the program. This would be fully consistent with the approach taken in other areas of federal law and policy, which have long given special consideration to such highly sensitive information. For nearly forty years, the Supreme Court has made clear that commercial trade secrets are a “property right [] protected by the Taking Clause of the Fifth Amendment.”¹²⁰ Likewise, Congress has repeatedly made clear its expectation that commercially sensitive information be appropriately safeguarded. For example, even beyond FOIA’s long-standing protection of “trade secrets and commercial or financial information that is obtained from a person and is privileged or confidential,”¹²¹ the Defend Trade Secrets Act prohibits the “misappropriation” of trade secrets through public disclosure and established a private cause of action to enable affected parties to sanction such misappropriation.¹²²

BIO recommends the following minimum controls and safeguards to give full meaning to the confidentiality requirement:

First, CMS should confirm that, in “implement[ing] a confidentiality policy that is consistent with existing requirements for protecting proprietary information,”¹²³ it will ensure protections comparable to, not only those under FOIA, but also those under government price reporting law and policy.

¹¹⁷ *Id.* §§ 1193(a)(4), 1194(e)(1).

¹¹⁸ Initial Guidance at 29.

¹¹⁹ *Id.*

¹²⁰ *Ruckelshaus v. Monsanto Co.*, 467 U.S. 986, 1004 (1984).

¹²¹ 5 U.S.C. § 552(b)(4); 45 C.F.R. § 5.31(d).

¹²² 18 U.S.C. § 1839(5)(B)(ii)(II).

¹²³ Initial Guidance at 29.

We appreciate CMS's confirmation that the protections under FOIA, including the prohibition on disclosure of information designated as confidential without providing a pre-disclosure notification and an opportunity to raise objections to disclosure,¹²⁴ will apply to information to be submitted under the program.¹²⁵ We seek confirmation that the protections under government price reporting law and policy will also apply.

In developing the Negotiation Program, Congress did not intend to disrupt the confidentiality requirements under other federal law and policy.¹²⁶ CMS's confidentiality policy should thus maintain the confidentiality of information protected against disclosure under all other federal law and policy. For example, under MDRP, "information disclosed by manufacturers . . . under [MDRP] . . . is confidential and shall not be disclosed by [CMS] . . . in a form which discloses the identity of a specific manufacturer . . . [or] prices charged for drugs by such manufacturer"¹²⁷ Similarly, Medicare Act provides that "[Average Sales Price (ASP)] information disclosed by manufacturers . . . is confidential and shall not be disclosed by [CMS] in a form which discloses the identity of a specific manufacturer . . . or prices charged for drugs or biologicals by such manufacturer"¹²⁸ Likewise, the 340B Drug Pricing Program (340B Program) generally prohibits disclosures of information submitted by manufacturers under the program.¹²⁹ Where confidential commercial information is protected against disclosure under these or any other federal programs, CMS should safeguard such information against disclosure to at least the same extent.

Second, CMS should implement robust storage and access controls and safeguards to protect the confidentiality of sensitive information. Confidentiality requirements are only as meaningful as the data privacy and security protections that are implemented to safeguard sensitive information against inadvertent or malicious¹³⁰ improper disclosure. Accordingly, CMS should implement robust systems and protocols, including by ensuring that all proprietary information stored in the Health Plan Management System (HPMS) and in electronic

¹²⁴ See 45 C.F.R. §§ 5.41, 5.42.

¹³⁰ Malicious third-party cyber activities have increasingly targeted the federal government—in, part, because its databases are repositories of significant amounts of sensitive information. Cf. David E. Sanger, *Russian Hackers Broke into Federal Agencies, U.S. Officials Suspect*, N.Y. Times, <https://www.nytimes.com/2020/12/13/us/politics/russian-hackers-us-government-treasury-commerce.html> (last updated May 10, 2021).

communications with the Agency is secure and accessible only to CMS staff and only where there is a legitimate programmatic need for access to such information.

In doing so, CMS should look to the safeguards it has already establish under MDRP. Under MDRP, CMS has implemented a system with numerous privacy and security protections to safeguard sensitive product and pricing data submitted by manufacturers. For example, the online interface allows a manufacturer to view its pricing data, such as its Baseline Average Manufacturer Price (AMP) data, while disallowing states, which do not have a programmatic need to view such information, from doing likewise.¹³¹ CMS should ensure that similar controls are in place with respect to HPMS, given CMS's intent to transition most information submissions to that system.

CMS should also specify how it will maintain the confidentiality of the subset of information that is required to be submitted via e-mail or Box. With respect to e-mail, CMS should explain, among other things, how it will enforce access security controls. With regard to Box (a third-party commercial platform), BIO asks CMS to specify how submitted information will be kept confidential, including as against misuse by Box personnel.

Third, CMS should establish a process to enable manufacturers to review a draft of the explanation of the MFP in advance of its publication and raise concerns about disclosure of confidential information. By statute, CMS is required to publish an explanation of the MFP.¹³² Such publication inherently poses heightened risk of disclosure of confidential commercial information. BIO appreciates that CMS intends to make only high-level comments regarding submitted data and refrain from sharing proprietary information.¹³³ But this is insufficient to safeguard against inadvertent disclosure of confidential commercial information. Accordingly, BIO asks that the manufacturer be given an opportunity to review the intended explanation in advance of publication, as well as an opportunity to raise concerns. Such precaution is well warranted here, given Congress's special emphasis on the need for safeguards with respect to the public explanation of the MFP, as evidenced by its specific cross-reference to the statute's confidentiality requirement.¹³⁴

BIO opposes CMS's proposed imposition of overly broad confidentiality obligations on manufacturers. BIO urges CMS to eliminate the proposed, one-sided requirement that manufacturers destroy all records related to the negotiation process and submit a Certificate of Data Destruction to CMS certifying that all

¹³¹ CMS, *Medicaid Drug Programs User Manual 1* (Nov. 3, 2021).

¹³² SSA § 1195(a)(2).

¹³³ Initial Guidance at 29.

¹³⁴ SSA § 1195(a)(2); see also *id.* § 1193(c).

information received from CMS during the negotiation period and potential renegotiation period(s) was destroyed. Like CMS, manufacturers are responsible for maintaining records associated with material decisions and must do so to maintain proper and adequate lines of supervision and oversight by boards, shareholders, and other stakeholders. Manufacturers must therefore be permitted to maintain (in a confidential format) reasonable records associated with the negotiation process to meet their oversight obligations, just as CMS will be maintaining its own records from the negotiation process.

Further, basic due process mandates that manufacturers be given the ability to maintain records related to negotiation proceedings. As CMS knows, the statute contemplates penalties of up to \$1 million per day for failing to submit required information. CMS's Initial Guidance further specifies that the Agency will consider a manufacturer that knowingly submits false information to have violated this provision. Especially given the vast magnitude of such penalties, it is imperative that manufacturers be permitted to maintain complete records of all information they believe may be relevant to defending against the erroneous imposition of sanctions.

It would be troubling in the extreme if manufacturers were required by CMS to destroy the very records that could one day be needed to defend against penalties that could reach hundreds of millions of dollars. "[T]he essence of due process is fundamental fairness," and little could be more fundamentally unfair than mandating destruction of the very records needed to verify an entity's innocence as against erroneous enforcement.¹³⁵

Moreover, BIO takes issue with the more specific blanket prohibition on manufacturers from disclosing or otherwise publicizing information "in the initial offer, including the ceiling price, or the concise justification from the Secretary or any subsequent offer of concise justification, nor information derived from those justifications or offers...". As with the broader records destruction provisions discussed above, this prohibition amounts to CMS putting its thumb on the scale of transparency as the only entity involved in the negotiation program who can control and confirm information flows. This one-sided information control heightens the ultimate public complaint that the entirety of the "negotiation" process is anything but. Rather, optically – and in practice – it appears CMS is proposing to control the entirety of the negotiation process, and to stifle any outside public discussion of the negotiation process itself. BIO disagrees with this approach and recommends CMS abandon it.

Further, the blanket "gag" sought in the proposed guidance raises several practical and Constitutional concerns. From a broader regulatory standpoint, certain regulatory agencies (*e.g.* The Securities and Exchange Commission) might well have conflicting standards for materiality determinations in disclosures made by publicly traded companies. We would argue that the exclusion in the guidance

¹³⁵ *Evans v. Wilkerson*, 605 F.2d 369, 371 (7th Cir. 1979).

from the disclosure prohibition based on state and federal law might not go far enough in covering certain regulatory obligations – both at the federal and state level. Particularly when considered in context with the records destruction obligations imbued in the guidance as well.

What is more, CMS appears to be making a more general affront to the protected speech of affected manufacturers. As has been reaffirmed many times before, prior restraints on speech are presumptively unconstitutional.¹³⁶ The government faces a heavy burden in showing a compelling interest in keeping negotiation discussions private, and we fail to see a legitimate reason why the government's interests are so advanced by muzzling private companies in the context of Medicare price negotiation discussions.¹³⁷ In fact, in this instance, any potential disclosure by a manufacturer would likely relate to truthful information that is, at a minimum, of significance to at least a portion of the public involved in the transaction of health insurance and health consumption. As such, we recommend CMS abandon these burdensome and unnecessary confidentiality and anti-disclosure provisions.

D. Special considerations in setting the MFP

It is vital that, in setting the MFP, CMS impose on itself bright-line limitations that mitigate the negative effects of the IRA and the MFP on patient access and on therapeutic innovation. BIO strongly urges CMS to adopt the following limitations.

BIO asks CMS to commit to a policy where it will not set the MFP below a price shown to imperil patient access (or otherwise below the MFP ceiling).

It is basic economics that centralized price-setting risks curtailing access to the supply of medicines.¹³⁸ If the government mandates a price too far below the price that would have been set by the free market, there will be an inevitable and profound mismatch between demand and supply.¹³⁹

BIO urges CMS, in carrying out the Negotiation Program, to be attuned to the risk to patient access if the MFP is set unduly low. The stakes are too high for CMS not to give due weight to such risk. The implication of a supply-demand mismatch is not limited to some economist's spreadsheet. Rather, it

¹³⁶ See, e.g., *Near v. Minnesota* 283 U.S. 697 (1931).

¹³⁷ As has been reaffirmed in many instances by the US Supreme Court, the government must articulate a compelling government need for the negotiation to remain out of the public discourse and must simultaneously introduce a narrowly tailored method for so restricting this discussion. In the context of this guidance, we see no such articulation of either a compelling need nor a narrow restriction. In fact, we see just the opposite. See, e.g., *New York Times Co. v. United States*, 403 U.S. 713 (1971).

¹³⁸ S. Atlas, *How to Reduce Prescription Drug Prices: First, Do No Harm*, 117 *Modern Med.* 14, 14 (2020).

¹³⁹ Rent control is the classic Economics 101 illustration: Price controls on rental stock result in undersupply; the result is a net societal loss of utility relative to the pareto optimal price. See, e.g., E. Glaser & E. Luttmer, *The Misallocation of Housing Under Rent Control*, 93 *Am. Econ. Rev.* 1027, 1027 (2003).

could mean the difference between millions of patients having access to life-saving medicines and empty shelves at the pharmacy counter. Indeed, the House Committee on Ways and Means has estimated that loss of innovation due to price controls could result in as many as “42 million patients without the medicine they need.”¹⁴⁰

The risk to longer-term innovation and development of new medicines is even more profound. One recent study by the University of Chicago concluded that the “mid-range effect” of price controls is 254 fewer new drug approvals; the researchers conservatively estimated that the loss in life from the price controls accordingly is twenty times larger than our country’s losses from the COVID-19 pandemic.¹⁴¹ Another study of the European experience found that a “10% drop in the price of medicines in price-controlled [European Union] markets was associated with . . . an 8% increase in the delay of access to medicines.”¹⁴² Still other studies have demonstrated that government price-setting is associated with dramatic declines in early research, which, of course, is the fundamental precursor to a robust and growing pipeline of new therapies targeting areas of unmet medical need.¹⁴³

Therefore, CMS should commit to a policy under which it will not set the MFP below a price shown to further imperil patient access (or otherwise below the MFP ceiling). This approach would help strike an equitable balance, giving weight to the objective of reducing prices today while also mitigating the risk that price controls will significantly imperil the drug supply or further curtail the development of the transformative medicines of tomorrow.

BIO also asks CMS to commit to setting the MFP at the MFP ceiling where failing to do so would further curtail therapeutic innovation.

It is vital that the Negotiation Program strike an appropriate balance such that blunt reductions in Medicare expenditures do not come at the expense of ongoing innovation that yields new and potentially life-saving medicines. Accordingly, BIO urges CMS to commit to setting the MFP at the MFP ceiling where doing otherwise would imperil therapeutic innovation, including in the following circumstances (not exhaustive):

¹⁴⁰ U.S. House Comm. on Ways & Means, Analysis: Americans Don’t Support Surrendering Innovation, <https://waysandmeans.house.gov/analysis-americans-dont-support-surrendering-innovation-for-democrats-drug-price-controls/> (Aug. 4, 2022).

¹⁴¹ See T. Phillipson & T. Durie, The Evidence Base on the Impact of Price Controls on Medical Innovation 1 (2021) (loss in life estimate was over a ten-year time period), available at https://bfi.uchicago.edu/wp-content/uploads/2021/09/BFI_WP_2021-108.pdf.

¹⁴² D. Schulthess & H. Bowen, *The Historical Impact of Price Controls on the Biopharma Industry*, Vital Transformations (Nov. 22, 2021).

¹⁴³ See T. Abbott & J. Vernon, *The Cost of US Pharmaceutical Price Reductions: A Financial Simulation Model of R&D Decisions*, 28 Managerial & Decision Econ. 293 (2007).

First, for a drug (small molecule), the MFP should not be set below the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

To be selected for negotiation, biologics (large molecules) must be at least eleven years post-licensure, while drugs (small molecules) must be at least seven years post-approval.¹⁴⁴ On account of the approximately two-year time lag between selection for negotiation and application of the MFP, an MFP cannot apply to a biologic until at least approximately thirteen years post-licensure; in contrast, an MFP cannot apply to a drug until at least approximately nine years post-approval. To help preserve small molecule innovation in parity with large molecule innovation, we ask that, for a small molecule, CMS set the MFP at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

Studies show that most products (whether small or large molecules) achieve modest levels of annual sales in their first five years on the market.¹⁴⁵ Thus, manufacturers may seek the economic benefit of an additional four-year shelter from selection for negotiation by focusing research and development on biologics instead of drugs.

Thus, we ask that CMS act to better balance the incentives regarding small molecule drug and biologic development by setting the MFP for a small molecule drug at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

Second, the MFP should not be set below the MFP ceiling during any year of the price applicability period into which patent protection extends.

CMS must consider a number of factors in determining the MFP for a selected drug, including “[d]ata on pending and approved patent applications.”¹⁴⁶ We ask CMS to ascertain whether, based on information submitted by the manufacturer, the selected drug will have any remaining patent protection at the start of the price applicability period and, if so, set the MFP at the MFP ceiling price for any year during such period into which such patent protection extends.

¹⁴⁴ SSA § 1192(e)(1).

¹⁴⁵ QuintilesIMS Inst., *Lifetime Trends in Biopharmaceutical Innovation: Recent Evidence and Implications*, at 2 (Jan. 2017).

¹⁴⁶ SSA § 1194(e)(1)(D).

The statute permits a drug to be subject to an MFP nine years post-approval and a biologic to be subject to an MFP thirteen years post-licensure.¹⁴⁷ By the time the price applicability period for a selected drug begins, the product’s regulatory exclusivity period likely will have expired—but not necessarily its patent protection period.¹⁴⁸ In other words, given that a patent protection period can extend beyond a regulatory exclusivity period, it may very well be the case that there will be remaining patent protection for a selected drug that extends into the price applicability period.

In the Initial Guidance, CMS proposes that, if a selected drug “has patents and exclusivities that will last a number of years,” CMS may adjust the “preliminary price” downward.¹⁴⁹ This is the opposite of what the policy should be. A selected drug’s ongoing patent protection supports a higher “preliminary price”—and, indeed, an MFP equal to the MFP ceiling. This is key to supporting pharmaceutical and biotechnology innovation in developing drugs and biologics that treat serious diseases.

It is a long and expensive process to bring a chemical or biological product from research and development to market, and many candidates do not make it through the process. To encourage innovation by rewarding manufacturers for their research and development investments and efforts, the federal government awards pharmaceutical and biotechnology companies with patent protection for a specified period of time. The patent protection period affords a manufacturer the opportunity to recover its research and development costs—not only for the drug for which the patent was awarded but also for other research and development investments that the manufacturer made. To support continued innovation, CMS should honor any remaining patent protection for a selected drug by specifying that the MFP will be set at the MFP ceiling during any year of the price applicability period into which such patent protection extends.

Third, the MFP should be set at the MFP ceiling until at least the first year during the price applicability period that starts after the date on which the most recently approved indication is thirteen years post-approval.

Innovation should not end with the approval of a first indication. Rather, finding novel uses for existing therapies is “essential for maximizing medicines’ therapeutic utility.”¹⁵⁰ Developers of

¹⁴⁷ *Id.* § 1192(e)(1).

¹⁴⁸ See FDA, Frequently Asked Questions on Patents and Exclusivity, available [here](#) (last accessed Mar. 2023).

¹⁴⁹ Initial Guidance at 53.

¹⁵⁰ B. Sahragardjoonegani et al., Repurposing existing drugs for new uses: A cohort study of the frequency of FDA-granted new indication exclusivities since 1997, 14 J. of Pharmaceutical Policy & Practice 1 (2021).

drugs and biologics therefore devote countless hours and untold capital to research and development of new indications, thereby expanding treatments to additional disease states and patient populations.¹⁵¹

In recent years, new indications have spurred vital medical breakthroughs across countless critical medical conditions. For example, new indications have been vital “to increase the portfolio of available effective cancer chemotherapeutic agents for patients.”¹⁵² Similarly, the repurposing of existing therapies has played a critical role in meeting the otherwise unmet needs of patients with rare medical conditions.¹⁵³

The seven- and eleven-year selection clocks work to extinguish such innovation by actively disincentivizing a manufacturer from making the considerable investment necessary to obtain approval of a new indication, given that such indication would run on the same selection clock. CMS must act to mitigate this concern by committing to setting the MFP at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the most recently approved indication is thirteen years post-approval. Such limitation on the setting of the MFP would provide greater certainty to manufacturers as they consider ongoing investment in research and development of new indications. This could avoid wholesale extinguishment of therapeutic innovation, to the detriment of patients with serious unmet medical needs, on account of the seven- and eleven-year selection clocks.

Fourth, the MFP should not be set below the MFP ceiling for vaccines recommended by the Advisory Committee on Immunization Practices (ACIP) at the Centers for Disease Control (CDC). Vaccination is often cited among the 10 greatest public health achievements of the century. In addition to their societal benefit, vaccines deliver significant benefit to individuals throughout their lifetime and allow older individuals to remain healthier and productive in their later years of life. The importance of vaccines was recognized in the IRA, which eliminated cost sharing for vaccines in Medicare Part D, building on the precedent in Medicare Part B where there was no cost sharing for vaccines. Because of the high value that vaccines confer not only to Medicare beneficiaries but to society as a whole, the MFP for vaccines recommended by the ACIP should not be set below the MPF ceiling.

¹⁵¹ See *id.* at 1–2 (noting the significant time and cost associated with obtaining approval of a new indication).

IV. Negotiation Factors

For purposes of negotiation of the MFP, the statute (SSA 1194 (e)) directs CMS to consider the following factors:

- Manufacturer-specific data (SSA 1194 (e)(1)): Research and development costs and the extent to which the manufacturer has recouped such costs; current unit costs of production and distribution; prior federal financial support for discovery and development; and data on pending and approved patents and exclusivity; and market data and revenue and sales volume data.
- Evidence about alternative treatments (SSA 1194 (e)(2)): the extent to which the drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such alternative; FDA-approved prescribing information for the drug and the alternatives; comparative effectiveness of the drug and the alternatives, including effects on specific patient populations; the extent to which the drug and the alternatives address unmet medical need.

The statute also directs CMS not to use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.

A. **Evidence on therapeutic alternatives and unmet need**

CMS should emphasize factors related to clinical value and unmet need and de-emphasize manufacturer specific data elements such as cost of production and research and development costs.

In developing a starting point for the initial offer, CMS proposes to utilize the net price for identified therapeutic alternatives and then adjust this starting point based on the review of the clinical evidence to develop a “preliminary price.” CMS will then consider the manufacturer specific data under section 1194(e)(2) and may adjust the preliminary price upward or downward. When there is no therapeutic alternative CMS would adjust the starting point based on how the selected drug fills an unmet medical need.

The proposed approach outlined by CMS is vague, and CMS’s intent is unclear. We strongly support an approach that emphasizes factors related to clinical benefit and unmet medical need and de-emphasizes manufacturer specific data elements such as cost of production and research and development costs – CMS should clarify how it will weight these factors in that regard. CMS should consider and prioritize high quality, robust real-world evidence (RWE), evidence provided by clinicians with the necessary expertise, as well as evidence submitted by manufacturers – who have a vast depth and breadth of

clinical and scientific expertise regarding their marketed therapies. CMS should also focus on patient-centered outcomes and the broader societal benefit conferred by a therapy. Further, providing higher relative MFPs to products that have advanced patient care and address unmet medical need will help maintain investment in assets and clinical programs that show scientific promise. At the same time, it is critical that CMS is transparent in its approach in determining therapeutic alternatives to selected drugs and provides a strong justification that the identified therapeutic alternatives are appropriate and are primarily driven by clinical guidelines and patient need versus cost.

It is essential that CMS clarify how it will evaluate the evidence it receives from different stakeholders and how such evidence will be considered in identifying therapeutic alternatives and setting the MFP.

CMS says it would adjust the preliminary price based on the totality of the relevant information and evidence submitted and gathered through the agency's analysis based on the clinical benefit the selected drug provides compared to its identified therapeutic alternatives. We support an approach that considers a wide range of high quality, robust evidence, including RWE. Further, information submitted by manufacturers should be considered a high priority in CMS's review as manufacturers have deep and unique expertise in their therapeutic areas of focus.

CMS should be transparent and provide sufficient detail regarding its framework for how different evidence was used to inform the identification of therapeutic alternatives for a selected drug, as well as the establishment of the preliminary price as well as the initial offer and response to any counteroffer, including what evidence was most impactful in CMS' analysis and why. CMS' review of the evidence should be patient-centered and have a focus on health equity and reducing disparities. To that end, we strongly support CMS's confirmation that evidence that uses discriminatory approaches such as QALYs will not be considered. We also note that other measures that have been often promoted as alternatives to QALYs – such as the Equal Value of Life Years Gained (evLYG) – are also problematic as they limit the value of interventions that both extend life and improve the quality of life – and CMS should similarly reject them. In reviewing the evidence CMS should recognize both the current and future value of therapies and remain flexible to keep pace with innovations in science and technology. Further, evidence on a therapy should be viewed in the context of its benefits to the Medicare program, as well as the overall health care system.

We recommend that CMS provide manufacturers with robust detail regarding its analysis of evidence throughout the negotiation process and provide manufacturers with opportunities for discussion and dialogue, including before CMS's initial offer in February 2024 and in its identification of therapeutic alternatives that will be used in setting the MFO. CMS should also provide a line of sight into its assessment of the evidence for the broader stakeholder community, so as to ensure appropriate

transparency and accountability not just to manufacturers but to Medicare beneficiaries and to providers and other key stakeholders.

We are concerned that CMS’s proposed definition of unmet medical need is too limiting; the agency should use a more robust definition. We recommend that CMS look to the FDA’s definition outlined in its “Guidance for Industry Expedited Programs for Serious Conditions – Drugs and Biologics.”¹⁵⁴ Under the FDA guidance, “An unmet medical need is a condition whose treatment or diagnosis is not addressed adequately by available therapy. An unmet medical need includes an immediate need for a defined population (i.e., to treat a serious condition with no or limited treatment) or a longer-term need for society (e.g., to address the development of resistance to antibacterial drugs).”

B. Submission of Information on Negotiation Factors Related to Therapeutic Alternatives and Unmet Need (Section 1194(e)(2))

CMS’s approach and processes for collecting information on the negotiation factors related to therapeutic alternatives and unmet medical need should ensure that a robust, comprehensive set of information submitted by manufacturers– with any necessary supplemental material – will be accepted and considered by CMS.

The negotiation guidance references the Negotiation Data Elements ICR, which describes how CMS intends to collect data on the negotiation factors. We are concerned that CMS’s approach may be too limiting in practice and will not allow for a robust submission of information - including any supplementary material – by manufacturers. We will be providing more detailed comments on the ICR, but note Questions 40 through 43, which collect information on prescribing data, therapeutic impact and comparative effectiveness, comparative effectiveness in specific populations, and unmet medical needs. The data fields are limited to 1,000-3,000 words, which is insufficient in length. Further, the data fields do not seem to contemplate submission of complementary information, such as charts and tables. We strongly recommend that CMS reconsider its approach and permit manufacturers to submit any information they determine relevant to the negotiation process (including information not related to the negotiation factors enumerated in the statute). Further, CMS should be required to consider all such information, not just the negotiation factors in sections 1194(e)(1) and 1194(e)(2).

¹⁵⁴ <https://www.fda.gov/files/drugs/published/Expedited-Programs-for-Serious-Conditions-Drugs-and-Biologics.pdf>

C. Submission of Manufacturer-Specific Data (Section 1194(e)(1))

We understand that the IRA requires CMS to consider factors under both section 1194(e)(1) and section 1194(e)(2). **However, as noted above, we believe CMS should de-emphasize factors the manufacturer-specific data in section 1194(e)(1) and focus on the factors that matter most to patients – those that are focused on clinical value and unmet need. In addition, to address issues that we highlight below, we recommend that, in lieu of the proposed standardized definitions, CMS allow manufacturers to use reasonable assumptions (with accompanying justifications) regarding the information they submit on the manufacturer-specific data.**

There are important considerations that will make it difficult – if not impossible – for CMS to standardize the definitions for the manufacturer-specific factors. For example, regarding research and development costs, a key issue for CMS to consider is that companies, and investors, invest in research and development for “programs” in a specific disease area, not simply discrete drugs. A program can have many drugs or biologicals at different stages of development each with multiple indications, and all which would factor into the research and development costs for an FDA-approved or licensed therapy. This can include thousands and sometimes millions of compounds that could be screened early in the research and development process, with a success rate of less than 12%.¹⁵⁵

Further, it can be misleading to approximate “value” using research and development costs. Not all companies conduct research and development in the same manner. Some smaller companies might undertake single-therapeutic, high-risk approaches to developing a compound, while many others, often bigger companies, conduct research using the “programs,” as noted. These differences in the way research and development can be conducted could disadvantage companies in negotiation if manufacturer-specific data is too heavily relied upon for “value.”

Looking at research and development costs in the post-market setting can also be misleading because of ongoing costs that are difficult to quantify. For example, the FDA requires post-market safety monitoring, these costs can also be augmented if a manufacturer must utilize FDA-mandated risk evaluation and mitigation strategies (REMS), something to which not every manufacturer is subjected. Another example is costly post-market clinical trials that can take years.

We also are concerned with CMS’s proposed requirement to collect information that is not collected today – once example is net revenue “without patient assistance programs.” It is unclear why CMS would be collecting data in this manner and the underlying implication of patient assistance programs on price.

¹⁵⁵ Biopharmaceutical Research and Development: The Process Behind the Medicines, PhRMA. 2015. Accessed: 03/28/2023. http://phrma-docs.phrma.org/sites/default/files/pdf/rd_brochure_022307.pdf

In other areas, the definitions CMS proposes are unclear, which will make it difficult for manufacturers to comply with submission requirements. For example, regarding data on approved and pending patents, clarifications are required to better define the patents and pending patent applications that must be disclosed. More precision is required where CMS is asking for patents “relating” or “linked to” the selected drug, as it is unclear what CMS means – related or linked how? In this respect, we also note that “patent” and “patent application” are well-understood terms of art that don’t require further definition in the CMS guidance. For example, the CMS guidance definition of a “pending patent application” specifies any patent application “for which a patent number has not been issued.” This definition would plainly include applications that are not, in fact, pending because they have been abandoned. An “approved patent application” presumably means a patent application that has received a notice of allowance, meaning that it is still a pending patent application (and not a “patent”) that does not require a special definition. And a “patent” comes into existence not on the date a patent application is “approved,” but on the date a patent is issued, and the official patent grant is transmitted. We recommend deleting the special definitions of “pending patent application,” “approved patent application,” and “expired patent,” and to change the operative language as suggested in our proposed edits below.¹⁵⁶

Patents, Exclusivities, and Approvals

For the purposes of describing patents, exclusivities, and approvals to be collected for use in the Negotiation Program for the selected drug, as described in section 1194€(1) of the Act and section 50.1 of this memorandum, CMS intends to adopt the definitions described in this subsection.

- *CMS considers patents relevant to this data to include:*
 - *all patent applications pending in the USPTO, international patent applications filed under the Patent Cooperation Treaty that designate the United States, and all U.S. patents, that are owned by, licensed to, or controlled ~~pending and approved patent applications, including expired and non-expired approved patents, submitted, sponsored, licensed, and/or acquired by the Primary Manufacturer relating to the,~~ and that claim the selected drug, a constituent part of the selected drug, or an approved method of using the selected drug as of September 1, 2023;*
 - *U.S. patents ~~linked to~~ that claim the selected drug, a constituent part of the selected drug, or an approved method of using the selected drug where the Primary Manufacturer is not listed as the assignee/applicant but with respect to which the manufacturer has enforcement rights (for example, for a joint venture product); and any patent that is with respect to the selected drug included in a list published under*

¹⁵⁶ Note that the nomenclature of “Primary Manufacturer” is retained in the edits we suggest but we note our comments later in this section that raise concerns with the “Primary Manufacturer” and “Secondary Manufacturer” construct.

Biotechnology Innovation Organization
1201 New York Ave., NW
Suite 1300
Washington, DC, 20005
202-962-9200

section 351(k)(9) of the Public Health Service Act or section §505(j)(7) of the Federal Food, Drug, and Cosmetic Act, ~~patent applications, pending and approved~~, for which a claim of patent infringement could reasonably be, or has been, asserted against a person engaged in the unlicensed manufacture, use, or sale of the selected drug in any form.

More fundamentally, CMS states it will consider the length of available patents and exclusivities and, if such patents and exclusivities will last for a number of years, the Agency may consider reducing the preliminary price downward. BIO strongly opposes such an approach. Rather, remaining patents and exclusivities should only be used to justify an *increase* in the preliminary price.

Regarding data on prior federal financial support in discovery and development, important contextual information should be considered by CMS. The biopharmaceutical industry's role in the U.S. research ecosystem is to undertake the clinical research and development required to advance basic science research by entities such as the National Institutes of Health (NIH) into safe and effective treatments available to patients. In 2018, the biopharmaceutical industry invested \$102 billion in R&D, most of which was focused on clinical research. Meanwhile, the entire NIH budget in 2018 was \$35.4 billion, only 8% of which was focused directly on clinical research.

Of note, of the 23,230 NIH grants in the year 2000 that were linked by NIH supported patents to 41 investigational drugs, only 18 had gained FDA approval by 2020. In fact, total private investment for these 18 approved medicines exceeded NIH funding by substantial orders of magnitude: \$44.2 billion in private investment compared to \$670 million in NIH. These findings are consistent with scholarship describing the complementary roles of public and private R&D funding, and the significant long-term investments shouldered by industry with no guarantee of approval. In fact, just 7.9% of medicines in clinical development are ultimately approved by the FDA.¹⁵⁷

We also note our concern with the proposal to hold a Primary Manufacturer responsible for submitting applicable information concerning a Secondary Manufacturer. A Primary Manufacturer has no inherent legal authority to compel a Secondary Manufacturer to act or not act, including to share such information. It would be fundamentally unfair and legally problematic for CMS to threaten a Primary Manufacturer with significant civil monetary penalties (CMPs) for failure to do the impossible. We note that this same concern pervades the Initial Guidance, given the numerous contexts in which CMS proposes to hold a Primary Manufacturer responsible for the action or inaction of a Secondary Manufacturer.

¹⁵⁷ Clinical Development Success Rates and Contributing Factors 2011-2020. Available at [bio.org](https://www.bio.org).

V. MFP Ceiling

A. Background

The calculation of the MFP ceiling, which represents the maximum possible MFP, is the lowest of three amounts:

- (1) the “applicable percent” of the Average Non-FAMP for 2021 (or, if there is such Non-FAMP, the Average Non-FAMP for the first full year following market entry), as increased by a Consumer Price Index for All Urban Consumers (CPI-U) factor;¹⁵⁸
- (2) the “applicable percent” of the Average Non-FAMP for the year before the year of the selected drug publication date (except for IPAY 2026);¹⁵⁹ or
- (3) (a) for a Part D drug, the sum of each “plan specific enrollment weighted amount” for each prescription drug plan (PDP) or Medicare Advantage prescription drug (MA-PD) plan;¹⁶⁰ or
(b) for a Part B drug, the Part B payment amount for the year before the year of the selected drug publication date.¹⁶¹

The “applicable percent” is 75 percent for “short-monopoly drugs,”¹⁶² 65 percent for “extended-monopoly drugs,”¹⁶³ and forty percent for “long-monopoly drugs.”¹⁶⁴

B. Average Non-FAMP

BIO recommends that, in defining Average Non-FAMP, CMS abandon its proposal to create a new price point calculated based on the four quarters of a calendar year, and instead simply adopt the existing annual Non-FAMP, calculated based on the four quarters of a federal fiscal year, under the Veterans Health Care Act of 1992 (VHCA).

As set forth above, Average Non-FAMP is calculated as part of determining the MFP ceiling.¹⁶⁵ Average Non-FAMP is a statutory term of art meaning “the average of the non-Federal average manufacturer

¹⁵⁸ SSA § 1194(c)(1)(A), (C). The CPI-U adjustment applies from September 2021 (or December of the first full year following market entry) to September of the year before the year of the selected drug publication date.

¹⁵⁹ *Id.*

¹⁶⁰ *Id.* § 1194(c)(1)A, (B)(i), (2).

¹⁶¹ *Id.* § 1194(c)(1)(A), (B)(ii).

¹⁶² *Id.* § 1194(c)(3)(A) (defining “short monopoly drug” as a selected drug that is not an “extended-monopoly drug” or “long-monopoly drug”).

¹⁶³ *Id.* § 1194(c)(3)(B); *see also id.* § 1194(c)(4) (defining “extended monopoly-drug”).

¹⁶⁴ *Id.* § 1194(c)(3)(C); *see also id.* § 1194(c)(5) (defining “long-monopoly drug”).

¹⁶⁵ *Id.* § 1194(c)(1)(A), (C).

price (as defined in section 8126(h)(5) of title 38, United States Code) for the 4 calendar quarters of the year involved.”¹⁶⁶

The statute does not specify which four quarters are “the 4 calendar quarters of the year involved but notably cross-references 38 U.S.C. § 8126(h)(5), i.e., the VHCA. As such, the statute effectively instructs CMS to calculate Average Non-FAMP by reference to how annual Non-FAMP is calculated under the VHCA.

The VHCA requires manufacturers to calculate and report quarterly Non-FAMPs and an annual Non-FAMP—but does not require manufacturers to calculate and report an “average” Non-FAMP based on the four quarters of a calendar year. Rather, the annual Non-FAMP is calculated based on the four quarters of a federal fiscal year—which runs from October 1 through September 30.¹⁶⁷

As such, the annual Non-FAMP is a stand-alone weighted average calculation based on data from the fourth quarter of a calendar year through the third quarter of the subsequent calendar year (i.e., the four quarters of a federal fiscal year).¹⁶⁸ The most coherent policy would be for CMS to adopt the same approach to calculating Average Non-FAMP for a year under the Negotiation Program. Given that the statute expressly cross-references the VHCA in the course of defining Average Non-FAMP, there is every reason to think that Congress wanted CMS to maximize alignment as between Average Non-FAMP and the annual Non-FAMP under the VHCA, rather than creating an entirely new price point.

In the Initial Guidance, however, CMS does not propose to borrow the established VHCA framework. Rather, CMS proposes to calculate Average Non-FAMP by reference to the four quarter of a calendar year.¹⁶⁹ This approach is inefficient and unnecessarily burdensome for both CMS and manufacturers. Under the proposal, the Agency will be obligated to develop, implement, and oversee a completely new process to facilitate collection of new pricing data, as the Agency cannot benefit from the efficiencies of the well-established process that VA has already put into place—because the VHCA approach is, as noted above, tied to a federal fiscal year, rather than a calendar year. By contrast, if the Agency instead were to borrow the existing VHCA framework, Average Non-FAMP would be equated with a price point that already exists, and all stakeholders would benefit from the resulting efficiencies.

¹⁶⁶ *Id.* § 1194(c)(6).

¹⁶⁷ For example, the data used to calculate the annual Non-FAMP for 2021 cover the period from October 1, 2020, through September 30, 2021.

¹⁶⁸ The annual and quarter 3 Non-FAMPs submitted to the Department of Veterans Affairs (VA) are used to calculate the Federal Ceiling Price (FCP), which caps pricing under VA Federal Supply Schedule contracts. Manufacturers are required to submit quarters 1, 3, and 4 Non-FAMPs, too, but these price points have no impact on the price paid by the federal government. While the data used to calculate these quarterly Non-FAMPs are incorporated into the four quarters of data used to calculate the annual Non-FAMP, these quarterly Non-FAMPs themselves are not used to calculate the annual Non-FAMP.

¹⁶⁹ Initial Guidance at 42–44.

If CMS does not reverse course, BIO agrees that CMS’s framework should be based on a weighted average.¹⁷⁰

A weighted average is consistent with the VHCA framework expressly cross-referenced in the statutory definition of Average Non-FAMP. As such, a weighted average better aligns to Congress’s intent.

More importantly, use of a weighted average will objectively enhance accuracy because it will account for differences in volume across quarters and therefore create the most accurate picture of average wholesaler pricing. Such enhanced accuracy is why Congress has consistently required the use of weighted averages across the various federal pricing programs associated with federal health care programs: VHCA (Non-FAMP), Medicaid (AMP), and Medicare (ASP) all use weighted averages, not simple averages.

Congress has consistently required the use of weighted averages because simple averages are less accurate. Simple averages result in over-valuation of sales in quarters with lower sales volumes, and under-valuation of sales in quarters with higher sales volumes. As such, it is critically important that CMS use a weighted average to ensure more accurate calculations of Average Non-FAMP, and we concur with CMS’s proposal to do so.

The Agency should establish an exceptions process to account for restatements and anomalies.

An exceptions process is vital. There will inevitably be situations where Average Non-FAMP will need to be restated in light of data errors or other issues identified after the fact or where an unusual circumstance will result in an anomalous Average Non-FAMP.

- **Non-FAMP restatements.** CMS must consider how it will address situations in which a Non-FAMP that is used for an MFP calculation is restated by the manufacturer and approved by VA. VA has long recognized the need for manufacturers to be able to restate a Non-FAMP where the reported Non-FAMP is determined to be inaccurate (e.g., sales data flaws, data system problems). The VA experience has demonstrated that restatements are not uncommon, with adjustments of contract pricing facilitated based on restated Non-FAMPs and FCPs. The Agency must expressly account for the need for such restatements—but the Initial Guidance does not do so.

¹⁷⁰ *Id.* at 43.

- **Non-FAMP anomalies.** The VA's experience reveals a variety of circumstances where an anomalous Non-FAMP can arise due to a misalignment of sales dollars and units. This can occur due to lagged sales, market shortages, or various other factors. VA has developed various exceptions and workarounds for calculating FCPs when there are Non-FAMP anomalies. It is vital that CMS develop its own processes for addressing anomalous Average Non-FAMPs. Any approach adopted by CMS needs to be flexible to account for the wide range of circumstances that can result in an anomalous Average Non-FAMP.¹⁷¹ But the Initial Guidance is silent on any such flexibilities.

BIO encourages CMS to adopt an exceptions process to account for Average Non-FAMP restatements and anomalies. In doing so, CMS should clarify how such process affects the MFP ceiling and, ultimately, the MFP.

C. Extended- and long-monopoly drugs

CMS should clarify whether the time period for determining whether a selected drug is an extended- or long-monopoly drug runs to the start of the applicable IPAY, or to the applicable selected drug publication date.

As set forth above, there are three options for setting the MFP ceiling. Two of these options look to the “applicable percent” of the applicable Average Non-FAMP.¹⁷² By statute, the “applicable percent” varies based on whether the drug is a short-, extended-, or long-monopoly drug.¹⁷³

With limited exceptions, extended monopoly drugs are, “with respect to an initial price applicability year, selected drug[s] for which at least 12 years, but fewer than 16 years, have elapsed since the date of approval . . . or . . . licensure,”¹⁷⁴ and long-monopoly drug are, “with respect to an initial price applicability year, selected drug[s] for which at least 16 years have elapsed since the date of approval . . . or licensure.”¹⁷⁵ Short-monopoly drugs are all other selected drugs.¹⁷⁶

Notably, the statute is silent as to the date to which the twelve- or sixteen-period that defines an extended- or long-monopoly drug runs. In the Initial Guidance, CMS takes inconsistent positions. On the one hand, CMS states that, for IPAY 2026, a delay request may be submitted where a reference

¹⁷¹ For example, in certain cases, it may be prudent for CMS to account for an Average Non-FAMP anomaly by looking to the prior year's figures; in other cases (e.g., a new product), this may not be possible.

¹⁷² SSA § 1194(c)(1).

¹⁷³ *Id.* § 1194(c)(3).

¹⁷⁴ *Id.* § 1194(c)(4)(A).

¹⁷⁵ *Id.* § 1194(c)(5)(A).

¹⁷⁶ *Id.* § 1194(c)(3)(A).

biologic will have been “licensed for between 12 and 16 years prior to the start of the initial price applicability year on January 1, 2026.”¹⁷⁷ On the other hand, in “Figure 2: Monopoly Types and Applicable Percentage for Initial Price Applicability Year 2026,” CMS conveys that, for IPAY 2026, it will count the 16-year period that defines a long-monopoly drug to September 1, 2023, i.e., the selected drug publication date for IPAY 2026.¹⁷⁸ In other words, CMS is inconsistent as to whether the twelve- or sixteen-year period that defines an extended- or long-monopoly drug runs to the start of the applicable IPAY, or to the applicable selected drug publication date.

BIO asks CMS to clarify its intended interpretation in light of the conflicting language in the Initial Guidance.

D. MFP ceiling for Part D drugs

BIO disagrees with CMS’s intended approach for calculating the MFP ceiling option specific to Part D drugs. CMS must calculate the MFP ceiling under such option exclusive of manufacturer price concessions unless they are passed through at the point of sale, consistent with CMS’s long-standing policy governing the Part D negotiated price.

As set forth above, one of the three options for determining the MFP ceiling with respect to a Part D drug is the sum of each “plan specific enrollment weighted amount” for each PDP or MA-PD plan.¹⁷⁹ Congress specified that the “plan specific enrollment weighted amount” is determined by reference to the Part D negotiated price.¹⁸⁰ As such, Congress made clear that the “plan specified enrollment weighted amount” is to be determined by reference to CMS’s policies governing the Part D negotiated price.

This is not what CMS proposes. In the Part D context, CMS has long defined the Part D negotiated price to be “inclusive of all price concessions from network pharmacies, except those contingent price concessions that cannot reasonably be determined at the point-of-sale”—but not to require inclusion of price concessions from manufacturers.¹⁸¹ Rather, PDPs and MA-PDs may choose to include manufacturer price concessions in the Part D negotiated price to the extent that they are passed through at the point of sale: “Part D sponsors are allowed, but generally not required, to apply rebates

¹⁷⁷ Initial Guidance at 17 (emphasis added).

¹⁷⁸ See Initial Guidance at 45.

¹⁷⁹ SSA § 1194(c)(1) (A), (B)(i).

¹⁸⁰ *Id.* § 1194(c)(2).

¹⁸¹ 42 C.F.R. § 423.100 (emphasis added). CMS has issued a rule that will revise the Part D negotiated price definition effective January 1, 2024. But such revision does not alter the fact that the Part D negotiated price does not require inclusion of manufacturer price. See 87 Fed. Reg. 27,704, 27,899 (May 9, 2022).

and other price concessions at the point of sale to lower the price upon which beneficiary cost-sharing is calculated.”¹⁸²

CMS’s Initial Guidance ignores this long-standing policy defining the Part D negotiated price. For purposes of calculating the MFP ceiling under the option specific Part D drugs, CMS instead proposes to use Direct and Indirect Remuneration (DIR) data—rather than solely PDE data—to calculate the “plan specific enrollment weighted amount.”¹⁸³ Notably, unlike PDE data, DIR data reflect all price concessions, including those received from manufacturers that are not passed through at the point of sale.¹⁸⁴

CMS’s proposed approach is contrary to statute, which makes clear that the MFP ceiling option must be determined by reference to the Part D negotiated price. By choosing expressly to define the MFP ceiling option by reference to the Part D negotiated price, Congress required such option to be calculated in accordance with policy governing the calculation of the Part D negotiated price. Any contrary approach would render meaningless Congress’s express choice to use the Part D negotiated price as the statutory reference point.

In addition to being inconsistent with statutory text and Congressional intent, CMS’s proposal also would create significant unnecessary complexities. It would be more burdensome for the Agency to determine the MFP ceiling for Part D drugs if the Agency were to apply a standard that is inconsistent with the Part D standard. In addition, it would impose a new and unfamiliar approach on pharmacies, plans, pharmacy benefit managers (PBMs), manufacturers, and other stakeholders, and would thereby increase the risk of confusion or error that could result in an erroneous MFP.

BIO urges CMS to abandon this proposal and instead align the Part D drug-specific MFP ceiling option with CMS’s long-standing policy defining the Part D negotiated price, consistent with the requirements of the statute.

VI. Providing Access to the MFP

A. Background

Under the Negotiation Program, the manufacturer of a selected drug must provide access to the MFP to:

¹⁸² 87 Fed. Reg. at 27,835 (the Part D negotiated price is “the price paid to the network pharmacy or other network dispensing provider for a covered Part D drug dispensed to a plan enrollee that is reported to CMS at the point of sale by the Part D sponsor”).

¹⁸³ Initial Guidance at 40.

¹⁸⁴ CMS, Medicare Part D – Direct and Indirect Remuneration (DIR) (Jan. 19, 2017).

- With respect to a Part B drug, “hospitals, physicians, and other providers of services and suppliers with respect to [individuals who are enrolled under Part B, including individuals who are enrolled in an Medicare Advantage (MA) plan, if payment may be made under Part B for the drug, and who are furnished the drug];”¹⁸⁵ and
- With respect to a Part D drug, “[individuals who are enrolled in a PDP or MA–PD plan if the drug is covered under such plan, and who are dispensed the drug,] at the pharmacy, mail order service, or other dispenser at the point-of-sale of such drug (and . . . to the pharmacy, mail order service, or other dispenser, with respect to such . . . individuals who are dispensed such drugs).”¹⁸⁶

MFP-340B duplicate discounts are prohibited: The manufacturer is required to provide access to either the MFP or the 340B price, whichever is lower.¹⁸⁷

B. MFP rebate model

BIO commends CMS for proposing that access to the MFP may be provided through an MFP rebate model and urges the Agency to clarify that the proposed fourteen-day period during which an MFP rebate must be paid runs from the date on which the manufacturer has validated eligibility for the rebate.

CMS proposes that a manufacturer may provide access to the MFP by either (1) ensuring that the price paid when acquiring the drug is no greater than the MFP or (2) providing retrospective reimbursement for the difference between the acquisition cost and the MFP.¹⁸⁸ BIO commends this approach.

Generally speaking, the manufacturer of a selected drug must provide access to the MFP to providers and pharmacies with respect to Part B, MA, and Part D beneficiaries.¹⁸⁹ It follows that the manufacturer has no obligation to provide access to the MFP to providers and pharmacies on units that will be furnished or dispensed to individuals who are not Part B, MA, or Part D beneficiaries (MFP-ineligible individuals).

An MFP rebate model is vital because it enables prospective safeguarding against diversion of MFP units to MFP-ineligible individuals. This is essential because the statute does not provide any retrospective

¹⁸⁵ SSA § 1193(a)(3)(B); *see also id.* § 1191(c)(2)(B).

¹⁸⁶ *Id.* § 1193(a)(3)(A); *see also id.* § 1191(c)(2)(A).

¹⁸⁷ *Id.* § 1193(d).

¹⁸⁸ Initial Guidance at 40.

¹⁸⁹ *Id.* § 1193(a)(3); *see also id.* § 1191(c)(2).

mechanism for doing so. For example, the statute does not provide any post-hoc audit right to either the manufacturer or CMS to validate that providers and pharmacies have appropriately furnished or dispensed MFP units. Nor is there any post-hoc dispute resolution mechanism that enables the manufacturer to contest and recover the MFP discount on units that were improperly furnished or dispensed. Likewise, the statute does not grant CMS authority to impose CMPs or other sanctions, such as termination of access to the MFP, on providers and pharmacies that engage in diversion. Under these circumstances, CMS must establish a means to prospectively prevent diversion of MFP units. Authorizing an MFP rebate model is the most logical and practical means of doing so. It provides a mechanism through which the manufacturer can confirm that a unit was in fact furnished or dispensed to an MFP-eligible individual before providing access to the MFP.¹⁹⁰

Absent an MFP rebate model, there would be no way to mitigate against unlimited diversion of MFP units. And this is not a merely theoretical concern. In contrast to the Negotiation Program, the 340B Program, which is generally administered via upfront discounts, features a statutory audit right, a statutory dispute resolution mechanism, and agency authority to impose sanctions, including termination of access to the 340B price.¹⁹¹ Yet even this constellation of statutory safeguards against diversion has proven deeply inadequate to prevent diversion of 340B units.¹⁹² In the face of this well-documented real world experience, it would be patently unreasonable if CMS were to require upfront MFP discounts with no such safeguards. Indeed, doing so would be impermissible, as it would be tantamount to nullifying the express limitation on the obligation to provide access to the MFP only with respect to MFP-eligible individuals.¹⁹³

A rebate model is also the most administratively straightforward means of providing access to the MFP. The rebate model is commonplace in the commercial sector and under Part D, such that an MFP rebate model can be implemented as seamlessly and efficiently as possible and in a manner well familiar to all

¹⁹⁰ As a manufacturer can confirm when it submits its “process for making the MFP available,” Initial Guidance at 32, the minimum necessary Medicare claims data will be used to validate eligibility for the MFP, and reasonable time frames for submission of a request for, validation of eligibility for, and payment of an MFP rebate will be established. Additionally, providers and pharmacies will know at the time that a unit of a drug is furnished or dispensed that the drug is a selected drug and its associated MFP-based cost-sharing. As such, an MFP rebate model will not interfere with timely access by MFP-eligible individuals to MFP-based cost-sharing.

¹⁹¹ PHSA § 340B(a)(5)(C), (d)(2)(B)(v), (3).

¹⁹² See, e.g., Examining HRSA’s Oversight of the 340B Drug Pricing Program: Hearings Before the Subcomm. on Oversight & Investigations of the H. Comm. on Energy & Commerce, 115th Cong. 2–3 (2017) (noting limited oversight against diversion and that between 63 and 82 percent of audited 340B covered entities have been found to be noncompliant with at least one program requirement) (statement of Rep. Tim Murphy), available at <https://www.congress.gov/115/chrg/CHRG-115hhrg26929/CHRG-115hhrg26929.pdf>; T. Okon, *Hospitals and for-profit PBMs are diverting billions in 340B savings from patients in need*, Stat News, <https://www.statnews.com/2022/07/07/for-profit-pbms-diverting-billions-340b-savings/> (June 7, 2022); see also PHSA § 340B(a)(5)(B).

¹⁹³ *Whitman v. Am. Trucking Ass’n, Inc.*, 531 U.S. 457, 484 (2001) (an agency may not implement a statute in a manner that “completely nullifies” an otherwise applicable provision).

stakeholders. And CMS has clear legal authority to permit an MFP rebate model, as the statute does not specify how the manufacturer of a selected drug must provide access to the MFP, and, what is more, the statute grants CMS broad discretion to “establish[] . . . procedures to carry out the provisions of [the Negotiation Program], as applicable, with respect to [MFP-eligible individuals].”¹⁹⁴

To ensure smooth integration of the rebate model, and because only pharmacies know the actual acquisition cost (AAC), BIO recommends CMS define the MFP discount using a publicly reported metric, such as wholesale acquisition cost (WAC).

BIO is concerned with the metric CMS is proposing to use when defining the MFP discount, the AAC. CMS proposes that manufacturers that provide access to the MFP using a rebate model will need to provide the pharmacy a discount equal to the difference between the pharmacy’s acquisition cost, or the AAC, and the MFP. Among others, there are concerns with accessibility of the pharmacy’s AAC as it is currently not known to entities beyond the pharmacy. BIO recommends CMS define the MFP discount using a publicly reported metric, such as wholesale acquisition cost (WAC).

To facilitate a functional rebate model, BIO urges CMS to clarify that the proposed fourteen-day period during which an MFP rebate must be paid runs from the date on which the manufacturer has validated eligibility for the rebate.

CMS proposes that the manufacturers provide retrospective reimbursement within fourteen days. But the Initial Guidance is silent on when the clock begins to run. CMS should clarify that the clock begins to run on the date on which the manufacturer has validated eligibility for the rebate, in accordance with commercial sector conventions. In fact, this is the only rational starting point.

If CMS were instead to suggest that the clock begins to run on the date on which the rebate is requested, there would be insufficient time for the manufacturer to confirm that the unit was in fact furnished or dispensed to an MFP-eligible individual before providing access to the MFP—and, more fundamentally, no incentive for a provider or pharmacy to provide any validating Medicare claims data (including the 340B and non-340B claims modifiers discussed in section VI.C). This would render the rebate model completely nugatory, as such data are essential to the rebate model. Alternatively, we believe CMS should require providers to furnish claims level data such that it is required to process an individual claim, including the 340B or non-340B claims modifier as necessary. As CMS notes in its communication to states entitled, “Best Practices for Avoiding 340B Duplicate Discounts in Medicaid,” manufacturer access to claims level data is likely needed for invoice validation.¹⁹⁵ The rebate model is

¹⁹⁴ SSA § 1196(a)(3).

¹⁹⁵ Best Practices for Avoiding 340B Duplicate Discounts in Medicaid, CMS, January 8, 2020. https://www.hhs.gov/guidance/sites/default/files/hhs-guidance-documents/cib010820_1.pdf.

useful only to the extent that it provides a meaningful opportunity to prospectively safeguard against statutorily prohibited diversion of MFP units to MFP-ineligible individuals. As such, the rebate payment clock must begin ticking only after the manufacturer has verified the propriety of the rebate. Any contrary approach would be both plainly irrational and run directly contrary to the clear intent of Congress, which declined to impose any obligation on the manufacturer to provide access to the MFP with respect to an MFP-ineligible individual.¹⁹⁶

To promote efficiency and program integrity and to minimize the burden on interested parties, CMS should adopt a third-party administrator or clearinghouse rebate model.

Finally, BIO strongly urges CMS to utilize a CMS-established third-party administrator (TPA) for the rebate model. By utilizing a TPA, CMS can ensure prompt payment while promoting efficiency and program integrity and minimizing obligations on stakeholders. The CMS-established TPA would also need to serve as a Medicare claims data clearinghouse. To enable manufacturers that choose the rebate option to validate the propriety of MFP rebate invoices, CMS should require all necessary claims level data be shared with the clearinghouse such that it is required to process an individual claim, including the 340B or non-340B claims modifier. The TPA clearinghouse would also be an effective way to ensure non-duplication between the MFP and the 340B program.

C. MFP-340B Duplicate Discounts

To prevent MFP-340B duplicate discounts, BIO urges CMS to condition payment of a claim for reimbursement for a unit of a selected drug on the accurate use of *either* a 340B or a non-340B claims modifier, across Part B, MA, and Part D.

As set forth above, the statute prohibits MFP-340B duplicate discounts.¹⁹⁷ To make this statutory prohibition meaningful, CMS must establish a mechanism that meaningfully allows manufacturers to avoid MFP-340B duplicate discounts across Part B, MA, and Part D.

With respect to Part B, CMS has already taken steps toward establishing such a mechanism. Effective January 1, 2024, all 340B covered entities that submit a Part B claims must use a 340B claims

¹⁹⁶ In the alternative to requiring payment of an MFP rebate within fourteen days of the date on which the manufacturer has validated eligibility for the rebate, CMS could requirement payment of an MFP rebate either (1) within thirty days of the date on which the provider or pharmacy submits all necessary validating Medicare claims data, to be tolled during the pendency of a reasonable dispute resolution process or (2) within 45 days of the date on which the provider or pharmacy submits all necessary validating Medicare claims data. Notably, if the clock were to begin to run before the submission of such data, it would render the rebate model pointless, as the entire point of the model is to enable the manufacturer to validate eligibility for the rebate.

¹⁹⁷ *Id.* § 1193(d) (the manufacturer is required only to offer the lower of the MFP and the 340B price).

modifiers.¹⁹⁸ With respect to Part D, CMS has similarly proposed to require a 340B identifier in prescription drug event (PDE) file, acknowledging that “requiring that a 340B indicator be included on the [PDE] record is the most reliable way to identify drugs that are subject to a 340B discount that were dispensed under Medicare part D,” for purposes of excluding 340B units from the Part D inflation rebate calculation.¹⁹⁹

BIO appreciates these steps, but CMS must take additional steps to make the prohibition of MFP-340B duplicate discounts meaningful. As a start, CMS must require the use of either a 340B modifier or a non-340B modifier, and condition payment of a claim on the accurate use of the applicable modifier. And CMS must implement the same constellation of essential safeguards with respect to MA units. All such safeguards are necessary to ensure that 340B covered entities are properly incentivized to accurately identify 340B units. And such safeguards must be paired with an MFP rebate model to prospectively guard against MFP-340B duplicate discounts, given the absence of a statutory mechanism for retrospectively doing so.²⁰⁰ Any other safeguards necessary to protect against MFP-340B duplicate discounts should be adopted as well.

The need for such protections is readily apparent in light of the long history of improper duplicate discounts in analogous contexts: There continues to be widespread 340B covered entity non-compliance issues with respect to the MDRP-340B duplicate discount prohibition.²⁰¹ The same risk is present with respect to MFP-340B duplicate discount, and CMS must establish a mechanism to guard against them, as the prohibition against MFP-340B duplicate discounts is meaningful only if CMS does so. “An administrative agency cannot abdicate its responsibility to implement statutory standards under the guise of determining that inaction is the best method of implementation.”²⁰²

D. Providing access to the MFP to Part D beneficiaries at the point of sale

BIO concurs with CMS that a manufacturer is not required to provide access to the MFP to Part D beneficiaries at the point of sale *directly*.²⁰³

¹⁹⁸ CMS, Part B Inflation Rebate Guidance: Use of the 340B Modifiers 1 (Dec. 20, 2022), *available at* <https://www.cms.gov/files/document/part-b-inflation-rebate-guidance340b-modifierfinal.pdf>.

¹⁹⁹ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum 18 (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>.

²⁰⁰ See § VI.B *supra*.

²⁰¹ See, e.g., Government Accountability Office, *Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement* (2018), *available at* <https://www.gao.gov/assets/gao-18-480.pdf>; see also PHSA § 340B(a)(5)(A).

²⁰² *United States v. Markgraf*, 736 F.2d 1179, 1183 (7th Cir. 1984).

²⁰³ Initial Guidance at 31.

In the Initial Guidance, CMS correctly recognizes that access to the MFP must be provided to Part D beneficiaries at the point of sale through PDPs or MA-PDPs, as opposed to the manufacturer (as a literal reading of the statute might suggest).²⁰⁴ This is because it is impossible for a manufacturers to provide access to the MFP to Part D beneficiaries at the point of sale directly because they are not a party to the transaction at the point of sale. Rather, the point-of-sale transaction is among the Part D beneficiary, the pharmacy, and the plan or its PBM. Not only are manufacturers not a party to the transaction at the point of sale, but they are also typically not even in privity of contract with the point-of-sale pharmacy (and may also not even be in privity of contract with the plan or its PBM). As such, the only rational way to operationalize the statutory directive is for CMS to establish a pathway by which the MFP is passed through to Part D beneficiaries by those that are parties to the point-of-sale transaction. Therefore, BIO concurs with CMS’s clarification that access to the MFP by Part D beneficiaries at the point of sale will be effectuated through plans, not manufacturers.

E. Application of the MFP Across Dosage Forms and Strengths

We request that CMS simplify its proposed approach and address concerns with its proposed methodology.

In section 60, CMS proposes a complicated set of comparisons for purposes of creating a single proposed MFP for each drug for negotiation purposes. BIO understands the agency’s application of the statutory directive to create a “maximum fair price across different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug.” However, the agency’s decision, discussed above to treat products that are the subject of discrete NDAs as the same drug because they have the same active moiety, unnecessarily compounds the complexity of this effort. In many cases, products requiring significantly different routes of administration treat different conditions or have different clinical profiles—which results in a requirement for discrete NDAs to establish that the use of these therapies is safe and effective. In addition, drugs with different routes of administration may have substantially different manufacturing costs.

Thus, while BIO understands what the agency was attempting to accomplish in the system it has proposed for resolving the calculation of MFP across all dosage forms and strengths, the complexity of the system is compounded by CMS’ desire to include, in a single calculation, products with multiple routes of administration that will often be approved under multiple NDAs as separate drugs. The calculation also relies upon standardized concepts of 30-day equivalent supply, which may or may not have a true equivalence, especially for any products with some formulations dosed once via injection to

²⁰⁴ SSA § 1193(a)(3).

last a longer period of time which may not be standardized across all clinical practice—and may differ markedly from oral formulations for the same chemical. The complicated equation CMS has established may not be able to adequately resolve these differences when calculating a standardized MFP across all forms and strengths of particular chemical compounds—and it need not do so for products approved under separate NDAs that should be treated as different drugs for purposes of MFP calculations.

BIO urges CMS to simplify MFP calculations by following the statutory language of the IRA and attempt to create a single MFP only for dosage forms of each drug that are identified by reference to the same NDA or BLA. Products that are separately approved should be treated as separate drugs. This will resolve much of the unnecessary complexity in the agency’s proposed calculations described in section 60.

In addition, BIO is concerned that the last step of the 10-step process CMS has outlined will create an additional round of price cuts on dosage forms and strengths which cost more than other dosage forms and strengths for the same product for purposes of these calculations. By selecting a single ceiling price for the MFP and then comparing it differentially to the NDC9 level ceiling prices for the different dosage form and strengths of products, CMS is effectively undermining its own “single” MFP ceiling. Products which cost more at the NDC9 level than the dosage form and strength level calculated in section 60.2.2 and 60.2.3 would be subjected to two rounds of cuts, one during the process outlined in section 60.5 and again during the negotiation process itself. This undermines the creation of a “single” MFP since the different dosage forms and strengths are not equally subjected to the two rounds of cuts. This could potentially penalize more expensive dosage forms and strengths and undermine the ability of manufacturers to continue to provide these products. Moreover, the differential impact of the CMS methodology across dosage forms and strengths could also result in inequitable patient cost sharing.

In sum, BIO urges CMS to consider ways to simplify its methodology for applying the MFP across different dosage forms and strengths to avoid these distortions. As noted, some of these issues could be mitigated if CMS treats products which are separately approved as separate drugs. In addition, BIO believes that the agency has the authority to apply the MFP using more simplified units of measure than the 30-day equivalent methodology CMS has proposed.

F. The Date on Which a Generic or Biosimilar Is Marketed and the Date on Which CMS Determines That a Generic or Biosimilar Has Been Marketed

It is imperative that CMS abandon its bona fide marketing standard. This standard for determining the date of marketing of a generic or biosimilar is incompatible with the statute and contrary to sound public policy. CMS should instead adopt a standard that consistently designates the MDRP “market

date” as both the date on which a generic or biosimilar is marketed *and* the date on which CMS determines that a generic or biosimilar has been marketed.

The statute anchors multiple important provisions to either (1) the date on which a generic or biosimilar is marketed or (2) the date on which CMS determines that a generic or biosimilar is marketed.

With respect to the former date, a drug or biologic may be selected for negotiation only if, by the selected drug publication date, it is a qualifying single source drug—which excludes a drug or biologic with respect to which a generic or biosimilar is marketed.²⁰⁵ In addition, a biologic subject to a delay in selection for negotiation is rendered ineligible for selection for negotiation if a biosimilar is marketed by the date that is two years what otherwise would have been the selected drug publication date.²⁰⁶ And a biologic may not be subject to such a delay if more than one year has passed since the biosimilar was licensed and the biosimilar is not marketed.²⁰⁷

With respect to the latter date, most notably, a selected drug ceases to be subject to the MFP at the start of the year that is “at least 9 months after the date on which [CMS] determines that at least one generic or biosimilar has been marketed.”²⁰⁸ In addition, a drug or biologic ceases to be subject to negotiation if, by the end of the negotiation period, CMS determines that a generic or biosimilar has been marketed;²⁰⁹ and a non-compliant manufacturer of a selected drug subject to an ongoing excise tax ceases to be subject to such tax on the date on which CMS determines that a generic or biosimilar has been marketed.²¹⁰

In either case, the determination of the date of marketing of a generic or biosimilar is of enormous consequence throughout the program. CMS has stated its intent to use an ill-defined and complicated process to make what is in fact an entirely straightforward determination. CMS intends to review PDE data to determine whether a generic or biosimilar is marketed under a “bona fide marketing” standard that reflects CMS’s subjective assessment of whether the degree of utilization of the generic or biosimilar represents “robust and meaningful competition.”²¹¹

²⁰⁵ *Id.* § 1192(e)(1)(A)(iii); (B)(iii). The statute refers to a generic or biosimilar that is both approved or licensed and marketed. We focus only on the latter because the date of marketing should never fall before the date of approval or licensure.

²⁰⁶ *Id.* § 1192(f).

²⁰⁷ *Id.* § 1192(f)(2)(D)(iii).

²⁰⁸ *Id.* § 1192(c)(1) (emphasis added).

²⁰⁹ *Id.* § 1192(c)(2).

²¹⁰ Internal Revenue Code (IRC) § 5000D(b)(1)(B).

²¹¹ Initial Guidance at 67. BIO notes that, in some cases, the Initial Guidance does not specify whether the Agency intends to use the bona fide marketing standard to determine the date of marketing. In particular, it is unclear whether CMS intends to use such standard with respect to provisions regarding delay in the selection of a biologic for negotiation. If CMS intends to use an alternative standard with respect to such provisions, it should clearly articulate such alternative and subject it to public comment.

CMS’s approach is deeply problematic for myriad reasons. Foremost is that the bona fide marketing standard is contrary to the plain language of the statute: CMS’s standard is not rationally related to the actual date of marketing. As a definitional matter, marketing is “[t]he act[] . . . of bringing or sending a product or commodity to market.”²¹² As such, once the “action of buying or selling” has occurred, a product has necessarily been “marketed.”²¹³

CMS itself has long recognized that the date on which a product is “marketed” is an objective point-in-time determination of the date on which it is made available for sale in the commercial marketplace—including in the course of implementing other provisions of the IRA as well as under the Part D program which will source the data on which CMS intends to rely in effectuating its bona fide marketing standard. Mere months ago, CMS proposed to determine when a product is “marketed” for purposes of the IRA’s Part D inflation rebates by reference to the “market date” that the manufacturer must report under MDRP.²¹⁴ In turn, under MDRP, CMS has long defined the “market date” of a product by reference to the date on which the product entered commercial distribution, consistent with the plain language definition of “marketed.”²¹⁵ And, under the Part D program, which will source the PDE data on which CMS intends to rely in effectuating its bona fide marketing standard, CMS has recognized that the date on which a product is “release[d] onto the market” triggers certain coverage-related obligations²¹⁶—which by necessary implication means that CMS will have already recognized that a product has been released onto market by the time such coverage-related obligations yield PDE data showing utilization of the product.

²¹³ *Id.*

²¹⁴ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of SSA, and Solicitation of Comments, § 40.3 (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>; FDA, National Drug Code Directory (July 22, 2022), *available at* <https://www.fda.gov/drugs/drug-approvals-and-databases/national-drug-code-directory#:~:text=Marketing%20start%20date%20is%20the,no%20longer%20in%20commercial%20distribution>. With respect to the IRA’s Part B inflation rebate, CMS proposed to determine when a product is “marketed” by reference to the “date of first sale” that the manufacturer must report for ASP purposes, which likewise is an objective point-in-time determination. CMS, Medicare Part B Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1847A(i) of the Social Security Act, and Solicitation of Comments, § 50.3 (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-b-inflation-rebate-program-initial-guidance.pdf>.

²¹⁵ 83 Fed. Reg. 12,770, 12,784 (Mar. 23, 2018) (MDRP National Rebate Agreement); *see also* 42 CFR 447.502.

²¹⁶ CMS requires that Part D plan sponsor P&T committees “make a reasonable effort to review a new FDA approved drug product (or new FDA approved indication) within 90 days of its release onto the market and . . . make a decision on each new FDA approved drug product (or new FDA approved indication) within 180 days of its release onto the market, or a clinical justification will be provided if this timeframe is not met.” Prescription Drug Benefit Manual, ch. 6 § 30.1.5 (emphasis added).

CMS should not supplant wholesale the statute’s objective point-in-time “marketed” standard with an extra-statutory standard based on the Agency’s subjective judgment of sufficiency of utilization.²¹⁷ Such judgment is immaterial to whether a product is in fact marketed—i.e., is available to be bought and sold in the commercial marketplace.

Notably, Congress well knows how to statutorily impose a “bona fide” standard in the drug pricing context. Congress expressly established such a standard when amending the MDRP statute in 2010 to specify that only “bona fide” service fees are exempt from the calculation of AMP.²¹⁸ By contrast, Congress chose not to establish such a bona fide standard here. “[W]here Congress knows how to say something but chooses not to, its silence is controlling.”²¹⁹

CMS’s extra-statutory bona fide marketing standard has vast legal implications. For example, as noted above, the date on which CMS determines that a generic or biosimilar has been marketed determines when the MFP terminates.²²⁰ As such, through the bona fide marketing standard, CMS is effectively claiming for itself limitless discretion to prevent the MFP from timely (if ever) terminating, notwithstanding the fact that a generic or biosimilar has in fact come to market, based on the Agency’s subjective assessment of whether PDE data show that the generic or biosimilar is utilized sufficiently. In addition, CMS is implicitly claiming for itself authority to re-institute an MFP after an MFP has been terminated, if the Agency concludes based on PDE data that utilization of the generic or biosimilar ceases to be “robust and meaningful.”²²¹

Such policies are completely untethered to anything in the text or structure of the statute and run directly contrary to Congress’s intent to allow market-based competition to govern where a generic or biosimilar has come to market to compete with a drug or biologic.²²² The Agency’s approach is therefore patently unlawful. “[N]either federal agencies nor the courts can substitute their policy judgments for those of Congress.”²²³ CMS’s effort to do so here is “effectively the introduction of a whole new regime of regulation,” which “is not the one that Congress established.”²²⁴

The Agency’s unlawful standard also necessarily yields an inaccurate determination of when a generic or biosimilar was marketed. The Agency’s reliance on PDE data guarantees that there will be a time lag

²¹⁷ It is unclear, for example, whether CMS expects a generic or biosimilar to capture and maintain a certain percentage of the market.

²¹⁸ SSA § 1927(k)(1)(B)(i)(II) (as amended by Pub. L. No. 111–148, § 2503(a) (2010)).

²²² See, e.g., SSA § 1192(c)(1).

²²³ *Brown & Williamson Tobacco Corp. v. FDA*, 153 F.3d 155, 176 (4th Cir. 1998), *aff’d*, 529 U.S. 120 (2000).

²²⁴ *MCI Telecomms. Corp. v. Am. Tel. & Tel. Co.*, 512 U.S. 218, 114 (1994).

between the actual date of marketing and the date of CMS's determination because it takes time for sales to be reflected in PDE data. Indeed, CMS's long-standing policy requiring Part D plan sponsors to determine whether to add a newly approved drug to their formulary within 180 days of its release onto the market ensures that the PDE data will not accurately reflect when the drug came to market. Many Part D plan sponsors will not add a newly approved drug to their formulary until the 180-day mark, and, thus, the first six months of PDE data following the market entry of the drug will necessarily reflect only very limited uptake.²²⁵ And some plan sponsors may choose not add the drug to their formulary at all. In addition, even where plan sponsors add the drug to their formulary, widespread uptake of a new product does not occur overnight. After a new product is made available for sale, providers and patients typically transition to such product gradually as they become increasingly familiar with its benefits relative to pre-existing alternatives.²²⁶ Such a product is in fact marketed during this uptake period, but CMS's standard ignores this fact and focuses instead on whether the product is adequately utilized, in contravention of the statutorily mandated standard.²²⁷ Such shifts in utilization patterns over time do not mean that the market is not working as intended.

The Agency compounds these concerns with its intent to review PDE data only once per month for purposes of determining when the MFP terminates.²²⁸ The Agency's approach virtually always ensures that there will be a lag between the actual date of marketing and the date of CMS's determination. This poses a significant concern with respect to when the MFP terminates. If there is a lag of even a single day between the actual date of marketing and the date of CMS's determination, a selected drug can be subject to the MFP for a full additional year. For instance, if, on April 1, a generic or biosimilar is in fact marketed on April 1, but CMS's determination of this fact is deferred until April 2, the selected drug is subject to the MFP for a full year longer than if CMS's determination had not been deferred.

It is imperative that CMS abandon its unlawful and ill-advised standard and instead adopt as its standard the "market date" reported under MDRP. The MDRP "market date" standard should be used for identifying *both* the date on which a generic or biosimilar is marketed *and* the date on which CMS determines that a generic or biosimilar has been marketed.

Under MDRP guidance, "market date" is "the earliest date the drug was first marketed under the application number by any labeler."²²⁹ Manufacturers report this date when reporting MDRP pricing

²²⁵ While plan enrollees may access a non-formulary drug via an exceptions process, access may not be immediate under such process; moreover, exception processes typically yield only a very small volume of utilization.

²²⁶ See A. Lubby, Factors affecting the uptake of new medicines: a systematic literature review, 14 BMC Health Services Research 469 (2014) (describing the various factors that affect early uptake of new medicines).

²²⁷ Other examples of deficiencies in CMS's approach include circumstances where low utilization is driven by uncontrollable factors such as supply shortages.

²²⁸ Initial Guidance at 62.

²²⁹ CMS, MDRP Data Guide § 5.15 (Apr. 2022).

data. As such, the MDRP “market date” is a familiar construct to both CMS and manufacturers, and carries the additional benefit of ensuring consistency across MDRP and the Negotiation Program. And, unlike the “date of first sale” used for ASP reporting purposes, the MDRP “market date” is available for generics and biosimilars without regard to whether they are subject to ASP reporting.²³⁰

It is particularly critical that the Agency equate the date on which CMS determines that a generic or biosimilar has been marketed with the MDRP “market date” because, as noted above, the difference of a single day in the date of CMS’s determination can result in the MFP being extended for a full additional year. Failing to do so would have a dramatic chilling effect on the development of generics and biosimilars. Manufacturers would be seriously disincentivized against investing in the development of such products if there is a risk that they would be forced to compete with the MFP for an unduly extended period of time. This, in turn, would defeat Congress’s objective of encouraging the development of generic and biosimilar market competitors.

For all of these reasons, we strongly oppose CMS’s extra-statutory bona fide marketing standard, and strongly urge CMS instead to adopt the MDRP “market date” as a uniform standard for identifying both the date on which a generic or biosimilar is marketed and the date on which CMS determines that a generic or biosimilar has been marketed.

VII. Other Issues

A. Selected Drugs and Inflation Rebates

BIO urges CMS to clarify that selected drugs are not subject to an inflation rebate.

In its Initial Guidance, CMS solicits comment on the application of Part B and Part D inflation rebates to selected drugs.²³¹ Notably, CMS asserts: “The Part B and Part D inflation rebate programs apply to selected drugs, regardless of the status of the drug as a selected drug. Alternatively said, whether a drug is a selected drug will have no bearing as to whether the drug is also subject to the Part B and Part D inflation rebate programs.”²³² This assertion is incorrect. BIO asks CMS to clarify a selected drug is not subject to an inflation rebate.

²³⁰ The “date of first sale” is reported only for products subject to ASP reporting, and thus may not be available for all generics and biosimilars whose marketing is implicated by the Negotiation Program. By contrast, the “market date” reported under MDRP is more broadly reported and is thus the superior metric to use. See CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of Social Security Act, and Solicitation of Comments, (Feb. 9, 2023), <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>.

²³¹ Initial Guidance at 71.

²³² *Id.*

By statute, the Part B inflation rebate calculation is based in relevant part on the amount by which “106 percent of the amount determined under paragraph (4) of [section 1847A(b) of the SSA] for [a part B rebatable drug] during the calendar quarter . . . exceeds . . . the inflation-adjusted payment amount . . . for such part B rebatable drug during the calendar quarter.”²³³

Importantly, the circumstances under which an amount is “determined” under paragraph (4) is dictated by section 1847A(b)(1) (paragraph (1)).²³⁴ Specifically, paragraph (1) dictates a payment amount of, “in the case of a single source drug or biological . . . , 106 percent of the amount determined under paragraph (4) or in the case of such a drug or biological product that is a selected drug . . . , with respect to a price applicability period . . . , 106 percent of the maximum fair price . . . applicable for such drug and a year during such period.”²³⁵

In other words, the payment amount for a selected drug is determined under paragraph (1), and such payment amount is determined without regard to paragraph (4). Rather, it is only the payment amount for a non-selected drug that is determined under paragraph (4).

It necessarily follows that the Part B inflation rebate calculation has no application to a selected drug. With respect to such a drug, there is no amount “determined under paragraph (4),” and therefore Part B inflation rebates have no applicability.

This is not surprising. There is no policy reason for Congress to apply inflation rebates to selected drugs. A manufacturer should not be obligated to pay an inflation rebate on a selected drug because Medicare expenditures on a selected drug are already constrained by the maximum fair price.²³⁶ Thus, with respect to a selected drug, Medicare is shielded from the increase in expenditures occasioned by a price increase that outpaces inflation that an inflation rebate is intended to address. Medicare does not need to be made whole on account of such a price increase, and, thus, no inflation rebate should be due.

For all of these reasons, CMS should clarify that a selected drug is not subject to an inflation rebate.

²³³ SSA § 1847A(i)(3) (emphasis added).

²³⁴ See *id.* § 1847A(b)(1).

²³⁵ *Id.* § 1847A(b)(1)(B) (emphasis added).

²³⁶ *Id.* §§ 1847A(b)(1)(B); 1860D-2(d)(1)(D).

B. MFP and ASP

BIO urges CMS to amend its regulatory definition of “unit” to exclude MFP units from the ASP calculation.

By statute, MFP units are included in Best Price.²³⁷ Sales included in Best Price are also generally included in ASP.²³⁸ Thus, in the ordinary course, MFP units would be included in the ASP calculation. But the inclusion of MFP units in the ASP calculation would have vast and dire consequences for patient access.

The inclusion of MFP units in the ASP calculation would increasingly deflate ASP over time. As a result, ASP-based provider reimbursement would increasingly become inadequate to cover providers’ acquisition costs. Eventually, providers would be left financially underwater if they were to furnish a selected drug to an MFP-ineligible individual, creating a very real risk that providers would no longer furnish such drugs to such individuals. And this vital threat to patient access to necessary medicines would be far-reaching. ASP is a reimbursement benchmark commonly used by non-Part B payers with respect to Part B drugs. As such, although Part B reimbursement for selected drugs will not be based on ASP, this would negatively affect countless individuals insured by non-Part B payers.

Fortunately, CMS has clear legal authority to prevent this. The ASP statute unambiguously confers on CMS broad authority to define “unit” for purposes of the ASP calculation “as . . . [CMS] determines appropriate.”²³⁹ CMS undoubtedly may exercise such authority to exclude MFP units from the ASP calculation to avoid the patient access concern described above.

The legislative history of the ASP statute makes abundantly clear that Congress intended for CMS to exercise such discretion in this way in precisely this sort of circumstance. When Congress delegated CMS the authority to define “unit” for purposes of the ASP calculation, it specifically stated that it was doing so to allow for the exclusion of “those sales that do not reflect market prices” from ASP.²⁴⁰ By definition, MFP units do not reflect market prices.

There is also clear Agency precedent for excluding units that do not reflect market prices from the ASP calculation. In 2005, CMS carved Competitive Acquisition Program (CAP) units out of the ASP exclusion by excluding such units from the “unit” definition.²⁴¹ In doing so, CMS noted that ASP and CAP prices

²³⁷ *Id.* § 1927(c)(1)(C)(ii)(V).

²³⁸ *See id.* § 1847A(c)(2)(A); *see also* 42 C.F.R. § 414.804(a)(1), (4)(i).

²³⁹ SSA § 1847A(b)(2)(B).

²⁴⁰ *See* H.R. Rep. No. 108-391, at 587–88 (2003).

²⁴¹ 70 Fed. Reg. 39,021, 39,077 (Jul. 6, 2005); *see also* 74 Fed. Reg. 61,738, 61,915 (Nov. 25, 2009).

were “intended to be alternatives to each other” and, thus, CAP units should not be included in the ASP calculation.²⁴²

Identical reasoning supports excluding MFP units from the ASP calculation. MFP units do not reflect market prices: Rather, the MFP is a government-set price. Further, the MFP functions as an alternative to ASP: Part B will reimburse providers based on the MFP in lieu of ASP.²⁴³

For all these reasons, sound policy dictates that CMS exclude MFP units of selected drugs from the ASP calculation. BIO urges CMS to do so well in advance of the first IPAY to avoid any confusion and potential destabilization on non-Medicare markets once MFPs go into effect for the first set of selected drugs.

C. Civil Monetary Penalties (CMPs)

BIO urges CMS to proceed with caution on the implementation of CMPs as proposed given the ambitious timelines in the statute and to allow manufacturers a reasonable time period to cure deficiencies before CMPs are imposed. And in no case should the Agency impose a CMP prior to finalization of relevant regulations.

Under the IRA, CMS can impose CMPs on drug manufacturers for the following infractions related to the Part D Drug Negotiation program:

- **Refusing Access to MFP Price:** CMS will impose a CMP of 10 times the amount equal to number of units of drug furnished multiplied by the difference between the price for such drug made available to MFP-eligible entities on a Primary Manufacturer of a selected drug that has entered into an Agreement with CMS and fails to provide access to a price that is less than or equal to the MFP to MFP-eligible individuals dispensed the selected drug to pharmacies, mail order services, or other dispensers with respect to MFP-eligible individuals who are dispensed the selected drug or to hospitals, physicians, or other providers or suppliers that furnish or administer the selected drug to MFP-eligible individuals.
- **Failure to Comply to Requirements:** Any Primary Manufacturer of a selected drug that has entered into an Agreement with that fails to comply with requirements determined by CMS to be necessary for the purposes of administering the Negotiation Program and monitoring

²⁴² 78 Fed. Reg. at 61,915.

²⁴³ SSA § 1847A(b)(1)(B).

compliance with the Negotiation Program will be subject to a CMP of \$1,000,000 for *each day* of such violation.

- **Provision of False Information:** If CMS determines that any manufacturer knowingly provides false information under the procedures to apply the aggregation rule for the Small Biotech Exception, such manufacturer shall be subject to a CMP equal to \$100,000,000 for each item of such false information. Likewise, if CMS determines that any Biosimilar Manufacturer knowingly provides false information under the procedures to apply the aggregation of the Biosimilar Delay, the manufacturer shall be subject to a CMP equal to \$100,000,000 for each item of such false information.

CMS will provide notice to the manufacturer with information regarding the CMP in accordance with section 1128A of the Act, including the option to either pay the CMP or to request a hearing as outlined in section 1128A. The CMP notice will include: Basis for the CMP; CMP amount due; Deadline for the manufacturer to respond with a hearing request or submit the CMP payment; Method to submit CMP payment(s); and Information on the right to request a hearing

The manufacturer will have 60 days from the date of receipt of the CMP notice to request a hearing—If the manufacturer does not request a hearing within 60 days, the CMP will be considered due on day 60 following the date of receipt of the CMP notice.

BIO urges CMS to proceed with caution on the implementation of CMPs as proposed. By any recognition, the time frames in statute for implementation of myriad sweeping changes in multiple parts of the Medicare program are ambitious. To make analogies to another program, BIO reminds CMS that a final rule to impose CMPs on drug manufacturers as part of the 340B program in 2017 was delayed multiple times. Although the 2017 Final Rule was scheduled to take effect on March 6, 2017, HRSA delayed the implementation of the rule multiple times. The Agency ultimately postponed the effective date of the rulemaking until July 1, 2019, to allow for “necessary time to consider more fully the substantial questions of fact, law, and policy identified by the Department during its review of the rule.”

We similarly urge CMS to proceed cautiously with the imposition of CMPs on drug manufacturers and urge all stakeholders to work in good faith to comply with the statutory requirements of data reporting. To this end, we request that CMS send a notice of intent to impose a CMP and a reasonable period to cure the deficiency and/or to dispute the basis for the CMP, before any imposition of a CMP. The IRA imposes a tremendous amount of data reporting on drug manufacturers and puts them at risk for significant financial penalties. It will take time for manufacturers, especially small manufacturers, to comply in good faith with all the necessary data collection requests in the first years of the Negotiation program. And in no case should the Agency impose a CMP prior to finalization of relevant regulations.

D. Negotiation Program Agreement

BIO urges CMS to ensure that the text of the Negotiation Program Agreement is made available for public comment at least sixty days in advance of the first selected drug publication date. Further, CMS should abandon its “Primary Manufacturer” and “Secondary Manufacturer” construct as part of the Agreement as it is impracticable and has no legal basis.

The Initial Guidance states that the Agency will make “reasonable efforts” to make the final text of agreement available to the public before the first selected drug publication date.²⁴⁴ It is imperative that CMS make the text of the agreement available for public comment and do so well in advance of when manufacturers will be required to execute the agreement.

Advance notice of, and an opportunity comment on, the precise content of the Negotiation Program Agreement is vital because manufacturers are subject to CMPs of \$1 million dollars per day for a violation of a terms of the agreement.²⁴⁵ What is more, manufacturers that decline to enter into the Negotiation Program Agreement are subject to punitive excise taxes, such that manufacturers are effectively compelled to enter into the agreement.²⁴⁶ Under these circumstances, it is imperative that CMS provide advance notice of, and an opportunity to comment on, the exact terms of the Negotiation Program Agreement. Manufacturers must be reasonably apprised of the specific obligations to which CMS proposes they be subject, and have reasonable opportunity to comment thereon, when compliance is enforced via such extraordinary sanction.

Advance notice is necessary at a minimum because manufacturers may need lead time to establish new processes in order to be prepared to comply with the terms of the agreement. CMS cannot put manufacturers in the untenable position of being subject to sanction for failing to comply with requirements that they cannot fulfill because the Agency did not supply adequate advance notice. Courts have long recognized that “[i]mpossible requirements imposed by an agency are perforce unreasonable” and therefore arbitrary and capricious.²⁴⁷

We also reinforce our earlier comments regarding CMS’s proposal to hold a “Primary Manufacturer” responsible for submitting applicable information concerning a “Secondary Manufacturer.” CMS also proposes, among other things, to require that “Primary Manufacturers” ensure that “Secondary Manufacturers” make the MFP available to MFP-eligible entities individuals and other entities, and CMS would impose CMPs on “Primary Manufacturers” for noncompliance by “Secondary Manufacturers.” We

²⁴⁴ Initial Guidance at 27.

²⁴⁵ SSA § 1197(c).

²⁴⁶ IRC § 5000D(b)(1)(A).

²⁴⁷ *All. for Cannabis Therapeutics v. DEA*, 930 F.2d 936, 940 (D.C. Cir. 1991).

Biotechnology Innovation Organization

Suite 1300
Washington, DC, 20005
202-962-9200

urge CMS to abandon its proposed requirements under this “Primary Manufacturer” and “Secondary Manufacturer” construct. A Primary Manufacturer has no inherent legal authority to compel a Secondary Manufacturer to act or not act.

E. Patient Access and Part D Plan Formulary Placement

CMS should take steps to protect patient access to needed therapies in all Medicare Part D Plans.

By statute, Part D plans must place selected drugs on their formularies.²⁴⁸ BIO recommends that CMS clarify how it will ensure robust beneficiary access to needed therapies, including selected drugs, and asks CMS to ensure safeguards that allow for diversity across formularies to meet patient needs. CMS should try to minimize class effects from the MFP process that would result in narrower formularies and provide fewer choices to patients. In addition, CMS should monitor plan coverage and tiering design, clinical appropriateness of utilization management policies, cost-sharing levels, and patient out of pocket exposure. BIO encourages CMS to update its oversight of formulary requirements and to re-examine Part D coverage determinations and appeals as well as tiering exceptions.

BIO appreciates this opportunity to provide feedback to CMS on the Initial Guidance. We look forward to continuing to work with the Agency on these important issues. Should you have any questions, please do not hesitate to contact Crystal Kuntz at 202-962-9200 or Ckuntz@bio.org.

²⁴⁸ *Id.* § 1860D-4(b)(3)(I).

Congress of the United States
Washington, DC 20515

April 12, 2023

The Honorable Xavier Becerra
Secretary
Department of Health and Human Services
200 Independence Avenue, SW
Washington, D.C. 20201

The Honorable Chiquita Brooks-LaSure
Administrator
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Secretary Becerra and Administrator Brooks-LaSure:

We write to express disappointment and concern with recent implementation guidance for the drug price-setting provisions included in the Inflation Reduction Act (IRA, Pub. L. 117-169). This guidance exacerbates the law's statutory flaws and compounds the profound uncertainty and risk posed by the legislation's sweeping drug price controls. We encourage you to reconsider the many components of the initial guidance that will otherwise stifle medical innovation and quality improvement, discourage proven public-private partnerships, undermine American intellectual property (IP) protections, and provide unacceptable conditions for public feedback. If finalized as proposed, these provisions will serve to make bad policy worse, harming patients, caregivers, and health care providers across the United States for generations to come.

The Administration's guidance clearly values government power and overreach above precedent and statute, at the expense of patients seeking potentially life-saving treatments. In an apparent effort to subject as many medications as possible to the IRA's price-setting program, the guidance uses an unusual definition of "qualifying single-source drugs" that aggregates entirely different medications according to their active ingredient or moiety, thereby discouraging research into future drug indications. This approach will blunt incentives for meaningful product improvements, in addition to punishing products that treat more than one disease.

The Centers for Medicare and Medicaid Services' (CMS) misguided drug definition will chill efforts to mitigate side effects, improve adherence, bolster quality, and identify new uses and patient populations that might benefit from a given product. As outlined by Professor Erika Lietzan in a 2018 study, "Development of new uses for already approved drugs, in particular, can make profound contributions to the public health."¹ Another analysis, released that same year, details a lengthy list of examples along these lines, such as a "failed attempt to a cancer drug" repurposed decades later to become "the first breakthrough in AIDS therapy."² By reducing complex drugs and biologics to their active ingredients and collapsing new drug applications into a single product for price-setting purposes, the definition included in CMS' guidance will decrease the likelihood of these types of groundbreaking developments moving forward. In light

¹ https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3103293

² <https://www.liebertpub.com/doi/pdf/10.1089/blr.2018.29073.cmh>

of this risk, we urge CMS to adopt a more conventional definition with a credible basis in the statute.

Even more alarmingly, this guidance appears to serve as a backdoor mechanism for achieving partisan policy goals, to the detriment of Americans' health care. Specifically, the guidance treats federal financial support at any stage of drug discovery or development as grounds for further price manipulation by the Secretary under the program, resulting in a de facto expansion of so-called "march-in" authority, as referenced, but never imposed, under the Bayh-Dole Act. This effort comes despite consistent rejections, including by the Biden Administration,³ of attempts to rely on federal funding for a drug as grounds to impose price controls.⁴ In fact, the Bayh-Dole Act's bipartisan authors repeatedly affirmed that their framework aimed to incentivize public-private partnerships and accelerate access to meaningful medical innovations, rather than to discourage such collaborations or to punish innovators and research centers through pricing restrictions.⁵ The price-setting program's treatment of federal support risks undercutting private-sector interest in partnering with the government, further harming American patients.

Anti-innovation policymaking pervades the agency's initial guidance. Drugs with longer remaining patent terms or exclusivities, for instance, will see a downward adjustment in their Secretary-mandated prices, inverting the IP incentive structure that has driven most major inventions and breakthroughs since our nation's founding. Research and development costs, meanwhile, would receive insufficient consideration during the price-setting process, with a narrow definition that ignores the complexities of drug development. In this way, CMS perpetuates a troubling pattern of mission creep, whereby the agency bypasses Congress and other federal departments to pursue goals outside of its jurisdiction.^{6, 7}

In addition to these and other substantive policy concerns with the Administration's drug price-setting program, we also urge CMS to incorporate meaningful transparency and accountability into every stage of the new initiative's implementation. Already, we find the opportunity for public comment and its unduly brief response period leaving patients, caregivers, and other stakeholders inadequate time and opportunity to review and consider the vast new government rules and regulations at stake. CMS should provide longer comment periods and should not attempt to shield any portions of its regulatory proposals from public feedback or engagement. Furthermore, in implementing the price-setting program, the agency has an obligation to extend offers for additional meetings to hear feedback and input directly from those subjected to or otherwise affected by the process. For any number of conditions, from Alzheimer's disease and cancer to the 95 percent of rare diseases that currently lack an approved treatment option, CMS must also ensure that patients can play a proactive and consistent role in the decision-making process.

Additionally, we have major concerns with the guidance's severe limitations on basic due process protections, including for small businesses. The proposed policies would prohibit the

⁷ https://www.finance.senate.gov/imo/media/doc/letter_on_medicare_and_accelerated_approval.pdf

disclosure of materials sent by the agency during the price-setting process, and manufacturers would ultimately need to destroy any such information, effectively undercutting the potential for the predictability, precedent, and stability that govern virtually all adjudication processes. When coupled with the law's broad restrictions on judicial and administrative review, these proposals stifle any opportunity for accountability, program integrity, or recourse for aggrieved parties.

We urge you to work diligently and quickly to address these and other issues as you begin implementing this far-reaching new price control program. The preliminary decisions made through this initial guidance process, if carried out without greater reflection and input from the public, will have dire consequences for American patients for decades to come.

If you have questions about this request, please contact Conor Sheehy of the Senate Finance Committee staff, Alec Aramanda of the House Committee on Energy and Commerce, and Patrick Dumas of the House Committee on Ways and Means.

Via email: IRAREbateandNegotiation@cms.hhs.gov
Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

We applaud the Centers for Medicare and Medicaid Services for soliciting feedback on the draft program guidance issued to describe the implementation of Medicare drug price negotiation under the Inflation Reduction Act. Since 1999, the Connecticut Health Policy Project (www.cthealthpolicy.org) has worked to improve access to affordable, quality healthcare for everyone. We provide policymakers and the public with analysis of policy options to achieve those goals. We have worked for years to protect underserved populations, including patients with disabilities, from discrimination. We are especially concerned about financial access to critical medications for underserved and at-risk populations such as the elderly, disabled, and people with complex medical needs. Currently, the prices of essential, innovative medications are the greatest barrier to accessing both the medications and, by raising premiums and cost sharing, the affordability of coverage for everyone. Finally having the authority to negotiate fair drug prices for seniors in the Medicare program is a critically important step in meeting the goals of a just health care system.

In order to ensure that drug prices are fair for consumers, we need independent analysis and tools that can be leveraged to determine what a fair drug price is. It is imperative to objectively compare treatments for clinical effectiveness and affordability using well-vetted, evidence-based tools. Given our strong and sustained advocacy for underserved communities, we support CMS being able to use such independent analyses, specifically cost-effectiveness.

We note that your program guidance requests information on metrics that “may treat extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill and that CMS should also exclude from consideration when developing offers and reviewing counteroffers.” It is imperative that CMS retain the ability to use measures of cost-effectiveness that do not undervalue the life extension of people we serve including those with disabilities, those who are older, or those who are terminally ill. Therefore, we encourage CMS to use nondiscriminatory health measures and versions of cost-effectiveness analysis to help CMS develop offers and review counteroffers under the IRA. Specifically, we believe that

measures that value each year of extended life the same meet the intent of the statute and do not “treat extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.” Examples of such non-discriminatory measures include the equal value of life years gained (evLYG), health years in total (HYT), or the generalized risk adjusted quality-adjusted life year (GRA-QALY).

Prescription drug prices are driving up healthcare costs that are squeezing family, employer, and government budgets -- displacing other healthcare spending and other important priorities beyond health. Over [one in ten US households](#) couldn't pay for a prescription drug due to cost. More than [five million Medicare beneficiaries](#) struggle to afford medications. While unintended, high drug prices ultimately undermine the health of patients.

Again, we applaud CMS for taking this important step, through negotiation, to ensure seniors have access to fairly-priced drugs.

Thank you for your commitment to the health and affordability of care for all Americans.

Sincerely,

A handwritten signature in cursive script that reads "Ellen M. Andrews". The signature is written in dark ink and is positioned above the typed name and title.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear. Dr. Seshamani:

CVS Health appreciates the opportunity to provide comments on “Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments” (“Initial Guidance”) issued by the Centers for Medicare & Medicaid Services (CMS) on March 15, 2023.¹

CVS Health serves millions of people through our local presence, digital channels, and our nearly 300,000 dedicated colleagues – including more than 40,000 physicians, pharmacists, nurses and nurse practitioners. Our unique health care model gives us an unparalleled perspective on how systems can be better designed to help consumers navigate the health care system – and their personal health care – by improving access, lowering costs, and being a trusted partner for every meaningful moment of health. And we do it all with heart, each and every day.

We thank CMS for giving the public and stakeholders an opportunity to provide input on various aspects of the Initial Guidance. Implementation of the Medicare Drug Price Negotiation Program (Program) will be complex and challenging, and will affect not only beneficiaries and manufacturers, but every entity in the pharmaceutical supply chain. Given our role as a health plan, health care provider, pharmacy and pharmacy benefits manager, we are well-positioned to comment from different perspectives to help facilitate the smooth implementation of the Program.

We especially appreciate CMS’ making clear that it is the responsibility of the Primary Manufacturer to ensure that the maximum fair price (MFP) is made available to MFP-eligible individuals as well as to pharmacies, mail order services, and other dispensers that provide a selected drug to an MFP-eligible individual. We also appreciate CMS clarifying its intention that its agreement with the Primary Manufacturer would not restrict the Primary Manufacturer or Secondary Manufacturer(s) from offering a price lower than the MFP. We ask that CMS implement the Program in such way that not only allows for manufacturers to offer lower prices, but continues to encourage them to do so. The primary mechanism used today to incentivize manufacturers to offer lower prices in the Part D program is inclusion and placement on a Part

¹ Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

D plan's formulary. Therefore, it is critical that CMS implement the Program in a manner that not only preserves, but strengthens this mechanism by giving Part D sponsors and their PBMs maximum flexibility to determine which drugs, and for selected drugs, which dosage form(s) and strength(s), to include on their formularies.

We also strongly support the requirement in the Initial Guidance that a Primary Manufacturer ensure that pharmacies, mail order services, and other dispensers, as well as intermediate entities, such as wholesalers, as applicable, are reimbursed timely for the full amount of the difference between their acquisition cost for the selected drug and the MFP within 14 days. We assume that the 14 day period refers to 14 calendar days after a request for reimbursement is received by the Primary Manufacturer, but ask that CMS clarify this in the Initial Guidance. We agree with CMS that existing mechanisms can be leveraged for this purpose, including use of the unique Part D processor identification number (RxBIN) and Part D processor control number (RxPCN) combination used by PBMs, to identify a claim for a MFP drug paid under a Medicare Part D benefit.

However, it is important to recognize that the Program differs from existing programs, such as the coverage gap discount program (CGDP), in significant respects. These differences will require that new processes be built and implemented, and this will involve significant resources and risk for participants in the pharmaceutical supply chain. For example, unlike the CGDP, which involves only point-of-sale adjustments, the Program will require reconciliation to dispensers' acquisition costs, something that is not currently in place in the industry. In light of this, we recommend that CMS seek ways in which to streamline and facilitate the process as much as possible, such as through the development of standardized agreements and reporting formats to be used by manufacturers and others in the supply chain to implement the Program. We also recommend that CMS require Medicare D Part D claims impacted by MFP be clearly identified with the applicable basis of reimbursement code value as defined by the National Council of Prescription Drug Programs.

CMS proposes two ways in which the primary manufacturer can ensure that access is provided to the MFP, namely, (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP. Given that the MFP is required to be made available only to Part D enrollees and dispensers will not know ahead of time how many patients will be eligible for the MFP, we anticipate that the second method -- retrospective reimbursement of the difference between the dispensing entity's acquisition cost and the MFP-- will in most cases be used. However, since acquisition cost data is highly sensitive competitive data, dispensers and others in the supply chain are unlikely to be willing to share this directly with manufacturers or their vendors that are involved in the supply chain. This creates a conflict of interest or, at least, competing business interests.

In order to address this, we believe it may be necessary to establish a chargeback system between each entity in the supply chain and the entity from which it purchased the drug. So, for example, in most cases pharmacies will seek reimbursement from the wholesaler from which they purchased the drug, and wholesalers in turn will seek reimbursement from the manufacturer from which it purchased the drug. This will require reporting by the dispenser of MFP drugs dispensed to MFP-eligible individuals during a given period. To the extent this reporting can be standardized and aggregated across manufacturers, it will reduce the costs and burdens on dispensers and others in the supply chain. In addition, many technical issues will need to be addressed, such as accounting for partial dispensed quantities to the full

package quantity. We ask that CMS provide ongoing guidance as these issues are worked through.

CMS states that it anticipates that pharmaceutical database companies will publish the MFPs so that the amounts would become more readily accessible to pharmaceutical purchasers, and CMS asks for comments on additional ways that CMS could help dispensing entities and MFP-eligible individuals know the MFP for a selected drug. We recommend that promptly after the MFP is established, Primary Manufacturers be required to report the MFP and its effective date to the standard drug compendia vendors and that these prices be made available in existing drug files incorporated into provider and payer claim adjudication systems.

Finally, we appreciate CMS confirming that dispensers will be paid a dispensing fee in addition to the MFP. We ask that CMS also confirm that this dispensing fee not only may, but should, be higher to ensure that pharmacies receive fair compensation for dispensing MFP drugs. The Program will only be a success if all entities in the supply chain are treated fairly and compensated appropriately for their services.

Thank you for considering our comments. We understand that the smooth and effective implementation of the Program is a top priority of CMS and Congress as a means to control drug costs. We stand ready to help CMS in any way we can to make the Program work and achieve its goals.

We would be happy to respond to any follow-up questions you may have.

Sincerely,

A handwritten signature in dark ink, appearing to read "Melissa Schulman". The signature is fluid and cursive, with the first name "Melissa" and last name "Schulman" clearly distinguishable.

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Secretary Becerra and Administrator Brooks-LaSure:

The Cystic Fibrosis Foundation is a national organization dedicated to curing cystic fibrosis (CF). We invest in research and development of new CF therapies, advocate for access to care for people with CF, and fund and accredit a network of specialized CF care centers. We thank the Centers for Medicare and Medicaid Services (CMS) for the opportunity to provide comments on the initial Medicare Drug Pricing Negotiation Program Guidance.

Cystic fibrosis is a life-threatening genetic disease that affects close to 40,000 children and adults in the United States. CF causes the body to produce thick, sticky mucus that clogs the lungs and digestive system, which can lead to life-threatening infections. If left untreated, infections and exacerbations caused by CF can result in irreversible lung damage, and the associated symptoms of CF lead to early death, usually by respiratory failure. Through thorough, aggressive, and continuously improving disease management, the average life expectancy for people with cystic fibrosis has risen steadily over the last few decades. With recent advancements in treatment options, more people with CF are aging onto Medicare than ever before.

We provide the following comments and recommendations for future guidance and program implementation.

Orphan Drug Exclusion

The CF Foundation appreciates CMS's request for recommendations to preserve and support incentives for orphan drug development within the context of Medicare drug price negotiation. However, we are concerned that the orphan drug exclusion as worded in section 30.1.1 of this guidance ("designated as a

drug for only one rare disease or condition”) may have concerning implications for development in this space.

Specifically, limiting the exclusion to drugs that have only one orphan designation may disincentivize sponsors from performing comprehensive research on drugs with the potential to treat multiple rare diseases, which we do not believe was the intent of this provision in the Inflation Reduction Act (IRA). Because orphan drug designations for new drugs are requested before submission of a marketing application and include tax credits for clinical research expenses, sponsors frequently request them very early in the drug development process. Having a single orphan designation as a criterion for exclusion from price negotiation may therefore disincentivize sponsors from pursuing concurrent development programs for drugs that may initially hold promise for treating multiple rare diseases or conditions.

We believe Congress intended to tailor this exclusion to drugs that are exclusively *approved* to treat rare disease populations and did not intend to deter sponsors from investigating a given therapy for multiple orphan diseases. We therefore urge CMS to clarify that drugs that receive multiple orphan drug designations will still be eligible under this exclusion.

Clinical Benefit

The CF Foundation appreciates CMS’s commitment to incorporating data beyond clinical trials to demonstrate the clinical benefit of a therapy. Using data beyond clinical trials, including patient-reported outcomes and real-world evidence, is critical to understanding the full value of therapies. In CF, benefits for patients who are on transformative modulator therapies extend far beyond the endpoints measured in clinical trials. For instance, real-world data has shown a reduction in the number of lung transplants and reduced treatment burden for patients on modulator therapy – benefits not captured in randomized clinical trials.

We support CMS recognizing that Quality Adjusted Life Years (QALYs) should not be used as a primary measure of cost-effectiveness analyses. QALYs look solely as longevity and do not account for the patient experience and benefits outside of those directly related to the length of life.

When CMS consults subject matter experts, this should include members of the patient community. Clinical experts, drug manufacturers, and researchers may not fully grasp the benefits or complications of a given therapy for patients. For instance, those individuals do not necessarily understand issues like treatment burden, which is an important consideration for people with CF. Additionally, in order to obtain meaningful feedback and data, we recommend CMS simplify and update the feedback submission form with plain language, provide significant notice of data collection prior to the 30-day submission timeframe, and issue specific instructions on the standardized format needed for data submitted. These updates will make it more likely for patients to engage, particularly given the short statutory timelines.

Data Collection on Impact

We support the provisions that require negotiated products to be included on Medicare Part D formularies. In order to evaluate the long-term impacts of the IRA and drug price negotiations on patient access and cost, we recommend CMS implement a data collection and analysis system looking at impacts both across a manufacturer’s drug portfolio, Part D plans, and in other insurance markets (marketplace, Medicare Advantage, and commercial plans). This should include drug expenditures to identify cost-shifting from a MFP product to a non-negotiated product, and trends in utilization and health outcomes.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Cytek Biosciences (NASDAQ: CTKB) appreciates the opportunity to comment on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare and Medicaid Services (“CMS”) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Cytek Biosciences provides cell analysis tools that facilitate scientific advances in biomedical research, drug discovery and development, and clinical applications. Our products are used at many of the world’s most renowned biotech and pharmaceutical companies, CRO firms, and government and academic research institutions.

There are multiple provisions in the IRA with negative unintended consequences for drug development, treatment cost, and availability:

1. Fewer new drugs will be developed – not only for seniors, but also for all Americans – if small molecule drug price negotiations begin at 9 years instead of 13 years.
2. Ironically, treatment costs will likely increase as the list of available therapies shifts away from small molecules and toward biologics, thereby frustrating the intent of the Inflation Reduction Act
3. Fewer repurposed drugs will be available to treat additional orphan medical conditions beyond the original approval population if price negotiation is initiated at 9 years for small molecule drugs as well as biologics.
4. Fewer new drugs will be developed unless CMS uses broadly defined criteria for assessing the value a new drug can bring in comparison to the therapeutic alternatives it considers when proposing negotiated Medicare prices. These criteria should include efficacy, safety, ease-of-use, value to caregivers, and risk reduction to the remaining population.
5. The “bona fide” generic competition standard will result in fewer new generics and higher costs for old drugs by reducing the reward for first filer generics and harming generic

competition. CMS should rely on competitive market derived prices rather than its negotiation process in setting drug prices.

6. The criteria used to assess a drug's value must be made public to allow companies to focus scarce resources on developing drugs that will actually be used clinically rather than wasting resources on projects that will be terminated due to lack of investment return. Wasting resources in this manner prevents the development of drugs that otherwise could have brought benefit to patients.

There are a variety of reasons for these consequences, which Cytex would be pleased to discuss with CMS, along with effective solutions that will address the real intent of the IRA legislation.

Please contact Paul Goodson, Head of Investor Relations, at 442-888-3854, or pgoodson@cytekbio.com, if we can support CMS in this important mission.

Sincerely,

Wenbin Jiang, Ph.D.
Chairman and CEO
Cytex Biosciences, Inc.

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Seshamani:

Daiichi Sankyo, Inc. submits the below comments in response to the Centers for Medicare & Medicaid Services' (CMS) *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for the Initial Price Applicability Year 2026, and Solicitation of Comments* (Guidance).¹ Daiichi Sankyo is dedicated to creating new modalities and innovative medicines for patients around the globe. With more than 100 years of scientific expertise, our company draws upon a rich legacy of innovation and a robust pipeline of promising new medicines to help patients. Through the outstanding knowledge and commitment of our scientists and other employees, we create innovative new medicines and methods of drug discovery and delivery. We share a passion for innovation, as well as compassion for the patients who need our medicines.

Daiichi Sankyo is disappointed that CMS is not accepting comments on Section 30 of the Guidance, which includes CMS' identification of a "qualifying single source drug" (QSSD), a fundamental component of the "Negotiation Program" (Program), and that this may raise due process and other issues. Daiichi Sankyo is encouraged, however, by CMS' stated interest in implementing the Program to

¹ Guidance, available at [Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments \(cms.gov\)](https://www.cms.gov/medicare/coverage/policies/2021/specialty/medicare-drug-price-negotiation-program).

support the development of medicines for patients with rare diseases. Daiichi Sankyo's comments are limited exclusively to that statement since CMS is refusing to consider comments on Section 30.

1. Orphan Drug Exclusion from Qualifying Single Source Drug

In the draft guidance, CMS states that it "is considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development."² As discussed in more detail below, the Inflation Reduction Act's (IRA) limits on the time that innovative drug manufacturers can recoup their research and development (R&D) investments incentivizes the development of medicines for large groups of patients and disincentivizes R&D focused on rare diseases. We believe there are actions within CMS' existing authority to implement the Program in a manner that continues to support and incentivize orphan drug development, and it is our sincere hope that CMS exercises this authority as expeditiously as possible for the benefit of patients.

In implementing this new law, a fundamental overhaul of the pricing and reimbursement of medications for Medicare beneficiaries, it is critically important to avoid unintended consequences that could have a negative impact on patients. This requires implementing the Program, consistent with CMS authority, in a manner that maintains a clear focus on patients and ensures not only short-term access to drugs that are already marketed, but also protects the R&D pipeline of new treatments and cures for patients who are the most vulnerable to shifting incentives.

a. Daiichi Sankyo's Commitment to Investing in Medicines for Patients with Unmet Needs

We appreciate CMS' interest and commitment to supporting the development of drugs for patients with rare diseases. Daiichi Sankyo shares this commitment to the R&D of new treatments and cures for patients with unmet needs and has invested in the development of drugs to treat rare diseases. At Daiichi Sankyo, passionate researchers are working every day using our science and technology to bring new medicines to patients who need them. Our dedication to transforming science into value for patients forms everything we do from our R&D strategy to product commercialization.

Our pipeline includes four medicines with orphan designations in clinical trials, reflecting our commitment to bringing new therapies to patients with unmet needs.³ These drugs are being studied with the goal of bringing effective therapies and improved quality of life to people with:

- Acute myeloid leukemia (AML) – a group of blood and bone marrow cancers, often spreading to the lymph nodes, liver, spleen, central nervous system, and testes. Only about 25% of patients with AML can expect to live 3 or more years, and 45% of patients with complete remission can expect similar prognosis.
- Netherton syndrome (NS) – a hereditary syndrome, characterized by skin inflammation and scaling, fragile hair, and being more prone to allergies, asthma, and eczemas. NS is very rare, with only 150 reported cases.
- Peripheral T-cell lymphoma (PTCL) – a very rare type of T-cell lymphoma that includes a diverse group of aggressive lymphomas, arising in the lymphoid tissues such as lymph nodes, spleen,

² Guidance at 11.

³ See Daiichi Sankyo, Our Pipeline, available at [Pipeline 3ADC \(daiichisankyo.com\)](https://www.daiichisankyo.com/pipeline).

gastrointestinal tract, and skin. Prognosis varies among subtype, but the most common type of PTCL is characterized as aggressive and has a poor prognosis.

- Pseudoxanthoma elasticum (PXE) –a hereditary disorder that causes some tissue in the body to become mineralized, resulting in symptoms that vary by person, but can include changes to the skin, to the retina of the eye that may result in significant loss of vision, to the cardiovascular system that may involve calcification of arteries and decreased blood flow, and to the gastrointestinal system that may result in bleeding in the stomach or intestines.

This research demonstrates the breadth of rare diseases, as well as the need to bring hope and improved outcomes to patients facing limited treatment options.

b. R&D Decisions Must Balance Science with Ability to Continue Pipeline Investments

Daiichi Sankyo’s researchers developing medicines for patients with rare diseases and other unmet medical needs must determine where to focus their work early in the development process. Our scientists must make the decision of whether to first evaluate a new chemical entity for a rare or for a non-rare population before testing even begins. Oftentimes, manufacturers may choose to first invest in researching a drug for a rare disease, which can involve smaller trials and may be able to show results earlier and come to market sooner than if tested first in a larger patient population. Because these studies typically include a small number of people, they can be used to provide evidence that a drug may be effective in later stages of development and help inform decisions about investing in larger, more costly trials. This benefits patients with rare diseases, who would then have access to new drugs sooner while the larger trials with more patients are still ongoing.

Those early decisions are led by the science, and the incentives established by the Orphan Drug Act and other congressional efforts have helped to provide companies like Daiichi Sankyo with the business case needed to put significant resources behind R&D for rare diseases. The IRA, however, provides a limited amount of time before a drug can be eligible for price setting. If Daiichi Sankyo and other innovative biopharmaceutical companies are not able to recoup those investments, or face a penalty for bringing a new therapy to a small group of patients as quickly as possible since there is a limited amount of time before a drug can be eligible for price setting, those R&D decisions will be reevaluated so that innovative companies are able to continue to invest in future therapies. This means that research into rare diseases could be curtailed significantly, if not slashed from portfolios entirely. It also means that the opportunity to learn more about a given molecule, and the rare disease itself, is lost along the way, even if a company does pursue its first indication in a bigger market. Even trials that eventually fail to show the benefit of a given therapy can add volumes of knowledge to the overall understanding of a disease, and that knowledge can serve as a steppingstone to other therapies that could be effective. Ultimately, the impact could be devastating to patients.

CMS’ guidance is aimed at the first initial price applicability year 2026, but it is impacting investment decisions right now. Since the passage of the IRA, innovative manufacturers have already made and continue to make decisions about which indications to invest in and how to sequence the launch of new products without clear guidance from CMS about how it plans to implement the orphan exclusion. How CMS implements this exclusion and when it provides that guidance will have immediate and long-term

impacts on people with rare diseases. Daiichi Sankyo urges CMS to provide that needed clarity expeditiously to guide its ongoing R&D analysis and provide companies with the opportunity to potentially unwind any decisions that may have already been made.

c. CMS Has the Legal Authority to Implement the Orphan Drug Exclusion to Support Orphan Drug Development

The IRA excludes certain orphan drugs from being eligible to be selected for price setting. Specifically, “the term ‘qualifying single source drug’ does not include ... [a] drug that is designated as a drug for only one rare disease or condition ... and for which the only approved indication (or indications) is for such disease or condition.”⁴ Consistent with the Guidance, if a drug or biological receives an additional indication outside the first orphan designation, it is no longer excluded from the definition of QSSD and is eligible to be a selected drug and subject to the Program’s price setting. The law requires that a drug is eligible for selection 7 years from approval, with the set price going into effect at 9 years. A biologic is eligible for selection at 11 years from licensure, with the set price going into effect at 13 years.

The statute requires that the timing for an orphan drug’s eligibility runs from the first approval outside the first orphan designation (*e.g.*, approval for a second disease or condition or receipt of a second orphan drug designation). That is when the orphan drug or biologic loses its exemption as a QSSD and becomes eligible for price setting. This interpretation is required to give full effect to the text of the orphan-drug exclusion, which prevents a drug from meeting the definition of QSSD, including its 7- and 11-year period provisions, if the conditions for the orphan exclusion are met.

d. Policy Reasons Compel CMS to Follow the Statute in Implementing the Orphan Drug Exclusion

In addition to the statute, policy reasons also compel CMS to implement the orphan drug exclusion this way. If the timing is retrospectively tied to the orphan drug's previously exempt approvals once the exemption is lost, then companies may be incentivized to wait or not seek orphan approval. Instead, they might conduct larger trials that take more time so that their first approval is for a larger population, and they can reach a larger number of patients in the 7- or 11-year period prior to being eligible for selection.

As described above, a company may be able to research a new drug or biologic for an orphan indication and bring it to market quickly, potentially bringing a curative therapy to a small set of patients with limited or no other treatment options. The manufacturer may also believe there are other promising indications that will take longer to research but would serve a much larger population of patients. If CMS interprets the 7- or 11-year clock to have already been running upon loss of the orphan exemption, this interpretation would incentivize the manufacturer to wait on the approval for the orphan indication, or not pursue it all, as it would “run the clock” on the 7/11 years on a very small population of patients.

However, if CMS reads the statute to tie eligibility for price setting to the date of the approval for a second disease or condition outside the orphan designation or receipt of a new designation, it preserves the incentive for a manufacturer to seek an orphan indication early and get the medicine out quickly to

⁴ Social Security Act § 1192(e)(3)(A).

an underserved group of patients. Specifically, it preserves the 7/11-year period for the subsequent indication for a larger group of patients. (See Appendix for illustrative example.)

Each of Daiichi Sankyo's orphan-designated drugs, while currently being tested for orphan diseases, has the potential to also address medical needs in broader, non-orphan patient populations. Because the IRA limits the time that biopharmaceutical companies can recoup their investments to 9 or 13 years before price setting, it pushes R&D toward development projects that enable a company to recoup its investment within a shorter period of time, since they cannot spread their costs over a longer period of time that includes a period of marketing only to a very small group of patients.

We cannot emphasize enough that companies like Daiichi Sankyo are making these R&D decisions now, and CMS cannot wait to act to provide companies like ours with needed guidance if it genuinely wants to "support orphan drug development." We urge CMS to provide innovative pharmaceutical companies with the clarity needed to know that our investments in rare disease drugs will continue to be viable and that patients with rare diseases will continue to benefit from robust pipelines offering new treatments and cures.

Daiichi Sankyo thanks CMS for its consideration of these comments responding to CMS' interest in additional actions to support the development of orphan drugs. We look forward to working with CMS on our shared goal of addressing the unmet needs of patients with rare diseases. If you have any questions or would like additional information on Daiichi Sankyo's experience in the development of orphan-designated drugs, please contact me at apezalla@dsi.com.

Sincerely,

/s/

Amanda Pezalla
Assistant General Counsel, Head of Government Affairs and Public Policy
Daiichi Sankyo, Inc.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Day One Biopharmaceuticals appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance). While we recognize that CMS is not accepting comments to section 30, we hope you will consider our comment given the potential impact section 30 could have on patients and biotechnology companies that are innovating in critical areas of unmet need.

Day One is unlike most other biotechnology companies: our focus is on pediatric oncology drug development. Pediatric oncology is an area of critical unmet need that is typically an afterthought in the pharmaceutical industry. Our lead product candidate, tovorafenib, is a small molecule type II pan-RAF kinase inhibitor currently under evaluation in a pivotal Phase 2 clinical trial among pediatric, adolescent, and young adult patients with relapsed or progressive pediatric Low-Grade Glioma (pLGG). The product has been granted Breakthrough Therapy and Rare Pediatric Disease designations by the U.S. Food and Drug Administration (FDA), as well as Orphan Drug designation from the FDA and the European Commission (EC).

We are concerned that the Drug Price Negotiation Program's exclusion for certain orphan drugs is overly restrictive and could harm products like tovorafenib. We recognize that the statute itself limits the exclusion to "[a] drug that is designated as a drug for only *one* rare disease or condition under section 526 of the Federal Food, Drug, and Cosmetic Act and for which the only approved indication (or indications) is for such disease or condition." SSA § 1192(e)(3)(A). Although CMS has reaffirmed this definition in section 30.1.1, it has also stated that it "is considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development." To achieve this objective, we encourage CMS to take broad actions that continue to incentivize the development of orphan drugs. For example, CMS can develop a policy to grant maximum fair prices at the statutory ceiling to any selected drug that only has indications for rare diseases. Additionally, CMS could exercise its discretion when selecting drugs to delay the entry of certain orphan drugs that do not meet the criteria for the exclusion.

CMS should take particular care to incentivize the development of small molecule orphan drugs. Currently, the Drug Price Negotiation Program and its implementation details in section 30 directly threaten the ability of companies like Day One with small molecule drugs in development to build sustainable businesses and bring novel therapeutic

options to children with cancer and other rare diseases. Without reasonable incentives to invest in small molecule drugs and pursue rapid registration paths for rare and neglected patient populations, it becomes extremely difficult for companies like ours to stay in business and continue to develop new medicines for these patients. This legislation will flip the model upon which the biotech industry has been built and will not only impact innovation, but worse, severely limit access to cutting-edge treatments.

Until Day One was founded a few years back, no other companies were taking a chance in pediatric oncology drug development. This lack of investment was due, in part, to the small patient populations covered. Through our drug development efforts, we are changing the paradigm and bringing hope to the pediatric cancer community – academics, patients and their families, and patient organizations, who have all been overlooked when it comes to therapeutic innovation. Unless CMS acts, the Drug Price Negotiation Program will upend all of this work and relegate children with cancer to the back of the innovation line once more.

On behalf of the children living with cancer, and the scientists and oncology community that support them, I ask that you please work with Congress to move the timing for NDA-path negotiations from 9 years to 13 years, the same time period as BLA-path drugs. This would ensure that the Drug Price Negotiation Program does not negatively impact the market for pediatric oncology orphan drugs.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to rare disease patients is minimized. Please contact me at Jeremy.bender@dayonebio.com if you have any questions regarding our comments.

Jeremy Bender, Ph.D.
Chief Executive Officer

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

We appreciate the opportunity to provide comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (“CMS”) website on March 15, 2023 (the “Memorandum”). We look forward to continued discussions with CMS.

There is a burgeoning health crisis in America due to the lack of treatments for diseases suffered by our seniors. Last summer, the U.S. Congress convened a roundtable of experts from government, academia, and industry to discuss its severity.¹ Alzheimer’s Disease has been identified as the fifth leading cause of death among adults over 65 years, and it alone will cost Americans over \$1 trillion dollars a year by 2050.² One disease is driving an immense burden on society. What society needs most now is research into the underlying biology of neurodegeneration so that we can discover a cure. This is our mission at Denali Therapeutics.

Denali Therapeutics Inc. (“Denali”) is a biopharmaceutical company founded with the mission to defeat degeneration by developing a broad portfolio of potential medicines engineered to cross the blood-brain barrier (BBB) for the treatment of neurodegenerative and lysosomal storage diseases, including Alzheimer’s, Parkinson’s, ALS, and rare neurodegenerative diseases. We believe that by rigorously assessing genetically validated targets, engineering delivery across the BBB, and guiding development through biomarkers, that we can improve our chances of finding a cure. Since our founding in May 2015, our team has built a pipeline that includes 7 clinical development programs, including 4 late-stage clinical studies, published over 20 papers in top-tier scientific journals and been awarded over 150 patents worldwide. Denali is based in South San Francisco, California, and employs over 400 individuals, many of whom are personally impacted by the diseases we seek to treat.³

¹ The Economic Cost of Alzheimer’s Disease: Hearing Before the Joint Economic Committee, 117 Cong. (2022), available at <https://www.jec.senate.gov/public/index.cfm/democrats/issue-briefs?id=02F4CADC-954F-4E3B-8409-A4213E3C0759> (last accessed April 13, 2023).

² Wong, W., Economic burden of Alzheimer disease and managed care considerations, *Am. J. Manag. Care*, 2020 Aug;26(8 Suppl):S177-S183.

³ For additional information, please visit www.denalitherapeutics.com.

Denali strongly believes in ensuring patients have access to medicines they need today and, in the future, and is concerned that the Guidelines will inadvertently impede this access. CMS's goal to lower the cost of prescription drugs for seniors and people with disabilities is commendable, and Denali supports Medicare price negotiations that are fair and consistent. Our comments focus on the potential unintended harms from the most drastic changes proposed in the negotiation process. We suggest alternatives that we believe will better achieve our shared goal of encouraging innovation and managing the costs of medicines.

- The negotiation process could result in eroding incentives for biosimilar development from drastic price cuts when biosimilars will be launching competing alternatives.
- The negotiation procedures should not preclude our ability to choose the optimal modality for a given therapeutic approach. By favoring biologics over small molecules, the negotiation process could create perverse incentives that could ultimately limit new treatment options for patients.
- The negotiation process should encourage new and post-approval research and development in medicines for high unmet needs by fixing the orphan drug exclusion and including the full post-approval costs of research and development in the MFP calculations.

I. Denali Respectfully Requests CMS to Consider Comments on Section 30 of the Guidelines

Denali recognizes that CMS is not requesting comments on Section 30 of the Memorandum.⁴ However, given the significant and substantive impact of the final rules, Denali would have provided these comments to CMS if it had been given the opportunity.

II. The Earliest Timing of Selection of for All Medicines Should be 11 Years from Approval to Avoid Non-Medical Based Development Decisions

We encourage CMS to adopt a uniform, 11-year earliest selection timeline for all small- and large-molecule treatments, or in the alternative, lessen the impacts on small molecule drugs through the MFP negotiation process. In Section 30.1 of the Memorandum, CMS has stated that it intends to distinguish between medicines based on their approval pathways, i.e., NDA- vs. BLA-approved medicines. We note that there is no scientific or medical rationale for such a distinction. Furthermore, in addition to being arbitrary, this distinction risks creating negative incentives for developing NDA-approved medicines (i.e., small molecule medicines) that are badly needed for diseases of the brain that affect seniors. Small molecule treatments may freely penetrate

⁴ Denali respectfully requests that CMS reconsider its decision to issue final rules related to Section 30 of the Guidelines. Notice and comment procedures are required under the Administrative Procedures Act. See 5 U.S.C. § 553(b) (2023). CMS may evade this APA obligation only "in emergency situations, or where delay could result in serious harm." *Jifry v. FAA*, 370 F.3d 1174, 1179 (D.C. Cir. 2004). The Memorandum falls short of the high threshold needed to invoke the emergency situations exception. Instead, the Memorandum claims that CMS may issue final rules without the notice and comment procedures because of the "complexity of the preparation that must be undertaken in advance of the publication of the selected drug list by September 1, 2023." Memorandum at 2. This is insufficient. In fact, the D.C. District Court already has rejected complexity as a basis for good cause. See *Nat'l Venture Capital Assoc. v. Duke*, 291 F.Supp.3d 5, 18 (D.D.C. 2017) (rejecting complexity as a basis for good cause). CMS will have had more than a year since the IRA was enacted to promulgate rules before September 1, 2023. Good cause "cannot arise as a result of the agency's own delay." *Wash. All. of Tech. Workers v. U.S. Dep't of Homeland Sec.*, 202 F.Supp.3d 20, 26 (D.D.C. 2016), *aff'd*, 857 F.3d 907 (D.C. Cir. 2017). The reasons for avoiding notice and comment procedures in the Memorandum could expose CMS to prolonged litigation and uncertainty surrounding implementation of the IRA. Denali urges CMS to reconsider.

cells (important for therapeutic targets that are present only inside cells), can be manufactured cheaply, and can be given to patients orally. Disincentivizing small molecule program investment risks depriving patients of what might be the only or best treatment for their disease.

Eleven years is an appropriate timeframe for selection into the negotiation program. Although it would result in less than the typical 14 years of exclusivity generally afforded under U.S. patent protection, it would create a level playing field for therapeutics and would focus development decisions on the likelihood of a drug's success at treating a disease, rather than an arbitrary factor like its approval pathway.

III. The Orphan Drug Exclusion Could Create Disincentives for Post-Approval Development, Hurt Patient Access, and Increase Unproven Off-Label Use

CMS should not subject orphan drugs to the negotiation process after they are developed in additional indications. CMS proposes to limit the orphan drug exclusion to medicines that are only approved for one rare disease. This would discourage the development of the medicine in other indications, in order to avoid subjecting the product franchise to price negotiations. For example, a particular medicine may first be developed for amyotrophic lateral sclerosis (ALS), an orphan indication. Post-approval development of the medicine in other rare neurological indications, such as leukodystrophies, could be disincentivized under the rules because approval in the second indication subjects the entire product franchise to the negotiation process. Manufacturers will also be incentivized to make different decisions on sequencing indications and determining global launches, which could lead to reduced patient access to drugs that could potentially treat their disease.

Furthermore, any impediments to post-approval drug development of orphan drugs could lead to increased off-label use. Previous studies have demonstrated that off-label use of approved medicines can be very high, and that most off-label uses have little or no scientific basis.⁵ In other words, a substantial share of prescribing is not validated by FDA-regulated studies and is based on weak or no data.⁶ This type of off-label prescribing should not be encouraged. If manufacturers were incentivized to do post-approval development into a broad range of indications, then FDA-regulated data would become available to better guide physician prescribing and could reduce off-label use. Therefore, investment into FDA-regulated development of products covered by the orphan drug exclusion should be encouraged under CMS's Guidance. Regulated and expanded indications are good for patient safety and access and should not be punished.

The negative incentives discussed above could be mitigated by not subjecting drugs to the negotiation process after they are developed in additional indications. Alternatively, creating a level playing field for all medicines that includes selection at the earliest 11 years from approval, regardless of approval pathway, would help alleviate the concerns.

IV. MFP Calculations Should Consider the Full Research and Development Costs of a Medicine to Incentivize Rigorous Research and Development

Denali is concerned that the Guidelines' proposed limitations on recovery of costs do not consider the full cost of drug development. Section 50.1 of the Guidelines provides that a drug's maximum fair price ("MFP") would consider research and development costs of the Primary manufacturer for the selected drug, and the

⁵ Radley D.C., *et al.*, Off-label prescribing among office-based physicians, *Arch. Intern. Med.*, 2006;166(9):1021–6.

⁶ Sahragardjoonegani, B., *et al.*, Repurposing existing drugs for new uses: a cohort study of the frequency of FDA-granted new indication exclusivities since 1997, *J. Pharm. Policy Pract.*, 2021;14:3

extent to which the Primary Manufacturer has recouped those costs. As defined in the Guidelines, “Research and Development Costs” would explicitly exclude “costs associated with *ongoing* basic pre-clinical research, clinical trials, and pending approvals” (emphasis in original).⁷

Denali notes that the definition excludes important costs that should be included for negotiating the MFP. For example, the basic pre-clinical research period is defined in the Guidelines as beginning on the date of initial discovery of the drug, or when the rights to hold the NDA/BLA were acquired.⁸ However, this definition has the potential to exclude important costs into potential drugs in the same class that did not ultimately become the drug subject to the IND filing. This limitation in the definition could set up incentives to limit research in similar potential candidates, thus limiting the overall knowledge of the potential safety and therapeutic potential of the mechanism of action and the drug that is ultimately approved. Costs should include research and development costs of failed trials that did not lead to FDA-approved indications and should include ongoing safety and efficacy research costs post-approval.

The definition of abandoned and failed drug costs are defined, but the full value of the costs of research and development of drugs with the same mechanism of action should be included. For example, if the approved drug is the second such compound studied in the class, the costs should include the studies of the first compound even though the drug was not advanced, given that it contributed to the learning and development of the drug that ultimately became subject of the approved NDA or BLA.

The Congressional Budget Office recently issued a report that contained findings that state manufacturers make high levels of investment into drugs that don't make it to the NDA or BLA stage for a variety of reasons, but nonetheless contribute to the success of the approved drug product:

In recent studies, estimates of the average R&D cost per new drug range from less than \$1 billion to more than \$2 billion per drug. Those estimates include the costs of both laboratory research and clinical trials of successful new drugs as well as expenditures on drugs that do not make it past the laboratory-development stage, that enter clinical trials but fail in those trials or are withdrawn by the drugmaker for business reasons, or that are not approved by the FDA. Those estimates also include the company's capital costs—the value of other forgone investments—incurred during the R&D process. *Such costs can make up a substantial share of the average total cost of developing a new drug. The development process often takes a decade or more, and during that time the company does not receive a financial return on its investment in developing that drug.*⁹ (emphasis added)

The Guidance should reflect the reality and necessity of these investments that are broader than the one molecular entity that is subject to the NDA or BLA in order to incentivize the most rigorous research possible.

V. Drug Price Negotiations Should Not Undercut Healthy Competition from Generics and Biosimilars that Controls Drug Costs

The Guidance should create better incentives for healthy competition in the marketplace. Denali believes that strong patent and exclusive marketing rights, followed by healthy generic and biosimilar

⁷ Memorandum at 82.

⁸ Memorandum at 83.

⁹ Research and Development in the Pharmaceutical Industry, Congressional Budget Office, April 2021, available at <https://www.cbo.gov/publication/57025> (last accessed April 12, 2023).

competition at the end of exclusivity periods, are the best way to encourage the continued discovery and development of medicines for high unmet needs of patients. In fact, the generic and biosimilar market in the U.S. represents a healthy control on drug prices. From 2021-2025, it has been estimated that biosimilar medicines will have reduced drug spending in the U.S. by \$38 billion dollars and could be as high as \$124 billion dollars.¹⁰ To maximize these savings, companies need incentives to develop biosimilars. A typical biosimilar company will invest between \$100-300 million dollars over 10 years to launch a biosimilar medicine.¹¹ Companies are only willing to take that risk if there is a potential for profit after approval. Yet, the biosimilars industry sees the IRA as eliminating incentives. According to one biosimilar leader, under the IRA, the U.S. market could “see the price of the brand biologic cut by 60% by the Department of Health and Human Services. That would eliminate some, if not most, of the investment made by developers to make more affordable medicines available to patients. Given the uncertainty around what drugs the government could decide are subject to price negotiation, biosimilar development could be forestalled for dozens of medicines. The overall effect would be more branded drugs maintaining their monopolies for longer.”¹²

Denali appreciates the opportunity to provide comments on the Guidelines and CMS’s consideration of our comments as the Drug Price Negotiation Program policies are developed. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and successfully, in a way that incentivizes research and development into medicines for high unmet medical needs and improves patient access to medicines. Please feel free to contact one of us if you have any questions regarding our comments.

Respectfully Yours,

Denali Therapeutics Inc.

IRAREbateandNegotiation@cms.hhs.gov

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Design Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Design Therapeutics is pioneering the field of small molecule genomic medicine, which holds the potential to safely and effectively deliver meaningful benefit to patients suffering with serious genetic disorders. Our novel small molecule therapeutic candidates called gene targeted chimera or GeneTAC™ molecules target the underlying cause of inherited genetic diseases. Through our proprietary GeneTAC™ platform, we can design and develop therapeutic candidates that dial gene expression up or down without requiring gene editing.

The development of drugs to treat genetic disease had been focused on novel complex modalities such as gene therapy, gene editing, and antibodies, which are large biologics. But through our GeneTAC™ platform, we have shown the ability to effectively target and modulate expression of specific mutated genes that cause serious disease. Our lead compound for the treatment of Friedreich ataxia (FA), a rare inherited, degenerative disorder that leads to permanent disability and shortening of life span, entered the clinic in 2022. Initial findings from our Phase 1 clinical trial in people suffering with FA indicate that our FA GeneTAC™ molecule could indeed restore transcription of the mutated frataxin gene, thus providing proof of mechanism for this novel modality. We plan to bring our second GeneTAC™ development candidate into the clinic to treat Fuchs endothelial corneal dystrophy (FECD), an inherited genetic disorder that leads to degeneration of the cornea and vision impairment in approximately 4% of people over 40 years of age. Currently, therapeutic options for FECD rely on corneal surgery for individuals with more advanced disease, leaving the majority of patients without treatment for years, sometimes decades. The FECD GeneTAC™ small molecule now under development for topical ocular delivery (eye drops) has been shown in *in vitro* studies to block transcription of the mutant gene, the root cause of the disease, potentially slowing or reversing visual impairment.

GeneTAC™ small molecules are able to overcome major limitations found in large biologic medicines, such as delivery into the brain and heart (relevant for treating FA) and the cornea (relevant for FECD), and can be formulated for different routes of administration, and optimized through medicinal chemistry toward favorable pharmaceutical properties. Like other small molecules, GeneTAC™ molecules can be tailored to a desired effect and tolerability, and do not result in irreversible genetic modifications (e.g., from gene editing and gene therapy).

We believe there is vital importance to continue and foster deployment of R&D resources and investment toward developing novel small molecule genomic medicines and afford protections and commercial exclusivity at similar levels afforded to that proposed in the IRA for biologics products.

The following are comments on specific provisions in the IRA which we believe will directly impact the development of potentially transformative novel small molecule genomic medicines toward a successful NDA and commercialization.

- I. **Provision (30.1):** Medicare negotiation for NDA-path drugs at only nine-years post-launch significantly disadvantages small molecules like the ones we are developing when compared with biologics and makes it more difficult for us to raise the capital necessary to fund their development. We urge you to work toward creating parity between small molecules and biologics by allowing small molecules the same 13-year exclusivity window as biologics. Progress in diseases like FA and FECD (not to mention Alzheimer's, heart disease, many cancers, etc.) relies on our and others' ability to attract funding for small molecule drug candidates. The current distinction could skew investment toward biologic drug development, complex modalities like cell and gene therapy, and away from diseases that have comparable healthy impact on Medicare populations.
- II. **Provision (30.1.1):** To be considered for the orphan drug exclusion, the drug or biological product must (1) be designated as a drug for **only one rare disease or condition under section 526 of the FD&C Act** and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition. This may limit our ability to explore additional uses for drugs that could help multiple orphan diseases like FA because they would no longer qualify for an exemption from price negotiation under the IRA. This prevents companies from trying to treat multiple orphan diseases with drugs that have already overcome a narrow funnel of early development, avoiding duplication of development costs and development risks, and hampers orphan drug development. With recent scientific breakthroughs (e.g., including potentially transformative novel drugs being developed at Design Therapeutics), small molecules are just as promising for treating serious diseases and therefore should receive the same considerations by CMS.
- III. **Provision (50.2):** Cost-effectiveness math embraced by ICER in the US and other HTA bodies elsewhere (e.g., NICE in the UK) is so simplified that it excludes many demonstrable benefits of medicines resulting in extreme underestimations of the value of new medicines. This math can then serve as an excuse for plans to refuse coverage, telling patients that the medicines aren't worth their prices instead of admitting that the plan just doesn't want to pay. Specifically, direct, and indirect costs as a result of an FA or FECD diagnosis exceeds costs circumscribed to select symptoms used for value calculations by CEAs. For example, FA is a progressive, disabling disorder that limits mobility starting in the second decade of life, and eventually requires the use of wheelchairs and other assistive devices. A therapeutic intervention that targets the cause of the disease, such as the one being developed by Design, has the potential to slow disease progression, reverse some symptoms and, if deployed early, prevent development of symptoms. A novel, transformative therapeutic like this could not only reduce disease symptoms and patient burden, but also substantially reduce need for caregiver services (be it from family or professional), allow a person with FA to complete their education and obtain/keep a job, etc. Further, a more effective treatment of FA could reduce costs associated with increased healthcare utilization (to manage a myriad of disease complications), loss of productivity due to the need for a caregiver, household accommodation to adapt to

disabilities, etc. In the case of FECD, progressive visual impairment can limit daily activities for years before patients are eligible for a surgical intervention (currently the only available treatment), which has its own risks and costs. Visual impairment affects mobility, ability to work, live independently, etc; each of which adds not only to direct patient suffering but also substantial costs to mitigate limitations imposed by visual impairment.

Instead of assessing overall costs associated with a particular disease, thus better assessing the true potential overall value of a novel, more effective therapeutic, ICER-like CEA utilizes assessments with over-simplified math that undervalues certain groundbreaking drugs. Considering that novel drugs will eventually go generic (e.g., many psychiatric and neurological drugs, most antibiotics, cardiovascular medicines, etc.) and will continue to keep us out of hospitals and nursing homes, costs of which do not “go generic”, ICER-like CEA talks society out of paying a finite mortgage for a drug even though the alternative is paying a rising rent forever. Undervaluing potentially transformative new drugs would signal to investors that the value of new medicines will be willfully underestimated and that their development will not be rewarded, which will turn investors away from funding biomedical R&D, locking us into today’s standard of care and the rising cost of hospitals and nursing homes.

- IV. **Provision (40.2.2):** CMS prohibitions on data disclosure and destruction of related documents make it impossible for companies to understand which value components CMS measures to determine MFP. Transparency is important so we can understand how CMS considers what is a “fair price.” We also worry that if CMS were to impose this kind of restriction, we would be unable to inform our board and the investor community about the negotiation process so they can make informed decisions about the future of drug development.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact me by telephone at (858) 692-5081 or by e-mail at jsiffert@designtx.com if you have any questions regarding our comments.

Sincerely,

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure:

We are writing to comment on the initial guidance, entitled: “Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments” (Guidance), published on March 15, 2023, by the Centers for Medicare and Medicaid Services (CMS). The Guidance addresses the implementation of sections 11001 and 11002 of the Inflation Reduction Act (IRA), which establishes the Medicare Drug Price Negotiation Program (Negotiation Program) to negotiate maximum fair prices (MFPs) for certain high-expenditure, single-source drugs and biologics. The Guidance provides further detail about CMS’s intended implementation of the Negotiation Program and solicits stakeholder feedback on specific issues surrounding this program, including the negotiation factors, how CMS will determine its pricing offer to a drug manufacturer, the negotiations process, and others.

While Congress exempted the IRA’s implementation from a requirement for a formal notice-and-comment rulemaking process, CMS has described in the Guidance a process for timely public input on how the MFP for a drug will be determined. We appreciate CMS’s efforts to solicit comments on most aspects of the Guidance pertaining to the implementation of the Negotiation Program, which has a tight statutory timeline for initial application in 2026.

The Robert J. Margolis, MD Center for Health Policy at Duke University (the Duke-Margolis Center or the Center) generates and analyzes evidence across the spectrum of health policy with the goal of improving health care, health, and health equity while avoiding unnecessary costs. A core mission of the Center is to focus on increasing the value of biomedical innovation to patients. As part of these efforts, we study the design, implementation, and feasibility of value-based payment (VBP) arrangements for medical technologies, which shift away from payments based on volume and promote payments based on the impact of the treatment. These approaches include payments linked to better evidence and outcomes, and “subscription” or population-based payments, for biomedical technologies, complementary to shifts in payments to health care providers that are similarly linked to improving outcomes and decreasing total medical expenditures. The suggestions below are informed by the Center’s experience and research in developing approaches to payment reform that support better evidence and outcomes for patients and better value across the system; in analyzing the impact of the current legal and regulatory environment on their adoption; and in working with multiple stakeholders to address the operational

challenges to their use. They are also informed by the collaborative work of the Center's Value for Medical Products Consortium (the Consortium), and by the work of the Center's Real-World Evidence (RWE) Collaborative, but may not represent the opinions of every member of these collaborations. Our Consortium and/or RWE Collaborative members are in many cases providing their own comments on behalf of their organizations.

Our comments reflect Duke-Margolis's independent analyses of the Guidance and recent work undertaken by the Consortium and the Collaborative. Our recommendations describe opportunities for CMS to refine the Guidance in light of considerations related to RWE and the use of quality evidence, program integrity and transparency, and arrangements that align drug payments with their observed value. An overarching theme in our comments is the importance of implementing the Negotiation Program in a sustainable way for years to come despite the substantial requirements with limited time statutorily imposed on CMS. To this end, we suggest that CMS lay out a clear *initial* framework for how it intends to carry out MFP determinations while also describing a pathway for refinements over time as experience with the program grows beyond Price Applicability Year 2026. Specifically, our recommendations are for CMS to:

1. Implement a clear framework for assessing comparative effectiveness and translating such analyses to prices
2. As part of this framework, describe how real-world evidence development, including evidence related to additional indications, will impact CMS's MFP determinations
3. Develop mechanisms to facilitate alternative payment arrangements for drugs that accomplish the intended goals of the IRA
4. Clarify how the manufacturer-specific factors will be used to guide the MFP, and collaborate to support accurate and efficient data collection
5. Clarify additional considerations for implementing the Negotiation Program

Our detailed comments are as follows:

Implement a clear framework for assessing comparative effectiveness and translating such analyses to prices

As described in the Guidance, CMS intends to consider evidence about therapeutic alternatives for a drug selected for price negotiation through an evaluation of the body of clinical evidence by considering factors in two areas: outcomes and safety. This evidence review will be informed by evidence submitted by members of the public, including drug manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties. CMS also intends to conduct its own literature review as part of this evidence review, prioritizing research that is methodologically rigorous. CMS intends to consider research on, and RWE relating to, Medicare populations as particularly significant to its assessment. CMS will place significant weight on assessing whether the drug fills an unmet medical need, which CMS defines as treating a disease or condition in cases where very limited or no other treatment options exist. CMS will then use this assessment of comparative effectiveness to adjust the initial price it set for the drug, which will generally be the net price of the closest therapeutic alternative in Medicare. CMS

should clarify its methodology for setting the initial price in case there are multiple therapeutic alternatives (for example, via some type of weighted average).

The Guidance provides a thoughtful overview of how it will consider evidence about therapeutic alternatives and the evidence assessment's impact on the determination of the negotiated price. The final guidance should build on stakeholder comments, including ours, to provide a more detailed framework that encompasses the major comparative effectiveness considerations, including how evidence and stakeholder engagements would contribute to the overall evidence assessments concerning the drug and its alternative treatment(s). CMS proposes a very broad and flexible "qualitative" approach which involves *"adjusting the starting point upward or downward relative to the clinical benefit offered by the selected drug compared to its therapeutic alternatives."* The agency also suggests that it wants to retain broad discretion regarding the evidence it will consider for setting the MFP, stating that it intends to consider a range of evidence types pertaining to the selected drug's therapeutic alternatives from a range of stakeholders, including evidence submitted by the public and patient-reported data, giving itself substantial flexibility to consider evidence from a variety of sources.

Such flexibility and broad discretion are understandable, especially for a new program facing a complexity of factors under a tight implementation deadline. However, flexibility also means uncertainty about how different types of evidence and contributions will matter (or not) in the assessment and the final MFP determination. Uncertainty will result in less effective investment and less investment in developing evidence that could improve the understanding of a drug's comparative effectiveness and thus its impact and use in Medicare beneficiaries. To encourage investment in drugs and supporting evidence that matter for Medicare beneficiaries, CMS should develop a plan for implementing an increasingly clear and rich framework for how different kinds of comparative effectiveness assessments will be integrated. Along with transparency about how it applies this qualitative framework to assessments over time, the assessment framework will become clearer and more robust with additional experience, potentially encouraging more drug development and supporting evidence development in ways that demonstrably improve outcomes and safety for Medicare beneficiaries.

To start this process, CMS should do more now to describe an initial guiding qualitative framework that will clarify the dimensions of comparative effectiveness that it will consider, how it will weigh different kinds of potentially relevant evidence (including RWE), and what evidence would lead to upward or downward price adjustments (including whether additional product improvements or indications could lead to upward adjustments, as we discuss further below).

As the IRA gave CMS considerable flexibility in how to incorporate comments and experience in the implementation of the price negotiation, CMS could describe the most important aspects of its comparative effectiveness assessments that should be detailed now and what aspects will require additional time and experience with the Negotiation Program implementation to help achieve better clarity. This more explicit Negotiation Program framework should describe how CMS intends to treat various evidence types in this process and lay out a framework for how the agency will engage with, and consider evidence from, different types of publicly reported studies and other submissions from stakeholders to support predictable, reliable assessments of comparative effectiveness.

For example, according to the Guidance, the use of RWE in its comparative effectiveness assessments may include evidence generated from patient-reported outcomes (PRO) data. In fact, value assessments that can systematically describe real-world value through PROs derived from electronic medical records or other RWE sources can address uncertainty around the real-world value of any drug under comparison,¹ but meaningful PRO studies can be costly to implement reliably. CMS could begin by describing PRO evidence likely to be most relevant to assessments in therapeutic areas that will be included in early negotiations, solicit further comments (and rely on existing tools and examples to incorporate PRO data) to help clarify how it will consider such evidence, and then provide transparent summaries of how such evidence contributed to the early assessments. Over time, this process would provide an increasingly clear and rich framework on how PRO-related evidence impacts CMS's qualitative assessments, which will drive more effective investment in relevant studies that include PROs.

CMS could create an initial “dashboard,” and refine it over time, to track and characterize key potential dimensions of the drug's impact on outcomes and safety that influence its assessments. Such a dashboard should focus on dimensions that matter to beneficiaries and improving health equity, goals that align with CMS strategic priorities and measures across its Medicare payment programs. This would help improve clarity about the basis for MFP determinations, and help guide input from beneficiary, consumer groups, and other stakeholders, to help CMS achieve its stated goals for the program. Below we provide additional suggestions for the use of such dashboard by CMS in the context of the other factors that it will consider in setting the MFP, as well as tracking the potential broader impacts that the Negotiation Program could have on drug access and innovation.

In developing its initial qualitative framework for comparative effectiveness and associated key metrics, CMS can draw on experience in the United States and elsewhere to describe how its comparative effectiveness assessments will inform a drug's price relative to its comparator. Several countries, such as France and Germany, use qualitative frameworks to integrate evidence on the comparative benefits and risks of alternative treatments in their drug price negotiations. These countries use scoring systems that rate the level of the “added benefit” the drug in question provides over a comparator product, and each level is typically tied to a range of payment adjustments. Some private payers use similar approaches.

This qualitative framework can also provide increasingly clear guidance on how CMS will consider the strength of evidence for the added health benefit, as described above, by prioritizing methodologically rigorous research. For example, the Institute of Clinical and Economic Review (ICER) assigns a level of certainty to its evidence finding, combining the magnitude of the comparative benefit with the level of certainty in the existing body of evidence for a drug. (In contrast to CMS's stated goal, Germany's framework appears to place most weight on more traditional randomized clinical trials, not other types of RWE; we support CMS's emphasis on RWE especially since its framework will be applied years after a product reaches the market.) Here, CMS could describe the kinds of evidence (and strength) likely to achieve the statutory ceiling price for a drug that presents a substantial clinical benefit compared to its

¹ Wu AW, Kharrazi H, Boulware LE, Snyder CF. Measure once, cut twice--adding patient-reported outcome measures to the electronic health record for comparative effectiveness research. *J Clin Epidemiol.* 2013 Aug;66(8 Suppl):S12-20. doi: 10.1016/j.jclinepi.2013.04.005. PMID: 23849145; PMCID: PMC3779680.

alternative treatment(s) in a relevant therapeutic area, while creating various payment “tiers” below the statutory ceiling for drugs demonstrating various levels of evidence short of a major improvement.

Similarly, CMS could describe the kinds of limited differences in meaningful outcomes and safety that would not support additional payment compared to a less expensive treatment. The comparative effectiveness methods CMS will use should provide increasingly clear illustrations of how to integrate differential impacts in the different dimensions of outcomes that may matter to patients, and how much any given difference in outcomes that matter would increase or decrease a selected drug’s “price category” from the price of its therapeutic alternative.

In addition to a pathway to an increasingly detailed qualitative framework, and a growing set of summary reports on implemented cases of price negotiation, CMS could provide more clarity to involved manufacturers through regular opportunities for manufacturers to consult early with CMS – beginning soon after a potentially relevant product comes to market and perhaps even before, in the pivotal trial design and implementation stage. CMS should also consider opportunities for input from a broad range of stakeholders to help flesh out its framework in particular relevant therapeutic areas. Especially in the early stages of Medicare price negotiation, these steps will help reduce uncertainty and generate the evidence and drug investments aligned with CMS broad goals. Food and Drug Administration (FDA) programs that provide regular and predictable meetings and public engagement opportunities have been very helpful for supporting investments by product developers in efficient and effective evidence development for products to demonstrate whether they meet FDA safety and effectiveness standards. Such programs could be similarly helpful here.

We note that, because these comparative effectiveness systems do not assess the evidence on benefits relative to costs, they will not clearly and easily reduce to a single-dimensional measure like cost-effectiveness. CMS comparative effectiveness methods must therefore consider how to integrate differential impacts in the multiple dimensions of outcomes that may matter to patients, and how much any given improvement in outcomes that matter should impact price. To augment its qualitative analyses, CMS could describe how particular quantitative assessment methodologies (other than quality-adjusted life years, or QALYs) could inform its qualitative framework. Potentially useful quantitative comparative effectiveness metrics such as equal value life years (evLY) have been developed to address concerns of potential discrimination from the use of QALYs.

Finally, price differences may well be anchored to quite different pricing or value levels across different therapeutic classes, even if CMS describes a clear and consistent basis for assessing an MFP relative to a reference product across different therapeutic areas. CMS should monitor whether such differences emerge, and develop ways to address them over time. This makes it even more important for CMS to continue to work toward transparent and predictable methodologies for tying its findings on comparative clinical benefits to its price determinations. A clear framework with a path toward greater clarity will lead to a smoother implementation of the Negotiation Program by reducing stakeholder misperceptions, increasing program stability from administration to administration, and encouraging better evidence development while preventing avoidable impacts on innovation and access.

The implementation burden for CMS in the coming months and years is substantial, and the agency has sought to quickly build its internal capabilities to carry out the Negotiation Program. Alongside CMS's internal implementation capabilities that it has been recently ramping up, CMS could contract the comparative effectiveness assessment process out to an independent organization or entity that would specialize in such activities, with the development of transparent methodologies and technical expertise, as needed. CMS could also support or encourage evaluations from multiple organizations with the goal of more robust assessment.

As part of this framework, describe how real-world evidence development, including evidence related to additional indications, will impact CMS's MFP determinations

Until now, formal health technology assessments (HTAs) of drugs have focused on new products, to help guide initial payer and manufacturer negotiations about coverage and payment. These assessments must rely mostly on premarket evidence, particularly from randomized controlled trials (RCTs). They often include only limited evidence on comparative effectiveness and impacts in real-world populations and conditions of use, and in particular, on diverse subgroups of patients and "off-label" uses, as such questions are not well suited to be answered through traditional RCTs in academic settings. Evidence from well-controlled studies is essential for FDA approval. But such premarket studies generally leave the important real-world questions for Medicare and other beneficiaries unresolved. Consequently, drugs are usually approved with quite limited evidence on comparative effectiveness, with limited evidence on potential impacts in different types of patients, and naturally, with limited prescriber experience. Drugs may be marketed in narrower indications that expand over time, with peak revenues coming some years after the drug's initial adoption. Many drugs have had important indications added long enough after initial marketing, typically five to six years after approval, but sometimes later.² Many drugs are also used "off-label," without such regulatory-grade evidence.

Because the CMS price negotiations will apply to drugs and biologics that have been on the market for at least 7 and 11 years, respectively, CMS has a critically important opportunity to encourage and support the development of much better RWE, both well-designed observational studies and real-world randomized trials (such as clinical trials embedded in routine practice with simpler data collection). To do so, CMS will need to provide more clarity that these types of evidence will have a significant impact on decisions, and provide some illustrative examples of the kinds of studies that would be impactful, just as we have described for the overall CMS comparative effectiveness framework.

More specifically, CMS should provide illustrations of the kinds of RWE that will impact comparative effectiveness and how it will weigh the quality and methods of RWE. There are extensive experiences and frameworks to draw on for this work, both in terms of how RWE can impact key dimensions of comparative effectiveness and how to consider data quality, as well as confounding variables and resulting biases. For example, several international HTA bodies have developed recommendations concerning the use of RWE in comparative effectiveness assessments that may be useful for CMS to

² Sahragardjoonegani B, Beall RF, Kesselheim AS, Hollis A. Repurposing existing drugs for new uses: a cohort study of the frequency of FDA-granted new indication exclusivities since 1997. *J Pharm Policy Pract.* 2021 Jan 4;14(1):3. doi: 10.1186/s40545-020-00282-8. PMID: 33397471; PMCID: PMC7780607.

consider. The United Kingdom’s National Institute for Health and Care Excellence (NICE) published a study design and analysis framework³ for using various types of non-randomized real-world studies in comparative effectiveness evaluations. This framework includes study eligibility criteria that mimic a hypothetical pragmatic trial, comparator requirements, defined follow-up period guidance, and ways for addressing bias and confounding with a detailed analysis plan to describe how the causal effect of interest is to be estimated. The FDA has also published a series of guidances on the use of information from routine clinical practice to derive “fit-for-purpose” RWE to inform its evaluations of product effectiveness.^{4,5}

We understand that the development of a detailed framework is a substantial undertaking. However, CMS could support an iterative process to implement and refine its own framework that would detail how RWE should be used by drug manufacturers as a potentially major part of relevant evidence for the key dimensions of outcomes and safety in its overall comparative effectiveness assessment. This would describe the major kinds of RWE that would be considered—for example, providing guidance on observational target trial approaches and practical randomized studies. It should also discuss ways for ensuring data quality and that data is fit-for-purpose, and ways to address confounding and biases in real-world studies (e.g., use of negative controls). CMS should also describe how the initial (relatively broad) guidance could be refined through further comments and experience—including CMS’s transparent summary of the impact of RWE on each comparative effectiveness assessment.

In particular, CMS should also provide additional clarity on how it intends to treat postmarket studies that add value to a drug through, for example, new formulations and delivery systems that increase patients’ ease of use and thus improve outcomes, and whether such product improvements could lead to upward price adjustments. In fact, the Guidance potentially creates a chilling effect on the development of new product modifications through its expansive definition of “Qualifying Single Source Part D Drugs” (QSSDs), which effectively aggregates all drug versions based on the drug’s active ingredient/moiety, including different New Drug Applications (NDAs) and Biologic License Applications (BLAs), for the purpose of price negotiations, based on the date of the introduction of the first-approved product. We understand that the definition of QSSD is not open for public comment. However, to minimize any adverse effects on the development of important RWE that can add significant value to a selected drug, CMS could clarify what types of evidence it will encourage in this context and whether and how such additional evidence related to product improvements could yield a higher MFP for the negotiated product “group.”

By providing a clearer pathway for implementing and completing RWE studies, and relying on their results, CMS could help shift manufacturer investments toward needed RWE and also reduce delays in drug access for patients who might benefit from this additional evidence generation. For example,

³ “NICE Real-World Evidence Framework,” Published June 23, 2022, <https://www.nice.org.uk/corporate/ecd9/chapter/methods-for-real-world-studies-of-comparative-effects>.

⁵ Food and Drug Administration, “Real World Data: Assessing Registries to Support Regulatory Decision-Making for Drugs and Biological Products,” November, 2021, <https://www.fda.gov/media/154449/download>

collaborations with The National Patient-Centered Clinical Research Network (PCORnet), which can be used for manufacturer-supported studies, can accelerate RWE studies on important safety or comparative effectiveness questions. Specific collaborations are likely to be possible across different therapeutic areas, building on a range of RWE platforms and resources.

Because RWE generation is often a lengthy and challenging process, it would be helpful for CMS to consider ways in which it can help accelerate the completion of these studies that tend to be more reflective of important Medicare subgroups than traditional RCTs. For example, CMS could facilitate the timely use of CMS data. It could also provide payment incentives for certain data reporting or quality improvement payment adjustments for developing evidence on comparative effectiveness and safety for treatments that are potentially important for the well-being of Medicare beneficiaries. This will likely be a “work in progress” in the early years of the Price Negotiation Program, which is all the more reason to provide a more detailed path forward for how it could be developed.

The IRA is being implemented at an important time in terms of closing these evidence gaps through postmarket, “real-world” evidence. The potential to learn more about drugs after they are on the market is growing, with increasing use of richer digitized and interoperable data, and progress in such areas as precision medicine, postmarket trial platforms, and statistical methods using increasingly rich data. Indeed, CMS has emphasized the goal of enhancing such evidence development to support care for Medicare beneficiaries. However, it is possible that the IRA may have a potentially adverse effect on the use of RWE to inform how to use drugs effectively once they are on the market through label expansions because it may reduce the drug’s price for newer indications that have not yet been on the market for 7 or 11 years (the timeframe for selecting drugs for negotiations for small molecule drugs and biologics, respectively).

CMS should therefore clarify whether and (at least qualitatively) how much the MFP could rise, or if it would be possible to implement a differentiated MFP for the additional indication (something which seems unlikely based on the Guidance) in the event of postmarket label expansions or, since label expansions can take some time, completion and publication of meaningful postmarket studies related to additional populations. Further work by the FDA and other health care stakeholders to clarify faster paths and additional opportunities for timely RWE studies—an area of considerable FDA activity and bipartisan Congressional interest—would encourage and enable product developers and other researchers to contemplate and plan for the systematic execution of such studies to obtain results faster and more efficiently. In addition to providing advance clarity on the Negotiation Program’s expected impact on drug indication expansions, we recommend that CMS support these activities, particularly in instances where postmarket surveillance and/or RWE studies (e.g., point-of-care or pragmatic trials) can support the generation of RWE that is highly relevant and valuable to the Medicare and Medicaid programs and their beneficiaries.

Develop mechanisms to facilitate alternative payment arrangements for drugs that accomplish the intended goals of the IRA

Alternative payment arrangements for drugs, such as subscription or outcome-based payment arrangements, have been proposed and implemented as a mechanism for increasing the health impact

and the value of pharmaceutical products. These models shift from a fee-for-service (FFS) payment structure with high unit prices to payments designed for increased uptake and impact on utilization and outcomes. The implementation of VBP arrangements for drugs might be meaningfully viewed on a spectrum, beginning with payments that remain FFS-based but that are adjusted based on expected value, as determined by existing evidence (e.g., indication-based pricing). Payments with larger shifts from FFS include outcome-based contracts that link payments to a product's actual performance or demonstrated value in a patient or a population, and extend to per-member per-month or whole population "subscription" payments that are not related to the volume of sales at all but rather to access and outcomes in a population.

The IRA could impact adoption of such innovative payment models, which in principle are highly aligned with the IRA goal of lower per-unit drug prices, but also with the equally important goal (from a beneficiary perspective) of increased access and uptake by beneficiaries who would be expected to have better outcomes with the use of the drug – including those who face nonfinancial barriers to access. For example, even though we have more low-cost, effective drugs for heart disease, diabetes, and behavioral health conditions than ever before (with more coming), rates of underdiagnosis and undertreatment remain high, particularly for lower-income and minority populations. CMS should take steps as part of the IRA's implementation to avoid barriers to the development of alternative payment models for drugs, and potentially to encourage them, since their intent is fully aligned with CMS's goals for the IRA as well as for payment reform more broadly in Medicare.

For example, Medicaid Best Price has often been cited as one of the key obstacles for manufacturers to enter into VBP arrangements with payers because providing a substantial rebate to a single commercial payer could require them to extend the same rebate to the entire Medicaid program. Recently-implemented CMS policy changes created Medicaid Best Price flexibilities, such as by allowing manufacturers to report "Multiple Best Prices"⁶ to address these concerns and spur more VBP in the commercial market. Similar concerns may be raised in the context of the impact of VBP arrangements on Medicare MFPs. We believe we can expect less disruption for VBP arrangements from the IRA requirements *so long as such arrangements remain a relatively small part of the market*. Unlike Medicaid Best Price, where a bad result for a single patient in a single contract could potentially reset Best Price for the entire Medicaid market, the prices leveraged in the IRA to determine the ceiling price (such as non-Federal average manufacturer price, or non-FAMP, and Average Sales Price, or ASP) are weighted averages that will be less influenced by low payments in alternative payment models. Furthermore, if a negotiated drug's ceiling price is based on its gross price (i.e., the non-FAMP, which does not include payer rebates), manufacturers and payers may have some flexibility to implement alternative payments via adjusting list prices and rebates without disrupting non-FAMP and thus MFP ceiling calculations.

However, in some cases, alternative payment models for drugs may have advantages over "FFS" drug price reductions alone—and thus could become a larger part of the market. For example, "subscription

⁶ Center for Medicare and CHIP Services, CMS, "Medicaid Drug Rebate Program Notice for Participating Drug Manufacturers, Technical Guidance—Value Based Purchasing (VBP) Arrangements for Drug Therapies Using Multiple Best Prices," March 23, 2022, <https://www.medicaid.gov/prescription-drugs/downloads/mfr-rel-116-vbp.pdf>.

models” that pay for drugs on a population and not per-unit basis could be better aligned with CMS-driven shifts in payments to health care organizations on a risk-adjusted, per-person basis. If payments are further linked to population outcomes (e.g., lower disease complication rates and lower total costs of care – including both drug and non-drug costs), these incentives have the potential to encourage manufacturers to collaborate with providers to further expand access to drugs in ways that are beneficial to patients as well as payers. For example, the administration is encouraging such drug payment reforms to increase access and uptake of curative treatments for hepatitis C infection.

CMS should clarify how alternative payment models for drugs that achieve better outcomes and lower total spending compared to FFS drug payments can be encouraged under the IRA. These arrangements, meant to have a substantially lower price per unit and substantially higher use compared to baseline FFS drug pricing models, could involve a low effective unit price linked to certain steps by drug manufacturers in collaboration with providers, such as outreach to patients who could most benefit from screening and drug treatment. Manufacturers could also receive additional “shared savings” payments when costly complications and non-drug spending for these patients are reduced. If widespread enough, these approaches could reduce the ceiling MFP, even though they lower total health care costs and advance Medicare’s strategic goal of providing more coordinated, accountable care for all beneficiaries.

To address these potential challenges, CMS should consider a regulatory safe harbor or other clarifications for well-designed alternative payment models when the combined drug pricing and access reforms would lead to significantly lower unit drug prices coupled with much higher utilization. CMS should only apply this approach when the manufacturer (and any participating Medicare Advantage or Part D plan) provide clear evidence that per-unit drug net price will be significantly lower than under FFS, with the same or a lower expected unit price than would occur through the MFP, and that, in conjunction with manufacturer, provider, and payer steps (e.g., less or no utilization review) to increase uptake and improve patient outcomes, outcomes will be better as a result of higher utilization with lower total costs of care.

There is a strong policy rationale for exploring these arrangements because they provide incentives for drug manufacturers to work with payers and providers to increase drug access in ways that improve patient outcomes. These payment approaches should also become more attractive under the IRA, since, for the reasons described above, it would provide a pathway for the manufacturer to ramp up sales and reach additional populations faster – but with clear accountability that the increased utilization improves beneficiary outcomes and total Medicare spending.

For the reasons described above, we propose that CMS consider a regulatory safe harbor or similar explicit steps to highlight and encourage such alternative payment arrangements for drugs. In the absence of an exemption for such arrangements that lower total spending, manufacturers could be deterred from implementing alternative payment arrangements with payers and providers who are accountable for total costs of care, despite the alignment of these reforms with overall CMS goals.

Clarify how the manufacturer-specific factors will be used to guide the MFP, and collaborate to support accurate and efficient data collection

After considering the selected drug's price of alternative treatment(s) and its clinical benefit compared to the alternatives, CMS will move to consider a range of manufacturer-specific factors listed in the IRA. These factors include the drug's research and development (R&D) costs, production and distribution costs, revenue and sales volume, patent and regulatory exclusivity protections, and prior federal funding of R&D. Unlike CMS's comparative effectiveness determinations, these factors are not reflective of the selected drug's value, but instead consider its revenues versus its associated costs. This approach has been used less widely in drug price negotiations, and so it would be helpful to implement a stepwise approach to help assure the benefits in terms of reasonable and significant adjustments in the MFP outweigh the potentially costly and complex data collection and analysis.

The IRA provides little detail on how these factors would impact CMS's pricing offer to a manufacturer. Consequently, to limit concerns about cost and uncertainty about potentially valuable investments in drugs, CMS appears to have broad discretion in deciding how to weigh these various data elements when making its pricing offer to the manufacturer. In the Guidance, CMS provides some insight into how these factors could directionally impact the price following the conclusion of the comparative effectiveness assessment. To prevent legal and perception risks, CMS should outline a clear, predictable, and transparent process that would describe how all these factors would be integrated to inform the price negotiation offers and counteroffers. This process should prioritize clarifying data provision and incorporation in MFP calculation based on the likely importance of the factor and the ease of obtaining reliable data to determine impact.

For example, a longer period of market exclusivity for a selected costly drug has a major impact on its revenues; as a result, how CMS considers remaining patent life is likely have a significant impact on the MFP determination. Consequently, CMS should consider prioritizing efforts to distinguish "clinically meaningful" secondary patents from those that were awarded for inventions that add little significant benefit to patients. Related, the agency should prioritize clarifying the standards it will be using to determine when a selected drug's remaining patent life is "too long" to warrant a downward price adjustment.

Conversely, R&D costs and public support for R&D are more challenging to consider and factor into decisions, and at least in many cases, may have less impact on the MFP. First, the cost of capital will be difficult to determine (and could be quite high in the early stages of product development). Furthermore, a manufacturer may not even know the level of private investment in the selected drug if it acquired it from another company, which is the case for most drug products. Further, if a product was acquired, the expected value of any previous public investment was presumably incorporated in the acquisition price, meaning that it was the initial developer and not the acquirer who benefitted financially from said government support.

Finally, the agency plans to rely on several proprietary data elements submitted by the manufacturer in making its pricing adjustments, while maintaining transparency at the same time. It would be helpful for the agency to clarify how much of the negotiation process will be subject to public transparency and

how it intends to explain the MFP without sharing any proprietary information in the event that proprietary factors played an important role in its pricing decision. Providing a clear and detailed summary of the reasons for a final MFP determination, while protecting proprietary information, will be critical for the Negotiation Program's predictability and public support over time.

Clarify additional considerations for implementing the Negotiation Program

Especially in the early years of the Negotiation Program, some enforcement discretion from CMS on implementing the MFP may be appropriate to avoid adverse effects from MFP application. Potential examples where CMS may wish to use its enforcement discretion and exempt a selected drug from MFP application may include the following, non-exhaustive list of examples:

1. A selected drug's comparative effectiveness assessment clearly yields a price that is significantly higher than the MFP ceiling. The drug's manufacturer is also planning additional RWE development and product modifications that will lead to greater patient benefit. Applying the MFP in this case would limit incentives for further evidence and product improvements if the selected drug's price cannot exceed the ceiling. Additionally, in this case, the manufacturer-reported factors do not lead to a price decrease (for example, the manufacturer has incurred high R&D costs with no prior government support, the drug has a short remaining patent life and high costs of production and distribution).
2. An orphan drug exempt from price negotiations as per the IRA's requirements seeking to pursue label extension studies for additional indications. Such studies, which could benefit patients, might not occur given that expanding to additional indications would eliminate the drug's exemption from negotiations.
3. Other areas where innovation is needed but is not occurring to a sufficient degree due to already-existing limited incentives. CMS should monitor for evidence on diminished investment in certain critical therapeutic areas that present their own distinct challenges and barriers after the IRA's implementation, potentially through the dashboard described above.

Aside from care in implementing more aggressive negotiations in cases like these, especially in the early years of the Program, clarifying potential problem areas over time could also provide the basis for developing bipartisan support for any needed future revisions in the IRA, which are typically needed for the long-term success and sustainability of major complex legislation. Despite best efforts, any major new policy initiative may have undesirable consequences. The CMS implementation approach should also include a dashboard at the therapeutic class level to monitor for such consequences and have room to develop plans to address them if necessary. For example, some commenters have raised concerns that the relatively limited time that a manufacturer will now have before price reductions take place may have implications on the launch sequence of drugs, particularly small-molecule drugs, with manufacturers shifting marketing plans toward other highly developed countries first. Relevant RWE and clinical experience can be generated there and subsequently used in the U.S. immediately upon launch to gain broader adoption more quickly than would have occurred otherwise if the manufacturer had to generate that evidence *after* FDA approval. Such decisions, delaying access for U.S. patients,

would allow the manufacturer to capture greater financial benefit of the drug during the full 9 or 13 years before the Medicare price cuts take place. (At the same time, the IRA's Part D redesign to provide more generous drug coverage with no beneficiary payments beyond \$2000 may also have a significant impact on drug uptake and innovation by reducing financial barriers for beneficiaries that limit drug use, with no new tools for plans to negotiate lower prices.)

CMS should track metrics like U.S. versus ex-U.S. initial introductions of new drugs, particularly those that add value according to its own comparative assessment framework. Similarly, the CMS dashboard and regulatory process could track markers of potential issues in other areas where concerns about adverse impacts have been raised, such as diminished investment in therapeutic areas focused on Medicare beneficiaries and small-molecule versus biologic drugs, as well as the timing and extent ("effectiveness") of generic and biosimilar competition. CMS could create a mechanism for stakeholder input into this evolving dashboard and the data that it collects on an ongoing basis, focusing on the beneficiary's perspective.

Finally, CMS should use public comments like these and further internal analysis to clarify its general proposed standard for "robust and meaningful" competition from a generic or a biosimilar drug. Whether this standard has been met determines whether a selected drug should cease being a selected drug – a major regulatory decision point. A standard for how much generic or biosimilar entry has occurred does not appear in the IRA. At the very least, it would be helpful for CMS to establish clear guidelines and illustrations of how this standard could be satisfied, while noting that there are also issues that could prevent effective competition from a follow-on entrant in a way that is beyond their control (for example, certain rebates that may limit competitive entry). Setting the bar too high for this standard might deter generic and biosimilar competition, something which appears concerning as it is from the applications of the IRA's negotiation provisions.

Conclusion

The Duke-Margolis Center appreciates this opportunity to provide feedback to CMS on the Guidance and CMS's consideration of our comments. Our recommendations on the use of high-quality evidence and the design of drug payments to improve outcomes in conjunction with the IRA's Negotiation Program can enable CMS to advance its mission of supporting the high-value, evidence-based, and affordable use of pharmaceuticals. Furthermore, we believe that a clear and predictable initial process for conducting the negotiations and mechanisms for public input and transparency in refining it over time will be important for a predictable and sustainable Negotiation Program and outcome. We and our colleagues would be pleased to provide more information on these issues if that would be helpful. If you have any questions, please contact Nitzan Arad (nitzan.arad@duke.edu) for more information. These comments are those of the authors at Duke-Margolis and are not reflective of the view of Duke University leadership, staff, or other affiliated individuals or organizations.

Sincerely,

Mark McClellan – Director, Duke-Margolis Center

Nitzan Arad – Assistant Research Director, Duke-Margolis Center

Rachele Hendricks Sturup – Research Director, Duke-Margolis Center
Marianne Hamilton Lopez – Senior Research Director, Duke-Margolis Center

RE: Initial Guidance on Medicare Drug Price Negotiation Program

Dear Deputy Administrator Seshamani:

Eli Lilly and Company (Lilly) appreciates the opportunity to respond to certain sections of the Initial Guidance (Guidance) on the “Medicare Drug Price Negotiation Program” (Program) but is concerned about its inability to comment on other critical issues, such as the definition of a “qualified single source drug” (QSSD).¹ Lilly is one of the country’s leading innovation-driven, research-based pharmaceutical and biotechnology corporations. Our company is devoted to seeking answers for some of the world’s most urgent medical needs through discovery and development of breakthrough medicines and technologies and through the health information we offer. Ultimately, our goal is to develop products that save and improve patients’ lives.

We appreciate the time constraints under which the CMS has been tasked with implementing this new statutory program but have some concerns that CMS is neglecting to address several key issues. As a member of both Pharmaceutical Research and Manufacturers of America (PhRMA) and the Biotechnology Industry Organization (BIO), Lilly largely joins those groups in their comments on the Guidance and encourages CMS to carefully consider the input of those organizations. Lilly takes this opportunity to offer the following comments to highlight matters of particular concern and Lilly-specific positions.

As a threshold matter, Lilly is deeply troubled by the language of the statute and this Guidance purporting to classify the process by which CMS sets a “maximum fair price” (MFP) as a “negotiation.” It is not. We also object to being forced to agree that the price, to be dictated by the government via this process, constitutes a “maximum fair price.” This characterization of the price as fair, aside from working a reputational harm, poses a non-trivial legal risk that plaintiffs’ attorneys, or others, will seek to use this “admission” to advance legal claims that other prices charged by manufacturers result in an “unfair” price or a deceptive trade practice. Because these terms are legally defined and prescribed by the Inflation Reduction Act of 2022 (IRA), we will occasionally adopt them for purposes of this letter; however, we do not agree that their use is appropriate or compatible with their plain meaning.

¹ Centers for Medicare & Medicaid Services (CMS), “Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments” (Mar. 15, 2023).

Political euphemism is being used here to steer public opinion away from concerns associated with the harmful and confiscatory impact of price controls, such as their chilling effect on innovation and research, limits on patient choice, and threats to the basic liberty of private parties. The use of these terms, however, will contribute to confused discourse and flawed policy outcomes. The use of the term “negotiation” in the context of this statute and this Guidance feels particularly Orwellian because there are so few indicia of an actual negotiation. Examples include, but are not limited to, the following:

- In a true negotiation, if a seller does not agree to the buyer’s offer price, the seller can walk away, losing the potential business opportunities on just those forgone sales; under the MFP regime, if a seller (the manufacturer) does not agree to the buyer’s (CMS’s) offer price, the seller is required to pay a daily tax to the United States Treasury equal to 19 times the total daily U.S. gross sales of the product in question;
- In a true negotiation, parties sign a contract **after** agreeing to a price term; under the MFP regime, manufacturers must sign a contract **before** agreeing to a price term;
- In a true negotiation, the non-price terms and conditions of a contract are proposed early in the negotiation process such that both sides have more or less equal knowledge of what those non-price terms will be; under the MFP regime, CMS alone knows what the non-price terms and conditions (Program requirements) will be, but the manufacturer does not (at least for the initial year);
- In a true negotiation, both parties can offer revision, clarification, amendment, or customization of the non-price terms and conditions of a contract; under the MFP regime, CMS will publish a “one size fits all” contract of adhesion that manufacturers must sign;
- In a true negotiation, either party may seek redress from an Article III court to redress any legal and equitable claims; under the MFP regime, manufacturers are foreclosed from seeking any form of judicial or administrative review of the most fundamental agency actions;
- In a true negotiation, a seller is free to discuss or describe their experiences with a particular buyer so that other sellers – or the public or Congress – can be on notice as to that buyer’s conduct in negotiation; under the MFP regime, manufacturers are subject to a gag order where CMS is not;
- In a true negotiation, buyers may – but certainly are not required to – turn over any manufacturing or distribution costs, sales forecasts, marketing budgets, or other trade secrets or proprietary data demanded by the buyer; under the MFP regime, CMS requires the submission of all manner of data, some impossible to locate or create;
- In a true negotiation, the buyer cannot threaten the seller with civil monetary penalties (CMPs) of up to \$100,000,000 per item if proprietary information is not turned over; under the MFP regime, these fines, and multiple others, can be wielded against manufacturers – and manufacturers alone.

For these reasons, Lilly respectfully rejects the proposition that the MFP regime establishes a “Negotiation Program,” and we will refer to the process by which the government sets the MFP simply as the “Program.”

Our other substantive comments can be summarized as follows:

- I. We urge CMS to engage in notice and comment for all aspects of its implementation of the Program. Specifically, CMS should (1) solicit comments on section 30 of the Guidance; (2) make proposed text of the Program agreement available for public comment at least 60 days in advance of the first selected drug publication date; and (3) meaningfully respond to and publicly post all comments on all provisions of the Guidance.
- II. CMS should revise the National Drug Rebate Agreement (NDRA) and the Coverage Gap Discount Program Agreement (and work with the Health Resources and Services Administration (HRSA) to revise the Pharmaceutical Pricing Agreement (PPA)) to permit immediate termination of such agreements in the event an MFP cannot be agreed upon by the manufacturer and CMS.
- III. We strongly urge CMS to rescind its policy on identifying distinct QSSDs and instead distinguish between different QSSDs by reference to distinct New Drug Applications (NDAs) or Biologics License Applications (BLAs). Accordingly, CMS should aggregate Medicare expenditures and apply the MFP across only those dosage forms and strengths that are marketed under a single distinct NDA or BLA for each QSSD.
- IV. We ask that CMS be especially solicitous of the special considerations that attach to orphan drugs in implementing the Program.
- V. With respect to the biosimilar delay provision, we recommend that CMS (1) set the deadline by which a biosimilar manufacturer must request a delay closer to the applicable selection date and allow broad supplementation of a timely request; (2) notify manufacturers of its determination prior to the applicable selection date and establish a reasonable mechanism to dispute the determination; (3) request and consider all relevant information; and (4) clarify what circumstances constitute incentivizing a biosimilar delay request.
- VI. We strongly urge CMS to rescind its unlawful bona fide marketing standard. CMS should instead use the definition of “marketed” in the NDRA, which manufacturers already report under the Medicaid Drug Rebate Program (MDRP).
- VII. We urge that CMS notify the manufacturer of any drug that it intends to select for the MFP process in advance of the applicable selection date and afford such manufacturer a reasonable opportunity to dispute the propriety of such intended selection. Additionally, we ask that CMS permit biosimilar manufacturers to ascertain from the agency whether CMS intends to select the applicable reference biologic in advance of the deadline for submitting a delay request to enable informed and efficient decision-making.
- VIII. With respect to the MFP process, we recommend the following:
 - A. CMS should enhance the proposed “consistent methodology and process” for “negotiation” and “renegotiation.” Specifically, we ask that this process include fully bespoke negotiations, consideration of all information submitted, a thorough justification of the initial offer and the response to any counteroffer, and full

opportunity to supplement submitted information where there are material changes or otherwise for good cause shown.

- B. CMS should permit manufacturers to rely on reasonable assumptions in connection with data submissions and provide voluntary explanations of data submissions, as appropriate.
 - C. CMS should establish more detailed safeguards to ensure that confidential commercial information is adequately protected from disclosure. Additionally, CMS's proposed policies regarding use and destruction of information by manufacturers are unlawful, and therefore CMS must abandon them.
- IX. In setting the MFP, we urge CMS account for special considerations by adopting the following recommendations:
- A. CMS should allow manufacturers to submit evidence demonstrating that a price will imperil patient access, and CMS should specify that the MFP will not be set below the lower of either that price or the MFP ceiling price.
 - B. CMS should clarify that it will not set the MFP below the MFP ceiling for any initial price applicability year (IPAY) during which the drug is under patent protection.
 - C. For a small molecule drug, CMS should specify that it will not set the MFP below the MFP ceiling until at least 13 years have lapsed since the drug's approval.
 - D. CMS should specify that the MFP will not be set below the MFP ceiling price where a state uses the MFP as a reference point in setting a price or payment limit outside of the Medicare market. And we ask that CMS specify that such use of the MFP will constitute a "material change" triggering selection for "renegotiation."
 - E. CMS should specify that the MFP will not be set below the MFP ceiling if the selected drug is subject to a value-based purchasing arrangement (VBP) and the multiple Best Prices (BPs) reporting option (MBPRO).
- X. We disagree with CMS's proposal to base the calculation of average Non-FAMP on a calendar year (rather than a federal fiscal year), but we agree that a weighted average is the best – and only appropriate – means of calculating the applicable average Non-FAMP.
- XI. We recommend that CMS use the start of the IPAY, not the date of selection, to measure the date period since approval/licensure to identify whether an "extend" or "long" monopoly drug.
- XII. We concur with CMS that manufacturers should be permitted to provide access to the MFP through a rebate model. However, to ensure the functionality of the model, we ask CMS to specify that rebates are not owed until after all necessary data have been submitted to the manufacturer. We also agree that manufacturers should not be required to provide the MFP to Part D beneficiaries at the point-of-sale directly.

- XIII. We recommend that CMS require Medicare Advantage (MA), MA-prescription drug (PD), and PD plans to require the accurate use of either a 340B or a non-340B claims indicator for Part B and D drugs as a condition of payment of a claim for reimbursement in advance of IPAY 2026.
- XIV. We urge CMS to clarify that selected drugs are not subject to an inflation rebate.
- XV. With respect to CMPs, we urge CMS to finalize its pre-sanction procedural safeguards and to adopt an additional process whereby manufacturers are given advance notice of an intent to impose a CMP and a reasonable opportunity to cure or dispute the deficiency.
- XVI. Finally, we recommend that CMS exclude MFP units from the definition of “unit” for purposes of the Average Sales Price (ASP) calculation.

I. CMS Should Engage in Notice and Comment for All Aspects of Its Implementation of the Program

A. CMS Should Solicit Comments on Section 30 of the Guidance

Although Lilly appreciates that CMS has provided opportunity to comment on many aspects of the Guidance, we are gravely concerned that CMS has not extended such opportunity across **all** components of the Guidance. In particular, Lilly is deeply concerned that CMS has finalized section 30 of the Guidance without opportunity for comment.² It is difficult to envision a more important section of the Guidance on which CMS should solicit comments. Section 30 sets forth foundational policies related to the identification of drugs eligible for an MFP: Among other things, section 30 includes CMS’s approach to distinguishing between different QSSDs. Providing a notice and comment opportunity is a beneficial transparency measure likely to improve implementation of the Program for patients who rely life-saving medicines.

These policies are fundamental to the Program and cut across virtually all aspects of the program’s implementation. CMS’s failure to solicit comment on these critical policies is therefore irreconcilable with the agency’s stated commitment to “prioritiz[ing] transparency and robust engagement” in implementing the program.³

Indeed, because the policies contained in section 30 undergird so many **other** policies described in the Guidance, CMS’s failure to solicit comment on this section casts fundamental doubt as to the meaningfulness of the comment process as a whole. CMS’s solicitation of comment cannot be meaningful if the agency does not seek comments on the foundational components of the Program’s implementation.

Lilly therefore strongly urges CMS to reconsider its decision to deem this section final and open the policies therein to public input. CMS should request stakeholder comments on **all** provisions of the Guidance – including section 30.

² Lilly acknowledges that the policies contained in section 30 of the guidance are final and that CMS is not soliciting comment even after the fact. Nonetheless, Lilly sets forth some of the comments it would have made on section 30 had CMS solicited comment.

³ CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 at 1 (Jan. 11, 2023).

B. CMS Should Make the Proposed Text of the Program Agreement Available for Public Comment at Least 60 Days in Advance of the First Selected Drug Publication Date

In the Guidance, CMS commits only to making “**reasonable efforts** to make the **final** text of the agreement available to the public before the first selected drug list . . . is published.”⁴ This is facially inadequate. The agency should not merely make such “reasonable efforts.” Rather, CMS should affirmatively commit to making the proposed text of the agreement available for public comment at least 60 days in advance of the first selection date and provide manufacturers the opportunity to offer feedback on the agreement that they may be expected to enter into shortly thereafter.

An opportunity for advance review and comment on the terms of the Program agreement is critical for myriad reasons. Manufacturers are subject to CMPs of \$1 million dollars per day for a violation of a term of the agreement;⁵ they are also subject to a punitive excise tax for failing to enter into the agreement by a specified date.⁶ Under these circumstances, manufacturers are effectively compelled to enter into and abide by the agreement. To give meaning to the agency’s stated intention that “entering into an Agreement is voluntary,”⁷ manufacturers should be given a reasonable opportunity to review in advance and provide comment on the precise terms of the agreement and potentially, in certain cases, negotiate customized terms and conditions that address potential manufacturing, distribution, or other product-specific attributes.

Advance notice will help to ensure that manufacturers are aware of any compliance responsibilities and give them greater time to prepare accordingly. Without advance notice, CMS could put manufacturers in the untenable position of being subject to requirements that are impossible to fulfill due to the agency’s own failure to provide adequate time for manufacturers to establish new processes needed to ensure compliance. Courts have long recognized that “[i]mpossible requirements imposed by an agency are perforce unreasonable” and therefore arbitrary and capricious.⁸ And this risk is especially acute if the agreement imposes requirements that necessitate the development of new or modified systems, require hiring of new staff, or entail entering into new or modified contracts with third parties.

A comment process on the specific terms of the agreement will also serve an equally critical role. It will help to ensure that “interested members of the public [can] communicate information, concerns, and criticisms to the agency”⁹ about an agreement with vast downstream consequences for manufacturers and access to medicines. The need for a comment process is particularly acute because it is vital that the agreement account for market realities. CMS may fail to consider these factors if the agency does not provide opportunity for meaningful engagement by stakeholders.

C. CMS Should Meaningfully Respond to and Publicly Post All Comments on All Provisions of the Guidance

Lilly also strongly urges CMS to respond meaningfully to stakeholder comments on **all** provisions of the Guidance – including section 30 – and thus fully follow through on the agency’s stated

⁴ Initial Guidance at 27.

⁵ SSA § 1197(c).

⁶ Internal Revenue Code (IRC) § 5000D(b)(1)(A).

⁷ Guidance at 27.

⁸ *All. for Cannabis Therapeutics v. DEA*, 930 F.2d 936, 940 (D.C. Cir. 1991).

⁹ *Conn. Light & Power Co. v. NRC*, 673 F.2d 525, 530 (D.C. Cir. 1982).

commitment to transparency and robust engagement. Given the statutory directive to implement the Program in its early years via guidance, as opposed to rulemaking,¹⁰ it is imperative that CMS adopt procedural safeguards that ensure its policymaking is transparent and fair. Inherent in such procedural safeguards is that the agency not only adopt a fulsome comment process, but also respond to comments in a meaningful fashion.

As the D.C. Circuit has observed, “the opportunity to comment is meaningless unless the agency responds to significant points raised by the public.”¹¹ The agency’s timely explanation of how commenters’ information, concerns, and criticisms factored into its final decision-making is what allows the comment process to serve its intended role of facilitating a “genuine interchange” of ideas.¹² The process of responding to discrete points raised by commenters helps to ensure that the agency is carefully considering the feedback it received from the public.

The need for a fulsome and two-sided dialogue is especially compelling here, given the newness and complexity of the issues at hand and the fact that the Program is supposed to reflect a form of negotiation. The Program will have vast ramifications for patients, providers, manufacturers, and other stakeholders across the United States, and the proposals herein represent the agency’s first significant endeavor to fill a largely blank slate. “The interchange of ideas between the government and its citizenry” is what “provides a broader base [to the government] for intelligent decision-making and promotes greater responsiveness to the needs of the people.”¹³ Misinformed implementation here could have especially sweeping negative repercussions with respect to Medicare beneficiary access to needed medicines. Under these circumstances, it is vital that CMS make every effort to maximize transparency and fairness by not merely affording a **full** opportunity for comment on **all** provisions of the Guidance but also **meaningfully responding** to stakeholder feedback, including on section 30 of the Guidance. Further, in furtherance of open government, CMS should publicly post all comments received on this Guidance, as well as others, so that all stakeholders can benefit from the varied perspectives and positions and understand which public policy and practical implementation points CMS finds persuasive.

II. Voluntariness

In Section 40.1, CMS reminds manufacturers of the potentially ruinous excise taxes that may be levied if manufacturers participating in federal healthcare programs do not sign the Program agreement by October 1, 2023 (before any MFP is set). In the next breath, CMS states that participation in the Program is “voluntary” for manufacturer.

At a minimum, we urge CMS to address certain legal and operational issues for manufacturers whose product is selected for the MFP process for IPAY 2026 but that may wish to withdraw from participation in federal healthcare programs. Specifically, CMS should revise the NDRA and the Coverage Gap Discount Program Agreement, and work with HRSA to revise the PPA, to permit immediate termination in the event agreement on an MFP cannot be reached or a manufacturer is dissatisfied with the MFP or the MFP setting process.

¹⁰ SSA § 1198(c).

¹¹ *Ala. Power Co. v. Costle*, 636 F.2d 323, 384 (D.C. Cir. 1979).

¹² *Conn. Light & Power Co. v. NRC*, 673 F.2d 525, 530 (D.C. Cir. 1982) (describing the purpose of notice-and-comment rulemaking).

¹³ *Buschmann v. Schweiker*, 676 F.2d 352, 357 (9th Cir. 1982) (internal quotation marks and citations omitted).

Under the statute, manufacturers that fail to agree to an MFP are deemed non-compliant with program requirements and subject to a punitive excise tax on the first day after the applicable statutory deadline (i.e., August 2, 2024, for IPAY 2026, and November 2 for each IPAY thereafter). The excise tax starts at approximately 200% of a product's daily gross sales in the United States during the first quarter of non-compliance and increases until it reaches 1900%. The excise tax ceases to apply "on the first date on which[:]

- (i) the notice of terminations of all applicable agreements of the manufacturers has been received by [CMS], and
- (ii) none of the drugs of the manufacturer of the designated drug are covered by an agreement under section 1860D-14A [Coverage Gap Discount Program] or 1860D-14C [Manufacturer Discount Program, which will replace the Coverage Gap Discount Program starting in 2025] of the [SSA] [collectively, the Discount Program]."¹⁴

The applicable agreements referenced include agreements under the Discount Program and under the MDRP. Therefore, an alternate to paying the tax is to withdraw all drugs from coverage under Medicare and Medicaid. Thus, as CMS correctly acknowledges in the Guidance, a manufacturer's decision to "enter[] into [a Program agreement] is [intended to be] voluntary." And the Program agreement may be "terminated by either party," at which time the selected drug will no longer be considered a selected drug.

To provide for a modicum of basic fairness and procedural due process, Lilly urges CMS:

- To clarify that it understands "notice of terminations" to refer to the notice required under the termination clause of each applicable agreement; and
- To revise its agreements under the Discount Program and the MDRP, and work with HRSA to revise the PPA, to allow for immediate termination of such agreements in the event that CMS and the manufacturer cannot agree to an MFP for a selected drug under the Program.

CMS should also establish an electronic process by which manufacturers can furnish the agency (and the Internal Revenue Service) with their notice of terminations of the applicable agreements in the event the parties cannot agree to an MFP, and specify that, under such process, the date received for purposes of the suspension of the excise tax is the date the notice is transmitted to the agency.

CMS also states that, "if the Primary Manufacturer of a selected drug elects to enter into an Agreement with CMS . . . , the Primary Manufacturer must submit to CMS [via the Health Plan Management System] all names, titles, and contact information for representatives authorized to execute the Agreement and conduct the negotiation" within "5 days following publication by CMS of the list of selected drugs for an initial price applicability year [September 1, 2023, for the first year of the Program]."¹⁵ We recommend that CMS recast the significance of entering contact information into HPMS. Specifically, a manufacturer's willingness to provide updated names, titles, etc. should not be construed to imply that the manufacturer has "elect[ed] to enter into an Agreement with CMS" but rather should be understood to mean that the manufacturer is "considering whether to enter into an Agreement with CMS." Otherwise, it could be suggested that, for IPAY 2026, a manufacturer would

¹⁴ IRC § 5000D(c)(1)(A).

¹⁵ Guidance at 27.

only have 5 days to “decide” whether to “agree” to a number of new terms and conditions it may have never seen before. That is a wholly unrealistic amount of time to make a decision of the magnitude occasioned by the MFP regime.

Failure to adopt these recommendations renders the Program agreement involuntary. This is because, as noted above, manufacturers that decline to agree to an MFP are subject to a substantial excise tax so punitive it could bankrupt them, the suspension of which occurs only after CMS receives notice of termination of applicable agreements such that the selected drug is no longer subject to such agreements. Under the current applicable agreements, termination does not become effective until a specified period after notice is given. Given the magnitude of the penalties involved, it would be fundamentally unfair to subject a manufacturer to such penalties in the interim. As such, CMS must amend the termination clauses of the applicable agreement to provide for immediate termination in the contemplated circumstance, and it must do so well in advance of August 2, 2024 – i.e., the date on which the excise tax can first begin to accrue for failure to agree an MFP. Notably, under the terms of the Discount Program agreement, termination is effective as of the day after the end of the calendar year if termination occurs before January 30 or the day after the end of the succeeding calendar year if termination occurs on or after January 30.¹⁶ A year-long delay in termination would result in hundreds of millions, if not billions, of dollars in liability. Given the magnitude of the penalties involved, it cannot be said that a manufacturer voluntarily entered into a Program agreement absent a meaningful opportunity to withdraw from the applicable agreements before sanctions are imposed.

III. Identifying QSSDs

A. *CMS Must Rescind Its Policy on Identifying Distinct QSSDs and Instead Distinguish Between Different QSSDs by Reference to Distinct NDAs or BLAs*

Under the Program, CMS selects a QSSD for the MFP process based on the agency’s calculation of “total expenditures” under Part B or Part D for dosage forms and strengths of the drug, and then applies the drug’s MFP to all such dosage forms and strengths.¹⁷ Importantly, the statute does not specify how to make a number of threshold determinations necessary for the fulfillment of these directives, namely:

¹⁶ Coverage Gap Discount Program Agreement, § VIII(d). Similarly, under the terms of the NDRA, termination is not immediately effective. Termination becomes effective on the first day of the first rebate period beginning 60 days after the manufacturer gives written notice. NDRA § VII(a); 83 Fed. Reg. 12,770 (Mar. 23, 2018).

¹⁷ SSA §§ 1192(e)(1), (d)(3)(B), 1196(a)(2). The statute employs different articulations when referring to the versions of the drug that must be taken into account in aggregating Medicare expenditures and applying the MFP. Specifically, section 1192(d)(3)(B) of the SSA refers to aggregation of Medicare expenditures “across dosage forms and strengths of the drug, including new formulations of the drug, such as an extended release formulation, and not based on the specific formulation or package size or package type of the drug.” And section 1196(a)(2) refers to application of the MFP to “different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug.” Regardless, the statutory text makes clear that, whether aggregating Medicare expenditures or applying the MFP, CMS may consider only formulations within dosage forms and strengths of the drug, and not any other formulations. This is so because the statute directs such aggregation and application at dosage forms and strengths of the drug, with all references to formulations appearing only in language qualifying such directives. *See BST Holdings, LLC v. OSHA*, 17 F.4th 604, 613 (5th Cir. 2021) (“To avoid ‘giving unintended breadth to the Acts of Congress,’ [a basic rule of interpretation is to] ‘rely on the principle of noscitur a sociis—a word is known by the company it keeps.’”); *see also FDA v. Brown & Williamson Tobacco Corp.*, 529 U.S. 120, 133 (2000) (“It is a ‘fundamental canon of statutory construction that the words of a statute must be read in their context and with a view to their place in the overall statutory scheme.’”).

- How to identify a QSSD and distinguish it from another when selecting a QSSD for the MFP process;
- How to identify “the drug” when aggregating Part B or Part D expenditures across dosage forms and strengths of “the drug;” and
- How to identify “[the] drug” when applying the MFP across dosage forms and strengths of “[the] drug.”

In the Guidance, CMS sets forth an approach to identifying a distinct QSSD by reference to active moiety (drugs) or active ingredient (biologics). Specifically, CMS defines QSSD to include all dosage forms and strengths of drugs or biologics that share the same active moiety or ingredient of the same NDA or BLA holder, respectively, regardless of whether the drugs or biologics are marketed pursuant to distinct NDAs or BLAs. As such, for the first IPAY, CMS will aggregate Part D expenditures across all dosage forms and strengths of drugs or biologics sharing an active moiety or an active ingredient of the same NDA or BLA holder and will apply the MFP across all such dosage forms and strengths.

As explained below, CMS’s approach contradicts the plain language of the statute. By law, CMS is required to identify each QSSD by reference to its NDA or BLA, such that:

- A QSSD is defined by reference to whether the product has a distinct NDA or BLA;
- Expenditures are aggregated across dosage forms and strengths marketed pursuant to a common NDA or BLA; and
- The MFP is applied across the dosage forms and strengths specific to each such NDA or BLA.

CMS’s contrary approach is not merely inconsistent with the statute, but it is also fundamentally unsound as a matter of policy, and risks constraining pharmaceutical and biotechnology innovation through a sweepingly overinclusive interpretation of what constitutes a distinct QSSD. Under the QSSD definition as interpreted by CMS, any innovation related to formulation made post the initial NDA/BLA, which could be meaningfully beneficial to patients, has no significance.

1. Distinct QSSDs Must Be Defined by Reference to Distinct NDAs or BLAs

Under section 1192 of the SSA, only “qualifying single source drugs” are subject to the MFP process. Subject to certain exclusions, “qualifying single source drugs” are defined as:

- Drugs approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act (FDCA), “for which, as of the selected drug publication date with respect to such initial price applicability year, at least 7 years will have elapsed since the date of such approval,” and that are not a listed drug for a drug approved and marketed under an abbreviated new drug application (ANDA) pursuant to section 505(j) of the FDCA (i.e., for a generic); and
- Biologics licensed under section 351(a) of the Public Health Service Act (PHSA), “for which, as of the selected drug publication date with respect to such initial price applicability year, at least 11 years will have elapsed since the date of such licensure,” and that are not the reference product for any biological product licensed and marketed under 351(k) of the PHSA

(i.e., for a biosimilar).¹⁸

The statutory text plainly specifies that a “qualifying single source drug” is defined by reference to each “such approval” or “such licensure,” which starts each seven- or eleven-year clock. As such, the statute requires that a distinct QSSD be defined by reference to a *distinct approval or licensure*, i.e., a distinct NDA or BLA.

CMS’s Guidance takes a contrary approach. The agency says that it intends to treat all dosage forms and strengths of products **with the same active moiety (drug) or active ingredient (biologic)** under applications held by the same primary manufacturer as the same QSSD, **regardless of whether such products are approved or licensed under distinct applications.**¹⁹

CMS’s approach cannot be reconciled with the statutory definition of QSSD.²⁰ Congress **explicitly** defined a QSSD by reference to “such approval” and “such license” to denote that QSSDs **must** be distinguished by their distinct approvals or licensures. As such, CMS’s policy is fundamentally at odds with the language of the statute, which evidences Congress’s clear intent to distinguish QSSDs by reference to distinct “approvals” or “licensures” – that is, whether they have a distinct NDA/BLA.

The statute reinforces Congressional intent to distinguish QSSDs based on their NDAs or BLAs by specifying in the QSSD definition that a QSSD that is a Part D drug must meet the “covered Part D drug” definition in the Medicare statute.²¹ The Medicare statute, in turn, defines a “covered Part D drug” by reference to the “covered outpatient drug” definition in the MDRP statute.²² And, under the MDRP statute, a “covered outpatient drug” is defined by reference to a Food and Drug Administration (FDA) approval or licensure under an NDA or BLA.²³ Indeed, the government itself recognizes as much.²⁴

The MDRP statute provides for only one exception to the rule that a drug or biologic is defined by reference to its NDA or BLA, and Congress specifically amended the statute to provide for such exception. Congress affirmatively amended the MDRP statute to treat a line extension as the same drug as its predecessor version(s), even when approved under a distinct NDA or BLA, when calculating the line extension’s Medicaid rebate amount.²⁵ Under the Program, no similar statutory exception exists, reinforcing the conclusion that Congress intended that a QSSD be identified by its NDA or BLA.²⁶ Congress clearly would have said otherwise had it intended any other result. Indeed, elsewhere in the IRA, Congress did do so. In the provisions governing the IRA’s Part D inflation rebate

program, Congress expressly referenced the MDRP statute's line extension provision to enable the grouping of products across NDAs or BLAs.²⁷ By contrast, Congress pointedly declined to do likewise in defining a QSSD.

Although the interpretive "inquiry begins with the statutory text, and ends there as [well because] the text is unambiguous,"²⁸ Lilly notes that there are a host of additional factors that lend further support for the conclusion that Congress intended QSSDs to be distinguished on the basis of distinct NDAs/BLAs.

First, FDA's framework for approving products via distinct applications strongly supports the use of distinct NDAs/BLAs as the standard for distinguishing between QSSDs. As a general matter, prescription drugs and biologics may be marketed only if approved or licensed by FDA.²⁹ Manufacturers seeking approval of a new drug must submit data to FDA sufficient to satisfy the safety and effectiveness standard for approval of an NDA³⁰ And manufacturers of a new biologic likewise must demonstrate to FDA the safety, purity, and potency of the product in order to be licensed under a BLA.³¹

FDA has spoken directly to the circumstances under which a change to an approved product can be approved by submitting a supplement to an already-approved NDA/BLA, and that for which a separate NDA/BLA should be submitted instead.³² It is reasonable and appropriate to rely on these FDA standards, such that a product approved/licensed via a separate NDA/BLA (as opposed to by a supplement to an already-approved NDA/BLA) is considered a distinct QSSD. For example, FDA directs manufacturers of a new active ingredient, e.g., a different salt, ester, or complex of an approved moiety, to submit a separate application.³³ On the other hand, a proposed different strength should be approved via a supplement.³⁴ And different container sizes and package types of a drug with the same indication and route of administration are all approved under a common application.³⁵ Certain changes in dosage form or route of administration may be approved via a supplement, but others should be approved via a separate application.³⁶

Second, a distinct NDA/BLA standard is consistent with the balance the statute strikes between the often-competing interests in encouraging pharmaceutical and biotechnology innovation and reducing prescription drug costs. The statute seeks to address this tension by, among other things, establishing a period of time after approval or licensure during which a product is not eligible for selection for the MFP process, thus preserving an incentive for the manufacturer to research and develop next-generation products. Similarly, distinguishing between products by the NDA/BLA under which they are approved reflects a balance between more significant changes (i.e., those requiring a new NDA/BLA), yielding distinct products for MFP setting purposes, and less significant

³⁴ *Id.* at 4.

³⁵ *Id.*

³⁶ *Id.* at 3.

ones (i.e., those approved under a supplement to an already-approved application), which are appropriately considered modifications of the same product. Any standard that does not reflect this distinction contravenes the balance Congress crafted by putting next-generation products at risk of being subject to MFP setting on an unduly short (and potentially immediate) time frame³⁷ Accordingly, the sweeping, extra-statutory approach set forth in the Guidance risks dramatically discouraging development of next-generation products.

Lastly, CMS's approach is also unnecessarily complicated. Defining each QSSD by reference to its NDA or BLA makes practical sense. It establishes a readily administrable bright line test for all parties under the Program. CMS will be able to easily identify the relevant dosage forms and strengths of a selected drug for purposes of aggregating Medicare expenditures and applying the MFP, and manufacturers will be able to confidently track the 7- or 11-year timeline from the NDA/BLA approval/licensure date for selection eligibility and make research and development decisions accordingly. By contrast, the approach in the Guidance adds unnecessary complexity to what Congress intended to be an easily administrable statutory standard.

For the foregoing reasons, Lilly vigorously disagrees with CMS's stated approach to identifying a QSSD for legal and policy reasons. We urge CMS instead to define each "qualifying single source drug" by reference to its NDA or BLA, as required by the statute and the dictates of sound public policy.³⁸

2. CMS Must Aggregate Part B or Part D Expenditures on a QSSD Across Only Those Dosage Forms and Strengths That Are Marketed Under the Distinct NDA or BLA of Such Drug

A necessary corollary to the requirement that each QSSD be defined by reference to its distinct NDA or BLA is that CMS must aggregate Medicare expenditures across only those dosage forms and strengths of the QSSD that are marketed under the applicable NDA or BLA. This follows from the statutory definition of "negotiation-eligible drug," which is defined as a QSSD that is among the 50

³⁷ This is the same balance between encouraging innovation and reducing drug costs that the Hatch-Waxman Amendments to the FDCA reflect by granting 5-year and 3-year exclusivity to innovative products, but then allowing easy market entry for generics after exclusivity expires. *See Amarin Pharm. Ir. Ltd. v. FDA*, 106 F. Supp. 3d 196, 198 (D.D.C. 2015) ("[T]he [Hatch-Waxman] Act sought to balance two competing policy goals: (1) encouraging the development of generic drugs to increase competition and lower prices in the pharmaceutical industry, while (2) maintaining incentives for pharmaceutical companies to invest in innovation and the creation of new drugs."); *Abbott Labs. v. Young*, 920 F.2d 984, 985 (D.C. Cir. 1990) ("Congress struck a balance between expediting generic drug applications and protecting the interests of the original drug manufacturers.").

³⁸ As CMS itself acknowledges, the agency must apply its definition of "qualifying single source drug" across all uses of such term in the statute. *See* Guidance at 10. Accordingly, if (contrary to the plain language of the statute) CMS maintains that products that share the same active moiety (drugs) or the same active ingredient (biologics) are the same QSSD, Lilly agrees with CMS that the market entry of a generic or biosimilar for any of such product must necessarily disqualify *all* such products from treatment as a QSSD. *See id.* Any other approach would be irreconcilable with CMS's stated approach to identifying a "qualifying single source drug." *See, e.g., Nat'l Credit Union Admin. v. First Nat. Bank & Tr. Co.*, 522 U.S. 479, 501–02 (1998) (a basic canon of interpretation is that similar or identical language must "be accorded a consistent meaning"). Importantly, CMS cannot bootstrap itself out of this outcome through its unlawful bona fide marketing standard for determining when a generic or biosimilar is marketed. *See* Section IV.

QSSDs with the highest total expenditures under Part B or Part D during a specified period.³⁹ To calculate total expenditures on a QSSD, the statute instructs that CMS must “use all data that is aggregated across dosage forms and strengths of the drug, including new formulations of the drug, such as an extended release formulation, and not based on the specific formulation or package size or package type of the drug.”⁴⁰

Because the statute requires QSSDs to be distinguished by reference to their distinct NDAs/BLAs, it necessarily follows that total Part B or Part D expenditures must similarly be aggregated by distinct NDA/BLA. The statute could not be clearer on this point. It requires expenditure data to be “aggregated across dosage forms and strengths of **the drug**, including new formulations of **the drug**, such as an extended release formulation, and not based on the specific formulation or pack size or package type of **the drug**” to determine whether a QSSD is among the highest Medicare expenditure QSSDs during a specified period and thus an MFP-eligible drug.⁴¹ “The drug” can only refer to the QSSD, which, for the reasons stated above, must be defined by its NDA/BLA. It follows, then, that references to the “dosage forms and strengths of the drug” are to the various dosage forms and strengths that are approved under the given NDA or BLA. Further, the succeeding phrase – starting with “including” – necessarily presents “new formulations” as examples of the broader category of products that the phrase qualifies (i.e., “dosage forms and strengths of the drug”). Put differently, the word “including” limits the new formulations of the QSSD (as identified by its NDA or BLA) for which CMS may aggregate Medicare expenditures to a subset of formulations – those related to a change in dosage form or strength. And, as noted above, this interpretation is entirely in keeping with the distinct NDA/BLA standard, as distinct dosage forms and strengths, including new formulations thereof, may indeed be approved under a single application.⁴²

Thus, CMS must aggregate Medicare expenditures across only those dosage forms and strengths (including any new formulations thereof) marketed under the applicable NDA or BLA in determining whether a product is MFP-eligible. This approach is mandated by the language of the statute, reflects a logical and coherent approach to its implementation, and gives effect to the Congressional intent underlying the MFP regime overall.

3. CMS Must Apply the MFP Across Those Dosage Forms and Strengths Approved Under the NDA or BLA of the Selected QSSD

The statute also directs CMS to adopt “procedures to compute and apply the maximum fair prices across different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug.”⁴³ In the Guidance, CMS says that it will apply the MFP across all dosage forms and strengths of a given active moiety or active ingredient whose approvals or licensures, respectively, are held by the same primary manufacturer.⁴⁴ However,

³⁹ SSA § 1192(d). In some cases, a drug may be reimbursed under both Part B and Part D depending on where it is administered or dispensed. Because the statute distinguishes between drugs reimbursed under Part D and those reimbursed under Part B, expenditures under each part are aggregated separately for purposes of determining MFP eligibility.

⁴⁰ *Id.* § 1192(d)(3)(B).

⁴¹ *Id.* § 1192(d) (emphasis added).

⁴² We note that some changes in dosage form may be approved via a supplement to an already-approved NDA or BLA, while others require submission of a new application. Submitting Separate Marketing Applications Guidance at 3.

⁴³ SSA § 1196(a)(2).

⁴⁴ Guidance at 8.

just as CMS musts define distinct QSSDs by distinct NDAs or BLAs, and must aggregate Medicare expenditures for purposes of identifying MFP-eligible drugs across dosage forms and strengths within a given NDA or BLA, so, too, must CMS compute and apply the MFP across the dosage forms and strengths within the NDA or BLA of the selected QSSD. This necessarily follows from the statutory text, which plainly directs that the MFP be applied across dosage forms and strengths of such drug. The admonition that follows – to ignore specific formulations in doing so – can be logically understood to mean only that, in applying the MFP across dosage forms and strengths, the fact that there may be multiple specific formulations of those dosage forms and strengths does not alter such directive.

CMS should also recognize that manufacturers might be forced discontinue to making certain product presentations if the MFP, which is set for a molecule regardless of product presentation, renders specific product presentations no longer economically viable. This is most likely to undermine patient convenience and potentially patient adherence, further arguing for CMS to take a more granular approach to its definition of QSSD.

B. The Orphan Drug Exclusion from the Definition of QSSD

Under section 1192(e)(3)(A) of the SSA, drugs that are “designated as a drug for only one rare disease or condition . . . and for which the only approved indication (or indications) is for such disease or condition” are excluded from the QSSD definition and therefore ineligible for selection for the MFP process.⁴⁵ In the Guidance, CMS says that it will use the Orphan Drug Product designation database and the FDA approvals database (Drugs@FDA) to determine whether a drug meets the requirements of this orphan drug exclusion.⁴⁶

As a threshold matter, we note that, in making a determination based on the above FDA resources, CMS should consider only a drug’s orphan designation(s) **at the time of selection**. FDA regulations allow a manufacturer to voluntarily withdraw a requested or granted orphan designation at any time.⁴⁷ FDA publicizes the withdrawal, and any benefit associated with the designation terminates.⁴⁸ With that in mind, CMS should look **only** at orphan designation(s) at the time of selection, and should not look to any previous designation that has been withdrawn when determining whether a drug qualifies for the orphan drug exclusion.

Lilly is concerned CMS’ interpretation of the orphan drug exemption will discourage drug sponsors from developing their product for additional disease states and undermine the intent of the Orphan Drug Act (ODA). CMS’s interpretation of the IRA makes products eligible for negotiation as soon as they have been designated under section 526 of the FD&C Act for more than one orphan disease – even if the drug is not actually FDA approved (or indicated) to treat more than one of the designated orphan diseases. For example, designating a drug under section 526 of the FD&C Act as a rare disease drug is done very early in the drug development process and a key part in unlocking critical ODA incentives such as research funding for clinical research to help de-risk this phase of drug development. However, an orphan designation does not allow the company to market the drug because it has not yet been shown to be safe and effective to treat that specific condition and therefore has not been approved under section 505(c) of the Food Drug and Cosmetic (FD&C) Act or

⁴⁵ SSA § 1192(e)(3)(A).

⁴⁶ Guidance at 11.

⁴⁷ 21 C.F.R. § 316.24(d).

⁴⁸ *Id.*

licensed under section 351(a) of the Public Health services (PHS) Act for that disease. In fact, FDA's Orphan Drug Designations and Approvals database currently contains 6,445 orphan drug designations (including withdrawn designations) compared to only 1130 approved orphan indications, demonstrating that a large number of orphan drug designations do not result in any FDA-approved indications.

Lilly believes that the language of section 1192(e)(3), due to the manner in which it was drafted, is ambiguous and therefore open to CMS interpretation. CMS states that to qualify for the orphan drug exclusion, "the drug or biological product must (1) be designated as a drug for only one rare disease or condition under section 526 of the FD&C Act and (2) be approved by the FDA for only for one or more indications within such designated rare disease or condition." This two-prong test, embodying two separate and distinct criteria, is a possible interpretation of the statute. But under the canons of legislative drafting, if the congressional authors had intended the two clauses to be read ***independently***, the proper legislative drafting would have structured the two clauses separately and in sequence. Instead, Congress did not separate the clauses, intending them to be read ***together***: that a drug designated for a given "rare disease or condition" has "only [one] approved indication" or multiple "approved... indications" ***within the scope of that designation***. CMS substantiates this plain meaning of the provision in accepting that an orphan drug with ***multiple*** ("one or more") FDA-approved indications qualifies for the exemption provided all such approved indications are within the scope of a ***single*** ("only one") ***designation***.

The cardinal rule of statutory construction is that the whole statute should be drawn upon as necessary, with its various parts being interpreted within their broader statutory context in a manner that furthers statutory purposes. The proper interpretation of the orphan drug exclusion "in a manner consistent with [the] legislative purposes" of the Program preserves an intentionally narrow class of qualifying orphan drugs determined upon the basis of a drug's FDA approval history – not on orphan drug designations which have no bearing on, or applicability to, prescription drug marketing or pricing. We encourage CMS to revise its guidance to reflect a sound statutory interpretation more fully in line with congressional intent.

Lilly is also concerned about the potential chilling effect residual uncertainty about CMS's implementation of the orphan drug exemption will have on rare disease drug development. Due to the complexity and long timeline from initial drug discovery and early research and development to full FDA approval, drug sponsors are making decisions now that will impact their drug development pipeline for decades to come. Remaining uncertainty about if, when, and how drugs will become negotiation eligible creates business risks that work as strong disincentives to develop drugs for the limited populations impacted by orphan diseases. For instance, CMS has remained silent as to when orphan drugs that receive an FDA approval for a second disease and therefore loose eligibility for the orphan drug exemption would become negotiation eligible. Qualifying single-source drugs must have been approved at least 7 years and qualifying single-source biologics must have been licensed at least 11 years to qualify, but CMS has not yet clarified if the 7 or 11 years will be counted beginning on the date of the FDA approval for the second disease that made the product negotiation eligible, or based on the first orphan drug approval. CMS should clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by FDA for 7 or 11 years to treat the second disease or condition and in doing so, would provide meaningful incentives for continued orphan drug development.

In addition, Lilly is concerned that there may be circumstances where the FDA resources that CMS will rely upon ***will not be sufficient*** to identify a product as qualifying for the orphan drug exclusion.

In particular, FDA's Orphan Drug Product designation database and the FDA approvals database will not identify a drug that has one orphan drug designation and is approved only for indications under that designation – but that has **not been granted orphan exclusivity**.

In this situation, the above FDA resources will not reflect the fact that an approved indication is within the scope of the orphan drug designation and therefore meets the statutory requirement for exclusion from the MFP process. One example where this can happen is when the designated drug has the same active moiety or active ingredient and is seeking approval for the same indication as an already-approved drug. If the designated drug is not “clinically superior” to the already-approved drug, the drug will not qualify for orphan exclusivity. Still, the approved indication is indisputably within the scope of the orphan drug designation, and the drug therefore unambiguously qualifies for exclusion under the statute; nothing in the statute requires that a drug have (or have had) orphan exclusivity in order to qualify for exclusion from MFP setting.

The Guidance does indicate that the agency will consult with FDA as needed.⁴⁹ However, given that there may be circumstances where CMS cannot determine from FDA's databases whether an indication falls within an orphan designation, CMS also should affirmatively allow manufacturers to provide evidence that an indication is within the scope of their drug's orphan designation. Specifically, we ask CMS to establish a pathway by which manufacturers of orphan drugs approved for qualifying indications that are not identified in the relevant databases can work with FDA and/or CMS to demonstrate that an indication falls within an orphan drug designation. CMS should consider written communications with FDA during the review and approval process or written confirmation from FDA regarding the orphan disease for which the drug is designated and the indication for which the product is approved to be acceptable evidence. Affording manufacturers the opportunity to participate in a process to ensure that eligible orphan drugs are excluded from selection for the MFP process is in keeping with overarching policy goals favoring protection of orphan drugs. It will also be more efficient for CMS, as it provides greater flexibility without the agency needing to expend its own resources consulting with FDA each time FDA's public databases are inadequate to verify a product's eligibility for the orphan drug exclusion.

C. Delayed Selection of Biologics on Account of Anticipated Biosimilar Market Entry

Under Section 1192(f) of the SSA, CMS may delay selection of a reference biologic for the MFP process where, among other things:

- The reference biologic that would have been selected for the MFP process would have been an extended-monopoly drug;⁵⁰
- The delay is requested by the sponsor of a pending or approved BLA for a biosimilar of the reference biologic before the date that would otherwise be the selection date of such reference biologic;⁵¹ and
- There is a high likelihood that the biosimilar will be licensed and marketed within two years of what would otherwise have been the reference biologic's selection date.⁵²

⁴⁹ Guidance at 11.

⁵⁰ SSA § 1192(f)(1)(A). See Section VIII(C) for a discussion of the extended-monopoly drug definition.

⁵¹ *Id.* § 1192(f)(1)(B)(i)(1).

⁵² *Id.* § 1192(f)(1)(A).

If, after a first year of delay, the biosimilar has not launched, the biosimilar manufacturer may request a second year of delay before the selection date that follows what would otherwise have been the reference biologic's selection date.⁵³ If the biosimilar comes to market within two years of what would otherwise have been the reference biologic's selection date, the reference biologic will not be eligible for selection for the MFP process. If a second year of delay is not granted or the biosimilar does not come to market within two years of what would otherwise have been the reference biologic's selection date, the reference biologic manufacturer will be required to pay retrospective rebates to CMS.⁵⁴

CMS's Guidance sets forth the agency's implementation of this delay request process. As detailed below, Lilly urges CMS to make certain modifications or clarifications with respect to the process outlined in the Guidance. Specifically, CMS should:

- Revise the Guidance to afford a biosimilar manufacturer a meaningful opportunity to request a delay, set the deadline by which a biosimilar manufacturer must request a delay as close as reasonably possible to the applicable selection date, and permit the biosimilar manufacturer to broadly supplement a timely request with any late-breaking information or otherwise for good cause;
- Notify biosimilar manufacturers of its determination as to a delay request prior to the selected drug publication date and establish a mechanism by which manufacturers can reasonably dispute the determination;
- Permit the biosimilar manufacturer to submit for CMS's consideration any information relevant to a determination of whether there is a high likelihood that the biosimilar will enter the market within two years of what would otherwise be the reference biologic's selection date; and
- Clarify the circumstances where an agreement will be considered to incentivize a biosimilar manufacturer to request a delay.

1. It Is Critical That CMS Afford a Meaningful Opportunity to Request a Delay, Set the Deadline for a Delay Request Closer to the Applicable Selection Date, and Allow Broad Supplementation of a Timely Request

Lilly believes that CMS should respect the intent of the statute to allow market-based competition to lower drug prices and there we strongly oppose the proposed delay request timelines and procedures outlined in the Guidance. In order to make the delay request process as meaningful and accurate as possible, CMS should set reasonable timelines that afford a biosimilar manufacturer a meaningful opportunity to request a delay. And, to ensure that the agency has the most up-to-date and accurate data as it evaluates delay requests, CMS should designate a delay request submission deadline that is closer to the applicable selection date. For the same reason, CMS should allow biosimilar manufacturers to broadly supplement their timely delay requests with additional information.

The statute requires a biosimilar manufacturer to request a delay "at a time . . . specified by the Secretary" prior to the selected drug publication date."⁵⁵ For IPAY 2026, the Guidance requires a

⁵³ *Id.* § 1192(f)(1)(B)(i)(2).

⁵⁴ *Id.* § 1192(f)(2)(B)(ii), (C).

⁵⁵ *Id.* § 1192(f)(1)(B)(i).

biosimilar manufacturer to notify CMS of its intent to submit a request by May 10, 2023.⁵⁶ Within five business days (i.e., by May 17, 2023), CMS will provide the manufacturer a fillable template and access to a manufacturer-specific Box folder.⁵⁷ The biosimilar manufacturer must then complete and upload the template and furnish all supporting documentation by May 22, 2023, only **three business days** from receipt of the template and access to the agency's Box folder. As such, CMS is requiring manufacturers to rush to prepare and submit delay requests, even though the submission deadline is set **over three months** in advance of the selected drug publication date.

Lilly is concerned that CMS's unreasonably accelerated and truncated timelines will inhibit the meaningfulness of the delay request process and will ultimately imperil the incentives for biosimilar competition that Congress intended to foster by establishing such process. This risk is only exacerbated because CMS says that it will automatically deny delay requests deemed "incomplete." There is no defensible justification for so significantly truncating the window during which manufacturers must prepare and submit delay requests, especially given the complex and multi-factorial information that must be submitted in support of such requests.

Worse still, the delay request timeline and process set forth by CMS risk **undermining the accuracy** of CMS's "high likelihood" determination. An informed determination of whether there is a "high likelihood" of timely biosimilar market launch should be based on the **most current information available**, and, necessarily information will be more mature closer to the selected drug publication date. Yet CMS's policy is to require manufacturers to submit the request **over three months in advance** of the selected drug publication date. And the request **cannot** be supplemented, with only very limited exception for updates as to whether the BLA has been accepted or approved by FDA.⁵⁸

The result is a process that includes no mechanism by which CMS can broadly account for late-breaking material developments that may dramatically impact the likelihood of a timely launch. This is concerning because the information bearing on whether a biosimilar is highly likely to be licensed and marketed within the specified period is subject to rapid and potentially unanticipated changes, and such determination is an amalgamation of numerous considerations, each with the potential to fluctuate, including:

- FDA's views of the data and other information submitted in the BLA to meet the requirements for licensing of a biosimilar;
- Communications from FDA about the status of the BLA, which inform whether and when the biosimilar manufacturer can expect licensure;
- The biosimilar manufacturer's production and distribution arrangements and progress, which inform whether and when the biosimilar manufacturer will be in a position to commercially manufacture and distribute a licensed product.⁵⁹

In order for CMS to maximize the accuracy of its delay request determinations, CMS **must** have (and rely on) the most current information available that bears on whether there is high likelihood that a biosimilar will launch within the specified period. As noted above, CMS should therefore (1) set the delay request deadline as close as administratively feasible to the selected drug publication date and (2) allow manufacturers to broadly supplement a timely request with late-breaking, material

⁵⁶ Guidance at 21.

⁵⁷ *Id.*

⁵⁸ Guidance at 23.

⁵⁹ See Section IV for a discussion of the identification of the appropriate market date.

information or for otherwise for good cause shown. This will allow CMS make more informed biosimilar launch likelihood determinations, while eliminating unnecessary timing barriers that can impede the ability of biosimilar manufacturers to access the delay request process in a meaningful fashion.

Ensuring that the information before the agency is not outdated or incomplete will also create efficiencies for the agency because it will reduce the likelihood that CMS erroneously concludes that there is a high likelihood that a biosimilar will launch within the specified period, such that CMS will be obligated to administer the payment of rebates by the reference biologic manufacturer when the biosimilar does not timely launch. CMS can avoid unnecessarily administering such payments, and the resulting needless inefficiency, by using the most current information available – i.e., by (1) setting the delay request deadline as close as administratively feasible to the selected drug publication date and (2) allowing manufacturers to broadly supplement a timely request with late-breaking, material information or for good cause.

2. CMS Should Notify Biosimilar Manufacturers of Its Determination as to a Delay Request Prior to the Selected Drug Publication Date and Establish a Mechanism by Which Manufacturers Can Reasonably Dispute the Determination

Under the Guidance, CMS will not inform a biosimilar manufacturer that submits a delay request that its request is denied until **after** the selected drug publication date.⁶⁰ This means that biosimilar manufacturers have no means to challenge erroneous “high likelihood” determinations. As noted above, this is particularly problematic given the unreasonably accelerated and truncated timelines for requesting the delay described in the Guidance. Accordingly, Lilly recommends that CMS revise its approach. CMS should notify a biosimilar manufacturer that it intends to deny its request in **advance** of the selected drug publication date and establish a mechanism by which manufacturers can reasonably dispute the agency’s determination before the selection of a reference biologic occurs.

3. CMS Should Request and Consider All Information Relevant to a Timely Biosimilar Launch Likelihood Determination

Section 1192(f) of the SSA specifies that a biosimilar manufacturer must submit certain information to support a request for a delay. Notably, section 1192(f)(1)(B)(ii)(I) provides that such a submission contain the contents described in subclauses (aa) and (bb):

- **Subclause (aa)** provides for the Secretary’s consideration of “information and documents **necessary** for the Secretary to make determinations [whether a delay should be granted], as specified by the Secretary, and **including**, to the extent available” the items described in **subclause (III)** of section 1192(f)(2)(B)(ii),⁶¹, namely:
 - “The manufacturing schedule for such biosimilar biological product submitted to [FDA] during its review of the application” and “[d]isclosures [in Securities and Exchange Commission filings] that pertain to the marketing of such biosimilar biological product, or comparable documentation that is distributed to the

⁶⁰ Guidance at 24.

⁶¹ SSA § 1192(f)(1)(B)(ii)(I)(aa) (emphasis added).

shareholders of privately held companies.”⁶²

- **Subclause (bb)** provides for the Secretary’s consideration of “all agreements related to the biosimilar biological product filed with the Federal Trade Commission or the Assistant Attorney General pursuant to subsections (a) and (c) of section 1112 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003.”⁶³

The structure of section 1192(f) therefore makes clear that Congress intended for CMS to consider the **full range of relevant information** necessary to make a “high likelihood” determination **based on all of the information submitted under subclause (aa), rather than solely the specific subset of information cross-referenced in such subclause**, i.e., the information described in subclause (III). By contrast, CMS’s Guidance improperly limits the universe of evidence that CMS will consider when evaluating whether the “high likelihood” standard is satisfied by providing that such evaluation will be performed only under **section 1192(f)(3)**, which limits the information on which an evaluation is based to the information described in subclause (III) and subclause (bb). **The additional information under subclause (aa) that, by statute, is “necessary” to determinations whether a delay should be granted is unaccounted for.**

The analysis must start with section 1192(f)(3), which specifically references information and documents to be considered in making the “high likelihood” determination: those described in subclause (III) and subclause (bb). The Guidance appears to indicate that section 1192(f)(3) represents the only pathway to a high likelihood determination and therefore that consideration of information is limited to these two categories of information.

This approach is contrary to the text and structure of the statute, which clearly contemplates that the test described in section 1192(f)(3) be **only one, non-exhaustive means** of satisfying the “high likelihood” standard. This follows from the plain language of subclause (aa), which directs manufacturers to submit information and documents that are “**necessary**” to a high likelihood determination “**including**” – but not limited to – those described in subclause (III).

The use of the word “including” is telling. “[T]he verb to include introduces examples, not an exhaustive list.”⁶⁴ As such, subclause (aa) **must** mean that there is a universe of information—beyond that articulated in subclause (III) – that **must** be considered as part of the “high likelihood” determination, especially given that the statute characterizes such information as “necessary” to such determination.

The necessary implication is that the “high likelihood” test articulated in section 1192(f)(3) **cannot** be the only means of demonstrating a high likelihood of timely biosimilar market launch, because, as noted, **that** test is limited to an evaluation of only certain specified categories of information (e.g., that described in subclause (III)). Any other interpretation would render the broad and mandatory information submission language in subclause (aa) completely superfluous: Manufacturers would be required to submit the full universe of information “necessary” to make a “high likelihood” determination, but the agency would arbitrarily disregard a subset of such “necessary” information in evaluating whether there is a high likelihood of timely biosimilar launch.

⁶² *Id.* § 1192(f)(1)(B)(ii)(III).

⁶³ *Id.* § 1192(f)(1)(B)(ii)(I)(bb).

⁶⁴ Scalia & B. Garner, *Reading law: The interpretation of legal texts* 199, 203-132-33 (2012).

Congress could not have intended such a perverse result, especially when it renders part of the statutory text in subclause (aa) completely nugatory. The only way to give meaning to the entirety of section 1192(f) is to understand that section 1192(f)(3) does not set forth the only set of information and documents that CMS may consider. CMS may consider **all** information and documents submitted in rendering its determination.

Of note, such an approach also makes logical sense in light of the broader context of the biosimilar delay provision. As noted above in Section III(C)(3), there is a wide range of information that informs whether there is a high likelihood that a biosimilar will be timely marketed. There is no one-size-fits-all approach to identifying the types of information that will help CMS determine whether to grant any particular request for a delay. Congress could not have intended for CMS to render a decision without considering information that is necessary to doing so. As biosimilar manufacturers are in the best position to determine what information may be relevant to that determination, CMS should request and consider all information deemed by a biosimilar manufacturer to support a high likelihood determination.⁶⁵

4. CMS Should Clarify What Circumstances Constitute an Agreement That Incentivizes a Biosimilar Manufacturer to Request a Delay

CMS is not permitted to grant a request for a delay where, based on specified information, the biosimilar manufacturer and reference biologic manufacturer have entered into an agreement that requires or incentivizes the biosimilar manufacturer to submit a delay request.⁶⁶

We appreciate the Guidance's confirmation that agreements between reference biologic manufacturers and biosimilar manufacturers, particularly those that enable a biosimilar manufacturer to market a biosimilar, are **not inherently disqualifying**, a conclusion that is required by the statute. Specifically, CMS implicitly but correctly acknowledges that an "agreement with the reference product manufacturing that permits the biosimilar manufacturer to market the Biosimilar in one or more dosage form(s), strength(s), and indication(s)" does not necessarily incentivize the biosimilar manufacturer to request the delay; to the contrary, CMS considers such an agreement a form of clear and convincing evidence of high likelihood that the biosimilar will timely enter the market.⁶⁷

Lilly concurs with CMS's recognition that not all agreements between reference biologic and biosimilar manufacturers incentivize a biosimilar manufacturer to request a delay. Lilly also emphasizes that any contrary interpretation would contradict the statute, which expressly provides that agreements between a biosimilar manufacturer and a reference biologic manufacturer are to be used as **evidence supporting** the likelihood that the biosimilar will come to market within the specified period, rather than treating the existence of such an agreement as categorically disqualifying.⁶⁸

While Lilly appreciates CMS's acknowledgement that the agency shares this interpretation, we also request clarification on the **specific circumstances** under which an agreement will be considered by CMS to incentivize a biosimilar manufacturer to request a delay. The only elaboration provided in

⁶⁵ As discussed in Section VI(C), confidential commercial information submitted by a manufacturer should be robustly protected from disclosure.

⁶⁶ SSA § 1192(f)(2)(C)(iv)(II)(aa).

⁶⁷ Guidance at 19.

⁶⁸ SSA § 1192(f)(1)(B)(ii)(I)(bb), (2)(B)(i)(II), (3)(B).

the Guidance is that an agreement must not “impos[e] improper constraints on the Biosimilar Manufacturer.”⁶⁹ Further elaboration is necessary particularly because biosimilar manufacturers will be required to certify that they have not entered into a disqualifying agreement (i.e., one with improper constraints), on penalty of “liability, including under the False Claims Act.”⁷⁰

Clarification of the applicable standard for identifying “improper” agreements, including examples, is needed to allow manufacturers to better understand the full range of circumstances where the agency will deem an agreement to create incentives for a biosimilar manufacturer to request a delay. Absent such clarification, the “improper constraints” standard is woefully ambiguous, especially given the significant consequences that follow if CMS finds that a disqualifying agreement exists. Manufacturers need clearer standards to be able to make informed decisions about the terms of agreements into which to enter. Greater certainty about what agreements CMS will consider improper is needed. Importantly, such clarity will facilitate agreements that **promote** biosimilar market entry, and thus further the biosimilar market competition Congress sought to promote in enacting the Program.

IV. CMS Must Rescind Its Bona Fide Marketing Standard; CMS Should Instead Use the “Market Date” Reported Under the MDRP

The statute uses the date on which a generic or biosimilar was “marketed” as a key reference point across multiple aspects of the Program’s implementation:

- **A drug or biologic is not MFP-eligible if a generic or biosimilar is marketed by what would otherwise be the drug or biologic’s selection date.** The statute specifically excludes from the definition of a “qualifying single source drug” any product that is “the listed drug for any drug that is approved and marketed under [the FDCA]” or “the reference product for any biological product that is licensed and marketed under [the PHSA].”⁷¹
- **If a biosimilar manufacturer requests and is granted a delay in the selection of a biologic for negotiation and the biosimilar is marketed within two years of the date on which the biologic would otherwise have been selected for the MFP process, the biologic will never be subject to selection for the MFP process.** Under specified circumstances, a biosimilar manufacturer will be granted a delay in selection of a biologic for negotiation “if [CMS] determines that there is a high likelihood . . . that a biosimilar biological product . . . will be licensed and marketed . . . before the date that is 2 years after [what would otherwise have been the biologic’s selection date].”⁷²
- **A biologic is not eligible for delay in selection for the MFP process if it is not marketed within one year of licensure of the biosimilar.** Specifically, the statute states that “[i]n no case shall the Secretary delay the inclusion of a biological product on the [selected drug list]

⁶⁹ Guidance at 19.

⁷⁰ *Id.* at 77, 80.

⁷¹ SSA § 1192(e)(1)(A)(iii); (B)(iii). Note that these and other provisions of the SSA refer to when a drug or biologic is **both** approved or licensed **and** marketed. The discussion herein presumes that a drug or biologic will be marketed only if it has been approved or licensed, so focuses only on the later of the two relevant dates, i.e., the date on which the drug or biologic is marketed.

⁷² *Id.* § 1192(f)(1)(A).

if more than 1 year has elapsed since the biosimilar biological product has been licensed” and “marketing has not commenced for such biosimilar biological product.”⁷³

The date on which **CMS determines** that a generic or biosimilar has been marketed also has critical implications for whether a drug or biologic will be subject to an MFP and for how long, as well as for how long a manufacturer will be assessed an excise tax if found to be non-compliant with program requirements:

- **If CMS determines after a drug or biologic is selected for the MFP process, but before the end of the “negotiation” period, that a generic or biosimilar has been marketed, the process for setting an MFP terminates.** Under the statute, a drug or biologic that has been selected for the MFP process and for which CMS has made a determination by the end of the “negotiation” period that a generic or biosimilar drug has been marketed shall not be subject to the MFP process for such period.⁷⁴
- **If CMS determines after the end of the “negotiation” period that a generic or biosimilar has been marketed, the drug or biologic generally will cease to be subject to the MFP starting with the first year that begins at least nine months after the date of such determination.** By statute, a selected drug generally will be subject to the MFP until the year that is “at least 9 months after the date on which [CMS] determines” that at least one generic or biosimilar has been marketed.⁷⁵
- **For a manufacturer that is subject to an excise tax as a result of noncompliance with program requirements, the excise tax ceases on the date on which CMS determines that a generic or biosimilar has launched.** Manufacturers may be subject an excise tax for failure to enter into an agreement to negotiate, failure to agree to an MFP, or failure to submit certain data to CMS.⁷⁶ The excise tax will cease to apply at any of certain points in time specified by statute, one of which is the date on which CMS determines that a generic or biosimilar has been marketed.⁷⁷

In the Guidance, CMS defines “marketed” in a manner that contorts this entirely straightforward statutory standard into a standard that is utterly untethered from the statute and that blatantly purports to expand agency authority far beyond the limits that Congress clearly imposed. CMS states, without any claim of statutory support, that a finding that a generic or biosimilar is “marketed” requires a finding that the generic or biosimilar presents “bona fide” competition based on the evaluation of prescription drug event (PDE) data over a 12-month period.⁷⁸ At least in the context of evaluating whether the application of the MFP should terminate, CMS states that such standard is met by reference to whether the generic or biosimilar presents “robust and meaningful competition,” as determined based on the agency’s subjective judgment.⁷⁹

⁷³ *Id.* § 1192(f)(2)(D)(iii).

⁷⁴ *Id.* § 1192(c)(2).

⁷⁷ *Id.* § 5000D(b)(1)(B).

⁷⁸ Guidance at 62.

⁷⁹ *Id.* at 67. Note that the Guidance does not make clear if the agency intends to apply its bona fide marketing standard in all situations under the statute where the marketing of a generic or biosimilar is consequential, e.g., the biosimilar delay provision. If CMS intends to use an alternative standard in any given situation, it should clearly articulate such alternative and subject it to public comment.

For the reasons stated below, Lilly urges CMS to rescind its bona fide marketing standard as extra-statutory and therefore unlawful. CMS should instead uniformly define (1) the date on which a generic or biosimilar is marketed and (2) the date on which CMS determines that a generic or biosimilar has been marketed by reference to the MDRP market date.

A. CMS's Bona Fide Marketing Standard Is Unlawful

Lilly is deeply troubled by CMS's bona fide marketing standard for multiple reasons. First and foremost, the standard is incompatible with the clear statutory language. As a matter of plain language definitions, "marketing" refers to the "work of advertising and offering goods or services for sale,"⁸⁰ or the action of "buying or selling" in a commercial marketplace.⁸¹ This means that, once the act of selling or buying has occurred, a product necessarily **has** been marketed. CMS has no discretion to interpret the statute otherwise.

CMS has recognized as much in its very own proposed policy implementing a different provision of the IRA, which looks to how CMS has already defined the term "marketed" in analogous contexts. Specifically, as recently as February of this year, CMS proposed to determine when a drug is "marketed" for purposes of the IRA's Part D inflation rebate provision by reference to the "market date" that the manufacturer is required to report under the MDRP program.⁸² This fully accords with the fact that CMS has long defined "marketed" under the NDRA to mean that a "drug is **available for sale** by a manufacturer in the states."⁸³ And, notably, under the Part D program, CMS has long recognized that the date on which a product is "**release[d] onto the market**" triggers Part D coverage decision-making.⁸⁴ Therefore, the PDE data on which CMS's bona fide marketing standard relies to determine whether a product is "marketed" show utilization of the product **after** the point in time when the product has been recognized as having come to market – under CMS's own policy.

Simply put, CMS has already defined when a drug is "marketed," under the IRA as well as under other drug pricing programs, and none of those definitions reflects the "bona fide marketing" standard CMS has invented. Here, CMS seeks to wholly replace the statutory reference point – the date of **marketing** – with an extra-statutory standard tied to the **degree of utilization**. Doing so patently lacks any legal basis. For purposes of evaluating whether a product is marketed, it is completely irrelevant whether the product is being utilized sufficiently, particularly where sufficiency is based on the agency's subjective judgment of whether adequate competition exists. The only consideration

⁸⁰ Cambridge English Dictionary, Definition of Marketing, <https://dictionary.cambridge.org/us/dictionary/english/marketing>.

⁸¹ Oxford English Dictionary, Definition of Marketing, <https://www.oed.com/view/Entry/114186?rskey=iyHQfr&result=2#eid>.

⁸² CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of SSA, and Solicitation of Comments, § 40.3 (Feb. 9, 2023). The CMS proposed guidance for the Part B inflation rebate uses the "date of first sale" reported for ASP purposes, which likewise has no qualitative component in its determination. CMS, Medicare Part B Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1847A(i) of the Social Security Act, and Solicitation of Comments, § 50.3 (Feb. 9, 2023).

⁸³ NDRA § I(l); 83 Fed. Reg. 12,770 (Mar. 23, 2018) (emphasis added).

⁸⁴ CMS requires that Part D plan sponsor P&T committees "make a reasonable effort to review a new FDA approved drug product (or new FDA approved indication) within 90 days of its release onto the market and . . . make a decision on each new FDA approved drug product (or new FDA approved indication) within 180 days of its release onto the market, or a clinical justification will be provided if this timeframe is not met." Prescription Drug Benefit Manual, ch. 6 § 30.1.5.

bearing on the statutory standard of marketing is whether the **product is sold** in the commercial marketplace.⁸⁵

Second, the agency's "bona fide marketing" standard is too vaguely defined to provide notice to stakeholders of its parameters. CMS provides no concrete definition or even illuminating examples of when the agency will consider a generic or biosimilar manufacturer to have engaged in bona fide marketing. It is entirely unclear whether CMS expects the generic or biosimilar manufacturer to have captured a percentage of the market or what factors (e.g., size of market, clinical advantage offered by the reference product) CMS will consider. Even after CMS determines that the generic or biosimilar manufacturers has engaged in bona fide marketing, CMS intends to monitor PDE data for continued "robust and meaningful competition."⁸⁶ Again, CMS fails to offer any explanation of what it will look for, e.g., does the agency expect the level of competition to stay the same? To increase? The Guidance is entirely too ambiguous to put either listed drug or reference product manufacturers or generic/biosimilar manufacturers on notice of how the agency intends to operationalize the standard.

Third, this very subjectivity provides CMS with boundless authority that Congress clearly did not delegate. The MFP termination date is a notable example. That date is defined by reference to the date on which CMS determines that a generic or biosimilar has been marketed.⁸⁷ There is a simple and straightforward means for making this determination: the MDRP market date. CMS recognizes that such date triggers the start of MDRP rebate liability as well as the IRA's Part D inflation rebate liability, but, on no justifiable basis, does not recognize that such date triggers the termination of MFP liability. CMS's bona fide marketing standard purports to vests the agency with limitless discretion to delay the MFP termination date, even indefinitely, based on the agency's subjective judgment as to the extra-statutory consideration of utilization sufficiency.

In addition, CMS is implicitly asserting the authority to **re-institute** an MFP after one has been terminated, if the agency concludes based on PDE data that utilization of the generic or biosimilar ceases to be "robust and meaningful."⁸⁸

Nothing in the text or structure of the statute purports to give CMS such sweeping authorities. Through its bona fide marketing standard, CMS is "effectively [seeking to] introduce[e] a whole new regime of regulation," which "is not the one that Congress established."⁸⁹ This is patently unlawful. "It is axiomatic that an administrative agency's power to promulgate legislative regulations is limited to the authority delegated by Congress. . . . Thus, if there is no statute conferring authority, a federal agency has none."⁹⁰

⁸⁵ Congress knows full well how to impose a "bona fide" qualitative standard when evaluating a given activity in relation to drug pricing. In the context of the MDRP, Congress specifically amended the statute to clarify that only "bona fide" service fees are exempt from the calculation of Average Manufacturer Price. SSA § 1927(k)(1)(B)(i)(II) as amended by Pub. L. 111-148, § 2503(a) (2010). And, in implementing that standard, CMS has engaged in extensive rulemaking to define the parameters of the "bona fide" determination. See 81 Fed. Reg. 5170 (Feb. 1, 2016). Such statutory basis for a "bona fide" standard is notably absent here, yet CMS is impermissibly purporting to substitute this standard for the one clearly prescribed by Congress.

⁸⁶ Guidance at 67.

⁸⁷ SSA § 1192(c)(2).

⁸⁸ See Guidance at 67.

⁸⁹ *MCI Telecomms. Corp. v. Am. Tel. & Tel. Co.*, 512 U.S. 218, 114 (1994).

⁹⁰ *Michigan v. EPA*, 268 F.3d 1075, 1081 (D.C. Cir. 2001).

Fourth, CMS's approach **guarantees** a significant delay between the date on which CMS determines that a generic or biosimilar has been marketed and the date on which the generic or biosimilar was in fact marketed. This is because it takes time for sales to be reflected in the PDE data. Under CMS's long-standing policy, Part D plan sponsors must determine within 180 days from the date on which a newly approved drug is released onto the market whether to add the drug to their formulary. Many Part D plan sponsors will not add a newly approved drug to their formulary until the 180-day mark, and, thus, the first six months of PDE data following the market entry of the drug will **necessarily** reflect only very limited uptake. The absence of PDE data, then, by no means substantiates the absence of marketing. CMS's bona fide marketing standard (exacerbated by the agency's intent to evaluate PDE data only once per month)⁹¹ clearly contradicts the statute as it ensures that CMS's determination of when a generic or biosimilar has been marketed will not accurately reflect when the generic or biosimilar was in fact marketed. Further, PDE data are not publicly available or otherwise transparent and thus, further aggravate credibility and verification concerns with the MFP process.

Compounding this concern is that, even where plan sponsors add a newly approved generic or biosimilar to their formulary, widespread utilization of the generic or biosimilar cannot be expected to occur overnight. Even after a product is made available for sale, providers and patients must become comfortable with switching to the new product.⁹² Under any rational interpretation of the word, the product is marketed during this transition period. And the fact that there may be a period of transition before claims data reflect a higher-level utilization does not mean that the market is failing to work as intended.

From a policy perspective, generic and biosimilar competition is a bedrock for affordability in the pharmaceutical industry. Approximately 90% of the drugs used in the US are generic^{93, 94} and come at significantly reduced prices (i.e., approximately 20% of the brand drug price for oral generics within the early years of generic availability)^{95, 96} Generic drug prices are so low that the environment has been described as a "race to the bottom" in terms of pricing, a situation that many have argued is unsustainable and leads to shortages, generic manufacturers leaving the market. By not being clear and setting the "marketed" bar arbitrarily and unnecessarily high for generic competition to be sufficient to remove a selected drug and allow for normal market-based competition, CMS increases the likelihood that generic drugs will be competing in the market with their reference branded drugs

⁹¹ Guidance at 62.

⁹² Uptake of a biosimilar, in particular, can be slow for myriad reasons. *See, e.g.,* Zachary Brennan, *Biopharma CEOs Explain Problems with Biosimilars to Congress*, Regulatory Aff. Profs. Soc'y (Apr. 12, 2019), available at <https://www.raps.org/news-and-articles/news-articles/2019/4/biopharma-ceos-explain-problems-with-biosimilars-t> (for example, uptake may be limited "due to physician confusion regarding interchangeability and extrapolation, and a lack of physician, patient, and payer incentives").

⁹⁵ US Food and Drug Administration (2021, November 1). *Generic Drug Facts*. <https://www.fda.gov/drugs/generic-drugs/generic-drug-facts>

⁹⁶ IMS Institute for Health Informatics (2016, January 1). *Price Declines after Branded Medicines Lose Exclusivity in the U.S.* <https://www.iqvia.com/-/media/iqvia/pdfs/institute-reports/price-declines-after-branded-medicines-lose-exclusivity-in-the-us.pdf>

being subject to the MFP. In this situation, the generic drug, in order to be competitive, would necessarily have to price their drug at roughly 20-40% of the MFP of the reference product, which is already deeply discounted. Given fixed costs of development and the already “race to the bottom” environment for generic manufacturers, this policy would put the sustainability of the generic industry as a whole in jeopardy and could result in monumental impacts to patient affordability in commercial (and public) markets. Combining this issue with the untenable burden on the biosimilar manufacturers to submit a delay request without knowing if the reference product of relevance is being selected, (argued elsewhere in the letter), in total, represents a lack of alignment by CMS with the IRA’s intent to safeguard the biosimilar and generic industry.

CMS should make every effort to avoid any delay in its determination that a generic or biosimilar has been marketed, as such a delay may be of enormous consequence to reference biologic manufacturers and biosimilar manufacturers alike. In particular, Lilly is concerned that the prospect of an unnecessarily extended MFP will create dramatic disincentives against generic and biosimilar market entry, thereby defeating Congress’s objective of encouraging such market-based competitors.⁹⁷

B. CMS Should Instead Set the Program Date of Marketing and the Date of CMS’s Determination of Marketing by Reference to the Definition of “Marketed” in the NDRA

A lawful and infinitely more reasonable approach would be for CMS to define the date of marketing and the date of CMS’s determination of marketing in a uniform fashion by reference to the familiar market date already reported by manufacturers for purposes of the MDRP.

Specifically, CMS defines “market date” in MDRP guidance as “the earliest date the drug was first marketed under the application number by any labeler.”⁹⁸ The NDRA in turn provides that a drug is first “marketed” on the date on which it was first “**available for sale** by a manufacturer in the states.”⁹⁹

Manufacturers routinely report this date when reporting pricing data under the MDRP, and such date is ascertainable for generics and biosimilars regardless of whether they are subject to ASP reporting.¹⁰⁰ Thus, there exists a long-standing construct with which CMS and manufacturers are well familiar, and to which they have ready access, on which the agency can and should rely to determine the date on which a generic or biosimilar launched for purposes of the Program. This approach has the added benefit of ensuring consistency across the MDRP and the Program for both the agency and manufacturers.

Adoption of the NDRA definition of “marketed” for purposes of the Program would eliminate any legal concerns, as CMS would be adopting a standard that comports with the plain language definition of marketing. Lilly emphasizes that it is especially critical that this standard be adopted in the context of the date of **CMS’s determination** of the date of marketing: As noted above, if there is a lag of even

⁹⁷ In addition, a lag of a single day between the date of marketing and the date of CMS’s determination of such marketing can result in the MFP being extended for a full additional year.

⁹⁸ CMS, MDRP Data Guide § 5.15 (Apr. 2022).

⁹⁹ NDRA § I(l); 83 Fed. Reg. 12,770 (Mar. 23, 2018) (emphasis added).

¹⁰⁰ The “first sale date” reported for ASP purposes is not a reliable method for determining the date of marketing here. The date of first sale is reported only for products subject to ASP reporting, and thus may not be available for all generics and biosimilars whose marketing is implicated by the Program, whereas the market date reported under the MDRP is more broadly reported and therefore a better metric to use.

one day between the date of marketing the date of CMS's determination of such marketing, a selected drug can be subject to the MFP for **an additional 12 months**.

V. Pre-Selection Process

- A. *CMS Should Notify a Manufacturer of Any Drug That the Agency Intends to Select for the MFP Process in Advance of the Selection Date and Afford Such Manufacturer a Reasonable Opportunity to Dispute the Propriety of the Intended Selection*

CMS should implement a “pre-selection” process whereby a manufacturer of a drug intended to be selected for the MFP process is notified of such intended selection and permitted to identify any concern to the agency in advance of the selection date. This process will enhance informed decision-making and promote efficiency and transparency.

As CMS knows, there is an inherent risk of error in the process of selecting drugs for the MFP process given the complexity of the statutory process. Eligibility is based on a myriad of factors, including whether a sufficient number of years post-approval or licensure have passed;¹⁰¹ whether a generic or biosimilar is marketed;¹⁰² whether an exclusion applies, for plasma-derived products, low Medicare spend drugs, certain orphan drugs, and small biotech drugs;¹⁰³ and whether Medicare expenditures are sufficiently high to qualify the drug for eligibility for selection.¹⁰⁴

As such, it is important that there be a mechanism to avoid erroneous selections. Further, it is critical that such mechanism be available in **advance** of the selection date – because, if an error in selection is identified **after** the selected drug publication date, the erroneously selected drug would be de-selected, but **no alternative** could be substituted. This is because the statute **requires** CMS to publish a list of drugs selected for the MFP process by no later than February 1 of the year that is two years before the applicable IPAY (or September 1, 2023, for IPAY 2026).¹⁰⁵

A pre-selection process will therefore both reduce the risk of error **and** facilitate a complete list of selected drugs. To make such pre-selection process meaningful, Lilly also recommends that CMS provide notice to affected manufacturers at least 30 days in advance of the selection date and afford manufacturers at least 14 days thereafter to respond to the agency with concerns.

In addition, CMS should include as part of the pre-selection process at least the next five drugs that would be selected as a substitute if, through the pre-selection process, CMS determines that a drug intended to be selected is, in fact, ineligible. This would enable manufacturers of such drugs to engage with the agency to similarly ensure that any such drug would be appropriate for substitution. This added process is particularly reasonable because there is no additional burden on the agency associated with identifying these additional drugs, given that CMS will already have identified the 50 qualifying single source drugs with the highest total Part D expenditures and, starting with IPAY 2028, the top 50 qualifying single source drugs with the highest total Part B expenditures.¹⁰⁶

¹⁰¹ *Id.* § 1192(e)(1).

¹⁰² *Id.*

¹⁰³ *Id.* §§ 1192(e)(3)(A)–(C), 1192(d)(2).

¹⁰⁴ *Id.* § 1192(d)(1)

¹⁰⁵ *Id.* § 1191(b)(3), (d)(1).

¹⁰⁶ *See id.* § 1192(d)(1).

B. CMS Should Also Establish a Pathway Whereby Biosimilar Manufacturers Can Solicit Information Regarding Whether CMS Intends to Select the Applicable Reference Biologic in Advance of the Deadline for Submitting a Biosimilar Delay Request

CMS should foster market-based price competition by creating a reasonable process by which biosimilar manufacturers can solicit information from CMS necessary to determine whether such manufacturers should submit a delay request under the statute.

The statute allows a biosimilar manufacturer to request a delay of the selection of a reference biologic for the MFP process where there is a high likelihood that a biosimilar for that biologic will be licensed and marketed within two years of what would otherwise have been the reference biologic's selection date, **so long as** the request is made **before** the reference biologic's selection date.¹⁰⁷

This timing requirement creates a dilemma for biosimilar manufacturers: A biosimilar manufacturer cannot determine whether it should request a delay without knowing whether an applicable reference biologic will be selected for the MFP process for a given year. But, in the ordinary course, the biosimilar manufacturer will have knowledge of the reference biologic's selection only **after** the selection date passes and the list of selected drugs is published, at which point it will be too late to request a delay. CMS acknowledges this conundrum in the Guidance, but the only advice it provides is that manufacturers should look to publicly available data and submit a delay request if they "**think** that a Reference Drug for their Biosimilar **may** be a selected drug."¹⁰⁸

It is patently unreasonable and inefficient for CMS to require biosimilar manufacturers to expend significant time and resources on biosimilar delay requests simply because a reference biologic "may" be subject to selection. Further, expecting biosimilar manufacturers blindly to guess as to whether to submit a delay request risks subverting Congress's purpose in creating the delay request process. Many biosimilar manufacturers may fail to submit such requests, simply because they are not aware that there is a serious risk that a reference biologic is a likely candidate for selection. This risks undermining the very purpose of Congress in creating the biosimilar delay request process, which is to incentivize market competition by encouraging the development of biosimilars by providing a longer runway of time for such development.

Rather than perpetuating unnecessary roadblocks to timely biosimilar delay requests, CMS should establish a process that makes the delay request process as meaningful as possible. The most logical and straightforward means of doing so is simply to allow biosimilar manufacturers to inquire with CMS whether an applicable reference biologic is anticipated for selection in advance of the delay request submission deadline. CMS should permit biosimilar manufacturers to solicit such information starting at least 30 days in advance of the biosimilar delay request deadline to ensure they have adequate time to make an informed decision regarding whether to request a delay.

VI. The MFP "Negotiation" Process

A. CMS Should Enhance the Proposed "Consistent Methodology and Process" for Initially Setting the MFP ("Negotiation") and Resetting the MFP ("Renegotiation")

The statute provides that CMS must "develop and use a consistent methodology and process" to

¹⁰⁷ *Id.* § 1192(f)(1)(B)(i)(2), 1192(f)(1)(A).

¹⁰⁸ Guidance at 16-17 (emphasis added).

negotiate the MFP.¹⁰⁹ Additionally, the statute provides that, beginning in 2028, CMS may enter into renegotiations for a selected drug in certain circumstances specified by statute, and that CMS must “specify the process for renegotiation,” which “shall, to the extent practicable, be consistent with the methodology and process” for initial negotiations.¹¹⁰ Thus, Congress intended the methodology and process governing both negotiation and renegotiation to be transparent and predictable for all entities involved.

Under the Guidance, CMS lays out its proposed framework for how the MFP process will proceed, including the process governing CMS offers, manufacturer counteroffers, and CMS responses to counteroffers – including justifications supporting such offers, counteroffers, and responses. CMS also proposes a framework for meetings between the manufacturer of the selected drug and the agency. Under the Guidance, such meetings will occur only where CMS rejects a manufacturer counteroffer, in which case CMS will extend a meeting invitation.¹¹¹ The initial meeting is to take place within 30 days of receipt of the counteroffer. Thereafter, CMS proposes to allow each party the opportunity to request one additional meeting – such that a maximum of three meetings is possible for each selected drug.¹¹² At such meetings, the parties may discuss new information bearing on the negotiation of the MFP.¹¹³

Lilly asks that CMS modify its proposed MFP process to include the recommendations set forth below.

1. CMS Should Commit to Engaging in Bespoke Negotiations with Each Manufacturer of a Selected Drug

CMS’s proposal allows for potential dialogue between the parties, which represents an important step toward implementing a meaningful process “for negotiations” as part of the Program.¹¹⁴ Nevertheless, we are concerned by the arbitrary limitations on engagement in the Guidance. As noted above, under the Guidance, real dialogue is limited to (1) instances where CMS rejects a counteroffer and (2) a maximum of three meetings. Importantly, the benefit of meaningful dialogue is not limited to when a counteroffer has been rejected. Engagement between the parties is equally beneficial in informing an initial offer. In fact, such early discussions can negate the need for a counteroffer, thereby generating efficiencies for both the agency and manufacturers.

Even more concerning is the arbitrary cap on the number of allowable meetings. Lilly does not see any benefit to establishing a categorical limit on the number of meetings between the parties. If both CMS and the manufacturer of the selected drug believe that one or more additional meetings would be productive to setting a more appropriate MFP, then CMS should allow such additional meetings to proceed rather than cutting off helpful discussions prematurely based on an arbitrary limit on the total number of meetings permitted.

Lilly recommends that CMS modify its proposed MFP setting process to allow for greater dialogue between the parties throughout the process and to specify that additional meetings (beyond the current maximum of three) may be held if agreed to by both parties. Further, to ensure productive dialogue, we urge CMS to commit to engaging substantively with the manufacturer in each meeting.

¹⁰⁹ SSA § 1194(b)(1).

¹¹⁰ *Id.* §§ 1194(f)(2), (4)(A)-(B).

¹¹¹ Guidance at 55.

¹¹² *Id.* at 55–56.

¹¹³ *Id.* at 56.

¹¹⁴ SSA § 1194(b)(1).

Given the limited number of drugs subject to negotiation in a given year, the recommended changes are manageable for the agency to implement and will facilitate a more productive and tailored process – which will be critical to any success under the program. There is also ample time to effectuate any additional meetings. The statute requires CMS to make the initial offer by June 1 of the year of the selection year (February 1, 2024, for IPAY 2026) and also provides that the manufacturer must accept the offer or make a counteroffer within 30 days.¹¹⁵ Even if CMS were to wait until June 1 (February 1 for IPAY 2026) to make the initial offer, and even if the manufacturer were to wait until the 30th day to make a counteroffer, there would still be four remaining months in the negotiation period (five for IPAY 2026). Therefore, more than adequate time exists in the negotiation timeline for the contemplated additional process.

2. CMS Should Commit to Considering All Information Submitted by a Manufacturer in Setting the MFP

CMS should specify that it will consider **all** information submitted by manufacturers throughout the process. Although the justifications for the initial offer and the manufacturer's counteroffer are moored to the negotiation factors enumerated in the statute, the statute by no means precludes CMS from considering additional information that a manufacturer determines relevant to the MFP process.¹¹⁶ Further, CMS's counteroffer responses are not statutorily required to be justified by reference to the statutorily enumerated negotiation factors.¹¹⁷ The statute clearly permits the agency to set the MFP by reference to any and all information submitted by manufacturers, and CMS should commit to considering all such information.

In the Guidance, CMS does not specify that a manufacturer may submit, and that the agency will consider, any information that the manufacturer determines relevant to the MFP process. The accompanying proposed information collection request (ICR) suggests that this is intentional, as the proposed ICR solicits information **only** with respect to the statutorily enumerated negotiation factors (and, even then, does so in an unduly cramped manner by imposing a severe word limit) and does **not** provide for any supplementary submission.¹¹⁸ CMS should not narrow the universe of relevant evidence that it will consider during the MFP setting process.

3. CMS Should Fulsomely Justify the Initial Offer and Any Response to a Counteroffer in Writing and Afford Manufacturers an Opportunity to Comment on Any Response Before an MFP Is Set

It is important that CMS provide a meaningful justification in support of its offers and responses to any counteroffers. Negotiations involving offers and counteroffers are commonplace in the commercial sector. And they commonly entail robust, open, and bilateral dialogue between the parties to facilitate mutually agreeable terms. By establishing a “negotiation” process, Congress intended the Program to be premised on such familiar concept.

Congress also established requirements to facilitate transparency in the process, which is a necessary

¹¹⁵ SSA § 1191(d)(5)(B), 1194(b)(2)(B).

¹¹⁶ See *id.* § 1194(b)(2)(B), (C)(ii)(II).

¹¹⁷ *Id.* § 1194(b)(2)(D).

¹¹⁸ CMS, Information Collection Request (ICR) Form for Negotiation Data Elements under Sections 11001 and 11002 of the Inflation Reduction Act (CMS-10847, OMB 0938-NEW) (ICR Form for Negotiation Data Elements).

predicate to good faith dialogue during negotiations. By statute, CMS must provide an initial offer, in writing, to the manufacturer of the selected drug and include with it a justification based on the factors described in section 1194(e) of the SSA.¹¹⁹ The manufacturer of the selected drug may make a counteroffer to the initial offer, and, where the manufacturer does so, CMS must respond in writing.¹²⁰

These statutory requirements limit the scope of the agency's discretion under the statute, and such limitation can be meaningfully effectuated only if CMS is fully transparent as to the information under section 1194(e)(2) on which the agency relied. Additionally, to abide by the patient-centered intent of this statutory program, CMS must describe what threshold and measurement will be used to "determine the effects of the selected drug and its therapeutic alternative(s) on specific populations"¹²¹ and whether the selected drug fills an "unmet medical need."¹²² It is well known that patient centricity has revealed a misalignment between what patients report as important to them about their disease and/or treatment, and the data and measurements typically utilized in research and public policy decision-making.¹²³ If CMS relies more heavily on "Manufacturer-Specific Data" (section 1194(e)(1)) than "Evidence About Alternative Treatments" (section 1194(e)(2)), including data supporting "unmet medical need," CMS may be disregarding what is most meaningful to patients.

When determining therapeutic alternatives for a selected drug, CMS should rely on external organizations for purposes of evidence synthesis or technology assessment only if such organizations meet specified standards. Such standards should ensure organizational independence, patient-centered procedures and methods, methodological rigor, and transparency. CMS should apply these same rigor and transparency standards to its internal "claims analysis" and review when adjusting the MFP starting point based on clinical evidence.¹²⁴ Furthermore, we recommend that the MFP for a selected drug be set at the ceiling if such drug demonstrates significant patient benefit.

To give meaning to the agency's stated goal of promoting transparency, we urge CMS to commit to including meaningful explanations as to how the agency arrived at the offer and the response to any counteroffer, including how the offer or response is supported by statutorily enumerated negotiation factors, how such factors (and any other information) were weighed and considered, and any non-manufacturer sources of information relied upon.¹²⁵

Additionally, we ask that CMS agree to respond to any counteroffer within 30 days of receipt. We also ask that CMS agree to give manufacturers at least 30 days to comment on the response. For any such comment process to facilitate a more effective MFP process, CMS must actually consider the comments before setting the MFP. We ask CMS to commit to this. Not only will this further transparency and fairness in the MFP process, but it will also help to ensure that the agency is not inadvertently setting the MFP based on any misunderstanding or gap in information.

¹²⁴ Guidance at 60.3.3.

¹²⁵ See CMS, Medicare Drug Price Negotiation Program: Next Steps in Implementation for Initial Price Applicability Year 2026 (Jan. 11, 2023).

4. CMS Should Clarify That a Manufacturer May Broadly Supplement Its Timely Submission After the Submission Deadline Where Subsequent Developments Arise or Otherwise for Good Cause

As part of the MFP process, a manufacturer of a selected drug will be required to submit certain information regarding the drug's non-FAMP, as well as other specified information relevant to the MFP process.¹²⁶ For example, the statute contemplates the manufacturer submitting data regarding research and development costs, production and distribution costs, market data, and revenue and sales volumes.¹²⁷ Further, CMS has signaled that the manufacturer will be permitted to submit evidence about alternative treatments.¹²⁸

Such manufacturer-provided information must be submitted by March 1 of the year of the selection date (or October 2, 2023, for initial price applicability year (IPAY) 2026), just one month after a drug is selected for negotiation.¹²⁹ Given this tight deadline, there is a very real possibility that unforeseeable changes will occur after the submission deadline, such as new data regarding comparative effectiveness becoming available, a new therapeutic alternative coming to market, production costs unexpectedly increasing, or restatement of pricing data.

Manufacturers have every incentive to diligently comply with CMS's submission requirements, but there is a legitimate need for flexibility in allowing manufacturers to supplement their timely submissions to ensure CMS has the most accurate understanding of the dynamics surrounding the selected drug. This is especially so both because of the novelty of the program and in light of the fact that manufacturers have only a month to compile and submit voluminous amounts of complex information. In some cases, the required information may not even be available in the format that CMS requests at the time of an initial submission.

The agency's current proposal does acknowledge that there may be a need to provide supplemental information to the agency after the submission deadline, but inexplicably limits presentation of such new information to **the negotiation meetings**. This is inadequate. As CMS knows, new information can take many forms, including detailed new empirical evidence, records of governmental action, and other materials not amenable to being provided or meaningfully digested in the context of a meeting discussion. And limiting the presentation of such information to the negotiation meetings necessarily means that CMS will be unable to review and consider that information ahead of such meetings, making those meetings less efficient than they otherwise could be. Moreover, such meetings will occur only where there is a rejection of a manufacturer offer, such that there is no vehicle for consideration of new information at the initial offer stage, rendering the MFP process unnecessarily inefficient.

Given the very short period afforded for preparation of an initial submission and the real possibility that new information of relevance to the MFP setting process will become available after the submission deadline, we ask that CMS to establish a more meaningful process to share additional

¹²⁶ *Id.* §§ 1194(b)(2)(A), 1193(a)(4). Presumably, CMS will designate information submitted by manufacturers under section 1194(e)(1) as information that is due by March 1 of a given year (or October 2, 2023, for IPAY 2026) under section 1193(a)(4).

¹²⁷ *Id.* § 1194(e)(1).

¹³⁰ SSA § 1194(e)(1).

information with the agency after the submission deadline has passed. Specifically, **in addition to being able to share new information at negotiation meetings**, CMS should broadly permit a manufacturer to supplement a timely submission if new information of relevance to the MFP process becomes available after the submission deadline or otherwise for good cause shown.

B. CMS Should Permit Manufacturers to Rely on Reasonable Assumptions in Connection with Information Submissions and Provide Voluntary Explanations of Information Submissions As Appropriate

Under the Program, manufacturers must submit vast quantities of information to CMS, and the agency must then consider such information, along with certain other statutorily enumerated negotiation factors. Required manufacturer-submitted information includes research and development costs of the selected drug, current unit costs of production and distribution of the drug; prior federal financial support for certain discovery and development of the drug; data on certain pending and approved patent applications, FDA exclusivities, and FDA applications or approvals regarding the drug; and market, revenue, and sales volume data in the United States for the drug.¹³⁰ CMS appears to intend such information to be submitted only through its proposed ICR.¹³¹

1. CMS Should Revise Its Proposed ICR to Allow Manufacturers Greater Ability to Provide Voluntary Explanations of Information Submissions

Consistent with the agency's own recognition of the importance of assumptions with respect to research and development costs and current unit costs of production and distribution,¹³² CMS should apply such reasoning to all other data elements. The proposed ICR includes fields for manufacturers to provide voluntary explanations of the data submitted.¹³³ However, the fields are limited to explanations of how a manufacturer made a particular calculation and are subject to word limits.¹³⁴

Lilly is concerned that the proposed ICR provides manufacturers no meaningful way to justify or provide additional background and context with respect to their data submissions, beyond that which is specifically requested by CMS in the accompanying instructions. It is vital that CMS provide manufacturers the opportunity to do so, as it will provide CMS with meaningful insight into how manufacturers developed their submissions and any assumptions the manufacturer was required to make in seeking to fulfill its data submission obligations. Our recommendation is consistent with the agency's framing of such fields in the Guidance as space for "narrative text."¹³⁵

This recommendation is especially critical with respect to products approved long ago as the information required to complete a data field may be unavailable due to common data retention policies or otherwise in the course of business. Under these circumstances, CMS must afford manufacturers flexibility to comply with information requests – for example, with respect to research and development expenses, by allowing manufacturers to stipulate to the fact that direct costs were recouped in the explanation section.

¹³⁰ SSA § 1194(e)(1).

¹³¹ See ICR for Negotiation Data Elements.

¹³² Guidance at 53.

¹³³ ICR Form for Negotiation Data Elements.

¹³⁴ *Id.*

¹³⁵ Guidance at 53.

For these reasons, we recommend that CMS specify that manufacturers may include voluntary explanations as part of their data submissions, and that the agency commit to considering such explanations. To allow for submission of any such explanations as appropriate, CMS should remove the arbitrary word limit. The ability to justify data submissions is of the utmost consequence when potentially hundreds of millions of dollars in CMPs are on the line should CMS believe that a submission of required information is false or incomplete.

We further urge CMS to permit manufacturers to stipulate to the fact that they have “recouped” their direct research and development (R&D) costs on a particular product should they so choose. As noted above, several drugs that CMS may consider for inclusion on the list of drugs subject to price setting were approved decades ago. Routine document retention, retirement, and destruction policies will likely render collecting the data necessary to precisely report direct R&D expenditures for such products impossible. Moreover, it does not matter – for innovative biopharmaceutical manufacturers – whether R&D costs have been “recouped.” Discovering new chemical or biological entities is not like “discovering” the next generation of the iPhone or building a utility, for example. Where there is relative certainty that a new product will “work,” a recoupment calculation might make sense. For biopharmaceuticals, discovery is high risk, and successfully launching a product is far from assured. Revenue from currently marketed products fund the exploration, research, and discovery of future medicines. Characterization of the goal as “recoupment” is wrong – finding the next cure, or the next dozen cures, is what we do. Consequently, whether CMS determines that a product has “recouped” its own R&D costs is, frankly, not the reference point.

2. CMS Should Permit Manufacturers to Rely on Reasonable Assumptions

In addition, CMS should specify that manufacturers may make reasonable assumptions when interpreting statutory (or any future regulatory) requirements regarding such information submissions.¹³⁶ As CMS well knows, reasonable assumptions serve an important role to bridge gaps in statutory, regulatory, and sub-regulatory instructions. There are often unresolved ambiguities in how complex information submission requirements interact with equally multi-faceted business practices and products. Reasonable assumptions allow manufacturers to set forth their understanding of how legal requirements apply to their singular circumstances, and thereby help to ensure that regulatory regimes can be operationalized even where significant ambiguities cannot reasonably be expected to be clarified or resolved, particularly on a regulated entity-by-regulated entity basis.

CMS also already has well-established frameworks governing reasonable assumptions. For example, in the ASP and MDRP reporting contexts, CMS has long permitted manufacturers to make reasonable assumptions where there is no agency guidance addressing a given issue.¹³⁷ CMS can and should readily adopt a similar approach here. In doing so, manufacturers will be permitted to make reasonable assumptions in furnishing required information consistent with the general requirements and intent of the Program, applicable regulations, and customary business practices. As noted above, such reasonable assumptions can be documented and described in the proposed ICR, such that the agency is apprised of manufacturers’ thinking and assumptions.

Neither the Guidance nor the proposed ICR addresses reasonable assumptions. Rather, the Guidance

¹³⁶ See SSA § 1194(e)(1); see also *id.* §§ 1193(a)(4), 1194(b)(2)(A) (manufacturer information submission obligations).

¹³⁷ See, e.g., 71 Fed. Reg. 69,624, 69,667 (Dec. 1, 2006) (reasonable assumptions regarding ASP reporting); 83 Fed. Reg. 12,770, 12,785 (Mar. 23, 2018) (MDRP agreement provision governing reasonable assumptions).

sets forth an appendix of proposed definitions related to manufacturer-specific data,¹³⁸ and the proposed ICR restates the proposed definitions.¹³⁹ This approach is problematic – because the agency proposes a standardized and rigid data submission framework applicable to all manufacturers and products.

Such a framework will inevitably lack the flexibility needed to accommodate the unique attributes that necessarily characterize the multitude of therapies eligible for selection for the MFP process. For context, there are over 20,000 prescription drug products currently approved for marketing in the United States, each with its own unique attributes.¹⁴⁰ Among other things, there are myriad differences in products' development histories, FDA regulatory histories, chains of ownership, and pricing and sales arrangements across the multi-layered drug distribution chain. Accordingly, it is impossible to develop a coherent “one-size-fits-all” approach to data submissions (and ill-advised for CMS to seek to do so). Attempting to shoehorn countless varying technologies, business practices, and circumstances into a single framework will inevitably result in less useful, relevant, and complete information being provided to CMS. It will also be a recipe for arbitrary decision-making.¹⁴¹ CMS will effectively be blinding itself to the full complement of data that a manufacturer deems most relevant to its product's development and pricing and that it reasonably views as falling within the categories of information required by statute to be considered.¹⁴²

As such, Lilly recommends that CMS rescind its appendix of proposed definitions (also included in the proposed ICR). CMS should instead adopt the aforementioned approach grounded in CMS's long-standing reasonable assumptions framework, and not attempt to shoehorn a broad universe of unique circumstances into highly regimented and inflexible data definitions. To the extent CMS disregards Lilly's request, please see Appendix B to this letter setting forth some of our preliminary concerns with CMS's data requests (in light of the compressed comment period and the complexity of this issue, we reserve the right to supplement this information later).

C. Confidential Commercial Information

1. CMS Should Establish More Robust Safeguards to Ensure That Confidential Commercial Information Submitted by Manufacturers Is Protected from Disclosure

The Program requires manufacturers to submit a host of information to CMS, including highly confidential manufacturer-specific data regarding research and development costs, revenue information, and sales volumes data.¹⁴³ Congress recognized the havoc that would be wreaked if sensitive information were publicly disclosed. As such, the statute imposes a stringent duty on CMS to maintain the confidentiality of such information: “Information submitted to the Secretary under this part by a manufacturer of a selected drug that is proprietary information of such manufacturer (as determined by the Secretary) shall be used only by the Secretary or disclosed to and used by the

¹³⁸ See Guidance, app. C.

¹³⁹ See ICR Form for Negotiation Data Elements.

¹⁴⁰ See FDA, Fact Sheet: FDA at a Glance, <https://www.fda.gov/about-fda/fda-basics/fact-sheet-fda-glance#:~:text=There%20are%20over%2020%2C000%20prescription,FDA%2Dapproved%20animal%20drug%20products> (Aug. 17, 2022).

¹⁴¹ See 5 U.S.C. § 706(2)(A).

¹⁴² See *Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (agency decision-making must be based on **relevant** data and cannot fail to consider important aspects of the problem at hand).

¹⁴³ SSA § 1194(e)(1).

Comptroller General of the United States for purposes of carrying out this part.”¹⁴⁴

Consistent with this broad statutory mandate of confidentiality, CMS states in its Guidance that it intends “to implement a confidentiality policy that is consistent with existing requirements for protecting proprietary information, such as Exemption 4 of [the Freedom of Information Act (FOIA)].”¹⁴⁵ However, the Guidance is devoid of any meaningful detail as to **how** CMS specifically intends to protect the confidential and proprietary information of manufacturers.

Lilly strongly urges CMS to specify the specific safeguards that the agency will put into place to protect the confidentiality of manufacturer information, including by adopting the safeguards described below. Lilly also urges CMS to implement all such safeguards in a manner that maximizes protection of confidential commercial information. Further, Lilly emphasizes that requirements of confidentiality are meaningful only if there are consequences in the event of a breach. As such, failure by CMS to protect confidential commercial information should result in a “renegotiation” if the manufacturer requests it.

i. Scope of Protection for Confidential Commercial Information

CMS’s Guidance confirms that, at minimum, the familiar safeguards under FOIA will apply to information submitted under the Program.¹⁴⁶ Lilly appreciates this confirmation, including with respect to FOIA Exemption 4’s prohibition on disclosure of information designated as confidential without providing a pre-disclosure notification and an opportunity to raise objections to disclosure.¹⁴⁷ Lilly also requests that CMS explicitly confirm that that, under the Program, manufacturer information will also be protected from disclosure to the same extent as such information is so protected under all other applicable federal laws and policies. For example, the Medicare statute provides that information submitted by manufacturers that relates to ASP “is confidential and shall not be disclosed by [CMS] in a form which discloses the identity of a specific manufacturer . . . or prices charged for drugs or biologicals by such manufacturer,” except in limited circumstances that are not relevant here.¹⁴⁸ Similarly, the Medicaid statute provides that “information disclosed by manufacturers . . . under [the MDRP] . . . is confidential and shall not be disclosed by [CMS] . . . in a form which discloses the identity of a specific manufacturer . . . [or] prices charged for drugs by such manufacturer,” except under limited circumstances that are not relevant here. Furthermore, the 340B Program generally protects the disclosure of information submitted by manufacturers participating in the program.¹⁴⁹ CMS should implement safeguards that ensure that information submitted under the Program is protected from disclosure to the same extent that such information is so protected under these federal laws and policies.

ii. Confidentiality Safeguards with Respect to the Public Explanation of the MFP

Lilly strongly urges CMS to adopt additional safeguards around the agency’s public explanation of the MFP. The statute requires CMS to publish such explanation of the MFP for each selected drug.¹⁵⁰ This public explanation poses an inherent risk of exposure of confidential commercial information given

¹⁴⁴ *Id.* § 1193(c).

¹⁴⁵ Guidance at 29.

¹⁴⁶ Guidance at 29; *see also* 45 C.F.R. §§ 5.41, 5.42.

¹⁴⁷ *See* 45 C.F.R. §§ 5.41, 5.42.

¹⁴⁸ SSA § 1847A(f)(2)(D) (subject to certain limited exceptions).

¹⁴⁹ *Id.* § 1927(b)(3)(D) (subject to certain limited exceptions).

¹⁵⁰ SSA § 1195(a)(2).

that the MFP likely will be based at least in part on drug pricing and other confidential commercial information. We recognize and appreciate CMS's stated intention to protect data elements containing non-public commercial or financial information from disclosure and to make only high-level comments about such information in the agency's public explanation of the MFP.¹⁵¹

However, Lilly believes that additional safeguards are needed to protect against **inadvertent** disclosure of proprietary information. Lilly recommends that CMS give manufacturers a reasonable opportunity to review the draft explanation in advance of public disclosure, including an opportunity to identify to CMS any way in which the draft explanation would directly or indirectly disclose manufacturers' confidential information. Doing so is well warranted given that Congress emphasized the need for confidentiality in the specific context of the public explanation of the MFP by explicitly cross-referencing the statute's confidentiality requirements in the provision requiring such explanation.¹⁵²

iii. Robust Storage and Access Controls

Lilly asks CMS to confirm that all trade secret, proprietary, and otherwise confidential commercial information of manufacturers will be stored in a secure manner with appropriate data privacy and security protections, as is necessary to protect sensitive information from inadvertent or malicious improper disclosure. Among other things, CMS should ensure that all confidential commercial information is stored appropriately in the Health Plan Management System (HPMS). We also ask that CMS specify how it intends to maintain similar confidentiality protections for information submitted to CMS via e-mail or Box. Among other things, we are concerned about the use of a third-party commercial platform like Box to collect voluminous amounts of proprietary information, and urge CMS to set forth the means by which the agency will ensure submitted information is kept confidential, including as against intentional or inadvertent misuse by Box personnel.

In evaluating other safeguards to better protect confidential records held by the agency, Lilly notes that CMS already implements many protections with respect to product and pricing data submitted by manufacturers participating in the MDRP. Under the MDRP, data are uploaded to an online interface that both state and manufacturer users access. Functionality of the interface, however, is limited by the user's role: State users do not have the ability to view quarterly or monthly pricing records or any product information because "some of this information is confidential (e.g., Baseline Average Manufacturer Price (AMP) data)."¹⁵³ To the extent not already accounted for, CMS should implement similar safeguards with respect to HPMS, and limit access by CMS staff to confidential information in HPMS only to situations where there is a programmatic need. CMS should also consider whether CMS's MDRP online interface includes other privacy and security protections that can be incorporated into the systems used to store confidential information under the Program to make such systems more robust in protecting the confidential information of manufacturers.

2. CMS's Must Abandon Its Proposed Policies Regarding Data Use and Destruction

- i. The Records Destruction Requirement Is Unenforceable Under the Terms of the Program Agreement, and, If CMS Were to Seek to Enforce It, Such Enforcement Would Be Violative of Manufacturers' Due Process Rights

¹⁵¹ Guidance at 29.

¹⁵² SSA § 1195(a)(2).

¹⁵³ CMS, *Medicaid Drug Programs (MDP) User Manual* 1 (Nov. 3, 2021).

As an initial matter, CMS's proposed requirement that a manufacturer destroy specified records, after the Program agreement terminates, is unenforceable. It is well-established that, when an agreement terminates, the obligations it imposes on parties terminate as well.¹⁵⁴ Thus, if a manufacturer declines to destroy such records after termination of the Program agreement, it violates no requirement of any such agreement. Accordingly, no CMP may be imposed.¹⁵⁵ CMS's observation that its own obligation to maintain the confidentiality of specified information "survive[s] termination of the Agreement"¹⁵⁶ does not alter the analysis. This is true because, as CMS acknowledges,¹⁵⁷ such information is protected from disclosure under FOIA, independent of whether a Program agreement is in force. Thus, as a requirement of the Program agreement established under section 1193(a)(5) of the SSA, the record destruction obligation ends with termination of the agreement, and therefore cannot be enforced after the agreement ceases to be in effect.

CMS must accede to this limitation against enforcement. If CMS were to treat the record destruction proposal as an enforceable requirement, it would raise serious questions of due process. As CMS knows, the statute imposes vast CMPs, including a CMP equal to \$100 million per piece of false information submitted by a small biotech drug or biosimilar manufacturer under section 1192(d)(2) or 1192(f)(1)(B) and \$1 million per day for a failure to submit required information.¹⁵⁸ The magnitude of these sanctions means that record-keeping is of paramount importance: Manufacturers must maintain complete records for evidentiary reasons to protect against mistaken penalties that could otherwise cost them hundreds of millions of dollars. By proposing to require that manufacturers destroy such records, the Guidance raises fundamental concerns under the Due Process Clause of the Fifth Amendment that would become ripe if the data destruction policy were treated as enforceable. "[T]he essence of due process is fundamental fairness," and little could be more fundamentally unfair than mandating destruction of the very records needed to verify an entity's innocence against erroneous penalty.¹⁵⁹ As the Supreme Court has long held, due process mandates a meaningful "opportunity to be heard."¹⁶⁰ Just as this includes the "opportunity to present reasons . . . why proposed action should not be taken," it must also include the right to maintain the evidence necessary to support such reasons.¹⁶¹

Enforcement of the record destruction proposal would also be patently arbitrary and capricious. Agency action is arbitrary and capricious if it "frustrate[s] the policy that Congress sought to implement."¹⁶² This describes exactly CMS's proposal. Mandated record destruction is irreconcilable with Congress's clear intent to establish a meaningful appeal process to challenge the imposition of a CMP. Specifically, section 1197(d) requires the Program to incorporate procedural requirements imposed under section 1128A. In turn, section 1128A(e) expressly provides that a party may "apply

¹⁵⁴ It is a "traditional principle that contractual obligations will cease, in the ordinary course, upon termination of the . . . agreement." *M&G Polymers USA, LLC v. Tackett*, 574 U.S. 427, 441–42 (2015) (citing *Litton Fin. Printing Div., Litton Bus. Sys., Inc. v. NLRB*, 501 U.S. 190, 207 (1991)).

¹⁵⁵ See SSA § 1198(c) (authorizing the imposition of a CMP of \$1 million per day only for a violation of a requirement of a Program agreement established under section 1193(a)(5)); see also *id.* § 1193(a)(5).

¹⁵⁶ Guidance at 29.

¹⁶⁰ *Mathews v. Eldridge*, 424 U.S. 319, 333 (1976) (internal quotation marks omitted).

¹⁶¹ See *Cleveland Bd. of Educ. v. Loudermill*, 470 U.S. 532, 546 (1985) (citing Friendly, "Some Kind of Hearing," 123 U. Pa. L. Rev. 1267, 1281 (1975)).

¹⁶² *Mylan Labs. Ltd. v. FDA*, 910 F. Supp. 2d 299, 306 (D.D.C. 2012).

to the court for leave to adduce additional evidence and shall show to the satisfaction of the court that such additional evidence is material.”¹⁶³ CMS may not impose a record destruction requirement that subverts the clear intent of this provision, which is to enable a party to present any material evidence to a court when a case is heard on appeal, without violating the prohibition against arbitrary and capricious agency action.¹⁶⁴

ii. The Manufacturer Gag Rule Violates Manufacturers’ Free Expression Rights and Threatens Unconstitutionally Excessive Fines

CMS’s proposed gag on manufacturer disclosure of negotiation-related information violates manufacturers’ basic First Amendment “right to speak freely.”¹⁶⁵ The proposal would compel manufacturer silence as to information highly relevant to political discourse—i.e., the government’s administration of a major program that implicates a far-ranging set of fundamental equities—through the threat of a CMP of \$1 million per day for as long as the Program agreement is in effect.¹⁶⁶ Should a manufacturer make any of a broad swath of program-related information publicly available, as is its right under the Free Speech Clause of the First Amendment, it could be penalized with boundless CMPs for as long as the Program agreement is in effect, as there would be no ability to “un-ring the bell” and thereby come back into compliance and cut off the CMPs. Such an unprecedented burden on free speech cannot be countenanced. As the Supreme Court has admonished, government “may no more silence unwanted speech by burdening its utterance than by censoring its content.”¹⁶⁷

Not only does CMS’s proposal not withstand heightened scrutiny, but it is not even rationally defensible. In fact, the federal government imposes no comparable requirement with respect to drug price negotiations under the Federal Supply Schedule (FSS) program administered by the Department of Veterans Affairs (VA). FSS agreements contain no language prohibiting a manufacturer from disclosing negotiation-related information. Especially in light of how the federal government administers the FSS program, there is no justification for the proposed severe speech restriction under the Program.

The prospect of effectively boundless CMPs also raises grave concerns under the Eighth Amendment’s prohibition against excessive fines. “The touchstone of the constitutional inquiry under the Excessive Fines Clause is the principle of proportionality.”¹⁶⁸ It is difficult to envision anything more “grossly disproportional” than the prospect of a million dollar penalty per day that could perpetuate for years or even decades – even more so because the penalty is imposed where there is no “loss to the public fisc,” and the manufacturer is simply exercising its constitutional right to speak freely.¹⁶⁹

3. The Gag Rule Is Irreconcilable with Corporate Fiduciary Duties and May Result in

¹⁶³ SSA § 1128A(e).

¹⁶⁴ See 5 U.S.C. § 706(2)(A).

¹⁶⁵ *Wooley v. Maynard*, 430 U.S. 705, 714 (1977).

¹⁶⁶ See Guidance at 69. Consistent with the discussion above, CMS’s proposed gag on manufacturers is unenforceable once the Program agreement terminates. The silence it imposes on manufacturers exists as a requirement of the Program agreement, which terminates with the agreement, as does the agency’s ability to impose a CMP for a violation of the agreement.

¹⁶⁷ *Sorrel v. IMS Health Inc.*, 564 U.S. 552, 566 (holding that a law compelling silence by pharmaceutical manufacturers with respect to certain pharmacy records violated the First Amendment).

¹⁶⁸ *United States v.ajakajian*, 524 U.S. 321, 334 (1998).

¹⁶⁹ *Id.* at 323-24.

Liability Under Federal and State Securities Laws

Manufacturers also cannot be subject to “gag” requirements that bar them from sharing material information with key constituents, including their boards and shareholders. Among other things, manufacturers have obligations to make material information available to shareholders and must maintain records to facilitate this obligation.¹⁷⁰

The proposed data use and destruction provisions will restrict important information from making its way into markets, resulting in potential liability for manufacturers under applicable federal and state securities laws. For example, were a public company to discuss its expectations regarding market share for a drug under development, and then later learn through the MFP setting process that it is unlikely to achieve the market share previously expected, it would be appropriate to use that information to update the market and reset expectations. Under CMS’s proposal, the company could not do so.

This could raise fundamental questions as to whether a company has violated its legal duties to update statements previously made to shareholders and potential shareholders – potentially exposing the company to vast liability for failing to provide material information to investors. Similar concerns can arise with private companies, which are subject to anti-fraud provisions of applicable federal and state securities laws. If a private company does not disclose information that is later viewed as material, it risks liability for failure to disclose that information. Hiding information from investors, whether public or private, runs contrary to the fundamental underpinnings of U.S. securities laws, which expect sunlight and visibility into important developments related to companies.

The Guidance’s generic exception to the gag requirement (“except as may required by applicable . . . law”) also does not address these concerns. In many cases there will not be bright line requirements under applicable law, leaving companies uncertain as to what they may and may not do to comply with their competing obligations.¹⁷¹

VII. Setting the MFP: Special Considerations

- A. CMS Should Allow Manufacturers to Submit Evidence Demonstrating That Pricing Below a Specified Level Would Imperil Patient Access, and CMS Should Specify That the MFP Will Not Be Set Below That Price (or the MFP Ceiling Price If Lower)*

Government price-setting has been shown by research to have profoundly negative impacts on innovation and thus impede patient access to critical therapies. For example, one study in Europe found that a “10% drop in the price of medicines in price-controlled [European Union] markets was associated with . . . an 8% increase in the delay of access to medicines.”¹⁷² Other studies have shown that reductions in pharmaceutical revenues caused by pricing regulation reduce the annual number

¹⁷⁰ Under nearly all states’ corporate laws, corporations are required to maintain records and permit shareholders to inspect their books and records. *See, e.g.*, 8 Del. C. § 220 (describing the power of a shareholder to demand inspection of a corporation’s books and records).

¹⁷¹ Guidance at 30.

¹⁷² D. Schulthess and H. Bowen, *The Historical Impact of Price Controls on the Biopharma Industry*, Vital Transformations (Nov. 22, 2021).

of marketed therapies.¹⁷³ Research has also demonstrated that government price-setting is associated with drastic declines in early stage research, which is the precursor to robust future transformational therapeutic innovation.¹⁷⁴ The adverse consequences of discouraging innovation are ultimately borne by patients, who are prevented from accessing the most effective treatments.¹⁷⁵

There may be instances where a manufacturer demonstrates that setting the MFP below a particular price would imperil patient access to the selected drug. In other words, such a mandated price would be so far below the market price that a mismatch between supply and demand would result. To protect patient access to medicines, we urge CMS to specify that, in such cases, it will not set the MFP below the lower of such price or the MFP ceiling price. Patient access should be a paramount consideration in interactions with manufacturers to set the MFP, and CMS should develop policies to specifically account for this concern to mitigate the negative impact on patients that could follow from the imposition of an unreasonably low MFP.

B. CMS Should Clarify That It Will Not Set the MFP Below the MFP Ceiling Price During Any Year of the Price Applicability Period During Which the Drug Is Under Patent Protection

As part of the MFP setting process, the statute requires CMS to consider a number of factors in setting the MFP for a selected drug, including “[d]ata on pending and approved patent applications [and] exclusivities recognized by [FDA].”¹⁷⁶ In the Guidance, CMS indicates that, if a selected drug has patents and exclusivities that will last a number of years, CMS may adjust the “preliminary price” downward.¹⁷⁷ Lilly strongly urges CMS to change course, and instead afford pricing relief based on whether, based on information submitted by the manufacturer, a selected drug will have any remaining patent protection at the start of the price applicability period that cannot be designed around (the basic drug substance patent) or that cannot be avoided via a “skinny label” (collectively, the “primary patents”). If it will, CMS should set the MFP at the MFP ceiling price during any year of the price applicability period during which the drug is under such patent protection.

The statute permits CMS to subject a drug to MFP setting at least seven years post-approval and a biologic at least eleven years post-approval.¹⁷⁸ In many cases, by the time the price applicability period for a selected drug begins, the product’s regulatory exclusivity period will have expired—but this is not necessarily the case for its patent protection period.¹⁷⁹ Patents afford longer exclusivity periods, meaning that it may very well be the case that there will be remaining patent protection for a selected drug that extends into the price applicability period.

It is vital that selected drugs still under patent protection be given special protection. The process of bringing pharmaceutical or biotechnology product from research and development to market is

¹⁷⁶ SSA § 1194(e)(1)(D).

¹⁷⁷ Guidance at 53.

¹⁷⁸ SSA § 1192(e)(1)(A)-(B).

¹⁷⁹ See FDA, Frequently Asked Questions on Patents and Exclusivity, available at <https://www.fda.gov/drugs/development-approval-process-drugs/frequently-asked-questions-patents-and-exclusivity#howlongexclusivity> (last accessed Feb. 2023).

exorbitantly long and expensive.¹⁸⁰ Many candidates fail despite significant investment. In a 2021 study of research and development costs, the Congressional Budget Office (CBO) found that “[t]he amount of money that drug companies devote to [research and development] is determined by the amount of revenue they expect to earn from a new drug, the expected cost of developing that drug, and policies that influence the supply of and demand for drugs.”¹⁸¹ The CBO also found that estimates of the average research and development costs for new drugs range from less than \$1 billion to more than \$2 billion, while only about 12% of all drugs that enter clinical trials are ultimately approved by FDA.¹⁸²

The patent system, like regulatory exclusivities, is designed to recognize the risks and costs inherent in innovation and reward such investment in research and development. Indeed, courts have expressly recognized that “the encouragement of investment-based risk is the fundamental purpose of the patent grant.”¹⁸³ It is the patent protection period that affords a manufacturer the opportunity to recover its research and development costs – not only for the drug for which the patent was awarded but also for other research and development investments that the manufacturer may have made. Simply put, the risk associated with bringing, and the investment required to bring, a new drug to market dwarfs the corresponding risk and investment for a copy product. From a technical perspective, the entry barrier for a new drug is sky high relative to that of the corresponding copy product.

CMS should take special care not to upset the long-standing policy designs of the U.S. patent system. It can do so by honoring any remaining patent period for selected drugs by specifying that the MFP will not be set below the MFP ceiling price for during any year during the price applicability period into which the drug’s patent protection period extends.

C. For a Small Molecule Drug, CMS Should Specify That It Will Not Set the MFP Below the MFP Ceiling Until at Least the First Year of the Price Applicability Period That Starts After the Date on Which Thirteen Years Have Lapsed Since Its Approval

To be MFP-eligible, biologics (large molecules) must be at least eleven years post-licensure, while drugs (small molecules) must be at least seven years post-approval.¹⁸⁴ The approximately two-year time lag between selection for the MFP process and application of the MFP means that an MFP cannot apply to a biologic until at least approximately **thirteen** years after licensure, whereas an MFP cannot apply to a drug until at least approximately nine years post-approval. CMS should set the MFP at the MFP ceiling until at least the first year during the price applicability period that starts at least **thirteen years after** the approval of a drug. This approach is necessary to help preserve small molecule innovation in parity with large molecule innovation.

¹⁸⁰ See also, e.g., Henry Grabowski, et al., Continuing trends in U.S. brand-name and generic drug competition, 24 J. Med. Econ. 908, 914 (2021) (finding that the average 2017-19 MEP of 13.0 years for new molecular entities (NMEs) of more than \$250 million has changed relatively little over the past decade and remains lower than for all NMEs (14.1 years). Paragraph IV challenges are more frequent and occur earlier for NMEs >\$250 million. Generic share erosion remains high for both NME types.

¹⁸² *Id.*

¹⁸³ *BIO v. District of Columbia*, 496 F.3d 1362, 1372 (Fed. Cir. 2007).

¹⁸⁴ SSA § 1192(e)(1).

In particular, Lilly is concerned that the nine- and thirteen-year distinction arbitrarily promotes large molecule biologic innovation to the detriment of small molecule drug innovation. Studies show that, in the first five years on the market, most products (whether small or large molecules) achieve modest levels of annual sales.¹⁸⁵ Accordingly, manufacturers may seek the economic benefit of an additional four-year shelter from selection for the MFP process by focusing research and development on biologics instead of drugs.

Disincentivizing manufacturers from investing in small molecule drugs presents serious risk to patient access to effective treatments. Studies have shown that biologics account for 37% of net drug spending in the United States and are estimated to cost 22 times more than small molecule drugs.¹⁸⁶ Such costs are prohibitive for many patients. Small molecule drugs, on the other hand, are generally less expensive to develop and produce than biologics. Lower production costs translate into lower drug prices, increasing accessibility for patients. Nevertheless, small molecule drugs do not enjoy the same additional four years of freedom from selection for the MFP process that biologics enjoy.

Moreover, while patients benefit from access to both types of products, small molecule drugs figure more prominently in the treatment plans of most Americans. Many biologics must be stored and administered in specialized clinics under the supervision of medical professionals.¹⁸⁷ One reason for this restriction is that biologics (which are produced from living organisms) require strict control over storage and handling that is often unnecessary for more stable chemically-derived small molecule drugs.¹⁸⁸ Also, with respect to a biologic, medical professional supervision may be necessary to administer care if the patient suffers from a serious, life-threatening side effect, such as an unintended immune response to the product. As a result, patient access to biologic treatments may be limited by geographic and/or time constraints. Small molecule drugs, by contrast, are more easily administrated and more readily mobile.

Accordingly, CMS should promote small molecule drug development to the greatest extent possible by setting the MFP for a small molecule drug at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval thereby helping to counterbalance the incentives that place a disproportionate emphasis on biologic development at the expense of small molecule drug development.

D. CMS Should Ensure Continued Manufacturer Participation in the Program – and Access for Patients to the MFP – by Including Meaningful Protections for Manufacturers Against “Spillover” Risks

Since the enactment of the IRA, several states have proposed legislation that would authorize or require the state to rely on a selected drug’s MFP as a reference point in setting a price or payment

¹⁸⁵ Quintiles IMS Inst., *Lifetime Trends in Biopharmaceutical Innovation: Recent Evidence and Implications*, at 2 (Jan. 2017).

¹⁸⁸ *Id.*

limit outside of the Medicare market.¹⁸⁹ And at least one state agency has promulgated regulations authorizing the state's Prescription Drug Affordability Board to consider a selected drug's MFP in setting an upper payment limit for the drug, as subject to an affordability review.¹⁹⁰ It is also possible that commercial entities will seek to invoke the MFP as a reference price in commercial negotiations. However, MFPs are not reference prices or objective external benchmarks; they are prices that manufacturers, based on forced disclosure of highly sensitive data, are compelled to make available with respect to Medicare beneficiaries because failure to do so will result in a penalty (styled as an excise tax) of up to 1900% of daily sales and/or effective exclusion from doing business with Medicare and Medicaid.

The MFP is not designed to serve as a reference price or external benchmark across non-Medicare markets. Indeed, broad spillover of this compelled price could engender risks to all federal healthcare program beneficiaries because widespread and unintended reliance on the MFP (by states or commercial entities) will make it impossible for manufacturers to continue to participate in federal programs at all. This is why Congress explicitly restricted the obligation to provide access to the MFP to units furnished or dispensed to **Medicare** beneficiaries.

The MFP is also not a rational metric for statewide drug pricing or payment restrictions—because it is not set by reference to any objective metric tied to the appropriate price or payment that should be applied to a drug across any given state market. Further, expanding the application of the MFP outside of the Medicare market risks fundamentally disrupting the careful balance that Congress struck in establishing the Program thereby jeopardizing patient access and impeding innovation.¹⁹¹ It would, for example, greatly skew the projected revenue and sales volume for a selected drug as well as the return on investment in research and development costs, factors that CMS must consider in setting an MFP.

More fundamentally, if the MFP is used as a reference point for non-Medicare markets, manufacturers will be unable to invest in ongoing innovation because they will face undue limitations on their ability to recoup the potentially billions of dollars in research and development costs associated with developing a single drug, much less the countless additional billions of dollars spent on research and development that never culminate in an approved product.¹⁹² Congress did not intend for the Program to grind the wheels of innovation to a halt, and unambiguously limited the scope of the MFP accordingly.

It is imperative that CMS address need to protect incentives for innovation by limiting the expansion of the MFP beyond the Medicare market and, thus, outside of the scope intended by Congress. To mitigate these serious concerns, Lilly asks CMS to address this in the Program agreement. We think there are at least two options. First, CMS could specify in the agreement that the MFP will not be set below the MFP ceiling price where the manufacturer shows that the MFP will be or has been used as

¹⁸⁹ See, e.g., S.B. 967, Va. Gen. Assembly (2023) (providing that the prescription drug affordability board “may adopt the Medicare maximum fair price . . . for a prescription drug product as the upper payment limit amount”); H.F. 17, Minn. Leg., 93rd Sess. (2023) (“When setting an upper payment limit for a drug subject to the Medicare maximum fair price under United States Code, title 42, section 1191(c), the board shall set the upper payment limit at the Medicare maximum fair price.”).

¹⁹⁰ 3 Colo. Code Regs. § 702-9:4.1(C)(2)(a)(ix).

¹⁹¹ See D. Schulthess and H. Bowen, *The Historical Impact of Price Controls on the Biopharma Industry*, Vital Transformations (Nov. 22, 2021).

¹⁹² See M. Schlander, et al., *How Much Does It Cost to Research and Develop a New Drug? A Systematic Review and Assessment*, *PharmacoEconomics* 1243–1269 (2021).

a reference point in setting a pricing or payment limit outside of the Medicare market. Alternatively, CMS could specify that, where there is a non-trivial amount of spillover of MFP pricing outside the Medicare market (say 5% of unit sales), that constitutes a “material change” to the agreement that triggers a “renegotiation.”

E. CMS Should Specify That the MFP Will Not Be Set Below Ceiling Price if the Selected Drug Is Subject to a VBP Subject to the MBPRO

CMS has repeatedly expressed a strong interest in promoting value-based pricing of and payment for drugs and biologics to promote access to the highest quality of care available while also achieving cost savings within its programs and across the health care system more generally.¹⁹³

In 2020, CMS promulgated a rule to better promote VBPs in the commercial and Medicaid marketplaces in light of historical obstacles under the MDRP by establishing the MBPRO.¹⁹⁴ The MBPRO is a new option for reporting BP where a manufacturer offers a VBP in the commercial market. Manufacturers that elect to report via the MBPRO are required to submit two distinct sets of BP data: (1) the set of potential BPs available under the VBP (VBP BP), which reflect the multiple value-based prices available under the arrangement; and (2) a single non-value-based BP (non-VBP BP), which reflects the lowest price available from the manufacturer outside of the VBP.¹⁹⁵ MBPRO ensures that state Medicaid programs have a choice between (1) participating in the VBP, in which case the Medicaid rebate amount is calculated based on the VBP BP, and (2) not participating in the VBP, in which case the Medicaid rebate amount is calculated based on the non-VBP BP.

In establishing the MBPRO, CMS recognized the “interest among patient and consumer groups, states, and manufacturers in the new multiple best price policy” in light of the shift to value-based pricing and payment that it represents.¹⁹⁶ CMS also stated that the policy “is meant to help improve patient access to new medications, particularly new high cost therapies such as gene or cell therapies, by facilitating the use of VBP arrangements when purchasing such medications.”¹⁹⁷

More recently, the Center for Medicare and Medicaid Innovation (CMMI) proposed a set of innovative models to further value-based pricing and payment, including a Cell and Gene Therapy Access Model that will enable CMS to coordinate and administer outcomes-based agreements with manufacturers of certain cell and gene therapies on behalf of state Medicaid programs.¹⁹⁸ This VBP-oriented model is consistent with the stated policy priorities of the Biden Administration. In fact, the model was in direct response to an Executive Order issued by President Biden on October 14, 2022, requiring HHS to consider models that “would lower drug costs and promote access to innovative drug therapies for beneficiaries enrolled in the Medicare and Medicaid programs,” including through the use of

¹⁹³ See, e.g., 85 Fed. Reg. 87,000, 87,032 (Dec. 31, 2020); 83 Fed. Reg. 22,692 (May 16, 2018) (explaining that “[v]alue-based transformation of our entire healthcare system is a top [Department of Health and Human Services (HHS)] priority”); CMS, What are the value-based programs? (last accessed Feb. 2023), available <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/Value-Based-Programs>.

¹⁹⁴ 85 Fed. Reg. at 87,032.

¹⁹⁵ 85 Fed. Reg. at 87,025.

¹⁹⁷ 85 Fed. Reg. at 87,032.

¹⁹⁸ HHS, HHS Secretary Responds to the President’s Executive Order on Drug Prices (Feb. 14, 2023), available at <https://www.hhs.gov/about/news/2023/02/14/hhs-secretary-responds-to-the-presidents-executive-order-on-drug-prices.html>.

“value-based payment that promotes high quality care.”¹⁹⁹

CMS should take special care to ensure that the Program does not undermine the very VBPs that CMS is seeking to advance through the host of initiatives described above. One way to do so is to specify that, where a manufacturer submits information during the MFP setting process showing that it offers a VBP for a selected drug and has elected the MBPRO or is participating in a VBP-oriented model, CMS will not set the MFP for the drug below the MFP ceiling price. Doing so will further the agency’s policy objective of promoting value-based pricing of and payment for drugs by incentivizing VBPs.

VIII. MFP Ceiling: Average Non-FAMP

Lilly respectfully recommends that CMS address the following points related to the average Non-FAMP and the calculation of MFP ceiling price.

A. The basis of the “average Non-FAMP”

The statute requires CMS to use an “average Non-Federal Average Manufacturer Price” (average Non-FAMP) as part of determining the ceiling for the MFP. In the Guidance, CMS signals its intent to develop, implement, and oversee a completely new pricing program to calculate the average Non-FAMP based on information collected over each given **calendar** year.²⁰⁰ Lilly strongly opposes this proposal as unnecessary, burdensome, and inconsistent with Congress’s intent. CMS should instead adopt an approach for calculating the average non-FAMP that simply adopts the annual Non-FAMP under the Veterans Health Care Act of 1992 (VHCA), which is based on the federal **fiscal** year.

In the first place, borrowing from the existing VHCA framework would generate vast efficiencies for both the agency and manufacturers. If CMS were to use the existing VHCA framework, there would be no need for CMS to create and oversee a completely new price reporting framework, which would save countless resources for both the agency and manufacturers.

Calculating the average Non-FAMP in a manner that aligns with the VHCA framework would also better align with Congress’s intent. The average Non-FAMP is statutorily defined to “mean[] the average of the non-Federal average manufacturer price (as defined in section 8126(h)(5) of title 38, United States Code) for the 4 calendar quarters of the year involved.”²⁰¹

The statutory cross-reference to 38 U.S.C § 8126(h)(5) is to the **VHCA**. As such, the statute effectively directs CMS to start with the Non-FAMP calculations under the VHCA to determine how to calculate the average Non-FAMP.

Under the VHCA, manufacturers are required to calculate and report quarterly Non-FAMPs and an annual Non-FAMP, and the annual Non-FAMP is calculated based on quarterly data from the federal **fiscal** year (not the calendar year).²⁰² Given the explicit statutory reference to the VHCA in the

¹⁹⁹ Executive Order No. 14087, 87 Fed. Reg. 63,399, 63,399–400 (Oct. 14, 2022).

²⁰⁰ Guidance at 42-44.

²⁰¹ SSA § 1194(c)(6).

²⁰² For example, for the 2021 annual Non-FAMP (a benchmark average Non-FAMP year referenced in the statute), the data used for the calculation covers the period of October 1, 2020, through September 30, 2021 (Q4 (CY1) through Q3 (CY2)). See SSA § 1194(c)(1)(C). Note that quarterly non-FAMP calculations themselves

average Non-FAMP definition, there is every reason to think that Congress wanted the Program's calculation of the average Non-FAMP to align with the VA's long-standing approach to calculating the annual Non-FAMP. As such, use of a federal **fiscal** year is the most appropriate way to calculate the average Non-FAMP. Lilly acknowledges that the statute specifies that the average Non-FAMP is calculated based on the "4 calendar quarters of the year involved," but the statute leaves room for use of a federal fiscal year-based approach because it does not specify whether the "year involved" is a calendar year or a federal fiscal year. This gives CMS ample discretion to base the average Non-FAMP calculation on the four quarters of the federal fiscal year (Q4 – Q3) to promote alignment between the average Non-FAMP calculation and the pre-existing VHCA calculation of the annual Non-FAMP.

It is also critical that CMS develop mechanisms to account for anomalies in the average Non-FAMP and to permit restatements of the average Non-FAMP due to data or other errors identified after the fact. The VA's experience under the VHCA has shown that issues inevitably arise that yield anomalous or erroneous non-FAMP-related calculations. Just as the VA has done, CMS must develop exceptions processes to account for such issues, irrespective of whether it calculates the average Non-FAMP using a calendar year- or a federal fiscal year-based approach.

Below, Lilly notes the following comments and considerations bearing on exceptions processes:

- *Average Non-FAMP Anomalies:* Anomalous Non-FAMPs can occur when sales dollars and units misalign. This can result from lagged sales, market shortages, or other factors. VA has recognized this and, in implementing the VHCA program, has developed certain exceptions and workarounds for calculating federal ceiling prices (FCPs) when there are anomalous Non-FAMPs. Similarly, CMS must develop an approach to addressing anomalous average Non-FAMPs for purposes of setting the MFP. In certain cases, use of a prior year's figures may be best, but there may be cases involving new products or other scenarios where use of the prior year's figures is not possible.
- *Restated Average Non-FAMPs:* VA also has recognized the need for a process to allow manufacturers to restate Non-FAMPs in cases where reported Non-FAMPs are determined to have been inaccurate, as a result of flaws in sales data, issues impacting data systems, and other factors. As such, restatements are not uncommon, and contract pricing can be adjusted based on restated Non-FAMP and FCPs. While VA handles restatements of annual Non-FAMPs, if CMS proceeds with its proposed calendar year-based average Non-FAMP computations, it must address any calculation errors that could arise. Additionally, in any case involving average Non-FAMP restatement, CMS must establish a process for account for such restatement in the setting of the MFP.

B. The 12/16 Year Time Period Used to Identify an "Extended" or "Long" Monopoly Drug Is Measured from the Date of the Approval/Licensure to the Start of the Applicable IPAY, Not the Date of the Selection.

The statute sets the ceiling price for the MFP for selected drugs by reference to three disjunctive options. Two of the options are notably based on the "applicable percent" of the applicable average Non-FAMP:

are not used to calculate the annual Non-FAMP. Rather, the annual Non-FAMP is a stand-alone weighted average calculation based on data over 4 quarters: Q4 – Q3.

- (1) An amount equal to the **applicable percent** of the average non-FAMP for 2021 (or, where there is none, the average non-FAMP for the first full year following market entry), increased by the percentage increase in the Consumer Price Index for All Urban Consumers from September 2021 to September of the year prior to the selected drug publication date (or, December of the first full year following the market entry); and
- (2) An amount equal to the **applicable percent** of the average non-FAMP for the year prior to the selected drug publication date (except for IPAY 2026).²⁰³

The “applicable percent” is, in turn, statutorily defined by reference to whether a drug is classified as a short-monopoly drug (75%), extended-monopoly drug (65%), or long-monopoly drug (40%).²⁰⁴ Pursuant to the statute, these classifications are primarily based on the number of years that have elapsed since a product was approved or licensed. With limited exceptions, an extended-monopoly drug is, “with respect to an initial price applicability year, a selected drug for which at least 12 years, but fewer than 16 years, have elapsed since the date of approval . . . or . . . licensure,” and a long-monopoly drug is, “with respect to an initial price applicability year, a selected drug for which at least 16 years have elapsed since the date of approval . . . or licensure.”²⁰⁵ Any other selected drug is a short monopoly drug.²⁰⁶

With respect to extended- and long-monopoly drugs, the most natural reading of the statutory text is that the twelve- and sixteen-year periods run from the selected drug’s approval or licensure date **to the start of its IPAY**. This comports with a plain reading of the statute, which expressly references the “initial price applicability year” and juxtaposes such reference with the date of approval or licensure.

Moreover, doing otherwise would lead to anomalous situations where a drug transitions from one classification to another **after** the MFP is set but **before** the MFP applies, e.g., where a drug is selected for the MFP process fifteen years after its approval but is seventeen years post-approval by the start of its IPAY. This cannot be what Congress intended – because the MFP would be negotiated based on an MFP ceiling calculated for an extended-monopoly drug but the drug would be a long-monopoly drug when the MFP starts to apply.

The Guidance is internally inconsistent. In one passage, CMS appears to propose to count the years to the date of selection.²⁰⁷ In another, the agency appears to propose to count the years to the start of the applicable IPAY.²⁰⁸ To ensure a workable system, Lilly recommends that CMS adopt a policy under which the years are counted from the date of approval or licensure to the start of the applicable IPAY. This approach comports with the natural reading of the statute and will eliminate irregularities.

IX. Application of the MFP

- A. *CMS Should Revise Its Proposed Methodology for Applying the MFP Across the Dosage Forms and Strengths of a Selected Drug Such That the Dosage Form/Strength-Level MFP Is Capped by the MFP Ceiling Only at the Drug Level and Not Also at the Dosage Form/Strength-Level.*

²⁰³ SSA § 1194(c)(1)–(2).

²⁰⁴ *Id.* § 1194(c)(3).

²⁰⁵ *Id.* § 1194(c)(4)(A), (c)(5)(A).

²⁰⁶ *Id.* § 1194(c)(3)(A).

²⁰⁷ Guidance at 45.

²⁰⁸ *Id.* at 17.

By statute, CMS must “establish[] procedures to compute and apply the [MFP] across different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug.”²⁰⁹ Given the complexities inherent in applying a single MFP across varying dosage forms and strengths, it is essential that the calculation be predicated on a transparent methodology, and one that finds support in the statute.

In the Guidance, CMS proposes to “translate the MFP once finalized . . . back into per unit (e.g., tablet) prices at the dosage form and strength level for the purposes of publishing per unit MFPs for the different dosage forms and strengths of the selected drug.”²¹⁰ Specifically, for IPAY 2026, CMS proposes to translate the MFP at the **drug** level into a price for each **dosage form or strength** at the **unit** level, as follows:²¹¹

1. **Cap the drug-level MFP by comparing such MFP to the lower of the two alternative drug-level ceiling prices:** Compare the MFP per thirty-day equivalent supply at the **drug** level to the lower of the two alternative ceiling prices, which are also calculated per thirty-day equivalent supply at the drug level. If the MFP is higher than the lower of the two ceiling prices, reduce the MFP so that it is equal to the lower of the two ceiling prices.²¹² The result is an MFP per thirty-day equivalent supply at the **drug** level.
2. **Weighted average wholesale acquisition cost (WAC) for each dosage form and strength:** Calculate a weighted average WAC at the **dosage form or strength** level per thirty-day equivalent supply, based on 2022 Part D PDE data.²¹³
3. **Weighted average WAC for the drug:** Use the weighted average WAC for each dosage form and strength, calculated at Step 2, to calculate a weighted average WAC per thirty-day equivalent supply at the **drug** level.²¹⁴
4. **WAC ratio for each dosage form and strength:** Calculate a WAC ratio for each dosage form and strength by dividing the weighted average WAC for each dosage form and strength, calculated in Step 2, by the weighted average WAC for the drug, calculated in Step 3.²¹⁵
5. **Dosage form/strength-level MFP:** Translate the single **drug**-level MFP, as capped in Step 1, into a **dosage form/strength**-level MFP by multiplying the single drug-level MFP by the WAC ratio calculated in Step 4 for each dosage form and strength. The result is an MFP per thirty-day equivalent supply at the **dosage form or strength** level.²¹⁶
6. **Cap (a second time) the dosage form/strength-level MFP by comparing such MFP to the dosage form/strength-level ceiling price:** Compare the dosage form/strength-level MFP, as calculated in Step 5, to the applicable dosage form/strength-level ceiling price (separately calculated as part of determining the ceiling price at the drug level used in Step 1). If the dosage form/strength-level MFP is higher than the applicable dosage form/strength-level

²⁰⁹ SSA § 1196(a)(2).

²¹⁰ Guidance at 38, 58-59.

²¹¹ A more complete summary of our understanding of this process is set forth in Appendix A.

²¹² Guidance at 48.

²¹³ *Id.* at 58 (CMS’s Steps 1 through 4).

²¹⁴ *Id.* at 59 (CMS’s Steps 5 through 7).

²¹⁵ *Id.* (CMS’s Step 8).

²¹⁶ *Id.* at 59 (CMS’s Step 9).

ceiling price, reduce the dosage form/strength-level MFP so that it is equal to the applicable dosage form/strength-level ceiling price.²¹⁷

7. **Per-unit dosage form/strength-level MFP:** For each NDC-9 of a dosage form and strength, calculate the MFP per thirty-day equivalent supply on the unit level by dividing the result from Step 6 by the units per total thirty-day equivalent supply for the dosage form and strength.²¹⁸

As set forth above, CMS proposes to apply the MFP ceiling **twice** – a first time at the **drug** level (Step 1) and a second time at the **dosage form or strength** level (Step 6). **CMS should not – and indeed may not – finalize this proposal.**

Double application of the ceiling price – at the drug level and, again, at the dosage form and strength level – finds no basis in law. The statute defines both the MFP and the ceiling price as a price determined at the **drug** level.²¹⁹ Nowhere does the statute contemplate the application of the ceiling price at the **dosage form or strength** level. To be sure, the statute directs CMS to establish a process to **apply** the MFP (which **already** has been capped by the ceiling price) to each dosage form and strength of the selected drug, but, in doing so, the statute does not authorize the application of the ceiling price a second time. The proposed double application of the ceiling price would violate the statute's clearly defined processes governing how to **cap** the MFP of a selected drug and, **separately**, how to **apply** such MFP across the dosage forms and strengths of such drug.

As a matter of fact, the application of the ceiling price a second time, at the dosage form and strength level, could cause the MFP of some dosage forms and strengths of a selected drug to be reduced a second time as demonstrated by the numeric example in Appendix A. A WAC ratio for a dosage form or strength **higher than 1.0** could generate a dosage form/strength-level MFP that is **above the dosage form/strength-level ceiling price**, and thus a dosage form/strength-level MFP that is doubly capped. Double capping the dosage form/strength-level MFP would unfairly penalize dosage forms and strengths with a higher WAC ratio, even though such higher WAC ratio could merely reflect a difference in utilization, such as a difference in dosing regimen or a higher Part D utilization.

In addition to abandoning its unlawful proposal to doubly apply the ceiling price, CMS should clarify the following:

- **First, CMS should specify how it will calculate the thirty-day equivalent supply and the total thirty-day equivalent supply.** Specifically, Lilly asks that CMS clarify that the definition of a thirty-day equivalent supply is the same as that used under the Part D program to calculate the cost thresholds for specialty tiers under which CMS determines the 30-day equivalent supply as follows: If the days' supply reported on a PDE is less than or equal to 34, the number of 30-day equivalent supplies equals one. If the days' supply reported on a PDE

²¹⁷ Specifically, CMS states that it “intends to ensure that the MFP per 30-day equivalent supply for each dosage form and strength of the selected drug calculated in step 9 of the methodology described in section 60.5 of this memorandum is not above the statutorily defined ceiling by comparing it to the applicable ceiling for a 30-day equivalent supply for that dosage form and strength of the selected drug calculated in either step 7 of section 60.2.2 or step 9 of section 60.2.3 (depending on which ceiling is selected).” *Id.* at 46.

²¹⁸ *Id.* at 59 (CMS's Step 10).

²¹⁹ See, e.g., SSA § 1194(c) (describing the ceiling price by reference to a drug). The reference to a drug, as opposed to a dosage form or strength, is telling, given that, elsewhere in the statute, Congress demonstrated its understanding of the difference between a drug and a dosage form or strength.

is greater than 34, the number of 30-day equivalent supplies is equal to the number of days' supply reported on each PDE divided by 30.²²⁰

CMS should further confirm that it will calculate the **total** thirty-day equivalent supply as the sum of individual thirty-day equivalent supplies across all applicable utilization of a selected drug.

- **Second, CMS should clarify how it intends to account for adjustments to PDE data in the calculation of the ceiling price and in the calculation of the dosage form/strength-level MFP.** PDE data may be adjusted until six months following the end of the plan year.²²¹ For IPAY 2026, the negotiation period will run from October 2, 2023, through July 31, 2024, such that the PDE data from the 2022 plan year will be finalized by the start of such period.²²² However, starting with IPAY 2027, the negotiation period will run from March 1 through November 1 of the year that is two years before the applicable IPAY. As PDE data for the preceding plan year will not be finalized until June 30 of such year, adjustments to such data will need to be accounted for when calculating the ceiling price and when applying the MFP across the dosage forms and strengths of the selected drug.
- **Third, CMS should clarify how it will calculate the twelve-month WAC used to calculate the dosage form/strength-level MFP.** We recommend that such WAC be a weighted average to accurately represent pricing across the twelve-month period. A weighted average would be consistent with CMS's general approach to calculating the ceiling price and to applying the MFP across the dosage forms and strengths of the selected drug, both of which rely on weighted averages.
- **Fourth, CMS's proposed calculations are incredibly complex; as such, CMS should provide numeric examples of how it intends to apply such calculations.** Numeric examples will enhance transparency and help stakeholders to understand CMS's proposed methodology.
- **Fifth, CMS should commit to provide each manufacturer of a selected drug with all of the PDE data on which CMS intends to rely under its proposed methodology.** Such data are not readily available to manufacturers and would be needed immediately upon selection for the MFP process to ensure that the manufacturer can meaningfully engage in such process.

B. Lilly Agrees with CMS That Manufacturers Should Be Permitted to Provide Access to the MFP Through an MFP Rebate Model

The statute grants CMS broad discretion to “establish[] . . . procedures to carry out the provisions of [the Program], as applicable, with respect to [MFP-eligible individuals].”²²³ Pursuant to this authority, the Guidance proposes that manufacturers may provide access to the MFP by either (1) ensuring that

²²⁰ 42 C.F.R. § 423.104(d)(2)(iv)(A)(ii).

²²¹ See, e.g., 2022 Annual PDE Data Submission Deadline, [https://www.csscoperations.com/internet/csscw3_files.nsf/F/CSSC2022%20Annual%20PDE%20Data%20Submission%20Timeline%20final_09%2022%202021.pdf/\\$FILE/2022%20Annual%20PDE%20Data%20Submission%20Timeline%20final_09%2022%202021.pdf](https://www.csscoperations.com/internet/csscw3_files.nsf/F/CSSC2022%20Annual%20PDE%20Data%20Submission%20Timeline%20final_09%2022%202021.pdf/$FILE/2022%20Annual%20PDE%20Data%20Submission%20Timeline%20final_09%2022%202021.pdf) (last accessed Apr. 6, 2023).

²²² SSA § 1191(d)(5); Guidance at 27, 55, 57.

²²³ SSA § 1196(a)(3).

the price paid when acquiring the drug is no greater than the MFP or (2) providing retrospective reimbursement for the difference between the drug acquisition cost and the MFP.²²⁴ This will allow for implementation of a rebate model, which is vital to ensure that the MFP is **exclusively** made available with respect to MFP-eligible individuals.

While Lilly agrees with the agency's approach of permitting access to the MFP to be provided through retrospective reimbursement, the reimbursement amount should be based on the difference between the MFP and WAC. WAC is the list price set and controlled by the manufacturer; manufacturers have no visibility into acquisition costs as wholesalers – which take legal title and physical possession of the product after it is shipped from the manufacturer's loading dock – are the sole arbiter of that price (except in those rare occasions where a manufacturer has an indirect contract with a pharmacy or provider).²²⁵

Also, as CMS knows, the statute requires that manufacturers provide access to the MFP only with respect to MFP-**eligible** individuals.²²⁶ Units of a selected drug purchased at the MFP therefore may not be administered or dispensed to individuals who receive benefits outside of the Part B, MA, or Part D programs, such as through a commercial health plan. Simply put, the plain terms of the statute effectively **bar** a provider or pharmacy from purchasing a unit of a selected drug at the MFP and dispensing it to an MFP-**ineligible** individual.

Despite this clear prohibition against MFP diversion, the statute does not provide manufacturers, or CMS for that matter, a right to audit providers and pharmacies for appropriate use of MFP units of selected drugs, and there is no statutory dispute resolution mechanism that manufacturers can use to recover MFP discounts from providers and pharmacies that administer or dispense MFP units to MFP-ineligible individuals. And there appears to be no statutory means at all by which CMS may penalize providers and pharmacies for administering or dispensing MFP-purchased units of selected drugs to MFP-ineligible individuals, such as by terminating a provider's or pharmacy's access to the MFP.

For this reason, a rebate model is **necessary** to effectuate the statutory prohibition against diversion of MFP units to MFP-**ineligible** individuals. By contrast, if the MFP were required to be offered only as an up-front discount at the time of purchase, it would be **impossible** to ensure that the provider or pharmacy subsequently administers or dispenses the unit to an MFP-eligible individual. Even if the manufacturer, or even CMS, were to subsequently ask the provider or pharmacy whether the unit was in fact appropriately administered or dispensed, it would have no means of recourse against the provider or pharmacy if the provider or pharmacy were to refuse to answer, or if the unit was in fact administered or dispensed to an MFP-eligible individual.

An MFP rebate model is the solution to this MFP diversion problem; rebate models are straightforward to administer, and a familiar construct already widely used in the Part D program and the commercial sector. Importantly, a rebate model will not jeopardize Medicare beneficiary access to reduced MFP-based cost-sharing. Providers and pharmacies will know at the time that a unit of a drug is administered or dispensed whether the drug is a selected drug and, if so, its associated MFP-based cost-sharing.

²²⁴ Guidance at 32.

²²⁵ In the event that the manufacturer provides a discount on the purchase price to the pharmacy or provider, that lower acquisition cost should replace WAC in the calculation of the reimbursement amount.

²²⁶ SSA §§ 1191(b)(2), 1193(a)(3).

For all of these reasons, Lilly strongly concurs with CMS's proposal to allow access to the MFP to be provided through an MFP rebate model, but encourages the use of WAC rather than acquisition cost.

C. To Make an MFP Rebate Model Meaningful, It is Vital That CMS Clarify That Rebates Are Owed Fourteen Days After the Manufacturer Has Verified MFP Eligibility

CMS proposes that manufacturers must furnish any retrospective reimbursement "within 14 days."²²⁷ The Guidance, however, does not specify when the fourteen-day clock starts to run.

It is imperative that CMS clarify that the clock begins to run on the day on which the manufacturer has **verified** that the individual to whom the unit of the selected drug was administered or dispensed was in fact an MFP-eligible individual. Starting the clock at any time before such verification occurs would be wholly irrational, as it would render the retrospective reimbursement model (i.e., rebate model) meaningless.

In addition, it is important that, to the extent the clock instead runs from the date on which all necessary validating Medicare claims data are received from the provider or pharmacy (in which case an additional fourteen days must be added to the clock to account for the need to validate MFP eligibility) and there is a dispute, the clock is tolled during the pendency of a reasonable dispute resolution process.

As explained in Section IX(B), a rebate model is necessary to effectuate the statutory prohibition against diversion of MFP units to MFP-**ineligible** individuals. The rebate model, however, is **only** useful to the extent it **actually** allows manufacturers to prospectively safeguard against the diversion of MFP units to individuals ineligible for the MFP. As such, a necessary prerequisite of a functional rebate model is that manufacturers not be required to pay rebates until **after** the manufacturer is able to verify that the rebate request relates to a unit of a selected drug that is actually eligible for the MFP. Even more fundamentally, there would be no incentive for the provider or pharmacy to furnish any Medicare claims data needed to validate MFP eligibility if a manufacturer were required to pay an MFP rebate within a specified time period, regardless of whether MFP eligibility has been validated. And, without a mechanism to ensure that a provider or pharmacy submits Medicare claims data and time for the manufacturer to verify MFP eligibility based on such data, any prospective safeguards afforded by a rebate model would become entirely illusory.

To this end, we recommend as an alternative that manufacturers be afforded 45 days from the receipt of all necessary validating data to pay the rebate to allow a reasonable window for processing as this is more consistent with commercial and Medicaid standards for rebate validation and payment. In other contexts, Congress has recognized that a longer window is appropriate for processing claims data. For example, section 1869(a)(2) of the SSA affords Medicare Administrative Contractors 45 days to evaluate whether a claim is clean – i.e., that it does not require further investigation or external development.²²⁸ In addition, to the extent that good faith disputes arise during processing, the clock should be tolled during that time such that manufacturers may withhold disputed rebate requests pending good faith resolution.

²²⁷ Guidance at 32.

²²⁸ SSA § 1869(a)(2); *see also* CMS, CMS Manual System: Pub 100-04 Medicare Claims Processing (Transmittal 1173), at 2, available at <https://www.cms.gov/regulations-and-guidance/guidance/transmittals/downloads/dwnlds/r1173cppdf.pdf>.

To give effect to Congress's prohibition of diversion of MFP units to MFP-ineligible individuals, we recommend that CMS specify that the rebate must be paid 45 days after the date on which the manufacturer receives all necessary validating Medicare claims data, and that the clock be tolled during the pendency of a reasonable dispute resolution process.

D. Lilly Concurrs with CMS That Manufacturers Should Not Be Required to Provide Access to the MFP to a Part D Beneficiary at the Point-of-Sale Directly

The statute provides that the manufacturer shall provide access to the MFP to Part D beneficiaries at the point of sale (as well as to pharmacies, mail order services, and other dispensers with respect to such individuals).²²⁹ In the Guidance, CMS correctly recognizes that, where units of a selected drug are dispensed to a Part D beneficiary, it would be **impossible** for **manufacturers** to provide the MFP at the point-of-sale **directly**.²³⁰ This is because manufacturers are **not** a party to the point-of-sale transaction. The point-of-sale transaction is instead among the pharmacy, the Part D beneficiary, and the plan (or its contracted pharmacy benefit manager (PBM)). Thus, the only logical way to effectuate the statutory mandate that manufacturers provide access to the MFP to Part D beneficiaries at the point-of-sale is by having the MFP discount passed through to such individuals by entities that **are** parties to the point-of-sale transaction. Therefore, we agree with CMS's clarification that access to the MFP by Part D beneficiaries must be effectuated through PD and MA-PD plans, and need not be directly provided by manufacturers.

E. CMS Should Work With HRSA to Enact Broad 340B Reforms Necessary to Implement the IRA and, at a Minimum, Should Require MA, MA-PD, and PD Plans to Require the Accurate Use of Either a 340B or Non-340B Claims Indicator for Part B and D Drugs as a Condition of Payment of a Claim for Reimbursement in Advance of IPAY 2026

Section 1193(d) of the SSA prohibits MFP-340B duplicate discounts.²³¹ By statute, manufacturers need only offer the lower of the two prices.²³² To effectuate Congress's intent in prohibiting MFP-340B duplicate discounts, CMS must adopt a mechanism to enable manufacturers to avoid paying such duplicate discounts on units of selected drugs – **including with respect to claims reimbursed by MA, MA-PD, and PD plans** – and should work with HRSA to undertake the host of broader 340B reforms necessary to ensure compliance with all of the recently enacted non-duplication provisions under the IRA.

To date, CMS has undertaken a weak and largely aspirational patchwork of reforms. For example, CMS has stated that, starting on January 1, 2024, all 340B covered entities that submit Part B claims must use specified 340B claims modifiers to identify 340B units.²³³ However, it is unclear what will happen to covered entities that fail to implement this requirement faithfully, nor has CMS identified any program integrity efforts (e.g., audits, exclusions, or penalties) that would drive covered entity compliance. With respect to Part D, CMS has similarly proposed to require use of a Part D 340B indicator as part of implementing the Part D inflation rebate program. In doing so, the agency acknowledged that “requiring that a 340B indicator be included on the [PDE] record is the most

²²⁹ SSA § 1193(a)(3)(A).

²³⁰ Guidance at 31.

²³¹ SSA § 1193(d).

²³² *Id.*

²³³ CMS, Part B Inflation Rebate Guidance: Use of the 340B Modifiers (Dec. 20, 2022), *available at* <https://www.cms.gov/files/document/part-b-inflation-rebate-guidance340b-modifierfinal.pdf>.

reliable way to identify drugs that are subject to a 340B discount that were dispensed under Medicare part D” for purposes of excluding 340B units from the Part D inflation rebate calculation.²³⁴

Lilly appreciates that these policies and proposals may constitute a reasonable starting point, but they fall short of ensuring that the clear statutory prohibition against duplicate discounts in the context of the Part B and Part D inflation rebate and MFP programs. Moreover, we have concerns that, where fraud or financial harm against a manufacturer is the policy concern, the government has been lax in deploying front-end controls and reluctant to impose back-end consequences. Accordingly, we urge CMS to work with HRSA to (1) define the statutory term “patient” for purposes of identifying and excluding ineligible 340B utilization; and (2) require covered entities to identify these patients at the point of drug administration or dispense.

In addition, there is a compelling need for the application of a consistent 340B claims indicator that applies across **all** types of claims, **including MA claims**, implicating the MFP-340B duplicate discount prohibition at the point of sale. Consistent and accurate use of a 340B claims identifier is **essential** to facilitate the prohibition of MFP-340B duplicate discounts. Absent such use of such an identifier, there is no means to identify units of drugs acquired under the 340B Program, and therefore no means to prevent MFP-340B duplicate discounts on selected drugs. We therefore strongly urge CMS to act expeditiously to mandate that MA, MA-PD, and PD plans to identify units of drugs acquired under the 340B Program using a consistent 340B claims identifier in their MA encounter data or PDE data.²³⁵ We recommend that CMS implement this policy via rulemaking. And accurate use of the applicable indicator should be made a condition payment of a claim for reimbursement.²³⁶ This is the case for **all** types of claims implicating the MFP-340B duplicate discount prohibition – i.e., Part B, MA, and Part D.²³⁷

It is paramount that CMS implement these policies given the well-documented history of improper duplicate discounting and Lilly’s own experiences. In the analogous context of MDRP-340B duplicate discounts, there is a long history of widespread 340B covered entity non-compliance with the MDRP-340B duplicate discount prohibition.²³⁸ Improper discounting persists despite statutory audit and dispute resolution processes and agency authority to penalize non-compliant 340B covered entities. By contrast, under the Program, there is no statutory audit or dispute resolution process to remediate MFP-340B duplicate discounts, nor any apparent agency authority to penalize a non-compliance provider or pharmacy.²³⁹ CMS must make certain that there are mechanisms in place to address this serious risk with respect to MFP-340B duplicate discounts. The statutory prohibition on MFP-340B

²³⁴ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum 18 (Feb. 9, 2023), available at <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>.

²³⁵ The identifier used should be consistent where possible, though different identifiers may be used for MA encounter data versus PDE data (e.g., the former could use the JG/TB modifiers, whereas the latter could use a different CMS-designated identifier appropriate for pharmacy claim transactions).

²³⁶ For claims reimbursed under MA and Part D, CMS should impose a requirement on plans to make accurate use of the 340B or non-340B identifier a requirement of the plans’ reimbursement of the provider or pharmacy.

²³⁷ The need for a 340B identifier in MA is also not addressed in CMS’s existing policies on Part B claims involving units of drugs acquired under the 340B Program.

²³⁸ See, e.g., Government Accountability Office, Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement, GAO-18-480 (2018), available at <https://www.gao.gov/assets/gao-18-480.pdf>; see generally 42 U.S.C. § 256b(a)(5)(A).

²³⁹ Compare SSA § 1193(d) with PHSA § 340B(d)(3).

duplicate discounts is meaningful only if CMS establishes a reliable and consistent means to identify units of drugs acquired under the 340B Program.²⁴⁰

For all of these reasons, we urge CMS and HRSA to work together to ensure the broader 340B reforms necessary to implement all of the new requirements of the IRA and to, at a minimum, condition reimbursement for a unit of a selected drug on the accurate use of either a 340B or a non-340B claims indicator across Part B, MA, and Part D. Lilly also urges CMS to adopt these changes well in advance of the start of IPAY 2026, the first IPAY applicable to Part D drugs, and the start of IPAY 2028, the first IPAY applicable to Part B drugs, to enable a manufacturer to avoid paying MFP-340B duplicate discounts, as contemplated by the statute.

X. Other Considerations

A. CMS Should Clarify That Selected Drugs Are Not Subject to an Inflation Rebate

As part of soliciting comment on the interaction between inflation rebates and selected drugs,²⁴¹ CMS contends that “[t]he Part B and Part D inflation rebate programs apply to selected drugs, regardless of the status of the drug as a selected drug. Alternatively said, whether a drug is a selected drug will have no bearing as to whether the drug is also subject to the Part B and Part D inflation rebate programs.”²⁴²

CMS’s contention is troubling because it is untrue. Selected drugs are not subject to inflation rebates, and Lilly urges CMS to clarify that this is the case. Under the statute, the Part B inflation rebate calculation is based on the amount by which “106 percent of the amount **determined under paragraph (4)** of [section 1847A(b) of the SSA] for [a Part B rebatable drug] during the calendar quarter . . . exceeds . . . the inflation-adjusted payment amount . . . for such Part B rebatable drug during the calendar quarter.”²⁴³

Importantly, the circumstances under which an amount is “determined” under paragraph (4) of section 1847A(b) is dictated by section 1847A(b)(1).²⁴⁴ Section 1847A(b)(1) dictates a payment amount of, “in the case of a single source drug or biological . . . , 106 percent of the amount **determined under paragraph (4) of section 1847A(b) or** in the case of such a drug or biological product that is a selected drug . . . , with respect to a price applicability period . . . , 106 percent of the maximum fair price . . . applicable for such drug and a year during such period.”²⁴⁵

In other words, a selected drug’s payment **must** be determined under section 1847A(b)(1), and such payment amount must be determined **without regard to paragraph (4)** of section 1847A(b). Taken together, this means paragraph (4) defines the payment amount **only** for a **non-selected** drug. Accordingly, by statute, the Part B inflation rebate **cannot** be applicable to a selected drug – because there is no amount “determined under paragraph (4),” and therefore Part B inflation rebates cannot be applicable.

²⁴⁰ See SSA § 1193(d).

²⁴¹ Guidance at 71.

²⁴² *Id.*

²⁴³ SSA § 1847A(i)(3) (emphasis added).

²⁴⁴ See *id.* § 1847A(b)(1).

²⁴⁵ *Id.* § 1847A(b)(1)(B) (emphasis added).

There is also every reason to believe such outcome was intended by Congress. There is no policy reason for application of inflation rebates to selected drugs. The MFP **already** constrains Medicare expenditures for selected drugs, and thus it would be illogical Congress to apply inflation rebates in addition to the MFP.²⁴⁶ This is especially true because the MFP already shields Medicare from price increases outpacing inflation, which is the very situation that inflation rebates were designed to address. Accordingly, we ask that CMS clarify that a selected drug is not subject to an inflation rebate, consistent with both the language of the statute and sound public policy.

B. With Respect to CMPs, CMS Should Finalize Its Pre-Sanction Procedural Safeguards and Adopt an Additional Process Whereby Manufacturers Are Given Advance Notice of an Intent to Impose a CMP and a Reasonable Opportunity to Cure or Dispute the Deficiency, to Help Ensure That CMPs Are Imposed Only Where Appropriate

By statute, CMS must impose substantial CMPs on a manufacturer that is found to be non-compliant with certain program requirements.²⁴⁷ Specifically, if a manufacturer:

- fails to offer the MFP with respect to an MFP eligible individual, a penalty will be imposed equal to ten times the difference between the price paid and the MFP for each unit of the selected drug that is sold at a price above the MFP;
- violates the terms of the program manufacturer agreement, a CMP of \$1 million per day of noncompliance will be imposed;
- knowingly provides false information with respect to eligibility for the statutory exceptions provided for small biotech drugs and for biologicals where market entry of a biosimilar is highly likely, a penalty of \$100 million will be imposed for each item of false information; or
- fails to comply with rebate requirements with respect to a biologic where a delay in selection was granted but either (1) after a first year of delay, CMS determined that there was no longer a high likelihood that the biosimilar would launch within the specified timeframe or (2) after a second year of delay, the biosimilar did not timely launch, a penalty will be imposed equal to ten times the amount of the rebate the manufacturer failed to pay.²⁴⁸

In the Guidance, CMS states its intention to monitor compliance with the Program.²⁴⁹ And, where deficiencies are identified, the agency proposes to notify manufacturers of the basis for the CMP, the deadline to respond with a hearing request or pay the CMP (i.e., 60 days after the date of receipt of the CMP notice), and the amount due, among other things.²⁵⁰

Lilly supports CMS's proposal to provide manufacturers a CMP notice and a hearing to dispute the deficiency **before** imposing sanctions. We understand CMS's proposal to mean that, if a manufacturer requests a hearing to appeal a CMP, imposition of such CMP will be **stayed** pending resolution of such appeal.

²⁴⁶ *Id.* §§ 1847A(b)(1)(B); 1860D-2(d)(1)(D).

²⁴⁷ SSA § 1197.

²⁴⁸ *Id.* § 1197(a)–(e).

²⁴⁹ Guidance at 68–70.

²⁵⁰ *Id.* at 70.

Lilly concurs with this approach. Given that penalties could be in the hundreds of millions of dollars, it is critical that CMPs not be imposed while an appeal is still pending. Indeed, if CMS were instead to impose such massive penalties without any mechanism for pre-deprivation review, it would raise fundamental questions of due process.²⁵¹

Lilly also believes that additional pre-sanction procedural safeguards are needed to ensure that penalties are imposed only where appropriate. Specifically, Lilly strongly urges CMS to afford manufacturers at least **30 days advance notice of an intent to impose a CMP (i.e., 30 days before the date on which CMS would send the CMP notice) and an accompanying opportunity to cure or dispute any deficiency** based on a factual or legal error before imposing penalties.

An advance opportunity to cure or dispute is justified due to the novelty and the complexity of the MFP regime. There inevitably will be significant ambiguities with respect to program requirements, especially in the early years, which means that manufacturers will necessarily be seeking to comply with such requirement in a landscape of considerable uncertainty. The size of the penalties alone indicate that CMPs should be used as an enforcement tool only when clearly warranted by a manufacturer's substantial and continued noncompliance, and never for inadvertent oversights or minor mistakes. It would be fundamentally unreasonable to levy millions of dollars in CMPs on a manufacturer for failing to comply with a requirement on account of a technical mistake or misunderstanding where the manufacturer was seeking in good faith to comply with an ambiguously worded directive. Affording manufacturers an advance opportunity to cure or dispute is essential to the fair implementation of the Program.

C. CMS Should Exclude MFP Units from the Definition of "Unit" for Purposes of the ASP Calculation

Under the statute, the BP calculation includes MFP units.²⁵² And, generally speaking, sales included in BP are included in ASP.²⁵³ Thus, in the ordinary course, the inclusion of MFP units in the ASP calculation would progressively reduce ASP.

For Medicare fee-for-service (FFS) purposes, inclusion of MFP units in ASP does not affect reimbursement rates because selected drugs are not reimbursed on the basis of ASP. The same, however, is not true for **non-Medicare** FFS units of selected drugs. Non-Medicare FFS payers often rely on ASP as a benchmark to set reimbursement rates. As such, if MFP units are included in the calculation of ASP, ASP-based reimbursement rates of non-Medicare FFS payers will become increasingly insufficient to make providers whole for their acquisition cost of the selected drug.

To protect access to critical medicines in non-Medicare FFS markets, we urge CMS to amend its definition of "unit" for purposes of the ASP calculation to exclude MFP units. Unless CMS does so, there is a very real risk that providers may be unable to furnish selected drugs to MFP-eligible individuals because they cannot afford to do so.

There is clear legal authority for CMS to completely eliminate this risk by excluding MFP units from the ASP calculation. Notably, the ASP statute expressly delegates authority to CMS to make the

²⁵¹ See generally *Matthews v. Eldridge*, 424 U.S. 319 (1976) (factors for evaluating when due process requires a pre-deprivation hearing include the nature and magnitude of the private interest affected and the risk of an erroneous deprivation, along with any implicated governmental interest).

²⁵² SSA § 1927(c)(1)(C)(ii)(V).

²⁵³ *Id.* § 1847A(c); see also 42 C.F.R. § 414.804(a)(1), (4)(i).

recommended change to the regulatory definition of “unit.” Specifically, the statutory definition of “unit” authorizes CMS to “establish the unit for a manufacturer to report and methods for counting units as [CMS] determines appropriate”²⁵⁴ Further, the legislative history makes abundantly clear that the delegation of this authority was for the specific purpose of excluding “those sales that do not reflect market prices” from ASP, which MFP units, by definition do not.²⁵⁵

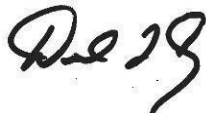

There is also clear regulatory precedent for excluding MFP units from the ASP calculation. CMS has excluded Competitive Acquisition Program (CAP) units from the ASP “unit” definition because ASP and CAP prices were “intended to be alternatives to each other.”²⁵⁶ Thus, CMS concluded that CAP units should be carved out from the ASP calculation.

The same logic applies here. The MFP is available only with respect to the Medicare FFS market.²⁵⁷ MFP-eligible individuals make up only a subset of the market, and, thus, the MFP does not reflect a market price that should be reflected in ASP in accordance with Congressional design. Moreover, the MFP, like the CAP, is an alternative to ASP, used in place of ASP to establish Medicare FFS reimbursement rates for Part B drugs that are selected drugs.

For these reasons, we urge CMS to exercise its authority to amend the ASP definition of “unit” to exclude MFP units from the ASP calculation.

Lilly appreciates the opportunity to comment on certain sections of the Guidance. We sincerely appreciate your thoughtful consideration of the issues discussed in this letter and look forward to working with you in the future to help ensure that patients have meaningful access to affordable health care benefits and prescription drug coverage. Please do not hesitate to contact Derek Asay at Asay_Derek_L@Lilly.com with any questions.

Sincerely,

Derek L. Asay
Senior Vice President, Government Strategy

²⁵⁹ *Id.* at 58 (Steps 1 through 4 of the application of the MFP process in the Initial Guidance).

²⁶⁰ *Id.* at 59 (Steps 5 through 7 of the application of the MFP process in the Initial Guidance).

<p>STEP 3(a): Calculate the ratio of the total 30-day equivalent supply for a dosage form and strength to the total 30-day equivalent supply across all dosage forms and strengths (i.e., on the drug level)</p> <ul style="list-style-type: none"> • Divide the total 30-day equivalent supply for each dosage form and strength by • The total 30 day equivalent supply across all dosage forms and strengths (i.e., the drug level)
<p>STEP 3(b): Calculate a weighted (by the 30-day equivalent supply ratio) WAC per 30-day equivalent supply on the dosage form and strength level</p> <ul style="list-style-type: none"> • Multiply the result from Step 3(a) for each dosage form and strength by • The result from Step 2(d) for each dosage form and strength
<p>STEP 3(c): Calculate the weighted (by the 30-day equivalent supply ratio) WAC per 30-day equivalent supply across all dosage forms and strengths (i.e., the drug level)</p> <ul style="list-style-type: none"> • Sum all the amounts calculated in Step 3(b) for each dosage form and strength
<p>Step 4: Calculate a WAC ratio for each dosage form and strength by dividing the weighted average WAC for each dosage form and strength, by the weighted average WAC for the drug.²⁶¹</p>
<p>Calculate the WAC ratio (i.e., the WAC per 30-day equivalent supply on the dosage form and strength level divided by the WAC per 30-day equivalent supply on the drug level)</p> <ul style="list-style-type: none"> • Divide the result from Step 2(d) by • The result from Step 3(c) <p>Note: If there is more than one dosage form and strength of the drug, at least one dosage form and strength will have a ratio that is greater than 1.0</p>
<p>Step 5: Derive a dosage form/strength-level MFP by multiplying the single drug-level MFP by the WAC ratio for each dosage form and strength.²⁶²</p>
<p>Calculate the MFP per 30-day equivalent supply on the dosage form and strength level</p> <ul style="list-style-type: none"> • Multiply the negotiated single MFP by the ratio in Step 4
<p>Step 6: Cap (a second time) the dosage form/strength-level MFP by comparing such MFP to the dosage form/strength-level ceiling price:</p>
<p>Compare the dosage form/strength-level MFP, as calculated in Step 5, to the applicable dosage form/strength-level ceiling price (calculated as part of determining the ceiling price at the drug level through as separate process). If the dosage form/strength-level MFP is higher than the applicable dosage form/strength-level ceiling price, reduce the dosage form/strength-level MFP so that it is equal to the applicable dosage form/strength-level ceiling price.</p>

²⁶¹ *Id.* (Step 8 of the application of the MFP process in the Initial Guidance).

²⁶² *Id.* at 59 (Step 9 of the application of the MFP process in the Initial Guidance).

Step 7: Calculate a per-unit dosage form/strength-level MFP per thirty-day equivalent supply on the unit level by dividing the result from Step 6 by the units per total thirty-day equivalent supply for the dosage form and strength.²⁶³

Calculate the MFP per 30-day equivalent supply on the unit level

- **Divide** the MFP per 30-day equivalent supply in **Step 6** by
 - The total number of units dispensed **divided by**
 - The total 30-day equivalent supply for a dosage form and strength

²⁶³ *Id.* at 59 (Step 10 of the application of the MFP process in the Initial Guidance).

APPENDIX B

Comments Related to Guidance Appendix C: Definitions for Purposes of Collecting Manufacturer-Specific Data

In this Appendix B, we provide our comments to CMS's proposed definitions for the purposes of collecting manufacturer-specific data found in Appendix C to the Guidance.

As a threshold matter, we highlight that the U.S. Securities and Exchange Commission (SEC) and other governmental bodies do not require external reporting of costs (including research and development costs) or profits at a product-specific level, and therefore Lilly does not prepare standard financial statements with this data at a product-specific level. Further, actual costs (including R&D costs) associated with individual Lilly products are not allocated, compiled, or reported by Lilly in the regular course of business, and estimated cost data (including R&D cost data) for individual products would reflect informal and unaudited financial analysis. Instead, Lilly produces audited financial reports on an enterprise level pursuant to governing regulatory standards and accounting principles. These audited annual reports are submitted to the SEC pursuant to federal laws and regulations.

As a result, Lilly believes manufacturers will need to make many reasonable assumptions for the purposes of calculating much of the data manufacturers will be required to submit to CMS. For manufacturers like Lilly, this data will be prepared solely for purposes of complying with the requirements of the IRA. Where possible, we recommend that manufacturer assumptions be based on existing audited financial reports submitted to the SEC and/or generally accepted accounting principles (e.g., U.S. GAAP).

Lilly has the following specific comments related to the definitions proposed in Appendix C of the Guidance.

Research and Development (R&D) Costs – General Comments

1. CMS Should Not Limit the Definition of R&D Costs to Costs Associated with “All FDA-Approved Indications of a Drug.”

CMS proposes allowing manufacturers to report R&D costs (pre-clinical, post-IND, etc.) “for all FDA-approved indications of a drug.” However, this proposal appears to ignore material costs incurred by manufacturers to invest in R&D for indications approved in non-U.S. markets (indications that may be approved by the U.S. FDA at a later time). Moreover, as we note elsewhere in our comments, this proposal is in tension with CMS's proposal to calculate “recoupment of R&D costs using the *global*, total lifetime net revenue for the selected drug.” The results of this recoupment calculation will be misleading, as a manufacturer will need to report global revenue (including revenue for indications approved in markets outside of the United States but that are *not* FDA approved), but the manufacturer will not be able to report the R&D costs associated with these approvals, which may be significant.

To resolve this tension and avoid this misleading result, CMS should allow manufacturers to submit global R&D expenses, regardless of whether a particular indication is FDA-approved.

2. CMS Should Define “Federal Funding” to Exclude “Indirect Federal Funding” and Should Allow Direct Federal Funding to be Allocated.

CMS is proposing to exclude “Federal funding” from the determination of R&D costs. CMS does not define “Federal funding,” and it is not clear from the Guidance whether CMS intends to exclude direct government funding of R&D, or direct and indirect funding. For example, the federal government may provide funding to a third-party entity or foundation that provides funding to manufacturers for R&D purposes. Because this indirect government funding may be unknown to manufacturers, we recommend that CMS exclude *indirect* Federal funding from the definition of “Federal funding.”

In addition, we highlight that Federal funding of preclinical research (like most preclinical research) is generally not product specific. As a result, such funding would need to be allocated, similar to how CMS acknowledges that indirect research costs must be allocated.

3. CMS Should *Include* Acquisition Costs in the Definition of R&D Costs.

CMS is proposing to exclude “acquisition costs” from the definition of R&D costs. This proposal ignores meaningful costs incurred by the manufacturer. Moreover, it is inconsistent with SEC guidance, which specifies that in-process R&D (IPR&D), including those IPR&D costs related to acquisitions, must be considered as normal costs of operations and included in Non-GAAP financial reporting as R&D costs. Specifically, in 2021, SEC clarified its position in letters to several manufacturers, including Lilly, that Acquired In-Process Research and Development (AIPR&D) should not be excluded from R&D expenses.

To comply with SEC’s guidance related to Rule 100(a)(2) of Regulation G, Question 100.01, beginning in 2022, Lilly included AIPR&D within non-GAAP EPS reporting. Thus, *excluding* such costs in a manufacturer’s reporting to CMS would be inconsistent with recent SEC statements on this matter and would ignore material costs. We recommend that CMS specifically include acquisitions costs in the definition of R&D costs.

4. CMS Should Not Exclude “Costs Associated with *Ongoing* Basic Pre-Clinical Research, Clinical Trials, and Pending Approvals” from the Definition of R&D Costs.

CMS is proposing to exclude “costs associated with *ongoing* basic pre-clinical research, clinical trials, and pending approvals” from the definition of R&D costs. We disagree with this proposal and believe excluding these costs ignores meaningful expenses incurred by manufacturers to advance and seek approval of innovative therapies. For example, manufacturers may continue to execute trials to further the understanding of approved molecules and to gain approval for additional indications of that molecule that will further benefit patients. However, these additional trial costs may be for indications that are not yet, and may not ever be, approved by FDA. We recommend that CMS specifically *include* these costs in the definitions of basic pre-clinical research costs, post-IND applications costs, etc., or specifically include these costs in the definition of “all other R&D costs.”

Moreover, as we note elsewhere in our comments, this proposal is in tension with CMS’s proposal to calculate “recoupment of R&D costs using the global, *total lifetime* net revenue for the selected drug.” The results of this recoupment calculation will be misleading, as a manufacturer will need to report global lifetime revenue (i.e., *ongoing* revenue), but the manufacturer will *not* be able to report global lifetime (i.e., *ongoing*) R&D expenses.

To resolve this tension and avoid this misleading result, we recommend that CMS specifically *include* ongoing R&D costs. Such approach better reflects not only the treatment of these expenses under U.S. GAAP but also results in a more proximate (and less misleading) recoupment calculation.

5. CMS Should Specifically Identify Milestone Payments As R&D Costs.

CMS is silent as to the treatment of milestone payments to third parties related to R&D (e.g., a payment paid based on achieving a Phase 1 or Phase 2 milestone). We recommend that CMS specifically clarify that milestone payments should be reported as R&D costs, consistent with recent SEC statements. In the absence of such clarification, we assume that milestone payments fit within the definition of direct research expenses, as such expenses can be specifically attributed to the discovery and preclinical or clinical development of the selected drug.

Research and Development (R&D) Costs – Comments on Specific Definitions

1. Definition 1 - R&D: Basic Pre-Clinical Research Costs: CMS Should Allow Manufacturers to Make Reasonable Assumptions Regarding Allocations of Research Expenses.

We agree with CMS's acknowledgement that manufacturers will need to proportionally allocate indirect pre-clinical research costs. We reiterate that manufacturers will need to make reasonable assumptions in their calculations and allocations of basic pre-clinical research costs.

2. Definition 2 - Post-Investigational New Drug (IND) Application Costs: CMS Should Specifically Allow Manufacturers to Make Reasonable Assumptions Regarding the Definition of Direct Costs for Post-IND Costs.

CMS proposes to define direct costs for post-IND costs as "Institutional Review Board (IRB) review and amendment costs, user fees, patient recruitment, per-patient costs, research and data collection costs, personnel, and facility costs that are directly related to conducting the dosing and Phase I, Phase II, and Phase III clinical trials during the post-IND period." We believe this definition could be construed too narrowly, as there are several trial-specific costs that are not specifically included in CMS's definition. For example, manufacturers incur costs such as clinical trial site monitoring, site training, safety stock, etc., that are essential to running clinical trials. Although some manufacturers may interpret these costs as "facility costs" or similar, we recommend that CMS specifically identify broader categories of direct expenses that are directly attributed to support of a clinical trial site, consistent with reporting of R&D expenses under U.S. GAAP and SEC reporting.

3. Definition 3 - R&D: Completed U.S. Food and Drug Administration (FDA)-Required Phase IV Trials: We Assume CMS Is Not Limiting Its Proposed Definition of Direct Costs for Completed Phase IV Studies to the Costs Listed in the Guidance.

CMS proposes to define direct costs for completed Phase IV studies to "*include* patient recruitment, per-patient costs, research and data collection costs, personnel, and facility costs that are directly related to conducting the completed Phase IV study" (emphasis added). We assume this definition *includes*, but is *not limited to*, these categories of costs. For example, there are many trial-specific costs (e.g., clinical trial site monitoring, site training, site contracting, safety stock, etc.) that are not

specifically identified in the Guidance. Consistent with our feedback to Definition 2 above, we recommend that CMS ensure its definition of “Completed FDA-Required Phase IV Trials” allows manufacturers flexibility to include categories of expenses that are directly attributed to support of a clinical trial site in a manner consistent with reporting of R&D expenses under U.S. GAAP and with SEC reporting.

4. Definition 4 - R&D: Post-Marketing Trials: CMS Should i) Further Clarify the Difference between Definitions 3 and 4, and ii) Broaden Definition 4 to Include Other Post-Marketing R&D Expenses, Including Expenses Not Associated with Clinical Trials.

As a threshold matter, we believe Definitions 3 and 4 may have some redundancy and could create confusion. Moreover, we believe there may be tension between CMS’s statement that R&D costs are costs associated with “FDA-approved indications of a drug,” but that Definition 4 may include “direct cost[s] for post-marketing trials conducted for the purposes of marketing claims.” We interpret this later statement to include such expenses as expenses related to post marketing studies related to new indications or line extensions, investigator-initiated studies, real-world evidence and/or observational studies, etc., that are not related to an approved indication, and that may not be related to a specific post-marketing clinical trial.

Accordingly, and consistent with our other comments, we recommend that CMS ensure this definition of Post-Marketing expenses allows manufacturers flexibility to include: i) categories of expenses that are directly attributed to support of a clinical trial site, and ii) other R&D expenses that may not be attributable to a clinical trial site (e.g., real-world evidence studies). This would be consistent with reporting of R&D expenses under U.S. GAAP and with SEC reporting guidance. In addition, we recommend CMS specify that this category may include expenses related to indications not approved, or not yet approved, by the FDA.

5. Definition 5 - R&D: Abandoned and Failed Drug Costs: CMS Should Broaden its Definition “Abandoned and Failed Drug Costs.”

We agree with CMS’s acknowledgement that manufacturers incur R&D costs associated with failed or abandoned products. However, CMS proposes limiting the reporting of such basic *pre-clinical research* costs to those costs associated with “the same active moiety / active ingredient or mechanism of action as the selected drug.”

We disagree with this limitation and believe it is overly narrow, as a large portion of basic pre-clinical research expense would not be assignable to any marketed product. For example, Lilly has made significant investment in researching Alzheimer Tau Tangle targeting molecules, some of which has failed, but all of which has contributed to the overall advancement of Alzheimer’s research. As a result, we recommend that CMS specially allow manufacturers to allocate the costs associated with abandoned or failed research to molecules in the same disease state or therapeutic class. This recommendation is consistent with CMS’s proposal to include in “failed or abandoned drug costs” an allocation of direct *post-IND costs*²⁶⁴ for drugs in the same therapeutic class as the selected drug that did not achieve FDA approval.

²⁶⁴ Similar to Definitions 2, 3, and 4, CMS has proposed that direct post-IND costs include IRB review and amendment costs, user fees, patient recruitment, per-patient costs, research and data collection costs,

6. Definition 6 - R&D: All Other R&D Costs: CMS Should Allow Flexibility in This Definition.

We appreciate that CMS has not adopted a definition for “all other R&D costs.” We assume that this category can include an allocation of indirect expenses, including R&D overhead expenses, non-molecule specific costs in support of research and trial development, and relevant general and administrative expenses that are not otherwise captured in the definitions above. (For example, CMS proposes to allow for an allocation of relevant general and administrative expenses in the determination of indirect research expenses associated with basic pre-clinical research.²⁶⁵ We assume an allocation of general and administrative expenses for other research, not pre-clinical, is appropriately captured in this Definition 6.)

In addition, manufacturers may classify certain expenses associated with Medical Affairs as R&D costs. We assume that certain Medical Affairs expenses directly associated with a product and classified as R&D costs should be included in this Definition 6.

Finally, as noted above, we recommended that Definition 4 be broadened to include other post-approval research and development expenses including or related to new indications or line extensions, investigator-initiated studies, real-world evidence and/or observational studies, safety monitoring, ongoing regulatory fees, and other post marketing R&D costs. To the extent CMS disagrees that these expenses should be captured in Definition 4, we assume these expenses would fit into this Definition 6.

7. Definition 7 - Global, Total Lifetime Manufacturer Net Revenue for the Selected Drug: CMS Should Resolve the Tension in Its Proposed Recoupment Calculation.

As noted elsewhere in our comments, CMS’s proposal to calculate recoupment using the global, total lifetime net revenue of the selected drugs is at odds with CMS’s proposed definitions of R&D expenses, both in terms of scope (*global* revenue versus expenses associated with *U.S. FDA* approvals) and in terms of timing (*lifetime* revenue versus expenses *excluding* ongoing or other lifetime expenses). As a result, and to better align with categorization of R&D expenses under U.S. GAAP and/or for SEC reporting purposes, we recommend that CMS specifically broaden the scope of R&D expenses to include global, lifetime expenses.

Current Unit Costs of Production and Distribution

As a threshold matter, we reiterate that the SEC and other governmental bodies do not require external reporting of costs at a product-specific level, and therefore Lilly does not prepare standard financial statements with this data at a product-specific level. As a result, Lilly believes

personnel, and facility costs that are directly related to conducting dosing and clinical trials for the drug. Consistent with our other comments, we recommend that CMS allow manufacturers flexibility to include in the allocation of post-IND costs categories of expenses that are directly attributed to the support of a clinical trial site in a manner consistent with reporting of R&D expenses under U.S. GAAP and with SEC reporting.

²⁶⁵ Similarly, CMS proposes to include “allocated shared operating and other indirect costs (such as capitalized production facility costs, benefits, generalized and administrative costs, and overhead expenses)” in the production and distribution costs.

manufacturers will need to make reasonable assumptions for the purposes of calculating the values required to be submitted, which may be prepared solely for purposes of complying with the requirements of the IRA.

1. CMS Should Define Distribution Costs to Include Additional Channel Fees and Expenses.

CMS proposes to define costs of distribution as all direct, and an allocation of indirect, costs related to “packaging and packaging materials; labeling; shipping to any entity (e.g., distributor, wholesaler, retail or specialty pharmacy, physician office or hospital, etc.) that acquires the drug from the Primary Manufacturer or any Secondary Manufacturer; and operating costs for facilities, transportation, and other expenses related to packaging, labelling, and shipping to any entity that acquires the drug from the Primary Manufacturer or any Secondary Manufacturer.” We note that manufacturers incur channel fees, including prompt pay discounts, administrative fees for inventory management and other wholesalers services, etc. These expenses are not explicitly called out in the Guidance, and they may be treated by manufacturers as a reduction in revenue, or as a distribution cost. Regardless, these expenses are important to understanding the totality of a product’s distribution costs, and we recommend that CMS include these expenses in the definition of distribution costs.

2. CMS Should Allow Allocation of Various Other Costs Associated with Producing and Distributing Product.

We agree with CMS’s recognition that manufacturers will need to allocate various direct and indirect costs. We recommend that CMS preserve flexibility in manufacturers’ ability to identify and allocate various product manufacturing costs in a manner consistent with U.S. GAAP and/or SEC reporting. Such costs may include expenses associated with royalties or other margin sharing arrangements, amortization of intangible assets, use/yield variances, purchase price variances, idle plant expenses, the impact of foreign exchange rate changes on inventories sold, etc. These expenses are part of standard U.S. GAAP accounting.

CMS should also factor in capital outlays required to build, improve, and/or maintain manufacturing facilities. While some of these costs may be reflected in the unit costs of production through depreciation expense, depreciation will not be representative of the significant capital investments required for entry and ongoing operations. CMS should carefully consider these investments when evaluating the total cost picture. In some product classes, there may not be alternative manufacturers with sufficient capacity given the significant barriers to entry.

Finally, CMS should consider the costs a new entrant would bear if they had to bring such a product to market and manufacturer the product at the same capacity as an incumbent manufacturer. This “replacement cost” is a better representation of the current benefit to society than costs in the past might have been.

Re: Comments on *Medicare Drug Price Negotiation Program: Initial
Memorandum, Implementation of Sections 1191 – 1198 of the Social Security
Act for Initial Price Applicability Year 2026*

Dear Dr. Seshamani:

The EveryLife Foundation for Rare Diseases appreciates the opportunity to comment on the March 15, 2023 initial memorandum on the Medicare Drug Price Negotiation Program (MDPNP). The EveryLife Foundation was founded to empower the rare disease patient community and focuses on a range of public policy issues at both the federal and state levels. Ensuring every person with a rare disease or condition can obtain affordable access to any medication approved by the Food and Drug Administration (FDA) is a top priority.

The Foundation recognizes and appreciates the intent behind the prescription drug negotiation program established by the Inflation Reduction Act. We understand the frustration Congress and most Americans have with the high costs of prescription medications. But we also recognize that multiple factors contribute to the costs of prescription drugs and believe an effective solution will be informed by understanding the systemic cost drivers that impact the entire healthcare system as opposed to disproportionately focusing on any single sector. We urge policymakers to recognize the transformational impact many prescription medications have had on countless American lives, including the lives of those suffering from a rare disease or disorder, as well as their role in reducing or preventing costs in other areas of healthcare, such as inpatient admissions, as well immeasurable life years saved.

The EveryLife Foundation appreciates the opportunity to provide feedback on the implementation of the MDPNP. We recognize CMS was not required to solicit public input in this phase of implementation; however, the patient community remains concerned with the limited opportunities offered for stakeholder feedback given the timelines outlined in the March 15th guidance. We join with other patient advocacy organizations in calling for CMS to utilize official notice and comment opportunities as the MDPNP implementation continues.

Earlier this year, the rare disease community commemorated the 40th anniversary of the enactment of the Orphan Drug Act (ODA) into law. Before the ODA became law, there was little biopharmaceutical interest in developing medications for rare diseases. In the four decades since its enactment, the FDA has issued more than 1,100 orphan designated approvals to treat rare diseases and disorders. This is unquestionably a success story, but that work is far from finished. The stark reality is that even 40 years after the ODA, 95% of all rare diseases and disorders lack any FDA-approved treatment. And while the ODA turned a once barren landscape into a vibrant ecosystem, developing treatments for rare diseases remains a highly challenging pursuit.

We appreciate that Congress recognized, at least partially, the challenges associated with rare disease therapy development by excluding a product that is approved to treat a single rare disease or condition from the Medicare negotiations. While we believe that the exemption, as written, is too narrow, we are especially concerned that the interpretation of this exemption as laid out in the March 15th guidance is even more restrictive than Congress intended and will have a serious negative impact on any industry incentives to evaluate a potential second, third or further application of a rare disease drug to another disease or condition.

As a rare disease-focused organization, we are particularly concerned about the lack of opportunity to provide input into the criteria for determining eligible products for the initial price applicability year of 2026. Given the implications of the criteria for determining eligibility of some orphan products on the highly sensitive rare disease therapeutic development ecosystem, we have provided comments and requests for clarification for the agency's consideration.

Additionally, our comments focus on the following areas:

- **Orphan drug designated approvals vs designations when determining eligibility**
- **Broadening and Clarifying the Definition of Unmet Need**
- **Methods for Determining Clinical Benefit - Process for Identifying Therapeutic Alternatives, Comparators, Exclusion of QALYs, Patient Experience Data**
- **Communication and Engagement Throughout the MDPNP**
- **Ensure Timely Access to Therapies**
- **Beneficiary Outreach and Protections**
- **Implement a Robust Monitoring Program**

Application of the Orphan Drug Exemption – Clarifications to Preserve Orphan Drug Incentives

CMS should consider orphan drug designated approvals vs designations when determining eligibility

As CMS knows, seeking and receiving orphan designation for a candidate therapy is not the same as submitting an application for a therapy's approval. The former process typically occurs relatively early in the product development process, typically many years if not longer before any possible approval is granted. We urge CMS to explicitly state that a drug with an orphan designation will not lose its orphan drug exclusion simply if it applies for and receives a designation for a second orphan medication. In addition, we urge FDA and CMS to establish a clearly defined process for FDA to share updates with CMS on both designations and eventual approvals. Given the risks of therapy development, including in exploring the repurposing of a drug approved to treat one condition for efficacy in treating another condition, simply obtaining an orphan designation should not result in any changes to an orphan exclusion. We already know there is widespread off-label use of drugs to treat rare conditions and are

concerned that loss of the orphan drug exclusion upon granting of a designation rather than approval would only further exacerbate this problem. Therefore, we urge CMS to clarify this point and further clarify that the orphan drug exclusion under current law would only be lost if FDA approves the same drug for treating a second disease or condition.

CMS should clearly articulate how it will address rare disease drugs within the letter of the current law

We appreciate the point in the memorandum that *“CMS will use the FDA Orphan product designation database and approvals on the FDA website”* and urge further clarification of this intent. Clarity on how CMS plans to implement the orphan exclusion, including by explicitly stating how it will interpret the requirement that all approvals be within one disease area, is highly encouraged. With the advancements in personalized medicine, there has been an increase in drug development for specific mutations or subtypes of disease. We believe CMS should act within their authority under the law to clarify they will consider separate approvals for different mutations or subtypes of one disease as still eligible for the orphan drug exemption. Without this clarity there will likely be diminished willingness to invest in the additional clinical research necessary to demonstrate effectiveness for other components of the patient population, leaving healthcare professionals, patients, and payers without the evidence they need to make informed decisions about appropriate use.

There are several examples of approved products and those in the pipeline that demonstrate the importance of preserving the exemption if all approvals are within mutations or subtypes of one disease. For example, Kalydeco received its original orphan designation in 2006 and its first approval in 2012. The original approved label was for one CFTR mutation (G551D) for patients 6 years and above. Over the next ten years, it received ten additional approvals, addressing 37 unique gene mutations on the CFTR gene that can cause cystic fibrosis. With each successive approval, more and more patients, who once had few to no treatment options, were able to benefit from this first in class innovative treatment with the confidence that the drug was appropriate for them. Ongoing efforts to develop therapies for diseases like ALS, MPS and other genetic diseases may face similar trajectories; and if not clarified, CMS risks negatively impacting the likelihood of these programs reaching the full range of potential eligible patients.

CMS should identify potential impacts related to changes in formulation

We urge CMS to clarify how the agency will address a potential situation in which a sponsor puts forward a new formulation that is clinically superior compared to the original formulation. The first-generation unity recognizes that first generation therapies may often be limited in their overall efficacy. But it is our hope that through further research, development, and exploration, product developers will produce more efficacious second, third, and subsequent generation treatments, including superior formulations of a first-generation product. We urge CMS to articulate how, for the purposes of IRA implementation, it plans to treat instances in which it determines that a new formulation warrants a product’s designation as a new molecular entity.

CMS should address combination therapies involving one or more rare diseases:

We encourage CMS to state how the agency will address medications that are a combination of two products. For example, if one of the two products is approved to treat a second orphan drug, how would that impact the exclusion for the combination product?

Factors Relevant to the Determination of Maximum Fair Price

Broadening and Clarifying the Definition of Unmet Need

Though we appreciate the guidance defined an unmet need as “treating a disease or conditions in cases where very limited or no other treatment options exist,” we urge CMS to clarify how it defines *limited treatment options* and how it will determine unmet need overall. A too narrow definition runs the risk of disincentivizing further therapy development in a space that still requires additional treatment at the risk of not meeting the unmet need exemption. Often within the rare disease space, drugs will be approved that only address one aspect of a condition or one specific mutation that can cause the disease or may be intended to slow disease progression but is not curative. A too narrow definition that does not take into account how treatments are utilized runs the risk of stunting interest in finding new and better treatments for the community.

Methods for Determining Clinical Benefit - Process for Identifying Therapeutic Alternatives, Comparators, Exclusion of QALYs, Patient Experience Data

We appreciate CMS’s thoughtful considerations on the identification of therapeutic alternatives and the several points raised related to our rare disease community’s priorities.

With respect to the identification of *Indications for the Selected Drug and Therapeutic Alternatives for Each Indication (60.3.1)*, CMS has stated that therapeutic alternatives for each indication of the selected drug will be considered. CMS has further stated that it “*considered evaluating non-pharmaceutical therapeutic alternatives; however, for initial price applicability year 2026, the agency plans to only consider therapeutic alternatives that are covered Part D or Part B drugs or biologics. CMS believes that pharmaceutical therapeutic alternatives will be the most analogous alternatives to the selected drug when considering treatment effect and price differentials.*” We concur that pharmaceutical alternatives are most appropriate comparators of the selected drugs and urge CMS to make permanent the consideration of only pharmaceutical therapeutic alternatives. In addition, we ask CMS to not consider *drugs* approved for each indication to be appropriate comparators to *biologics* within the same indication.

Related to the analysis of *Selected Drugs with Therapeutic Alternative(s) (60.3.3)*, we are appreciative of CMS’ emphases on the products’ outcomes and safety profiles.

We applaud CMS’ exclusion of metrics that treat extending the life of any individual as lower value than the life of another individual; this includes QALYs when used in association with life extension. Evidence that values extending the lives of some as less than extending the lives of others, whether based on disability status, age, diagnosis, demographic, or special populations, is unethical. We appreciate that CMS is seeking input on what other measures should also be considered inappropriate, and equally as important, which measures should be considered appropriate for use.

In addition to the outcomes listed by CMS for consideration (safety, efficacy, health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes), we suggest that CMS consider measures that are seen as beneficial to patients and caregivers¹. Those include measures that capture direct medical costs, especially out-of-pocket costs; non-medical costs to patients and families, effects on future costs, and work loss and absenteeism. The National Economic Burden of Rare Disease Study estimated the overall annual economic burden of rare disease in 2019 exceeded \$966 billion in the United States. Of the total economic burden, the largest costs were indirect costs from productivity losses at \$437 billion, direct medical costs at \$418 billion and non-medical and uncovered healthcare costs of \$111 billion absorbed directly by families living with rare diseases. Aside from absenteeism, inpatient care was the biggest expense, accounting for nearly 15% of the overall economic burden while prescription medication and administration costs accounted for about 10% and outpatient care for about 6%. Meaningful assessments of product affordability must focus on more than just one aspect of the overall health care system².

As the science of Patient-Focused Drug Development has evolved beyond the regulatory ecosystem, several organizations and initiatives have served as leaders within this space. To that end, CMS should work closely with patient communities, as well as partners such as the Innovation and Value Initiative (IVI), the National Health Council (NHC), the Institute for Gene Therapies (IGT), PAVE (the Patient Driven Values in Healthcare Evaluation) within the University of Maryland School of Pharmacy, and other leaders within this space who are leading innovative, patient-centered valuation efforts.

Communication and Engagement Throughout the MDPNP

We appreciate the agency's interest in creating a useful public explanation for the negotiated MFP. There is a great deal at stake for the rare disease community and a clear understanding of what factors were considered in determining the MFP is necessary to guide ongoing stakeholder engagement and clarity to the investment community that catalyzes most rare disease therapy development. As communities, we have evolved our engagement within the neighboring product development and regulatory ecosystems and have developed processes that enable engagement, patient experience data inclusion, and transparency.

While fewer than 5% of the more than 10,000 rare diseases have any FDA-approved disease-modifying therapies, we are grateful for recent breakthroughs that have extended the life expectancies of once-fatal conditions and we are optimistic about the research that is ongoing to develop treatments for additional conditions. For more than a decade, the rare disease patient community has played a significant role in the paradigm shifts and statutory changes that have occurred with respect to the inclusion of patients and patient experience data within clinical trial design, product development, and regulatory review.

As collaborative stakeholders, we have experienced a tremendous evolution of patient engagement and related areas since their infancy in PDUFA V – through their continued development via the 21st Century Cures Act and PDUFA VI -- and now their continued maturation in the implementation of PDUFA VII today. In this time, the landscape has shifted for the rare disease community. We've seen a deepened engagement and understanding of the patient perspective via numerous approaches such as through the evolution of Patient Focused Drug Development that facilitated new levels of transparency and engagement between regulatory agencies and relevant stakeholders around the integration of patient experience data within the regulatory review.

As a positive byproduct of these engagements, the CDER-issued [series of guidance documents](#) for conducting patient-focused drug development have been critical tools in providing stakeholders with practices for

- collecting comprehensive and representative input;
- methods to identify what is important to patients;
- selecting, developing, or modifying fit-for-purpose clinical outcome assessment; and,
- incorporating clinical outcomes assessments into endpoints for regulatory decision-making.

In addition, FDA’s issuance of numerous other guidances has been critical to our pipeline as it has informed the inclusion of patient experience data within clinical trial and patient-focused product development activities for drugs, cell- and gene-based therapies, diagnostics, and medical devices.

We encourage CMS to leverage the lessons learned throughout the evolution of patient focused drug development experiences in the regulatory environment as it proceeds with MDPNP implementation, including the proposed communication and transparency restrictions and in the required public explanation.

Gag Period Implications

Frequent and open communication before, during, and after the negotiation process is paramount to establishing public trust in the process and to informing the evolution of a program that constitutes a significant change in how drug prices are determined. Unfortunately, the restrictions proposed in Section 40.2.2 are likely to result in decreased transparency and reduced ability to understand and address the lessons learned in each negotiation process. While we understand and appreciate the need to protect the confidentiality of certain proprietary business information, imposing what amounts to a “gag order” on manufacturers is counterproductive. We encourage CMS to adapt the intended communication restrictions to prohibit sharing of only the most sensitive proprietary information and to abandon plans to place blanket restrictions on the sharing of information exchanged during the negotiation process. We hope CMS leverages its experience on how to communicate agency interactions and sensitive information within the regulatory environment to inform a final plan for what information will be restricted.

Content for Public MFP Explanation

To be an effective engagement tool, we encourage CMS to consider the following elements:

- Stakeholder groups who were engaged during negotiation
- Whether patient experience data (PED) and real-world evidence (RWE) was submitted during the negotiation process
- If patient experience data (PED) and real-world evidence (RWE) was considered in determining the MFP
- If submitted information was not considered to be relevant, publish a discussion of the rationale including what limited the agency’s ability to consider the submitted information
- Which metrics were used to evaluate clinical benefit
- Which outcome measures were considered when selecting therapeutic alternatives
- Criteria used to determine unmet need

The final public explanation must be easy to navigate and while much of the requested information is technical in nature, we encourage CMS to provide an appropriate short summary that will enable patients to understand the process that was used to determine the MFP and what they can expect to experience when obtaining their negotiated product. Additionally, while we recognize CMS is not statutorily required to publish the public explanation prior to March 1st of the year prior to the IPAY, we urge the agency to consider moving up this timeline to ensure that the information obtained in the explanation can be used by stakeholders to inform the submission of information for the selected products in the next IPAY.

Ensure Timely Access to Therapies

We appreciate that the law requires payers to include products selected for the MDPNP on the plan formulary. Rare disease patients are facing an onslaught of restrictive coverage policies, high cost-sharing requirements, and burdensome utilization management strategies. While the requirement to include the negotiated product on the formulary is a step in the right direction, we urge CMS to provide additional clarity on the parameters for coverage of negotiated products. Such parameters should seek to provide fair access to negotiated products and limit the potential for payers to arbitrarily implement restrictive utilization management practices as a reaction to increased liability because of the Part D redesign component of the IRA or as a reaction to the required coverage. It is also essential that CMS clarify that plans should not place additional utilization management restrictions on non-negotiated therapeutic alternatives solely due to their negotiation status.

Beneficiary Outreach and Protections

The MDPNP represents a significant technical change to how some drug prices are set, however much of this process is occurring outside of the view of the average Medicare beneficiary. We believe it is important for CMS to consider previous learnings from large scale program implementation efforts, such as the implementation of the durable medical equipment competitive bidding program, when designing beneficiary education and protection efforts. For example, we appreciate the intention to establish a toll-free number and email as mentioned in section 90.2; however, without sufficient public awareness and understanding of what eligible individuals are entitled to and the complaint mechanisms that exist, these resources will go under-utilized. We suggest that CMS consider identifying opportunities to include clear and accessible information about access to the MFP for negotiated products and complaint mechanisms in highly visible locations that don't rely on a beneficiary seeking out said information online or a third party remembering to provide such information. Considerations could include placement on leaflets provided by retail pharmacies with each prescription, along with additional placements in patient portals, relevant healthcare professional locations and community settings.

Implement a Robust Monitoring Program

The rare disease therapeutic development ecosystem is highly sensitive to changes in policy and the underlying incentives that drive investment in high-risk and high unmet need communities. For this reason, the [Rare Disease Community Statement on Drug Pricing Policy Priorities](#) recommends that rare disease therapies are excluded from policy experiments or demonstrations that significantly alter how prices are set until or unless it is proven that the changes do not threaten patient access and medical innovation. Given the limited nature of the exclusion for orphan drugs in the MDPNP, active monitoring

of a broad range of metrics to monitor the impact of the program on the rare disease ecosystem is paramount.

Specifically, we suggest CMS establish procedures to monitor the following metrics:

- Increases in launch price trends
- Growth in the use of utilization management strategies
- Trends in the approval of new indications for approved orphan designated products
- Increased time between completion of phase 3 clinical trials and FDA filing for follow on indications of approved orphan designated products
- Trends in the approval of new formulations of approved products
- Shifts away from investment in drug development programs for rare diseases that primarily affect Medicare beneficiaries
- Reliance on off-label use of therapies

Actions CMS can take to Support Orphan Drug Development

Beyond clearly articulating how the agency plans to interpret the statutory language and preventing any overly narrow approach to implementation, we appreciate CMS' interest (as stated in section 30.1.1) in other actions it could take to support orphan drug development. With that in mind, and recognizing these actions are outside of the scope of the current MDPNP, we offer the following points for the agency's consideration.

- **Support early dialogue between payers and rare disease developers/ manufacturers:** The FDA has long operated a program that provides medical device manufacturers with the opportunity to engage with payers early in the development process to obtain payer feedback that may inform clinical evaluation and other decisions. The intent is to maximize the likelihood of favorable coverage policies upon a product's market clearance. The EveryLife Foundation sees tremendous value in this approach and believes FDA and CMS should institute a similar program focused on rare disease therapy development which falls under the authority of CDER and CBER. Through a rare disease early payer engagement program, CMS and FDA can jointly establish a process to enable voluntary early dialogue between rare disease product manufacturers and payers – including Medicare and Medicaid. Through such interactions, we would hope that payers could provide invaluable inputs, including thoughts on trial design and data needs they will want to see to support a positive coverage decision. These interactions would also help manufacturers educate payers about specific rare diseases and conditions as well as the impact an approved therapy would have on the patient population. Given the potential significant benefits associated with an early payer engagement program, we urge CMS to work with FDA to launch such an initiative in the near-term.
- **Support development of diagnosis codes for rare diseases and disorders.** The diagnostic odyssey is the term used to describe the often multi-year period – and the rounds of medical appointments, tests, and other procedures – that patients with rare disease must often navigate just to receive an accurate diagnosis. One of the challenges associated with this process is the lack of ICD-10 codes for rare diseases and conditions. CMS, along with the Centers for Disease Control and Prevention (CDC) plays an important role in this process by staffing the ICD-10 Coordination and Maintenance Committee, which handles requests for new or updated codes. Some rare disease communities have been successful in navigating the process to successfully

develop codes for their disease or condition, but the vast majority of rare diseases lack any such codes. We would encourage CMS to work with the CDC to identify and implement improvements to facilitate the promulgation of additional rare disease codes. Specifically, we would encourage them to work on resource guides to help patient communities and researchers understand and navigate this process. In addition, convening a dedicated meeting or meetings of the committee each year focused on rare disease applications should be considered. Ultimately, by establishing more diagnostic codes for rare diseases, CMS can help shorten the diagnostic odyssey and could also help enhance understanding of a rare disease's natural history.

- **Do not Undermine FDA approvals and create additional impediments to coverage.** The Foundation is concerned about actions CMS has taken that have hindered program beneficiary access to FDA-approved medications, demonstrated most clearly in the agency's actions regarding novel therapies for Alzheimer's disease. While Alzheimer's is not a rare disease, we are troubled by the actions that have cast dispersion on the validity of an approval pathway created by Congress and of high importance to rare disease stakeholders. Limitations in natural history data associated with many rare diseases necessitate the use of a validated surrogate endpoint. We recognize the concerns regarding how the approval pathways have at times been used and the desire of policymakers to address these gaps. But, we are very concerned about actions that threaten to undermine the pathway overall and the ramifications such actions may have for those developing therapies to treat rare conditions and, most importantly, the patients who stand to benefit. We urge CMS to clearly recognize and communicate the value of the Accelerated Approval pathway which has been so successfully applied for patient unmet needs in common and rare cancers and to prevent from taking any actions that undermine drugs approved via this pathway. Specifically, we urge you to ensure that any rare disease therapy approved under Accelerated Approval be fully covered by programs under your authority.
- **Innovate in Utilization Management Strategies**
In rare diseases, time is a precious commodity. Extensive diagnostic odysseys often lead to diagnoses of rapidly progressive diseases with limited life expectancies. Utilization management techniques create unnecessary hurdles to critical and time-sensitive treatment interventions, yielding irreversible disease progression and catastrophic healthcare costs.

In 2021, 94% of prior authorization requests were approved, but of the over 2 million requests that were denied, only 11% were appealed with only 80% of those being successfully appealed. The data aligns with the stories we consistently hear from rare disease patients³. We urge CMS to partner with CMMI to explore innovative ideas to radically change the use of prior authorization policies, especially for vulnerable populations including those with rare diseases. Gold carding programs, shortened response times, and creating a pathway to eliminate prior authorization for certain drugs are among the many ideas that would help to limit the amount of prior authorization requests submitted for vital treatments and services.

Conclusion

Lowering the cost of health care, including prescription drug therapies, is an important goal that warrants thoughtful insight on how best to develop policies that will ensure the lowering of costs while

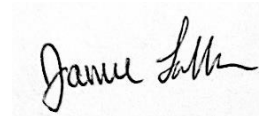

limiting potential negative unintended consequences. Policies that are implemented without consideration of the impact on incentives for rare disease research and development will mean lives will be lost and unnecessary suffering will be extended. We appreciate CMS's thoughtful process to ensure that the proposed negotiation process does not harm the same patients it is intending to help.

Thank you for the opportunity to provide comments on how the proposed negotiation process could impact the rare disease community and potential avenues to ensure that rare disease therapy development is not harmed through that process; the EveryLife Foundation and our partners are eager to engage with you. Please contact Jamie Sullivan, Senior Director of Policy at jsullivan@everylifefoundation.org if we can provide any additional information to inform your process.

Sincerely,

Annie Kennedy

**RE: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial
Price Applicability Year 2026, and Solicitation of Comments**

Dear Deputy Administrator Seshamani:

Exelixis is writing to submit comments on the Centers for Medicare & Medicaid Services' (CMS) initial guidance regarding the Drug Price Negotiation Program (Program) under the Inflation Reduction Act of 2022 (IRA) (Initial Guidance).¹

Exelixis is an innovative, research-based pharmaceutical company that focuses exclusively on accelerating the discovery, development, and commercialization of new medicines for difficult-to-treat cancers. We are committed to serving patients in desperate need of more effective cancer therapies. Our discovery efforts have resulted in two available products that are marketed by Exelixis: CABOMETYX® (cabozantinib) tablets and COMETRIQ® (cabozantinib) capsules. Exelixis has a long-standing commitment to research and development (R&D), year-over-year making significant investments to deliver the next generation of medicines that raises the standard of care for patients with cancer. Before we had a commercialized product, we spent between 73 percent and 87 percent of operating expenses on R&D (nearly \$2.3 billion). In 2022, Exelixis invested approximately 55 percent of its revenue for the year in R&D, and we anticipate investing approximately 56 percent of our revenue in R&D in 2023.²

¹ CMS, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (Mar. 15, 2023), *available at* <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

² Exelixis Announces Fourth Quarter and Full Year 2022 Financial Results and Provides Corporate Update (Feb. 7, 2023), *available at* <https://ir.exelixis.com/news-releases/news-release-details/exelixis-announces-fourth-quarter-and-full-year-2022-financial>.

We are incorporating by reference comments from our trade association (BIO) and commenting here on issues of particular importance to Exelixis. Exelixis' comments can be summarized as follows:

- Consistent with the statute, CMS cannot require manufacturers to provide access to the maximum fair price (MFP) to individuals who are not MFP-eligible. Therefore, CMS should not require manufacturers to provide access to the MFP until after the manufacturer verifies that an individual is MFP-eligible. Exelixis recommends that CMS designate a centralized third-party administrator (TPA) to facilitate retrospective MFP discounts. Following the TPA's initial verification, Exelixis recommends that the TPA provide manufacturers with access to claims-level data, which would enable manufacturers independently to verify whether an individual is eligible for an MFP discount. Exelixis further recommends that CMS define the MFP discount based on the difference between the MFP and the annual non-Federal average manufacturer price (ANFAMP), rather than a pharmacy's actual acquisition cost.
- CMS should establish mechanisms to prevent duplicate 340B and MFP discounts, consistent with the Agency's statutory obligation. At a minimum, Exelixis recommends that CMS: (a) require covered entities to use 340B claims indicators and reject claims that do not include the proper indicator; (b) leverage the TPA to verify the 340B status of selected drugs; and (c) include the 340B indicator in the claims-level data that the TPA provides manufacturers, so that manufacturers also can verify the 340B status of a selected drug. In order to further reduce the risk of duplicate discounts, Exelixis encourages the Agency to permit manufacturers to provide the 340B ceiling price as a retrospective rebate, after an individual's eligibility has been verified.
- Consistent with Congressional intent, CMS should implement the carveout for small biotech drugs in a manner that protects small and mid-size biotechnology companies, which are the engines of discovery. Accordingly, CMS should make clear that pursuant to the definition of qualifying single source drug set forth in the Initial Guidance—under which all dosage forms, strengths, and formulations that share the same active moiety and the same New Drug Application (NDA) holder are considered together—a qualifying single source drug must qualify as a small biotech drug for *all* of its formulations, provided the NDA holder retains ownership of these formulations (and thus they continue to constitute the same qualifying single source drug).

I. CMS Should Establish Mechanisms to Ensure that the MFP is Provided Only to Eligible Beneficiaries

Under the IRA, a manufacturer of a Part D selected drug must agree to provide access to the MFP to “[MFP]-eligible individuals . . . at the pharmacy, mail order service, or other dispenser at the point-of-sale of such drug” and to such individual’s “pharmacy, mail order service or other dispenser.”³ In relevant part, an “[MFP]-eligible individual” is defined as “an individual who is enrolled in a prescription drug plan under part D of title XVIII or an MA-PD plan under part C of such title if coverage is provided under such plan for such selected drug.”⁴ Significantly, the statute does not require manufacturers to provide MFP access to an individual who is not an MFP-eligible individual.

The Initial Guidance states that manufacturers may provide access to the MFP in one of two ways: “(1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP.”⁵ The Initial Guidance further states that a manufacturer that chooses to provide access to the MFP through retrospective reimbursement must reimburse “pharmacies, mail order services, and other dispensers, as well as intermediary entities, such as wholesalers, as applicable . . . the full amount of the difference between the acquisition cost for the selected drug and the MFP within 14 days.”⁶

A. Manufacturers Should Not be Required to Provide Access to the MFP Until After Verifying that an Individual is MFP-eligible

Exelixis supports permitting manufacturers to provide the MFP via a retrospective discount. As described in the comments of our trade association, BIO, the lack of any statutory audit or enforcement mechanisms against dispensers makes it vital that manufacturers be able to verify that an individual is MFP-eligible before providing the MFP discount. However, we are concerned that the Initial Guidance does not explain how CMS (or manufacturers) will be able to verify whether an individual is eligible for the MFP. This is critically important because the statute does not require manufacturers to provide access to the MFP to individuals who are not MFP-eligible. Therefore, as a matter of program integrity, Exelixis urges CMS to establish a transparent, centralized mechanism that will allow manufacturers to verify that an individual is MFP-eligible before the manufacturer is required to provide an MFP discount.

Exelixis disagrees with CMS’s suggestion in the Initial Guidance that wholesalers could help facilitate MFP discounts. In relevant part, the Initial Guidance states:

³ Social Security Act (SSA) § 1193(a)(3).

⁴ SSA § 1191(c)(2).

⁵ Initial Guidance § 40.4.

⁶ Initial Guidance § 40.4.

For example, a pharmacy may purchase a medication for \$100 per bottle and the MFP as applied to this selected package is \$80. The Medicare beneficiary is enrolled in a Part D plan under which coverage of the selected drug is available, thus the beneficiary is an MFP-eligible individual. For this example, the plan has not negotiated a lower price for the medication. The pharmacy provides the negotiated price (i.e., MFP plus a dispensing fee) at the point of sale to the Medicare beneficiary. As a result of this transaction, the pharmacy is owed \$20 by the manufacturer. The pharmacy would submit the information regarding the \$20 chargeback amount to its wholesaler and receive a credit from the wholesaler for that amount. The wholesaler would be compensated by the manufacturer after billing the manufacturer for the chargeback amount.⁷

Wholesalers are not well-positioned to oversee effectuation of the MFP. Wholesalers do not engage in claims-level transactions with pharmacies, and therefore do not have access to the data needed to verify whether an individual is MFP-eligible. In addition, there are dozens of wholesalers in the nation, making it difficult to create any sort of standardized claim verification and payment process through the wholesaler channel. In particular, smaller regional wholesalers may be unable or unwilling to collect and provide the information necessary to verify MFP discounts, which could cause further consolidation in the drug distribution system and imperil drug access in portions of the country, such as rural areas, that are serviced by regional wholesalers.

Instead, Exelixis recommends that CMS designate an independent, centralized TPA to facilitate retrospective MFP discounts. This entity could serve a similar role as the TPA in the Medicare Part D Coverage Gap Discount Program, which identifies claims eligible for discounts and facilitates the transfer of funds between pharmaceutical manufacturers and plan sponsors. The TPA model has proved workable in appropriately handling claims-level data, resolving disputes by manufacturers, and processing invoicing and payments from manufacturers in a timely manner.

After the TPA screens claims to determine if the individual is MFP-eligible, the TPA should provide manufacturers with access to certain claims-level data elements from the Prescription Drug Event (PDE) record, so that the manufacturers are able to verify whether an individual is MFP-eligible. At a minimum, manufacturers would need access to the following fields from the PDE record: national drug code (NDC), drug description, Rx ID, billing code, 340B indicator (discussed below), dispense/service date, dispensing/ provider national provider identifier (NPI), dispensing pharmacy/ provider name, pharmacy claim ID, prescribing NPI, dispensed units, billed units, billed amount, reimbursement amount, submission date, claim date, and Medicare plan ID.

Finally, Exelixis believes that 14 days — even if measured from the date of the manufacturer's receipt of complete claims information — is not sufficient time for manufacturers

⁷ Initial Guidance § 90.2.

to verify that an individual is MFP-eligible. Manufacturers should have time commensurate with industry standards before they are required to pay the MFP discount. For example, manufacturers have 38 days after receiving an invoice to pay a discount under the Part D Coverage Gap Discount Program,⁸ and 37 days to pay a rebate after receiving a rebate invoice under the Medicaid Drug Rebate Program.⁹ A period at least this long would be appropriate for verification of the MFP, which involves complex determinations of whether an individual is MFP-eligible and whether a particular unit was subject to a 340B discount. To ensure that pharmacies are provided the MFP discount in a timely manner, the TPA could potentially provide an initial discount payment to pharmacies within 14 days (following the TPA's initial screening for eligibility), with true-ups of the MFP discount if needed following verification by the manufacturer.

B. CMS Should Define the MFP Discount as the Difference between the MFP and ANFAMP

Exelixis disagrees with CMS's intention to use a dispensing entity's actual acquisition cost as the point of comparison for determining the MFP discount amount. The actual acquisition cost can be highly variable — both from pharmacy-to-pharmacy, as well as within a pharmacy if more than one wholesaler supplies a product to a pharmacy. We believe that it would be burdensome and operationally challenging to require pharmacies to report actual acquisition costs. For example, the variability in acquisition costs increases the risk that pharmacies may misreport their acquisition costs, which could lead to repeated corrections of the MFP discount amount. We instead propose that CMS define the MFP discount amount as the difference between the MFP and the ANFAMP of a selected drug. This is similar to how discounts are calculated for purposes of the TRICARE Retail Pharmacy (TRRx) Program, which provides the Department of Defense (DoD) the federal ceiling price (FCP) on drugs that are dispensed by community pharmacies and reimbursed by TRICARE. The TRRx rebate amount is calculated as the ANFAMP (which approximates the pharmacy acquisition price) less the FCP.¹⁰ Using ANFAMP, rather than actual acquisition cost, is also consistent with the structure of the IRA, given that the MFP ceiling is determined in part based on a selected drug's Non-FAMP.¹¹ Because the calculation of ANFAMP includes chargeback-based discounts that are processed through wholesalers to end customers, including pharmacies, it is also a better approximation of pharmacy acquisition costs than benchmark prices, such as Wholesale Acquisition Cost (WAC).

⁸ 42 C.F.R. § 423.2315(b)(3).

⁹ Interest Calculation for Late Rebate Payments, CMS, <https://www.medicaid.gov/medicaid/prescription-drugs/medicaid-drug-rebate-program/interest-calculation-for-late-rebate-payments/index.html#:~:text=In%20accordance%20with%20section%201927,before%20interest%20begins%20to%20accrue>.

¹⁰ 32 C.F.R. § 199.21(q)(3)(ii).

¹¹ SSA § 1194(c)(1)(A)-(C).

II. Consistent with the Statute, CMS Should Establish Mechanisms to Prevent MFP and 340B Duplicate Discounts

Under the IRA’s nonduplication provision, a manufacturer of a selected drug is not required to provide access to the MFP *and* the 340B ceiling price when a covered entity dispenses a selected drug to a Medicare beneficiary that is a “patient” of the covered entity.¹² Instead, manufacturers are required to provide access to *either* the MFP or the 340B price, whichever is lower.

Exelixis is concerned that despite the statutory nonduplication provision, there remains a significant risk of duplicate 340B and MFP discounts. For example, with respect to Medicaid and 340B duplicate discounts, the Office of Inspector General (OIG) has noted that even though such “duplicate discounts are prohibited by law . . . they . . . could occur in the Medicaid rebate process.”¹³ The Government Accountability Office (GAO) has expressed similar concerns, pointing to CMS’s “limited oversight of state Medicaid programs’ efforts to prevent duplicate discounts.”¹⁴ Therefore, we strongly encourage CMS to take seriously its statutory obligation to prevent duplicate MFP and 340B discounts and to establish robust safeguards.

At a minimum, we recommend that CMS require covered entities to identify units of selected drugs that are purchased under the 340B program when submitting a claim. It is widely-recognized that a 340B claims-level modifier requirement would help prevent duplicate discounts. OIG has recommended that CMS “require States to use claim-level methods to identify 340B claims,” noting that such requirement would “improve accuracy in identifying 340B claims and thereby reduce the risk of duplicate discounts.”¹⁵ Although CMS has declined to establish a universal claims level modifier requirement, a claims modifier is among the Agency’s recommended “best practices” for States to avoid 340B duplicate discounts in the Medicaid program.¹⁶ Exelixis is encouraged that for purposes of the Part D inflation rebate, CMS intends to require that a 340B indicator be included on the PDE record.¹⁷ Exelixis strongly encourages CMS to carry over this requirement to the Program. CMS also should require indicators for non-340B claims and reject claims without either indicator. This would reflect CMS’s approach for the discarded drug refund, where providers and suppliers submitting claims for single-dose container or single-use package drugs that are payable under Part B must include the “JW” modifier to note the amount of drug that was discarded, or, effective July 1, 2023, use

¹⁶ Best Practices for Avoiding 340B Duplicate Discounts in Medicaid (Jan. 2020), https://www.hhs.gov/guidance/sites/default/files/hhs-guidance-documents/cib010820_110.pdf.

¹⁷ Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of Social Security Act, and Solicitation of Comments, CMS (Feb. 9, 2023), *available at* <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>

the “JZ” modifier to attest that no amount of drug was discarded.¹⁸ CMS established the JZ modifier after “observ[ing] low compliance with JW modifier use.”¹⁹

CMS also should leverage the Program’s TPA (as described above) to help determine whether a claim for a selected drug is subject to a 340B discount, based on PDE data. The TPA could help facilitate the determination of whether an MFP discount or a 340B discount is owed, similar to the role of 340B TPAs or split-billing vendors with respect to Medicaid and 340B duplicate discounts. As stated above, after verifying that a claim is MFP-eligible, the TPA should provide certain claims-level data (including the 340B indicator) to a manufacturer so that the manufacturer can independently verify that the claim was not subject to a 340B discount and is eligible for the MFP.

In addition to the concerns described in Section I.A above, Exelixis has concerns that the 14-day timeframe for manufacturers to pay the MFP discount does not provide manufacturers with sufficient time to verify whether a claim also is subject to a 340B discount.²⁰ In recent years, pharmacies are increasingly using a “replenishment inventory model,” under which non-340B purchased drugs are initially dispensed to a patient and then “replenished” with 340B drugs once 340B patient eligibility is confirmed. In our experience, the lag between a pharmacy dispensing a drug and the 340B replenishment order often exceeds 14-days. Given OIG’s longstanding concerns that the replenishment model “creates complications in preventing duplicate discounts” in the Medicaid program,²¹ the Secretary should take steps to ensure that the replenishment model does not lead to duplicate discounts in the Medicare program as well. Specifically, the Secretary should impose a time limit after a unit of product is dispensed for a covered entity to determine whether the product is 340B eligible and replenish the unit at the 340B ceiling price. This time period must end before MFP invoices are compiled and sent to manufacturers. Then, manufacturers should have a reasonable period after the replenishment window has closed to verify whether a selected drug is subject to a 340B discount before providing the MFP discount. This would be consistent with other government discount and rebate programs, which under certain circumstances, permit manufacturers to verify and dispute whether a discount is required. Under the Coverage Gap Discount Program, for example, manufacturers have 60 days to dispute discounts on quarterly invoices.²² Under the Medicaid Drug Rebate Program, manufacturers also can dispute claims that were previously paid using the Prior Quarter Adjustment Statement (PQAS) process.²³

²⁰ Initial Guidance § 40.4.

²¹ Memorandum Report: Contract Pharmacy Arrangements in the 340B Program, OIG (Feb. 4, 2014).

²² 42 C.F.R. § 423.2330(c)(1).

²³ CMS, Medicaid Drug Rebate Program Dispute Resolution, <https://www.medicaid.gov/medicaid/prescription-drugs/medicaid-drug-rebate-program/medicaid-drug-rebate-program-dispute-resolution/index.html> (last updated Mar. 2, 2023).

Exelixis believes that the safeguards that we propose above should be viewed as the baseline for reducing the risk of duplicate MFP and 340B discounts. We are concerned, however, that even with our proposed safeguards, it is not possible to eliminate duplicate discounts under the current structure of the 340B program. Currently, with the exception of certain AIDS Drug Assistance Program (ADAP) covered entities, manufacturers are required to provide upfront 340B discounts to all other covered entity types. This means that manufacturers currently do not have the opportunity to verify whether a patient qualifies for a 340B discount before providing the discount, which significantly increases the risk of diversion and duplicate Medicaid rebates, despite the respective statutory prohibitions.²⁴

The new MFP discount—coupled with the MFP/340B nonduplication provision and the replenishment model—introduce unprecedented complexity to the 340B program. Consistent with our support for retrospective MFP discounts (discussed in Section I.A.), we believe that the most effective way for the Agency to comply with the IRA’s nonduplication provision is if the Secretary also permits manufacturers to provide 340B discounts as a retrospective rebate to *all* covered entity types. Shifting to a 340B retrospective rebate is within the Secretary’s discretion, because the 340B statute permits the Secretary to implement the 340B program through a “rebate or discount, as provided by the Secretary.”²⁵ Permitting manufacturers to verify an individual’s eligibility for a 340B (or MFP) discount before such a discount is owed will promote program integrity and ensure compliance with statutory duplicate discount prohibitions.

III. CMS Should Implement the Small Biotech Carveout Consistent with Congressional Intent

Exelixis is disappointed that CMS is not soliciting comments on Section 30, which addresses foundational issues such as the exception for small biotech drugs (the “small biotech carveout”) and the definition of a qualifying single source drug. Doing so deprives stakeholders of a valuable opportunity to provide input on the Program to help support its implementation consistent with congressional intent. In particular, we note that the Initial Guidance does not provide *any* guidance on important aspects of the small biotech carveout, including the exception for new formulations. Despite a record of clear Congressional intent to preserve the ability of small biotechnology companies to continue their development of innovative medicines, Exelixis is concerned that the absence of definitive guidance from CMS on the scope of the small biotech carveout creates uncertainty as to whether that provision will safeguard the innovation of companies, like Exelixis, that it was intended to assist. Therefore, since the new formulations exception is not addressed at all in Section 30 of the Initial Guidance (and thus there is no guidance on this point for CMS to issue as final), we are submitting comments regarding the new formulations exception for CMS’ consideration in developing its revised Program guidance.

²⁴ Public Health Service Act § 340B(a)(5).

²⁵ Public Health Service Act § 340B(a)(1).

As described further below, Exelixis urges CMS to make clear that pursuant to the definition of qualifying single source drug set forth in the Initial Guidance—under which all dosage forms, strengths, and formulations that share the same active moiety and the same NDA holder are considered together—a qualifying single source drug must qualify as a small biotech drug for *all* of its formulations, provided the NDA holder retains ownership of these formulations (and thus they continue to constitute the same qualifying single source drug). We believe a contrary approach would be inconsistent with the statutory obligation to calculate a single MFP for each qualifying single source drug, and inconsistent with Congress’ intent to protect R&D incentives for small biotechnology companies.

A. Congress Intended to Protect R&D Incentives for Small Biotechnology Companies

A key principle underlying the IRA is to protect incentives for small biotechnology companies. In the lead-up to the IRA’s predecessor, the Build Back Better Act, Senate Finance Committee Chair Ron Wyden released a set of “Principles for Drug Pricing Reform.”²⁶ The principles set forth a mission: to “mak[e] prescription drug prices more affordable while encouraging innovation and scientific breakthroughs.”²⁷ Significantly, the principles recognized the unique and critical role of small biotechnology companies, stating that “[t]he research that led to these medical advances can largely be traced back to small biotechnology companies that take on a disproportionate share of the risk of R&D.”²⁸ Therefore, Chair Wyden indicated that drug pricing reforms should be “tailored to the scale of these companies, as well as other factors that affect their access to capital.”²⁹

All of the subsequent drafts of the drug pricing reform legislation—including the IRA, as enacted—reflect Chair Wyden’s commitment to protect small biotechnology companies. For example, one of the key provisions that Congress included in the IRA to protect small biotech manufacturers is the small biotech carveout. This carveout excludes “small biotech drugs” from the Program for three years, after which such drugs will have a temporary floor on the MFP determined under the Program.³⁰ Additionally, under the Part D redesign provisions of the IRA, certain smaller manufacturers (known as “specified manufacturers” and “specified small manufacturers”) will have their manufacturer discounts phased-in over a five-to-seven-year period.³¹

B. CMS Should Interpret the New Formulations Exclusion from the Small Biotech Carveout Consistent with the Statute and Congressional Intent

²⁶ Chairman Ron Wyden, Principles for Drug Pricing Reform 1 (June 2021), *available at* <https://www.finance.senate.gov/imo/media/doc/062221%20SFC%20Drug%20Pricing%20Principles.pdf>.

²⁷ *Id.* at 1.

²⁸ *Id.* at 3 (emphasis added).

²⁹ *Id.*

³⁰ SSA §§ 1192(d)(2)(A); 1194(d).

³¹ SSA § 1860D-14C(g)(4)(B)-(C).

Under the small biotech carveout, a “small biotech drug” is defined as “a qualifying single source drug” that satisfies certain Medicare expenditure thresholds.³² The IRA further states that “a new formulation, such as an extended release formulation, of a qualifying single source drug shall not be considered a [small biotech drug].”³³ CMS is not soliciting comment on section 30 of the Initial Guidance, which addresses the small biotech carveout and other foundational issues related to selection under the Program. We are deeply concerned that CMS’ decision to skip over the step of providing stakeholders an opportunity to comment before issuing final guidance deprives stakeholders of an important process protection and creates avoidable programmatic risk. Neither the Initial Guidance nor the separate Information Collection Request on the small biotech carveout³⁴ addresses the new formulation exclusion to the small biotech carveout at all, leaving manufacturers without a clear understanding of how CMS will determine whether their drugs qualify as small biotech drugs. Nevertheless, if CMS maintains the definition of qualifying single source drug set forth in the Initial Guidance, we believe that the statute requires a qualifying single source drug to qualify as a small biotech drug for *all* of its formulations, provided the NDA holder retains ownership of these formulations. In addition to securing other intended effects, this outcome will also protect the R&D incentives that drive investment in innovation like that demonstrated by Exelixis in its development of COMETRIQ[®] and CABOMETYX[®].

1. The MFP, and thus the Small Biotech Carveout, Applies Equally to All Formulations of the Same Qualifying Single Source Drug

Under the statute, the scope of a “qualifying single source drug” is significant at every stage of the Program. A qualifying single source drug that meets certain criteria is a negotiation-eligible drug,³⁵ and a negotiation-eligible drug that meets certain criteria is a selected drug.³⁶ CMS is required to establish a single MFP for each selected drug, as well as to “establish[] . . . procedures to compute and apply [that] maximum fair price across different strengths and dosage forms of a selected drug and not based on the specific formulation or package size or package type of such drug.”³⁷ Therefore, the statute establishes a chain under which a single MFP ultimately is determined for each qualifying single source drug that is selected under the Program.

The Initial Guidance defines a “qualifying single source drug” to include all dosage forms, strengths, and formulations of a product that share the same active moiety and the same NDA holder.³⁸ Because a single MFP will apply across all of these formulations, if CMS maintains the definition of qualifying single source drug set forth in the Initial Guidance,

³² SSA § 1192(d)(2)(A).

³³ SSA § 1192(d)(2)(C).

³⁴ 88 Fed. Reg. 4184 (January 24, 2023).

³⁵ SSA § 1192(d)(1).

³⁶ SSA § 1192(b).

³⁷ SSA § 1196(a)(1)-(2).

³⁸ Initial Guidance at 8.

Exelixis believes a qualifying single source drug must qualify as a small biotech drug for *all* of its formulations, provided the manufacturer retains ownership of the NDA of all of these formulations (and thus all formulations continue to constitute the same qualifying single source drug) and the qualifying single source drug meets the Medicare expenditure thresholds set forth in SSA § 1192(d)(2)(A).

2. Applying the Small Biotech Carveout to all Formulations of the Same Qualifying Single Source Drug Furthers the Innovation Incentives Underlying this Provision

As Congress recognized when enacting the IRA, small and mid-size biotechs, like Exelixis, play an increasingly larger role in discovering innovative medicines. This involves overwhelming challenges and inherent risks of failure at each step of the discovery, development, regulatory, and commercialization process. For example, during most of Exelixis' nearly 30-year history, the company operated without product revenue, taking significant risks to sustain formidable research facilities and clinical trials. Exelixis was founded in 1994, focused initially on early-stage scientific research before shifting exclusively to cancer. We used an industry-leading high throughput drug discovery process to identify compounds with therapeutic potential and advance them through preclinical and clinical development. As is typical, a large majority of these drug candidates failed. But, some succeeded, of which the most promising was cabozantinib. FDA approved COMETRIQ[®] (cabozantinib) capsules in 2012 to treat a small population of patients with a rare thyroid cancer.³⁹ We suffered a catastrophic event in late 2014 after two phase 3 registrational cabozantinib clinical trials failed in prostate cancer. These events forced us to restrict spending immediately, reduce our workforce by more than 70 percent, and focus our limited financial resources on two important and difficult-to-treat indications – kidney and liver cancer. Fortunately for seriously ill cancer patients and the company, cabozantinib demonstrated positive results in two large global pivotal trials, and CABOMETYX[®] (cabozantinib) tablets was approved in 2016.⁴⁰

CABOMETYX[®] is Exelixis' primary commercial product, and it is the culmination of decades of high-risk investments in cutting-edge science. We estimate that Exelixis invested over \$2 billion on the *separate* development of CABOMETYX[®], including internal and external work required to perform discrete clinical trials on each drug and efforts to achieve regulatory approvals. The significant time and expense to conduct additional clinical trials to obtain a new NDA for important and difficult-to-treat cancer indications is the sort of investment that Congress sought to protect and encourage through the small biotech carveout.

If CMS were to interpret the small biotech carveout to apply only to certain formulations of a qualifying single source drug — in spite of the statutory language to the contrary — CMS

³⁹ Drugs@FDA: FDA-Approved Drugs, New Drug Application (NDA): 203756, *available at* <https://www.accessdata.fda.gov/scripts/cder/daf/index.cfm?event=overview.process&ApplNo=203756>.

⁴⁰ Drugs@FDA: FDA-Approved Drugs, New Drug Application (NDA): 208692, *available at* <https://www.accessdata.fda.gov/scripts/cder/daf/index.cfm?event=overview.process&ApplNo=208692>.

would also be undermining Congress' intent to protect small biotech R&D incentives. Such an outcome would impose a heavy and irrational penalty on manufacturers that invest in improvements to the formulation of their existing products while also seeking new indications to benefit different patient populations, rather than just seeking FDA approval for new indications using the same, and perhaps less advantageous, formulation.⁴¹ Such a result would undermine innovation and frustrate the express goals of Congress in enacting specific protections for small biotech drugs. If CMS nevertheless intends to move forward with this interpretation, we believe it is imperative that CMS issue guidance and provide an opportunity for stakeholders to submit comments before finalizing its interpretation.

IV. Conclusion

Over the company's 29-year history, Exelixis' employees and investors have become accustomed to the natural turbulence of the biotechnology industry. We have also come to appreciate the tremendous influence that government incentives (and disincentives) can have upon biotech investment decisions, and how those decisions ultimately enhance or impede innovation. Although the IRA will fundamentally alter the future of biopharmaceutical innovation, we are encouraged that Congress recognized and expressed a desire to preserve innovation incentives, particularly for smaller biotechnology companies like Exelixis. It is therefore critically important that CMS implement the IRA consistent with the plain language of the statute and congressional intent.

For instance, the definition of an "MFP-eligible individual" and the MFP/340B nonduplication clause demonstrate Congress' intent to limit when manufacturers are required to provide access to MFP and 340B discounts. As a matter of program integrity, CMS must take seriously its statutory obligation to implement these key provisions. For example, CMS should establish robust safeguards to ensure that manufacturers are required to pay MFP discounts only after an independent TPA and the manufacturer verify that the patient is eligible for the discount. Additionally, given the unprecedented complexity that the MFP introduces to the 340B program, we urge the Agency to establish parallel safeguards and/or consider permitting manufacturers to provide retrospective 340B discounts. Such measures will help ensure that MFP discounts are provided only where Congress intended.

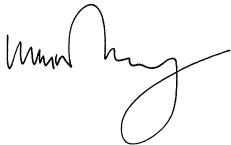

CMS also should carefully consider the impact of its policies on smaller biotechs, like Exelixis, that drive a significant share of medical innovation. We urge the Agency to clarify that a qualifying single source drug will qualify as a small biotech drug for *all* of its formulations,

⁴¹ Such a result would be an unprecedented disincentive to develop superior formulations and operate quite differently, for example, than the new formulations provision of the Medicaid rebate statute. Prior to the Affordable Care Act amendments to the Medicaid rebate statute, manufacturers could potentially reduce their Medicaid rebate liability by launching new formulations of certain covered outpatient drugs. The Affordable Care Act amendments removed this incentive for launching a new formulation, but they did not *penalize* manufacturers for launching new formulations. Affordable Care Act § 2501(d) (as amended by Health Care and Education Reconciliation Act of 2010 § 1206(a)) (codified at SSA § 1927(c)(2)(C)).

provided the NDA holder retains ownership of these formulations. Such an outcome is mandated by the statute and consistent with Congress' intent to maintain incentives for innovation, particularly by small biotechnology companies. It is an important step to help achieve Congress' intention of encouraging such businesses to invest further in the next generation of lifesaving treatments.

We hope CMS will take these comments into consideration when developing revised Program guidance. We would be happy to answer any questions that CMS may have regarding the topics we address herein.

Sincerely,

A handwritten signature in black ink, appearing to read 'Michael M. Morrissey', with a stylized, flowing script.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

EyePoint Pharmaceuticals, Inc. ("EyePoint") appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance). EyePoint is a company committed to developing and commercializing therapeutics to help improve the lives of patients with serious eye disorders.

Although the agency isn't specifically requesting feedback on Section 30 of the Drug Price Negotiation Program at this time, we believe it is important for the agency to understand that Section 30, as currently drafted, could have a significant, detrimental impact on EyePoint's ability to develop and commercialize innovative therapeutics for patients. The current language in the draft for Section 30 allows for only 9 years between the granting of an NDA and setting of a Maximum Fair Price for small molecule therapies versus 13 years for biologic, large molecule therapies. This will put companies such as EyePoint, which develops small molecule extended delivery therapeutics that help prevent blindness and are injected into the retina and that compete with multiple biologic therapies, at a serious disadvantage, which may ultimately impact patient care. Companies such as ours may be forced to hold on making FDA submissions for NDAs until all of the potential indications have been studied rather than try to get the product to market for individual indications in a more expedient manner. This will obviously negatively impact patient care as patients in need would be denied an opportunity for a newly approved therapy for a longer period of time.

Secondly, as EyePoint and other similar companies intend to continue developing new and innovative small molecule therapies, Section 30, as presently drafted, will inevitably require us to emphasize and prioritize development programs that are more likely to generate a more rapid positive return in order to compete with new biologic treatments, and will diminish our willingness and ability to take on risks associated with the development of small molecule therapies that are less likely to achieve commercial success within the 9-year time frame of Section 30.

We appreciate your consideration of our comments as you develop the Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to patients from the reduced or delayed availability of innovative medicines is minimized.

Sincerely,

Nancy Lurker
CEO, EyePoint Pharmaceuticals, Inc.

RE: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure,

Families USA (FUSA) is a leading national, non-partisan voice for health care consumers, dedicated to the achievement of high quality, affordable health care and improved health for all. Central to realizing that vision is reducing the burden of prescription drug costs on America's families.

The high and rising cost of prescription drugs in the United States is a profound health problem and a significant economic burden on our nation's families, including people who rely on Medicare for their health coverage. Large drug corporations, in their efforts to maximize profits, too often raise the prices of both existing and new prescription drugs to obscene, price gouging levels. As a result, U.S. drug prices are nearly twice as high as prices in other comparable countries, even after rebates.ⁱ And millions of Medicare beneficiaries, particularly lower-income and Black and Latino beneficiaries, struggle to afford the prescription medications that they need due to cost.ⁱⁱ

FUSA applauds the Biden Administration and the Centers for Medicare and Medicaid Services (CMS) for taking the first major step in implementing the historic reform of prescription drug pricing in the Medicare program, issuing proposed program guidance for the negotiation process for selected drugs whose negotiated prices would be available beginning in 2026 (i.e., Initial Price Applicability Year 2026). We appreciate the opportunity to comment on this proposed guidance and appreciate all of the work from CMS to facilitate lower drug costs for millions of older adults and people with disabilities. There are aspects of the guidance that we support but chose not to reflect on in this comment in order to prioritize a few key areas of recommendations.

We believe it is critical for the experiences of the millions of people who rely on Medicare to access affordable prescription drugs to remain the focus of implementation efforts. To that end, this comment letter will provide recommendations across the following areas:

1. Soliciting Public Comments Regarding the Implementation of the Medicare Drug Negotiation Program
2. Section 60.3: Methodology for Developing an Initial Offer
3. Section 40.2.1: Confidentiality of Proprietary Information & Section 60.6: Publication of the MFP

4. Section 40.4: Providing Access to the MFP
5. Section 60.3.4: Consideration of Manufacturer-Specific Data & Section 100.2: Violations of the Agreement
6. Section 50.2: Evidence About Therapeutic Alternatives for the Selected Drug

1. Soliciting Public Comments Regarding the Implementation of the Medicare Drug Negotiation Program

Under the Administrative Procedures Act (APA), CMS is required to provide an opportunity for public comment on any proposed rules or regulations as they relate to any new or existing law. However, in the case of the IRA's drug price negotiation provisions, the IRA waived these requirements and directs CMS to implement many of the law's drug negotiation provisions through sub-regulatory "program instruction or other forms of program guidance" for the parts of the process that lead to maximum fair prices that take effect beginning in 2026, 2027, and 2028. Despite the IRA's waiving of APA requirements, CMS has indicated it will voluntarily solicit comments on a number of areas in its Medicare Drug Negotiation Proposed Guidance.

FUSA applauds CMS for voluntarily providing the public opportunities to submit feedback regarding implementation of the Medicare Negotiation Program, including soliciting comments for the majority of its draft guidance on the Medicare Drug Negotiation Program, as it relates to "Initial Price Applicability Year 2026." This is a critical step to ensuring that the needs of families and consumers are prioritized as CMS implements the Medicare Drug Negotiation Program, allowing the public, including consumer and patient advocates, sufficient opportunities to provide input to inform negotiation policy decisions.

2. Section 60.3: Methodology for Developing an Initial Offer

The IRA requires CMS to develop and apply a consistent methodology and process for negotiating with drug manufacturers to arrive at a maximum fair price. It clearly states that CMS must develop a negotiation process that "aims to achieve the lowest maximum fair price for each selected drug."

A vital step in the negotiation process is how CMS arrives at the initial price that it offers to drug manufacturers. The law lists nine factors that CMS is required to "consider" when calculating an initial and final maximum fair price offer. However, the IRA provides no direction for how CMS should prioritize, weight, or define these factors when arriving at a pricing decision.

In the proposed guidance, CMS outlines its plan to calculate an initial maximum fair price offer to drug manufacturers based on a three-step process. First, CMS will identify therapeutic alternatives for the selected drug subject to negotiation and calculate the Part D net price(s) of those therapeutic alternatives.^{iii,iv} Second, based on the prices of those therapeutic alternatives, CMS will begin developing an initial price offer, and adjust that offer "relative to whether the selected drug offers more, less, or similar clinical benefit compared to its therapeutic alternatives," to arrive at a "preliminary price." Third, CMS will adjust the preliminary price based on a number of manufacturer-specific data. For example, CMS would lower the price depending on whether federal support was received for drug discovery and development or whether the selected drug has patents or exclusivities that last for a number of years.

We are appreciative of CMS' efforts in proposing a process for developing an initial price offer with limited statutory direction. We are also supportive of CMS' intent to adjust the maximum fair price offer based on comparative effectiveness research, such as patient-reported outcomes and patient experience data as well as manufacturer specific data (e.g., research and development costs, unit costs of production). **However, we are deeply concerned with CMS' proposed approach to anchoring the initial "preliminary price" based off Part D net prices of therapeutic alternatives.** There is substantial evidence that the drug prices paid by Medicare Part D are significantly inflated compared to the prices paid by other public payers within the United States, as well as prices paid by other comparable countries.^{v,vi,vii} For instance, according to the Government Accountability Office, Part D net prices were at least two to four times higher than publicly available prices in comparable countries in 2020.^{viii} We are concerned that Part D net prices do not reflect the true value of these medications and relying on them as a fundamental starting point for Medicare drug negotiation would undermine the Medicare Drug Negotiation Program and the program's ability to achieve meaningful cost savings for consumers and families. CMS acknowledges these concerns in their own proposed guidance, stating that the Part D net prices associated with the "therapeutic alternative(s) for a selected drug may not be priced to reflect its clinical benefit...."^{ix}

Based on the concerns above, **FUSA strongly encourages CMS to reassess its approach to developing a maximum fair price offer, avoiding the use of Part D net prices as a starting point.**

Instead, we encourage CMS to employ a cost-effectiveness approach to develop a preliminary price range, which could then be adjusted to arrive at a maximum fair price. Specifically, we recommend CMS establish non-biased (see discussion below at comment # 6) cost-effectiveness targets or thresholds that serve as an initial price range for each selected drug, and which could then be adjusted based on comparative effectiveness research, the prices of therapeutic alternatives, and other manufacturer specific data to arrive at a maximum fair price. To calculate these targets, CMS should, in consultation with the HHS Office of the Assistant Secretary for Planning and Evaluation, determine an upper and lower bound cost or price per unit of health gained (as well as cost per condition-specific measure of clinical benefit) that it deems appropriate and reflective of the opportunity cost of the treatment in relation to the treatment's added net benefits for Medicare patients over time.^x

We believe the cost effectiveness approach outlined above guarantees that the maximum fair price calculated by CMS truly reflects the therapeutic value of the drug subject to negotiation and, importantly, avoids relying on prices, such as Part D net prices, that are all too often the result of widespread market failures and pharmaceutical industry gaming.^{xi} Further, this approach has the added benefit of providing the strongest financial incentives for drug manufacturers to focus on true therapeutic innovations.

3. Section 40.2.1: Confidentiality of Proprietary Information & Section 60.6: Publication of the MFP

The public reporting requirement of the final maximum fair prices and an explanation for how it arrived at each maximum fair price, including which factors were considered is important because it provides the public and other payers of prescription drugs with access to information on the value of select high-priced prescription drugs and what a fair price may be. This information is critical for the public and people who rely on Medicare for their health coverage to understand CMS' justification for arriving at a final maximum fair price for a selected drug, and to increase transparency around the underlying cost and value for the prescription drugs subject to negotiation. Additionally, this level of transparency is essential for other payers to be able to effectively negotiate the prices of prescription drugs with drug

manufacturers and exert downward pressure on the price of prescription drug price across the entire U.S. market. Notably, the IRA affords CMS wide discretion to decide which information used to calculate a maximum fair price is made public or is “proprietary” and not made public.

FUSA is disappointed with CMS’ proposal to treat the vast majority of the manufacturer specific data it would receive as proprietary and therefore would not be public. CMS intends to keep the following information non-public, unless already made public through other means, such as: non-Federal average manufacturer price, research and development costs and recoupment, unit costs of production and distribution, pending patent applications, and market data and revenue and sales volume data.

FUSA is also disappointed with CMS’ proposal to only provide “high level comments” when disclosing a public justification for how it arrived at a maximum fair price(s) during negotiation. CMS intends to only include high level comments explaining the maximum fair price without sharing any information that it deems as proprietary, such as research and development costs.

There is a strong public interest to ensuring the Medicare Drug Negotiation Program is achieving its statutory mandate of achieving the lowest maximum fair price possible. Without transparency into key data that CMS is using to inform a maximum fair price, the integrity of the Medicare Drug Negotiation Program is at heightened risk for industry gaming or sabotage. Further, making this data publicly available could help to spur competition in the private insurance market and help drive down prices for consumers and families who rely on private, employer sponsored insurance coverage. **FUSA strongly urges CMS to reconsider the extent to which it categorizes certain manufacturer specific data as proprietary and at a minimum make public the following information: non-Federal average manufacturer price, research and development costs and recoupment, and unit costs of production and distribution.**

Further, FUSA urges CMS to implement the IRA’s reporting requirement in a way that publicizes as much information as possible. This includes which factors and value frameworks were used to come to their decision regarding a maximum fair price, as well as any information received from drug manufacturers.

4. Section 40.4: Providing Access to the MFP

To ensure the IRA and the Medicare Drug Negotiation Program truly results in lower drug prices for people who rely on Medicare, it is critical that families and consumers have access to the lower negotiated price at the pharmacy counter and at point of sale. In its proposed guidance, CMS has indicated it plans to require that the “negotiated price of a Part D drug is the basis for determining beneficiary cost-sharing and for benefit administration at the point of sale.” **FUSA applauds CMS for taking this critical step to ensure every consumer and family that relies on Medicare for their health care needs has access to and benefits from the lower negotiated price for drugs that are selected for Medicare negotiation.**

FUSA also applauds CMS for planning to conduct ongoing oversight and monitoring to ensure that every eligible individual, including all Medicare beneficiaries, have access to the lower negotiated prices for selected drugs. Continuous monitoring and oversight of drug manufacturers and pharmacies is critical to ensuring no entity across the prescription drug supply chain, including drug manufacturers, wholesalers, pharmacy benefit managers, or pharmacies, are taking advantage or gaming the Medicare Drug Negotiation to their benefit and to the detriment of consumers and families.

5. Section 60.3.4: Consideration of Manufacturer-Specific Data & Section 100.2: Violations of the Agreement

As CMS begins the drug negotiation process, it will request information from drug manufactures to inform its calculation of maximum fair prices and as part of the negotiation process. According to CMS' proposed guidance, this will include requesting information from drug manufacturers on their research and development costs; current costs of production; data on pending and approved patent applications; market data; sales information; and non-Federal average manufacturer price.

While we applaud CMS for confirming that manufacturers would be subject to civil monetary penalties if manufacturers knowingly provide false information to CMS as part of the Medicare Drug Negotiation Program, **FUSA is deeply concerned that CMS is proposing to rely on the “assumptions and calculations” related to certain manufacturer specific data, such as research and development costs, that are reported to CMS by manufacturers with limited oversight or independent verification.** Drug manufacturers often game government reporting systems to their benefit. For example, it was found that many manufacturers have misclassified their drugs as generics, thus paying significantly less in rebates under the Medicaid Drug Rebate Program, resulting in more than a billion dollars in overcharges.^{xii}

FUSA strongly encourages CMS to develop additional guardrails in order to closely scrutinize any data reported by drug manufacturers on their drug sales and related prices. CMS should rely on independent data sources whenever possible and consider contracting with an audit firm or firms for any otherwise unaudited manufacturer data. It is essential that all of the information used to inform the Medicare negotiations are accurate and complete to ensure that CMS has the information it needs to calculate *truly* fair prices.

6. Section 50.2: Evidence About Therapeutic Alternatives for the Selected Drug

In their effort to consider alternate treatments for selected drugs, CMS is required to not use measures that would evaluate or weight the life of an elderly, disabled, or terminally ill person as any less than another life. This guidance bars CMS from using Quality Adjusted Life Years (QALYs) as a measurement tool. **There are many promising frameworks and methodologies to help assess health care value, and that importantly do not discriminate on the basis of disability, age, or any other protected status; we are supportive of restrictions for the use of QALYs and strongly encourage CMS to identify other measurement tools to assess therapeutic value.**

We want to specifically highlight usage of “Equal Value of Life Years Gained,” or EvLYG, which is a metric that measures gains in length of life of a given treatment in a way that ensures that all years of life are valued equally.^{xiii} EvLYG is an evaluation tool we support CMS using, as it allows for a treatment's value and quality to be assessed without disproportionately affecting certain populations.

Conclusion

Families USA greatly appreciates CMS for taking this important step to implementing the Medicare Drug Negotiation Program. Authorized by the IRA, this historic health care reform holds the promise of reducing the high cost of prescription drugs and helping ensure that consumers and families that rely on

Medicare for health coverage truly have access to affordable, live-saving medications. Families USA looks forward to continuing to work with CMS on the implementation of this program, as well as other efforts to lower the high cost of prescription drugs.

Thank you for your time in considering these comments. Please contact Aaron Plotke (APlotke@familiesusa.org) and Hazel Law (HLaw@familiesusa.org) with any questions.

Sincerely,

Frederick Isasi

The Honorable Meena Seshamani, M.D., Ph.D
Deputy Administrator and Director of the Center for Medicare
Department of Health & Human Services
Centers for Medicare & Medicaid Services
7500 Security Boulevard
Baltimore, Maryland 21244-1850

Dear Deputy Administrator Seshamani,

On behalf of First Databank (FDB), a trusted leader in drug knowledge for over 40 years, we appreciate the opportunity to comment on the Centers for Medicare & Medicaid Services' (CMS) initial guidance regarding Inflation Reduction Act requirements. CMS has issued guidance on establishing an inflation rebate for single source drugs and biological products, as well as establishing an MFP ceiling for designated drugs that covers both Medicare Part B and Part D. FDB is writing in response to the agency's request for comments on this guidance.

In order to make CMS's guidance on implementing an MFP ceiling effective and transparent, we urge the agency to publish the list of selected drug moieties, their respective NDCs, and unit-level MFPs in a structured and machine-readable format. Additional clarity surrounding data elements and definitions in the final publication, such as dosage forms and strength-specific MFPs would be paramount to making this implementation a success. A preliminary test file should be made available to all interested parties, along with the definition and layout of each data element. In addition, the schedule of release for the expected updates should be published in advance so that users of the content know when to expect the updates.

We acknowledge that CMS is intending to use the NDC-9 to derive unit-level MFPs to be applied across all strengths and dosage forms for negotiation. FDB recommends additional context be provided in terms of the final, negotiated unit-level MFPs and the format in which this report will be disseminated to the public as it relates to the FDA's proposed rule on the NDC-12 format. We hope CMS takes into account the structure and formatting of future file releases which will be impacted by the FDA's proposed rule.

We appreciate your consideration of these issues. Please contact me if you have any questions.

Thank you for your time.

Ethan Chan, PharmD, MS (he/him/his)
Senior Product Manager
FDB (First Databank, Inc)

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Frontier Medicines appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

As the child of first-generation immigrants, I saw our pediatrician help my parents save my four-year old brother and then was devastated as we watched that heroic doctor swiftly perish from an incurable cancer. As a result, I decided at a young age to devote my life to science and finding new medicines that save lives. That is my American Dream. I co-founded Frontier Medicines to deliver drugs against undruggable targets – small molecule drugs that have the potential to be transformative for patients, including those with cancer that is currently untreatable.

Now, having been on both sides of the innovation equation, as both a biotech investor and founder of multiple biotech companies, I know the incredible amount of effort it takes to develop new medicines. I also know first-hand the benefits possible for patients when innovation is allowed to flourish, having

played a part in discovering first-in-class, precision medicines such as Ayvakit and Retevmo. These small molecule drugs have not only improved and prolonged the lives of patients with the rare disease and cancers they treat, but also helped people return to normal life. Today, the companies I've started employ nearly 1,000 Americans across the country—all working to give patients better options for tomorrow. With the IRA's arbitrarily short timeline for small molecule drugs, the U.S. government is actively discouraging future biotech innovation in this country – a sector America currently leads in the world. As currently written, the draft CMS guidance will hurt, not help, Medicare patients. The guidance penalizes small molecule medicines, medicines which currently are powerful tools in the efforts to treat deadly cancer and the toughest of diseases.

Furthermore, the current guidance actively discourages the innovation of medicines for rare and orphan diseases—essentially limiting efforts to only one disease area. In the wake of the IRA's passage, we are already seeing companies and those who fund them forced to step away from exploring additional rare disease medications and usage. One has to wonder how many Medicare patients and loved ones will go without new treatments in the future as a result.

In rushing to implement the IRA, the U.S. government is actively discouraging future biotech innovation in this country – a sector America currently leads in the world. Before we destroy one of the major American success stories, we need to take the time to get this right. Otherwise, patients will suffer in the years to come, as will the employees of small biotech companies who are trying to help them. Fixing the IRA matters to all of us. When innovation suffers, patients are the ones who lose.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact Victoria Fort, VP of Corporate Affairs at Frontier Medicines, by email at Victoria.fort@frontiermeds.com if you have any questions regarding our comments.

Best regards,

Chris Varma, Ph.D.

RE: Medicare Drug Price Negotiation Program Guidance

Dear Director Seshamani:

Frontiers of Freedom, founded in 1995 by U.S. Senator Malcolm Wallop, is an educational foundation whose mission is to promote the principles of individual freedom, peace through strength, limited government, free enterprise, free markets, and traditional American values.

I have served as the organization's President and CEO since 1998.

I appreciate the opportunity to provide comments to the Centers for Medicare & Medicaid Services' Initial Implementation Guidance and related Fact Sheet released March 15, 2023.

My primary focus will be Section 40.2.2, covering Data Use Provisions and Limitations of the Initial Implications Guidance. This section expressly prohibits pharmaceutical manufacturers from disclosing any information from CMS's initial offer, including the ceiling price. This section further prohibits the audio or visual recordings of such discussions, nor other dissemination of content written or verbally discussed during the negotiation period.

Additionally, CMS proposes that manufacturers destroy all correspondence and other information shared concerning any drug or biologic no longer qualifying as a selected drug. This includes all information received during the negotiation or renegotiation periods.

I believe these provisions violate core principles of American values and will undermine the goals that the negotiation process was established to achieve. My response will address three key problems inherent to this section of the drug price negotiation process:

1. Limitation of the proposed rules on manufacturers' Freedom of Speech
2. Hindrance of transparency and deterioration of stakeholder confidence
3. Limitations on good-governance standards and industry-level shared learning

Limitations of the proposed rules on manufacturers' Freedom of Speech
