The notion of barring private sector participants from discussing aspects of "negotiating" with government regulators is antithetical to the basic tenets of free speech. This statutory gag order constitutes a clear governmental restraint on speech. The U.S. Supreme Court has long held that restraints on speech constitute a "most serious and the least tolerable infringement on First Amendment rights."

Manufacturers should be free to express their views on government activities relating to the price negotiation program as well as any other matter. Access to pharmaceuticals is critical for millions of Americans – and open discussion as to how drug prices are set is of paramount importance ensuring access to and development of medicines.

Hindrance of transparency and deterioration of stakeholder confidence

The proposed limitations on the free speech of bidding-process participants will erode public confidence in the price-setting process. By design, patients and other stakeholders may not know for months, if ever, important disclosures relating to drug price negotiations. Those relying on these treatments will naturally question why the process is shielded from scrutiny.

Such suspicion is expected given the proposed lengths CMS intends to go to in avoiding disclosure. CMS' proposed requirement that a "Certificate of Data Destruction" must be submitted within 30 days of a drug or biologic no longer qualifying as a selected drug will raise serious public concerns about what is happening behind the scenes.

Transparency should be present throughout the negotiation and renegotiation period(s) without explicit requirements to destroy all notes, emails, or other communiques relating to the initial offer and any subsequent offers. At the Federal level, such actions would be at odds with basic government FOIA and record retention principles, which are key elements of any good-governance approach. Yet under these rules, manufacturers are required to hide and destroy materially valuable information.

Limitations on good-governance standards and industry-level shared learning

This loss of transparency also muzzles manufacturers from pointing out flaws, oversights, or methodological problems in CMS' administration. Given the scale of the new price

FRONTIERS *of* FREEDOM

negotiation program, such feedback is critical to iteratively improving how bidding is conducted as well as its compliance monitoring.

The proposed gag order will also prevent future program participants – i.e., the inventors of tomorrow's life-saving medicines – from learning from previous bidding processes. This hurts small life-science firms, steepens the learning curve, and creates a distinct competitive advantage to existing manufacturers.

Encouraging Transparency

The research companies that research, develop, manufacture, and sell life-extending and life-saving drugs to the nation's 65 million Medicare participants are a critical part of the healthcare ecosystem. Manufacturers' ability to freely and openly share information on the drug-price negotiation program will be critical to the public's confidence in Medicare. Transparency and data sharing should be encouraged, not prohibited.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

We are submitting this letter as independent health economists with a long history of collaboration on pharmaceutical policy analysis. In the interests of transparency, we declare that much of this work has been funded by pharmaceutical companies. We appreciate the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

We would like to comment in particular on Section 1193(e)(1) on “Manufacturer-specific data.” This section requests information on a number of items related to research and development (R&D) costs, production and distribution costs, recoupment, and related revenue items. We believe this request reflects a fundamental misunderstanding of the economics of the regulated U.S. and global pharmaceutical marketplace. Even if compliance with this request for R&D costs were possible (which is highly questionable), the submitted estimates would be irrelevant to the determination of the Maximum Fair Price (MFP) for a specific product. This is not to say that evidence and value do not matter. Indeed, in determining MFP through negotiation, the statute does specify what we see as the critical factor: “(A) The extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.”

The current market for innovative medicines is regulated through a combination of intellectual property protection (patents and exclusivities) and regulatory (Food & Drug Administration; FDA) statutes and regulations. The result is what economists call a “market design” that

incentivizes medical innovation by offering potentially high (but uncertain) rewards for high-risk investments, but then uses competition to keep down prices at later stages of the product life cycle. Patent-protected FDA-approved products that offer additional patient benefit have some degree of monopoly power through the period of protection that results from these patent and regulatory exclusivity provisions. For most new drugs, the protection averages 12 to 16 years (Kesselheim et al., 2017). During this period, the manufacturer has the exclusive right to market their compound: copies are not allowed to be marketed. This does not mean, however, that they do not face competition in the same drug class: other compounds with the same biological target and mechanism of action can compete with them. The market design is “oligopolistic competition” among single-source products. The best product in the class may receive a premium price and substantial rewards during this period of protection. But, by law, eventually the effective market exclusivity period will end and either generic or biosimilar versions (in the case of biologics) will be allowed to compete with the originator and others in the drug class. The value of this monopoly power is thus limited by market competition and by time. It is well known that about nine in 10 products fail during development: there is no guarantee that their costs are recouped in any way. Rather, the market design is that the rewards to the investors in the successful product will have to cover the costs of failures to sustain the market. The rewards to any one product, in fact, should be viewed against the cost of the 10 products needed to yield that one success. Thus, the product-specific R&D costs of any one product are irrelevant to the rewards it does (or does not) earn in the marketplace.

Indeed, imagine that an innovator discovered the cure for Alzheimer's disease based on a brilliant insight into molecular biology with a mechanism of action that was so compelling that it gained approval based on a small, low-cost trial using a surrogate marker that everyone accepted. Would we say that that innovator should only receive a small reward for such a miracle cure because its product-specific development costs were low? Some might argue that, but that ignores how the incentives in this investment system have operated for over 50 years. Of course, as we know, many billions of dollars have been spent by the industry on Alzheimer's disease research and thus far very little of this investment has been recouped. This lack of success is, of course, a concern for patients and their families, but it shows the market design is working. Money is going into R&D for diseases that matter, even where the science is difficult, i.e., where companies see high returns if they can deliver treatments that provide additional health benefit to patients.

The Inflation Reduction Act (IRA) does not directly or explicitly propose to move from this high-risk/high-reward market design to an alternative market design that is an essentially “cost-plus” marketplace with a regulated rate of return. But this may be the consequence of the proposed negotiation process for a MFP. While there can be an argument for such a cost-plus regulation in some markets where monopoly power exists — such as parts of the utility sector — it makes little sense in the complex life sciences industry with many competitors: many of whom will fail due to the complexity of the science, and with government granting of temporary market power only for successful products. We assume that CMS is not seeking to change the fundamental life sciences R&D market design which is based on incentives to reward medical advances with such temporary market power. In which case, these historical R&D costs are irrelevant to the value that patients and payers place on any specific product.

Furthermore, from a cost-accounting perspective, given that the rollout of this program will be for products that have been on the market for at least seven years, we surmise that, as most companies cannot accurately answer these questions for products they are about to submit to the FDA, they certainly will not be able to answer them for past products. They have not done the historical cost-accounting on a product-specific basis that would allow such tracing and linkage to individual products. Although estimates of the cost of specific trials could, in principle, be produced, the costs of all the individuals in the biopharmaceutical organization who are working on multiple products during the pre-launch (including discovery and pre-clinical) period are not routinely tracked or allocated to a specific product. Thus, it would most likely be infeasible to provide this information accurately. Of course, assumptions and estimates could be made, but to what end? They are irrelevant to the value of any specific product to Medicare beneficiaries, and they would not in any case adequately address the cost of failures.

In order to explore the challenges of estimating R&D costs, consider the estimates of drug development costs that have appeared in the literature. As the 2021 Congressional Budget Office report (CBO, 2021) makes clear, success rates vary by therapy area, reflecting the diverse scientific challenges, but also making an attribution of relevant failure costs even more difficult. Identification and attribution of discovery and pre-clinical costs is also challenging. The duration of the R&D process is important, as it affects the cost-of-capital component of any estimate of “successful” R&D expenditure. Of the three studies discussed by the CBO:

- Prasad and Mailankody (2017) dealt with earlier research (i.e., discovery and pre-clinical) expenditures and with the large number of failures by including all R&D costs for their (single product) companies. However, this has a survivor bias, in that the R&D costs of companies working in the same areas that go out of business are not included.
- Wouters et al. (2020) used Securities and Exchange Commission (SEC) filings to estimate discovery and pre-clinical expenditures and the analysis by Wong et al. (2019) of success rates by clinical area to multiply up estimates to take account of failures: i.e., they attempted to estimate the “system-wide” costs associated with bringing an individual product to market. As Cutler (2020) points out, Wouters et al. recognize that they are likely to have underestimated pre-clinical costs because of the difficulty of linking them to a specific molecule.
- DiMasi et al. (2016) used aggregate company R&D expenditures to estimate discovery and pre-clinical expenditures along with success/failure rates taken from a broader industry wide database of clinical success rates by stage. Again, this is an attempt to estimate costs including non-product specific discovery and pre-clinical costs and take account of failures that are not specific to the company concerned. The authors also sought to identify post-launch R&D costs, recognising that evidence of comparative effectiveness is increasingly collected post-launch.

In summary, the literature indicates the challenges of estimating R&D costs attributable to one product, and the difficulty of taking account of failures at the level of one company.

Questions about the current costs of the manufacturing and distribution of a product near the end of its exclusivity could conceivably be answered. Companies do have some idea of what is

called the current “cost of goods”: indeed, many put effort into reducing them. Again, however, this ignores the fact that the current market design aims to promote generic and biosimilar competition at the end of the exclusivity period. With competitive market forces, entrants will compete on price, thereby reducing product prices to a point that will sustain competition among multiple entrants, thus, approximating the social marginal cost of manufacturing and distribution (including marketing costs). In other words, as long as the end of exclusivity is enforced and the transition to generic and biosimilar competition promoted, there is really no need to collect information on the cost of goods of specific products. Indeed, using price control to force down the price of the innovator’s product will reduce the incentive for generic and biosimilar company entry. Studies of European markets, where pricing policies impact post-patent markets differently, have shown, for example, “On the one hand, systems that rely on market-based competition in pharmaceuticals promote a clear distinction between firms that act as innovators and firms that act as imitators after patent expiry. Here, original products enjoy premium prices and exclusivity profits under patent protection, and face fierce price competition after patent expiry. On the other hand, in systems that rely on administered prices, penetration by generic drugs tends to be rather limited.” (Maggazini et al., 2004). The “delay request” mechanism in the IRA to allow biosimilar entry and use competition rather than set an MFP (which by implication will make competitive entry harder) supports the view that price control makes entry less attractive for generic and biosimilar manufacturers. The reality is that market competition will generate a market price that approaches the marginal cost of production and distribution. No further negotiation is needed.

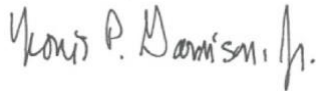

Finally, we would like to re-iterate and emphasize that the key factor that should be considered in Medicare Drug Price Negotiation Program to better align price with value is the “(A) The extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.” Pursuing that objective would provide better incentives that are more likely to promote dynamic efficiency, i.e., the optimal amount and types of R&D investments to improve population health and well-being. In other words, implementation of the legislation should either focus on an MFP linked to value (driven by comparative effectiveness) or an MFP linked to simulating a post-patent/ post-exclusivity market with potential generic or biosimilar entry. In either case, R&D costs are irrelevant, even if they could be appropriately attributed.

Summary Recommendation:

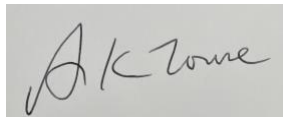

In terms of the implementation of the MFP under IRA, we would recommend: (a) removing any link to use R&D costs to reduce or increase the price derived from the use of comparative effectiveness research; (b) focusing on the estimation of the value that the product is delivering to patients, families, and the health system; (c) avoiding completely the related erroneous notion or calculation of R&D cost “recoupment”; and (d) focusing on ensuring more competitive entry from generic and biosimilar manufacturers.

We appreciate your consideration of our comments as you develop and refine the Drug Price Negotiation Program and its policies. We look forward to continuing to work with CMS to ensure that this program is implemented to promote more efficient development of and equitable access to innovative medicines for all Americans, while producing knowledge that is beneficial for the health and well-being of all persons globally. Please contact us if you have any questions regarding our comments.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

GenAdam Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

GenAdam Therapeutics is a platform company using pyroptosis to directly induce tumor cell death and provide anti-tumor immune surveillance. GenAdam's aim is to safely and efficiently deliver a programmed cell death gene (caspase-1) through an adeno-associated virus delivery vehicle for the induction of pyroptosis.

Summary Comments

Provision 30.1

Recommendation

Change the timing for NDA-path negotiations from 9-years to the same 13-year period as for BLA-path drugs. While 13 years is less than the typical 14 years of marketing exclusivity afforded by patent protection, investment can recalibrate slightly to one less year with very slightly higher launch prices so as to keep drug R&D investible.

Provision 30.1.1

Recommendation

The harms from IRA's treatment of orphan drugs could be mostly alleviated by creating small- and large-molecule parity for negotiation at 13 years (see above). CMS should look to only active orphan drug designations for the purposes of determining eligibility for the orphan drug exclusion (not including withdrawn orphan drug designations). Ideally, NDA-path drugs would get 13 years before being negotiated, in which case this provision is harmless. But until then, investors would need to know that if the old generic drug's approvals serve to invalidate the orphan exemption of the new formulation, then CMS would consider the availability of generics to also serve as a basis for not selecting the new formulation for negotiation (at least not until year 11 for price reduction after 13 years). Furthermore, the bona fide marketing standard is extra-statutory in nature with no basis in the law, which defines the standard simply as "marketed". The standard is ambiguous and subjective. The appropriate test, as specified in the IRA, is an objective, point-in-time determination of whether a drug has been "marketed," which can be determined by reference to the

“market date” reported by the manufacturer to the Medicaid Drug Rebate Program. It is defined as the date on which the drug is first sold in the US, and is the standard that CMS is using to determine whether a drug is marketed for purposes of the MDRP, the Part D inflation rebate guidance, and ASP (where the standard is articulated slightly different as the “first sale date.”

Provision 50.2

Recommendation

Provision 90.4

Recommendation

The IRA threatens to make generic business models unsustainable for drugs that treat Medicare populations. One might think this doesn't matter because price reduction will be achieved via negotiation. However, because generic competition often drives costs down not only by eroding the gross margins of the original drug but also spurring manufacturing improvements that lower cost of goods, the IRA threatens to leave society paying more for old drugs in the long run by deterring generic competition. This could increase overall costs across market segments (Medicare and commercial payers).

Provision 40.2.2

Recommendation

* * * * *

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized.

Re: Comments on *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026*

Dear Dr. Seshamani:

Genentech appreciates the opportunity to provide comments on the *Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026* (the “Guidance”). We believe we have aligned goals in seeing the Inflation Reduction Act implemented to reduce patient costs, prudently spend taxpayer funds on needed medicines, and maintain or improve the innovation ecosystem in the United States.

Genentech is a leading biotechnology company dedicated to pursuing groundbreaking science to discover and develop medicines for people with serious and life-threatening illnesses. We are committed to improving patients’ lives through new innovations. To this end, in 2022 we, under the Roche umbrella, invested \$15 billion globally in research and development – more than any other health care company in the world. In the past ten years, we have delivered to patients 20 new medicines that treat devastating diseases like cancer, multiple sclerosis, and hemophilia. In addition to our over 40 approved medicines, we have 70 potential new medicines in clinical or preclinical development and have been granted 39 FDA Breakthrough Therapy Designations for medicines with the potential to provide substantial improvement over currently available treatments.

Access to clinically appropriate treatment is essential to improving health and health equity for Americans. To this end, we provide the following comments and recommendations to help us achieve our shared goals of reducing Medicare spending and patient out-of-pocket costs, while still delivering needed innovations to patients today and in the future. Specifically, in implementing the IRA’s Medicare Drug Price Negotiation Program (the “Negotiation Program”), CMS should:

- **Deliver savings and preserve incentives for innovation.**
 - Convene stakeholder panels to help inform key decision points (e.g., therapeutic alternatives, unmet needs, therapeutic advances, patient and societal benefits) (50.2, 60.3)
 - Establish the maximum fair price (MFP) for products addressing unmet needs or advancing patient care at the ceiling price (60.3)
 - Only consider manufacturer-specific data in instances where the selected drug provides fewer benefits relative to therapeutic alternatives(60.3)
 - Clarify that products will be excluded from the Negotiation Program if they are approved for a sole orphan indication at time of selection, regardless of how many orphan designations the product may have (60)
- **Ensure patient benefit and program integrity.**
 - Establish standards that ensure patients will be, at the very least, no worse off in terms of both access to therapy and cost-sharing, under the Negotiation Program than they were previously (110)
 - Provide meaningful opportunity for patient and stakeholder feedback, including on key decision points and on CMS's analyses (60.3, 40.2.2)
 - Establish retrospective implementation of the MFP via a third party administrator to ensure seamless access to selected drugs (40.4)
 - Implement a system to identify 340B-eligible sales at the point of sale to avoid duplicate discounts (40.4)
- **Use manufacturer-specific data definitions to encompass important aspects of drug development.**
 - To the extent CMS takes into account manufacturer-specific factors, including research and development (R&D) costs, include in the definition of R&D costs the costs of failures from research areas that never had a drug come to market, the cost of ongoing studies, and acquisition costs (of both marketed and failed drug candidates), to include partnering agreements and any other in-licensing development agreement (60.3.4 and Appendix C)
 - Establish agreements with secondary manufacturers of a selected drug to ensure a complete data picture and transparency between CMS and all manufacturers (40)
- **Create a workable exchange of information between manufacturers, stakeholders and CMS.**
 - Establish feasible data submission criteria to enable manufacturers to meet the submission deadline (which is only 30 days after selection), including by allowing rolling submissions of data to inform the initial offer and counteroffers (50.1, 50.2, 60.4)
 - Similarly, allow for a rolling submission of data by the public to ensure CMS has the best data available to inform the negotiation process (50.2)
- **Maintain viability of generic and biosimilar markets.**
 - Remove a drug from the Negotiation Program (i.e., no MFP) if a generic or biosimilar launches after the end of the negotiation period, but before the Initial Price Applicability Year (IPAY) begins (70)
 - Remove requirement for robust and meaningful competition from generic/biosimilar marketing requirement within QSSD definition (90)
- **Ensure public trust and safeguarding of information.**

- Establish robust confidentiality standards to protect manufacturer proprietary information (40.2.1)
- Provide transparency into CMS analyses and evaluations of selected drugs and allow for stakeholder feedback (40.2.2)

For ease of review, we provide our section by section comments in the order CMS provided in the Guidance.

SECTION 40 REQUIREMENTS FOR MANUFACTURERS OF SELECTED DRUGS

CMS should enter into agreements with Secondary Manufacturers to ensure a complete accounting of manufacturer-specific data and allow Secondary Manufacturers to participate in the negotiation process.

When a selected drug has more than one manufacturer, CMS intends to designate each such manufacturer as either the “Primary Manufacturer” or a “Secondary Manufacturer.” The Primary Manufacturer would be the New Drug Application or Biologics License Application holder, and all other manufacturers would be deemed Secondary Manufacturers. CMS intends to require the Primary Manufacturer to carry out all duties relating to the Negotiation Program and does not contemplate any direct relationship between the Secondary Manufacturer and CMS. For instance, the Primary Manufacturer would be required to report aggregated data from both the Primary Manufacturer and any Secondary Manufacturer(s) for non-FAMP, current unit costs of production and distribution, and certain data within market data and revenue and sales volume for the selected drug. However, the Guidance indicates that CMS would consider only those R&D costs incurred by the Primary Manufacturer. Further the Guidance contemplates only the Primary Manufacturer participating in negotiation activities with CMS and, under Section 40.2.2 *Data use, Disclosure, and Destruction*, would prohibit the Primary Manufacturer from sharing any information with Secondary Manufacturer(s), effectively blocking the Secondary Manufacturer(s) from aiding the Primary Manufacturer in negotiating the selected drug’s MFP with CMS.

We have three main objections to CMS’s proposed approach. First, it imposes an undue burden on the Primary Manufacturer by requiring the Primary Manufacturer to collect sensitive information from other manufacturers and report that information to CMS. Second, limiting the consideration of R&D cost data to that only of the Primary Manufacturer does not take a holistic view of the role of each manufacturer in developing a selected drug. Third, the approach does not contemplate any role for Secondary Manufacturer(s) in the Negotiation Program even though Secondary Manufacturers would have information and perspectives worth considering as part of the process.

To address these concerns, we recommend that CMS enter into a Negotiation Agreement with each Secondary Manufacturer pursuant to which:

- The Secondary Manufacturer is required to directly submit information regarding each of the relevant negotiation data elements, which should include R&D costs, directly to CMS, allowing

CMS to obtain needed information without requiring manufacturers to share commercially sensitive information with competitors; and

- The Secondary Manufacturer is permitted to witness all negotiation activities alongside the Primary Manufacturer, including each of the negotiation meetings with CMS, and to access all written correspondence between CMS and the Primary Manufacturer regarding the negotiation process, subject to the data use, disclosure, and destruction requirements described in Section 40.2.2 of the Guidance.

To simplify things for CMS, the agency could draft a single Negotiation Agreement, to be signed by both Primary Manufacturers and Secondary Manufacturers, and clearly delineate which terms are applicable to Secondary Manufacturers, Primary Manufacturers, or both.

Section 40.2 Submission of Data to Inform Negotiation

- a) 40.2.1 Confidentiality of manufacturer submitted data

CMS should work closely with manufacturers to determine a more appropriate and thorough confidentiality and data use policy that will safeguard manufacturer proprietary data.

Section 1193(c) of the Inflation Reduction Act (IRA) restricts both use and disclosure of proprietary data, but in the Guidance, CMS fails to fully articulate its confidentiality policy. Instead, CMS “intends to implement a confidentiality policy consistent with existing requirements for protecting proprietary information, such as Exemption 4 of FOIA...” The lack of detail in this proposed policy raises important concerns about what CMS will consider proprietary, how proprietary information may be used, and how CMS will safeguard the data from unauthorized access, disclosure, or use. At a time where cybersecurity threats and corporate espionage by foreign actors are increasing, particularly within the biopharmaceutical sector, CMS’ collection of such highly sensitive information could leave the government and manufacturers vulnerable to attack.

It is in the interest of all parties to develop a mutually beneficial, comprehensive confidentiality policy concerning the exchange and safeguarding of sensitive information. We therefore urge CMS to propose and open for public comment a detailed confidentiality policy for the Negotiation Program. In doing so, we recommend CMS consider explicitly incorporating reference to trade secret protections, evaluate appropriate FOIA exemptions, and consider modeling its policy on federal and state requirements that have successfully implemented protections for similarly sensitive confidential information.

Additionally, we disagree with CMS’ contention that certain information reported by manufacturers is part of the public record and thus not subject to protection nor exempt from disclosure under FOIA. Indeed, some of what CMS is defining as “federal financial support”—for example, research and development (R&D) tax credits and certain aspects of a manufacturer’s federal grants or contracts—are not publicly available, as CMS asserts. Further R&D costs and program failures for a specific molecule or therapeutic area, net revenue and price calculations, costs of production, information from tax filings, and certain government contracts are proprietary information that are not publicly available. As these data points are all key competitive information, they must be kept confidential and only used for the purposes outlined in the statute. For these reasons, we suggest CMS work closely with manufacturers to determine

a more appropriate definition of confidential information that would not risk public disclosure of confidential information. We further urge CMS to ensure that manufacturers have the opportunity to review any CMS statements or data regarding a selected drug prior to publication to ensure that no proprietary or confidential information can be inferred.

b) 40.2.2 Data Use, Disclosure and Destruction

CMS should revise its data use, disclosure, and destruction policies to reflect important principles of government accountability, free speech, and fair negotiation practices. Further, CMS should make public its analyses (except, as applicable, to keep confidential any manufacturer-submitted proprietary data), and provide an opportunity for public comment.

In the Guidance, CMS describes manufacturer requirements related to the submission of data and the use, disclosure, and destruction of data and other information received during the negotiation process. Specifically, CMS proposes to prohibit a manufacturer from publicly disclosing any information contained in CMS' initial offer, counter offers, or concise justification, as well as any information exchanged during the negotiation period. Further, CMS proposes to require that all CMS information retained by the manufacturer during the negotiation process be destroyed within 30 days of a drug no longer qualifying as a selected drug. CMS believes such requirements will align negotiations under the Negotiation Program with negotiations typically conducted by other entities, and will enable CMS to achieve the lowest MFP for each selected drug. We have several concerns with these proposed requirements.

First, the proposed policies fundamentally contradict the principle of government transparency and accountability. Transparency in how the government conducts negotiations—with careful consideration given to the confidentiality of sensitive manufacturer-provided information, as described above—is critical to the public interest, especially for patients who have the most at stake in the negotiation. Yet under this policy, CMS' analyses and methods for determining an initial offer and evaluating subsequent counteroffers will, at best, be summarized in CMS' concise justification. While some elements of a negotiation between two private entities are similarly subject to a confidentiality agreement, the public sector is unique in its obligation to serve the American people and to be subject to public scrutiny, which forces accountability in how the government is executing the law (and in this case, ensuring that the government is appropriately balancing the important goals of cost reduction and access to both current and future treatments).

Second, CMS justifies its proposal around the use, disclosure, and destruction of data and other information received during the negotiation process as being in alignment “with how negotiations are typically conducted by other entities.” However, the Negotiation Program does not represent a true, open, and voluntary negotiation, considering the penalties for manufacturer noncompliance that apply throughout the negotiation process. Moreover, as a general matter, the confidentiality agreements we enter into with other entities (payers, PBMs, etc.) are the result of mutual negotiation of the terms, and narrowly scoped to offer the minimally necessary protection for each party. In contrast, CMS' proposed policy appears designed to exclusively benefit the Agency in its aim to achieve the lowest MFP, which CMS

itself asserts. Additionally, our private sector agreements do not include any requirements to destroy documentation.

Third, the proposed policies regarding data use, disclosure, and destruction would prevent manufacturers from maintaining institutional knowledge about critical aspects of the negotiation (e.g., information considered and methodologies used) for the purposes of negotiating future selected drugs or renegotiations. Not only does this requirement exceed CMS' authority under the statute, it does not adhere to data retention policies imposed in other federal programs.

In light of these concerns, we strongly urge CMS to revise its confidentiality policy in alignment with the following principles:

- Manufacturers must be able to negotiate the terms of the confidentiality agreement.
- Any restrictions on a manufacturer's use or disclosure of information exchanged during the negotiation process should be narrow.
- CMS should make public its analyses (except, as applicable, to keep confidential any manufacturer-submitted proprietary data), and provide an opportunity for public comment.
- CMS' data destruction policy must be modeled after similar policies used in other federal programs.

Additionally, as discussed above in Section 40, CMS should allow each Secondary Manufacturer to participate in all negotiation activities alongside the Primary Manufacturer, including each of the negotiation meetings with CMS, and to access to all written correspondence between CMS and the Primary Manufacturer regarding the negotiation process. If CMS does not adopt this recommendation, at the very least, CMS must allow the Primary Manufacturer to share any and all documentation regarding the negotiation process with Secondary Manufacturer(s).

Section 40.4 Providing Access to the MFP

CMS should establish retrospective implementation of the MFP via a third party administrator to ensure seamless access to selected drugs. Additionally, to fulfill the statutory obligation to avoid duplicate discounts, CMS should implement a system to identify 340B-eligible sales at the point of sale.

We appreciate CMS' intent to allow manufacturers to offer the MFP to MFP-eligible entities and their providers retrospectively, as it aims to provide manufacturers meaningful flexibility while promoting program integrity. However, as proposed, this option lacks important provisions and safeguards, making it extremely difficult for manufacturers to implement. Specifically, we have the following concerns with the proposed approach:

- A lack of data access to validate MFP eligibility—While manufacturers are required to offer the MFP only to, or on behalf of, MFP-eligible individuals, the Guidance provides no mechanism or process through which data are made available to manufacturers to identify qualifying individuals.
- Insufficient time to provide retrospective reimbursement—When a manufacturer chooses to provide retrospective reimbursement, the Guidance would require the manufacturer to reimburse

pharmacies and intermediaries, including wholesalers, within 14 days. While unclear, we interpret this to mean within 14 days of dispensing (rather than the manufacturer's receipt of an invoice). Regardless, this narrow time frame, paired with the above-mentioned lack of data, does not provide sufficient time for manufacturers to validate MFP eligibility or identify potential duplicate discounts.

- Interplay with 340B—Under section 1193(d) of the Social Security Act (the “Act”), manufacturers are not required to offer the MFP to a provider if the provider was already offered a lower price under the 340B Drug Pricing Program; if the MFP is lower than the 340B price, on the other hand, manufacturers must offer the lower MFP price for that product. Because it can take longer than 14 days to identify a 340B-eligible claim, pharmacies—not knowing at the time of dispensing or claim filing that a claim was eligible for a 340B discount—could invoice manufacturers for the difference between a non-340B acquisition price and the MFP. (Through the typical replenishment model used by pharmacies, however, the dispensed product would have actually been acquired at the 340B price.) Manufacturers in this case could end up paying duplicate discounts when that claim is later identified as 340B-eligible.

To avoid these issues, and to promote program integrity, we urge CMS to:

- Remove the requirement for retrospective payment to be made within 14 days, in recognition of the operational complexities.
- Implement a process akin to the current Coverage Gap Discount Program (CGDP) whereby a third party administrator facilitates manufacturers' access to data in order to identify/validate MFP-eligible claims and facilitate rebate payment. Modeling a solution off of the CGDP could help (but not necessarily resolve) concerns around the very short window for repayment proposed in the Guidance, since the CGDP allows for up to 38 days from report receipt to make payment.
- Implement a system to identify 340B-eligible claims at the point of sale. This system should be paired with strict enforcement of the use of the 340B indicators, as proposed for the Part D inflation rebate Guidance.

SECTION 50 NEGOTIATION FACTORS

Section 50.1 Manufacturer-Specific Data

CMS should revise definitions included in Appendix C to better reflect how companies approach drug development. Additionally, CMS should establish flexibilities in line with statutory requirements for manufacturers to provide basic information by the October 2, 2023 deadline, while extending the deadline for new reporting requirements.

We are very concerned that the manufacturer-specific factors set forth in section 1194(e)(1) of the Act are not reflective of the benefits a product delivers or of how prices are set in a competitive market. Moreover, as evidenced by CMS' proposed definitions for each of the manufacturer-specific factors, and the Agency's proposed approach for using such data, it will be very difficult to establish uniform definitions for these terms, creating the high likelihood that any meaningful reliance on these factors as part of the Negotiation Program would result in an arbitrary determination of the MFP across selected drugs. As discussed in more detail in subsequent sections, establishing price based on benefits provided to

patients and society is key to achieving goals of both reducing costs and maintaining incentives for the highest value treatments. We therefore urge CMS to consider the manufacturer-specific factors outlined in Section 1194(e)(1) of the Act only for those selected drugs that provide fewer benefits than therapeutic alternatives.

To the extent that CMS must apply the manufacturer specific data, the Agency should define, collect, and apply data from all manufacturers of a product. The Guidance contemplates that CMS would consider only certain information from the Secondary Manufacturer(s) as part of the negotiation process. In particular, CMS would consider only those R&D costs incurred by the Primary Manufacturer. We are concerned that this approach does not take a holistic view of the role of each manufacturer in developing a selected drug by limiting the consideration of R&D cost data to that only of the Primary Manufacturer. As stated in Section 40, we recommend instead that CMS enter into agreements with all Secondary Manufacturers and expand data collection from Secondary Manufacturers to include R&D costs.

Additionally, CMS is requesting new price types and cost calculations that are not required under any other government program (e.g., R&D costs by drug or U.S. commercial average net price). New systems and software, data flows, and interoperable connections will need to be established that will require significant investment and can take more than one year to develop and implement. Therefore, the requirement for manufacturers to submit all of this data within 30 days after CMS publishes the selected drug list is very concerning. Under current systems and assumptions, this would not be possible to complete within 30 days because novel accounting practices would need to be developed using data collected from multiple external partners (depending on the selected drug). CMS should use its enforcement discretion to implement procedures such that the submission of certain basic information by the statutory deadline will not trigger penalties, even as the manufacturer continues to supplement the information through a secondary deadline.

The manufacturer specific factors are discussed in more detail in the discussion of Section 60.3.4 and Appendix C, below.

Section 50.2 Evidence About Therapeutic Alternatives for the Selected Drug

CMS should allow submission of data on a rolling basis from all stakeholders and explicitly seek out feedback from patients, caregivers, and clinicians. Further it is essential that CMS accept data submissions after the Agency has established therapeutic alternatives for a selected drug.

Timeline: The timeline for all stakeholders to submit data on the factors enumerated in Section 1194(e)(2) of the Act is too short. We strongly urge CMS to allow for the submission of data on a rolling basis. Additionally, CMS must allow manufacturers and other stakeholders to continue to submit data after CMS has made its selection of therapeutic alternatives public. This is crucial for a valid analysis of a selected drug because the identification of therapeutic alternatives is foundational to the other data CMS will consider under section 1194(e)(2), including therapeutic benefit and comparative effectiveness. (See comments below on Section 60.4).

Solicitation of Evidence: Patients with conditions treated by the selected drug (and their caregivers) and providers treating conditions for which the selected drug is indicated are the most important stakeholders

for the purposes of the Negotiation Program. As such, they should be offered the opportunity to engage with CMS beyond simply providing written comments 30 days after a product is selected for negotiation. The ICR is restrictive (in both scope and time to respond) and not conducive to robust participation by these stakeholders, especially those less familiar with, and with fewer resources to commit to, engagement with the federal government. CMS should explicitly seek out their feedback, ideally by identifying and proactively engaging the stakeholders most affected, or with the most experience in the given therapeutic area. Engagement of these stakeholders should occur in public fora and should allow for a more open exchange (vs. one-way ICR process). Feedback provided by these two important groups should be given higher priority than other comments from the public. Three major areas where their feedback should be solicited are:

- **Unmet needs:** What are (or were previously) unmet needs for their conditions? Or the conditions they treat? And the extent to which a selected drug may (or may not) meet these needs across a drug's lifecycle?
- **Therapeutic alternatives:** What are appropriate therapeutic alternatives to the selected drug? Specifically, what products would you feel comfortable being treated with (or using to treat) instead of the selected drug? How do alternatives compare to the selected drug in terms of safety, efficacy, and quality of life?
- **Therapeutic advance:** What represents a therapeutic advance for a specific indication? And the extent to which a selected drug may (or may not) provide such advancement? To what extent the selected drug substantially improves treatment of Medicare beneficiaries?

SECTION 60 NEGOTIATION PROCESS

In creating and implementing the IRA's Negotiation Process, CMS should both produce savings and preserve incentives for innovation. The MFP methodology should help incentivize investments in the types of treatments that have the most potential for patients. Specifically, 1) CMS should establish the MFP at the ceiling price for products that address unmet needs or are proven to be therapeutic advances, and 2) only use the manufacturer-specific data to adjust the initial offer if the product provides fewer benefits than therapeutic alternatives.

The IRA directs the Secretary to develop and use a consistent methodology and process for negotiations that aims to achieve the lowest maximum fair price (MFP) for each selected drug, and requires the Secretary to consider nine enumerated factors, *as applicable* to the relevant selected drug, as the basis for determining the MFP offers and counteroffers. At a principal level, we believe that CMS should implement the IRA to achieve two overarching and equally important goals: 1) delivering cost savings to Medicare and its beneficiaries, and 2) maintaining incentives to invest in the innovations that can deliver meaningful benefits to patients. We urge CMS not to overlook the crucial nature of the latter – to achieve this, it is critical that CMS create a process that predictably recognizes therapeutic advances and treatment options that address unmet medical needs by weighting benefits to patients and society most heavily, and only considering manufacturer-specific data in cases where there is no evidence of such benefits.

In establishing this patient-centered framework, CMS should explicitly define evidence standards for demonstrating therapeutic advance and unmet need and how that evidence will be translated into the initial MFP offer in order to create a predictable paradigm. Evidence standards should incorporate

feedback from stakeholders, particularly patients, caregivers, and providers, to ensure that the standards are meaningful to Medicare beneficiaries and those who care for them. A predictable and meaningful pricing system is key to incentivizing investment in the types of therapies that are valued most highly. Without a system that clearly defines and predictably recognizes therapeutic advances and products addressing unmet medical needs, we anticipate that investment¹ will move away from the riskiest and most needed research and development efforts. We anticipate products that are structurally disadvantaged under the IRA (e.g., small molecules, products with large Medicare populations, therapeutic areas that require incremental innovation, new platform technologies that require more time for uptake) will be the most affected, with post-approval research and development dollars declining and manufacturers making difficult decisions with regard to US launches (e.g., hold early launches until data on larger patient populations are mature). All of these potential consequences would hurt patients, particularly Medicare beneficiaries. We believe it is possible to achieve a better balance. Below are suggestions specific to CMS' initial Guidance.

We appreciate CMS outlining a methodology to develop an initial offer in the Guidance (Section 60.3). However, as discussed, CMS' proposed methodology does not provide the framework necessary to incentivize the most difficult and riskiest research and development efforts. In order to deliver cost-savings and support innovation, we recommend CMS amend the MFP methodology to:

- Establish an MFP at the ceiling price for products that, over the course of the product's lifecycle, have provided **therapeutic advancements** or treated previously **unmet medical needs**.
 - While the MFP is determined only after a selected drug has been on the market for at least 7 or 11 years, it is essential that a selected drug be recognized for its attributes over the course of its lifecycle to encourage continued innovation. If CMS were to examine the benefits a product provides only at the time CMS establishes the initial MFP offer—which will occur at least 7 or 11 years after the product's initial approval and potentially decades after the initial research investment—manufacturers could not reliably invest in addressing unmet needs and potential therapeutic advances. Specifically, such a methodology would consider the availability of products that were approved well after the manufacturer decided to invest in the development of the selected drug, and arbitrarily fail to recognize the particular value of groundbreaking products in a therapeutic area.
- Create clear criteria for determining whether a product has provided therapeutic advancements or treated previously unmet medical needs over its lifecycle. Specifically:
 - A selected drug would be deemed a **therapeutic advance** if one or more of its indications represents:
 - Significant improvement in clinical outcomes, as assessed by patients with lived experience with the disease. For purposes of this analysis, CMS should establish a standard similar to the *substantial clinical improvement* criterion used by CMS to determine eligibility for the New Technology Add-on Payment (NTAP); OR

¹ Investment includes capital from manufacturers but is also much broader, including capital from venture capital funds and the limited partners typically funding them, public investors, and personal investors.

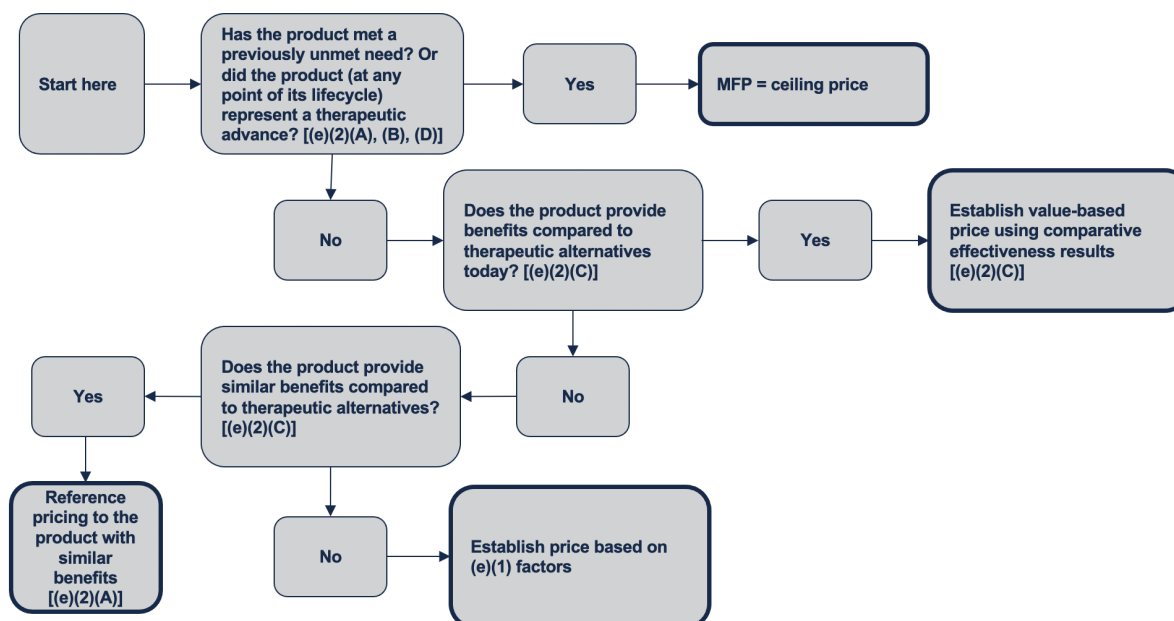

- Improvements on a validated *clinical outcome assessment*,² for the disease state; OR
 - Measurable positive impact in vulnerable populations (e.g., socially vulnerable or disadvantaged, low socioeconomic status, disabled) that could help improve health disparities.
- A selected drug would be deemed to have met a previously **unmet medical need** if one or more of its indications:
 - Was approved to meet an unmet medical need as defined by FDA in its 2014 Guidance³; OR
 - Treats a patient group previously unresponsive to or ineligible for currently available treatments; OR
 - Targets a disease state affecting a disproportionate share of vulnerable patients (i.e., socially vulnerable or disadvantaged, low socioeconomic status, disabled).
- For selected drugs that do not meet one or both of the above criteria, CMS would establish the MFP by considering evidence regarding the **comparative effectiveness** of the drug to determine whether the selected drug provides benefits compared to therapeutic alternatives. In determining the magnitude of benefit, CMS should weigh indications where the selected drug provides benefits compared to existing treatments most heavily. Providing higher weight to indications delivering the most value would help incentivize the most promising drug development (particularly post-approval) and would help remove some disincentives / structural disadvantages created under the IRA for orphan products where research and development can be most difficult and expensive but potential for delivering meaningful benefits may be higher.
- To avoid unintended consequences of setting MFPs too low, CMS should only use the manufacturer specific factors, enumerated in Section 1194(e)(1) of the Act, when a product provides fewer benefits than therapeutic alternatives.

To illustrate how CMS would apply these standards in practice, we have put together the following diagram that contemplates the methodology as a decision tree.

² National Center for Biotechnology Information. Definition and Resources on Clinical Outcome Assessments. Accessed: <https://www.ncbi.nlm.nih.gov/books/NBK338448/def-item/glossary.clinical-outcome-assessment/>

³ US Food and Drug Administration. Guidance for Industry Expedited Programs for Serious Conditions – Drugs and Biologics. May 2014. Accessed: <https://www.fda.gov/files/drugs/published/Expedited-Programs-for-Serious-Conditions-Drugs-and-Biologics.pdf>

Figure 1. Decision Tree to Represent Recommended Methodology for Developing an Initial Offer

This methodology would achieve the following:

- Maintains innovation incentives by establishing the MFP at or near the ceiling price for the highest value products;
- Weights clinical benefits most heavily; and
- Provides savings to Medicare and patients by using prices below the statutory ceiling price for products that demonstrate lower patient value.

While the statute directs CMS to develop and use a consistent methodology for MFP negotiations that aims to achieve the lowest MFP, the statute also requires CMS to take into account the statutory factors “as applicable to the drug,” and gives CMS significant discretion regarding the design of this methodology. The methodology outlined above is consistent with the statute’s broad framework because it can be applied consistently across selected drugs and aims to achieve the lowest MFP while also taking into consideration the statutory negotiation factors “as applicable to the drug.” Specifically, our recommended methodology considers all of the statutory factors and applies them, as applicable, to selected drugs in order to achieve the overarching aims of reducing costs and maintaining access to innovative medicines today and in the future.

Technical clarification needed regarding the orphan drug exemption

CMS should apply the orphan drug exclusion based solely on those orphan drug designations for which a product has approved indications.

Some of the most difficult to treat and highest unmet needs are found in rare diseases, where there are unique challenges for drug development. The IRA’s orphan drug exemption is limited in scope and applies only to those orphan products for which all approved indications treat a single rare disease or condition. However, in the Guidance, CMS has adopted an interpretation under which a product would

lose eligibility for the orphan drug exclusion upon receipt of a second orphan drug designation, regardless of whether that designation has any approved indications. This interpretation creates significant disincentives for orphan drug development.

Orphan drug designations are typically granted early in the development process and provide manufacturers with important incentives (tax credits, exemption from user fees, and potential for longer exclusivity period) to undertake this high-value research. However, an orphan designation does not mean that a product will be successful in being approved for any indications for the designated disease or condition. Indeed, orphan drugs are often studied for multiple disease categories, because of the risk/benefit profile for such research. In other words, drug candidates are studied for multiple diseases to improve their chances of success in obtaining at least one approval. As of April 2023, the FDA has granted 6,445 orphan designations and approved 1,130 orphan indications; these data speak to the risky nature of orphan drug development. And of those designations that ultimately result in an approval, the average time between designation and approval is 65 months or 5.4 years.

Instead of supporting this type of research, CMS' interpretation that a drug with multiple orphan drug designations immediately loses eligibility for the orphan drug exemption undercuts this policy by discouraging manufacturers from undertaking additional research for orphan indications before the manufacturer has any, even remote, certainty that they will be successful in bringing that indication to market. Ultimately this policy will result in less research and progress for patients with some of the highest unmet needs; therefore, we urge CMS to instead clarify that the agency will consider only those orphan drug designations for which a product has an approved indication in applying the orphan drug exclusion.

Section 60.1 Establishment of a Single Proposed MFP for Negotiation Purposes

CMS should provide alternative options for comparing prices between therapeutic alternatives when a 30-day supply is not easily defined or the comparison of the cost of 30-day supplies would be different than comparing the total cost of a course of therapy.

For the purposes of determining a single price included in an initial offer and evaluating clinical benefit compared to therapeutic alternatives, CMS proposes to identify a single price for a 30-day equivalent supply of a selected drug, which is to be weighted across all dosage forms and strengths.

While we understand CMS' rationale for determining a single price for the purpose of negotiating a single MFP, we believe the proposed methodology can be problematic when it is used for cross-product comparison. We believe CMS should be most concerned with the total cost for a similar outcome. Therefore, if comparing a 30-day supply vs. comparing the total cost of a course of therapy would provide different results, CMS must provide alternative mechanisms for comparing price to ensure a fair comparison. Specific examples where problems could arise include (but are not limited to): fixed duration course of therapy, less frequent dosing, differences in dosing for varying indications, differences in persistence and adherence, and differences in loading and maintenance doses.

Before finalizing its approach, we urge CMS to explore, and seek public feedback on, alternatives that will better account for these differences.

Section 60.3 Methodology for Developing an Initial Offer

a) 60.3.1 Identifying Indications for Selected Drug and Therapeutic Alternatives for Each Indication

CMS should identify preliminary options for therapeutic alternatives based on rigorous criteria and then convene a multi-stakeholder panel, including patients and clinicians with first hand experience, to validate therapeutic alternatives for each indication. At the conclusion of this process, CMS should make the selection of therapeutic alternatives public and accept additional data submissions from all stakeholders.

CMS intends to identify all labeled indications from the products prescribing information and identify therapeutic alternatives for each indication using data submitted by the Primary Manufacturer and the public, FDA- approved indications, indications included in the CMS-approved Part D compendia, widely accepted clinical guidelines and peer-reviewed studies. CMS intends to begin by identifying therapeutic alternatives within the same drug class as the selected drug based on properties such as chemical class, therapeutic class, or mechanism of action (MOA) before considering therapeutic alternatives in other drug classes. We support CMS' intent to identify therapeutic alternatives by indication and to start with products with the same MOA. As such, we recommend that to identify the preliminary options for therapeutic alternatives, CMS should look to evidence-based clinical guidelines and other widely recognized, scientifically rigorous, evidence-driven resources to identify preliminary therapeutic alternatives. CMS should prioritize products with the same mechanism of action (MOA) and the same indication / labeled populations to identify therapeutic alternatives. If a product is the only one of its MOA for a given indication, it should be viewed as not having any therapeutic alternatives, unless an evidence synthesis demonstrates the same or better outcomes with another treatment for the given indication. If in evaluating comparative effectiveness research, a selected drug has significant improvements compared to a potential therapeutic alternative, the product should not be included as a preliminary therapeutic alternative.

After CMS has identified preliminary therapeutic alternatives, CMS should convene a multi-stakeholder panel (explicitly including manufacturers, patients with lived experience [including patient advocacy groups], and clinicians treating the conditions in question) in order to validate the correct therapeutic alternative(s) for each indication. Ideally this process should consider both quantitative and qualitative data as well as input from patients and clinicians, as not all of the ways that treatments impact patients can be routinely captured and compared quantitatively. Finally, CMS must make a public determination of therapeutic alternatives as early in the process as possible to allow sufficient time for the manufacturer to submit additional data and prepare for any potential counter offers.

b) 60.3.2 Developing a Starting Point for the Initial Offer

CMS should be agnostic to whether the starting price is above or below the ceiling price as the statute only limits offer and counteroffers at the ceiling price. CMS should not penalize products with no therapeutic alternatives by using a different pricing metric for the starting point.

For selected drugs with at least one therapeutic alternative, CMS intends to use the net price(s) and/or ASP(s) of such therapeutic alternative(s) as the starting point for the initial offer. To the extent a selected drug does not represent a therapeutic advance or address an unmet need and thus qualify for an MFP at the ceiling price (see Figure 1), we support the use of net prices and/or ASPs as the starting point for the initial offer. However, we are concerned that CMS intends to cap the starting price at ceiling price. The statute requires only that CMS cannot make an initial offer or accept a counteroffer that is below the statutory ceiling price. Limiting each step of the pricing methodology at the ceiling price would arbitrarily cap intermediate prices, depressing the amount CMS subsequently adjusts both upwards and downwards based on the various statutory negotiation factors. CMS should instead use the therapeutic alternative pricing as the starting point regardless of whether it is above the statutory ceiling price. CMS can then apply the statutory ceiling price as the last step in the process.

Additionally, for selected drugs without therapeutic alternatives, CMS intends to use the Federal Supply Schedule or Big Four price as the starting price. We disagree with CMS' intended policy to use the FSS or Big Four price for selected drugs with no therapeutic alternatives, as this price is artificially depressed through the inclusion of certain required discounts. This seems particularly inappropriate for products for which there are no other therapeutic options. For these products, the starting point should instead be the product's own net price or ASP.

c) 60.3.3 Adjusting the Starting Point based on Clinical Benefit

CMS should create comparative clinical effectiveness standards, by which it adjusts the starting point upwards or downwards, based on the totality of quantitative and qualitative evidence with special recognition of input from those directly affected by the disease state or treatments being evaluated. Further, CMS should use FDA's well established definition of unmet need to better recognize important treatment advancements.

Comparative Effectiveness Research: In this section the agency states, "To evaluate the clinical benefit conferred by the selected drug compared to its therapeutic alternative(s), as applicable, CMS intends to broadly evaluate the body of clinical evidence, including data received from the public and manufacturers as described in section 50.2 of this memorandum, and data identified through a CMS-led literature review. CMS may also analyze Medicare claims or other pharmaceutical drug datasets for utilization patterns, clinical data, or other information relevant to the selected drug and its therapeutic alternative(s) and may consult with clinical and academic experts." We agree with CMS' general approach, but would also recommend that the agency incorporate the following:

- CMS should create comparative clinical effectiveness standards such that CMS compares the totality of evidence of the impact of treatments on patients, their families/caregivers, the health system and society overall. To do this, CMS should convene a panel of patients, caregivers, and clinicians to provide input on the disease state and treatment options. *This recommendation builds on recommendations provided in Section 50.2 regarding stakeholder convening.*
 - A holistic approach to comparative clinical effectiveness is required because formal comparative clinical effectiveness methods have a rigid focus on regulatory endpoints that change over time and ignore the highly important patient-relevant and health system-related treatment factors that drive overall patient outcomes.

- To do this, in addition to information collection described in Section 50.2, CMS should convene panels of patients and providers with lived experience with the products and disease states being evaluated. CMS should limit stakeholder feedback that is not tied to published studies or guidelines to those with first hand experience.
- For selected drugs with multiple indications, CMS should weight indications where the selected drug provides benefits to patients most heavily. This will help provide incentives for manufacturers to invest in the most promising assets and incentivize post-approval R&D efforts for the most promising indications.
- When analyzing real world evidence (RWE) (or evaluating completed RWE studies) to determine treatment effects, CMS must use methods that are anchored to best practices for defining patient progression or outcomes or leverage validated methods in peer-reviewed literature.

Unmet need: In this section, the agency states, “CMS will consider whether the selected drug fills an unmet medical need, which CMS intends to define as treating a disease or condition in cases where very limited or no other treatment options exist.” This definition is far too narrow and does not adequately contemplate the needs of patients with serious conditions and how drug development aims to meet unmet needs. As stated above, we recommend CMS adopt the following standards for “unmet medical need”:

- A product approved to meet an unmet medical need as defined by FDA in its 2014 Guidance⁴;
OR
- Treats patient group previously unresponsive to or ineligible for currently available treatments;
OR
- A product targeting a disease state affecting a disproportionate share of vulnerable patients (i.e., socially vulnerable or disadvantaged, low socioeconomic status, disabled).

Weighting of Indications: We appreciate CMS’ call out that benefits may vary depending on indication and that a qualitative approach to adjustment may be necessary. We want to reiterate the importance of weighting indications with greatest patient or societal benefits most heavily. This will help incentivize drug development activities that have the most promise to advance patient care.

d) 60.3.4 Consideration of Manufacturer-Specific Data

CMS should only consider manufacturer specific data when a product provides fewer benefits compared to therapeutic alternatives.

As noted above, the manufacturer-specific factors do not accurately reflect a functioning drug development market. Drug development is an inherently risky endeavor. Continued robust R&D investment leading to advancements that address unmet need requires a predictable paradigm that is decoupled from the extent to which R&D costs are ultimately recouped. By contrast, defining R&D costs at the level of a single selected drug does not capture the full scope of risk taken in drug development (e.g., failed research targets, partnerships, acquisitions), nor accurately reflect the fluid nature and costs of R&D and drug development over time (e.g., from inflation, natural disasters, supply chain disruptions, or

⁴ US Food and Drug Administration. Guidance for Industry Expedited Programs for Serious Conditions – Drugs and Biologics. May 2014. Accessed: <https://www.fda.gov/files/drugs/published/Expedited-Programs-for-Serious-Conditions-Drugs-and-Biologics.pdf>

investments in manufacturing technology and capacity, etc.), resulting in an incomplete picture of the full costs of R&D. We further note that CMS' current definition for R&D costs is plagued by selection bias in that, by definition, any drug selected for negotiation was a "success". CMS' proposal to consider only the R&D costs of "successes" or therapeutic areas with an eventual success introduces bias to R&D cost factors such that it cannot provide information from which reliable conclusions can be made.

While we recognize that CMS is required by statute to consider all of the statutory negotiation factors, including R&D costs, as applicable to the drug, the inherent flaws in the manufacturer-specific factors militate in favor of prioritizing the clinical factors as part of the negotiation process. Only after CMS determines that a drug does not provide additional benefits compared to therapeutic alternatives should the manufacturer-specific factors be used to inform the initial offer. To prepare for that eventuality, we share the following concerns with CMS' proposals to consider the manufacturer-specific factors:

- CMS intends the manufacturer-specific data to have either upward or downward pressure on the initial offer, but does not clearly describe the circumstances nor the extent to which these data will influence the offered price. Without a clear process, there exists the high possibility for arbitrary application of these data to inform MFP offers.
- CMS suggests that tax credits should be included in calculations of Prior Federal Support. However, the inclusion of tax credits is inconsistent with their intended purpose -- incentivizing behavior to advance an issue of importance to the government, for instance medical innovation. Applying punitive measures to recipients of such tax credits, in the form of downward adjustments, will only slow the innovation these tax credits were meant to encourage.
- Patents and exclusivities award innovation by providing a time-limited opportunity to market a product without certain types of competition – a practice that is enshrined in the Constitution. Manufacturers continue to innovate through continued R&D on approved drugs to show efficacy in additional indications, improve delivery, or improve efficacy. All of these activities, to the extent they result in new intellectual property, may result in new patents or exclusivities. CMS' suggestion that downward pressure on the initial offer may occur if existing patents will "last for a number of years" after drug selection fails to recognize that these patents were awarded to recognize significant innovation, and will be a strong disincentive to continue to innovate after initial approval because the full value of innovation would not be realized.
- CMS is requesting certain price information and states there may be downward pressure on price if the average commercial net price is lower than the ceiling price. What is particularly concerning is that CMS is requesting average commercial price information net of patient assistance, suggesting that CMS intends to treat patient assistance programs as some form of price concession. Collection of price types that are net of patient assistance programs is inconsistent with statute and recent court rulings affirming that patient assistance is meant for patients and is not part of the sales price to purchasers.⁵ Patient assistance programs are not even considered or discussed when developing contracting strategies with commercial entities, further illustrating that patient assistance is not and should not be viewed as a price concession. Therefore, this information is not appropriate to consider when setting the initial price point and we recommend that CMS withdraw these metrics.

⁵ *PhRMA v. Becerra*, Civil Action 1:21-cv-1395 (CJN) (D.D.C. May. 17, 2022)

Additional concerns regarding the arbitrary nature of the definitions of these factors are included below in comments on Appendix C.

Section 60.4 Negotiation Process

CMS must allow for a more dynamic exchange between the Agency and manufacturers during negotiation.

Timeline for submitting data: As discussed with the timeline for submitting data regarding the manufacturer-specific factors described in section 1194(e)(1) of the Act, we are very concerned with the requirement that manufacturers must submit **all** information on the factors described in section 1194(e)(2) to CMS by October 2, 2023, just 30 days after CMS publishes its list of selected drugs. The breadth and complexity of the data that manufacturers are required to report under section 1194 cannot be overstated. This aggressive timeframe will limit the amount of information we can prepare and submit, and it ignores the reality that new information and data—which can be material to the negotiation—are constantly being generated and may not be available in this very short timeframe.

In addition, development of a given drug continues throughout its lifecycle, as new indications, dosages, and formulations are explored and added, bringing meaningful value to patients. Manufacturers collect and publish evidence on a drug’s safety and efficacy over time, which can be particularly important for fixed duration therapies or others whose data on the long-term durability of effect may increase over time. Health economic and outcomes research and other data generated through real-world studies also provide meaningful information about how the drug works in certain populations and settings. As such, CMS can expect that the evidence package for a drug may evolve over the course of the drug selection and negotiation processes. Manufacturers should be able to submit all data, as they become available, that support the most complete and timely characterization of the value of the product.

Finally, CMS notes that it “may also analyze Medicare claims or other pharmaceutical drug datasets for utilization patterns, clinical data, or other information relevant to the selected drug and its therapeutic alternative(s) and may consult with clinical and academic experts” when evaluating the clinical benefit of a selected drug. We are concerned that under CMS’ interpretation of section 1193(a)(4), manufacturers would not be able to respond to or refute CMS’ analyses with the manufacturer’s own data. Additionally, this interpretation also prevents manufacturers from providing any supplemental or clarifying information CMS may request throughout the negotiation process. We disagree with this approach.

Manufacturers must have the opportunity to submit data regarding the section 1194(e)(2) factors after the 30-day timeline described in the Guidance, on an ongoing basis as the data are available. Doing so will: 1) ensure that CMS has the timeliest information to inform its initial offer and subsequent consideration of counteroffers, as applicable; 2) allow manufacturers to respond to or validate CMS’ own analyses; and 3) allow manufacturers to respond to CMS requests, as needed. We believe Congress did not intend to impose such a rigid timeline, nor categorically exclude important product information from CMS’ consideration, as evidenced by the language in sections 1194(a)(2)(A) (as amended by section 1191(d)(5)(A)) and 1193(a)(4)(B) of the Act, which require manufacturers to submit “information that the Secretary requires to carry out the negotiation”—not, for example, “all information to be considered by

CMS during the negotiation process” by the October 2 deadline. Further, Congress did not specify that additional information cannot be submitted after the deadline. CMS, acting in the public interest, should accept and consider all manufacturer-provided data relevant to the negotiation, provided at any point during the negotiation process.

Mechanics of the negotiation process: In this Guidance, CMS proposes a negotiation process that allows for a maximum of three in-person or virtual meetings, two at the request of CMS and one at the request of the Primary Manufacturer of the selected drug. This proposal is overly restrictive—especially considering the length of the negotiation process and the amount and complexity of information to be considered. We recommend CMS instead provide for a more dynamic exchange. Importantly, manufacturers should be able to request meetings after the submission of information regarding the manufacturer-specific factor, but before CMS’ initial offer, and on an ongoing basis to discuss additional information the manufacturer and/or the public may submit to CMS regarding the factors described in sections 1194(e)(1) and 1194(e)(2) on a rolling basis (in alignment with our recommendations above).

SECTION 70 REMOVAL FROM THE SELECTED DRUG LIST BEFORE OR DURING NEGOTIATION

CMS should only require implementation of MFPs for products that remain single source on the first day of the IPAY.

The IRA allows for negotiation only of those products that have been on the market for a specified period of time without a marketed generic or biosimilar. Section 1192(e)(1) of the Act defines a “negotiation eligible” drug as a “qualifying single source drug” (QSSD) “with respect to an initial price applicability year.” The statutory language tying a QSSD to a given IPAY can be read to indicate that, in order to be negotiation eligible for a given IPAY, a product must meet this criterion on the first day of the IPAY, rather than the last day of the negotiation period, as CMS states in the Guidance. Based on this reading, we urge CMS to revise its guidance to more closely follow the intent and text of the statute, which provides that a negotiation-eligible drug ceases to qualify as a QSSD and thus cannot be a selected drug subject to an MFP if a generic or biosimilar enters the market before the first day of the IPAY. For example, for IPAY 2026, if a generic or biosimilar for a negotiation-eligible drug included on the selected drug list comes to market after the end of the negotiation period, but before January 1, 2026, CMS should not apply the MFP for that product during IPAY 2026.

SECTION 90 MANUFACTURER OVERSIGHT AND COMPLIANCE

CMS should not implement a robust and meaningful competition standard for determining whether a product is a QSSD, as it is contrary to the statutory definition.

The statute defines a QSSD as a product without a marketed generic or biosimilar, among other requirements. In determining whether a product has a marketed generic or biosimilar, we appreciate that CMS would want to investigate whether the generic or biosimilar is truly offered for sale and thus a bona fide marketing standard may be appropriate. However, CMS has exceeded the bounds of the statute by proposing to establish a “robust and meaningful competition” standard and to impose requirements that the product be “widely available” or show up in the PDE data. We strongly urge CMS to focus on the

statutory standard of whether the generic or biosimilar is marketed and not to adopt these standards that exceed CMS' authority under the statute.

SECTION 110 PART D FORMULARY INCLUSION OF SELECTED DRUGS

CMS should implement safeguards to preserve access (formulary placement and cost-sharing) to both selected and non-selected drugs after the MDPNP takes effect.

We support the agency's goal of ensuring that selected drugs are covered under Part D; however we have concerns about *how* these products may be covered, and the consequences for patients. When it comes to access to needed treatment, no patient should be worse off under the Negotiation Program than they are today. This principle must be true for all patients, including those taking selected drugs and those taking non-selected drugs. However, as currently constructed—particularly considering the steep discounts CMS is poised to secure through the Negotiation Program and the requirement for selected drugs to be guaranteed coverage under a plan's formulary—the Negotiation Program will fundamentally alter class-wide dynamics for both selected and non-selected drugs and potentially threaten patients' access to needed treatments

Under the current system, manufacturers often offer rebates to plans in exchange for preferred formulary placement. In some therapeutic classes, such rebates are very common and serve as a considerable source of revenue for plans. In these classes, we can expect that the coverage requirements under the Negotiation Program could dramatically reduce plan revenues for that product by requiring plans to cover drugs with a lower price, making it more difficult for plans to negotiate a rebate or other discount. To counter this downward pressure on plan revenues, a plan may nominally include a selected drug on its formulary—thereby technically complying with the statutory requirement—while implementing utilization management techniques (e.g., step therapy) that adversely affect patient access to the selected drug.

Conversely, patients taking non-selected drugs could be worse off than today under two scenarios: 1) generally, as plans face increased liability under the Part D benefit beginning in 2025, they are likely to restrict access (via increased utilization management and/or higher patient out-of-pocket costs) for non-selected drugs, for which coverage is not required, particularly in classes where steep rebates are less common; and 2) if CMS requires that selected drugs have preferred formulary status, patients taking non-selected drugs would likely face utilization management and/or higher patient out-of-pocket costs.

We urge CMS to provide additional specificity around the requirements for coverage of both selected and non-selected drugs, and in doing so, implement safeguards to ensure that plans cannot disrupt care for patients or otherwise make them worse off than under current formulary guidelines. This also underscores the importance of careful consideration of therapeutic alternatives and negotiation of reasonable MFPs for selected drugs, so as not to exacerbate these dynamics.

APPENDIX C DEFINITIONS FOR PURPOSES OF COLLECTING MANUFACTURER SPECIFIC-DATA

CMS must amend definitions of the manufacturer specific data requirements to better realize the realities of drug development.

Appendix C provides CMS' definitions for the manufacturer-specific data being requested. While we believe manufacturer-specific data should only be considered when the selected drug provides fewer benefits than therapeutic alternatives, it is still important that CMS provide clarity, where possible, on what is expected, while recognizing that a one-size-fits all approach will not be possible for all of the requested data points.

Below we address specific comments on each data point.

R&D Costs:

- Generally it is very difficult to apportion R&D costs to just one drug. Because each drug's development path will have unique nuances, R&D costs should include the underlying or fundamental research that enabled, contributed to, or led to the development of the successful selected drug. CMS should also allow manufacturers to make reasonable assumptions on costs and the apportionment of those costs. For example, rather than set an arbitrary limit on length of pre-clinical research to 52 months, CMS should allow manufacturers to make reasonable assumptions on the length of a particular pre-clinical program.
- The definitions proposed by CMS do not reflect how the industry operates with respect to its approach to R&D. Due to the inherent risk in drug development manufacturers will purposefully diversify risk across the entire portfolio and then cross-subsidize over different therapeutic areas or mechanisms of action. The drug development successes enable further research and allow manufacturers to take risks that may never pan out. It is important to remember that the areas of most unmet need are often some of the riskiest areas to develop medicines (e.g., Alzheimer's disease). Therefore, we feel strongly that R&D costs and failures should include the costs of failures from research areas that never had a drug come to market.
- Moreover, the cost of drug development should include the cost of failures because failures are an inevitable consequence of: (1) the pursuit of treating diseases of increasing complexity, and (2) the nature of a scientifically-regulated industry, where the bar for "success" continually rises as improved products come to market. Not counting failures would incentivize the pursuit of "me-too" medicines which might carry the highest likelihood of clinical success, but do the least to advance patient outcomes.
- Secondary Manufacturer R&D costs, including failures, should be included in the calculation of total R&D costs. Excluding these costs would not encompass the full range of drug development scenarios resulting in an inaccurate reporting of the true cost of drug development. For example, Secondary Manufacturers can incur certain R&D costs that will later be used to support the Primary Manufacturer's NDA/BLA filing.
- Drug development takes many paths and may include partnerships or acquisitions that may bring needed funding to support continued development, bring new capabilities or efficiencies, enhance efforts to scale up production, or any number of added benefits. Ultimately this activity furthers advancements in science that can bring innovative drugs that address unmet needs to market. For these reasons, acquisition costs (of marketed and failed drug candidates), partnering agreements, or any other in-licensing development agreement should be included in R&D costs.

- Manufacturers continue to study and innovate on marketed drugs that result in additional R&D costs (e.g., by confirming efficacy in new indications). Given that CMS intends to use R&D costs to place upward or downward pressure on the initial price offering, CMS should allow manufacturers to include the cost of *ongoing* studies (including pre-clinical studies) in their R&D cost calculations to reflect the reality of continued study on marketed drugs. Without including ongoing R&D costs, manufacturers would be disincentivized from conducting further studies as these R&D costs will not be able to inform MFP in those scenarios where the selected drug provides fewer benefits than therapeutic alternatives.

Current Unit Costs of Productions and Distribution:

- As discussed previously, this point-in-time calculation of unit costs of production and distribution do not accurately reflect the true costs since market approval, but rather a snapshot of the current environment at the time of drug selection.

Prior Federal Financial Support:

- As discussed previously, tax credits should not be included in this metric because it is antithetical to the spirit of tax credits generally and would disincentivize the very behavior the tax credit is intended to promote.

Market Data and Revenue and Sales Volume Data:

- CMS is requesting data on new price types not required to be reported under other federal reporting requirements. As stated previously, requesting these price types net of patient assistance is inappropriate and inconsistent with statute as patient assistance is not a form of price concession or remuneration and does not factor into the contracting decisions made by manufacturers.
- CMS should clarify if the new price types being requested should include U.S. Territories to avoid confusion and facilitate accurate price reporting.
- CMS should provide further guidance on how to calculate WAC at the NDC-9 level. WAC is currently calculated at the NDC-11 level and calculations of WAC at the NDC-9 level may require manufacturers to make reasonable assumptions on the methodology.
- CMS should clarify that prices reported for the FSS and Big Four Price are inclusive of the Industrial Funding Fee to remain consistent with the public reporting by the VA.

We welcome the opportunity to discuss these ideas with you further and address any questions you may have. Please reach out to me or Valerie Reynolds (reynolds.valerie@gene.com) at anytime.

Sincerely,

David Burt

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani:

Gilead Sciences, Inc. (Gilead) appreciates this opportunity to comment on the above-captioned memorandum providing initial guidance (Initial Guidance) regarding the implementation of sections 11001 and 11002 of the Inflation Reduction Act (IRA), which establish the “Medicare Drug Price Negotiation Program” (MFP Program) to determine “maximum fair prices” (MFPs) for selected drugs.¹

Gilead is a research-based biopharmaceutical company that discovers, develops, and commercializes innovative medicines in areas of unmet medical need. We endeavor to transform and simplify care for people with life-threatening illnesses around the world. Our portfolio of products and pipeline of investigational drugs includes treatments for HIV/AIDS, liver diseases, cancer, inflammatory and respiratory diseases, and cardiovascular conditions. Our portfolio of marketed products includes a number of category firsts, including complete treatment regimens for HIV infection available in a once-daily single pill, the first oral antiretroviral pill available to reduce the risk of acquiring HIV infection in certain high-risk adults, and the first Hepatitis C virus (HCV) treatment to provide a complete regimen in a single tablet. Gilead is committed to ensuring that people have access to our medicines.

While we appreciate the efforts of CMS to provide initial guidance regarding implementation of the MFP Program and to solicit stakeholder comments on portions of this guidance, Gilead is disappointed that CMS has only provided a thirty-day comment period, which is insufficient for stakeholders to provide robust feedback on guidance of this length and magnitude. This period falls far short of the sixty-day notice and comment period that the Department of Health and Human Services (HHS) provides “in most cases”²—including for programs, rules, regulations that are far less complex and with far fewer ramifications, and fails to

¹ Memorandum from Meena Seshamani, M.D., Ph.D., CMS Deputy Administrator and Director of the Center for Medicare to Interested Parties (March 15, 2023), <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

² See HHS How to Participate in the Rulemaking Process, <https://www.hhs.gov/sites/default/files/regulations/rulemaking-tool-kit.pdf>.

align with the principles set forth in HHS’s Good Guidance Practices Final Rule.³ We encourage CMS provide at least a sixty-day comment period for future guidance.

We are also concerned that CMS chose to issue Section 30 of the Initial Guidance “as final, without a comment solicitation.”⁴ Although CMS officials previously stated an intent to “engag[e] stakeholders . . . throughout [the IRA implementation] process,” the Agency has not provided an opportunity for the public to review and comment on Section 30.⁵ This lack of engagement of stakeholders is inconsistent with the Biden Administration’s Executive Order that “regulatory actions should be informed by input from interested or affected communities;...interested or affected parties in the private sector and other regulated entities; those with expertise in relevant disciplines; and the public as a whole.”⁶ The Executive Order also provides that agencies shall incorporate “best practices for information accessibility and engagement with interested or affected parties, including, as practicable and appropriate, community-based outreach; outreach to organizations that work with interested or affected parties;...and expansion of public capacity for engaging in the rulemaking process.”⁷ It is important that CMS solicit comments on all portions of the Initial Guidance through a public docket and respond in a revised guidance document, so that manufacturers and other stakeholders can have an opportunity to submit comments and review CMS responses to concerns raised.

The comments that follow are intended to further build on suggestions in the comments of our trade associations, the Pharmaceutical Research and Manufacturers of America (PhRMA) and the Biotechnology Innovation Organization (BIO). In particular, Gilead echoes our trade associations’ concern that the MFP Program could hinder continued biopharmaceutical innovation. As described further below, these risks are particularly acute with respect to HIV treatments and could hinder discovery of an eventual cure. We also urge CMS to implement the MFP Program in accordance with the statute, including enforcing the statutory limitation on duplicate discounts. Failing to enforce such limitations will exacerbate the impact of the IRA on the incentives and resources of manufacturers to invest in the development of innovative drugs and therefore further limit the scope of therapies patients will be able to access in the future.

Our specific recommendations can be summarized as follows:

- CMS Should Establish a Robust Process to Prevent MFP and 340B Duplicate Discounts. Gilead appreciates that manufacturers are allowed to provide access to the MFP through a retroactive reimbursement approach, which supports verification that a selected drug was dispensed to an MFP eligible individual and avoids duplicate MFP and 340B discounts on the same unit of dispensed drug. We encourage CMS to issue more detailed guidance regarding the retrospective reimbursement process. Such guidance should (1) clarify that manufacturers may use a retroactive reimbursement model to implement the 340B price, (2) require that pharmacies use a uniform, mandatory standard for reporting 340B units,

⁷ *Id.* at 21880.

(3) implement a claims clearinghouse model to validate 340B claims, (4) establish a neutral third party administrator to administer retrospective MFP discounts while reconsidering use of Average Acquisition Cost in calculating those discounts, and (5) ensure that manufacturers are provided timely and accurate Prescription Drug Event (PDE) data with 340B identifiers.

- CMS Should Enter into Separate Medicare Drug Price Negotiation Agreements with Primary and Secondary Manufacturers. Requiring Primary Manufacturers to collect proprietary information from Secondary Manufacturers and making them responsible for ensuring that the Secondary Manufacturer provides MFP pricing is inappropriate, because it would raise business fairness and antitrust concerns and would be difficult to operationalize.
- CMS Should Provide Manufacturers Clarity on the Program Data Elements and Adequate Time to Collect Data. Gilead urges CMS to provide more clarity to manufacturers around the definitions of the MFP Program data elements and avoid discouraging manufacturers from offering discounted pricing to customers that Congress has consistently excluded from government pricing metrics. In addition, CMS should provide manufacturers with more than thirty (30) days to collect and report these numerous data elements.
- CMS Should Not Consider “Therapeutic Alternatives” for Purposes of Developing the MFP for HIV Medicines and Should Set the MFP for HIV Drugs Approved Under an NDA at the MFP Ceiling. Considering HIV medicines as therapeutic alternatives of one another for the purposes of developing the MFP fails to recognize how HIV therapies work, specifically that HIV drugs are unique, and each drug has specific qualities related to safety and tolerability, drug-drug interactions, dosing and drug resistance that should be considered when selecting the best HIV treatment regimen for a patient. Constructing therapeutic alternatives for HIV medicines for purposes of developing the MFP would also undermine progress on eliminating HIV and harm patients by disincentivizing innovation in treatment and cure development. To avoid disincentivizing the development of future HIV treatments and cures, CMS should set the MFP for HIV drugs approved under an NDA at the MFP ceiling to avoid disproportionately impacting investments in such drugs.
- CMS Should Define and Select Therapeutic Alternatives Based on Clinical Appropriateness. Gilead urges CMS to clarify that the selection of therapeutic alternatives should be based exclusively on clinical appropriateness, rather than cost of therapy. Clinical appropriateness should be determined through review of clinical guidelines, and through input from clinical experts, manufacturers, and providers. While we strongly believe there are no therapeutic alternatives for HIV treatments, if CMS uses comparators in the negotiation process for an HIV drug, CMS should rely on the HHS HIV guidelines. For example, a single tablet regimen with an A1 recommendation as an initial regimen for most people with HIV should only be compared to other single tablet regimens with “A1” recommendations for the same population. Multi tablet regimens are not appropriate comparators for single tablet regimens.

- CMS Should Broaden the Definition of Unmet Medical Need to Reduce Harm to Subpopulations with High Disease Burden. Gilead urges CMS to broaden the definition of the unmet medical need factor in Section 50.2 of the Initial Guidance to consider patient subpopulations within the disease that have high disease burden—such as specific and difficult forms of a disease—and unmet need. In those cases, a medicine may help to close disparities between populations. For example, people who inject drugs, lower income populations, and stigmatized populations are more likely to be infected with HIV but can also face greater challenges in adhering to medicines because of these same challenges.
- CMS Should Define Clearer Standards for Determining the MFP that Consider Societal Benefit, Transmission of Disease, and Public Health Impact When Measuring the Value of Selected Drugs. Gilead requests that CMS establish a more defined process for determining the MFP and clarify how data and evidence will be appraised and how such appraisal will impact the initially offered price. Specifically, Gilead urges CMS to (1) weight value-based factors much more heavily in determining the initial offer than cost-recovery factors (*e.g.*, R&D costs), (2) use a societal perspective and capture a broad range of outcomes and elements of value rather than focusing on a narrow, payer perspective of value, and (3) consider long-term impact rather than focusing on short-term or yearly impact that aligns with a government or payer’s budgetary cycles. Gilead also recommends that CMS avoid the use of cost effectiveness metrics, which can fail to reflect the diverse experience of the broad patient community by assuming uniform value across patient groups.

Our more detailed comments on the Initial Guidance are set forth below. We hope that CMS will consider these comments when developing further guidance.

I. Requirements for Manufacturers of Selected Drugs (Section 40)

A. CMS Should Establish a Robust Process to Prevent MFP and 340B Duplicate Discounts.

Gilead appreciates that the Initial Guidance would allow manufacturers to provide access to the MFP by “providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP.”⁸ We believe a retroactive reimbursement approach is critical to (1) enabling verification that a selected drug was in fact dispensed to a MFP-eligible individual, and (2) avoiding duplicate MFP and 340B discounts on the same unit of product. As CMS acknowledges, and as required by the IRA, manufacturers of selected drugs are only required to provide the lower of the MFP *or* the 340B ceiling price—but not both—when a covered entity dispenses a selected drug to a Medicare beneficiary that is a “patient” of the covered entity.⁹ Without more detailed guidance, however, it will be difficult for CMS and manufacturers to prevent diversion of drugs sold at the MFP price and identify and prevent duplicate discount in accordance with the IRA.

⁸ Initial Guidance § 40.4.

⁹ SSA § 1193(d); Initial Guidance § 40.4.1.

i. HHS Should Clarify that Manufacturers May Also Use a Retrospective Reimbursement Model to Implement the 340B Ceiling Price

In the course of implementing the IRA, HHS is presented with an opportunity to align the MFP Program and the 340B Program through use of the retrospective reimbursement model for both programs. The Initial Guidance provides that “[i]f the 340B ceiling price is subsequently determined to be lower than the MFP, then the manufacturer would be responsible for providing to the covered entity the difference between the MFP and the 340B ceiling price.”¹⁰ This statement seems to contemplate that manufacturers would provide access to the MFP to covered entities *before* the 340B discount is provided. Under the current discount model used by covered entities, however, the 340B discount is provided upfront, rather than through a back-end rebate. We believe that a retrospective rebate model could also promote the integrity of the 340B program, and we support the use of such model as contemplated in the Initial Guidance. We thus encourage CMS to work with the Health Resources and Services Administration (HRSA) to clarify that manufacturers may also use a retrospective reimbursement model to implement the 340B ceiling price. This approach would simplify the process for identifying duplicate MFP and 340B discounts, while leveraging the opportunity to improve, strengthen, and streamline the 340B Program.

ii. To Ensure an Accurate and Timely PDE Record, CMS Should Require that Pharmacies Use, a Uniform, Mandatory Standard for Reporting 340B Units

Gilead supports the 340B Program as one way to ensure broader access to medicines for uninsured, low-income patients. We are concerned, however, based in part on our experience with the 340B Program, that unless further guidance is provided and sufficient guardrails are put in place, it will be difficult, if not impossible, to identify and prevent duplicate discounts consistent with the IRA. The 340B program has experienced unprecedented growth in recent years; by one estimate, purchases under the 340B Program totaled more than \$40 billion in 2021, an increase of 15.6% over 2020.¹¹ Gilead has developed robust processes and procedures to identify rebate claims by state Medicaid programs for drugs purchased by covered entities through the 340B Program.¹² Yet, despite our efforts, these processes have inherent limitations, due to, in large part, to limited quality and availability of Medicaid claims-level data and lack of agency guidance for preventing duplicate discounts. The biggest barrier to Gilead identifying and preventing duplicate discount is lack of sufficient data, both with respect to the availability of claims-level data and the quality of the data that is available. CMS will need to issue further guidance that establishes a mechanism for the provision of claims level data, or we will continue to have challenges identifying and preventing duplicate discounts as we implement the MFP Program.

It is thus critically important that CMS establish a uniform, mandatory standard for reporting 340B units on the PDE record. Covered entities currently do not consistently include 340B modifiers on insurance claims, particularly if use of such modifiers is not mandatory. A recent study found that “[m]odifier usage reached 90% in some segments when reporting was mandatory, fell below 20% when it was optional, and dropped below 1% when it was

¹⁰ Initial Guidance § 40.4.1.

¹¹ Drug Channels, *The 340B Program Climbed to \$44 Billion in 2021—With Hospitals Grabbing Most of the Money* (Aug. 15, 2022), <https://www.drugchannels.net/2022/08/the-340b-program-climbed-to-44-billion.html>.

¹² See 42 U.S.C. § 256b(a)(5)(A).

impractical.”¹³ Unless CMS establishes a uniform, mandatory standard for reporting 340B units, 340B modifiers will not be used consistently, thwarting manufacturer efforts to comply with the statutory prohibition against duplicate MFP and 340B discounts.

Notably, 340B claims modifier usage was higher when the 340B status of the claim was known prior to or at the point-of-sale.¹⁴ Currently, however, it is less common for covered entities (and in particular, their contract pharmacies) to use a pre-purchased inventory model, where product pre-purchased at the 340B price is kept on the pharmacy shelf to fill the prescriptions for the covered entity’s patients. Instead, under the replenishment model, when filling a prescription, the contract pharmacy initially dispenses product purchased at a non-340B price. The pharmacy sends an electronic record of its claim to a third-party administrator (TPA), which reviews the claims to determine which prescriptions were filled by an eligible patient of the covered entity. Once the TPA has made its determinations, it transmits that information back to the pharmacy. After the contract pharmacy has dispensed a certain volume of a given drug to 340B-eligible patients, that volume is “replenished” with product purchased at the 340B price. Because a pharmacy using the replenishment model does not know the 340B status at the point of sale, the replenishment model poses significant challenges to the consistent use of a 340B indicator.¹⁵

Gilead recommends that CMS work with HRSA to require that all covered entities and contract pharmacies identify a patient as 340B-eligible at the point of sale and dispense product purchased under the 340B program to that patient. This identification requirement would help ensure that a pharmacy knows the 340B status of a particular unit of drug at the time the product is dispensed and thus can include a 340B indicator as appropriate on the claim, resulting in accurate claims information submitted in real time and prior to adjudication. Such a requirement should also apply regardless of the insurance that the patient presents at the time of dispense, since pharmacies may not be able to accurately determine whether the patient has Medicare Part D coverage at the point of sale. With respect to Medicare Part D claims, CMS also should require pharmacies to populate 340B identifier on the claim at the point of sale to identify the claim as either 340B or not 340B and require Part D plan sponsors to deny claims that do not have the field populated with one of these values.

iii. Additional Safeguards, Such as a 340B Claims Clearinghouse, are Needed if 340B Units are Identified After an Insurance Claim is Submitted

Although requiring a 340B identifier on each claim at the point of sale would be a timely and efficient way to ensure accurate PDE data, if HHS nevertheless permits covered entities and

¹³ Rory Martin, *et al.*, Can 340B Modifiers Avoid Duplicate Discounts in the IRA?, IQVIA White Paper (Feb. 2023), <https://www.iqvia.com/locations/united-states/library/white-papers/can-340b-modifiers-avoid-duplicate-discounts-in-the-ira10>.

¹⁴ *Id.* (The “340B status of a drug must be known at the point of sale to the patient in order to apply the modifier to the claim prior to adjudication. While this is possible for pharmacies that identify 340B transactions at the point of sale, which may occur in entity-owned pharmacies and often in those that use physical inventory, the drug’s 340B status is unknown for pharmacies using the 340B replenishment model and virtual inventory which is used by almost all contract pharmacies.”).

¹⁵ The HHS Office of Inspector General also has found that the replenishment model creates complications in preventing diversion and duplicate discounting under the 340B program. *See* OIG, Memorandum Report: Contract Pharmacy Arrangements in the 340B Program, OEI-05-13-00431 (Feb. 4, 2014), <https://oig.hhs.gov/oei/reports/oei-05-13-00431.pdf>.

their contract pharmacies to identify product as 340B-eligible after the product is dispensed (which can result in identification of the patient as 340B-eligible *after* the insurance claim is submitted), it is critical that HHS establish robust guardrails around the replenishment model to enable the accurate submission of 340B indicators.

First, HHS should limit the timeframe for replenishment, so that covered entities must determine whether a particular unit of product is subject to a 340B discount within a specified period after the product is dispensed. This timeframe should be shorter than the time period in which manufacturers are invoiced for MFP claims, so that units are identified as subject to a 340B discount *before* an MFP discount is requested on the same unit. Without such a limitation, it will be difficult, if not impossible, to determine in a timely manner if a claim is subject to duplicate discounts.

Second, if a covered entity identifies a product as subject to a 340B discount after the claim has been submitted, HHS (through CMS and HRSA) should establish a clear and straightforward process for the covered entity to timely identify such 340B claims. One option would be to create a 340B claims clearinghouse to promote the integrity of the 340B PDE indicator data. HHS could refer to the Oregon Medicaid program's model as an example of a claims clearinghouse that generally works effectively for this purpose today.¹⁶ Under this model, covered entities (and any 340B vendors or contract pharmacies that submit claims on their behalf) must identify and submit 340B claims for each calendar quarter to the clearinghouse within thirty days after the end of that quarter, and the state rebate vendor uses the 340B claims files to match up the original paid encounter and exclude the claim from the quarterly drug rebate process.¹⁷ If there is an error and a validation fails, it is sent back to the trading partner for correction.¹⁸ The Oregon model could be adapted to apply to MFP claims instead of Medicaid claims (recognizing that HHS would need to update the claims level data collected by the clearinghouse to include data applicable to the Medicare Part D program. The specific claims level data that should be required are described below). The claims data could be used to validate and update as needed the information provided on the MFP invoice. In addition, if a manufacturer reviews the claims data and identifies a unit that was not correctly identified as subject to a 340B discount, and the covered entity agrees that the claim should have been billed as a 340B claim, that manufacturer should have the ability to submit this information to the clearinghouse, including appropriate documentation of the covered entity's agreement, and the clearinghouse should update the claim information to reflect the 340B status. This will help increase the accuracy and integrity of the clearinghouse model.

If HHS implements a clearinghouse model, Gilead encourages HHS to clearly set forth applicable claims submission requirements for all 340B stakeholders. HHS should also establish penalties for covered entities that do not submit claims data to the clearinghouse in the specified period. For example, a covered entity's repeated failure to comply could result in losing eligibility for participating in Medicare Part D or the 340B program. Additionally, Gilead encourages HHS to employ the same clearinghouse to comply with other statutory requirements that involve

¹⁶ Oregon Health Authority, Retroactive 340B Claims File Instructions, <https://www.oregon.gov/oha/HSD/OHP/Tools/340B%20Claims%20File%20Instructions%20and%20Design.pdf>.

¹⁸ *Id.*

identifying 340B claims, such as the prohibition against Medicaid duplicate discounts¹⁹ and the non-duplication provision for Part D inflation-based rebates.²⁰

iv. CMS Should Use a Third-Party Administrator to Administer Retrospective MFP Discounts and Reconsider Use of Average Acquisition Cost in Calculating those Discounts

Gilead supports the use of a neutral, single third-party administrator (TPA) to administer retrospective MFP discounts across manufacturers, for the reasons described in the comment letters of our trade associations. Use of a TPA will allow for consistent patient access to the MFP at the point-of-sale, while also ensuring reimbursement to pharmacies through a standardized, central process with timely data. Moreover, using the same TPA to administer both the MFP discount program and the 340B clearinghouse would provide efficiencies, because the TPA could obtain Medicare Part D PDE data from CMS in addition to 340B claims information from covered entities, and use this information to remove 340B claims from the MFP invoices provided to manufacturers (unless the MFP is lower than the 340B ceiling price, in which case amount invoiced to the manufacturer would be reduced to equal the difference between the MFP and the 340B ceiling price).

We also ask CMS to reconsider use of the dispensing entity's actual acquisition cost (AAC) as the metric used to calculate MFP-based rebates. As discussed in PhRMA's comments regarding the Initial Guidance, AAC is hard to track and is not currently reported by pharmacies to other stakeholders. Using it may incentivize higher AACs in order to increase MFP rebates. Reporting AAC could also create misaligned incentives in contracting between pharmacies and other entities in the pharmaceutical supply chain. For example, if pharmacies report the AAC as part of the claim transaction between the pharmacy and Part D plan (or a PBM), knowledge of the AAC could allow the plan or PBM to undercut the pharmacy in negotiations for total pharmacy reimbursement.

v. Under Any Approach, CMS Must Ensure that Manufacturers Have Timely and Accurate PDE Data with 340B Identifiers

Finally, regardless of whether CMS chooses to utilize a claims clearinghouse model and/or a TPA, CMS (directly or through the TPA) should provide manufacturers with PDE data, including 340B identifiers, to enable identification of MFP-eligible claims and prevent diversion of product subject to the MFP discount to individuals that are not MFP-eligible individuals. It is critical that manufacturers receive accurate and timely PDE data to ensure to integrity of the Program. Such claims data should, at a minimum, include the following data fields:

- Part D Contract ID and Part D Plan Benefit Package ID
- Prescription Number
- Rx BIN Number
- Prescribed Date
- Fill Date (i.e., date of service)
- 9-digit National Drug Code (NDC)

¹⁹ Public Health Service Act § 340B(a)(5)(A).

²⁰ SSA § 1860D-14B(b)(1)(B).

- Standardized Numerical Identification (SNI)
- Quantity dispensed
- Pharmacy ID
- Prescriber ID
- Wholesaler Invoice Number
- 340B Covered Entity ID/NPI
- 340B claims identifier

Without access to the foregoing data in a timely manner, it will not be possible for manufacturers to appropriately identify and eliminate units that may otherwise be subject to duplicate MFP and 340B discounts.

We note that the collection and aggregation of the foregoing data fields should not present any concerns with respect to protected health information, as manufacturers can be provided with these data fields for purposes of validating rebate claims.²¹ Manufacturers' access to the same information from the PDE data is necessary to ensuring appropriate identification of MFP-eligible claims and preventing the diversion of product subject to the MFP discount to individuals that are not MFP-eligible.

vi. Manufacturers Must Have Adequate Time to Review the PDE Data Prior to Providing Retroactive Reimbursement of MFE

Lastly, CMS should measure the time period in which manufacturers must provide access to the MFP to reimburse pharmacies from the date on which the manufacturer receives all data necessary to validate the eligibility of the underlying MFP rebate claim, rather than the date the product is dispensed to the patient. Given that plans submit PDE entries to CMS on a two-week cycle,²² the necessary claims level data elements described above may not even be available within

²¹ HHS, Does the Privacy Rule Permit State Medicaid Agencies to Disclose Protected Health Information to Pharmaceutical Manufacturers and Third Party Data Vendors for Purposes of Validating Claims under the Medicaid Drug Rebate Program?, <https://www.hhs.gov/hipaa/for-professionals/faq/456/does-hipaa-permit-state-medicaid-agencies-to-disclose-information-to-pharmaceutical-manufacturers/index.html> (“The Privacy Rule permits State Medicaid agencies to disclose protected health information, such as prescription numbers, to pharmaceutical manufacturers and third party data vendors that assist the pharmaceutical manufacturers, for purposes of validating claims submitted under the Medicaid Drug Rebate program. Because the amount of the rebate is based on drug utilization by individual enrollees, such disclosures are permitted as part of a State Medicaid agency’s payment activities.”); HHS, Does the Privacy Rule Permit Health Plans to Disclose Protected Health Information to Pharmaceutical Manufacturers for the Adjudication of Drug Rebate Contracts?, <https://www.hhs.gov/hipaa/for-professionals/faq/455/does-hipaa-permit-health-plans-to-disclose-information-to-pharmaceutical-manufacturers/index.html> (“The Privacy Rule permits a health plan to disclose protected health information, such as prescription numbers, to a pharmaceutical manufacturer for purposes of adjudicating claims submitted under a drug rebate contract. Because the amount of the rebate is based on drug utilization by individual enrollees, such disclosures are permitted as part of a covered entity’s payment activities.”). Medicare is considered a “health plan” for HIPAA Privacy Rule purposes. 45 CFR § 160.103 (including, under the definition of “Health Plan,” Parts A, B, and C of the Medicare program and an issuer of a Medicare supplemental policy).

²² See Contract Year (CY) 2022 Part D Pricing Data Submission Guidance, CMS (May 28, 2021), <https://www.cms.gov/files/document/cy2022drugpricingsubmissionguidelines05282021final.pdf>.

14 days of the date the product is dispensed to the patient—rendering a manufacturer unable to determine if a unit is subject to duplicate discounts.

In addition, even once the manufacturer receives the necessary data, validating claims with 14 days is not feasible. Other government rebate programs provide manufacturers a much longer period in which to pay claims. For example, manufacturers have 38-days after receiving an invoice to pay a discount under the Part D Coverage Gap Discount Program,²³ and 37-days to pay a rebate after receiving a rebate invoice under the Medicaid Drug Rebate Program (MDRP).²⁴ Given the “novel” and “complex” nature of the MFP Program,²⁵ Gilead urges CMS to provide manufacturers at least this long to review and validate MFP discount claims before the manufacturer is required to pay such claims.

B. CMS Should Enter into Separate Medicare Drug Price Negotiation Agreements with Primary and Secondary Manufacturers

Section 40 of the Initial Guidance provides that if “more than one entity meets the statutory definition of manufacturer for a selected drug,” CMS “intends to designate the entity that holds the NDA(s)/BLA(s) for the selected drug to be ‘the manufacturer’ of the selected drug (hereinafter ‘Primary Manufacturer’).” Any other entity that meets the statutory definition of manufacturer for a drug product included in the selected drug and “either (1) is listed as a manufacturer in an NDA or BLA for the selected drug or (2) markets the selected drug pursuant to an agreement with the Primary Manufacturer” would be a “Secondary Manufacturer.” Secondary Manufacturers would include any manufacturer of any authorized generics and any repackager or relabeler of the selected drug that “meet these criteria.” CMS intends to sign an agreement only with the Primary Manufacturer, and the Primary Manufacturer would be required to, among other things: (1) report manufacturer-specific information for the Secondary Manufacturer (in some cases blending that information with the Primary Manufacturer's own data to report combined pricing metrics); (2) ensure that the Secondary Manufacturer make the MFP available to MFP-eligible individuals; and (3) pay civil monetary penalties (CMPs) for violations stemming from noncompliance by any Secondary Manufacturer.

Gilead has significant concerns with CMS’ proposal. As a threshold matter, the IRA does not authorize CMS to impose program requirements or penalties on a distinct corporate entity, which is the effect of the Primary/Secondary Manufacturer policy. In addition, the Initial Guidance would require Primary Manufacturers to have insight into and control over aspects of the Secondary Manufacturer’s pricing, particularly where the Primary Manufacturer and Secondary Manufacturer are not affiliates. Reporting the required data under Section 40.2, Section 50.1, and Appendix C of the Initial Guidance to CMS would require Primary Manufacturers to access proprietary information from Secondary Manufacturers, who may be competitors, raising both business fairness concerns and legal antitrust issues. Moreover, a process of obtaining this information from Secondary Manufacturers is not feasible for the Primary Manufacturer to operationalize.

²³ 42 C.F.R. § 423.2315(b)(3).

²⁴ Interest Calculation for Late Rebate Payments, CMS, <https://www.medicaid.gov/medicaid/prescription-drugs/medicaid-drug-rebate-program/interest-calculation-for-late-rebate-payments/index.html>.

²⁵ 87 Fed. Reg. 62433, 62433 (Oct. 14, 2022).

For these reasons, Gilead recommends that CMS not adopt the Initial Guidance on Primary and Secondary Manufacturers as final. Instead, CMS should adopt an approach similar to the one it uses in the MDRP. Under the MDRP, CMS enters into separate National Drug Rebate Agreements with each labeler and holds each labeler individually responsible for compliance with the requirements of that agreement. Likewise, if more than one distinct legal corporate entity meets the definition of manufacturer under the IRA, CMS should enter into separate agreements with each manufacturer. This approach is consistent with the text and structure of the IRA, which adopts the definition of “manufacturer” in Social Security Act § 1847A(c)(6)(A), which in turn cross-references the definition of “manufacturer” in the Medicaid rebate statute.²⁶ In addition, the IRA contemplates multiple agreements with multiple manufacturers, stating that the “Secretary shall enter into agreements with manufacturers of selected drugs.”²⁷ Entering into separate agreements with each Primary and Second Manufacturer also avoids discouraging manufacturers from entering into arrangements with authorized generic manufacturers, repackagers, and relabelers. Such arrangements are pro-competitive and consistent with Congress’ goals of lowering drug prices.

C. CMS Should Support Accurate Submission of Data by Providing Manufacturers Clarity on the Data Elements and Adequate Time to Collect Data

Gilead recognizes that CMS has issued a separate information collection request (ICR) regarding the MFP Program data elements that would be required to be reported for initial price applicability year 2026.²⁸ We note at a high level, however, that it is particularly important that CMS provide additional clarity to manufacturers around the definitions of these data elements and, in doing so, avoid discouraging manufacturers from offering discounted pricing to customers that Congress has consistently excluded from government pricing metrics. In particular, many of the market data, revenue, and sales volume data elements included in Appendix C of the Initial Guidance are new and reference terms such as “commercial” prices are not defined. In the context of the MDRP and the Medicare Average Sales Price (ASP) program, Congress has specifically excluded “any prices” to certain customers, such as the Department of Veterans Affairs (VA) and 340B covered entities, from the pricing metrics under those programs, so that manufacturers can offer discounted pricing to those customers without impacting their prices to the entire Medicare and Medicaid programs. CMS should take a similar approach here and clarify that “commercial” prices exclude prices to ASP and Best Price-exempt customers.

In addition, CMS should provide manufacturers with more than thirty (30) days to collect and report these numerous data elements. Manufacturers generally have at least a quarter to calculate pricing metrics reported to government healthcare programs, such as Best Price and ASP, and they have forty-five days to calculate Non-FAMP, which is the pricing metric specifically identified in Section 11001 of the IRA. CMS should provide manufacturers at least this much time to report the data elements identified in Section 40.2, Section 50.1, and Appendix C of the Initial Guidance, which are more numerous than those required under other government healthcare programs and in many cases are completely new. This will help support accurate and complete manufacturer submissions and thus further the integrity of the MFP Program. We also encourage

²⁶ SSA § 1191(c)(1) (referencing SSA § 1847A(c)(6)(A), referencing SSA § 1927(k)(5)).

²⁷ SSA § 1193(a) (emphasis added).

²⁸ 88 Fed. Reg. 16983 (Mar. 21, 2023).

CMS to provide an opportunity for manufacturers to submit additional information to address questions or misunderstandings regarding their data submissions.

II. Negotiation Factors and Negotiation Process (Sections 50 and 60)

Gilead is concerned that CMS’ framework for setting MFPs has the potential to disincentivize innovation in important therapeutic areas, such as HIV. By significantly shortening the effective time period in which a manufacturer can determine its own price for a product in the Medicare market, the IRA has the potential to undermine the incentives created by the patent system. Any limitation to these incentives can have a negative result for innovation and ultimately patients. This could lead to less investment and could result in fewer new drugs for unmet medical needs.

This impact is particularly concerning for HIV medicines. As manufacturers develop novel HIV therapies, these innovations over time form important building blocks toward a cure for HIV. If CMS’ negotiation process disincentivizes innovation in the HIV therapeutic area, this will stifle the incremental innovation that Gilead believes is critical to ending the HIV epidemic and which are building toward an eventual cure for HIV. As described further below, CMS should clarify that HIV medicines do not have therapeutic alternatives for purposes of determining the MFP. In addition, we urge CMS to define clearer standards for the methodology and process for measuring the value of selected drugs and determining the MFP, and to consider the societal benefit of the drug and public health impacts such as transmission of disease.

A. CMS Should Not Consider HIV Medicines “Therapeutic Alternatives” for Purposes of Developing the MFP and Should Set the MFP for HIV Drugs Approved Under an NDA at the MFP Ceiling

Gilead strongly disagrees with CMS’ proposal to set the “starting point price” for the initial offer based on the Part D net prices and/or ASPs of therapeutic alternatives, as this overlooks the unique needs of patients and could result in unfairly low prices. As described further below, the use of therapeutic reference pricing—both in development of the starting point price and subsequent adjustments to that price—is particularly inappropriate for HIV medicines. Gilead therefore urges CMS to consider HIV selected drugs to have no therapeutic alternatives during the initial offer or counteroffer process.

Considering HIV medicines as therapeutic alternatives of one another for purposes of developing the MFP fails to recognize that HIV drugs are unique, and each drug has specific qualities related to safety and tolerability, drug-drug interactions, dosing and drug resistance that should be considered when selecting the best HIV treatment regimen for a patient. Assuming treatments are therapeutic equivalents would not recognize the significant public health value that the full scope of HIV treatments provides for patients. Prescribers must consider the patient’s specific drug resistance, co-morbidities, and the impact of side effects when making a prescribing decision for each patient. Early treatment initiation with the right antiretroviral product for the

patient is critical to achieving better individual patient health outcomes, as well as significantly decreasing the risk of HIV transmission to others.²⁹

A provider's careful selection of a treatment regimen supports patient medication adherence and increases each patient's chance of achieving and sustaining viral suppression.³⁰ Viral suppression stops HIV infection from progressing, helping people living with HIV stay healthy and live longer, while effectively eliminating risk of sexually transmitting the virus to an HIV-negative partner.³¹ A 2018 study found that 86% of people living with HIV have been diagnosed by a healthcare provider, but only 60% of the diagnosed population has achieved viral suppression. Of the diagnosed population, only 57% receive ongoing care.³² Even among those patients who continue to receive treatment, many have experienced and struggled with treatment adherence.

Finding the right individual treatment to promote patient adherence and persistence is crucial to ending the HIV epidemic: a recent report states that if an Incidence : Prevalence ratio of less than 0.03 is maintained over time, the epidemic would be eliminated.³³ This report found that “viral suppression on reducing incidence will only be fully realized when testing and treatment targets are achieved in all populations.”³⁴ This underscores the significant need for better and broader optionality in treatment choice, enabling clinicians to tailor regimens to different patient populations with the aim of improving not only adherence but also persistence and therefore clinical outcomes. Continued innovation in the HIV therapeutic area can help address those challenges while work continues toward development of an eventual cure.

Use of therapeutic reference pricing will undermine progress on eliminating HIV and harm patients by disincentivizing manufacturers to develop novel HIV treatments, especially those designed to reach people who experience system inequities and disparities in accessing healthcare. Innovation in HIV treatment is ongoing to provide patients with more options to meet their clinical needs and preferences and achieve sustained viral suppression. Treating these medicines as therapeutic equivalents of each other devalues these benefits, to the detriment of HIV patients. Advancements in HIV treatments have resulted in regimens that are highly effective, have high barriers to drug resistance, and have unsurpassed tolerability and safety. The advances in HIV medicine means that certain HIV regimens can be started immediately after HIV diagnosis—also

³⁴ *Id.*

known as rapid start of HIV treatment—before results of recommended resistance testing or baseline laboratory testing are available.³⁵ Certain modern HIV regimens support innovative models of care like telehealth and telemedicine services for HIV treatment and prevention because they require less clinical monitoring.³⁶ The ongoing development of long-acting HIV medicines also is an important step towards supporting adherence for patients living with or at risk for HIV and offers new treatment options to patients who may not be well-suited to taking a daily oral pill. These newer daily oral single tablet regimens and long-acting medicines have potential to improve adherence for patients who live in difficult circumstances where taking a daily pill is impossible, and would provide an option for individuals with multi-drug resistant forms of HIV.³⁷ In addition, treatments that can be administered less frequently than daily dosing could provide options for those who find daily dosing challenging, with the aim of improving not only adherence but also persistence and therefore better clinical outcomes. Treating these medicines as therapeutically equivalent to older medicines would undermine innovation by ignoring the value of these treatments to patients and the healthcare system and undervaluing or disregarding entirely research and development costs.

There is longstanding recognition in the Medicare program that patients need access to the particular HIV medication that was prescribed for them, and that one HIV product cannot simply stand in for another. As CMS itself has previously recognized in the context of the Medicare Part D protected classes policy, with respect to antiretrovirals, there are a “number of multiple drug combinations and adjunctive therapies involved,” drug protocols are subject to change, and changing drug resistance plays a role “in determining the selection of among the different antiretroviral drugs.”³⁸ Moreover, CMS has acknowledged that “[t]he need to adjust specific combination antiretroviral therapy in real time is complex and must consider, among other things, viral sensitivity to the drugs, drug interactions, pregnancy status (if applicable), and potentially the patient’s pharmacogenomic profile of the cytochrome P450 system.”³⁹ HHS’ guidelines on HIV treatment also state that “selection of a regimen should be individualized” to the patient based on factors such as virologic efficacy, potential adverse effects, pill burden, drug–drug interaction potential, and comorbid conditions.⁴⁰ CMS should align with this recognition that no one treatment

³⁵ See, e.g., AIDS Education & Training Center Program, Rapid ART, <https://aidsetc.org/sites/default/files/media/document/2023-03/ncrc-rapidart-1-pager.pdf> (providing that Rapid (or immediate) ART can be appropriate for people with suspected acute HIV infection, with or without a confirmed HIV diagnosis).

³⁹ *Id.*

⁴⁰ HHS, Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV, G-4 (Mar. 23, 2023), <https://clinicalinfo.hiv.gov/en/guidelines/adult-and-adolescent-arv>.

HIV regimen has a clear therapeutic alternative and clarify that HIV medications do not have therapeutic alternatives for purposes of determining the MFP.

We also note that while drugs approved under a New Drug Application (NDA) are potentially subject to negotiation after only *seven* years, biological products approved under a Biologics License Application (BLA) are not subject to negotiation for *eleven* years.⁴¹ HIV treatments generally are approved under NDAs and therefore subject to the MFP Program four years sooner than would be a comparable biological product. This distinction does not reflect the value that HIV medicines bring to patients and to the public health at large. To avoid disincentivizing the development of HIV treatments arbitrarily simply because of their approval pathway, CMS should set the MFP for HIV drugs approved under an NDA at the MFP ceiling to avoid disproportionately impacting investments in such drugs.

B. CMS Should Define and Select Therapeutic Alternatives Based on Clinical Appropriateness

Gilead urges CMS to clarify that the selection of therapeutic alternatives should be based exclusively on clinical appropriateness, rather than cost of therapy. The statute’s reference to “therapeutic” alternatives makes clear that such alternatives should be selected based on their therapeutic use.⁴² Clinical appropriateness should be determined through review of clinical guidelines, input from clinical experts, manufacturers, and providers, and other related methods. We emphasize that manufacturers and healthcare providers have particularly deep knowledge and experience regarding selected drugs, and thus it is crucial that CMS meaningfully engage with these stakeholders when determining therapeutic alternatives. While we strongly believe there are no therapeutic alternatives for HIV treatments, if CMS uses comparators in the negotiation process for an HIV drug, CMS should rely on the HHS HIV guidelines. For example, a single tablet regimen with an “A1” recommendation as an initial regimen for most people with HIV should only be compared to other single tablet regimens with “A1” recommendations for the same population.⁴³ Multi tablet regimens are not appropriate comparators for single tablet regimens.

C. CMS Should Broaden the Definition of Unmet Medical Need to Reduce Harm to Subpopulations with High Disease Burden

Unmet medical need is defined narrowly in Section 50.2 and Section 60.3.3.1 of the Initial Guidance, focusing on diseases for which there are very limited or no treatment options. This definition should be broadened to consider patient subpopulations within the disease that have high disease burden—such as specific and difficult forms of a disease—and unmet need. In those cases, a medicine may help to close disparities between populations. For example, people who inject drugs, lower income populations, and stigmatized populations are more likely to be infected with HIV but can also face greater challenges in adhering to medicines because of these same challenges. Patients who do not adhere to existing HIV treatments may become resistant to such

⁴¹ See SSA § 1192(e)(1)(A)(ii), (B)(ii).

⁴² Only then, *after* the therapeutic alternatives are identified, can CMS consider their costs as a factor in determining the MFP. SSA § 1194(e)(2).

⁴³ HHS, Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV. What to Start: Initial Combination Antiretroviral Regimens for People with HIV. (Sep. 21, 2022). <https://clinicalinfo.hiv.gov/en/guidelines/hiv-clinical-guidelines-adult-and-adolescent-arv/what-start-initial-combination-regimens?view=full>.

medicines and need new options to treat their disease. Resistance may also develop over time in highly treatment experienced (HTE) patients, leading to high disease burden and few choices for effective therapies. As discussed above, there is a significant need for better and broader optionality in treatment choice, allowing healthcare providers to tailor regimens to patients with the aim of improving not only adherence but also persistence and therefore clinical outcomes. If CMS does not consider the need for continued innovation in a therapeutic area such as HIV, it risks decimating future research and investment in that therapeutic area, to the particular detriment of patients experiencing disparities and inequities in the U.S. healthcare system.

We also note that the definition of “unmet medical need” in the Initial Guidance is much narrower than the definition the FDA uses. FDA defines unmet medical need as “a condition whose treatment or diagnosis is not addressed adequately by available therapy” that includes either “an immediate need for a defined population” or “a longer-term need for society.”⁴⁴ FDA further explains that such a drug will treat a condition (1) where there is no available therapy; (2) where there is available therapy, but the drug presents additional benefits; and (3) where the only available therapy was approved under the accelerated approval program and clinical benefit against the primary endpoint has not yet been verified.⁴⁵ Broadening the definition of unmet medical need to consider patient subpopulations within the disease that have high disease burden would better align with this existing agency guidance.

D. CMS Should Define Clearer Standards for Determining the MFP that Consider Societal Benefit, Transmission of Disease, and Public Health Impact When Measuring the Value of Selected Drugs

Gilead appreciates CMS’ intention to avoid establishing an overly rigid, formulaic process for determining the MFP. Such a process likely would not include the necessary flexibility to fully capture the value of different types of therapies. The process and methodology outlined in the Initial Guidance, however, is too unstructured and open-ended to satisfy the statutory requirement that CMS implement a “consistent methodology and process” for setting MFPs.⁴⁶ We are concerned that CMS’ proposed methodology and process are unclear and could be applied inconsistently, which will result in prices that are arbitrary and are certainly not fair to the manufacturer.

Accordingly, we request that CMS establish a more defined process to improve predictability, while still retaining flexibility to account for differences in value across therapies. We encourage CMS to define a specific approach that is clearer as to how data and evidence will be appraised, and how that appraisal will impact (or be weighted compared to other factors) the offered price. As part of that process, we recommend that:

- Value-based factors (*e.g.*, comparative effectiveness and unmet need) should be weighted much more heavily in determining the initial offer than cost-recovery factors (*e.g.*, R&D costs). This will help incentivize innovation by focusing on the value of treatment to individual patients and the greater society, rather than limiting innovation by focusing on development costs.

⁴⁴ FDA, Guidance for Industry Expedited Programs for Serious Conditions – Drugs and Biologics (2014), <https://www.fda.gov/files/drugs/published/Expedited-Programs-for-Serious-Conditions-Drugs-and-Biologics.pdf>

⁴⁵ *Id.*

⁴⁶ SSA § 1194.

- CMS should use a societal perspective and capture a broad range of outcomes and elements of value rather than focusing on a payer perspective of value which focuses on a narrow set of clinical outcomes. This is recognized as a best practice by the International Society for Pharmacoeconomics and Outcomes Research (ISPOR) and the health economics community. This includes consideration of value measures such as adherence, productivity, disease severity, impact on total cost of care, limiting transmission of infectious diseases, and scientific spillover/innovation.⁴⁷
- For any type of outcome or evidence-based measure used, it is critical that CMS consider long-term impact rather than focusing on short-term or yearly impact that aligns with budgetary cycles. Health economic analysis typically would not show cost offsets in a single year. If CMS focuses on short-term or yearly impact, it will lack the ability to account for the product's full public health impact and/or cost-saving potential that accrues over time.

Gilead appreciates that CMS reinforces in Section 50.2 in the Initial Guidance that quality-adjusted life year (QALYs) will not be considered in negotiation.⁴⁸ Patient groups and governmental bodies such as the National Council on Disability consider use of the metric to be discriminatory towards patients with chronic disease, the elderly, disabled, and other historically marginalized patient populations by placing lower value on their lives and the health gains they may achieve relative to healthier populations. There are better methodologies that assess product value that are more comprehensive, focus on the effectiveness of the product in improving health, and center value on diverse patient perspectives.

For example, Multi Criteria Decision Analysis (MCDA) is a transparent methodology that is increasingly utilized for decision making about health care value. Through an MCDA process, patients are asked what matters most to them, and these weighted factors are the basis for the analysis. As a result, MCDA captures a broader set of value factors in addition to clinical effectiveness, which could include disease severity, potential for a cure, equity, societal value, and caregiver burden. MCDA can be implemented in a way that summarizes the quantitative and qualitative evidence about a product, without simply aggregating quantitative data into one single metric. While MCDA sometimes utilizes QALYs, it can be employed without them.

While MCDA is a preferable approach, another, less-resource intensive, potential approach is the use of cost-consequence analysis (sometimes referred to as an impact inventory or dashboard) to catalog evidence and present it in a way that easily allows for ascertaining all aspects of value. In this approach, all relevant outcomes for the intervention and its comparators are presented in a disaggregated tabular format. This would help facilitate a transparent, value-based assessment and negotiation, especially if it includes the full spectrum of evidence, including traditional clinical outcomes, cost impacts, and societal benefits. This type of approach was recommended by an expert panel convened by USC and the Aspen Institute as a practical,

⁴⁷ Darius N. Lakdawalla *et al.*, *Defining Elements of Value in Health Care—A Health Economics Approach: An ISPOR Special Task Force Report*, 21 *Value in Health* 131-139 (2018), <https://www.valueinhealthjournal.com/action/showPdf?pii=S1098-3015%2817%2933892-5>.

⁴⁸ We also agree that a study should not be completely discarded because it includes QALYs. Studies often contain multiple outcomes, and a QALY metric can be disregarded in favor of a more patient-centered outcome within a single study.

transparent, non-QALY based form of value assessment for the US context.⁴⁹ Determinations on which elements to include could be driven by stakeholder input to mimic the MCDA approach.

We encourage CMS to avoid use of other cost effectiveness metrics that attempt to oversimplify the measurement of value. A single metric that assumes uniform value across patient groups will never reflect the diverse experience of the broader patient community. Furthermore, such metrics are often not transparent in how value is measured, and rarely capture the full value of a product to society. For example, methods that rely on single cost effectiveness metrics do not include aspects of product value such as the impact on health equity, family and caregiver burden, cost savings from reduced hospitalizations and other health care use, and reduced population transmission of infectious diseases.

Lastly, we are concerned that the Initial Guidance provides for limited input from patients and clinicians on what is important in appraising value. This is out of step with best practices in other countries and from groups like ISPOR.⁵⁰ Stakeholder input is critical to ensuring that the methodology and process align with patient preferences and clinical practice. For example, patients should be asked about care preferences and which outcomes matter most to them in line with the MCDA approach described above. Clinicians practicing in the disease area that a selected medicine treats should be engaged to help select clinically appropriate comparators.

* * * *

Gilead hopes CMS will incorporate these suggestions into its revised guidance and implement the MFP Program with a goal of ensuring that it does not disincentivize biopharmaceutical innovation, which could hinder finding a cure for HIV and ending the HIV epidemic. If you have any questions, please do not hesitate to contact Michelle Drozd at Michelle.Drozd2@gilead.com or Laura Okpala at Laura.Okpala@gilead.com.

GSK Comment Letter

Response to CMS Initial Memorandum: Medicare Drug Price Negotiation Program

April 14, 2023

Via electronic submission: IRARebateandNegotiation@cms.hhs.gov

Meena Seshamani, M.D., Ph.D.
CMS Deputy Administrator and Director of the Center for Medicare
Centers for Medicare & Medicaid Services
U.S. Department of Health and Human Services

Baltimore, MD 21244-8016

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani:

GSK appreciates the opportunity to comment on the initial memorandum for the Medicare Drug Price Negotiation Program. GSK is a global biopharmaceutical company with the ambition and purpose to unite science, technology, and talent to get ahead of disease together. We seek to prevent and treat disease with vaccines, specialty, and general medicines.

GSK supports policy solutions that transform our U.S. healthcare system to one that rewards innovation, improves patient outcomes, and achieves higher value care. As the Centers for Medicare & Medicaid Services (CMS) implements the Medicare Drug Price Negotiation Program, we are concerned that CMS' policies will adversely impact meaningful innovation, create operational challenges, and limit patient access to transformative therapies.

GSK is a member of and endorses the comments of the Pharmaceutical Research & Manufacturers of America (PhRMA) and the Biotechnology Innovation Organization (BIO) on the Medicare Drug Price Negotiation Program. We respectfully submit the additional comments below to highlight issues of paramount interest to GSK and the patients we serve.

We make the following recommendations for addressing our concerns:

- Set the maximum fair price (MFP) at or near the statutorily mandated ceiling price for any vaccine products selected for Medicare negotiation;
- Improve and clarify the ways Primary manufacturers provide access to MFP by either removing the 14-day requirement or clarifying that the 14-day requirement is after patient eligibility has been verified, and using WAC as the basis for determining MFP discounts/rebates; and
- Ensure that evidence used in determining pharmaceutical therapeutic alternatives for each selected drug is scientifically rigorous, and that experts – including manufacturers and clinicians – are engaged as central resources in this determination.

Below are our recommendations with supporting rationales:

I. Value of Vaccines and Setting the MFP

Vaccines are a public health tool that deserve unique considerations that are not similarly contemplated for other classes of biologics or drugs. Specifically, vaccines are preventive in nature, have benefits seen at a population health level, and typically have durable effects. As a matter of public health policy, maximum uptake of vaccines should be encouraged to minimize the burden of preventable diseases and illnesses and to address health inequities. GSK is concerned that Medicare negotiation for vaccines will disincentivize innovation in infectious and emerging disease – an area that historically has less investment than others¹.

The Centers for Disease Control and Prevention (CDC) sets the US adult and childhood immunization schedules based on recommendations from the Advisory Committee on Immunization Practices (ACIP). FDA-approved vaccines undergo a rigorous evaluation of safety and effectiveness, disease severity, economic analyses, and other factors through ACIP's vaccine recommendation process. Subjecting ACIP-recommended vaccines to Medicare negotiations, after they have already undergone rigorous analyses by experts, could reduce incentives for the development of new vaccines for current and future public health threats. ***Given the unique circumstances of vaccines, GSK recommends that if a vaccine product is selected for negotiation, CMS set the MFP at or near the statutorily mandated ceiling price.***

It is important to note that vaccines are treated differently than biologics and drug products throughout the Inflation Reduction Act (IRA). Under section 1194(c), the applicable percent for vaccines is described with short-monopoly drugs at 75% and vaccines approved under Section 351 of the Public Health Service Act are expressly excluded from the definitions of extended-monopoly and long-monopoly drugs.² Additionally, Medicare beneficiaries already experience no cost-sharing for vaccines covered by both Part B and Part D as a method of encouraging higher utilization that reduces short- and long-term costs for the Medicare program. Therefore, Medicare negotiation for low-cost, high-volume vaccines will have little to no effect on Medicare beneficiary access because beneficiaries are not subjected to out-of-pocket costs for vaccines.

While several critical therapeutic areas, including oncology, HIV, and rare diseases, warrant special consideration, at a minimum, we urge CMS to recognize the unique importance of vaccines when setting MFPs, given their remarkable public health benefit.

II. Improve and Clarify Ways to Effectuate MFP to Maintain Program Integrity

CMS proposes to effectuate the MFP price for selected drugs during the initial price applicability year (IPAY) 2026 by requiring Primary Manufacturers to either ensure the price paid by the dispensing entity is no greater than the MFP or a retrospective reimbursement for the difference between acquisition costs and the MFP. Under the retrospective reimbursement method, CMS proposes to require the Primary Manufacturer provide the payment difference within 14 days.

GSK recommends CMS either remove the 14-day requirement or clarify the 14-day requirement is after a Primary Manufacturer has verified the patient is an MFP-eligible individual. The 14-day requirement is not feasible to process rebates to effectuate the MFP price after the drug has been

¹ [Innovation policy and the market for vaccines - PMC \(nih.gov\)](#)

² Inflation Reduction Act of 2022

dispensed. GSK must verify MFP eligibility for Medicare beneficiaries before issuing rebates. Not doing so could result in duplicate discounts given the lack of access to proper data sets to determine a patient's status for a dispensed drug. The 14-day requirement brings increased risks to program integrity as it relates to MFP and 340B duplicate discounts, which are prohibited in the IRA.

However, GSK will be able to provide a rebate to effectuate the MFP if manufacturers are granted flexibility to provide the reimbursement difference after verification occurs. CMS could partner with a third-party administrator (TPA) to establish a standard invoicing cycle with appropriate validation and payment processing timelines. A comparable process exists, and has been successfully implemented, for the Part D Coverage Gap Discount program, in which Palmetto GBA serves as the TPA. Allowing CMS or manufacturers to establish a third-party administrator to serve as a clearinghouse to effectuate the MFP will improve data integrity and processing timelines.

In addition, **GSK recommends CMS clarify that Wholesale Acquisition Costs (WAC) will be used as the basis to determine MFP discounts/rebates.** CMS provides Primary Manufacturers the option to provide rebates "for the difference between the dispensing entity's acquisition cost and the MFP."³ Manufacturers do not normally sell direct to pharmacy locations. Instead, manufacturers sell products at WAC to wholesalers and distributors who then resell the product to pharmacy locations. A pharmacy's Actual Acquisition Cost (AAC) will likely not equal the cost for which the manufacturer sold the product. Use of AAC as the basis to determine MFP rebates may result in higher base prices than the list prices the manufacturer used for the sale of the drug. Manufacturers are not able to validate the AAC and varied cost bases will result in inconsistent MFP rebates paid for the same product to different pharmacies. AAC may include any third-party markups from entities in the supply chain that will inflate the price and result in higher rebates than required to effectuate the MFP. WAC is a published list price set in advance and available to all entities in the supply chain. The use of WAC as the basis will ensure accurate effectuation of the MFP.

We urge CMS to take specific steps – including either removal of the 14-day requirement or additional clarity on verification of MFP eligibility and the use of WAC as the basis for determining MFP discounts/rebates – to appropriately effectuate the MFP and maintain integrity of the negotiation program.

III. Engage Experts and Proactively Seek Stakeholder Input on Identifying Therapeutic Alternatives

For IPAY 2026, CMS proposes to identify the selected drug's FDA-approved indications that are neither excluded from coverage nor otherwise restricted, and then identify pharmaceutical therapeutic alternatives for each indication of the selected drug, using manufacturer-submitted data, widely accepted clinical guidelines, and peer-reviewed studies. CMS proposes to review existing literature and real-world evidence (RWE), along with conducting its own internal analytics. **GSK recommends that CMS carefully consider the totality of evidence when identifying therapeutic alternatives, including clinical trials and pre-/post-approval real-world evidence that inform appropriate comparators.** CMS should take a methodologically rigorous, data-driven, and patient-centered approach based on the standard of care and clinical decision-making to reviewing evidence. CMS should strictly avoid any bias that could impact therapeutic alternative selection and MFP determination.

³ CMS. "Medicare Drug Price Negotiations Initial Memorandum." Pg. 32. March 15, 2023.

Response to CMS Initial Memorandum:
Medicare Drug Price Negotiation Program

GSK believes that experts, including manufacturers and clinicians, should be included as additional resources for providing clinical confirmation of identified evidence used in determining therapeutic alternatives, and that CMS should go beyond what the Agency laid out in the Guidance to engage key stakeholders in the selection of therapeutic alternatives. Manufacturers are in a strong and unique position to inform CMS' determination of appropriate therapeutic alternatives for a selected drug, based on their extensive expertise and research on the benefits and impacts of their medicines throughout the product lifecycle. In addition, manufacturer-sponsored research frequently includes comparative effectiveness research, which requires selection of a clinically appropriate comparator. Clinicians with disease-specific expertise and disease-specific clinical guidelines generated by clinicians should also play a role in CMS' determination of a selected drug's therapeutic alternatives.

It is procedurally unclear when CMS will identify the therapeutic alternatives for a selected drug and communicate that information to the manufacturer. ***GSK strongly recommends that CMS publicly identify the therapeutic alternative selected, allow manufacturers sufficient time to review any additional research conducted by the Agency, as well as additional submissions from other stakeholders.***

We encourage CMS to carefully consider the totality of evidence when selecting therapeutic alternatives, to make therapeutic alternative selections public, and to allow for sufficient time to review agency research and stakeholder submissions.

GSK appreciates the opportunity to provide comments on the Medicare Drug Price Negotiation Program. We stand ready to engage with CMS on this critical work to ensure the program is implemented without adverse impacts to innovation and, most importantly, Medicare beneficiaries. Please do not hesitate to contact Amy Efantis, Vice President Government Affairs & Public Policy, (Amy.J.Efantis@gsk.com) and/or Harmeet Dhillon, Head of Public Policy, (Harmeet.S.Dhillon@gsk.com), should you have any questions or requests for additional information.

Respectfully,

A handwritten signature in black ink, appearing to read "A. Efantis", is positioned below the word "Respectfully,".

Amy Efantis

Vice President, Government Affairs and Public Policy
GSK

The Honorable Chiquita Brooks-LaSure
Administrator
Centers for Medicare & Medicaid Services
Department of Health and Human Services
Baltimore, MD 21244-1850

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026

Dear Administrator Brooks-LaSure:

With the Centers for Medicare & Medicaid Services' (CMS') issuance of its initial set of guidance on implementation of the Inflation Reduction Act of 2022 (IRA), it has become increasingly clear that (a) the IRA has the potential to exact unintended, but catastrophic, consequences for patients with extremely rare conditions; and (b) CMS may not have a sufficient understanding of our communities' unique challenges to steer its policies in a "do no harm" direction. Haystack Project, therefore, appreciates the opportunity to submit its comments on CMS' Initial Guidance.

Haystack Project is a 501(c)(3) non-profit organization enabling rare and ultra-rare (20,000 or fewer US patients) disease patient advocacy organizations to coordinate and focus efforts that highlight and address systemic reimbursement obstacles to patient access. Our core mission is to evolve health care payment and delivery systems with an eye toward spurring innovation and quality in care toward effective, accessible treatment options for all Americans. We strive to amplify the patient and caregiver voice in these disease states where unmet need is high and treatment delays and inadequacies can be catastrophic.

Our comments to the Initial Guidance briefly outline the inherent differences in commercial realities between the treatments our patient and caregivers rely upon and/or hope for and those that address more common diseases and conditions. We also identify specific provisions within the Initial Guidance likely to have unintended consequences for our patient populations as well as actions CMS can take to minimize those consequences.

We ask that CMS fully consider our comments and that it also give Haystack Project and its member organizations the opportunity to meet with IRA-implementation staff and leadership to articulate our concerns in greater detail so that we may work together to protect access to necessary treatments for all patients, regardless of the rarity of their condition(s).

Background: Individuals with Rare and Ultra-Rare Conditions will be Disproportionately Impacted by the IRA's Potential to Deter Innovation.

Although countless lives have been improved or saved by new therapies enabled by Congress' set of incentives for orphan drugs, significant unmet need predominates in extremely rare conditions and rare cancers:

- Of the approximately 7,000 rare diseases identified to date, 95% have no FDA-approved treatment option.
- 80% of rare diseases are genetic in origin, and present throughout a person's life, even if symptoms are not immediately apparent.
- Diagnosing a patient with a rare disorder is usually a multi-year process involving a series of primary care clinicians, specialists, and diagnostic testing regimens – extreme rarity of a disorder compounds the resources required for diagnosis. Patients often progress to more serious and more costly disease states by the time they receive a diagnosis.
- If a diagnosed condition has no FDA-approved option, treatment often involves off-label use of existing products.
- Approximately half of identified rare diseases do not have a disease-specific advocacy network or organization supporting research and development, and lack of disease-specific natural history severely complicates research toward new, targeted treatments.

Patients suffering from rare diseases that are currently untreatable have maintained hope that the incentives toward innovation, coupled with increased scientific understanding of disease mechanisms, would stimulate progress toward treatment and, eventually, a cure. The economic calculation of unmet patient need balanced against research and development costs, projected risk, and population-based revenue estimates must be accompanied by an analysis of whether it is possible to successfully clear reimbursement mechanisms and hurdles that may tip the scales for or against pursuing a specific drug candidate for an orphan indication. For patient populations approaching the 200,000 orphan disease limit, current incentives have proven to be sufficiently robust to mitigate clinical trial and reimbursement risks. As affected populations dwindle below 20,000 or even into and below the hundreds, the balance can be far more tenuous, and risks or uncertainties can discourage the investor interest required to take promising therapeutic candidates from bench to market.

Patients with rare and ultra-rare conditions as well as rare cancers rely on payers and society in general to lay a strong foundation that gives investors a level of comfort that the costs of research and development can be recouped, either through the price of the new drug, its use in other patient populations, or both. Without this, there is little reason for us to hope they will invest their limited resources in advancing the treatments we need.

Haystack Project and its member organizations have focused on educating stakeholders and shaping health policy to address longstanding challenges to treatment access and innovation. We have engaged with CMS through comments on CMMI model proposals, implementation and refinement of the Medicare Quality Payment Program (QPP) and the Affordable Care Act, as well as throughout annual rulemaking cycles refining policies under Medicare Parts A, B, C and D. In 2019, Haystack Project expressed its increasing concerns that health reform efforts initiated to decrease health care costs would fail to consider our patient communities:

We are concerned that drug-pricing reforms will all but close the narrow window for commercial viability of ultra-rare disease treatments. Our sincere hope is that a greater understanding of our experiences will enable pragmatic solutions to existing problems and guide future health system refinements that take our unique needs into account.

Since enactment of the IRA, Haystack Project membership has continued to grow – both in numbers (nearly doubling to 150 ultra-rare disease advocacy organizations) and in the acute sense of urgency on the need to be heard, prioritized and accounted for in the policy decisions shaping treatment access and product development for the foreseeable future. We recognize that the IRA offers financial relief to our patient communities in (1) capping Part D out-of-pocket costs and (2) enabling a “smoothing” mechanism so that patients can spread their out-of-pocket costs over the year. We expect that these Part D refinements will reduce financial stress on patients and their families so that more patients can base their treatment decisions on medical need rather than financial resources.

Unfortunately, the drug price negotiation program presents significant threats to the fragile balance that has historically enabled researchers, manufacturers, and investors to capture an adequate return on investment for

targeted treatments in small population diseases and rare cancers. Haystack Project expects that the drug price negotiation program will marginally reduce healthcare costs for patients with relatively common conditions. The vast majority of ultra-rare disease and rare cancer patients - who routinely hit the out-of-pocket cap in Part D - will not experience any benefit from CMS' drug price negotiation. That is not to say that the program will have no impact on our patients. Haystack Project's community of patients and caregivers fear that unless CMS implements the drug price negotiation program with proactive and intentional consideration of the complex set of incentives and risks inherent to developing treatments in the ultra-rare disease space, the scales will inextricably tip away from innovation.

We ask that CMS:

- Engage in meaningful dialogue with Haystack Project and other patient organizations to identify innovative approaches to accommodate challenges associated with developing rare and ultra-rare disease treatments, including through CMMI and CMS' general demonstration authority.
- Expand the window for stakeholder feedback on the Initial Guidance, and in particular, consider implications for rare diseases.
- Identify 'qualifying single source drug' by NDA/BLA.
- implement the orphan drug exemption to maintain incentives for rare disease drug development and expansion of labeled indications for existing therapies
 - Work with patient and other stakeholders to ensure that access to orphan drugs is not impeded by diversity of rare conditions for which a treatment is safe and effective.
 - Implement a transparent process for manufacturers to submit evidence demonstrating that a particular product is eligible for the orphan drug exception.
 - Identify orphan drug designations for a particular product at the time of selection, not the date on which the product achieved one or more of its FDA approvals.
- Apply the small biotech exception with minimal burden to manufacturers.

Haystack Project urges CMS to expand the window for stakeholder feedback on the Initial Guidance.

Haystack Project engages its member organizations by analyzing and educating its members on new policy proposals likely to impact treatment access and innovation. This enables our communities to contribute general feedback as well as specific examples of how a new policy might impact patients. The Initial Guidance contains a complex set of interconnected proposals and mechanisms that require thorough analysis, substantial knowledge of the drug and biologics manufacturing industry, and significant time to ascertain and convey its impacts to non-industry stakeholders. The 30-day comment period was far too short to enable Haystack Project to collect specific, meaningful input from our member organizations and incorporate the feedback into a comprehensive comment.

In addition, CMS' decision to broadly define 'qualifying single source drug' for negotiation eligibility purposes was unexpected. Haystack Project had anticipated that CMS would identify negotiation-eligible drugs on the basis of NDA/BLA approvals. This decision will shape the IRA drug price negotiation program to negate existing incentives for securing approvals in small population conditions and burden industry stakeholders in a manner not likely contemplated within the statute. The repercussions from CMS' decision are likely far-reaching and, we believe, warrant a level of consideration that cannot be accomplished without stakeholder feedback. We urge CMS to reverse its finalization of Section 30 of the Initial Guidance and solicit additional stakeholder comments on the entirety of the guidance.

CMS Should Reconsider its Definition of Qualifying Single Source Drug

Haystack Project was both surprised and disappointed that CMS' Initial Guidance finalized a definition of qualifying single source drug that looks to active moiety or active ingredient rather than NDA/BLA. We had expected that CMS would look to the statutory language and its reference to products as negotiation-eligible if the product was approved under an NDA/BLA and seven/eleven years have elapsed since such approval. Under CMS' definition, it would be possible to render a drug eligible for which an NDA is approved, for example, 2 years before a product with the same active moiety/ingredient is selected for negotiation. Under any reading of the plain language of the IRA, the product would not be negotiation-eligible.

We have significant concerns that CMS' approach to identifying products eligible for negotiation (and to which any Maximum Fair Price (MFP) would be applied) maximizes the extent to which the IRA's drug price negotiation program will hinder research and development toward expanded labels for existing treatments. Individuals with relatively common conditions will likely maintain access to promising therapies developed for other conditions based on compendia listings for off-label uses. Off-label treatments for extremely small population conditions are rarely included in the various compendia relied upon for Part D coverage, and patient access is completely foreclosed. In fact, Haystack Project has heard from several patient groups that treatments within the standard of care for their ultra-rare condition fall outside the Part D benefit. Unless CMS retracts its determination to include all NDAs/BLAs for a product as a singular qualifying single source drug for negotiation purposes, our patients have little hope that manufacturers be able to justify investing in NDA/BLA approvals for ultra-rare uses of existing treatments.

In addition to the concerns described above, Haystack Project expects that CMS' definition of qualifying single source drug will place burdens on manufacturers that Congress did not consider in drafting the IRA. We note that CMS' set of examples on application of the qualifying single source drug definition included scenarios with multiple NDAs and multiple manufacturers. The Initial Guidance contemplates requiring the primary manufacturer (NDA/BLA holder) to assume full responsibility and liability for participation in the negotiation process, submission of complete, accurate information and access to the MFP.

Agreements between manufacturers are generally based on contracts negotiated and executed before the parties perform any manufacturing, distribution, and/or marketing activities. They outline the duties and responsibilities of the various parties based on the laws and regulations in place at the time of contract execution and may provide for amendment based on specified legal or regulatory changes. Neither the IRA nor CMS' Initial Guidance provide for any mechanism through which a primary manufacturer can secure information or performance from a secondary manufacturer. While CMS might assume that manufacturers can contract with each other to accommodate the IRA requirements, the substantial liability and potential monetary penalties placed on primary manufacturers negates the potential for a level playing field between the parties. We expect that CMS will face legal challenges to this provision of its Initial Guidance and urge the Agency to take a more pragmatic approach. Identifying negotiation-eligible products by NDA/BLA will preserve incentives for research and development of new uses for existing products, and minimize the potential that manufacturers will be responsible for activities over which they have no control.

The Orphan Drug Exclusion Should be Implemented to Maintain Incentives for Developing New Treatments in Rare Conditions and Expanding Labeled Indications of Existing Therapies

Haystack Project appreciates that CMS recognizes the need to protect access to orphan drugs currently available as well as innovations that have yet to be developed. We fully support CMS' determination to qualify drugs for the exclusion based on whether approved indications are within a single designation. Unfortunately, the policy on defining a qualifying single source drug by active moiety/ingredient discussed above will likely reduce manufacturer interest in pursuing multiple indications within or beyond a single designation.

When the IRA was enacted, our member organizations voiced significant concerns that the narrow exception for orphan drugs would introduce a new set of considerations to deter pursuit of FDA approval for multiple uses of promising new therapies. Drug and biotech manufacturers already face considerable pressures to fulfill their legal

obligations to shareholders while maintaining their commitment to improve care for the patient communities they serve. The landscape envisioned under CMS' Initial Guidance increases the tension between those interests. For example, it would be difficult to make a financial case for investing in clinical studies toward approval of an ultra-rare indication outside a product's original orphan designation unless the financial consequences of losing eligibility for the orphan drug exception were outweighed by projected revenue from a new indication. The smaller the population, the less likely it is that the manufacturer could justify investing in the research needed for FDA approval. Any decision to rely on off-label use (for cancer uses and indications likely to be included in compendia) would be more likely driven by math than an intent to game the system. CMS, patients, and manufacturers can and should be aligned on incentivizing (or at least not discouraging) research that maximizes access to innovations across indications through a demonstration of safety and efficacy sufficient to garner FDA approval.

Patients with ultra-rare conditions and rare cancers are particularly concerned that:

- Manufacturers will face pressures to focus on an orphan indication with the largest patient population.
- Research and development programs confirming clinical benefit for accelerated approval treatments may be halted and indications withdrawn if those indications fall outside a single orphan drug designation. We note that on April 6, 2023, AbbVie and Johnson & Johnson announced withdraw of the accelerated approvals for Imbruvica (ibrutinib) in mantle cell lymphoma (MCL) and marginal zone lymphoma (MZL). Patients with these rare cancers will have only one BTK inhibitor available to treat their disease.
- Pressures to focus on larger-population orphan designations/indications could delay product approval and increase initial research and development costs. The BTK inhibitor described above was approved for MCL a year before receiving approval in chronic lymphocytic leukemia (CLL).
- The IRA's chilling effect on research and development will fall disproportionately on patients with ultra-rare diseases and rare cancers.
- Investors and shareholders will seek to ensure that initial price points for newly-approved drugs are sufficient to recoup research and development costs and achieve a profit margin from successful innovations.

Once again, we appreciate that CMS has limited discretion in implementing the orphan drug exclusion and that the Agency seeks stakeholder feedback on how it might implement the IRA drug price negotiation program without deterring access and innovation in rare diseases. We urge CMS to:

- Work with patient and industry stakeholders to remove the single orphan designation requirement from the IRA orphan drug exception.
 - o The existing statutory language will severely chill research and development to secure approval for ultra-rare disease uses of existing orphan drugs.
 - o The set of compendia used to determine whether a use is medically accepted (and, therefore, a covered Part D drug) tend not to include off-label uses in ultra-rare conditions.
 - o Ultra-rare patients can find that treatments that are part of the standard of care are not within the Part D benefit *for patients like them* simply because their condition is too rare to catch the attention of drug compendia listings.
- Identify qualifying single source drugs by NDA/BLA (as more fully outlined in the preceding section).
- Engage in meaningful dialogue with Haystack Project and other patient-centered organizations to preserve the balance in incentives and risks that has spurred innovation in rare and ultra-rare disease treatments, including through CMMI and CMS' general demonstration authority.

- Implement a transparent process for manufacturers to submit evidence demonstrating that a particular product is eligible for the orphan drug exclusion.
- Identify orphan drug designations for a particular product at the time of selection, not the date on which the product achieved one or more of its FDA approvals.

The Small Biotech Drug Exception should be Applied with Minimal Burden to Manufacturers.

Haystack Project understands that CMS has been charged with implementing the Inflation Reduction Act provisions related to price negotiation, including the small biotech exception, as Congress directed. In our comments to the Information Collection Request associated with the Small Biotech Drug Exception, we asked that CMS to exercise its implementation discretion to minimize the IRA's potential to disrupt the fragile balance between risk and reward that has fueled hope for new treatments within our patient communities. We reiterate our recommendation that CMS provide stakeholders with greater clarity on the process it will use to determine eligibility for the small biotech drug exception, including that the Agency:

- Ensure that manufacturers know how and when they will be informed of CMS' receipt of a submission and determinations on completeness and eligibility for the exception. CMS' communication could be by email, letter, or other mechanism, but it is essential that manufacturers know what they are looking for and when to look for it.
- Provide a substantive response to submissions when it determines that a small biotech manufacturer's drug is ineligible for the exception. The response should be sufficiently detailed to enable manufacturers to provide any data or other information that may refute a negative CMS determination.
- Implement a dispute resolution process that manufacturers can understand and utilize in the event of a negative determination.
- Accept manufacturer submissions through a dedicated email "inbox." Haystack understands that CMS envisions developing an HPMS tool that manufacturers would use to submit information on the Small Biotech Exception ICR form. Unfortunately, creating new processes within short implementation timeframes increases the likelihood for delays, errors, and inadvertent inclusion or exclusion of information. Emailed submissions with automated receipt response will give manufacturers confidence that the information they intended to send was received.
- Maintain open lines of communication between specific CMS personnel making determinations on small biotech drug exception eligibility and manufacturers submitting information to qualify their drugs. Our patient and caregiver communities know all too well that the decisions on our access to treatments are often made within closed processes that do not include our participation. The IRA implementation processes are new to industry, patients, and CMS, and are therefore vulnerable to miscommunications, inadvertent submission errors, and other missteps that could prove dispositive. A clear and open line of communication between CMS staff and manufacturers can avoid unintended delays and erroneous determinations.
- Streamline continuing eligibility for the small biotech drug exception. Under the IRA, a drug determined to be eligible for the exception would lose its eligibility only if the manufacturer is acquired by a manufacturer that does not qualify for the exception. We urge CMS to apply the exception to drugs for each year upon receipt of a simple statement certifying that the manufacturer has not been acquired by another entity. A new eligibility submission should only be required when an acquisition has occurred, and the new manufacturer seeks to qualify for the exception.

- Allow for small biotech drug exception submissions in each year for which the exception is applicable. This will permit companies that failed to fully submit required information within the timeframe allowed to secure the exception for the drugs it was intended to benefit.
- Furnish a material response to submissions indicating whether the submission was successful. The response should (as noted above) provide a clear and substantive rationale for CMS' decision if the Agency determines that the drug is ineligible for the small biotech drug exception.

Haystack Project has previously expressed its concern that CMS' ICR and the explanations accompanying it did not fully implement the IRA small biotech drug exception. We urge CMS to modify its "form" for small biotech drug exception qualification to fully comply with the statutory two-pronged "test" conferring eligibility when drugs meet **either** prong. This means that a drug would be eligible for negotiation applicable to Part D drugs if it meets either the 1%/80% test on Part D expenditures or the 1%/80% test on Part B expenditures.

Conclusion

Haystack Project appreciates the opportunity to submit feedback on the Initial Guidance toward implementing the drug price negotiation program within the IRA. Our member organizations have significant concerns that the decisions CMS makes within the next several months could determine the set of new treatment options in ultra-rare conditions and rare cancers for the foreseeable future. More importantly, the decisions likely to have the greatest impact are being made without a meaningful engagement and dialogue between CMS and the rare and ultra-rare disease community.

We would appreciate the opportunity to meet with IRA implementation staff and leadership to further discuss the concerns within our communities and possible mechanisms to address them, such as:

- Including patient-centered value considerations within the negotiation process.
- Ensuring that the importance of a particular treatment in a rare or ultra-rare condition is not lost within the context of its use in a relatively common condition with multiple available treatment options (i.e., averaging benefit across uses marginalizes the health care needs of ultra-rare patients).
- Incorporating value-based payment arrangements into the drug price negotiation process.
- Developing mechanisms to encourage (carrots rather than sticks) manufacturers to apply discounts throughout a product's lifecycle – not just for Medicare patients after the product has been selected for negotiation.
- Additional ideas within our member organizations to foster innovation and treatment access for patients with ultra-rare conditions and rare cancers.

Once again, we thank you for your consideration of our comments and look forward to a substantive discussion to ensure that all Medicare beneficiaries have access to the treatments they need. In the meantime, if you have any questions, please contact me or our policy consultant M Kay Scanlan, JD at 410.504.2324.

Very truly yours,

Alagille Syndrome Alliance
Stay strong. Press on.

Re: Comments to the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments Dated March 15, 2023.

Administrator Brooks-LaSure,

Thank you for the opportunity to respond to the Initial Memorandum issued on March 15. As shared in our meeting on February 3 and through our subsequent letter, we believe Distributors are well positioned and willing to address the supply chain challenges that will result from implementation of the Maximum Fair Price (MFP) Manufacturer Discount Program.

As you know, Healthcare Distribution Alliance is the national trade organization representing primary pharmaceutical Distributors whose members ensure the safe and efficient distribution of prescription medications to healthcare providers and the patients they serve. Our members are the vital link between the nation's pharmaceutical Manufacturers and more than 300,000 pharmacies, hospitals, physicians, clinics, long-term care facilities, durable medical equipment providers, and others nationwide.

As noted in our letter of February 28 and our earlier meeting, a retrospective claims-based chargeback discount process could leverage existing industry chargeback capabilities for Manufacturers to provide Dispensers access to MFP; however, there are gaps in today's data flows that must be overcome, in particular, claims data is required to operationalize a claims-based chargeback discount process.

Our comments to the Initial Memorandum are focused on the administration of the Manufacturer discount program as discussed in Sections 40.4 and 90.2 which deal with providing and monitoring access to the MFP. The Initial Memorandum emphasizes Part D claims, so we have tailored our responses in similar fashion. However, our comments also apply to Part B claims, which will have additional complexities and nuances. Our comments reflect our role as Distributors as well as our interest in ensuring that our pharmacy, physician, and other provider customers have access to the MFP.

If Manufacturers choose to pursue a claims-based chargeback discount process, we believe the result would need to be a unified solution that would handle Part B and Part D claims ensuring that discounts flow efficiently from Manufacturer, to Distributor, to Dispenser. It must be noted that none of these entities currently has in place the full infrastructure required for a claims-based chargeback process. Without clear, consistent CMS policy and a willingness by CMS to perform those roles in the process that it is best suited to, it will be difficult for industry stakeholders to justify the investments needed and could lead to serious delays.

1. Manufacturer's Obligation to Provide Access to the MFP

CMS guidance states and emphasizes that the Manufacturer must provide Dispensers with access to the discounted price. We interpret that emphasis to indicate that CMS may not intend to contract a Third-Party Administrator believing that industry can administrate the program alone. CMS must reconsider such a position. A worst case scenario would be for individual Manufacturers to develop separate systems and processes creating multiple inefficiencies across the industry and increasing overall healthcare costs. CMS is best positioned to perform certain crucial roles needed for the industry to adopt a unified solution that is effective and efficient, therefore CMS must perform those roles. We will continue working with Manufacturers and channel stakeholders as they evaluate the potential adoption of a claims-based chargeback process to provide access to the MFP. As noted in our letter of February 28, providing accurate, timely claims-based chargebacks to Dispensers would require accurate and timely claims data from the payors.

Key Point: A claims-based chargeback discount process could effectively provide Dispensers access, given that Medicare or its contracted entities supply claims data.

2. Not Burdening Dispensers to Access MFP

CMS guidance uses an example of a pharmacy initiating a chargeback request to its Distributor to receive the Manufacturer discount. However, relying on Dispensers to initiate the discount process would be problematic. First, Dispensers do not typically provide claim information to Distributors. Secondly, our Distributor members, who provide many support programs for providers and pharmacies, have firsthand experience with the limitations in the systems and business processes used to operate these small practices. For example, some systems cannot accurately report claim reversals as a post-adjudication function. Requiring Dispensers to perform additional steps to initiate the discount process would require significant modifications to the systems that operate their businesses. It would add needless cost and complexities to administering the discount program. Putting this burden on Dispensers could create financial chaos for small providers and pharmacies, potentially leading to beneficiary disruption. Instead, the Manufacturer Discount Program should be triggered automatically by the claims process without manual intervention by the pharmacy or physician's office.

The statute intrinsically defines the Manufacturer Discount Program as an integral part of the claims process. Likewise, we strongly believe that leveraging the automated, reliable claims process is integral to implementing the program. Dispensers should access the MFP via claims data from Medicare's Contracted Entities.

Key Point: CMS should not burden Dispensers to initiate the claims-based chargeback process; it should be triggered automatically by the Part B and Part D claim approvals.

3. Fundamental Requirements for an Effective Chargeback Discount Process

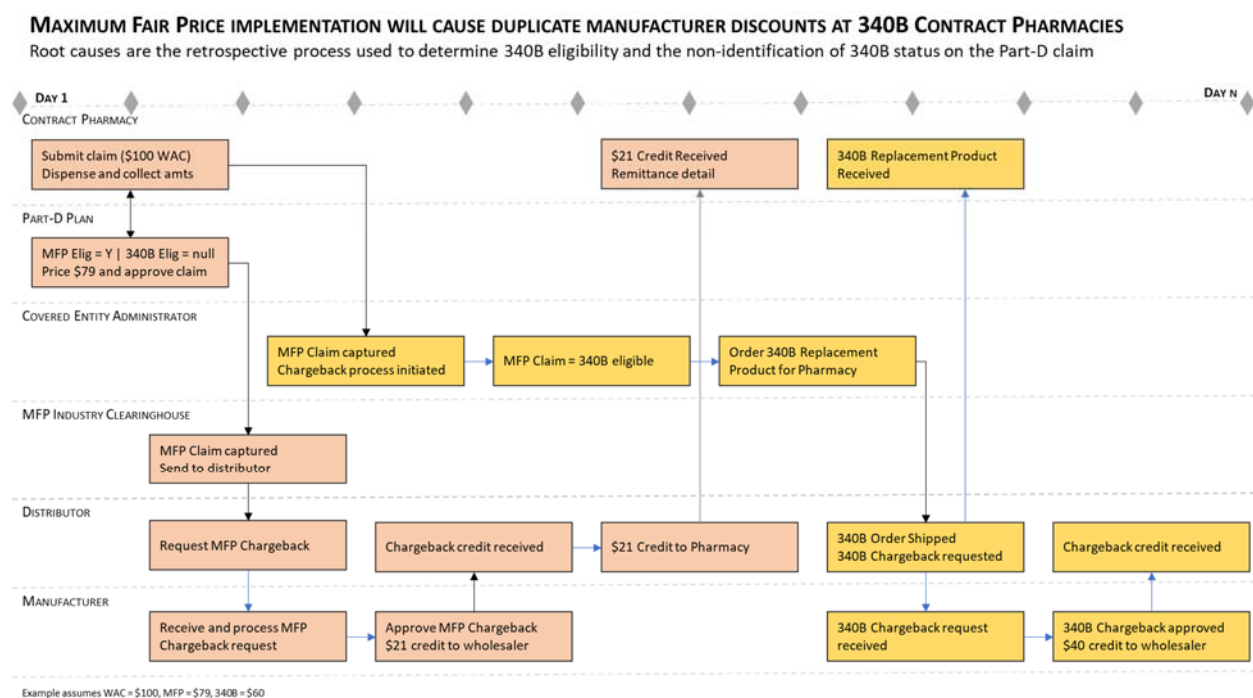

We believe both Dispensers and Manufacturers, with the direction and oversight of CMS, would consider an industry-operated claims-based chargeback process to be a credible and dependable

way to provide access to the MFP. This is true, however, only to the extent that stakeholders trust the integrity and validity of the claims data. This data must be timely, accurate, and complete. Claims, reversals, and rebills are all crucial transactions to accurately administer discounts. Furthermore, paper claims still occur, as do “offline” adjustments by Plan D Sponsors, such as Dispenser audits. These nuances are not available in any data source other than the payor’s claims data. This data can be provided in PDE format or other NCPDP standard format. Furthermore, to meet the 14-day requirement for Part D, the data should be made available no less frequently than daily to allow ample time for Distributors and Manufacturers to each perform their respective role.

Key Point: CMS-contracted entities are the authoritative, best source for trusted data essential to the discount program. CMS guidance should ensure their full cooperation.

4. Preventing Duplicate Discounts when 340B Ceiling Price is Lower Than MFP

Without additional guidance from CMS, 340B-eligible claims dispensed to MFP-eligible patients *WILL* result in duplicate discounts for MFP products, in particular at 340B Contract Pharmacies. There are two root causes of this issue. First, at the point of sale, a Contract Pharmacy does not know if a prescription qualifies for 340B. This typically happens days later by the 340B Contract Administrator hired by the 340B Covered Entity. Second, while current NCPDP claim standards include a 340B indicator, it is generally not used today even when patient eligibility is known due to the concern that the Part-D Sponsor would base reimbursement on the 340B ceiling price.

Example of Duplicate Discounts

The graphic above illustrates the issue. It assumes a 2026 dispense to an MFP-eligible beneficiary for an MFP-selected product. The Part D Sponsor has approved the claim and correctly calculated patient out-of-pocket costs. The submitted claim triggered a chargeback request of \$21 that is approved by the Manufacturer and flowed from the Distributor to the Pharmacy. During that process the Administrator hired by the Covered Entity has uploaded the pharmacy’s claims and identified this claim as 340B eligible and automatically reordered 340B replacement stock shipped to the Contract

Pharmacy and billed it to the Covered Entity. As a result, the Manufacturer has issued two discounts, a \$21 MFP discount and a \$40 340B discount.

Key Point: Current practices, if unchanged, will result in duplicate discounts.

While existing NCPDP claim standards allow a pharmacy to prospectively indicate that the product being billed is purchased under 340B rights (see below), use of the indicator is limited. A key barrier to its use is the concern expressed by Covered Entities that identifying the claim as 340B would lead to Part D Sponsors reducing reimbursement to the Covered Entity basing it on the 340B price rather than the WAC or MFP. Perhaps CMS could offer guidance on this issue. From the perspective of the claims-based chargeback process, use of the indicator would result in no chargeback request to the Manufacturer and no duplication.

The NCPDP standard uses the Submission Type Code [Field D17-K8] with a value of AA for this purpose. The value AA indicates that “*prior to providing service, the pharmacy has determined the product being billed is purchased pursuant to rights available under Section 340B of the Public Health Act of 1992 including sub-ceiling purchases authorized by Section 340B (a)(10) and those made through the Prime Vendor Program (Section 340B(a)(8))*”.

The other barrier to adoption of the prospective 340B indicator is the nature of Contract Pharmacy arrangements where the 340B status of the claim is unknown at the point of sale and determined retrospectively by the 340B Administrator. If CMS were to require use of the 340B indicator it would force the Administrator to modify its processes that reorder and ship 340B replacement product to the Contract Pharmacy to not reorder replacement product for an MFP Product unless the 340B indicator appears in a claim. The modified process would first notify the Contract Pharmacy to reverse the claim and resubmit the claim with the 340B indicator. Once the Administrator detects the 340B indicator in the resubmitted uploaded claim, it would then reorder the 340B replacement product. Note that in this sequence, the initial claim would auto-trigger the MFP discount process, however, the reversal of the claim would also trigger the MFP discount process and would offset the earlier claim, eliminating the MFP discount. The resubmitted claim would also trigger the chargeback process, but due to the presence of the 340B indicator it would not be forwarded to the Manufacturer for an MFP discount. It should be stressed, however, that the administrative process of claim reversals and resubmittals could be quite burdensome for the Contract Pharmacy. Plus, each time a claim is resubmitted the 14-day payment window resets to the newest claim date impacting the cash flow of the Contract Pharmacy.

Key Point: Use of the 340B indicator could eliminate duplicate discounts, but existing barriers to use of the indicator remain high.

Given the barriers to use of the 340B indicator in the claim, a retrospective process that eliminates duplicate discounts could be part of the claims-based chargeback process. This would require the 340B Contract Administrator (on behalf of the Covered Entity) to upload the 340B claims to the chargeback process. The 340B claims would be matched against the claims that entered the chargeback process automatically after claim submittal. Duplicates discounts would be identified, causing the chargeback process to send an MFP chargeback reversal to the Manufacturer and the Dispenser eliminating the duplicate discount. The retrospective process would also properly account for claims that might contain the 340B indicator. In other words, the retrospective process does not preclude any use of the prospective process, they could work in tandem. This retrospective process would rely on the obligation for the timely and accurate submission of the 340B claims data.

Key Point: Adding a 340B retrospective claims process to the claims-based chargeback process would eliminate duplicate discounts and avoid the barriers to the 340B indicator.

5. Nonduplication when 340B Ceiling Price is Higher Than MFP

If the MFP of a selected drug is lower than the 340B price, the Manufacturer must provide the Covered Entity with access to the lower MFP. In other words, the Covered Entity is owed the difference between the MFP and the 340B ceiling price. The claims-based chargeback process could accurately act upon claims that meet this condition if the 340B indicator is populated. To illustrate this point, assume the MFP=\$50 which is lower than the 340B \$60 price. The 340B claim would automatically enter the claims-based chargeback process. The process would detect that the MFP is lower than the 340B price and initiate an MFP chargeback request to the Manufacturer for \$10. This chargeback would flow from the Manufacturer to the Distributor to the Covered Entity. The retrospective process described above with the obligatory uploading of 340B claims by the Covered Entity into the claims-based chargeback process could also handle this scenario.

Key Point: Retrospective reporting of 340B status would also comply with the “lesser of” discount requirement in the claims-based chargeback process.

6. Discussion on Transparency and Complaints

CMS anticipates that pharmaceutical database companies such as the drug compendia First Databank and Medi-Span will publish the MFPs, making them readily accessible to pharmaceutical purchasers, and that such transparency will help dispensing entities and eligible individuals to know the MFP for a selected drug and determine whether they are able to access it. This seems reasonable. We recommend that CMS publishes NDC numbers along with the list of MFP drugs. Beneficiaries will have NDC numbers readily accessible on their printed prescription materials. The NDC list would also help Plan Sponsors, Distributors, and Dispensers ensure accurate handling.

Key Point: CMS should include NDC numbers when publishing the list of MFP drugs.

7. Complaints from Beneficiaries

CMS intends to establish a process for beneficiaries, dispensing entities, and other providers and suppliers to report instances when the MFP should have been made available to them but was not. We believe CMS should look at the processes for Beneficiaries and Dispensers through separate lenses. In our opinion, reported patient incidents will most likely be related to other issues a beneficiary may experience in the Medicare program. For example, beneficiaries may have not received the MFP due to other issues that Medicare staff is already experienced in dealing with, such as lapsed coverage, outstanding premiums or specific plan nuances. Therefore, we recommend these complaints are handled by existing CMS staff and processes.

Key Point: Use Medicare’s existing complaint mechanisms for Beneficiaries.

8. Complaints from Dispensers

We believe that Manufacturers (and Distributors in a claims-based chargeback process) will act in good faith to implement the new CMS guidelines for MFP. Consequently, we anticipate that Dispensers’ complaints will also be dealt with in good faith. Complaints that may arise will be complex and likely reflect a misunderstanding of the new guidelines on the part of the Dispenser. Dispensers fill thousands of Medicare claims each year; would CMS accept a complaint of an individual claim where the Plan Sponsor properly applied MFP but the Dispenser is uncertain they received the retrospective discount? An alternative would be for each Manufacturer to state how Dispensers can file complaints with them. CMS may want to offer an appeals process, but should require that Dispensers first use the Manufacturer’s designated complaint process which would resolve nearly all issues.

Key Point: CMS should ask Dispensers to make reasonable efforts to first resolve the issue with its trading partners prior to appealing to CMS.

9. Discussion on Secondary Products

CMS guidance discusses the responsibilities of a Primary Manufacturer to ensure the MFP is available for a selected drug with Secondary Manufacturers. In our opinion, it is unlikely that a Dispenser or patient would experience the issue described in the guidance. Again, we believe that Manufacturers will act in good faith to implement the Manufacturer Discount Program. In the example from the guidance, there is a selected product from a Primary Manufacturer, yet there is no MFP on the same product from the Secondary Manufacturer. This oversight would be exposed to the industry at large as soon as CMS publishes the list of selected drugs with NDCs and would likely be resolved prior to launch date.

Similarly, CMS points out that it is possible for an entity to purchase one or more drug or biological products included in the selected drug from a Distributor, repackage or relabel such products, and then re-market them pursuant to one or more NDA(s) or BLA(s) included in the selected drug. CMS believes that the MFP should be made available to eligible individuals and Dispensers.

The success of the discount program will depend on efficient and effective processes that do not rely on individual actions but are auto triggered and automated. In this vein, the importance of drug identifiers cannot be overstated. The list of selected products must be reduced to a list of NDC identifiers for use by all stakeholders.

Key Point: The authoritative list of NDCs should be maintained by CMS and made available to Plan D Sponsors, Dispensers, and all industry stakeholders.

10. Summary

We believe that CMS cannot rely solely on industry to implement the discount program. While Distributors believe a claims-based chargeback process is viable with appropriate data access, it cannot be accomplished without CMS, who must lead to ensure the industry is able to adopt a unified solution that works for all industry stakeholders and avoids any beneficiary disruption.

This leading role should ensure that:

- A single, consistent, unified solution for Part B and Part D is developed.
- CMS performs the crucial roles that it is best positioned to perform, such as administering the timely, accurate and complete collection of claims data from its contracted entities.
- A claims-based chargeback process can rely on Medicare and its contracted entities.
- Dispensers should not be burdened to initiate the claims-based chargeback process; it should be triggered automatically by the Part B and Part D claim approvals.

Implementing a claims-based chargeback process will require both public and private investments. The industry may still need its own intermediary to fully execute a claims-based chargeback process, but that intermediary would not be a substitute for those roles best suited to CMS. We believe that Manufacturers will fully evaluate the benefits and viability of a claims-based chargeback process and we stand ready to assist them in that evaluation. Those benefits include purchasing and acquisition costs records as well as the broad contractual and financial relationships Distributors have in place with more than 300,000 pharmacies, hospitals, physicians, clinics, long-term care facilities, durable medical equipment providers, and others nationwide.

We believe 2026 is achievable with suitable advanced planning. All industry participants—including Manufacturers, Distributors, Dispensers, and Medicare’s Part D and Part B Contracted Entities—will require lead time to design, plan, test, and modify systems. As Distributors, we are willing to do our part, if called upon, to assist CMS and Manufacturers in administering the discount program and ensuring that our Dispenser customers and their patients have timely and accurate access to MFP.

We appreciate being a resource for Medicare and are continuing our early readiness efforts.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance

Dear Deputy Administrator Seshamani:

The Healthcare Leadership Council (HLC) thanks the Centers for Medicare & Medicaid Services (CMS) for the opportunity to submit comments on CMS' initial guidance for the Medicare Drug Price Negotiation Program for Price Applicability Year 2026.

HLC is a coalition of chief executives from all disciplines within American healthcare. It is the exclusive forum for the nation's healthcare leaders to jointly develop policies, plans, and programs to achieve their vision of a 21st century healthcare system that makes affordable high-quality care accessible to all Americans. Members of HLC – hospitals, academic health centers, health plans, pharmaceutical companies, medical device manufacturers, laboratories, biotech firms, health product distributors, post-acute care providers, home care providers, and information technology companies – advocate for measures to increase the quality and efficiency of healthcare through a patient-centered approach.

Lowering the out-of-pocket costs consumers pay for prescription drugs and ensuring that consumers can manage those costs over the plan year is a top priority for HLC members. We appreciate CMS laying out the requirements and parameters of the Negotiation Program included under Sections 11001 and 11002 of the Inflation Reduction Act (IRA). In response, HLC offers the following comments on what we identify as problematic provisions within the IRA, as well as the initial guidance which undermines biopharmaceutical innovation and patient access to next generation therapies.

Transparency

HLC encourages CMS to develop guidance and rules that are open and transparent, and provide meaningful opportunities for stakeholder input. The IRA includes vague standards for government price settings and gives CMS wide latitude to implement those provisions. In particular, the law sets tight deadlines for implementation, far shorter than other major healthcare legislation. It also allows CMS to implement policy changes through program instruction or guidance, rather than traditional rulemaking that gives stakeholders adequate time to digest and respond thoughtfully to any major proposed policy changes. We urge CMS to work more collaboratively with the private sector to discuss and recommend alternative solutions to arrive at the same goal.

Patient Access and Part D Redesign

HLC believes government price controls will have a negative impact on the Medicare Part D program which reaches beyond the specific number of drugs selected for price setting and results in patients losing access to their medicines. Specifically, we believe price setting one selected drug could impact other therapeutic competitors in the same class of medicines. In addition, we are concerned that the downstream effects of price setting will reduce consumers' choice of plans and formularies in Part D. Beneficiaries enjoy a broad array of plan choices in Part D, including different formulary options.¹ As more prescription drugs are subject to Maximum Fair Pricing (MFP), the ability of plans to differentiate from one another will decrease and lead to fewer choices in plans or formulary distinctions for consumers. Furthermore, with fewer plan choices and thus less competition, we are concerned that premiums will increase.

Reference Pricing Standards

CMS proposes to base its decision making on standards of therapeutic "reference pricing," which is controversial and often results in judgments that are clinically inappropriate and disregard the needs of patient subgroups. The requirement of a therapeutic alternative that is similar to the selected drug often overlooks significant differences in the needs of patients, as many alternative therapies do not fit within broad judgments of clinical similarity. We believe this metric which is relied upon by the Department of Veterans Affairs is not appropriate for care delivered in a broader community setting compared to special populations who receive care in closed healthcare delivery systems.

We are also concerned the proposed definition of "unmet needs" is too narrow. The definition proposes to restrict these unmet needs only for diseases for which there are limited or no treatment options available. Such a narrow definition devalues medicines that help address patient needs and could result in worse health outcomes for individuals who don't meet this definition precisely but have few treatment options.

Innovation

HLC strongly supports policies that are transparent and incentivize innovations that enable all Americans to live longer, healthier lives. We have already seen several biopharmaceutical companies withdraw medicines from clinical trials because of the expectation that IRA's price controls would keep them from recouping their investment. We believe this initial guidance will further compound the IRA's negative effects on continued innovation by setting rules that explicitly devalue existing patents or exclusivities for selected drugs.

Within the guidance, CMS states they intend to consider the length of available patents and exclusivities and may consider adjusting the preliminary price downward if the patents and exclusivities will last for several years. We believe this policy penalizes companies that have secured patent rights even prior to approval by the Food and Drug Administration, particularly for small molecules. Devaluing existing patents and exclusivities will also be damaging for post-approval research and development which many manufacturers invest in for patient safety, as well as finding further indications for their medicines that will aid more patients.²

Thank you for the opportunity to provide comments on the initial guidance for the Medicare Drug Price Negotiation Program. HLC looks forward to engaging with the administration as the regulatory process proceeds. If you have any questions, please do not hesitate to contact Debbie Witchey at (202) 449-3435 or dwitchey@hlc.org.

+++++

Dear Congress/CMS:

As patient representatives, we advocate on behalf of patient interests and interpret how certain policies will positively or negatively affect them. Patients know firsthand the benefits of a strong health care system that provides access to new and groundbreaking treatments. In recent years, we have seen great strides in the treatment of ALS, cancer and Alzheimer's disease that have increased lifespan, slowed the ravage of disease and improved the quality of lives.

Last year, Congress passed significant policies within the Inflation Reduction Act (IRA) focused specifically on patient costs. We were especially pleased by the improvements to Medicare Part D that included adding an out-of-pocket cap, establishing a \$35 limit on monthly insulin costs, and eliminating cost sharing for vaccines. These policies will provide immediate relief to patients. Thank you.

However, other policies around prescription drug prices faced significant debate during the legislative process. Policymakers must keep in mind the unknown long-term impacts on the development of new treatments – especially those for complex and rare diseases – and patients' ability to access those new therapies.

Now it is time for the real work as the Administration begins the lengthy process of implementing IRA's policies. We urge Congress to continue oversight throughout the implementation process and insist that patient voices are heard.

The Medicare Drug Price Negotiation Program contained in the law seeks to establish negotiated rates, or the Maximum Fair Price (MFP), for medications. While focused on reducing drug costs, the unintended negative consequences for drug coverage,

formulary priority, access and further research and development could harm patients. For example, as new prices are determined, payors may favor products on their formularies that have a negotiated price. This could ultimately make other medications more difficult to access as payors encourage use of these negotiated price medications and discourage others. Payors already utilize cost saving measures that negatively impact patients such as restrictive formularies, step therapy and strict prior authorizations. Patients need access to the correct treatments, or they will suffer. The addition of products with artificially lowered prices is likely to create yet another restrictive process for patients.

It is critical that the Administration take patient needs and access to treatments into account when implementing the law. To do that we are committed to regular and open communications with CMS throughout the law's implementation and execution. ***We urge Congress to ensure that regulators at CMS create specific opportunities for patient advocates to participate in the regulatory process.***

Our specific recommendations include:

- **Host regional roundtables to solicit feedback from patients.** We strongly recommend that CMS create a structure similar to that used to implement the Affordable Care Act (ACA) and utilize the CMS regional staff to hold patient-centered roundtable discussions throughout the country to ensure that patients have the opportunity to share their experiences and insights directly with CMS, regardless of their physical location. Providing regional opportunities is particularly important in the patient community where resources may make participation at the federal level more of a challenge than in their state and local communities.
- **Release draft guidance, solicit written comments.** We are pleased that CMS has announced that it will issue draft guidance that seeks public input on key provisions of the MFP program. We hope that the draft guidance includes and seeks feedback on the process, including the methodology CMS uses to determine the MFP. Soliciting written comments from the public is critical.
- **Develop patient-centered criteria.** CMS should also develop, with significant input from patients, patient-centered criteria that must be adhered to as CMS implements the drug pricing provisions. This will ensure patient perspectives are heard and patient needs are prioritized. The ACA required that the Center for Medicare and Medicaid Innovation develop similar criteria.
- **Meaningfully engage patients in determining the MFP for each drug.** Patient advocates can offer both substantial and critical perspectives as CMS considers what a price should be for a specific drug. CMS should create a process through which it will consistently and meaningfully engage with patients determining each drug's price, and ensure they have a say in the outcome.
- **Study the impact of the drug pricing provisions on patients.** CMS should study the impact that negotiation has on patients prior to negotiation, focusing on issues related to access to current and future therapies. For example, CMS

should study the impact of the drug pricing provisions on Medicare Part D coverage, including formulary placement and utilization management.

Should you have any questions or comments, please contact Liz Helms, Founding Director, CCPA at lizh@chroniccarealliance.org. Thank you for your time and attention to these critical issues.

Re: Comments on *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026*

Dear Dr. Seshamani:

The **HIV+Hepatitis Policy Institute** is a leading national HIV and hepatitis policy organization promoting quality and affordable healthcare for people living with or at risk of HIV, hepatitis, and other serious and chronic health conditions. Given the importance of medications to the health and well-being of people living with and at risk of HIV, people with hepatitis B & C, and their growing reliance on Medicare for prescription drugs, we are keenly interested in the implementation of the *Medicare Drug Price Negotiation Program* that CMS is setting up as required by the *Inflation Reduction Act* (IRA). While much of the request for comments contained in the *Initial Memorandum* are more appropriate for drug manufacturers to respond to, patient groups such as ours are also keenly interested in the negotiation process and its outcomes.

Patients are looking forward to the implementation of the IRA and its new \$2,000 out-of-pocket maximum along with an annual smoothing mechanism. We are also closely monitoring the *Medicare Drug Price Negotiation Program* to ensure that patients will directly benefit from the process in the form of lower out-of-pocket costs and fewer access barriers such as utilization management. We are also concerned about the unintended consequences of the *Negotiation Program*. We want to make sure that as a result of the negotiation process, patient access to the medications they need will not be reduced by more limited formularies and increased utilization management. At the same time, patients should not pay higher out-of-pocket costs for drugs that are not undergoing the negotiation process. Additionally, patients need assurance that the *Negotiation Program* will not impede development of new medications that can help improve the lives and well-being of people not only here in the United States but throughout the world.

HIV+HEPATITIS POLICY INSTITUTE

HIVHep.org | Twitter: @HIVHep | Facebook: HIVHep

Our comments below are not in order of importance but follow the order of the *Initial Memorandum*. The **HIV+Hepatitis Policy Institute** has also reviewed the *Information Collection Request for Negotiation Data Elements under Sections 11001 and 11002 of the Inflation Reduction Act* and will separately provide comments on the proposed data collection elements, but our review of this document has also helped inform the comments below.

Sections 50.1 Manufacturer Specific Data & Section 60.3.4 Consideration of Manufacturer Specific Data

The **HIV+Hepatitis Policy Institute** has witnessed the ups and downs of the drug development process over the years. Drugs to treat HIV have progressed from the first antiretrovirals with serious side-effects and limited effectiveness to more effective multi-drug regimens to highly safe and effective single-tablet antiretroviral regimens which enable people with HIV today, not only in the United States but around the world, to live as long as people who do not have HIV. We now even have drugs that prevent HIV as well as new long-acting medications for the treatment and prevention of HIV, with more in the pipeline. Hepatitis B can be treated with daily drugs and Hepatitis C can be *cured* in as little as 8 to 12 weeks. Drug researchers are currently working on a cure for HIV and hepatitis B and vaccines for HIV and hepatitis C.

While CMS is seeking specific data points for the costs and revenues for specific drugs, the research and development process for drugs does not work on an individual drug by drug process. It is essential to look at research and development costs not just for an individual drug, but in the aggregate, including the vast majority of medications in the R&D pipeline that never make it to market. Again, we would expect drug manufacturers to explain all of this in their comments but given our experience in the significant advances in HIV and hepatitis drug development, we are keenly aware of how these advancements have taken place.

By requesting data on specific drug costs and revenues at the time of the negotiation process, CMS is ignoring many factors including the following:

- 1) The years of R&D that the drug manufacturer invested and learned from as it researched other drugs that led to the development of the negotiated drug;
- 2) The failures and costs of those other drugs;
- 3) Manufacturers may highly profit from the negotiated drug in order to invest in other drugs that fail or may not be as profitable;
- 4) The investment and costs that may occur for new indications for the negotiated drug, along with future revenue that may arise from it;
- 5) The investment the manufacturer is making on new drug development that is not associated with the negotiated drug;
- 6) The amount and costs of free or reduced cost drugs the manufacturer provides globally to low income countries; and
- 7) The value of the drug to the rest of the world and eradicating illnesses, such as infectious diseases.

Seeking specific data on only the drug that is subject to negotiation does not fully capture the aggregate cost of drug development and will likely curtail future drug development by undervaluing the R&D process.

Section 60.3.3.1 Analysis for Selected Drugs with Therapeutic Alternatives

This seems to be the only section for which the public, including patient groups, will be able to provide comments on the negotiation process. Not only is the scope very limited, but the comment period will only be 30 days, leaving under-resourced patient groups and the general public out of the process. Since we have reviewed the proposed *Information Collection Request* for this section, we also know that CMS will only be collecting comments that are cited in literature. This is not a true public comment period that patients and their providers can participate in.

We would urge CMS to provide more opportunities for public input into the negotiation process so we can offer true comment on the patient experience and our needs. There are many factors that should be addressed that CMS is not seeking public comment on, including how specific drugs promote health equity and reduce racial, ethnic, and other health disparities. These matters are particularly important to people with or at risk of HIV and hepatitis. CMS must also take into account that not every patient is the same and reacts to a particular drug in the same manner. Further, not everything patient communities would want to comment on is cited in literature.

We urge CMS to provide additional opportunities for meaningful public comment as part of the negotiation process and to offer responses to the comments submitted.

Section 110 Part D Formulary Inclusion of Selected Drugs

The proposed guidance offers just one sentence on the topic of formulary inclusion of drugs selected for the *Negotiation Program*, merely restating what is in the law, namely that a negotiated drug must be covered by Medicare plans. We believe that patients need to realize a substantial benefit for any drug that undergoes the negotiation process. Patients should be able to access the drug at the lowest tier and free of any utilization management barriers such as prior authorization and step therapy. Since the IRA will most likely impact the price of similar drugs, patients should also benefit from their reduced costs and should realize those savings free of restrictions.

While plans are required to cover negotiated drugs, we are concerned at the same time that plans may limit the inclusion of non-negotiated drugs. This would be damaging to the health and well-being of Medicare beneficiaries.

We urge CMS, as it implements the drug negotiation process, to monitor benefit plan design to ensure that access and affordability of Medicare drugs are not diminished.

Thank you for this opportunity to comment on this proposal. Should you have any questions or need any additional information, please do not hesitate to reach out via phone at (202) 462-3042 or email at cschmid@hivhep.org.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance: Initial Memorandum, Implementation of Section 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Seshamani:

In response to the Centers for Medicare & Medicaid Services' (CMS) "Drug Price Negotiation Program Guidance: Initial Memorandum, Implementation of Section 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments", Incubate submits the below comments to express our concern that the guidance does not consider industry warning signs and will have a detrimental impact on future investment in the life sciences, ultimately to the detriment of patients.

Incubate is a coalition of early-stage life sciences venture capital firms representing the patient, corporate, and investment communities. Our primary aim is to educate policymakers on the role of venture capital in bringing promising treatments to patients in need.

CMS Doubles Down on Price Controls

Since passage of the Inflation Reduction Act (IRA) in August 2022, Incubate has sounded the alarm that the law creates significant uncertainty for the life sciences investor community and upends the successful ecosystem of biopharmaceutical investment, research, and development that has enabled the United States to lead the world in developing new drugs. A number of investors and companies have already shifted resources away from developing small molecule medicines and pursuing post-approval research in light of the IRA.¹

We are disappointed that despite the opportunity to correct the law's ambiguity, CMS' initial implementation guidance lacks transparency in the price setting process and does not address fundamental issues created by the law.

Lacks Transparency in the Price Setting Process

In this guidance, CMS did not address the significant confusion with the implementation of the law in a way that would protect incentives towards innovation. The Agency did not consider mitigating the law's impact and, in fact, doubled down on problematic components of this law.

¹ Incubate Coalition. (n.d.). Life Science Investment Tracker. Retrieved April 14, 2023, from <https://incubatecoalition.org/life-science-investment-tracker/>

One example is CMS' very broad interpretation of what forms of a drug should qualify for price setting. CMS is choosing to apply the maximum fair price (MFP) to all forms of a drug with the same active ingredient or active moiety, even if they are completely new forms (e.g., IV vs. subcutaneous), approved under different product applications at the FDA, and regardless of whether all the forms meet the age requirement for an eligible drug. Investors continue to be concerned about the broad application of MFP, which will drive less investment and development.

Disincentivizes Small Molecule Drug Development & Post-Approval Research

The guidance also reinforces the IRA's perverse incentive to invest in biologics, instead of the development of small molecules. As we have noted previously, the standard 14-plus year calculation, established by a combination of patents and exclusivities, that venture capitalists rely on to recoup their investments, has shifted under this law to provide a larger reward for the development of biologics (13 years) than the development of small molecules (nine years).² The larger reward for biologics, ensured by the additional four-year exemption from price setting, penalizes small molecule development.

Small molecule drugs offer enormous benefits, both to patients and the health system, especially when they become inexpensive generics. These are not just the pills of yesterday. Small molecule drugs, some of which can cross the blood-brain barrier, offer hope for neurological diseases like Alzheimer's and brain cancer, which was highlighted in President Biden's Cancer Moonshot effort. Understanding the simple economic principle that capital will be allocated in the direction of the biggest risk-adjusted reward, we can anticipate fewer investments in small molecule medicines, which will be detrimental to patients.

We are also concerned that this guidance will discourage drug makers and venture capitalists from pursuing new uses for existing drugs through post-approval or secondary indications. The guidance specifically references how extending patents and exclusivities could directly lower MFP calculations:

“In considering element (4) on patent applications, exclusivities, and applications and approvals for the selected drug, CMS intends to consider the length of the available patents and exclusivities before the selected drug may no longer be single source. For example, if the selected drug has patents and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward.”³

The IRA's price-setting timelines already signaled to drug developers that they not follow the science, as any returns on investment will get cut off before new uses for medicines are developed. Under CMS' guidance, companies will now be penalized for successfully innovating new uses by lowering the preliminary price if there are existing patents and exclusivities on a drug. As a result,

² Stanford, J. March 6. Congress must fix IRA small-molecule penalty. Stat News, <https://www.statnews.com/2023/03/06/congress-must-fix-ira-small-molecule-penalty/>.

³ Centers for Medicare & Medicaid Services. (2021). Medicare Drug Price Negotiation Program: Initial Guidance. Retrieved April 14, 2023, from <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

we expect research and development efforts towards secondary indications will decrease, thus limiting the investment and exploration of new or alternative applications of medical discoveries - which are critical for continued R&D in sectors like cancer.

Distorted Calculation of the MFP

The investor community is also unsettled about the opacity around the MFP calculation. Under CMS' guidance, there will be no understanding of the justification of the 2026 MFPs until after the next group of drugs are selected for negotiation. Disconcertingly for investors, there is also no visibility into CMS' process for their calculation.

In addition, all of the valuable contributions to raise an MFP are not being taken into account. We ask that the Agency consider the clinical, patient, and societal benefits of a drug when determining the calculation of MFPs. CMS does not currently take these variables into account, despite them significantly contributing to the value of the drug. We urge CMS to allow these variables to increase the MFP.

Perverse Signal to the Market

Finally, I must underscore the most concerning signal that this rule sends to the market: that following the science will not be rewarded moving forward. Our current life sciences ecosystem – one that made the United States the top drug developing nation in the world – has previously operated by pursuing science first. This rule sends a signal to both innovators and investors that some discoveries are more valuable than others, and that some should not be further developed. If not corrected, we are fearful of the long-term ramifications on American biopharmaceutical discovery.

Thank you for your consideration in these comments, please do not hesitate to contact John@incubatecoalition.org for additional information.

Sincerely,

John Stanford

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani:

Incyte appreciates the opportunity to submit comments in response to the Centers for Medicare and Medicaid Services' (CMS's) *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for the Initial Price Applicability Year 2026, and Solicitation of Comments* (the Guidance).¹

At Incyte, we exist to positively affect the lives of patients through heavy investment in biopharmaceutical R&D. To this end, we employ more than 800 world-class scientists who are committed to finding solutions for some of the most critical unmet medical needs. In 2022 alone, Incyte invested \$1.6 billion on R&D, representing nearly 47% of the company's total net revenues during that time. Revenue from sales of our approved products, chiefly Jakafi® (ruxolitinib), fuel Incyte's clinical development program of 25 investigational medicines intended to transform the treatment of cancer and inflammatory and autoimmune conditions.²

Incyte supports the comments submitted by our trade associations, the Pharmaceutical Research and Manufacturers of America ("PhRMA") and the Biotechnology Innovation Organization ("BIO") on the Initial Guidance. Incyte writes separately to provide our comments on Section 60, specifically in response to CMS's solicitation for comments on section 60.1 "Establishment of a Single Proposed MFP for Negotiation Purposes."

Incyte is concerned that CMS is not accepting comments on the qualifying single source drug (QSSD) definition and other foundational issues in Section 30. Because CMS has issued Section 30 as final without comment solicitation, Incyte is not providing comments on that section; however, as we previously stated in our comment

¹ Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

² Incyte Corporation Pharmaceutical Portfolio, <https://www.incyte.com/what-we-do/pharmaceutical-portfolio> (last visited March 6, 2023).

letter on the small biotech ICR, Incyte believes that CMS's expansive interpretation of a QSSD is contrary to the statute, and strongly disagrees with the approach.³

As Incyte has previously communicated with CMS, the core concern at the root of our comments in this letter is that Opzelura™ (ruxolitinib) cream and Jakafi® (ruxolitinib) are different U.S. Food and Drug Administration (FDA)-approved drugs that are indicated to treat entirely different conditions in different therapeutic areas—dermatological vs. antineoplastic indications—with no overlap. Yet, because these two drugs share an active ingredient—if Opzelura and Jakafi were selected under the Drug Price Negotiation Program— CMS proposes to establish a single maximum fair price (MFP) for these two different drugs that are indicated to treat wholly unrelated patient populations with separate and distinct medical conditions (that vary greatly in prevalence). In light of these profound differences, these two drugs compete in separate therapeutic classes with dissimilar marketplace characteristics and as a result—not surprisingly—they have different pricing that bears no relation to one another. As Incyte's comments illustrate, CMS's guidance regarding the establishment of a single proposed MFP at the outset of the negotiation process is unworkable with these two drugs.

Further, we want to bring to CMS's attention the challenges of basing such a price on a 30-day equivalent supply for certain dosage forms, especially for a cream product like Opzelura where an amount used cannot be generalized across patients and a prescriber cannot prescribe the product based on a finite quantity over a particular period of time.

Incyte's comments on the Guidance include the following:

- I. CMS Should Clarify How It Intends to Establish a Single Price for Two Drugs That Have Separate Indications, Compete in Separate Therapeutic Classes, Have Wholly Unrelated Patient Populations, and as a Result Have Different Pricing
- II. CMS Should Clarify How It Intends to Develop an MFP Considering Therapeutic Alternatives for Different Disease States in Different Therapeutic Classes With Different Marketplace Characteristics
- III. CMS's Approach to Apply Ratios for Each Dosage Form and Strength Is Flawed
- IV. CMS Should Clarify How It Intends to Calculate 30-Day Supplies for Topical Medications
- V. CMS Should Clarify How It Intends to Handle Federal Supply Schedule (FSS) and Big Four for Manufacturers that Offer Dual Prices

- I. **CMS Should Clarify How It Intends to Establish a Single Price for Two Drugs That Have Separate Indications, Compete in Separate Therapeutic Classes, Have Wholly Unrelated Patient Populations, and as a Result Have Different Pricing**

As noted, Opzelura and Jakafi are different products that are indicated to treat entirely different conditions in a different therapeutic area—dermatological vs. antineoplastic/immunological indications—with no overlap. Additional differences between the products are included in Table 1. **Given the vast differences between these drugs, including among the statutory factors CMS must consider when establishing the MFP, it is unclear how CMS could establish a single price that is “fair” with respect to both products.**

³ Incyte Comments on the Information Collection Request regarding the Small Biotech Exception, CMS-2023-0008-0001 (Mar. 27, 2023), available at <https://www.regulations.gov/comment/CMS-2023-0008-0002>.

Table 1: Key Differences between Jakafi and Opzelura

Ruxolitinib Phosphate → Active Pharmaceutical Ingredient in two separate drugs marketed by Incyte			
	Jakafi	Overlap	Opzelura
Product Form	Tablet (60 count bottle)	×	Topical Cream (1.5%, 60 gm tube, 100 gm tube)
Route of Administration	1 tablet taken twice a day by mouth	×	Applied thin layer twice daily directly to affected area of skin; up to 20% (atopic dermatitis) or 10% (non-segmental vitiligo) of body surface area
Key Studies	<u>COMFORT-1</u> <u>COMFORT-2</u> <u>RESPONSE</u> <u>REACH-1</u> <u>REACH3</u>	×	<u>TRuE AD1</u> <u>TRuE AD2</u> <u>TRuE-V1</u> <u>TRuE-V2</u>
Uses Addressed by Approved Indications	Antineoplastics Approvals -Myelofibrosis ^{1,2} (2011) -Polycythemia Vera ^{1,2} (2014) Immunological Approvals -Acute Graft Versus Host Disease ^{1,2} (2019) -Chronic Graft Versus Host Disease ^{1,2} (2021)	×	Dermatological Approvals -Mild to Moderate Atopic Dermatitis (2021) -Non-Segmental Vitiligo ¹ (2022)
Wholesale Acquisition Costs	Jakafi's WAC per package (5-25mg/1 (60 tablets)) in 2023 ~\$16,600	×	Opzelura's WAC per package (15mg/g (60g tube)) in 2023 ~\$2,000
Distribution*	Specialty Distributors Specialty Pharmacies	×	Full Line Wholesalers Retail Pharmacies
Standalone Approvals	Each product was approved under a separate, complete NDA reviewed by different, distinct review divisions within the FDA		

1. Approval represents area of unmet need – first approved therapy for indication

2. Rare Disease

*As of the date of this comment letter

Given the degree of differences between Jakafi and Opzelura, we believe that applying a single MFP across these products is misguided. Assuming these two drugs are part of the same negotiation—which we strongly disagree with because Opzelura is not a new formulation of Jakafi—then we recommend that CMS arrive at a single MFP (using ratios or some other equitable means) towards the end of the negotiation, not the start.

II. CMS Should Clarify How It Intends to Develop an MFP Considering Therapeutic Alternatives for Different Disease States in Different Therapeutic Classes With Different Marketplace Characteristics

As discussed in Section IV, because a 30-day supply of Opzelura can vary greatly from patient-to-patient -- or even for a given patient depending on their symptoms during that time -- we do not understand how CMS will determine the 30-day supply. Even assuming CMS could develop a reasonable proxy for a 30-day supply, combining non-FAMPs and Part D net prices for products with such vastly different pricing results in a ceiling that bears no resemblance to these pricing metrics for the particular products. (For example, as described further below, Non-FAMP for Jakafi is approximately 8x greater than that of Opzelura).

Based on the statutory negotiation factors related to “therapeutic alternatives” listed at SSA 1194(e)(2), it is unclear how CMS will establish a starting point for, and make adjustments to, the initial offer price when such factors are totally unrelated and significantly different.

To develop a “preliminary price” for the Initial Offer, CMS intends to identify therapeutic alternative(s) of the QSSD, consider the therapeutic alternative(s)’ Part D net price or Part B ASP, as applicable, and evaluate the clinical benefit of the QSSD compared to its therapeutic alternative(s) for each of the QSSD’s indications. If there are multiple therapeutic alternatives, CMS intends to consider the range of net prices and/or ASPs as well as the utilization of each therapeutic alternative to determine the starting point within that range. CMS will then adjust the preliminary price based on other manufacturer-specific data, submitted under SSA 1192(e)(1).

Once the starting point for the initial offer has been established, CMS proposes to adjust the starting price by evaluating the clinical benefit conferred by the selected drug compared to its therapeutic alternatives and then consider each category of the manufacturer-specific data. Incyte requests that CMS provide clarity on how the Agency intends to consider these criteria and establish a single MFP for a cancer therapy and a dermatological cream. How will CMS account for the differences between these products when compared to their therapeutic alternatives? How will CMS weigh manufacturer-specific data that varies significantly across these two drugs? For example, in circumstances where a factor with respect to one drug counsels for a downward adjustment while the same factor with respect to the other drug counsels for an upward adjustment, how will CMS determine the impact of that factor?

III. CMS’s Approach to Apply Ratios for Each Dosage Form and Strength Is Flawed

After CMS establishes a single MFP, the Agency intends to convert that single MFP into per-unit MFPs for each different dosage form and strength of a QSSD. While Incyte agrees that the approach to negotiate a single price across all dosage forms and strengths is one permissible interpretation of the statutory requirements at 1194(c)(1)(A), we do not believe this process is the only permissible interpretation, and it is not appropriate for products like Jakafi and Opzelura.

If CMS were to move forward and apply these MFP ratios at the NDC level for products such as Jakafi and Opzelura, it would further exacerbate the flawed process outlined in Section II. At issue is the fact that CMS will select a single MFP and then scale it to each of the QSSD’s different dosage forms and strengths. Applying this WAC price ratio at the end does not cure the flawed process to establish the single MFP in the first place. Further, we believe it may penalize more expensive dosage forms and strengths of the QSSD. Jakafi’s WAC per package in 2023 is approximately \$16,600 whereas Opzelura’s WAC per package in 2023 is approximately \$2,000. As of today, this 8x pricing metric extends roughly to comparisons of the products’ AMPs, NFAMPs, Federal Supply Schedule (FSS), and Other Government Agencies (OGA) prices. Since CMS scales the NDC-specific MFP only after considering the products together at all of the earlier stages, the underlying MFP is likely to have significant challenges given that it was developed in a way that attempts to consider and reconcile various inputs across two drugs that are wholly unrelated to each other.

Incyte believes that CMS’s current intended approach that would allow products like Jakafi and Opzelura to be part of the same negotiation is flawed because CMS consolidates various pricing and other data of entirely unrelated products to produce a single “fair” price. The ratios applied to each NDC will likely have significant problems given that it would be developed in a way that attempts to consider and reconcile various inputs across products that are wholly unrelated to each other.

There is a path for CMS to remedy the complex challenges that drug products like Jakafi and Opzelura present, even with their differing indications, routes of administration, and therapeutic alternatives. For cases like Incyte’s, CMS should reserve to itself the option to “split” the negotiation into two tracks, and separately consider the merits of each drug at certain points during the process. This can be performed in a manner consistent with CMS’s current interpretation of IRA’s mandate to aggregate drug products into a single QSSD, and negotiate a “single” MFP. For example, at the outset of the process, Jakafi and Opzelura would be treated as a single QSSD for

purposes of selection and calculation of total Medicare expenditures. Yet from there, CMS could calculate a ceiling price, starting point and initial offer for the two drugs separately. The negotiation process would yield two MFP-component prices, one for each drug, which CMS could then blend into a single MFP based on the relative weights of the two drugs' WACs. That single MFP would satisfy the requirement of SSA 1194(c)(1)(A). Finally, CMS could disaggregate that single MFP, again on the basis of WAC, to re-create the two MFP component prices negotiated for the two different drugs.

IV. CMS Should Clarify How It Intends to Calculate a 30-Day Supply for Topical Medications

CMS intends to establish a ceiling and the MFP based on a 30-day equivalent supply of a selected drug. However, there will be significant challenges creating a 30-day supply amount for topical medications, such as creams, foams and ointments. Based on the initial guidance, it is unclear how CMS will develop a 30-day supply for a topical drug like Opzelura, the amount of which depends on the size of the affected area for a patient. For patients using Opzelura to treat atopic dermatitis, the Prescribing Information directs them to "[a]pply a thin layer twice daily to affected areas of up to 20% body surface area."⁴ For patients using Opzelura to treat nonsegmental vitiligo, the Prescribing Information directs the patient to apply "[a]pply a thin layer twice daily to affected areas of up to 10% body surface area."⁵ Thus, the amount of product actually used by patients on a 30-day-basis can vary significantly, both from patient-to-patient as well as for a given patient depending on their symptoms at the time. With this variability, forecasting an annual number of refills in order to estimate a 30-day supply price estimate will likely lead to inaccurate results further complicating and calling into question CMS's intended single-MFP approach.

Incyte requests that CMS issue guidance clarifying how CMS intends to calculate a 30-day supply for topical medications.

V. CMS Should Clarify How It Intends to Handle Federal Supply Schedule (FSS) and "Big Four" Pricing for Manufacturers that Offer Dual Prices

CMS states that "if there is a single therapeutic alternative with a price above the statutory ceiling, then CMS intends to determine the starting point for the initial offer based on the [FSS] or [Big Four] price."⁶ CMS also intends to collect information on the QSSD's FSS and Big Four prices for purposes of adjusting the initial offer price.⁷

The VA guidelines permit manufacturers to choose either single or dual pricing for its covered drugs.⁸ Under the single pricing scenario, manufacturers sell each covered drug to all FSS customers (Big Four and Other Government Agencies (OGA) at one price that is at or below the federal ceiling price. On the other hand, under the dual pricing scenario, manufacturers have two prices for each covered drug, which include (1) an FSS price for the Big Four federal agencies that does not exceed the federal ceiling price; and (2) an FSS price for all OGAs that is not limited to the federal ceiling price.

CMS should clarify how it intends to use the "FSS or Big Four" prices for purposes of setting and/or adjusting the initial offer price. There are instances where a manufacturer elects to offer different FSS prices to "Big Four" agencies as compared to OGA customers. Based on the Initial Guidance, it is unclear how CMS would take that split pricing into account in terms of setting the initial offer price and/or modifying it. Incyte recommends that

⁴ Opzelura Prescribing Information, section 2.2 available at <https://www.opzelura.com/prescribing-information.pdf>.

⁵ Opzelura Prescribing Information, section 2.3 available at <https://www.opzelura.com/prescribing-information.pdf>.

⁶ See Section 60.3.2, at 49.

⁷ See Guidance, p. 89.

⁸ See VA Dear Manufacturer Letter (May 4, 1993).

CMS clarify how it intends to use Federal Supply Schedule pricing when different pricing exists for Big Four and OGA agencies.

Incyte appreciates the opportunity to comment on this Memorandum. We hope that CMS will provide clarity on the issues outlined above. We would welcome the opportunity to meet with you or answer any questions CMS may have about our comments, at your request. Thank you.

Sincerely,

A handwritten signature in cursive script, reading "Barry Flannery".

Centers for Medicare and Medicaid Services

Department of Health and Human Services

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026

Dear Dr. Meena Seshamani, M.D., Ph.D.,

Thank you for the opportunity to comment on the initial guidance regarding implementation of sections 11001 and 11002 of the Inflation Reduction Act (IRA) (P.L. 117-169), which establish the Medicare Drug Price Negotiation Program to negotiate maximum fair prices for certain high expenditure, single source drugs and biological products.

My comments on this initial guidance are reflective of my experiences as a Health Economist in the pharmaceutical industry generating and leveraging evidence for Health Technology Assessments and drug price negotiations with government payers, primarily outside of the United States. I am also a Doctoral student in Health Policy at Johns Hopkins Bloomberg School of Public Health. The comments I have provided below are my own and do not reflect the opinions of any organizations that I am affiliated with other than myself.

In the final guidance for implementing the Medicare Drug Price Negotiation Program it is critical that CMS provide more clarity regarding the negotiation factors included in section 50. The initial guidance does not currently include the specificity necessary to ensure that the appropriate evidence is generated, provided and reviewed to inform maximum fair price negotiations.

The following comments are specifically referring to Section 50.2, *“Evidence About Therapeutic Alternatives for the Selected Drug”*. This section states that CMS will consider, “The extent to which the selected drug represents a therapeutic advance compared to existing therapeutic alternatives for the selected drug and the costs of such existing therapeutic alternatives”. My first comment refers to the statement, “The extent to which the selected drug represents a therapeutic advance”. My second comment refers to the statement, “compared to existing therapeutic alternatives”. My third comment refers to comparing the costs of selected drugs with, “the costs of such existing therapeutic alternatives”.

My first comment on section 50.2 is referring to the statement that CMS will consider, “The extent to which the selected drug represents a therapeutic advance”. The definition of a “therapeutic advance” must be explicitly stated in the guidance. A drug can be considered a “therapeutic advance” for a variety of reasons, which may differ by therapy area. Common attributes associated with “therapeutic advances” include improvements in clinical endpoints, improvements in a patient's quality of life and ability to do daily activities, and a reduction in adverse events associated with currently available therapies.

Dr. Aris Angelis and Dr. Panos Kanavos have identified several attributes generally taken into consideration by payers, clinicians and patients when assessing the value of a medicine in their publication, [“Multiple Criteria Decision Analysis \(MCDA\) for evaluating new medicines in Health Technology Assessment and beyond: The Advance Value Framework.”](#) The attributes highlighted include burden of disease (severity, prevalence, availability of treatments), therapeutic impact (clinical endpoints and quality of life), safety (adverse events, tolerability and contraindications), innovation (nature of treatment and ease of use), and societal impact (improving public health, improving productivity, reducing other healthcare costs).

Some of these attributes may not be appropriate for the Medicare Drug Price Negotiation Program given the program will be focusing on single source drugs that have been approved for at least 7 years or biological products that have been approved for at least 11 years. Additionally a societal perspective may not be appropriate for Medicare given the intention of the Drug Price Negotiation Program is to lower the price of some of the costliest single-source brand-name Medicare Part B and Part D drugs. Therefore, the attributes that CMS should consider when defining a “therapeutic advance” should at minimum include burden of disease, therapeutic impact and safety.

My second comment on section 50.2 is referring to the statement that CMS will consider the extent of the therapeutic advance of a drug, “compared to existing therapeutic alternatives”. This statement requires clarification regarding how many “existing therapeutic alternatives” the drug will be compared to and how the appropriate “therapeutic alternative” will be determined.

Dr. Ziouani, Dr. Granados and Dr. Borget assessed the most common approaches to defining comparators for health technology assessments in their publication, [“How To Select The Best Comparator? An International Economic Evaluation Guidelines Comparison”](#). It was determined that the most common approach to selecting a comparator is to use the standard of care for local practice. Given the potential ambiguity of this conclusion, CMS should identify the “existing therapeutic alternative” by assessing the most commonly used alternative to the drug of interest for a specific indication using internal data.

It is also critical to specify how this comparison will be conducted and if there is a preference for clinical trial data, real world data or indirect treatment comparisons. Given the interest in the Medicare population specifically, real world data may be the most appropriate source of evidence for comparing selected drugs with existing therapeutic alternatives.

My third comment on section 50.2 is referring to the statement that CMS will compare the costs of selected drugs with, “the costs of such existing therapeutic alternatives”. This statement requires clarification on the costs that will be considered. Given the focus of the program is to lower the price of some of the costliest single-source brand-name Medicare Part B and Part D drugs, the focus should be on acquisition cost. However, this must be clearly stated in the guidance.

In conclusion, section 50.2 of the final guidance should include the following clarifications:

- A therapeutic advance is defined as a reduction in burden of disease, a significant improvement in clinical endpoints or an improved safety profile compared to standard of care.
- An existing therapeutic alternative is the most commonly used alternative to the selected drug of interest for a specific indication, which will be identified by CMS using internal data.

- The only costs that will be considered are drug acquisition costs. Indirect costs associated with a drug will not be considered.

Thank you again for the opportunity to comment on the initial guidance for implementing the Medicare Drug Price Negotiation Program. If there are any questions regarding my recommendations please do not hesitate to contact me via email at [REDACTED].

Sincerely,

[REDACTED]

[REDACTED] [REDACTED]

Dear Centers for Medicare and Medicaid Services,

Average drug prices are excessive in the USA.

They are much higher than in other developed countries. The average prices of these other developed countries would be a fairer starting point in negotiations. Big Pharmaceutical companies have a long history of callous price gouging.

Thank you

██████ ██████

April 13, 2023

Meena Seshamani, M.D., Ph.D.
CMS Deputy Administrator and Director of the Center for Medicare
Centers for Medicare & Medicaid Services
U.S. Department of Health and Human Services
7500 Security Boulevard
Baltimore, MD 21244-1850

Dear Director Seshamani:

I am writing in response to your March 15 Memorandum on Medicare's Drug Price Negotiation Program, which provides initial guidance on the implementation of sections 11001 and 11002 of the Inflation Reduction Act. Thank you for the opportunity to provide input on this matter.

By way of background, I am a hematologist and the Chief Innovation Officer at Mayo Clinic in Arizona. My work focuses on the treatment of myeloma and related conditions, the genetics of myeloma and related conditions, and the development of novel therapies. I also work in pharmacoeconomics and policy. My comments here should be taken as personal opinion and do not necessarily reflect the thoughts of Mayo Clinic. I have published extensively in the matters I discuss below (Google Scholar April 11th 2023 H Index 125, 60,420 citations)

I am worried about how CMS's new guidance will impact patients living with cancer diagnoses such as multiple myeloma, and other serious illnesses. The guidance seems to double down on shortcomings present within the Inflation Reduction Act, reinforcing policies that will inevitably hinder biopharmaceutical advancement and stifle innovation. I have seen concerning signs that the future development of certain small-molecule medicines may be in jeopardy because of the IRA. I have witnessed conversations on how additional research will not be further supported as a consequence of the IRA provisions.

Consider that CMS's guidance discourages critical "follow-on" innovation, the important research that takes place after a drug is first approved. The guidance suggests that the government will essentially penalize companies that patent novel discoveries made after a medicine is approved, even if those discoveries necessitated years of expensive and risky research.

Scientists regularly conduct research and development long after a medicine has received regulatory approval. This research can help uncover additional benefits for patients. For example, follow-on research can reveal that a medicine approved to treat a disease in a specific phase can also treat the same disease in other phases. Other times, scientists discover that a drug intended for one illness can treat one or more entirely different conditions.

In addition to revealing new uses, follow-on research can also lead to improvements in a drug's safety, efficacy, or method of administration. Many times, post-approval research helps bolster patient adherence, thereby improving clinical outcomes.

Every single drug used for the treatment of myeloma has undergone modifications to its use because of follow-on research. I can provide multiple examples of how follow-on research has helped patients with myeloma and related conditions. Rigorous post-approval clinical trials allow physicians like me to help as many people as possible with the treatments we have available to us.

Severely reducing the length of time drug makers have to charge a market price for their product will make it significantly harder for companies to justify the cost and risk of post-approval research.

A [2022 report](#) from the Food and Drug Administration highlighted 25 particularly meaningful approvals for new uses or indications of approved drugs. Many of these post-approval research breakthroughs provided much-needed treatment options for patient groups with unmet needs.

Consider just two of these new approvals: A groundbreaking treatment for pediatric patients with juvenile myelomonocytic leukemia, a rare blood cancer primarily affecting young children; and two therapies approved for combined use to treat pediatric patients with tumors expressing a BRAF mutation.

Policymakers should focus on protecting and even increasing incentives for post-approval advances, not weakening them. Unfortunately, the new guidance suggests that CMS actions will stifle follow-on innovation continues in the future.

I am also concerned about the Inflation Reduction Act's unequal treatment of conventional, "small-molecule" medications and large-molecule "biologic" treatments. The law subjects new small-molecule drugs to price negotiations after just nine years, while biologic medications are exempt from negotiations for thirteen years following regulatory approval. This will inevitably steer investment dollars away from important small-molecule research.

As a physician familiar with the applications of both small-molecule biologic therapies, I can assure you that penalizing small-molecule development has no basis in science.

For one, small-molecule medications can usually be taken in pill form in the comfort of one's home. This enables individuals to bypass the time and costs associated with visiting hospitals or clinics, where biologic medicines often have to be administered under the supervision of trained professionals. The fact that small-molecules are easier to administer makes them valuable options for rural, economically disadvantaged, and minority populations.

Small-molecules are on the cutting-edge of cancer treatment. Many of the newest, most exciting precision cancer treatments employ small-molecule medications to directly target cancerous cells. Unlike conventional chemotherapy, small-molecule drugs are able to target particular proteins or genes *within* cancer cells, avoiding harmful spillover into normal, healthy cells. This can mean fewer side effects for patients.

Lastly, CMS's new guidance appears to adopt the Inflation Reduction's Act shortsighted focus on drug prices, rather than value and patient outcomes. Since becoming a physician, I've seen, first-hand, how new therapies have transformed the prognosis for myeloma. Thirty years ago, patients with myeloma survived for a median of two years following diagnosis. As of today, the average myeloma patient could expect to live for more than eight years after diagnosis, assuming he or she has access to the best available therapies. Thanks to the revolutionary therapies available today, I firmly believe some patients can be cured of the disease. More on this can be found in "[Value and Cost of Myeloma Therapy—We Can Afford It](#)," a 2018 paper I authored for the American Society of Clinical Oncology's Educational Book. One particularly illuminating finding is that more widely covering the "maintenance drugs" needed to manage chronic illnesses results in substantial net health savings due to reduced hospitalizations, surgeries, and other complications.

A narrow focus on drug prices ignores the reality that biopharmaceutical innovation has been responsible for substantial improvements in our ability to treat myeloma and other cancers. Discouraging future medical progress, as the Inflation Reduction Act will do, is a heartbreaking move in precisely the wrong direction.

The United States is the cauldron of biopharmaceutical progress, with more drugs developed here than the rest of the world combined. The innovative work done in the United States ultimately becomes a gift to all of humanity. Misguided changes to America's regulatory environment will diminish these global benefits considerably. We should all be proud of this contribution.

As Dr. Peter Kolchinsky has rightly stated in his book *The Great American Drug Deal*, society should not think about funding drug development as paying rent forever, but rather as paying off a mortgage in order to be free from debilitating illnesses in the future.

These are just some of my concerns. Without a more rigorous attempt to lessen the negative consequences of the Inflation Reduction Act, the impacts on future biopharmaceutical innovation -- and thus, patient health -- could be catastrophic. Should you have any questions or want to discuss my concerns in further detail, please do not hesitate to contact me.

Sincerely,

Centers for Medicare and Medicaid Services

RE: Medicare Drug Price Negotiation Program Guidance

To Whom It May Concern:

I am pleased to offer comments regarding the initial memorandum, dated March 15, 2023, regarding implementation of Sections 1191-1198 of the Social Security Act for initial price applicability year 2026. I will focus my comments on Section 50.2 of the memorandum, and specifically CMS' proposals regarding use of comparative effectiveness research and the quality-adjusted life year (QALY) metric.

As the mother of a child with a disability, advocate for the needs of those with disabilities, and former member of the National Council on Disability, I am concerned that CMS' position in the initial memorandum may disadvantage individuals with disabilities. As I outline in greater detail below, I believe CMS' constrained view of the prohibition on the use of QALYs is at odds with the consensus of the disability community, contradicts prior Departmental practice, and could allow for violations of federal law.

The Disability Community Opposes "QALYs and Related Measures"

The drug negotiation regime included in Section 11001 of the Inflation Reduction Act (IRA) had its roots in prior legislation introduced in the House of Representatives in the fall of 2019 as H.R. 3, the Elijah Cummings Lower Drug Costs Now Act. Title I of that bill as introduced created a negotiation process that linked the maximum fair price to the average price of a pharmaceutical in six countries: Australia, Canada, France, Germany, Japan, and the United Kingdom.¹

In response, the Consortium of Citizens with Disabilities (CCD)—the largest coalition of organizations that advocates on disability policy—sent a letter to congressional leaders objecting to the linking of the maximum fair price to international prices. The letter noted that “many of the nations used to create the average international market price rely on QALYs to determine their coverage and prices. CCD is very concerned that these provisions effectively import a QALY-based and discriminatory system from abroad. These systems are discriminatory against people with disabilities and do not have a place in the United States health care system.”²

¹ Proposed Section 1191(c)(3) of the Social Security Act, as included in Section 101(a) of H.R. 3 (116th Congress), the Elijah Cummings Lower Drug Costs Now Act, as introduced, September 19, 2019.

² Letter from Consortium of Citizens with Disabilities to House Energy and Commerce Committee Chairman Frank Pallone, House Ways and Means Committee Chairman Richard Neal, and House Education and Labor Committee Chairman Bobby Scott regarding H.R. 3 (116th Congress), September 24, 2019, <https://www.c-c-d.org/fichiers/CCD-Letter-HR-3-Final-9.24.19.pdf>.

The CCD letter also stated the broader concerns with QALYs among most members of the disability advocacy community:

CCD has expressed concern with the use of value assessments and cost-effectiveness measures that rely on Quality-Adjusted Life Years (QALY). The QALY is a discriminatory measure based on the idea that disabled lives are less valuable than non-disabled lives. CCD opposes the use of QALYs and related measures and supports an explicit ban on the use of QALYs in any health care legislation that considers value or effectiveness of health care.³

Following the CCD letter, the House of Representatives passed in December 2019 a revised version of H.R. 3 that incorporated provisions regarding individuals with disabilities. Specifically, the House bill included language requiring CMS to consider during the negotiating process “information on comparative effectiveness analysis for such products, taking into consideration the effects of such products on specific populations, such as individuals with disabilities, the elderly, terminally ill, children, and other patient populations”—language that largely mirrors Section 1194(e)(2)(C) of the Social Security Act, as enacted by Section 11001 of the IRA.⁴

The 2019 bill passed by the House also included language stating that “the Secretary shall not use evidence or findings from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, non-disabled, or not terminally ill”—language that also largely mirrors Section 1194(e)(2) of the Act, as enacted by the IRA.⁵

However, the House-passed bill also stated that “nothing in the previous sentence shall affect the application or consideration of an AIM [average international market] price for a selected drug.” In addition, the bill did not include the explicit ban on QALY usage requested in the CCD letter of September 24, 2019.⁶

CMS’ Interpretation Could Allow for Use of the QALY Metric

In Section 50.2 of the initial memorandum, CMS wrote that:

Section 1194(e)(2) of the Act additionally requires that CMS not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.

³ Ibid.

⁴ Proposed Section 1194(d)(2)(C) of the Social Security Act, as included in Section 101(a) of H.R. 3 (116th Congress), Elijah Cummings Lower Drug Costs Now Act, as passed by the House of Representatives, December 12, 2019.

⁵ Proposed Section 1194(d)(2) of the Social Security Act, as included in Section 101(a) of H.R. 3 (116th Congress), as passed by the House of Representatives.

⁶ Ibid.

Information submitted by members of the public, including manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties, or other information found by CMS that treats extending the life of individuals in these populations as of lower value, for example certain uses of quality-adjusted life-years (QALYs), will not be used in the negotiation process. In instances where a study uses QALYs in a life-extension context but has clearly separated this use of QALYs from other evidence in the report (e.g., clinical effectiveness, risks, harms, etc.) that is relevant to the factors listed in section 1194(e)(2) of the Act, CMS intends to consider such separate evidence. CMS will ask entities submitting information to indicate whether or not their submission contains information from studies that use QALYs in a life-extension context. CMS is soliciting comment on other metrics, in addition to QALYs, that may treat extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill and that CMS should also exclude from consideration when developing offers and reviewing counteroffers.

In Section 50.2, CMS has echoed Section 1194(e)(2) of the Act regarding the value of extending the life of individuals who are elderly, disabled, or terminally ill. This language also mirrors Section 1182(c)(1) of the Social Security Act, which prohibits the Secretary from using comparative effectiveness research to “determine[e] coverage, reimbursement, or incentive programs under Title XVIII in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, non-disabled, or not terminally ill.”⁷

However, prohibiting the use of QALYs solely “in a life-extension context,” as CMS proposes in Section 50.2 of the memorandum, would permit their use in other contexts—for instance, where a pharmaceutical could improve the quality (as opposed to the quantity) of life for individuals with disabilities, the elderly, or the terminally ill.

Using QALYs in these other contexts would represent bad policy for CMS to pursue, as the QALY metric by definition views the quality of life for individuals with disabilities as of “lesser” value than those without disabilities. More importantly, use of the discriminatory QALY metric can violate other federal laws, even outside of considerations centered on “a life-extension context,” as the initial memorandum proposes.

CMS’ Current Interpretation of Discriminatory Behavior Contradicts HHS’ Prior Actions

The language of Section 50.2 focuses solely on the interactions between QALYs and Section 1194(e)(2) of the Social Security Act. This interpretation would confine any restrictions on QALYs solely to the “life-extension context.” However, CMS’ umbrella department has previously taken a more expansive—and appropriate—view regarding discrimination

⁷ Section 1182(c)(1) of the Social Security Act, as enacted by Section 6301(c) of the Patient Protection and Affordable Care Act, P.L. 110-148.

against individuals with disabilities, a view that CMS should adopt regarding the use of QALYs and similar metrics.

In August 1992, the Department of Health and Human Services (HHS) rejected a Medicaid waiver application from the state of Oregon. HHS denied the waiver because Oregon's rankings for determining services the Medicaid program would cover under the waiver were based "in substantial part on the premise that the life of a person with disability is less than the value of the life of a person without a disability," which in the Department's view violated the Americans with Disabilities Act.⁸

In a letter to Oregon Governor Barbara Roberts explaining the reasons for the rejection, HHS cited several concerning aspects of the ranking mechanism. It viewed a telephone survey used to solicit public opinion regarding the benefits that Medicaid should cover as perpetuating stereotypes against individuals with disabilities.⁹ It also criticized the "community values" section of the rankings—which included metrics like "quality of life" and functional "independence"—as valuing the life of individuals with disabilities less highly than individuals without disabilities.¹⁰ Finally, HHS criticized specific benefit exclusions as discriminatory, such as prohibiting coverage of liver transplants for cirrhosis of the liver associated with alcoholism (but not other conditions), and prohibiting life support for low birthweight babies under 23 weeks' gestation.¹¹

In publicly defending his decision to reject the Oregon waiver, then-Secretary Louis Sullivan stated that "our principal concern is that Oregon's plan in substantial part values the life of a person with a disability less than the life of a person without a disability. This premise is discriminatory and inconsistent with the Americans with Disabilities Act."¹² Oregon subsequently resubmitted the waiver, which HHS approved in March 1993. Oregon's revised waiver deleted language in the original proposal that "weighed the contribution of the services, if any, to a patient's quality of life," in large part due to the objections that HHS had raised regarding its discriminatory nature.¹³

The record regarding the Oregon waiver confirms that HHS has taken action against measures that discriminate against individuals with disabilities, for reasons going far beyond the comparatively narrow "life-extension context" laid out in Section 50.2 of the initial memorandum. CMS should therefore ensure that the data and metrics used in its negotiation process comply not just with Sections 1194(e)(2) and 1182(c) of the Social

⁸ Letter from Health and Human Services Secretary Louis Sullivan to Oregon Governor Barbara Roberts, reprinted in "ADA Analyses of the Oregon Health Plan," *Issues in Law and Medicine* March 1994, <https://law-journals-books.vlex.com/vid/ada-analyses-oregon-health-care-plan-53364177>.

¹³ Robert Pear, "White House Expected to Back Oregon's Health Care Rationing," *New York Times* March 18, 1993, <https://www.nytimes.com/1993/03/18/us/white-house-expected-to-back-oregon-s-health-care-rationing.html?module=inline>.

Security Act, but the Americans with Disabilities Act and other measures intended to prevent discrimination against individuals with disabilities.

CMS Should Exclude All Uses of QALYs and Similarly Discriminatory Measures

In 2019, the National Council on Disability (NCD), on which I served, issued a report regarding the use of QALYs. The report “found sufficient evidence of the discriminatory effects of QALYs to warrant concern, including concerns raised by bioethicists, patient rights groups, and disability rights advocates about the limited access to lifesaving medications for chronic illnesses in countries where QALYs are frequently used.”¹⁴

The examples compiled in the NCD report explain why the Consortium of Citizens with Disabilities has stated it “opposes the use of QALYs and related measures.”¹⁵ Related measures would include metrics like the equal-value of life year gained (evLYG), which discriminates based upon age and contains similar flaws regarding quality-of-life improvements.

To protect against any discrimination against the most vulnerable in society, CMS should utilize a less constrained interpretation of factors and evidence it will exclude from the negotiation process than that spelled out in Section 50.2 of the initial memorandum. Specifically, CMS should exclude any data or findings that use quality-adjusted life years, or other similar metrics like the equal-value of life year gained, from the negotiation process.

General Comment

The negotiation of drug prices will be a long-awaited benefit for seniors on Medicare.

As a Medicare Ship Counselor, I find that my clients become most frustrated with the following:

1. Manufacturers make drug price changes after annual enrollment. The beneficiary has selected and enrolled for the following year with no guarantee of the price they will pay.
2. Lack of education on how the pricing works. The contracting with Manufacture, Insurance, and Pharmacies. Posting the negotiated rate with NOC and at the Pharmacy may be helpful.
3. Shopping for the best price is difficult when the pharmacy says I need the script. Many times the scripts are sent electronically to one pharmacy. More upfront transparency is needed on prices.

Hello.

In response to CMS's request for comment by April 14, 2023 at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf> (at page 1), I strongly support any efforts that allow the federal government to negotiate Medicare Part D prices with manufacturers, providers, and suppliers (including pharmacies) that furnish Medicare Part D drugs. In my view, the lack of such negotiating power in the historic Medicare Part D legislation signed into law by President George W. Bush was a major failure and only highlighted the immense power of the Big Pharma lobbyists and political money.

It is my fervent hope that President Joseph R. Biden, Jr. will quickly (preferably before 2026, which is the target date set forth in the guidance for the initial negotiations) and effectively correct this colossal mistake for the financial—and, most importantly, clinical—benefit of tens of millions of Medicare enrollees. The general welfare, which includes true access to the medications they need, of our elderly and disabled population should be a much higher priority and consideration than any political funding concerns. I do not believe that the ability of the Medicare program to negotiate drug prices, as every other health care insurer in the U.S. already does, will significantly impact the research and development of important new drugs despite Big Pharma's contrary and entirely self-serving arguments. My only concern is that the Negotiation Program does not go far or fast enough.

Should you have any questions or need more information about my support for the Negotiation Program, you may contact me at this email address or [REDACTED]. Thank you.

Sincerely, _____

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Inhibrx appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

While Inhibrx is developing biologic therapeutics for oncology and orphan indications, we strongly believe small molecule drugs will see a significant decrease in investor funding based on the changes in the IRA impacting the 9-13 year period. Prior to founding Inhibrx in 2010, I was the principal of a biotechnology investment fund for 8 Years. During that time my fund did extensive analysis of the costs, success rates and commercial revenues from small molecule drugs and we concluded that investor returns across small molecule programs were at best low single digits and likely barely breakeven. With the impact of the 9-13 year period small molecule drug development is no longer economically viable.

We also believe there are small molecule programs in development that will choose only one orphan disease to pursue when the therapeutic could have benefit across several orphan diseases. We are fortunate that biologics managed to retain 13 years of market-based pricing before having their price impacted by Medicare negotiation which also spills over into Medicaid; we urge CMS reduce the prices of small molecule drugs during the 9-13 year period only as little as required by IRA. Wherever it may be possible to interpret the IRA in such a way as to exempt a small molecule from the IRA, we hope CMS will.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors as well as those with orphan diseases from fewer innovative medicines is minimized. Please contact Mark Lappe, CEO of Inhibrx, by telephone at (858)759-1499 or by e-mail at mark@inhibrx.com, if you have any questions regarding our comments.

Sincerely,

Mark Lappe

April 14, 2023

Meena Seshamani, M.D., Ph.D.
CMS Deputy Administrator and Director of the Center for Medicare
Centers for Medicare & Medicaid Services
7500 Security Boulevard
Baltimore, Maryland 21244-1850

Dear Dr. Seshamani,

The Innovation and Value Initiative (IVI) appreciates the opportunity to provide comments to the Centers for Medicare and Medicaid Services (CMS) on the initial guidance for implementation of the Medicare Drug Price Negotiation Program (Medicare DPNP).

IVI is a 501(c)3, non-profit research organization committed to advancing the science, practice, and use of health technology assessment (HTA) in health care. Founded in 2017, the organization includes members from the research, patient, payer/purchaser, clinician and innovator stakeholder communities. IVI's work emphasizes collaboration and exploration of new solutions in pursuit of a U.S. learning healthcare system supported by patient-centered HTA and focused on high-quality, efficient, innovative, and equitable care for all people and communities. We believe this is only possible with a fundamental shift to resource allocation, coverage, and access-related decision-making that aims to maximize value for all stakeholders—particularly patients and other covered individuals.

Our work is guided by our Principles for Value Assessment.¹ These principles apply not only to the narrow context of HTA, but are the foundation of a patient-centered and equitable health system based on value to all stakeholders. The implementation by CMS of the Medicare DPNP should be grounded in these principles, the foremost among them being patient-centricity, transparency, equity, and vigorous methods enhancement.

IVI recognizes that the legislation includes specific guidelines and places limitations on implementation of the DPNP, and we commend CMS for its efforts to develop thoughtful and thorough guidance under considerable time constraints. Examining the initial guidance for the DPNP through the lens of IVI's core principles raises a number of concerns with both immediate and long-term implications, including:

¹ Full description of our Principles for Value Assessment in the U.S. available at:
<https://thevalueinitiative.org/principles-for-value-assessment-in-the-us/>

- The guidance fails to incorporate multiple elements needed to advance health equity, deliver value to patients, and influence the evolution of health research and healthcare delivery to support value-based decision making.
- The processes for comment, evidence collection, and assessment of included drugs raise a number of immediate concerns.

We appreciate the opportunity to offer comments and suggestions in the following areas:

Focus of DPNP should be on maximizing value, not simply minimizing prices

To the extent allowed by existing legislation, the DPNP should emphasize understanding and maximization of value—as opposed to simply minimizing product prices—as a primary objective of the program and orient program guidelines around this objective.

As the largest health insurer in the U.S., Medicare policy or programmatic changes have the potential to shape the structure of the U.S. health system at all levels. As such, CMS implementation of the relevant sections of the Inflation Reduction Act (IRA)—and particularly related to the DPNP—presents an opportunity to establish an inclusive and forward-thinking approach that emphasizes negotiations and decision-making based on maximizing value to Medicare enrollees, the Medicare system, and American society, rather than simply on minimizing unit prices.

The initial guidance for the Medicare DPNP, reflecting the emphasis in sections 11001 and 11002 of the IRA on price, outline a process constructed around the primary objective of negotiations to reduce prices for high-cost drugs and minimize costs to Medicare. Price does not equate to value. Rather, price (and costs as a result) is one of multiple components of value. This narrow focus on price as opposed to more comprehensive assessments of value risks perpetuation of decisions that shape patients' care based on budget concerns rather than value.

Value is multi-faceted, and CMS should endeavor to include a broader set of outcomes and other elements influencing value for Medicare and its enrollees when considering any benchmark price for negotiations. Data elements required by CMS per section 50.1 of the initial guidance are not sufficient to determine a price based on the value of the drug. Additional elements of value that reflect impacts on different stakeholders should be considered. For example, patient-level elements may include financial impacts of care, burden on family caregivers, and patient goals for treatment.² As a public

² See for example:

Wilson, M., Thavorn, K., Hawrysh, T. et al. Engaging Patients and Caregivers in an Early Health Economic Evaluation: Discerning Treatment Value Based on Lived Experience. *PharmacoEconomics*. 2022;40:1119–1130. <https://doi.org/10.1007/s40273-022-01180-4>

program, broader societal elements are also important to consider. Some examples include incentives for innovation, impacts on health equity, and insurance value.³

Implementation of the Medicare DPNP will establish a formal approach and framework that sets a precedent for both CMS and private sector approaches to price negotiations and decisions about coverage and access. We strongly encourage CMS to incorporate broader concepts of value into assessments and negotiations to the greatest extent possible, and to clearly articulate these considerations in the final guidance.

Health equity must clearly inform all aspects of DPNP guidelines

Equity implications of all aspects of the program should be systematically considered as part of DPNP activities, and strategies to support equity (by including members of underrepresented or “specific” populations as formal partners in the process, for example) should be incorporated wherever possible.

Health equity is the first pillar of the Centers for Medicare & Medicaid Services’ (CMS) Strategic Plan,⁴ which states:

CMS is working to advance health equity by designing, implementing, and operationalizing policies and programs that support health for all people served by our programs by incorporating the perspective of lived experiences and integrate safety net providers and community-based organizations into our programs.

Regarding the Center for Medicare (CM), it goes on to state:

As one of the largest payers in our health care system, CM is catalyzing delivery system transformation by issuing policies that advance equity across all Medicare programs and activities ... and consistently engaging people with Medicare throughout the policy process.

In the initial guidance neither the word “equity” nor related terms appear in the text. As a highly visible and novel program within Medicare, it is imperative that the DPNP reflect the objectives and practices outlined in the CMS strategic plan.

IVI recently completed Phase 1 of its Health Equity Initiative, a multi-stakeholder-driven process that aims to identify actionable changes to HTA processes, methods, and

dosReis, S., Butler, B., Caicedo, J. *et al.* Stakeholder-Engaged Derivation of Patient-Informed Value Elements. *The Patient*. 2020; 13:611–621. <https://doi.org/10.1007/s40271-020-00433-8>

³ Lakdawalla DN, Doshi JA, Garrison LP, Phelps CE, Basu A, Danzon PM. Defining Elements of Value in Health Care—A Health Economics Approach: An ISPOR Special Task Force Report [3]. *Value in Health*. 2018;21(2):131-139.

⁴ Source: CMS Strategic Plan Fact Sheet. Pillar: Health Equity. <https://www.cms.gov/files/document/health-equity-fact-sheet.pdf>

communication that acknowledge and resolve existing health disparities in research and healthcare decision-making.⁵ Many of the key themes arising through this ongoing process have implications for the Medicare DPNP, for example:

- **Fundamental change:** Incremental changes (“tinkering around the edges”) are insufficient to address the systemic issues impacting equity
- **Accountability:** Change will not occur without accountability for and to all stakeholders
- **Meaningful engagement:** All actors—and especially underrepresented communities—must be meaningfully engaged throughout the process, including decision-making.
- **Data and methods:** Incomplete evidence and imperfect methods are not an excuse to continue practices that perpetuate bias or inequities. A “learning laboratory” approach is needed for testing methods (especially mixed quantitative/qualitative) and identifying evidence gaps.
- **Transparency:** Transparency is a necessary condition for both trust and accountability—particularly as an antidote to lack of trust of marginalized communities for researchers, providers, and decision-makers—and critical to the advancement of health equity.

Many of these findings, which largely align with the priorities and planned actions outlined in the CMS strategic plan, have direct application to the Medicare DPNP. In all aspects of planning and execution of the Medicare DPNP, health equity should remain a principal concern and the lens through which decisions are made, with consideration at minimum of:

- **Implications of external factors for equity**—underrepresentation of specific groups in data, for example.
- **Alignment of practices and guidelines with equity goals**—ensuring DPNP process reflects actions outlined in CMS strategic plan and recommendations from IVI’s work. For example, engaging members of underrepresented communities as collaborators.
- **Downstream equity implications of DPNP processes**—deliberate consideration of potential equity impacts now and in the future, including implications for access and affordability, and potential influences on the private market.

⁵ More information available at: <https://thevalueinitiative.org/health-equity-initiative/>

IVI strongly recommends revision of the DPNP guidance to align with CMS's strategy, positioning health equity at the forefront by clearly outlining specific actions including:

- **Process for evaluating potential bias and equity implications of evidence.**
- **Creation of enrollee advisory groups**, including patients and other members of diverse communities with relevant lived experience, with explicit opportunities to participate in specified stages of negotiations.
- **Calling for and incentivizing evidence generation and data collection** with underrepresented populations.

Systematic approaches to elevating patient voices are needed

Affected beneficiaries (e.g., current patients), their families and caregivers, and organizations that represent them must be actively involved in DPNP processes with a meaningful voice in decision making, and specific measures to ensure patient experience and other inputs are elevated in CMS's evaluation of candidate drugs must be explicitly outlined in the guidance.

IVI appreciates the steps taken in the initial guidance to provide opportunities for patients, their families and caregivers, and organizations that represent them to provide input or submit evidence to support DPNP negotiations. We are concerned that the initial guidance fails to include mechanisms for patient engagement beyond evidence submissions and does not include guidelines or processes to ensure evidence from patient experience, qualitative or quantitative, is incorporated alongside other evidence such as clinical trial data.

Formal mechanisms for patient engagement in negotiations should be included to provide essential guidance and context from lived experience, such as a treatment-specific advisory group formed for each drug following its selection for negotiation. Mechanisms for inclusion of patient stakeholder voices are also a key tool for advancing health equity. Inclusion of members from diverse populations and backgrounds to serve on patient advisory groups provides members of historically underrepresented communities an important opportunity to have a voice in the process.

Engaging patients in dialogue or soliciting input from patients and other affected populations is necessary but not sufficient, however. It is critical that CMS explicitly include measures throughout the DPNP processes to ensure patients have equal standing as stakeholders and participants in decision making. In the case of a patient advisory body, guidelines should outline the topics within the group's scope, including how input and recommendations will be documented. Most importantly, the guidelines should identify specific points in DPNP processes where advisory groups have complete or partial decision authority and provide a detailed outline of these processes.

Similar steps are required to ensure that evidence submitted on patient experience, patient preferences, and similar topics is included in negotiations, especially in the context of determining unmet need, degree of therapeutic advance, and comparison to alternative therapies. Such evidence is frequently dismissed or discounted in similar contexts due to perceived lack of rigor relative to other evidence or lack of experience incorporating qualitative data. DPNP guidelines should specify measures to ensure consistent inclusion of patient experience data.

Measures include:

- Inclusion of patient researchers in CMS evaluation teams.
- Explicit frameworks for evaluation of evidence and weighting in reviews.
- Guidelines for mixed-method approaches designed to account for qualitative evidence.

Clarity and specificity in methods and overall approach are needed

While a “qualitative approach” to evaluating evidence on a given drug provides CMS staff with needed flexibility, greater transparency into this process is needed.

As a research organization grappling daily with the challenges and complexity of comparing medical technologies in the context of HTA, IVI recognizes the need for flexibility in CMS’s approach (as outlined in sections 50 and 60) when evaluating evidence, conducting analyses, and evaluating therapies in negotiations. To ensure transparency, predictability, and consistency, however, a flexible and “qualitative approach” should be conducted within a methodological framework describing types of data and evidence to be used, guidelines for evaluating and prioritizing evidence, procedures for engagement with external parties, methodological guidelines (especially for mixed-method approaches), and other relevant subjects. Articulating these considerations will provide consistent guidance to CMS teams working in varied therapeutic areas, increase the relevance and usability of evidence submitted to CMS, and provide the transparency necessary to ensure both rigor and accountability.

As part of this descriptive framework, the initial guidance should include greater detail on a number of methodological subjects, including:

- **Therapeutic advance:** Provide clear definition and outline the methods for measurement and evaluation
- **Clinical benefit:** Provide more details on how “clinical benefit” will be translated into “adjusting the starting point” for negotiations. For example, adjustment amount and how patient input will contribute to this definition
- **Unmet need:** Provide clear definition, including steps for consideration of health equity, and outline the methods for measurement and evaluation

- **“Other factors” to be considered:** Further define what “other factors” CMS would consider. These should include patient lived experience as well as additional elements of value, including both patient-level elements, for example non-clinical and economic impacts, caregiver burden, and patient preferences. and elements of value from the societal perspective, including scientific spillovers, impacts on innovation, real-option value, insurance value⁶
- **Modeling and analysis:** Describe whether and in what ways simulation modeling, decision analyses, or other approaches may be used for therapy evaluation

Finally, the potential discriminatory effects of the quality-adjusted life year (QALY) are well-documented, but it remains the most widely accepted methodological tool for incorporating impacts on quality of life alongside life extension. The guidance currently underscores the risks of discrimination without recognizing this methodological need, describing ongoing efforts to identify other potentially discriminatory metrics for exclusion from CMS consideration. The guidance fails to recognize both the methodological role of the QALY and the importance of developing alternative methodologies. CMS should revise the guidance to reflect these considerations, encourage research to advance alternative metrics, and outline a process for considering use of new metrics in DPNP negotiations. The guidance also states that CMS will consider evidence from studies where the QALY evidence is “clearly separated,” but the meaning and intent of this statement are unclear. Greater clarity is needed to prevent confusion on the part of researchers and stakeholders interested in submitting evidence, and to ensure evidence submitted is aligned with CMS expectations.

DPNP guidance must be informed by forward-looking strategic considerations

In an environment where availability of evidence and methodologies lags behind the needs of comprehensive value assessments, CMS must endeavor to spur innovations that advance the field, for example, by calling for data on relative treatment effects across patient subpopulations and encouraging exploration of novel methods to capture quality-of-life outcomes as an alternative to QALYs.

IVI is founded on the belief that a patient-centric, value-driven healthcare system is possible with the collaboration, inclusion, and investment of all stakeholders. CMS has a unique opportunity to move that vision forward in its implementation of the Medicare DPNP.

We call on CMS to embrace this opportunity. The steps implemented to engage and include diverse populations of patients in negotiation processes can set a higher standard for private health plans. Demonstrating mixed-method approaches to

evaluation may drive increased incorporation of patients' lived experience, while the outcomes and other factors considered in the process will shape both the priorities of the research community and the evidence it produces.

We appreciate the opportunity to provide input on this important issue. Please do not hesitate to contact me or Mark Linthicum, Director of Policy, at mark.linthicum@thevalueinitiative.org for further discussion.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance

The Institute for Clinical and Economic Review (ICER) is pleased to provide comments on the [Medicare Drug Price Negotiation Program Guidance Initial Memorandum](#). ICER is an independent non-profit research organization that evaluates medical evidence and convenes public deliberative bodies to help stakeholders improve patient outcomes and control costs. Our reports are used by the Veterans Administration and by most Medicaid and private insurance plans to help inform their formulary determinations and to support drug price negotiation. As part of the international community of health technology assessment organizations, we also participate in many activities related to the development of methods of evidence assessment, cost-effectiveness analysis, and public deliberation that can support governments in achieving affordable access to high-value care.

We have comments related to several key issues within the draft guidance:

Issue 1: Section 50.2. “CMS is soliciting comment on other metrics, in addition to QALYs, that may treat extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill and that CMS should also exclude from consideration when developing offers and reviewing counteroffers.”

Comment: There are widely-recognized metrics other than the QALY that can be used for comparative clinical effectiveness and cost analyses that meet the intent of the IRA statute. Prominent among these alternatives is the “equal value of life years gained,” or evLYG. The evLYG was designed to weigh the value of extended life of all individuals in exactly the same way, with each year of life gained from treatment valued the same, thereby eliminating any risk of valuing extended life lower for conditions in which people are elderly, disabled, or terminally ill. The evLYG metric is not the only non-QALY alternative that meets this standard, but the evLYG has served for many years as the bedrock of ICER’s drug price benchmarks that are used by the Veterans Administration, Medicaid programs, and most private insurers. The evLYG has also gained acceptance in state legislation as a non-discriminatory alternative to the QALY, and legislative language allowing the evLYG has been supported by a prominent disability rights group in Massachusetts. We provide further rationale that support the view that the evLYG is consistent with IRA statute and will be helpful for CMS in its deliberations below.

Recommendation: *We propose that CMS clarify that research using non-QALY alternatives such as the evLYG that value each year of extended life equally, irrespective of whether an individual is elderly, disabled, or terminally ill, meet the statutory standard for consideration by CMS in its drug price negotiations under the IRA. CMS should stipulate, however, that it will not consider any evidence that separates populations eligible for treatment into subpopulations by age or level of ability/disability to generate different findings for the purposes of determining the maximum fair price.*

Further Rationale:

- 1. *The evLYG measure was developed specifically to address concerns about the QALY. It values any extended life from treatment in the same way for all individuals.***

CMS is likely to hear from some groups that there is no summary measure of health gain that meets the statutory standard, or that there are potential measures that would be non-discriminatory but that are in development and have not been previously used or accepted by the broader health economics community. We argue that there are measures that meet the statutory language and intent that are ready for use as part of the evidence that can help CMS construct and justify initial price offers. Specifically, the [equal-value of life years](#) gained (evLYG) metric was designed with the explicit intent to address concerns about the QALY's potential to devalue extended life. The first-known version of the evLYG was created by [Nord et al.](#), who more than 20 years ago developed the "equal value of life" measure in which any extension of life attributed to an intervention is valued at a quality-of-life weight of 1, or ideal health. This measure did not gain widespread use, and since Nord's efforts, most approaches to addressing discrimination concerns regarding the QALY have emphasized the role that deliberative processes should play in integrating important social values into any application of cost-effectiveness to public policy. However, in 2018, recognizing the concerns about the QALY from some patient groups and policymakers, we developed a variation of Nord's earlier approach that we named the evLYG. The key difference between the evLYG and QALY is that the evLYG assigns a single, uniform utility (i.e. rating of quality of life) to each increment of extended life provided by an intervention compared to its comparator. Unlike Nord, the evLYG does not assign a utility of unrealistic ideal health to time during life extension. Instead, the evLYG assigns to time in extended life a utility that reflects the norm of the entire U.S. general population. No matter the age or health status of patients with the condition, if a treatment extends life it will be credited with the same value for each unit of time. Some commentators have claimed that the evLYG meets concerns about discrimination by the QALY by sacrificing the ability to measure quality of life, but this is a misunderstanding. The evLYG treats extended life in the same way across all conditions but also fully values the relative effects of different treatment options on improvements or decrements in quality of life during all time that is not attributed to an intervention's added survival.

- 2. *Leading academics affirm that the evLYG values extended life in a non-discriminatory fashion consistent with IRA statute.***

Richard Frank and Len Nichols, leading health economists associated with Brookings Institution, recently shared their thoughts on [threats to Medicare's new drug negotiation power](#) and highlighted that the evLYG has been "employed in numerous settings for reasons precisely consistent with Congressional intent and would be available to HHS for use in the negotiations set out in the IRA." Other academics have voiced similar views. Peer-reviewed [research](#) conducted by University of Washington academics confirms that the evLYG and another non-QALY measure of health gains named the Health Years in Total weigh any time of extended life the same for all individuals. This

means that there is no risk of devaluing a treatment for anyone, including the elderly, disabled, or the terminally ill. Further, leading cost-effectiveness academics at Tufts University have recently published an [article](#) emphasizing that the evLYG and Healthy Years in Total “place the same value on additional years of life across diseases and populations.” In an [earlier article](#), these academics specified that “For those uncomfortable with QALYs, evLYG assessments offer what they might regard as “fair” or “equal” evaluations, assigning an equal value to life extension regardless of the patient’s current state of health.

There are potential limitations to any summary measure of clinical effectiveness that combines the impact of treatment on length of life and quality of life, but the evLYG has been acknowledged by academics as an alternative to the QALY that meets the primary goal of valuing extended life the same way for all individuals, thus avoiding the QALY’s risk of discrimination in valuation of extended life for treatments of the elderly, people with disabilities, and the terminally ill.

3. *Leading disability groups have not labeled the evLYG as being discriminatory, and in at least one case have supported legislation with language that would clearly allow use of measures that value extended life in a manner consistent with the evLYG.*

The [National Council on Disability](#) (NCD) produced a report on the QALY and its “devaluation” of life with disability. In that document they mention the evLYG but do not label it as discriminatory. In a subsequent [report](#), the NCD evaluated non-QALY alternatives, and while they comment on potential limitations of the evLYG and all other non-QALY alternative measures, they do not label the evLYG as discriminatory. On page 8 of this report, they acknowledge that the evLYG values extended life the same for all individuals: “Under ICER’s modified version of the EVL approach, the evLYG, any extension of life is valued the same across every population, at a quality-of-life weight of the general population.” Similarly, the Disability Rights Education & Defense Fund published an earlier [report](#) in 2021 that does not describe the evLYG as discriminatory. In fact, the authors of this report note on page 6 that “the evLYG eliminates the risk of undervaluing life-extension for people with disabilities...”

Finally, in Massachusetts, the Disability Policy Consortium, a major organization advocating for the disability community, is a leading supporter of a Crisis Standards bill ([H.1180](#)) containing language that would prohibit the use of the QALY while firmly allowing use of the evLYG and other similar measures that do not devalue extended life from treatment. This language is shown below:

For any public or private entity, or agency of the commonwealth, when determining whether a healthcare treatment should be available within a formulary, or determining the value of a healthcare treatment, to employ a measure or metric which assigns a reduced value to the life extension provided by a treatment based on a pre-existing disability or chronic health condition of the individuals whom the treatment would benefit.

This language was developed in discussions between the Disability Policy Consortium and ICER in 2022 with an explicit mutual acknowledgment that it would prohibit the QALY while allowing use of the evLYG as an alternative that would not have discriminatory implications for people with disabilities. Thus, the evLYG stands out as a metric that was developed to address the risk of devaluation of extended life and has been viewed by multiple groups advocating for people with disabilities as not having the same discriminatory risk posed by the QALY.

- 4. Several states have adopted legislation to guide prescription drug affordability reviews with safeguard language that has the same intent as that in the IRA: prohibiting the QALY but retaining the ability to use other measures such as the evLYG that do not devalue extended life for the elderly, those with disabilities, or those with terminal illness.**

Several states have considered ways to address prescription drug costs using measures other than the QALY. Following testimony from disability groups and others, Washington state passed a law creating a [Prescription Drug Affordability Board](#) with safeguard language prohibiting the QALY that would still allow measures such as the evLYG: “The methodology determined by the board must not use quality-adjusted life years that take into account a patient’s age or severity of illness or disability to identify subpopulations for which a prescription drug would be less cost-effective. For any prescription drug that extends life, the board’s analysis of cost-effectiveness may not employ a measure or metric which assigns a reduced value to the life extension provided by a treatment based on a preexisting disability or chronic health condition of the individuals whom the treatment would benefit.” Oregon has also established a Prescription Drug Affordability Law with [similar language](#) that would prohibit use of evidence based on the QALY but allow research based on the evLYG: “For any prescription drug that extends life, the board’s analysis of cost-effectiveness must weigh the value of the quality of life equally for all patients, regardless of the patients’ age or severity of illness or disability.”

These laws and some pending legislation, such as that establishing a Prescription Drug Affordability Board in [Vermont](#), are good examples of how state authorities designing safeguards with the same intent of the IRA statute have adopted similar yet more detailed terms that would prohibit use of the QALY while retaining the ability to use summary measures such as the evLYG to support comparative clinical effectiveness and cost comparisons that are essential to the full function of a drug price negotiation effort.

- 5. CMS has already stated that it intends to consider measures of treatment success such as “survival.” The evLYG incorporates considerations of the number of years gained from treatment in the same way as this widely-accepted measure.**

In section [60.3.3.1 of the CMS Initial Guidance document](#), CMS provides information about measures that will be included within the scope of comparative effectiveness evidence: “CMS intends to consider health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience when reviewing the clinical benefit of the selected drug and its therapeutic alternative(s). When reviewing such information, as noted above CMS will not

use evidence in a manner that treats extending the life of any individual as lower value than the life of another individual; this includes QALYs when used in association with life extension. Health outcomes such as cure, **survival**, progression-free survival, or improved morbidity could be considered when comparing the selected drug to therapeutic alternatives.”

Common comparative survival outcome measures, such as 5-year survival among patients with cancer, are expressed as life years gained when comparing the selected drug and its therapeutic alternative(s). 5-year survival therefore varies and is influenced by the starting age among individuals who take the same drug. But it seems unreasonable to argue that survival measures could therefore be used “in a manner that treats extending the life of any individual as lower value than the life of another individual.” 5-year survival outcomes weigh extended life in the same way – each year of extended life is counted as a year no matter what the condition is or how old the patients are with that condition. This is the same approach used by the evLYG. By specifying in the draft guidance that survival and thus life years gained would be considered as part of the evidence on comparative clinical effectiveness, CMS is demonstrating its reasonable interpretation that extended life can be measured fairly across conditions and individuals of different ages. This interpretation would encompass the conclusion that the evLYG does not treat extended life as lower value for the elderly any differently than 5-year survival outcome measures.

Issue 2: Section 60.3.2. “Specifically, CMS is soliciting comments on the advantages and disadvantages of using net prices and/or ASPs as the starting point for the initial offer for selected drugs with at least one therapeutic alternative and the Federal Supply Schedule or Big Four price for selected drugs with no therapeutic alternative or for selected drugs with therapeutic alternatives with net prices and/or ASPs greater than the statutory ceiling. CMS is also soliciting comment on other starting points for the initial offer, including but not limited to other domestic reference prices, along with their disadvantages and advantages. Lastly, in the event that there are multiple therapeutic alternatives for the selected drug, CMS is soliciting comment on how to consider the range of net prices and/or ASPs and utilization of each therapeutic alternative to determine a single starting point for developing the initial offer.” (p. 49-50).

Comment: CMS faces a difficult challenge in designing a consistent process for determining relevant comparators and using comparisons with those comparators to arrive at the initial offer that reflects the overall goal of achieving “the lowest maximum fair price for each selected drug.” Reference pricing has been proposed by CMS as the anchor to its approach. Reference pricing can be done “internally” within the prices paid by a single payer for a set of drugs, with the general intent being to reduce the price of a particular drug to that of a lower priced, equivalently effective drug. Reference pricing can also be used to describe an “external” approach of selecting a lower price for a given drug from among the prices paid by other payers, as in international reference pricing. For the purposes of our comments and recommendations below, we will primarily focus on internal reference pricing within a set of drugs paid for by CMS, but we recognize that CMS is also considering external reference pricing to prices paid by other payers such as the VA and the Big Four, and may receive comment suggesting even broader external reference pricing to foreign countries.

Internal reference pricing of a drug against its comparators is relatively straightforward when the evidence is judged not to demonstrate any clinical advantages for the drug in question. In that case, the drug can be set at the same price as the comparator or a “basket” of comparator drugs. But real problems arise when there are no drugs that can be viewed as reasonable clinical comparators. It is also problematic to use internal reference pricing to a single or multiple comparators when these comparators themselves are priced far above reasonable value in relation to their clinical benefits for patients.

One could argue that the conceptual intent of the IRA drug negotiation statute was to address the market “failure” that occurs when a drug has no generic or biosimilar competition despite many years in the market. Following that logic, it would seem reasonable to assume that simple reference pricing to other brand name drugs, or even reference pricing outside CMS to lower prices paid for the same drug by the VA or the Big Four, would not represent what a true “generic” price should be. Therefore, some might argue that CMS should decide that lowest maximum fair price for every drug will be a price reflecting only the marginal cost of production of the drug today, with some slender “profit” margin on top. However, this approach would be the most radical available to CMS, and the downside to this “generic pricing” model is that it would reduce prices so dramatically that the manufacturer might see

little reason to continue marketing the drug. For that reason, other alternatives should be considered, although one could still argue that if a drug under negotiation has multiple comparators with the same mechanism of action and identical side effect profiles, a true generic pricing approach would not present a great risk to patients given that they could switch to other drugs with comparable outcomes if the manufacturer chooses to remove the drug under negotiation from the market.

If a true generic pricing approach is not taken, how else could CMS apply a consistent approach to determine a maximum fair price lower than the ceiling price established by statute for a drug that is superior to its comparators? CMS could develop an arbitrary system in which it assigns a certain % higher price over the comparator for each categorical degree of clinical superiority. For example, a drug determined to be “incrementally” superior could get 10% higher price than its comparator, whereas a drug that is “moderately” superior could get 15% higher pricing. But there is no economic justification for any particular magnitude of % increases unless the increases are scaled to the magnitude of the clinical benefit in a reliable, transparent manner. In addition, a blunt % additive approach would also fail to address the problem of pegging prices for negotiated drugs to comparators that are themselves overpriced in relation to clinical value.

This is where cost-effectiveness techniques offer advantages that could prove useful. Value-based, or “threshold” prices could be generated for every drug under negotiation, whether there are no comparators or multiple comparators. These results could supplement any reference pricing approach to provide an alternative set of prices to consider as an initial offer price. When the judgment of the clinical evidence is that there are no meaningful differences between a drug under negotiation and its comparator, the results of internal reference pricing and cost-effectiveness threshold pricing will be essentially the same; but when there are advantages and/or disadvantages between the drugs, a cost-effectiveness threshold price can give a scaled pricing recommendation that would provide CMS with additional evidence-based options from which to select an initial offer price. In the Recommendations below we set out a brief description of how cost-effectiveness analysis could be woven into the CMS process and address several of the conceptual and practical challenges that would be involved.

Recommendations:

No matter what method CMS ultimately uses, there will be three main phases: 1) determining the indication(s) and comparator(s); 2) judging the evidence; and 3) using the evidence to determine prices eligible for consideration as the initial offer price.

1. Determining the indication(s) and comparator(s).

Determining comparators for clinical and cost comparisons will be one of the most challenging aspects of determining an initial offer price. There are three different situations: 1) no active drug comparator; 2) a single drug comparator; and 3) multiple comparators. In some situations, it may be that some patients with a condition are treated with surgery or a procedure whereas others are treated with a comparator drug. This is the case, for example, with hypertrophic cardiomyopathy. Whether patients may be treated with other drugs, surgery/procedures, or just “supportive care,” CMS will face difficult

choices about which alternative treatment options should serve as formal comparators. If too many comparators are selected, the burden on both the drug maker and CMS gathering and evaluating evidence could become extreme. And the number of comparators for each drug under negotiation may expand with the number of indications that CMS decides to evaluate as part of its determination of an initial offer price. We therefore propose the following decision rule as one that CMS could adopt to create a consistent and transparent approach that still leaves enough flexibility to manage less common situations. Thresholds for selection of indications and comparators are arbitrary but are suggested as representing a compromise between the goals of comprehensiveness and feasibility:

- A. For drugs with multiple indications, if the most common indication accounts for >75% of use among Medicare beneficiaries then CMS can perform its entire evaluation based on that single indication. If this is not the case, then CMS should select the top two indications by use among the Medicare population. This information should be determined by analysis of CMS data.
- B. For each indication, CMS should select no more than two comparators for determination of its initial offer price.
- C. The first comparator should be the lowest cost alternative treatment recognized as a reasonable alternative by clinical guidelines and/or the expert opinion of specialist clinicians and patient groups, whether that treatment is another drug, a procedure/surgery, or supportive care. CMS may wish to set a minimum use threshold for eligibility of a potential comparator to ensure that comparators have face validity with clinicians and patients.
- D. The second comparator should be the second lowest cost alternative treatment recognized as a reasonable alternative for use in that indication by clinical guidelines and/or the expert opinion of specialist clinicians and patient groups.
- E. Instead of the second lowest-cost alternative treatment, CMS could consider selecting as a second comparator the most commonly-used alternative treatment. The advantage of this approach is that it would enhance face validity with clinicians and patients and may be more likely to be more similar in its level of benefits and risks to the drug under negotiation, facilitating a simplified reference pricing approach. The disadvantage of this approach would be the risk that the most commonly-used alternative is not reasonably priced itself, limiting the ability of CMS to identify a lower price that would be reasonable to consider as a maximum fair price.

2. Judging the evidence.

Once the indication(s) and comparator(s) have been determined, the next phase requires CMS to judge the evidence on comparative clinical effectiveness. For this purpose, CMS can choose to emphasize comparisons of individual clinical outcomes, including both benefits and harms. However, CMS may also find it useful, especially when drugs under negotiation and their comparators have differing sets of benefits and/or harms, to evaluate comparisons of summary clinical outcomes such as the evLYG. Summary measures will provide another perspective on what will otherwise be a relatively qualitative comparison of the overall net health benefit provided by the drug under negotiation and its comparators.

CMS also has the choice on whether to use qualitative language to describe its judgment of the evidence or to use discreet categories of comparative clinical effectiveness. For example, health technology agencies in Germany and France, and ICER in the US, have categories of comparative clinical effectiveness, such as “comparable” or “minimal added benefit.” Making a categorical determination of this type requires a clear set of categories with general language distinguishing the thresholds between them. CMS may not have time to develop a new scheme of this type and so may wish to consider adopting one of the existing frameworks. One advantage of an ordered categorical approach is that it creates a mechanism for greater reliability and transparency of decision-making versus qualitative language alone. Another advantage is that categories of comparative clinical effectiveness can be linked explicitly to reference pricing, with each category associated with a specific price % difference (if any) from the comparator. The downside of a categorical approach is that it is difficult to combine considerations of benefit, risk, and uncertainty in a way that provides adequate flexibility for different comparisons, but our judgment is that CMS will be able to support its rationales for initial offer pricing more effectively if it adopts a categorical approach to judging the evidence on comparative clinical effectiveness versus qualitative language alone.

3. Using the evidence to determine the initial offer price.

Once the evidence on comparative clinical effectiveness has been judged, CMS can translate that into initial offer prices through several mechanisms, each of which, under different circumstances, may offer the preferred route to a lowest maximum fair price. We propose that CMS would benefit from adopting two mechanisms: 1) a reference pricing approach; and 2) a cost-effectiveness threshold approach.

Each of these mechanisms would function differently depending on the nature of the comparator(s) and the judgment of the comparative clinical effectiveness. A reference pricing approach is easiest when CMS judges the evidence not to demonstrate clinical superiority of the negotiated drug over its comparator. In that case, reference pricing would suggest that the price of the negotiated drug should be set at the same level as the comparator. A cost-effectiveness threshold approach, however, would allow both the negotiated drug and its comparator to be compared to each other and to care without active treatment. This kind of analysis may suggest that both drugs are overpriced in relation to their added clinical benefits, and therefore suggest an initial offer price even lower than the reference price of the lowest cost comparator. Having both a reference price and a cost-effectiveness threshold price would provide CMS with perspective on fair pricing and on their choices for framing an initial offer price.

The advantages of having both mechanisms provide potential initial offer prices are even clearer when the negotiated drug is judged to be clinically superior to its comparator. As noted earlier, even a categorical reference pricing method cannot provide a consistent, transparent mechanism for suggesting an initial offer price unless an arbitrary “added % price” is determined for each category of comparative clinical effectiveness. Cost-effectiveness threshold pricing, however, consistently translates added clinical benefit into a price that is scaled in a consistent, transparent manner over the price of the comparator. CMS could consider a single cost-effectiveness threshold price or a price range by using

traditional cost-effectiveness ranges of \$100,000-\$150,000 per evLYG. As noted earlier, having potential initial offer prices generated through a reference pricing approach and a cost-effectiveness threshold approach gives CMS more flexibility to address all the different permutations of comparators and judgments about comparative clinical effectiveness. Using both methods would give CMS the tools to address situations when there are no true comparator drugs and when the prices paid for comparators or the prices paid by the VA or other Big Four entities do not adequately represent prices commensurate with the clinical value of the negotiated drug.

The primary challenge with adopting a two-method approach is that CMS is not staffed to develop cost-effectiveness models for all the drugs it will be negotiating, at least for this first cycle. If a cost-effectiveness threshold approach is considered, the first cycle of negotiation would need to rely on cost-effectiveness results from outside sources or from the drug makers themselves. Even if CMS is not fully prepared to generate or vet cost-effectiveness information in this first cycle of negotiation, we would propose that it set out guidance that would allow for this function in the future, and that in the short term it seeks to build enough internal capacity to vet the cost-effectiveness results that may be submitted by drug makers themselves.

In summary, we encourage CMS to develop as clear a process as possible, with decision algorithms that provide external clarity for drug makers and other stakeholders while buttressing CMS's ability to justify the rationale for its initial price offers on each negotiated drug. We believe that categorical approaches to judging comparative clinical effectiveness will best support a broader effort to enhance consistency and transparency, and we propose that a dual mechanism of reference pricing and cost-effectiveness threshold pricing be implemented to give CMS the full range of evidence-based tools to translate comparative clinical effectiveness judgments into initial price offers under differing scenarios of drugs, indications, and comparators.

Issue 3: In the Section 60.3.2, CMS suggests benchmarking prices based on net prices for Part D drugs with at least one therapeutic alternative.

Recommendation: We suggest that any starting position, such as the net prices for Part D drugs, be freely available to the public. Without open public access to Part D drug net pricing, it will be challenging for CMS to receive actionable public comment on comparative analyses given the starting point will be unknown.

Issue 4: In Section 60.3, CMS is silent on whether or not a drug that is associated with health system cost offsets (e.g. reduced hospitalization costs or reduced health care services) when compared to its therapeutic alternative shall be a factor in drug price negotiation. Economic theory and corresponding value assessment best practices support the inclusion of health system cost offsets in estimating a value-based price.

Recommendation: We suggest CMS request evidence beyond the net price of therapeutic alternatives to include all health system costs associated with the drug of interest and its therapeutic alternatives.

Issue 5: In Section 60.3.3.2, CMS provides the following interpretation of unmet medical need, “A selected drug will be considered to meet an unmet medical need for an indication included in the analysis in cases where limited or no treatment options exist.”

Recommendation: We suggest CMS allow for a broader definition of unmet medical need to include situations when treatment options may exist, but the patient population remains far from achieving the health of the general US population. Methods exist whereby unmet medical need is quantified through [shortfall](#) approaches that compare the general population’s expected health to that of the patient population prior to the introducing the health impacts from the drug of interest. These shortfall calculations can be done with non-QALY measures of health gain such as the evLYG or Healthy Years in Total.

RE: Medicare Drug Price Negotiation Program Guidance

Dr. Meena Seshamani
Deputy Administrator and
Director of the Center for Medicare
Department of Health and Human Services
7500 Security Blvd.
Baltimore, MD. 21244-1850

Dear Director Seshamani:

I and my colleagues at the Institute for Policy Innovation (IPI) would like to thank the Center for Medicare for this opportunity to comment on how pharmacy benefit managers affect drug access and affordability.

The Institute for Policy Innovation is a non-profit, non-partisan public policy “think tank” based in Irving, Texas, and founded in 1987 to research, develop and promote innovative and non-partisan solutions to today’s public policy problems. IPI is a public foundation, supported wholly by contributions from individuals, businesses and other non-profit foundations.

The Inflation Reduction Act, signed into law last year, introduced unprecedented changes to the Medicare Part D prescription drug benefit. For the first time, the government is empowered to directly negotiate prices for certain high-cost drugs covered by Medicare. On March 15, the Centers for Medicare & Medicaid Services released "initial" guidance describing how it proposes to implement its new price-setting authority.

What CMS proposes in this 91-page memo should alarm patients and physicians, as well as advocates for government transparency and accountability.

By way of background, I am a resident scholar with the Institute for Policy Innovation, a non-profit, non-partisan public policy "think tank" based in Irving, Texas, and founded in 1987 to research, develop, and promote innovative and non-partisan solutions to today's public policy problems. I am also a past president of the Health Economics Roundtable for the National Association for Business Economics, the largest trade association of business economists. The guidance sets forth vague standards for how it will identify which drugs are subject to price controls, while severely curtailing input from patients or their doctors. It grants vast discretion to government bureaucrats to decide the price-setting process, while requiring negotiations take place behind closed doors, leaving the public in the dark. Yet despite the momentous changes CMS envisions to Medicare -- changes CMS itself calls "novel" and "complex" -- it has limited the public comment period to just 30 days, half the time typically provided.

The Biden Administration justifies this power grab by claiming its drug pricing provisions will save the government \$237 billion over 10 years. Yet [according](#) to the nonpartisan Congressional Budget Office (CBO), government price controls largely achieve their lower costs by narrowing or restricting the choice of medications available to patients. Many analysts predict that the program will only achieve its savings targets if it forces patients to switch away from medicines they have relied on for months or years.

Medicare beneficiaries won't be the only ones impacted. Given the size of its patient population, Medicare will exert a significant downstream effect on private plans with its drug pricing decisions. All patients will feel the brunt of stifled innovation, as fewer new cures and treatments are developed.

A CBO [analysis](#) of a similar bill predicted that return on investment for new drugs would drop by 15 to 25 percent after Medicare price controls are implemented -- resulting in 30 fewer new medicines by 2029. An [analysis](#) by Tomas Philipson at University of Chicago predicted that 135 fewer drugs would launch by 2039.

The stakes are too high to prematurely cut off debate. Patients, physicians, and other stakeholders must have sufficient time to weigh in. Instead, CMS is trying to rush the process, ruling that certain key provisions in its guidance -- such as which types of drugs are eligible for price-setting -- are already "final" and thus not subject to *any* public feedback.

In some cases, CMS is even overreaching its statutory authority. Congress exempted from price negotiations drugs which have been on the market for fewer than nine years (for small-molecule drugs) or 13 years (for biologics) -- yet CMS claims it can negotiate prices for drugs that have not yet reached the end of the patent-protection period provided by Congress -- and again, argues that its determination is "final."

What space CMS does provide for patient and physician input is plainly inadequate. Under its proposed guidance, once CMS selects a drug for price negotiations, patients and physicians will only be invited to share their perspectives during a general "information collection request" (ICR). This ICR will take place before crucial data is shared, such as what treatment alternatives

are available or which drug indications or disease outcomes might be relevant. Using the ICR itself suggests the pro forma character of this process, as ICRs are typically used by the government to collect technical data. Clearly, CMS does not intend to place much value on patient or physician viewpoints.

How will CMS ascertain a drug's "fair" price? It proposes to compare a selected drug not to a bioequivalent, but to all drugs that treat the same condition or have a similar therapeutic effect. It will then base its price on the lowest-priced drug in that therapeutic class. This pricing scheme is supposed to shift drugmakers away from developing the so-called "me-too drugs" that follow on a medical innovation. Yet, as patients and doctors know all too well, medications are not interchangeable, and patients with the same disease may respond very differently to a particular drug. Besides, these so-called me-too drugs provide valuable competition for the original products. Many patients work with their physicians over a long period of time to find the right combination of medications that adequately treats their condition and limits side effects. Nor is a first-in-class drug necessarily the best. Lipitor and Crestor were the fourth and fifth statins approved by the FDA, yet these "me-too drugs" have proven more effective in treating heart disease than earlier medications.

But the public will not be privy to many key details on how the CMS determines a drug's price. CMS rules require that drugmakers keep confidential all negotiation discussions, including the price CMS offers and any justification it provides for its price. Moreover, drugmakers must destroy all information received from CMS during negotiations within 30 days after a drug no longer qualifies as a selected drug. These requirements would run afoul of FOIA and government record-keeping rules, and they could even constitute a prior governmental restraint on speech.

This lack of transparency will hinder efforts to hold government accountable. While drugmakers have a strict 30-day window to submit data on a drug and to accept an offer, CMS only has to share a public explanation for its price more than a year after soliciting initial feedback and six months after a drug's price is published. In the meantime, drugmakers will be muzzled by confidentiality rules from raising concerns about CMS errors or methodological problems.

The Inflation Reduction Act failed to reduce inflation, but it could jeopardize the rare government program that achieves high levels of public approval. A survey last year found that nearly 90 percent of seniors say they are satisfied with their Medicare Part D coverage. Yet the Biden Administration has proposed to radically change the program, potentially limiting patients' access to life-saving medicines and endangering future cures. Nearly 50 million Americans rely on Medicare Part D. The program must not be drastically changed until their voices have a chance to be heard.

Sincerely,

Merrill Matthews, Ph.D.
Resident Scholar
Institute for Policy Innovation

INSTITUTE FOR REGULATORY ANALYSIS AND ENGAGEMENT EST. 2021

MEMORANDUM

To: Dr. Meena Seshamani, MD PhD, Director, Centers for Medicare & Medicaid Services
From: Andrew Langer, Chairman, Institute for Regulatory Analysis and Engagement
Date: April 14, 2023
Re: Comments Regarding Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments, published by CMS on March 15, 2023

Director Seshamani:

The following are the comments of the Institute for Regulatory Analysis and Engagement (IRAE) on the United States Department of Health and Human Services/Centers for Medicare & Medicaid Services' (CMS) Guidance regarding the Medicare Drug Price Negotiation Program, published March 15, 2023 (found online at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>).

IRAE is a non-profit, non-partisan research, education and advocacy organization. Our mission is to inject a common-sense perspective into the regulatory process, to ensure that risks and costs of regulation are fully considered based on sound scientific and economic evidence and to ensure the voices, interests and freedoms of Americans, and especially of small business, are fully represented in the regulatory process and debates. Finally, we work to ensure that regulatory proposals address real problems, that the proposals serve to ameliorate those problems, and, perhaps most-important, that those proposals do not, in fact, make public policy problems worse.

We are especially interested in issues with a fundamental constitutional bearing, as this proposal certainly is. While many regulatory analyses start and end with an underlying statutory framework and how a proposed rule aligns with an agency's obligations under the Administrative Procedure Act, this analysis also discusses how CMS' proposed guidance has further constitutional implications.

It is our opinion that the Guidance offered by CMS does precisely that—it fails to ameliorate the problems it is supposed to address, instead will making matters far worse, while at the same time having constitutional implications.

IRAE offers the following:

- The program forces manufacturers to comply with data-sharing limitations that constitute a clear violation of their First Amendment right to free speech. Additionally, the methodology proposed for determining drug prices is fundamentally flawed. The provisions stipulated in the propose guidance will impose needlessly onerous burdens on U.S. drug manufacturers and ultimately hurt patients.
- According to Section 40.2.2 of the guidance (Data Use Provisions and Limitations), manufacturers would be prohibited from disclosing to the public any information from negotiations with CMS. This includes information about ceiling-price offers, CMS's justification for its offers, or any information derived from the process. This would infringe on the free-speech rights of manufacturers and is at direct odds of open and transparent government.
- CMS proposes onerous, draconian measures to enforce this secrecy. For example, audio and video recordings of conversations between CMS and manufacturers would be prohibited. This completely ignores the reality of corporate operations in the modern age, where digital records are a normal part of interoffice communication.
- Similarly, CMS places an unreasonable demand on manufacturers by requiring that they certify within 30 days the destruction of all information from the negotiation period -- including the manufacturer's own written notes and emails -- should a drug or biologic no longer qualify as a selected drug.

It should also be noted that Section 40.2.2 would almost certainly be rejected by the courts. The Supreme Court has consistently and correctly struck down prior restraints of speech. IRAE finds it interesting that this is yet another rulemaking in 2023 alone that has the Biden Administration at odds with the First Amendment, and the second time in as many months that IRAE has expressed such concerns with a subdivision of the Department of Health and Human Services.

Which begs the question: why is this administration, why is this federal agency, so focused on impinging on the First Amendment rights of American citizens?

What the guidance seems to require is also in conflict with the Freedom of Information Act and the Biden administration's state transparency principles. While the information that the government would presumably accrue during the negotiation period would be subject to FOIA, manufacturers would be compelled to destroy the very same information and would be prohibited from sharing it with the public.

America's pharmaceutical industry relies on a thriving, collaborative exchange of ideas with scientists, lab workers, patients, and government regulators. Left unamended, Section 40.2.2 will

handicap this exchange of ideas. By prohibiting manufacturers from sharing information about the negotiation process, CMS prevents them from pointing out flaws or methodological problems and educating other manufacturers and stakeholders.

We also have serious concerns regarding how CMS plans on setting maximum fair prices of selected drugs and biologics. According to Section 60.3, Methodology for Developing an Initial Offer, CMS will develop offers based on similar "therapeutic alternatives" for the selected drug and rely on the alternative's net price and average sales price (based on Medicare Part D) to determine a starting point. This is wholly inappropriate, as comparing one drug to a "similar" therapeutic is bound to lead to clinically unsuitable results, given the broad range of unique needs and preferences of patients.

CMS must consider the chilling effect that Section 40.2.2, Date Use Provisions and Limitations, will have on the U.S. drug manufacturing industry, and to eliminate any component of this section that would infringe upon the constitutional First Amendment rights of manufacturers. We also urge CMS to propose a more sensible and accurate method for determining drug pricing.

Without significant revisions, the Drug Price Negotiation Program will throttle, not promote, innovation.

Conclusion

This proposal is bad policy. It fails to address the underlying problem it is trying to solve, will most-likely make that problem worse, and at the same time has serious implications for federal freedom of information law generally and the First Amendment to the Constitution of the United States.

CMS should withdraw this proposal and rework it entirely.

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani,

Thank you for this opportunity to comment on the Initial
Memorandum for Implementation of the Medicare Drug Price
Negotiation Program.

All Americans share the goals of reducing the costs of healthcare, in
particular, the cost of drugs, while preserving access to the life-
extending and often life-saving benefits of the drugs that treat
cancer, heart disease, Alzheimer's, autoimmune conditions, and so
many other lethal diseases.

We applaud many aspects of the Inflation Reduction Act that will
cap out-of-pocket costs, eliminate cost-sharing for vaccines, and
make insulin much more affordable for patients.

ICAN, International Cancer Advocacy Network, is a 501(c)(3) non-
profit organization that connects Stage IV cancer patients to clinical
trials, cutting-edge treatments at our leading academic centers,
second opinions, and other services that patients dealing with the
most serious stage of cancer require. Since our founding in 1996, we
have helped over 17,500 patients in all 50 states and 72 foreign
countries. Additionally, ICAN started the Exon 20 Group in 2017 to
aid patients fighting two rare genetic mutations that are particularly
associated with very lethal lung cancer.

In short, we deal every day with patients who are dependent on the
drug discovery pipeline to extend, and in an increasing number of

cases, save their lives. Our main focus when it comes to matters of legislation and regulation, whether on the state or federal level, is thus on protecting that pipeline. We wish to offer an actual “in-the-trenches” perspective on these issues.

There are many ways that the Medicare Drug Price Negotiation Program can be improved. In particular, we wish to associate ourselves with the detailed comments and very thoughtful recommendations of the Personalized Medicine Coalition (PMC), the Partnership to Improve Patient Care (PIPC), the Council for Affordable Health Coverage (CAHC), the Haystack Project, and the Chronic Care Policy Alliance (CCPA).

We will focus these comments on the drug discovery pipeline and continued access to the widest possible choice of drugs, both those currently available, and those that will be available in the future. Every single person—including all those reviewing this and the many other comments on these issues—has a very personal stake in protecting that pipeline and that access.

Ultimately, there are two main forces that will drive down costs: 1) the drug discovery pipeline, and 2) the increasing ability to tailor treatments to the specific person—personalized medicine. One has only to think of the impact on healthcare costs of an effective treatment for Alzheimer’s, or a long-term cure for one of the many forms of cancer.

We wish to emphasize the following:

1) Incorporating the Patient Voice: CMS should create much greater opportunities to incorporate the patient voice in the development of the program and the decisions that will be made regarding drugs. This includes such proposals as regional roundtables and participation via teleconference to include those who may not be able to travel to Washington, D.C., or a regional roundtable, due either to cost, physical disability, or health limitations from the condition or treatment.

2) Extend the Time for Feedback: CMS should extend the amount of time for feedback by stakeholders once the list of selected drugs is announced. 30 days is simply too short to receive the kind of serious feedback that is essential for this process (see the above point for ways to improve feedback).

3) Remove Disincentives for Investment: The distinction between nine years before price negotiations/price setting for small molecule drugs (e.g. pills and tablets) versus 13 years for large molecule drugs (e.g., biologics) will inevitably distort the market from initial investment through decisions made after approval. This will have an almost certain negative impact on investment in drug discovery. Biologics are wonderful and we hope for many more discoveries in that area, but what should determine investment decisions is the science and the promise of a drug rather than the arbitrary class a drug falls into.

Additionally, there are many decisions made after a drug is approved that will be negatively affected by these arbitrary timelines. Currently, there are obvious incentives to invest in research to find additional uses for a drug. What incentive will there be under these timelines? Indeed, they will rapidly decline every year after approval. Thus, there will inevitably be fewer drugs being discovered and even fewer of those will be developed. Patients will suffer on both fronts.

We are aware that removing these disincentives for investment will require legislation to correct the problem. However, CMS can certainly recommend such changes to Congress.

4) **Using Research:** There are three critical areas that CMS should consider when implementing the IRA:

a) Avoiding Being Misled by the Wrong Average: Just as you would not judge a cancer cure by merging the population of cancer patients and those of another disease, so it is a mistake to rely on the average of the progression-free survival statistics even for a specific cancer (and this applies to any other disease). Any process that does not take into account “exceptional responders” will be fundamentally flawed and will cause real, measurable damage to the patients who are being helped by a drug.

b) Incorporate Real World Evidence (RWE): Similar to the point above, a drug should be continually re-evaluated to see the value of a drug to patient outcomes in multiple sub-populations (e.g., ethnicities and gender, but also other factors such as comorbidities).

c) Ensure that Quality-Adjusted-Life Years (QALYs) are not used when evaluating drugs: We are aware that the law prevents direct use of QALYs, but CMS should make it explicitly clear that QALYs will not be used in any manner —*including indirectly*.

The advances in treatments for cancer, heart disease, autoimmune diseases, and many other serious or fatal conditions over the past 50 years have been astonishing. Most of these advances were due to drug discovery. It is the United States, as all statistics make clear, that has led the way in most of these fields, and has done majority of drug discovery throughout the world. It is these continued breakthroughs that will lead to not only reductions in healthcare costs, and reductions in health disparities for underserved populations, but also, and most importantly, to extended life with a higher quality of life for millions of people in the United States and around the world.

We ask you to keep those people in mind as you make these critical decisions.

Please do not hesitate to contact me at marcia@askican.org or (602) 618-0183 if you need any additional information.

Thank you for your consideration.

Respectfully submitted,

Dear Dr. Seshamani,

ISPOR – the professional society for health economics and outcomes research (HEOR) - is pleased to respond on behalf of its membership to your consultation “**Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments.**”

ISPOR is a scientific and educational society with many of its members engaged in evaluation of health technologies, including pharmaceuticals, medical devices, and other interventions. Established in 1995, ISPOR is a not-for-profit organization and the leading source for scientific conferences, peer-reviewed and MEDLINE®-indexed publications, good practices guidance, education, collaboration, and tools/resources in the HEOR field. We have a large membership living and working in 110 countries globally, across a range of disciplines, including health economics, epidemiology, public health, pharmaceutical administration, psychology, statistics, medicine, and more, from a variety of stakeholder perspectives, such as the life sciences industry, academia, research organizations, payers, patient groups, government, and health technology assessment bodies. The research and educational offerings presented at our conferences and in our journals are relevant to many of the issues and questions raised in this request for information.

The response to this consultation was led by the Policy Outlook Committee of our most senior advisory body, the Health Science Policy Council. To engage our membership, we created a survey where their comments on different sections of the Memorandum could be recorded. We recognize that the Inflation Reduction Act (IRA) gives Secretary the option to consider a variety of different factors as part of the negotiation. Most of our members would strongly support consideration of “[t]he extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.” We have less consensus on the other suggested factors, but we will leave to it those individual members to submit their detailed comments on those. We chose to provide comments in the areas most related to our scientific expertise, which is represented in part by an extensive set of Good Practices and similar reports (<https://www.ispor.org/heor-resources/good-practices>). Our comments are summarized in six major points below.

1. **CMS definition of unmet need.** Section 1194(e)(2) of the Act directs CMS to consider evidence about alternative treatments to the selected drug, as available, including, “the extent to which the selected drug and the therapeutic alternatives to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy.” However, in the memorandum (p. 51), it is stated that “CMS will consider whether the selected drug fills an unmet medical need, which CMS intends to define as treating a disease or condition in cases where very limited or no other treatment options exist.”

We believe that this narrower interpretation of unmet need, while perhaps easier to identify and implement, may disadvantage some therapies where, despite available treatment and interventional options, a substantial burden of disease remains and significant healthcare (therapeutic, diagnostic, preventative) innovations are needed. Heart disease and cancer are still the leading causes of mortality¹ despite many treatments that improve outcomes. The actual burden of disease includes both direct and indirect factors beyond mortality, including loss of functionality, pain, mental illness, and sensory deficits (ie, quality of life deficits, as well as effects on caregivers, etc). In addition, the negative impact of these diseases on quality of life can be measured via disease-specific utilities, which are readily available² but absent from the definition of unmet need. Neurological diseases are additional examples where treatments may exist, such as for Parkinson's disease, but the unmet medical need is still high, and the value of addressing such unmet need should be clearly reflected in the Maximum Fair Price (MFP). Most new products are supported by burden of illness studies and updated research should support MFP negotiation.

2. **Comparative effectiveness.** “Comparative effectiveness of the selected drug and its therapeutic alternatives” is clearly a key consideration in MFP determination and we fully support CMS in its plan to use real-world evidence (RWE) in this area. We would like to make a few points here:
- 1) RWE will complement randomized clinical trial (RCT) data, clinical guidance, and expert consultation (including manufacturers and patients) in determining the most relevant therapeutic alternatives. RWE can indicate which alternatives are most used in general, as well as in different clinical situations (often including different indications) or key subpopulations.
 - 2) While recognizing the recent guidance from the FDA and other bodies relating to RWE, evaluating the quality of the research generating RWE can also be informed by a number of ISPOR Good Practices reports on comparative effectiveness research (CER), including these topics:
 - i. Defining, reporting, and interpreting³
 - ii. Bias and confounding in the design⁴
 - iii. Causal inference⁵
 - iv. Transparency⁶

⁶ Berger ML, Sox H, Willke RJ, et al. Good practices for real-world data studies of treatment and/or comparative effectiveness: Recommendations from the joint ISPOR-ISPE Special Task Force on real-world evidence in health care decision making. *Pharmacoepidemiol Drug Saf*. 2017;26(9):1033-1039.

- v. Replicability (joint with the International Society for Pharmacoepidemiology [ISPE])⁷
- vi. Assessing relevance and credibility⁸

3) Different studies will yield different results, so evidence synthesis is likely to be necessary to generate a primary estimate of the difference in effect (with the recognition that uncertainty is present). Methods such as network meta-analysis and indirect treatment comparisons may be important here, and ISPOR has also created several Good Practices Reports on this topic:

- i. Interpretation⁹
- ii. Conduct¹⁰
- iii. Assessing relevance and credibility¹¹

3. **Value considerations.** Translating comparative effectiveness to fair pricing involves an assessment of the value of treatment effects, since pricing needs to be fair not only within a disease area, where CER can provide answers, but also across diseases, where CER does not. Value of treatment to patients and society involves several factors, probably most important of which is the clinical benefit per se, but other factors can be important as well. The delineation and estimation of those factors has been described recently by ISPOR¹² and by the Second Panel on Cost-Effectiveness in Health and Medicine,¹³ among others. Factors that are based on value to individuals include severity of disease, insurance value, value of hope, real option value, family spillovers, and others. CMS is well-positioned to also take into account factors that have broader value to society, such as productivity loss/gain, scientific spillovers, health equity, and others noted in ISPOR's "Value Flower" and in the Second Panel's Impact Inventory. While measurement of some of these factors is an evolving science, good progress¹⁴ is being made and it is presently feasible to take many of them into account.

4. **Measuring clinical benefit.** The exact metric for capturing clinical benefit in value calculations that includes not only survival gains but also quality of life improvements, has been a matter of considerable

debate.¹⁵ The IRA legislation forbids the use of the most standard measure, quality-adjusted life-years (QALYs), to the extent it gives relatively lower value to the extension of life of older, disabled, or terminally individuals. We do not believe that in most cases use of QALYs will disadvantage those groups since incremental QALY gain between treatments is the actual benefit measure and typically those groups will be represented in both treatment and comparator groups. The focus on treatment-based gains in quality of life is in fact generally more likely to benefit these groups since they tend to have lower quality of life ratings prior to treatment.

However, in cases where the value of treatment that extends survival in an older, disabled, or terminally ill population is being compared to the value of treatment to a more general population, alternative measures can be used such as equal value of Life Years Gained (evLYG),¹⁶ health years in total (HYT),¹⁷ and the generalized risk-adjusted QALY (GRA-QALY)¹⁸. Extended discussions of the use of QALYs relative to these alternative measures can be found in recent or forthcoming articles.^{19,20,21} In short, we recommend that CMS work with ISPOR and other expert groups in this area to settle on the most feasible approach to including both survival and quality of life gains in a clinical benefit measure for use in value calculations.

5. **Qualitative approach.** To provide some structure to the “qualitative” approach that CMS intends to use to adjust the MFP starting point for other clinical and value-based considerations, we recommend two considerations.

First, it is useful to have a single value construct to aggregate different factors influencing the value of treatment. The standard cost/QALY metric used by many countries and other groups does not easily capture all value elements and is of course based on the QALY measure. An ISPOR task force on value assessment suggested several such aggregate measures.²² One approach is a specific deliberative process called multi-criteria decision analysis (MCDA) that results in a single value construct; ISPOR has

issued a pair of Task Force reports^{23,24} that describe how MCDA works. In this case it would involve having a group of educated stakeholders weigh relevant measures, including a clinical benefit measure but not necessarily the QALY, in a process that results in a single value measurement. MCDA can be conducted in a way that uses different value elements in different cases but can be comparable across cases as long as a common clinical benefit measure is employed.

Second, the broader qualitative process CMS intends to use can be informed by, or could directly use, a deliberative process as well, which has been described for use in health technology assessment (HTA).²⁵ Deliberative processes for HTA are intended to facilitate participatory decision making, using discussion and open dialogue between stakeholders. They are a specific instance of the type of process that employs “accountability for reasonableness”²⁶ as a basis for establishing fairness. We encourage CMS to consider such an approach.

6. **General process considerations.** This initial year involves some relatively short timelines that are necessary due to the legislation and do not realistically offer time for deliberative processes and may limit meaningful stakeholder engagement. We encourage CMS to consider extending timelines for future years to facilitate transparency in these assessment methods (preferably including a memorandum detailing the qualitative process that becomes used) and allow for more extensive engagement and deliberation. We also encourage CMS to consider adapting their guidance for this process based on learnings from the initial implementation experience.

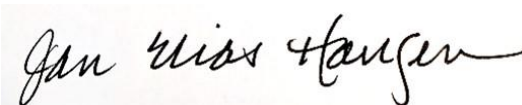

We thank CMS for the opportunity to comment on this consultation; if you have questions about any of these comments, please contact our Chief Science Officer, Richard Willke, at rwillke@ispor.org.

We look forward to working with CMS throughout the implementation of the program. We know this will be a multiyear process and that approaches and methods may change along the way. We welcome the opportunity for further discussion about the considerations in this response and to engage in additional consultations.

Sincerely,

Robert Abbott

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Jnana Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023.

I am the CEO of Jnana, a small biotech company focused on developing new oral medicines for diseases where patients are in urgent need of better treatments. The company was founded in 2017, is based in Boston, Massachusetts, and currently has about 85 employees. Within Jnana, we have built an innovative platform for discovering small molecules that modulate previously undruggable targets. We are advancing first-in-class therapies to treat rare diseases and autoimmune & inflammatory diseases. I am writing because of our concern that our ability to maximize the benefit to patients from the new medicines we are developing may be negatively impacted by CMS's implementation of the Drug Price Negotiation Program.

Our concerns:

About 18,000 people in the U.S. are living with the rare disease phenylketonuria (PKU), with most inadequately treated. Our clinical candidate JNT-517, currently in a Phase 1 clinical trial, is a potential new oral medicine for treating PKU that may address much of this unmet medical need. The mechanism by which our clinical candidate operates might also provide an effective approach for treating more rare metabolic diseases such as Maple Syrup Urine Disease, where patients currently have no therapies.

We are now carefully considering whether the loss of exclusion from the CMS Negotiation Program a second rare disease indication might trigger impacts our potential plans to explore additional rare disease indications beyond PKU with JNT-517, given the restrictive criteria for exclusion requiring a drug product be approved for "only one rare disease or condition".

Implementation of the IRA might also impact other programs in our pipeline. Conducting clinical trials in common autoimmune & inflammatory diseases, where patients often have multiple immune pathways dysregulated and the disease is heterogeneous patient to patient, takes a substantial amount of time and funding and carries significant risk. Biotech companies like Jnana often initially test an innovative medicine in a rare immune disease where one of these immune pathways is dysregulated and the disease is less heterogeneous with the aim of most efficiently achieving clinical proof-of-concept and advancing the new medicine to patients.

With our platform, we have discovered a potential first-in-class medicine that may help treat both rare and common autoimmune & inflammatory diseases. Because eligibility for selection for the Negotiation Program occurs only 7 years following the first drug product approval, we may not be able to pursue the optimal drug development route if this route involves initial clinical testing and approval in a rare immune disease.

What can be done to mitigate negative impact on the development of innovative medicines?

We strongly urge CMS to support legislation: 1) extending the Initial Price Applicability for drug products, which is currently 7 years following approval, to the same as biological products, which is currently 11 years following licensure; and 2) eliminating the overly restrictive qualifying criteria for the orphan drug exclusion to enable any medicine only approved for orphan indications to qualify for the exclusion. These changes would incentivize investors to support biotech companies to develop the best possible medicines for the most patients, irrespective of the modality of the medicine, and therefore serve the best interest of patients.

In the absence of such changes in legislation, we urge CMS to start the selection clock on the date a drug product loses its eligibility for the orphan drug exclusion. We further urge CMS to set the maximum fair price under the Negotiation Program at the ceiling price for any drug product until 11 years following approval (the first year of Initial Price Applicability for biological products). We believe these changes are important to better support orphan drug development and the development of innovative medicines more broadly.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to patients from fewer innovative medicines is minimized. Please contact me at jkotz@jnanatx.com if you have any questions regarding our comments.

Sincerely,

A handwritten signature in black ink that reads "Joanne D Kotz". The signature is fluid and cursive, with the first letters of each word being capitalized.

Joanne D Kotz, Ph.D.
Cofounder and CEO
Jnana Therapeutics

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Seshamani:

On behalf of Johnson & Johnson (J&J) we submit the following comments in response to the Centers for Medicare & Medicaid Services' (CMS, the Agency) *Medicare Drug Price Negotiation Program (Program or the Program): Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for the Initial Price Applicability Year 2026, and Solicitation of Comments* (Guidance or the Guidance).¹ J&J is the world's most comprehensive and broadly-based manufacturer of healthcare products for pharmaceutical, medical devices, and diagnostics markets. For nearly 130 years, we have led the way in innovation and are continuing this heritage today by bringing important new pharmaceutical products to market in a range of therapeutic areas on behalf of all our current and future patients, including Medicare, Medicaid, and Marketplace beneficiaries. We are engaged members of BIO and PhRMA and endorse their comments also submitted in response to this Guidance while providing further input below.

J&J has serious concerns about the Guidance which will require significant engagement and resolution with manufacturers before Program implementation. As the largest healthcare company in the world, and a leading manufacturer of life-changing therapeutics within the life sciences, we are deeply concerned about the far-reaching impacts of the *Inflation Reduction Act of 2022 (IRA)* on biopharmaceutical innovation. The policies and unworkable operational complexity advanced throughout the Guidance only further increase our concerns regarding the impact this Program will have on current and future beneficiaries.

We are deeply troubled that the Guidance does not address critical priorities on which we sought collective alignment with the Agency since the passage of the IRA. Specifically, our core principles are to advance and promote program operational feasibility and workability, program integrity measures to preserve biopharmaceutical innovation for future beneficiaries, data access and transparency and the assurance of a positive beneficiary impact. Upholding these principles is critical for manufacturers faced with limited opportunity within the confines of the IRA price-setting system masquerading as

¹ Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

“negotiation.” In a true negotiation, all parties to the Agreement would have clear standards that guarantee a consistent methodology and process, transparent access to data, the ability to interpret and defend submitted data, and fundamental rights to due process.

The Guidance was a genuine opportunity to offer the primary party to the “negotiation” predictability and transparency throughout the Program. In place, the Guidance lacks sufficient clarity in describing the Agency’s intended approach and methodology, restricts opportunities for meaningful input (with certain sections limiting comment and response altogether), strictly limits our Agency engagement, proposes ill-defined standards that do not approximate any form of a “negotiation” and creates significant uncertainty about the future of the Program’s policies and operations, all of which will lead to meaningful consequences for the Medicare beneficiaries of today and tomorrow.

We urge CMS to significantly increase their engagement with key stakeholders, extend the timelines for public comments and re-work a substantial portion of the Guidance to align with the statutory mandate of a predictable Program that employs consistent processes and methodologies. We are also aligned with the comments submitted by PhRMA regarding the applicability of section 1871 of the Social Security Act to the Guidance.

With recognition of our significant concerns, we urge CMS to *prioritize* the following issues within the updated Guidance:

- CMS’ definition of a qualified single source drug (SSD) as proposed in the Guidance departs from well-established statutory definitions and we urge CMS to consider the significant unintended consequences for beneficiaries and innovation with adopting the definition as proposed;
- Set the Maximum Fair Price (MFP) for selected drugs at the ceiling price for all Medicare Part D medicines for the first ‘initial price applicability year’ (IPAY 2026) to advance a more reasonable timeline for Program implementation and to allow for the development of greater Agency experience and expertise;
- Effectuate the MFP via a data-driven, retrospective discount model facilitated by a Third-Party Administrator (TPA);
- Revise the Guidance to prevent duplicate MFP-340B discounts as required under law;
- Adopt a simplified application of the MFP specific to each dosage form and strength;
- Adopt the definition of “manufacturer” as described in Statute at 1847(c)(6)(A);
- Explicitly prioritize the impact to Medicare beneficiary lives, health outcomes, and society for selected drugs in evidence review;
- Request CMS issue proposed guidance, with comment opportunity, about the interaction between the Program and the Part B inflation rebate program ahead of 2028; and
- Request CMS coordinate with the Food and Drug Administration (FDA) in the further development of Guidance and throughout the implementation of the IRA

Our complete recommendations are below.

IDENTIFICATION OF SELECTED DRUGS FOR INITIAL PRICE APPLICABILITY YEAR 2026 (Section 30)

The Agency's approach to Section 30 will lead to unintended consequences for patients, including Medicare beneficiaries and beyond, through its threat to innovation of new drugs and further innovation of existing drugs.

J&J recognizes that CMS is not accepting comments to Section 30 and has issued this section as "final." However, we anticipate there will be significant consequences of the approach CMS sets forth in Section 30 through its departure from longstanding and well-established definitions and interpretations of a single source drug.

There is a high likelihood that this departure will lead to additional unintended consequences that we cannot yet identify. The IRA is a complicated and convoluted statute. Under these circumstances and given the magnitude of the impact to Medicare beneficiaries, as well as other patients, a measured approach would be more prudent, and would still align to statutory requirements and timelines. This would mitigate unintended consequences apt to occur under such rushed deadlines.

Below, we highlight a few particulars of concern.

A. The Agency's Definition of a Qualified SSD Departs from Well-Established Statutory Definitions.

The Agency's definition of a "qualified" SSD departs from well-established statutory definitions and interpretations of a single source drug (SSD). While the statute added 'qualifiers,' it did not redefine SSDs. The qualifiers should be interpreted as limiting which SSDs are eligible to be negotiated and subsequently selected by CMS for negotiation. This is the only approach that harmonizes with other Federal health care law and operational realities.

The plain language of the IRA states what drugs are potentially subject to the compulsory discounting mechanism. IRA § 1192(e). The statute uses the "term of art" "single source drug," found throughout multiple prior statutes, to identify and limit the drugs subject to the mechanism. *Id.*; See 42 U.S.C. § 1396r-8(k)(7)(A)(iv)) (defining "single source drug" as "a covered outpatient drug ...which is produced or distributed under a new drug application (NDA) approved by the Food and Drug Administration"); 42 U.S.C. § 1395w-3a(c)(6)(D) (defining "single source drug or biological" as "a biological or a drug which is not a multiple source drug and which is produced or distributed under a NDA approved by the Food and Drug Administration...").

That "term of art" is reinforced by the plain language of § 1992(e) itself. A "drug" is defined by referencing an "approv[al]" under Section 505(c) of the Federal Food, Drug, and Cosmetic Act—the FDCA provisions under which single source drugs obtain approval through an NDA. A "biologic" subject to § 1192(e) similarly must be "licensed under section 351(a) of the Public Health Service Act" under which a single source biologic obtains approval through a Biologics License Application (BLA). Section 1992(e) refers to "qualifying"¹ single source drug to then denote that subset of "single source drugs" that meet the other plain language limitations of the statute.²

Multiple provisions within the Act reinforce that § 1192(e) controls what drugs and biologics are and are not subject to the compulsory discounting process. See § 1192(c)(1) ("selected drugs" determined "in

² IRA § 1192(e).

accordance with subsection (i)(2)”), (d)(1) (“negotiation-eligible drug” is “a qualifying single source drug, as defined in subsection (e)”), (d)(1)(B) (“high spend drug is, determined in accordance with subsection (e)(2),...”).

Section 1192(d)(3)(B) references the use of “data that is aggregated across dosage forms and strengths of the drug, including new formulations of the drug, such as an extended-release formulation”. However, that reference to data is not a part of the subsection that defines a “qualifying single source drug.” The plain language of § 1192(d)(3)(B) states that such data is only to be used “[i]n determining whether a qualifying single source drug,” separately determined under subsection (e), “satisfies any of the criteria described in paragraph (1) [regarding negotiation-eligible drugs] or (2) [regarding the “small biotech” exception].”

In other words, the plain language of § 1192(d)(3)(B) states that, once a “qualifying single source drug” has been determined, use of data in accord with § 1192(d)(3)(B) for the specifically, limited purposes delineated there, is appropriate. Those limited purposes only concern the calculation of the “total expenditures” used to identify negotiation eligible drugs or to determine if the small biotech exception applies. But data use for the purpose of determining total expenditures does not function to expand qualified SSDs that are subject to the MFP.

All the above is important because CMS’ definition of a qualified SSD creates unnecessary conflict and complexity with other Federal health care programs. Statutes should be interpreted in a manner compatible with the existing body of law into which the statute will be applied particularly where Congress is aware of existing laws on the same subject when it passes a new law.³ We urge CMS to harmonize the definition of qualified SSDs to other Federal health care programs to which it will be applied. This will better enable more reasonable, efficient, and successful implementation of the IRA.

B. There Will Be a Significant Impact on Incremental Innovation with CMS’ Approach to Defining a qualifying SSD.

If CMS adheres to the approach outlined in the Guidance, there will be unintended consequences. We highlight just a few here.

Most importantly, if CMS’ definition of a qualified SSD was applied to drugs already being marketed, there are clear examples where incremental innovation never would have occurred. We urge CMS to consider that some innovations and continuous improvement vastly enhance product profiles and increase product safety and effectiveness. The value of this innovation is established through commercial payer negotiations which inure to the benefit of government programs through Medicare, Medicaid, VHCA and 340B pricing calculations.

There are clear examples of incremental innovation leading to standard of care, or other much needed benefits by patients. And we should not overlook that today’s innovation leads to tomorrow’s generics.

For example, had the IRA already been in effect, there is a high likelihood that drugs society depends on today for mental health conditions, such as Long Acting Injectables (LAIs), that have become standard of care, may never have been developed. LAIs were developed following initial discovery and approval of certain oral solid dosage forms of the drugs. LAIs have improved patient adherence, reduced overall health

care costs, and lowered societal burden (e.g., reduced risk of incarceration in schizophrenia patients treated with long-acting injectable anti-psychotics).^{3,4,5}

Similarly, considerable continued development and innovation has been undertaken for drugs used to treat HIV. Without this incremental innovation, many patients today would be without therapies to maintain control over their HIV.^{6,7} The disincentives embodied by CMS’ definition of a qualified SSD risk bringing a halt to further innovation of HIV medicines, unless an entirely new active moiety were discovered. And yet, much of the innovation and advancements in HIV has been made from the initial approved drug(s).

As the examples above convey, we believe CMS’ approach is apt to significantly jeopardize future meaningful innovation for beneficiaries. We urge CMS to appreciate that continuous innovation involving drugs approved under an initial NDA enhance product profiles, can increase product safety and effectiveness, as well as patient adherence and can lead to savings with respect to in other health care costs as safety and patient compliance increase.

To summarize, by aggregating qualified SSDs to apply to new NDCs under an NDA or those with the same active moiety/ingredient, CMS further jeopardizes innovation and the harm that the IRA is likely to cause as it will constrain investment of time, resources and effort on incremental innovation that could benefit patients and may become the next standard of care.

C. Creation of an Extra-Statutory “Bona Fide” Marketing Standard

§ 1192(e) states that the presence of an “approved and marketed” generic drug under FDCA § 505(j) or biosimilar under PHS § 351(k) results in the exclusion of the reference product from the definition of a qualified SSD. This is a critically important protection provided to manufacturers that face generic competition and, therefore, already are subject to substantial pricing pressure. In articulating this protection, the plain language of the statute refers to a generic drug or biosimilar that is “marketed.” IRA § 1192(e).

However, the IRA creates a new standard to determine whether a reference drug or biological is excluded from the definition of a qualified SSD and, therefore, protected from the compulsory discounting mechanism. That new standard – not found in the statute – requires “bona fide marketing” of the generic drug or biosimilar.⁸

This change in substantive legal standard, which was not the subject of public comment, is troubling, for several reasons. First CMS has effectively added the phrase “bona fide” to the statute. Second, the standard

⁸ Guidance Section 30.1 at ps. 10

is undefined. Regulated parties are provided no notice as to what CMS believes is “bona fide” marketing and what is not. Indeed, the criteria to be applied are not disclosed. Third, the standard is fundamentally inconsistent with the commercial realities that apply particularly to generic drugs, which are not marketed in the traditional sense.

An extra-statutory “bona fide” marketing standard, applied to generic drugs and biosimilars, undermines the statutory purpose to protect otherwise qualifying single source drugs from the compulsory discounting mechanism. The risk that the application of that standard would render that protection a nullity appears significant. We therefore urge CMS to remove the “bona fide” marketing requirement and apply the statute as written.

D. Orphan Drug Exclusion

The orphan drug community and patient advocates have expressed significant concern about the limited nature of the exclusion from “qualifying single source drugs” for orphan drugs. Under the statute, an orphan drug may only be designated “for one rare disease or condition” under § 526 of the FDCA and only possess an “approved indication (or indications)” for “such diseases or conditions.” *Id.* § 1192(e)(3). The Guidance asserts a position on this exclusion that contracts it even further, beyond the plain language limits of the text chosen by Congress. The effect is to curtail even the limited protection provided by statute. Unfortunately, the unintended consequence of CMS’ decision will be to undermine innovation in therapies designed to assist vulnerable orphan disease patients even more.

Patient advocates and others have expressed serious concerns about the disturbing implications for innovation in orphan disease treatments created by the statute, even as written. This narrow exception will limit the applicability to orphan therapies, even ultra-orphan therapies, subjecting them to the compulsory discounting process and seriously impacting their viability and, therefore, patient access.

CMS’ final Guidance makes matters worse by asserting that it will consider “all dosage forms and strengths and different formulations” of orphan drugs “as described in Section 30.1” of the Guidance in delineating the exception. This means that orphan drugs under separate NDAs and BLAs will be treated by CMS as a single qualified SSD contrary to the plain language of § 1192(e). The consequence of this will be to deny orphan drug protection, even in some of the limited circumstances required by the plain language of § 1192(e)(3). Such an outcome, contrary to the language, structure, and purpose of the orphan drug exclusion, is concerning, given the negative impact on orphan patient access to therapy and innovation in these important disease areas – where that innovation is so desperately needed.

Notwithstanding these concerns, we appreciate CMS’ comment that “CMS is considering whether there are additional actions CMS can take in its implementation” of the compulsory discounting mechanism “to support orphan drug development.”⁹ We believe that there are important steps that CMS can and should take, including limiting the compulsory discounts imposed on orphan drugs selected under the mechanism to the least extensive discount required to otherwise be imposed under the Act.

We note that, in discussing the possibility of supporting orphan drugs, CMS states that it “will consult with FDA, as needed.” By implication, this excludes all other stakeholders – health care practitioners,

⁹ *Id.* at 11

scientists, patients, patient advocates, and manufacturers – from what could and should be an important discussion. We urge CMS to engage on this important topic with all stakeholders, and we would be interested in participating in that effort.

E. Low-Spend Medicare Drug Exclusion

In addition to the qualified SSD issues identified above, CMS, in articulating its position regarding the low spend Medicare drug exclusion, states that it will employ total expenditures consisting of “the total allowed charges, inclusive of beneficiary cost sharing under Part B.” *Id.* at 11. We believe that this conflicts with the plain language of the statute. The Guidance would include sums that will incorrectly increase the calculation of Medicare spend for purposes of applying the exclusion.

As defined in the IRA, the term total expenditures means, with respect to Part D, “the total gross covered prescription drugs costs (as defined in section 1860D-15(b)(3)).” IRA § 1192(c)(5). Title 42 U.S.C. Section 1860D-15(b)(3) in turn, refers to: “with respect to a Part D eligible individual enrolled in a [Part D plan] ..., the costs **incurred** under the plan, not including administrative costs, but including **costs** directly related to the dispensing of covered ... drugs.” *Id.* (emphasis added). For more than 15 years, CMS, by regulation, has stated that these “costs” must be “actually paid costs”, which in our view, is compelled by the statute’s plain language reference to costs “incurred”. 42 C.F.R. § 423.308. Actually, paid costs or costs “incurred” do not include direct and indirect remuneration (DIR), including discounts, rebates, or other price concessions typically received and applied.” 87 Fed. Reg. 79452, 79611 (Dec. 27, 2022). Because CMS has not acknowledged its departure from this longstanding agency practice or adequately justified its change in course, this element of the Guidance is arbitrary and capricious under the Administrative Procedure Act.¹⁰

The Guidance is inconsistent with the plain language of the statute. As noted, the statute requires that only costs “incurred” be considered. Instead, the Guidance purports to use “total allowed charges.”¹¹ CMS’ intention to exclude DIR amounts, which substantially reduce the costs “incurred,” would seriously erode the protection afforded by the low spend exclusion, threatening significant and adverse patient access and innovation impacts. For all these reasons, we urge CMS to consider only costs actually incurred, as directed in the statute and in keeping with established agency precedent.

F. Plasma-Derived Product Exclusion from Qualifying Single Source Drugs (30.1.3)

CMS proposes to refer to “approved product labeling”¹² to determine if products fall within the plasma-derived product exclusion outlined in section 1192(e)(3)(C) of the Act. We urge CMS to strictly adopt the language in accordance with section 1192(e)(3)(C) of the Act.

G. Submitting an Initial Delay Request for Initial Price Applicability Year 2026 (30.3.1.3)

CMS proposes a template in Appendix B of the Guidance as a useful tool in connection with the Biosimilar Manufacturer’s¹³ intent to submit an Initial Delay Request. However, there are inconsistencies in the proposed submission process. For example, the last paragraph on page 74 of the Guidance states that incomplete or late submissions will not be accepted. However, a subsequent paragraph on page 75

¹⁰ See *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 514 (2009).

¹¹ Guidance Section 30.1.3. ps.11

¹² Guidance Section 30.1.3 ps. 11

¹³ Guidance Section 30.3.1 ps. 16

states that late, incomplete, or inaccurate submissions may adversely affect the negotiation, which suggests a delinquent submission will be accepted. This inconsistency is confusing and should be corrected as follows: If the Biosimilar Manufacturer submits an Initial Delay Request that is not timely, complete, and accurate, the submission may adversely affect the Negotiation Program, including the process for selecting drugs for negotiation for initial price applicability year 2026.

REQUIREMENTS FOR MANUFACTURERS OF SELECTED DRUGS (Section 40)

A. Definition of a Manufacturer

Regarding the definition used for manufacturer, J&J recommends that CMS:

1. Adopt the definition for manufacturer outlined in IRA statute at 1847(c)(6)(A). Under this definition, different manufacturers are not aggregated as one primary manufacturer, and secondary manufacturers are eligible to directly enter into agreements with CMS.
2. Consider the FDA product labeler ID in determining the manufacturer of a product to account for scenarios in which the NDA/BLA holder is not the manufacturer responsible for marketing.

Adopt the Definition of Manufacturer Outlined in the Statute

As noted by CMS and outlined in section 1191(c)(1) of the Act, the Negotiation Program statute adopts the definition of “manufacturer” established in section 1847A(c)(6)(A) of the Act and as defined 1927(k)(5). Despite the clear definition for “manufacturer” outlined in statute, CMS indicates its intent to apply different definitions, for Primary Manufacturer and Secondary Manufacturer, which are terms originating from the Medicaid Drug Rebate Program (MDRP) specific to government pricing calculations for Average Manufacturer Price (AMP) and Best Price (BP). Despite their inclusion in this guidance, neither of these terms is referenced in the IRA. These definitions ignore and override the statutorily adopted manufacturer definition, and do not align to the intent of the law.

We are concerned that the conflicting application of terms and definitions could introduce program integrity issues due to these inconsistencies. In contrast with these terms, the “manufacturer” definition that is laid out in the IRA includes “... any entity which is -engaged in production...OR the packaging, repackaging, labeling, relabeling, or distribution of prescription drug products.”¹⁴ This statutory definition conflicts with CMS’ intent to enter into agreements with only Primary Manufacturers, as the statutory definition for “manufacturer” would apply to “Secondary Manufacturers” which CMS intends to deem ineligible for entering into Medicare Price Negotiation Agreements (Agreements). We agree with the statute that CMS should enter into Agreements with Secondary Manufacturers that meet the statutory definition of “manufacturer.” We urge CMS to follow the statute in defining manufacturer to align with the term defined in section 1847A(c)(6)(A) of the SSA.

In its initial guidance, CMS proposes its intent to hold Primary Manufacturers that enter into Agreements with CMS accountable for collecting and reporting necessary information applicable to any Secondary Manufacturer; and ensuring that any Secondary Manufacturer make the MFP available to MFP-eligible individuals, pharmacies, mail order services and other dispensers. J&J strongly opposes this approach which would not be practical or feasible legally or operationally.

¹⁴ 42 U.S.C. 1396r-8(k)(5)

Primary Manufacturers do not have access to the required data and information for unaffiliated Secondary Manufacturers do not have authority or control over a nonaffiliated Secondary Manufacturer’s operations and cannot “ensure” that another manufacturer makes the MFP available, as the IRA does not provide them with the authority to do so. Secondary Manufacturers are under no obligation to provide Primary Manufacturers with proprietary commercial information, certified government pricing information, or other required data and CMS cannot impose liability on one corporate entity related to the activities of an unaffiliated corporate entity. Further, requiring a Secondary Manufacturer to disclose its trade secrets to a Primary Manufacturer would destroy the trade secrets, potentially resulting in an uncompensated taking of the Secondary Manufacturer’s property and other competitive harms.

In many instances, Primary Manufacturers and Secondary manufacturers are distinct and unaffiliated entities. In fact, Primary and Secondary Manufacturers can be direct competitors in a market, and there is no incentive to exchange or provide commercial practices. Moreover, this forced relationship could hinder cross-industry collaboration and have a negative impact on the development of new therapies for patients. We are concerned that sharing the required data across Primary and Secondary Manufacturers could heighten exposure to federal and state antitrust laws due to the sharing of proprietary information. CMS previously responded to similar concerns in its February 2016 Medicaid Program Final Rule in which the Agency agreed not to finalize its proposal regarding the sharing of pricing data between competing manufacturers and recognized the challenges of obtaining pricing information from non-related manufacturers¹⁵. Lastly, even if a Primary Manufacturer were willing to try to compel a Secondary Manufacturer to share the required information for submission, it would require restructuring of contracts and business terms, as well as the establishment of a process to obtain the information, and it would be infeasible to do so in the period provided in the law and the process outlined by CMS.

We ask CMS to revise all proposals which would hold Primary Manufacturers accountable for the submission of data and pricing actions of unaffiliated Secondary Manufacturers, as Primary Manufacturers do not have access to the required data elements for Secondary Manufacturers and do not have the needed control or authority to ensure their compliance.

CMS should use the unique product labeler ID assigned to each establishment by the FDA to better identify Primary Manufacturer instead of reviewing only the holder of NDA/BLA.

We also ask CMS to clarify in its final guidance how it will handle scenarios in which the manufacturer is not the holder of NDA / BLA. For example, CMS outlines that to the extent that more than one entity meets the statutory definition of manufacturer for a selected drug for purposes of initial price applicability year 2026, CMS intends to designate the entity that holds the NDA(s)/BLA(s) for the selected drug to be “the manufacturer” or “Primary Manufacturer.” There are many instances where the NDA holder is not the Primary Manufacturer, including in the case of split licensures or acquisitions. In these cases, the structure of agreements is unique for each arrangement. For example, responsibilities can be divided per indication, jurisdiction, and other factors etc. In some instances, manufacturers may divide responsibilities, for example, with one entity holding the NDA/BLA and the other responsible for market access and pricing. It is not uncommon for an entity to develop the drug and hold the NDA/BLA and then assign marketing responsibilities to an unaffiliated manufacturer who has more expertise in marketing and access.

¹⁵ 81 FR 5169

B.1. Entrance into an Agreement with CMS (40.1)

CMS should provide manufacturers with visibility to, and the opportunity to comment on, the template agreement to allow for a more expedited review following the publication of the list of selected drugs. We request at least 90 days to review and provide comments on the Agreement before CMS' finalization of the template.

CMS proposes to make “reasonable efforts” to make the final text of the Medicare Drug Price Negotiation Agreement (*Agreement*) available to the public before the selected drug list for IPAY 2026 is published¹⁶. CMS stipulates that manufacturers of selected drugs that elect to enter a negotiation agreement with CMS will have five days following publication of the list of selected drugs to provide contact information for the individuals authorized to execute the Agreement and conduct the negotiation. While the statute states that the Agreements for the initial price applicability year (*IPAY*) need to be signed by October 1, 2023, it does not call for a five-day timeline for review. J&J opposes the creation of a new process not defined in statute, specifically if such processes will result in financial penalties for noncompliance, and we urge CMS not to adopt this five-day timeline. We ask CMS to clarify its interpretation of the statute including its resulting authority regarding this five-day timeline, and to further clarify implications of noncompliance with this proposed five-day timeline, including if there are associated penalties.

B.2. Share the Agreement with Manufacturers in Advance to Provide Sufficient Opportunity to Review and Comment

J&J is concerned that there is insufficient opportunity for manufacturers to review and comment on the Agreement prior to signature, as is typical practice for contract review. J&J underscores the importance of providing manufacturers with sufficient time to review and comment on any agreement which would require signature. We recognize that the statute does not afford ample time before the IPAY, and therefore we ask CMS to establish and provide guidance on an error correction process as it relates to the submission of this data, which will be necessary to ensure program integrity.

C. Submission of Data to Inform Negotiation (40.2)

CMS states its intent to require manufacturers to submit required information for the IPAY by October 2, 2023, noting that manufacturers will not be able to submit this data until the Agreement is fully executed. The statute and its resulting authority did not establish such a short timeline, especially if failure to meet this [impossible] time period is under the penalty of excise tax liability. The agency's proposed approach is therefore contrary to law under the Administrative Procedure Act, 5 U.S.C. § 706(2).

CMS can allow for a longer and more flexible period for data submission beyond October 2, 2023. Thirty (30) days (and a single day following execution of the Agreement) to supply the requested information is infeasible for manufacturers. Under the statute, the October 2, 2023, deadline is limited to non-FAMP data, as per section 1193(a)(4). We ask CMS to clarify its authority to establish such a timeline with associated financial penalties and urge the Agency to extend and implement flexibility in such timelines. Further, we ask CMS to establish and provide guidance on an error correction process as it relates to the submission of this data, which will be necessary to ensure program integrity.

C.1. Confidentiality of Proprietary Information (40.2.1)

¹⁶ Guidance Section 40.1 ps. 27

CMS should provide manufacturers the opportunity to review and comment on the explanation of the MFP prior to publication to confirm that no confidential or proprietary information would be improperly disclosed, additionally the Agency must pursue enhanced measures to protect the confidentiality of company data, including the establishment of a pre-disclosure consultation process with manufacturers.

While we appreciate CMS' stated intent to treat certain data elements as proprietary if they cannot be found publicly, J&J is concerned that CMS has not defined how it will safeguard the sensitive information submitted by manufacturers, and what sources of public information it intends to use to determine if the information is proprietary. It is important manufacturers have confidence their proprietary and highly sensitive, confidential business information will be appropriately protected by CMS, and therefore, we ask CMS to provide guidance on what controls and safeguards it will use to protect confidential information that will be shared under the program. Further, we ask CMS to provide guidance on what acceptable sources of public information it will use to determine if data is confidential and proprietary.

Information regarding Non-Federal Average Manufacturer Price (Non-FAMP or NFAMP), research and development costs, production and distribution costs, and revenue and sales volume, among others, is highly sensitive and often meets the definition of a protected trade secret.¹⁷ It would be very damaging to manufacturers if such confidential and proprietary information were disclosed.¹⁸ The statute clearly directs CMS to safeguard confidential information. Information should be maintained in accordance with standard and customary document retention policies. Therefore, we ask CMS to define and implement a confidentiality policy extending beyond existing FOIA protections, to also align with protections included in other federal programs including MDRP¹⁹, 340B²⁰, etc. We note that Exemption 4 of FOIA addresses disclosure of information, but not use, and therefore CMS' intent to adopt a confidentiality policy consistent with existing proprietary information protections such as Exemption 4 of FOIA is not sufficient, as the Agency's confidentiality policy should cover disclosure and use, as described in statute²¹.

We also ask CMS to establish and provide manufacturers with details on robust storage and access controls and safeguards to protect the confidentiality of sensitive information submitted and stored in HPMS, email or Box. Providing these details to manufacturers is foundational, as it is imperative that manufacturers understand and trust these safeguards prior to engaging in the negotiation process if they are expected to disclose sensitive information. In addition, the confidentiality protections should plainly express that the information submitted by manufacturers is submitted only with the intent that it be maintained and treated as highly confidential. It is expressly not being 'voluntarily' provided as that term is at times used in regard to FOIA. For its confidentiality policies, we ask that CMS provide manufacturers the opportunity to review and provide feedback prior to finalization. J&J is aligned with the recommendations outlined by PhRMA in its comment letter specific to CMS' establishment of confidentiality and data security policies.

¹⁷ See Defend Trade Secrets Act, 18 U.S.C. § 1839(3).

¹⁸ See, e.g., H.R. Rep. 114-529 at 2 (2016) (explaining that "[i]n a global economy based on knowledge and innovation, trade secrets constitute some of [a] company's most valuable property"); S. Rep. No. 114-220 at 1 (2016) (trade secrets are "an integral part of the operation, competitive advantage, and financial success of many U.S.-based companies").

¹⁹ SSA § 1927(b)(3)(D): https://www.ssa.gov/OP_Home/ssact/title19/1927.htm

²⁰ Health Res. & Servs. Admin., General Instructions for Completing the Pharmaceutical Pricing Agreement 7 (2019), available at <https://www.hrsa.gov/sites/default/files/hrsa/opa/pharmaceutical-pricing-agreement-example.pdf>

²¹ 45 CFR 5.41

Finally, given the heightened risk of disclosure of confidential information in CMS' publicly available explanation of the MFP, it is important that CMS provide manufacturers with the opportunity to review and raise concerns prior to publication. The ramifications of an inappropriate disclosure of proprietary information in a publicly posted explanation are so significant for manufacturers that an additional level of review is warranted. Indeed, because trade secrets are extinguished when disclosed to the public,²² CMS should adopt additional confidentiality protections regarding its MFP explanations in order to avoid significant questions under the Fifth Amendment's Takings Clause. Therefore, we ask CMS to provide manufacturers the opportunity to review and comment on the explanation of the MFP prior to publication to confirm that no confidential or proprietary information would be disclosed.

C.2. Data Use Provisions and Limitations (40.2.2)

CMS proposes a data destruction policy which would require the Primary Manufacturer to destroy all information received during the negotiation period from CMS within 30 days of a determination by CMS that the drug or biologic no longer qualifies as a selected drug. J&J does not support this policy which on its face has no direct impact on CMS' ability to achieve an appropriate MFP and undermines transparency. In principle, this policy contrasts with general business operations, internal controls, and accounting practices. We are concerned that this unilateral and onerous data limitation requirement solely on manufacturers will undermine the rights of manufacturers including related to the First Amendment and erodes the spirit of negotiation intended by Congress. J&J is concerned with this proposal and asks CMS to clarify how it relates to the Agency's authority to achieve the lowest MFP for each selected drug.

We strongly oppose any arbitrary and unilateral requirement to destroy materials that conflict with best business practices and argue that such a policy is not material to CMS' authority to establish the lowest MFP.

Manufacturers need to maintain documentation for best price determination initial submission and refiles (up to three years), as this is important for internal controls and accounting purposes. In addition, the information may need to be retained for disclosure to the Department of Veterans Affairs (VA) as part of commercial sales practices disclosure. This arbitrary policy is especially concerning considering CMS does not clarify how it would approach situations in which determinations impact an active MFP. It is not a common or acceptable commercial practice to destroy material relevant to active contracts. When CMS makes a determination during an active IPAY, manufacturers will need to retain associated documentation of the active agreement.

D.1. Providing Access to the MFP (40.4)

Successful effectuation of the MFP within the Program is best supported via a data-driven, retrospective discount model facilitated by a third-party administrator (TPA)

Within the Program the manufacturer of a selected drug must provide access to the MFP to providers and pharmacies with respect to MFP-eligible Part B, MA, and Part D beneficiaries.²³ Manufacturers have no obligation to provide access to the MFP to providers and pharmacies on units dispensed to non-Part B, MA, or Part D beneficiaries (MFP-*ineligible* individuals). CMS proposes defining "providing access to

²² See, e.g., *Attia v. Google LLC*, 983 F.3d 420, 425 (9th Cir. 2020) (public disclosure of a trade secret generally "extinguishes[s] the information's trade secret status," resulting in loss of the associated property right); *Life Spine, Inc. v. Aegis Spine, Inc.*, 8 F.4th 531, 540 (7th Cir. 2021) ("Publication . . . destroys the trade secret").

²³ 1193(a)(3); see also id. 1191(c)(2)

the MFP” as ensuring that the amount paid by the dispensing entity (pharmacies, etc.) for the selected drug is no greater than the MFP. Duplicate discounts of the MFP and the 340B program are explicitly prohibited under the law, and the manufacturers are statutorily required to provide the *lower of* the MFP or the 340B price.²⁴

To achieve these goals CMS proposes that a manufacturer provide access to the MFP either by: (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP or by (2) providing a retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP. Under the retrospective model, manufacturers must ensure “reimbursement” within a fourteen-day period. J&J has significant concerns that CMS has proposed an entirely unworkable model given the parameters of the current pharmaceutical supply chain. Significant, meaningful changes are required for the Agency to achieve IRA implementation as required under statute. J&J ***strongly urges*** CMS to collaborate with the primary stakeholders within the pharmaceutical supply chain to advance a ***workable*** solution that is clarified in updated Guidance.

Successful Program implementation requires CMS to adopt and facilitate a ***data-driven retrospective discount model operationalized through a third-party administrator (TPA)***. A retrospective discount model best facilitates timely access to an accurate MFP for verified, eligible MFP beneficiaries. Doing so will significantly increase program compliance (and reduce program integrity risks), assure the Agency of a more successful path toward timely Program implementation and provide the best overall experience for Medicare beneficiaries and other stakeholders in the critical path to MFP effectuation. Further, a retrospective model eliminates the unintended impact to NFAMP calculations resulting from sales processed through wholesalers, thus reducing impact on other government pricing calculations.

The core attributes of our proposed data-driven retrospective discount model are:

(1) Aligned with statutory intent: CMS has the legal authority to permit and facilitate an MFP retrospective discount. The statute does not specify the process by which the manufacturer of a selected drug must provide access to the MFP, and CMS is granted broad discretion to establish procedures to implement the provisions of the Program.²⁵

(2) Offer a pathway for the MFP-eligible beneficiary to benefit from the MFP discount at the point of sale (POS), effectuated through the plans, not manufacturers: J&J is aligned that an MFP-eligible beneficiary will have timely access to MFP-based cost sharing at the POS. We are further aligned to CMS’ clarification that access to the MFP by Part D MFP-eligible beneficiaries at the POS will be effectuated through plans, not manufacturers. We emphasize that manufacturers are not party to the transaction among the Part D beneficiary, the pharmacy, and the plan or its PBM at the POS, and thus the logical interpretation of the statute is for CMS to establish and/or facilitate a pathway whereby the MFP is passed-through to the MFP-eligible Part D beneficiaries by those directly party to the transaction at the POS.

(3) Data-driven, providing manufacturers with access to critical claims data that enable verification of the MFP-eligible individual, prevent payment of both the MFP statutory discount and a 340B discount on the same unit and confirm the MFP discount amount: The same robust data-driven approach will also improve CMS’ auditing capabilities for compliance.

²⁴ 1193(d).

²⁵ IRA 1196(a)(3)

(4) Aligned to a low-burden, administratively straightforward, workable model for all stakeholders: A retrospective discount model is the least administratively burdensome, practical, and compliant approach to providing access to a validated MFP price for MPF-eligible beneficiaries. The retrospective approach will also provide predictability to the pharmacies who will not be administratively burdened with the establishment of numerous, different processes and requirements with separate manufacturers.

(5) Facilitate sound program stewardship: J&J strongly underscores the importance of a retrospective model to best position CMS to advance sound program stewardship. Specifically, a retrospective discount is the only valid approach to offering a mechanism through which critical parties to the negotiation can verify that the MFP-eligible unit, at the correct MFP price is dispensed to an MFP-eligible beneficiary. A core component of program stewardship is providing a meaningful mechanism by which the manufacturers can logically implement the prohibition on MFP-340B duplicate discounts across Part B, MA, and Part D. ***A retrospective discount model supports meaningful implementation on the prohibition of MFP-340B duplicate discounts as prohibited under statute.***²⁶ The Manufacturer is required to provide access to the MFP when the MFP is lower than the 340B ceiling price. When a 340B ceiling price is subsequently determined to be below the MFP, the manufacturer would be required to provide the covered entity the difference between the MFP and the 340B ceiling price.

Data verification is a critical path under any scenario and requires CMS to play *an active role* in facilitating manufacturers' access to data for verification. With respect to MFP-340B duplicate discounts, CMS has taken important steps toward advancing such a mechanism. For example, effective January 1, 2024, all 340B covered entities must use 340B claims modifiers when submitting Part B claims.²⁷ CMS has similarly proposed to require a 340B modifier or identifier on the PDE record for the purposes of excluding 340B units from the Part D inflation rebate calculation.²⁸ CMS must build upon these initial steps to implement the prohibition of the MFP-340B discounts and specifically require the use of a 340B modifier (or a non-340B modifier) and condition payment of the claim on accurate modifier use (as recommended below).

We urge CMS to directly respond to our request that fair and sound program stewardship principles are advanced within the Program. Particularly as the statute does not provide other safeguards and mechanisms to assure MFP units are appropriately furnished; there is no ability to audit dispensed MFP units, nor is there a dispute resolution mechanism that enables manufacturers to contest improperly furnished units, or other penalties imposed upon parties that engage in practices that fall outside of the provision of the law and Program.

A neutral third-party administrator (TPA) will advance program stewardship and minimize stakeholder burden. A retrospective discount operationalized through a TPA will align to all the principles outlined within this section. A TPA approach will leverage existing methods to offer the MFP-eligible beneficiary access to the verified MFP at the POS, significantly minimizes critical stakeholder administrative burden (pharmacists, plans, beneficiary, CMS, and manufacturers) and will advance the integrity of the Program. The approach adopted with the successful implementation of the Coverage Gap Discount Program

²⁶ 1193(d) (the manufacturer is required to only offer the lower of the MFP and the 340B price).

²⁷ CMS, Part B Inflation Rebate Guidance: Use of the 340B Modifiers (Dec. 20, 2022). Available at <https://www.cms.gov/files/document/part-b-inflation-rebate-guidance340b-modifierfinal.pdf>

²⁸ Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D-14B of Social Security Act, and Solicitation of Comments (Feb 9, 2023). Available at <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>

(CGDP), created by the passage of the Patient Protection and Affordable Care (Act) in March 2010 and implemented less than a year later in January 2011, is a helpful model for consideration that would also leverage CMS' existing resources to increase the likelihood of program success.²⁹

The critical role of the TPA is to allow the eligibility of the MFP claim to be verified and enable manufactures and health plans to match eligible claims with the correct retrospective discount amount. In doing so, the TPA will make required data fields available to manufacturers, and other parties as needed, on a detailed claims-level basis at the time of invoicing. In Appendix A we outline the Part D and Part B requested data fields required for the TPA to operate successfully. Most of these data fields are already made available through the PDE record which significantly reduces the burden on the TPA.

If CMS does not pursue a TPA, at a minimum CMS must outline the process by which manufacturers will receive access to the detailed claims data required to verify the retrospective MFP discount.

The fourteen-day requirement should be eliminated until CMS clarifies the payment parameters (including payment flow to intermediaries) and the ability of manufactures to verify MFP discount eligibility.

J&J is aligned with CMS establishing reimbursement parameters to ensure pharmacies and other dispensers are promptly paid and we underscore that such prompt payments are made possible with the facilitation of intermediate entities. However, a fourteen-day period is impossible given the current guidance. At a minimum, there is insufficient time for the manufacturer to confirm that a unit was furnished or dispensed to an MFP-eligible beneficiary using the accurate methodologies required under the statute (including the *lower-of* standard for MFP-340B). In more practical terms, it is impossible for manufacturers to exchange and confirm data to verify MFP eligibility and 340B non-duplicative claims within this period.

Further, once CMS has clarified the payment parameters and a data driven verification process, we also request CMS clarify that any imposed timeline (fourteen-days, or otherwise) will only apply to the transactional payment of the discount value owed to the dispenser and that the clock starts *only after* the manufacturer has validated eligibility for the rebate.

D.2. CMS should leverage existing metrics, such as WAC, within the retrospective discount methodology to define the MFP discount amount.

CMS' proposal to use actual acquisition costs (AAC) is unpractical and inappropriate in calculating the value of the MFP discount. First, AAC is only available at the individual prescription level, known only to the dispensing pharmacy. It would be a new requirement for pharmacies to report ACC, and unclear to whom in the supply chain pharmacies would have to report. Second, conflicts may arise in requiring a pharmacy to report AAC to the wholesaler, thereby offering the wholesaler access to new data that may influence their negotiation position with the pharmacists. WAC is a widely adopted price reporting metric and is the logical choice.

D.3. CMS must clarify its proposed ten-year record retention policy.

CMS plans to require a Primary Manufacturer to retain for at least ten years from the date of sale any records relating to sales of the selected drug. This proposal conflicts with the previously outlined record

²⁹ SSA 1860-D-14A, Public Law 111-148; Public Law 111-152

destruction policy, and we further underscore that a Primary Manufacturer *is not responsible* for any other manufacturer's records retention process.

E.1 Nonduplication with 340B Ceiling Price 40.4.1

Payment of a claim for reimbursement for a unit of a selected drug must be conditioned on the accurate reporting of either a 340B or a non-340B claims modifier, uniformly across all Medicare programs (Part B, MA, and Part D)

The statute prohibits MFP-340B discounts. To compliantly implement this provision, CMS must facilitate a mechanism that allows manufacturers the pathway by which to comply with the law. We appreciate the steps CMS has already taken to establish 340B claims modifiers within Medicare, but more must be done. Specifically, we are urging CMS to require the use and reporting of either a 340B modifier or a non-340B modifier (or both), and condition claims payment on the accurate use of the applicable claims modifier(s). Not only are these modifiers required for compliant implementation of the Program, but unfortunately there is a documented history of duplicate discounts permeating the 340B program, including widespread 340B covered entity non-compliance with respect to the analogous Medicaid-340B duplicate discount prohibition.³⁰ In addition, CMS should establish a comprehensive auditing program of 340B Covered Entities (CEs)' appropriate identification and reporting of units subject to 340B agreements. This process could be further facilitated by a clearinghouse which is responsible for identifying and verifying 340B dispensed units administered to Medicare enrollees.

F. Compliance with Administrative Actions and Monitoring of the Drug Price Negotiation Program (40.5)

J&J acknowledges that a manufacturer that enter into an Agreement with CMS must comply with monitoring compliance requirements. However, CMS does not provide guidance on actions or processes the Agency intends to undertake to advance these efforts. We urge CMS to provide manufacturers with these plans when available, and to provide advance notice and opportunity for manufacturers to respond to any monitoring or compliance requests. We ask CMS to allow for flexibility and feedback as it develops and rolls out these processes.

NEGOTIATION FACTORS (Section 50)

Section 1194 of the IRA requires a "consistent process and methodology" for MFP price-setting. Unfortunately, Sections 50 and 60 of the Guidance fall far short of meeting these statutorily defined standards. Critical components of the Program, namely the statutory factors and the price setting methodologies addressed within these sections of the Guidance lack substantial clarity and fail to provide stakeholders, particularly manufacturers, with the predictability and certainty needed to comply with the statute. The framework for the statutory factors lacks a beneficiary-focused vision, a clear pathway toward predictable decision making and severely lacks clarity on how the Agency will accept and use data to arrive at the MFP. Most concerning is the minimal discussion on how value will be determined, how this determination is aligned to Medicare beneficiaries' well-being, and how this will inform the selected drug's MFP. Instead, the initial guidance and Information Collection Request (ICR) places an inappropriate and overemphasis on the non-clinical, manufacturer-specific data that bear little to no influence on beneficiary health. Where CMS has advanced specifics on the factors' influence on

³⁰ See Government Accountability Office, Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement (2018), available at <https://www.gao.gov/assets/gao-18-480.pdf>. See also PSA 340B(a)(5)(A).

establishing the MFP, it does so with ill-conceived methods that exceed statutory authority and are damaging to biopharmaceutical progress, and to our beneficiaries.

Unfortunately, the lack of a “consistent process and methodology” continues throughout section 60 where CMS’ proposes unworkable approaches to establishing and effectuating an MFP within the Program.

We urge CMS to significantly increase their engagement with key stakeholders, extend the timelines for public comments and re-work a substantial portion of these sections to align with the statutory mandate of a predictable Program that employs consistent processes and methodologies in establishing the MFP.

Our factor-specific feedback follows in the section below; however, we strongly request CMS consider the following in a significantly revamped framework for the negotiation factors.

- Update the framework to align with our collective goals of promoting beneficiary health and well-being, improving quality of care, and appropriately considering the value of medicines. Regarding the approach and methods adopted by CMS in considering statutorily required factors, J&J strongly recommends that first, selected drugs should be primarily assessed on their impact to patient lives, health outcomes, and society. Manufacturer-specific data on non-clinical factors of selected drugs should be considered secondary to clinical effectiveness during the MFP price-setting process as they have less bearing on patient outcomes, and
- Advance clarity and predictability in how the statutorily defined factors will be used within the Program to determine the MFP; this explanation should be offered across all the factors and be transparent to all stakeholders, particularly those party to the Agreement. CMS should clearly delineate, in updated guidance, their approach to reviewing evidence and engage in a transparent, scientifically rigorous, consistent, replicable, and open process. Further, the CMS must clearly delineate how each of these factors will inform the MFP in a transparent process before the start of the negotiation process.

A. Manufacturer-Specific Data (50.1)

As outlined in Section 50.1 of the Guidance, CMS delineates and elaborates the data required for submission by the Primary Manufacturer. The Agency intends to require data on research and development (R&D) costs borne by the Primary Manufacturer and if these costs have been recouped, current unit costs of production and distribution, prior Federal financial support, data on pending and approved patent applications, and market data and revenue sales volume data. This section of the Guidance is supplemented by Appendix C, which provides additional definitions and description of data collected during the MFP price-setting process. While required by statute, we note that the factors included here bear little influence on Medicare beneficiary health outcomes and do not inherently reflect the value of the selected drug.

a. *Consideration of research and development (R&D) costs*

As described in Section 50.1 of the Guidance, CMS has indicated their intention to assess the research and development costs and the extent to which the Primary Manufacturer has recouped these costs. As outlined in Appendix C, these include costs incurred during pre-clinical research, for the submission of

post-Investigational NDA, FDA-required Phase IV clinical trials, post-marketing trials, abandoned and failed drug costs per molecule or moiety, and other R&D costs. As outlined in the guidance, these data are collected with the intention to determine if a Manufacturer has recouped these costs as defined by “global, total lifetime net revenue for the selected drug.”³¹

While collection of R&D data for the purposes of determining Primary Manufacturer cost recoupment is required by statute, the approach currently outlined by CMS is unnecessarily burdensome and the proposed calculation of R&D spending in the guidance may not be compatible with existing financial accounting practices. The approach also neglects the multi-faceted and interlinked elements that comprise the research ecosystem, which may result in an incomplete and inaccurate calculation of R&D investment. For instance, placing obligatory reporting requirements on the Primary Manufacturer to disclose certain costs could create confidentiality and antitrust challenges in collaborative efforts. Further, as the Guidance itself acknowledges, such data may not exist or be accessible, for instance in cases where a company has been acquired and no longer exists. We also caution CMS to ensure that interpretation of R&D costs avoid survivorship bias, which erroneously separates historic investment on one product from most other assets that have failed.³² While challenging to access and report at the individual drug level, it should be noted that all these investments are essential in supporting the maturation of medical innovation.

As such, we recommend that CMS simplify the R&D reporting requirements to allow the Primary Manufacturer to offer an attestation in instances where the manufacturer believes to have fully recouped the R&D costs. Under such an approach, CMS can satisfy statutory obligations and, when necessary, collect more detailed information in cases where the Manufacturer has not yet recouped costs and could influence the MFP price-setting process. Lastly, it is important to consider the unintended consequences of pricing approaches based on the cost of development and production (“cost-plus”) that have been found to be disincentivize R&D productivity and innovation and are not driven by product value.

When defining various components of R&D costs, we encourage CMS to consider inclusion of costs associated with monitoring the safety and efficacy/effectiveness of marketed, FDA-approved drugs. Experience has shown that the research conducted after a drug’s FDA-approval provides significant and meaningful evidence about the drug’s profile as it is used larger and more diverse populations than the clinical development program. While post-approval studies conducted may be FDA requirements or voluntary additional real world evidence generation and related scientific engagements include objectives focused on pharmacovigilance, health outcomes, and comparative benefit-risk to inform decision making across stakeholders (health authorities, HCPs, patients and payers). We encourage CMS to consider these efforts as material research expenses within this section of the guidance. It is essential in understanding the real-world safety and effectiveness of drugs, particularly in subpopulations and groups with specific unmet needs not represented in the clinical development program and aligns with the Agency’s intention to understand patient outcomes to implement value-based approaches to inform the MFP.

Lastly, CMS specified in Appendix C that manufacturers use a cost of capital rate of 8.1%. Ideally, this rate would be specific to each manufacturer, however, in the interest of operational simplicity, CMS could adopt a more standardized rate observed across industry. We are concerned as 8.1% is significantly lower

³¹ Guidance, Appendix C, ps. 83

³² Drakeman, D.L., Drakemaken, L. N., *From Breakthrough to Blockbuster, The Business of Biotechnology*. 2022.

than amounts suggested by current empirical data which provides a range from 10.35% to 10.57%.³³ The approach to arrive at these independent estimates is also consistent with established research cited in CMS' guidance.³⁴ We strongly recommend that CMS publish updated values to be consistent with current industry data.

b. Current Unit Cost of Production and Distribution

In consideration of current unit costs of production and distribution, CMS proposes to set costs as an average across Primary and Secondary Manufacturers for all direct and indirect costs associated with sourcing materials of the drug, delivery mechanism, packaging, shipping, and other operating costs. Under the current definition outlined in Appendix C, these costs are fixed and neglect the variability and market conditions that often determine production costs. Further, the definition of these costs excludes the relevant and appropriate programs that support patient access to medicines and physician education and runs counter to the policy objective of value-based and patient-centered care. We are also concerned that the definition of these costs uses a fixed-in-time determination which risks harming market dynamics and, under certain market conditions, could escalate drug shortages as noted by the FDA and recently experienced with certain essential medicines.³⁵ We encourage CMS to broaden its understanding of the costs manufacturers incur to bring medicines to patients to adjust for various market dynamics and to include spending on disease awareness, physician and patient education, and other programs that Medicare beneficiaries rely on for access to their treatments.

c. Prior Federal Financial Support

As proposed in the Guidance, CMS employs an overly broad definition of prior financial support for novel therapeutic discovery and development of a selected drug to set the MFP. Public-private collaboration and partnerships that gather and disseminate knowledge and mutually supportive multistakeholder efforts to advance scientific and medical discovery have brought, and will hopefully continue to, bring a great deal of value to patients and society.³⁶ We are concerned that the current approach may result in the perception that prior financial support could be used as factor for CMS to justify a reduction in the MFP. Not only is this an operationally complex task, but overly simplistic linkages to prior Federal financial support do not lend sufficient insight into the extensive work and contribution of Manufacturers in bringing the selected drug to market and may result in negative and unintended consequences. As such, we are particularly concerned about the inclusion of tax credits for orphan disease drugs as a form of prior Federal financial support, as adjustments to the MFP based on this could be antithetical to the incentives of drug development for the treatment of individuals, and Medicare beneficiaries, with rare disease. We strongly recommend removal of tax credits from the definition of prior federal financial support. We also urge CMS to limit this information solely to funding that resulted

³³ Values are based on average of 598 biotechnology and 281 pharmaceutical manufacturers, Damodaran, A. (2023). Cost of Capital and Equity. https://pages.stern.nyu.edu/~adamodar/New_Home_Page/datafile/wacc.html

³⁴ Prior published peer-reviewed economic literature cited by CMS also suggest using a rate of 11.5%. DiMasi JA, Hansen RW, Grabowski HG. The price of innovation: new estimates of drug development costs. J Health Econ. 2003 Mar;22(2):151-85. doi: 10.1016/S0167-6296(02)00126-1. PMID: 12606142.

in a patent application containing a Government Interest Statement and/or research where a patent assignee was a US government agency.

d. Patents, Exclusivities, and Approvals

The proposal by CMS mandate disclosure of confidential patent information may hinder industry collaboration. For example, a Primary Manufacturer and Secondary Manufacturer may be collaborators advancing a particular drug with one mechanism of action to treat a particular disease in a certain therapeutic area. However, the Primary Manufacturer and Secondary Manufacturer may also be developing competing products with a different mechanism of action in the same disease and therapeutic area. In this scenario, if the collaboration drug is selected for negotiation, the Secondary Manufacturer could be forced to disclose confidential patent information to the Primary Manufacturer relating to their competitor product since the strategies for protecting both products may be scientifically intertwined (e.g., patent protection for assays, methods of treatment, combination therapies, etc.). Accordingly, this forced disclosure will disincentivize companies from collaborating, which will decrease the discovery and development of new innovations, which reduce patient choice and consequently harms patients. As such, we strongly encourage CMS to update its guidance to clarify that the submission of any non-public patent information by a Primary or Secondary Manufacturer should be discretionary. Taking that approach would, among other things, avoid significant questions that the Guidance would otherwise raise under the Fifth Amendment's Takings Clause.

As part of the negotiation process, Section 50.1 and Appendix C of the guidance require a Primary Manufacturer to submit to CMS non-public, and often highly confidential, patent application information. Section 50.1 (on page 35) provides that a Primary Manufacturer is required to report to CMS "[d]ata on pending and approved patent applications, exclusivities recognized by the FDA, and applications and approvals under section 505(c) of the FD&C (Food, Drug, and Cosmetic) Act or section 351(a)". Further, Appendix C provides that, "[a] pending patent application is any provisional or nonprovisional patent application submitted to the United States Patent and Trademark Office for which a patent number(s) has not been issued." We are concerned that the broad and vague language used to describe indirect applications is too ambiguous and unclear. We echo PhRMA's comments on this matter and urge CMS to consider the applications that are directly related to the selected drug, as confirmed by Primary Manufacturer.

Additionally, CMS requires sharing data on pending and approved patent applications, exclusivities recognized by the FDA, and other applications as part of the negotiation process. However, the agency has not indicated how this information will be used to determine the MFP. It is important to note that a patent is a Constitutionally protected property right granted by the US Patent and Trademark Office that protects new and innovative inventions. Property rights are a necessary economic incentive that promote innovation, knowledge sharing, patient, and doctor choice, as well as economic growth. Moreover, patents provide an opportunity for pharmaceutical and biotechnology companies to recoup investments made to deliver new products and patient solutions, which is especially important since R&D investment is high risk and rife with failure. Similarly, marketing exclusivity is a key incentive for drug developers and awarded for different innovations that enhance patient outcomes. We recommend the guidance be amended to require that the MFP be at or near the relevant price ceiling for a drug protected by at least one existing unexpired patent or exclusivity.

e. Market Data and Revenue and Sales Volume Data

As outlined in Section 50.1 and Appendix C, Primary Manufacturers must submit to CMS market data and revenue and sales volume data for the selected drug to inform the negotiation process. As currently defined, these definitions are very broad and often considered confidential, proprietary information. In addition to PhRMA’s comments, we strongly urge CMS to guarantee that any information collected on this matter be discretionary. Further, we encourage CMS to provide the appropriate flexibility to allow either the Primary or Secondary Manufacturer responsibilities for disclosure and reporting of this information.

B.1.1. Non-FAMP Data (50.1.1)

CMS Should Align non-FAMP with the Veterans Health Care Act of 1992 (VHCA)

J&J urges CMS to adopt the existing annual non-FAMP which calculated based on the four quarters of a federal fiscal calendar year under the VHCA. Leveraging this existing calculation will minimize operational disruptions that may arise with the creation of a new price point based on the calendar year. While the statute mandates the submission of the non-FAMP for the “applicable year,” it does not specify that CMS use calendar year as opposed to a fiscal calendar year. We highlight this as an opportunity for CMS to leverage data already available and to align with the VHCA rather than creating a new calculated price point based on calendar year. All stakeholders would benefit from the resulting efficiencies.

J&J urges CMS to adopt use of the fiscal year instead of calendar year for reporting of non-FAMP data. CMS does not define a process for non-FAMP restatements or for addressing non-FAMP anomalies which is important for addressing scenarios in which restatements may be necessary or to account for anomalous non-FAMP data.³⁷ J&J encourages CMS to outline a process for non-FAMP restatements and anomalies in final guidance.

We ask CMS to clarify the submission requirements for drugs where there is no non-FAMP data in 2021. For this scenario, CMS states its intent to require the Primary Manufacturer to submit data on the non-FAMP, unit type and total unit volume for each NDC-11 of the selected drug for the first full year following market entry of such drug. However, no details are provided to define the phrase “market entry.” Therefore, we ask CMS to define market entry in its final guidance to provide more clarity around this requirement for manufacturers.

B.2. Evidence About Therapeutic Alternatives for Selected Drug (50.2)

a. Quality Adjusted Life Years (QALYs)

At J&J, we believe that a medicine’s value is most accurately measured by its impact on patients, caregivers, and society. Accordingly, we believe that any form of value assessment should reflect these aims by being holistic and include a treatment’s impact on not only the health system, but also society at large. We support CMS’s intention to consider the full range of effects of a treatment and be centered on the patient and beneficiary perspective. We agree with CMS that the QALY is highly flawed and discriminatory in measuring the value of human health, particularly for those beneficiaries that are

³⁷ See VA PBM “Dear Manufacturer” Letter (Oct. 13, 2022) under Compliance or Pricing Errors.

elderly, live with chronic illness, or disability and are aligned with the Agency’s decision to disallow use of QALYs in evidence submitted to inform the negotiation process.³⁸ The prohibition on Medicare reliance on QALYs as outlined in the SSA applies to the Negotiation Process and determination of the MFP and therefore QALYs should not be used in any context.

Beyond the discriminatory nature of the QALY, there are numerous other well-known conceptual and technical problems with estimating QALYs.^{39,40,41} While the techniques may be useful for hypothesis generation in academic settings, given their significant flaws, QALYs should be assessed against a higher standard in the context of informing CMS’ decisions that directly impact beneficiaries’ and their families’ access to healthcare. For example, “the EQ-5D, which is the most commonly used PRO [patient-reported outcome] within QALY calculations, does not meet the FDA’s standard for patient involvement and therefore does not have legitimacy.”⁴² As such, this measure is not fit for reflecting the values that patients have for different health states, disease conditions, and consequently the value of alternative treatments.

Further, the potential for discrimination with the QALY, and its adaptations, is not merely contingent upon the differences in expected longevity. Nuemann and Cohen state: “Moreover, there are concerns that cost-per-QALY ratios potentially discriminate on the basis of age *and* disability by favoring younger *and* healthier populations that have more potential QALYs to gain.”⁴³ (*italic emphasis added*) In the Guidance, CMS states that “*certain uses* of quality-adjusted life years (QALYs) will not be used in the negotiation process.” This language is ambiguous and could allow use of QALYs in certain therapeutic areas where patient benefit does not include “life extension.” We also remain concerned about the influence of QALY-based research, even if such data has been separated from submitted evidence. We strongly encourage CMS to provide updated Guidance that more clearly and definitively prohibit QALYs, and similar metrics in any and all evidence submitted to the Agency.

CMS also solicits comments from stakeholders on other metrics, in addition to QALYs that the agency should exclude from consideration during the negotiation process. We encourage CMS to avoid use of metrics adapted from the QALY, such as the Equal Value of Life Years Gained (evLYG). The evLYG is even more problematic than the QALY, as by definition, it *disregards* quality of life impacts during the period of life extension. As such, important patient-centered considerations such as the side-effects of treatments would be excluded from consideration. Researchers have noted that using the evLYG could harm cancer patients in particular.⁴⁴ Furthermore, the evLYG measure and the alternative HYT (health

years total), have been shown to be logically inconsistent over time, which should negate their use by CMS.⁴⁵ We agree with the assessment of the National Council of Disability, an independent federal agency of the US government, that “(t)he QALY/evLYG system still relies on health utility weights to measure quality of life improvements, despite the fact that such measures are typically derived from survey data and do not account for the complexity of the preferences and experiences of people with disabilities.”^{46, 47} We thus strongly encourage the Agency to protect vulnerable beneficiaries and disregard studies using the evLYG or other generic measures. Aligned with FDA Guidance, CMS should prioritize disease-specific and patient-centric quality of life instruments that capture the value of therapies to the populations CMS seeks to protect.⁴⁸

b. Evaluation of Real-World Evidence and Process Guiding Review of Submitted Research

The Guidance outlines CMS’ proposal to accept and review information on selected drugs and therapeutic alternatives from the Primary Manufacturer, other manufacturers, and members of the public. Further, CMS intends to review existing literature and real-world evidence, conduct internal analytics, and consult subject matter and clinical experts to inform its decision making during the MFP price-setting process. While we are encouraged by the rigor CMS states it intends to use, the Guidance provides little information on the criteria, standards, and process that will guide its review. We encourage the Agency to provide additional clarity and ensure its process is transparent, replicable, and methodologically sound. We strongly encourage CMS to provide public transparency into the submission of all non-proprietary information on stakeholders’ reports on therapeutic alternatives that are considered. Further, to account for the interest of manufacturers’ fiduciary responsibility, CMS should provide additional clarity on the requirement of the submission on therapeutic alternatives and relevant data and allow manufacturers to make public any of their redacted information shared with CMS upon agreement to the MFP. Doing so allows for meaningful and productive engagement throughout the process and assurance that medicines are being appropriately assessed and guided by patient-centeredness.

We believe that manufacturers, patients, providers, and other members of the public should have clarity in the Agency’s rationale and approach in interpreting such a vast body of evidence across comparators and indications. Specifically, transparency into the criteria used and measures taken to ensure the highest quality of research are important determinants in maintaining the public’s trust with the Agency’s decision-making. We urge CMS to recognize the severity of different outcomes (e.g., symptomatic outcomes, hospitalization, mortality) when evaluating clinical evidence and to weigh endpoints

accordingly. After characterizing the clinical comparators and clinical value, CMS analysis should also allow for inclusion of both economic and societal value that matters to beneficiaries.

To guide this process, we recommend that CMS engage with the manufacturer regarding its thinking across the factors during the negotiation process, like a process used in other evaluations on evidence such as the Advisory Committee on Immunization Practices' (ACIP) Evidence to Recommendations framework. In addition, we recommend CMS hold public meetings and provide engagement opportunities with a variety of stakeholders, including patient advocates, to discuss the evidence and understand alternative therapeutic choice and patient preferences. CMS also states that it intends to review additional evidence independently and separately and conduct internal analytics. However, the Guidance does not provide any information describing the methodology it intends to utilize in examining additional research, and the experts and members of the public consulted during this process. As applied to both the evidence submitted to the Agency and its own internal research and analytics, we urge CMS to develop and publish more detailed standards for evidence considered in determining the selected drug's MFP.

c. Addressing Unmet Need & Evidence for Certain Subpopulations

We appreciate CMS explicitly stating its intention to avoid formulaic numerical price setting, highlighting a preference for the qualitative evaluation led by evidence on comparative clinical value over cost-factors in determining initial MFP. However, the agency should broaden the definition of unmet need beyond the availability of therapies to include the current drugs' therapeutic profile correlated to the needs of patients and subpopulations, especially those with historically disparate access or outcomes. CMS should take an approach that harmonizes the Guidance with orphan and pediatric regulatory exclusivities codified in other federal statutes.

In the Guidance, CMS notes that it will prioritize data and evidence that is specific to the Medicare population and favor evidence with products with existing evidence demonstrating impact to Medicare populations. In developing a drug and collecting data on the clinical impact of the product, manufacturers consider all populations that use the therapy. We appreciate the Agency's focus on safeguarding and promoting the health of Medicare beneficiaries and we seek to develop post-approval evidence that demonstrates the impact of therapies on specific populations, including Medicare beneficiaries. As the agency weighs the vast amount of data and research on a selected drug, we urge the Agency to consider the value of these therapies for a diversity of patients, particularly certain vulnerable groups. Aligned with the agency's focus on advancing health equity, we encourage CMS to also consider the value of studies with varied origins and primary objectives or populations.

NEGOTIATION PROCESS (Section 60)

A. Establishment of a Single Proposed MFP for Negotiation Purposes (60.1)

Simplified Application of the MFP Specific to Each Dosage Form and Strength (Sections 60.1, 60.2.1, 60.2.2, 60.2.3, 60.2.4, 60.5)

CMS proposes a complicated methodology to establish the MFP specific to each dosage form and strength. The statute provides CMS with the authority to apply a more simplified and appropriate approach to establishing the MFP specific to each dosage form and strength.

We agree that the statute requires CMS to negotiate the MFP for a selected drug and further directs CMS to establish procedures to compute and apply the MFP to each specific dosage form and strength, as

applicable. However, we disagree with the complicated methodology CMS proposes to (1) identify a single price for use at each step in the negotiation process and (2) to establish the price across all dosage forms and strengths. We are further concerned with the unintended negative impact this approach will have on beneficiaries. To aid the Agency, we propose an alternative, simplified methodology, aligned with the statute, which calculates the differentiated MFP applied to each dosage and strength. Our practical methodology is consistent with the statutory requirement and CMS’ intent “to publish the MFP at the per unit (e.g., tablet) level for each dosage form and strength associated with the selected drug.”⁴⁹

Our methodology will achieve five primary goals:

- Align with CMS’ commitment to maintain price variation “*specific to each dosage, form and strength of the selected drug*”⁵⁰,
- Alleviate the circumstance that the single MFP methodology generates a price above the statutorily defined ceiling price for a specific dosage form (see Table 1),
- Significantly reduce the administrative burden on the Program [by leveraging existing price reporting calculations and promoting transparency, reliability, and validity,]
- Establish equitable beneficiary cost-sharing based on beneficiary and provider-preferred dosage strengths and forms, and
- Mitigate disincentives for continued innovation and improvement of in dosage formulations, strengths, and indications.

For the Agency’s consideration, we outline below a workable, alternative methodology and urge CMS’ collaboration in response.

CMS’ Proposed Methodology Will Have Unintended Consequences for Beneficiaries

Impact on Cost Sharing for Beneficiaries

Calculating a single MFP across all dosage forms, regardless of whether an equivalency metric is applied, impacts the MFP-eligible beneficiaries co-payment for a selected drug. This approach will have an inequitable impact on copayments for beneficiaries who use different form, strength, or package sizes of the product. With CMS’ proposed approach, beneficiaries’ cost-sharing will be based on the Single NDA equivalent MFP, not the actual utilized product, resulting in cross subsidizing across different forms and strengths. This outcome is not intended under the Statute. Table 1 offers an illustrative example:

Table 1: Flawed Methodology and Impact on MFP-eligible Beneficiary Cost-Sharing with a Single NDA Equivalent MFP

⁴⁹ Guidance Section 60.5 ps. 58

⁵⁰ Guidance Section 60.2.4 ps. 46

NDC 9	Product Description	NDC 9 PDE Weighted MFP p/LUM	PDE W-Avg 30 Days Equiv Qty	NDC9 Weighted 30 Day Equiv MFP	Across NDC9 PDE Weight %	MFP Across NDC9 30 Day Equiv
		A5	A6	A7 (A5XA6)	A8	A9 (Sum A8*A7)
	<u>5MG Strength</u>					
12345-0125	BrandC 100 Pills					
12345-0125	BrandC 30 Pills	\$ 9.88	30	\$ 296.27	26%	
12345-0125	BrandC 90 Pills					
	<u>5MG Strength</u>					
12345-0234	1MLX 5MG					\$ 348.56
12345-0234	2MLX 5MG	\$ 367.36	1	\$ 367.36	74%	
12345-0234	3ML X 5MG					

100%

CMS' proposed approach would result in a single MFP of **\$348.56** rather than separate MFPs of \$296.27 and \$367.36 respectively at each specific dosage form NDC-9 level, and notably the single MFP across all dosage forms is higher for the beneficiaries on the pill form than the MFP ceiling specific to that dosage form. This is an unfortunate outcome, and not an intended consequence of the IRA.

Further, CMS' proposed approach encourages linear pricing over time, which fails to account for unique production costs of different forms, etc. Consider a 5MG tablet (per the above table): used very rarely, the manufacturer will produce a much lower volume, with a greater per unit production costs. Under the methodology proposed by CMS the higher per unit production cost will impact the co-pays of all strengths unless the manufacture prices the same price per unit for the larger 10mg (which may be used more frequently and have lower per unit production cost). It is an unintentional consequence that risks pitting beneficiary cost obligation against reasonable production-cost accounting. Not to be overlooked, another unintended consequence of the proposed approach would be to disincentivize volume-based discounts for differential package sizes utilized across differing sites of care.

Impact on Innovation to Better Address Beneficiary Need

We are further concerned with the broader unintended beneficiary consequences resulting from the reduced incentives for incremental innovation under CMS' proposed methodology. The development of new dosage forms and strengths reflect advances in clinical medicine and the demands of patients and clinicians to achieve improved medication management and tolerance, enhance adherence and reduce burden, among others. Ongoing product innovation of an approved therapeutic helps to improve response to patients' medical needs and preferences and serves to improve care and outcomes.

Recommended Approach is Aligned to CMS' Objectives and Significantly Streamlines the MFP Calculation

We are aligned with the Statute and the Agency that an MFP should be calculated specific to each dosage, form and strength (NDC-9) and account for the variation in prices *"specific to each dosage, form and*

strength of the selected drug”.⁵¹ Our recommended methodology, described below, calculates the ceiling price **for** the lowest unit of measure (LUM) of a selected drug and establishes **a metric** from which CMS may negotiate a **percent of the MFP ceiling** as described in Section 60.4 to arrive at the published MFP per LUM.

To calculate the MFP ceiling for the LUM, weighted to specific dosage forms (NDC-9), the following steps should be followed:

Step 1: Establish the MFP ceiling based on the calculations required by Section 1194(C)(1) using the LUM (Tables 2 and 3)

Specifically, section 1194(C)(1) sets forth the calculations for the MFP ceiling determination where the MFP ceiling is the lower of (i) the sum of the plan specific enrollment weighted amount (EWA) or (ii) an amount equal to the assigned applicable percent described in Section 1194(C)(3), of the average annual non-FAMP (aNFAMP). As Section 1194 does not prescribe how such calculations must be performed, a straightforward, simplified, and practical approach to calculate the MFP ceiling for the LUM level, weighted for the specific dosage forms (NDC-9) is most expedient, transparent, and reliable. Calculating the MFP ceiling at the LUM is consistent with existing claims billing methodologies and allows for straightforward comparisons within the calculation. Tables 2 and 3 illustrate this calculation. Tables 2 and 3 reflect an example of a product with two different dosage forms (i.e., pills and vials), each with a distinct NDC-9, and each NDC-9 with three different package sizes at the NDC-11 level. While we neither recommend, nor see the value in, providing the MFP ceiling in 30-day equivalents, the MFP ceiling calculated for the LUM can easily be converted to a 30-day supply by multiplying the MFP ceiling for the LUM to a price per 30-day equivalent supply quantity.

To determine the MFP Ceiling, perform two calculations: 1) the amount equal to the assigned applicable percent of the aNFAMP described Section 1194(C)(1)(C), as illustrated in the example in Table 2, below, and 2) the amount equal to the sum of the plan specific EWA as indicated in Section 1194(C)(1)(B), as illustrated in Table 3. Compare the results of each calculation and select the “lower of.” (See Table 4)

Establishing the MFP at the LUM for the specific dosage form will provide CMS with a metric that can be applied uniformly across dosage forms and strengths for purposes of MFP setting. (See Table 5).

To perform each calculation, there are three simple steps, described below:

1. Calculate the MFP Ceiling per package.
 - ^a Apply the 75% of the aNFAMP specific dosage form, see Table 2 Column A1⁵²
2. Convert the MFP Ceiling per package (NCD-11) to “the MFP Ceiling per unit” (LUM NDC-11).
 - a. MFP Ceiling per package divided by number of units within a package, see Table 2 Column A3
3. Calculate the weighted **MFP Ceiling per Unit** for each dosage form (NDC-9)
 - a. Sum of MFP Ceiling per Unit multiplied by NDC-9 PDE weight percentage, see Table 2 Column A5

⁵¹ Guidance section 60.2.3

⁵² assumes the assigned applicable percent from Section 1194(C)(1) is 75% for short monopoly drugs.

Table 2 MFP Ceiling Based on “Applicable Percent” of the Average NFAMP

NDC 9	Product Description	Assigned Applicable %	aNAMP* (Pkg)	Step1	Package Size	Step 2	NDC9 PDE %	Step 3
				NDC 11 NFAMP Ceiling MFP p/Pkg		NDC 11 MFP p/LUM		NDC 9 PDE Weighted MFP p/LUM
		S	N	A1 N*S	A2	A3 A1/A2	A4	A5 Sum A3*A4
	<u>5MG Strength</u>							
12345-0125	BrandC 100 Pills		\$ 1,035	\$ 776	100	\$ 7.76	1.1%	
12345-0125	BrandC 30 Pills	75%	\$ 396	\$ 297	30	\$ 9.90	87.4%	\$ 9.88
12345-0125	BrandC 90 Pills		\$ 1,188	\$ 891	90	\$ 9.90	11.5%	
	<u>5MG Strength</u>						100.0%	
12345-0234	1MLX 5MG		\$ 430	\$ 323	1	\$ 322.50	0.3%	
12345-0234	2MLX 5MG	75%	\$ 980	\$ 735	2	\$ 367.50	82.4%	\$ 367.36
12345-0234	3ML X 5MG		\$ 1,470	\$ 1,103	3	\$ 367.50	17.3%	
*Inflation adjusted aNFAMP (this could be replaced with "Enrollment weighted amount")							100%	

Table 3 follows the same steps as above but uses the sum of the plan specific EWA:

Table 3 MFP Ceiling Based on “Enrollment Weighted Average” (EWA)

NDC 9	Product Description	NDC 11 EWA p/Pkg	Package Size	NDC 11 MFP p/LUM	NDC9 PDE %	NDC 9 PDE Weighted MFP p/LUM
	<u>5MG Strength</u>					
12345-0125	BrandC 100 Pills	\$ 1,350	100	\$ 13.50	1.1%	
12345-0125	BrandC 30 Pills	\$ 405	30	\$ 13.50	87.4%	\$ 13.50
12345-0125	BrandC 90 Pills	\$ 1,215	90	\$ 13.50	11.5%	
	<u>5MG Strength</u>				100.0%	
12345-0234	1MLX 5MG	\$ 475	1	\$ 475.00	0.3%	
12345-0234	2MLX 5MG	\$ 950	2	\$ 475.00	82.4%	\$ 475.00
12345-0234	3ML X 5MG	\$ 1,425	3	\$ 475.00	17.3%	
						100%

Step 2: Select the “Lower of” the Applicable Percent aNFAMP or EWA to Determine the MFP Ceiling

Once each calculation is performed, compare the results of each of the two methods above, and select the lower of the two methods. See Table 4 below for an illustration of this comparison.

Table 4 MFP Ceiling Determination: Lower of “Applicable Percent” aNFAMP or “Enrollment Weighted Amount”

Table 2		Table 3		
NDC 9	aNFAMP Amount p/LUM	EWA p/LUM	Lower of	MFP Ceiling p/LUM
12345-0125	\$ 9.88	\$ 13.50		\$ 9.88
12345-0234	\$ 367.36	\$ 475.00		\$ 367.36

Step 3 Determination of the Proposed MFP for Negotiation Purposes Using the Ceiling as Basis

This metric establishes the ceiling price for the LUM. The example below illustrates how a percent of the ceiling can be applied specific to each dosage form and strength for negotiation purposes. This figure can be converted to a 30-day equivalent supply MFP. This approach also allows CMS to confirm the Proposed MFP for Negotiation Purposes does not exceed the Ceiling.

Percent Application of the MFP Ceiling Across Dosage Form and Strengths:

Apply a “percent application” to the MFP ceiling across all dosage forms at the LUM.⁵³

			Proposed MFP for Negotiation
NDC 9	MFP Ceiling p/LUM	% Application of the MFP Ceiling	MFP p/LUM
12345-0125	\$ 9.88	95%	\$ 9.38
12345-0234	\$ 367.36	95%	\$ 348.99

B.1. Determination of the Ceiling for the MFP (60.2.1)

We also urge CMS to provide manufacturers with the opportunity to review and reconcile the Agency’s collected data for purposes of calculating the ceiling for the MFP to ensure accuracy and completeness of the MFP ceiling calculation. This is important for transparency and enabling validation of calculations, but also important to a manufacturer’s ability to make counter offers during the negotiation process.

B.2. Sum of Plan Specific Enrollment Weighted Amounts (60.2.)

J&J opposes CMS’ proposed use of Direct and Indirect Remuneration (DIR) data to calculate for a selected drug an amount equal to the sum of the plan specific enrollment weighted amounts. Specifically, the statute states that the MFP ceiling must be determined by reference to the Part D negotiation price. The use of DIR data rather than PDE data conflicts with what is described in statute because, unlike the

⁵³ For illustrative purposes, assumes 95% for the CMS selected percent of ceiling price.

Part D negotiation price, DIR includes all price concessions including those received from manufacturers that are not passed through at the point of sale. The proposed approach does not align with statute or the existing Part D standard and should be modified accordingly.

B.3. Average Non-Federal Average Manufacturer Price (60.2.3)

While we agree with including steps to prorate to account for different prices for different strengths, forms, and formulations, we do not support CMS' intent to use WAC proration. Please see our comments for section 60.5 below for more details and for our recommended methodology and approach for determining the MFP Ceiling. Aligned with our comments under section 60.5, we also encourage CMS to consider separately each BLA/NDA for purposes of determining monopoly type.

B.4. Selection and Application of the Ceiling for the MFP (60.2.4)

Please refer to above comments

C.1. Developing a Starting Point for the Initial Offer (60.3.2)

CMS states that by using the net price of a therapeutic alternative as the starting point for the initial offer, the Agency is “able to focus the initial offer on clinical benefit by adjusting this starting point relative to whether the selected drug offers more, less, or similar clinical benefit compared to its clinical alternatives.” CMS then says that if the price of the therapeutic alternative is above the MFP ceiling or if there is no clinical alternative, then CMS will use the Federal Supply Schedule (FSS) or the “Big Four” price as the starting point.

J&J objects to the use of the FSS or “Big Four” prices in this manner. First, the use of these price points is inconsistent with the reasoning behind using the price of a therapeutic alternative—if the price of the alternative is above the ceiling or if there is no clinical alternative, the most consistent choice of a starting point is the ceiling price. This would most closely reflect the value of the therapeutic alternative and would be appropriate for any product with no clinical alternative since such a product clearly addresses an unmet need. In addition, the FSS and “Big Four” prices are inappropriate for use in the MFP price setting process because they are intended for specific non-Medicare populations within closed systems and do not represent a retail price. CMS should use the ceiling price as the starting point in proposing an initial offer when the therapeutic alternative's price is above the ceiling or if there is no therapeutic alternative.

CMS asks for comments on how to determine the starting point for the initial offer when there are multiple therapeutic alternatives. When considering multiple therapeutic alternatives, J&J recommends that it would be most appropriate to consider the highest-value therapeutic alternative. As CMS is setting up an untested system to determine prices which will have broad impacts on the incentives to develop new drugs and to seek additional indications, CMS should begin this process in a manner that minimizes harm to ongoing innovation by undervaluing selected drugs.

C.2. Adjusting the Starting Point Based on Clinical Benefit (60.3.3)

CMS says that it will evaluate clinical evidence, including data submitted by the public and the manufacturer, as well as a literature review, and will analyze Medicare data or “other pharmaceutical datasets” for utilization patterns, clinical data, or other information. CMS also states that the Agency may consult with clinical and academic experts.

J&J recommends that CMS consider the full range of benefits associated with the selected drugs. CMS should consider the impact of a selected drug on patients, caregivers and the broader society and give due weight to important considerations like convenience, added adherence, caregiver burden, and other societal impacts (e.g., impacts on incarceration or health system savings) in determining the initial offer. We also ask CMS to provide manufacturers the opportunity to recommend outside experts to weigh in on key issues, such as comparator selection and clinical/societal benefits.

In addition, J&J urges CMS to provide transparency and clearly explain to the manufacturer the data sources used and how CMS factored them into adjusting the initial proposed offer. CMS should include this level of detail in the initial offer and engage with the manufacturer prior to the initial offer to allow the manufacturer to make a meaningful counteroffer.

C.3. Analysis for Selected Drugs with Therapeutic Alternative(s) (60.3.3.1)

When evaluating alternative treatments for selected drugs, CMS states that it will consider whether a drug meets an unmet medical need if it treats a disease or condition “in cases where very limited or no other treatment options exist.” This definition of unmet need is unduly narrow and will not provide appropriate recognition of drugs that provide important clinical improvements as compared to alternative treatments.

J&J recommends that in determining whether a drug addresses an unmet need, CMS should consider the selected drug’s position in the current standard of care for the disease. If the selected drug is recognized as the most effective treatment for its indication based on being the standard of care, it de facto addresses a need that is unmet by existing alternatives based on its demonstrated effectiveness.

CMS also notes that it will consider the effects of the selected drug on specific populations. In addition to the groups specified in the guidance, CMS should consider impacts on subpopulations that have had historically disparate healthcare access and outcomes.

In CMS’ choosing a comparator as the alternative for a selected product that has multiple indications, generic comparators should not be used to deflate the MFP of the negotiated product when no other branded products are available to beneficiaries in one of the indications. Not only could choosing an older generation drug be an inappropriate therapeutic comparator, it also disincentivizes research in multiple indications and reduces treatment choices for diverse patient populations if being the only branded product in the indication would negatively impact the MFP.

C.4. Consideration of Manufacturer-Specific Data (60.3.4.)

CMS outlines its plans to adjust the preliminary price downward if R&D costs have been recouped and if the preliminary price is above the costs of production and distribution. J&J notes that this approach is inconsistent with the approach CMS describes to develop a value-based preliminary price. If CMS maintains that the preliminary price reflects the value of the drug vs. an appropriate comparator, then the suggested reductions would only serve to undervalue the selected drug. J&J recommends that CMS should consider these factors only as potential increases to the preliminary price to address R&D costs that have not been recouped or to avoid pricing below cost.

If the selected drug has patents and exclusivities that will last for several years, CMS states it may consider adjusting the preliminary price downward. J&J finds this reasoning perverse and is deeply problematic for two reasons. First, the existence of patents and exclusivities is evidence of value as

determined via the patent process or FDA review and therefore—the existence of patents or regulatory exclusivity should push the price UP, not down. Second, the IRA already includes a mechanism to address products that have extended periods on the market without generic or biosimilar competition (i.e., the ceiling-price step-down and related renegotiations) so CMS should not seek to penalize manufacturers again by reducing the initial offer due to the expectation of continued exclusivity. Further, the agency’s approach is arbitrary, capricious, and contrary to law, 5 U.S.C. § 706(2), because it would cause unnecessary conflict with the Patent Act and statutes that authorize regulatory exclusivities, and also because it would give rise to significant questions under the Fifth Amendment’s Takings Clause. Established principles of statutory interpretation—including the duty to construe statutes together as a harmonious whole and the constitutional avoidance canon—counsel in favor of taking an alternative approach that would not penalize manufacturers for obtaining and exercising patent rights.

D. Negotiation Process (60.4)

CMS intends to allow for a maximum of three in-person meetings after the manufacturer’s counteroffer has been rejected. J&J does not support or understand the justification to limit interaction with manufacturers in such a narrow manner.

This approach does not reflect a true spirit of negotiation or align with our experience. For example, negotiations with Pharmacy Benefits Managers (PBMs) and state agencies for formulary and Preferred Drug List (PDL) placement normally include a kick-off meeting and additional opportunities to meaningfully engage rather than adoption of predetermined limits on meetings. Given the importance of comparator selection in developing the initial offer, CMS should meet with the manufacturer upon drug selection to discuss selection of an appropriate comparator. In addition, J&J recommends that CMS should allow for a meeting with the manufacturer upon the manufacturer’s data submission to allow discussion of the clinical evidence package and to answer any questions prior to CMS’ development of the initial offer. CMS should also allow for a meeting prior to proposing the initial offer so that the manufacturer can provide input on the evidence sources CMS intends to use in finalizing the offer. These meetings should be in addition to the post-offer meetings that CMS discusses in the Guidance.

Given the centrality of the identification of therapeutic alternatives in the process CMS describes in the Guidance, CMS should inform the manufacturer about the selected alternative as soon as possible. Such notification will allow the manufacturer to prepare to review CMS’ initial offer and to respond with an appropriate counteroffer within the 30 days allowed in the guidance.

MANUFACTURER COMPLIANCE AND OVERSIGHT (Section 90)

A. Monitoring of Manufacturer Compliance (90.1)

CMS indicates it will closely monitor manufacturer compliance with terms of the agreement and aspects of the negotiation program, including tracking, monitoring progress, and engaging directly with manufacturers. CMS notes failure to comply with certain terms and deadlines could result in excise tax liability. As the negotiation process will include collection and disclosure of business sensitive and critical information, J&J emphasizes the need for sufficient time to evaluate all proposals for information and price before punitive actions such as CMPs or excise tax liability are asserted. Moreover, the possibility that failure to comply with the Guidance would result in imposition of tax liability further

underscores that the Guidance is a legislative rule that must be vetted through notice-and-comment rulemaking before taking effect.⁵⁴

B. Monitoring of Access to the MFP (90.2)

CMS outlines its plans for monitoring compliance with providing access to the MFP at the point of sale, including establishing a process for beneficiaries, dispensing entities, and other providers and suppliers to report violations to CMS. CMS notes it will investigate these reports and impose CMPs on Primary Manufacturers if CMS determines the Primary Manufacturer (or Secondary Manufacturer) failed to provide MFP. J&J is concerned that CMS does not outline any plans to institute a dispute resolution process or details on how it will engage with Primary Manufacturers following a report. Bedrock due process requirements dictate that CMS must, at a minimum, provide manufacturers with notice and an opportunity to be heard before the agency makes a finding of noncompliance or imposes penalties. The reporting process CMS outlines would be universally available to beneficiaries, dispensing entities and other providers and suppliers and therefore susceptible to incorrect information. It is important for program integrity that manufacturers be afforded the opportunity to engage in a dialogue with CMS in response to any report and a dispute resolution process if the Manufacturer disagrees with CMS' findings. Such a process should be broad and transparent, with advance guidance made available to manufacturers. We are aligned with PhRMA's comments on this topic.

PART D FORMULARY INCLUSION OF SELECTED DRUGS (Section 110)

CMS notes that "Medicare Part D plans shall include each covered Part D drug that is a selected drug on Part D formularies during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period." While this statement is consistent with the IRA statute, we urge CMS to go beyond simply requiring selected drugs to be on formulary to safeguard appropriate drug coverage in Part D.

J&J is concerned that the price-setting process may lead plan sponsors to disadvantage access to selected or non-selected drugs via increased utilization management (UM) for any number of potential reasons, for example based on their preference for lower prices from the MFP or higher rebates from competing products. Without appropriate oversight, this is likely to lead to significant disruption for patients and providers, including high levels of non-medical switching and nonadherence.

This risk is likely to be exacerbated by the IRA's Part D redesign, which shifts substantial risk to plan sponsors. Plan sponsors may respond by narrowing formularies, increasing UM, and moving more products to higher cost-sharing tiers. These access barriers could seriously undermine the goal of the benefit redesign to make the Part D program more valuable for beneficiaries.

J&J recommends that CMS review and update its formulary review standards and update rules around plan coverage decisions, UM, narrowing formularies, medication exclusions, restrictive tiering, cost sharing levels and patient out-of-pocket exposure. CMS should conduct vigorous oversight of these activities and otherwise ensure that patients have meaningful access to selected drugs by limiting plans' ability to impose barriers to access those drugs.

⁵⁴ See, e.g., 5 U.S.C. § 553; Social Security Act § 1871; *Azar v. Allina Health Services*, 139 S. Ct. 1804 (2019).

APPLICATION OF MEDICARE PART B AND PART D PRESCRIPTION DRUG INFLATION REBATE PROGRAMS TO SELECTED DRUGS (SECTION 120)

Inflation rebates should only apply when the manufacturer has increased price.

CMS is soliciting comments as to whether additional guidance would be appropriate or necessary with respect to the interaction between the Program and the Part B inflation rebate program for years before IPAY 2028. We urge CMS to issue guidance to ensure the two discrete programs do not have an interactive effect. The benchmark CPIU and benchmark amount should have no bearing as to when a drug is selected, as this could result in unintended consequences including subjecting manufacturers to inflationary penalties when no price actions have been taken. When a drug is no longer a selected drug, the drug's benchmark price and the CPIU index resets to the most recent year measurements. If this happens, the manufacturer could be subject to the inflation penalty due to the CPIU index reset without taking any price action in the market post the "selected" designation – particularly when inflation returns to the normal rate of 1-2% annually. *See illustration below.*

■

Illustrative Example: No lag, Avg ASP= Quarterly. No list price actions or change in commercial contracting activities since upon drug selection. Biosimilar launched 2028, and drug no longer selected - resetting Benchmark CPIU and Payment period. ~Annual inflation of 3% (2023-2028)

	Channel Mix	2021	Applicable Year MFP		No Longer Selected*
			Y1 - 2026	Y2 - 2027	
		Net Price			1Q28
Medicare Part B	70%	60	\$ 50	\$ 51	57
Commercial	30%	60	\$ 60	\$ 60	60
Avg Calc ASP		60	\$ 53	\$ 54	58
Allowable Increase %			129%	133%	103%
Actual Increase			-	-	109%
Inflation Penalty %					6%
Selected Drug 2021-2027	33%				
Non Selected Drug 3Q26-3Q27	3%				

(Calculated ASP for applicable payment 1Q28)

In this hypothetical illustration, a drug is assumed to have a net price of \$60 and an average sales price (ASP) of \$60 in 2021. The drug is selected in 2026 with an MFP of \$50 and ASP of \$53. In 2027, the MFP is \$51, and ASP is \$54. In 2028, the drug is no longer selected because a biosimilar is marketed. After the drug is no longer selected in 2028, the price is no longer at MFP, and it is assumed that the Medicare Part B price is \$57 resulting in an ASP of \$58. During this time, the commercial price remains the same, no price increases have been taken, and annual inflation has been 3%. The benchmark CPIU resets, and any ASP increases over 103% will be subject to the inflation penalty. In this illustration, the actual increase in ASP since the applicable MFP year in 2026 is 109% resulting in a 6% inflation penalty. Based on this illustration, if a manufacturer does not want to be subject to an inflation penalty for a drug that is no longer selected and for which no price increases were taken, then the manufacturer

would need to keep the price at the MFP. Therefore, once a drug is selected, the manufacturer will always be constrained by the MFP even when it is no longer selected or else be subject to the inflation penalty.

CONCLUSION

J&J appreciates this opportunity to provide our extensive feedback to CMS on this Initial Guidance. Recognizing the significance of our comments, including our feedback in those sections in which CMS has not expressly solicited comment, we urge CMS to respond promptly and ramp-up the inclusion of manufacturers in the policy development process and to do so in a timely and transparent manner that will better serve current and future Medicare beneficiaries.

Sincerely,

A handwritten signature in black ink that reads "Jacqueline Roche".

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Seshamani:

Kaiser Permanente appreciates the opportunity to comment on the *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments* (hereinafter “Initial Guidance”).¹

Kaiser Permanente is the largest private integrated health care delivery system in the U.S., delivering health care to 12.6 million members in eight states and the District of Columbia.² Kaiser Foundation Health Plan, Inc. and our health plan subsidiaries are Medicare Advantage Organizations (MAOs) and provide more than 1.8 million Medicare beneficiaries with prescription drug coverage through Medicare Advantage-Part D plans. Kaiser Permanente’s mission is to provide high-quality, affordable health care services and to improve the health of our members and the communities we serve.

Within our footprint, we maintain a primarily internalized pharmacy system, including over 550 outpatient, hospital, infusion, specialty and mail order pharmacy sites staffed by over 14,000 pharmacy personnel. Kaiser Permanente spends approximately \$10 billion annually on pharmaceuticals. Our Permanente Medical Group (PMG) physicians and other authorized practitioners prescribe, and our pharmacies dispense, over 90 million prescriptions annually.

We commend CMS’ efforts to provide timely implementation guidance on these key provisions of the Inflation Reduction Act (IRA). If implemented successfully, the Medicare Drug Price Negotiation Program (hereinafter the “Negotiation Program”) will be a critical mechanism to curb unsustainably high drug prices for Medicare beneficiaries. As a prescription drug purchaser that negotiates directly with pharmaceutical manufacturers to obtain the lowest possible drug prices for our members, Kaiser Permanente is well positioned to share recommendations on various aspects of the Initial Guidance to ensure CMS can effectively negotiate the lowest price for each selected

¹ 88 Fed. Reg. 16449 (March 17, 2023).

² Kaiser Permanente comprises Kaiser Foundation Health Plan, Inc., one of the nation’s largest not-for-profit health plans, and its health plan subsidiaries outside California and Hawaii; the not-for-profit Kaiser Foundation Hospitals, which operates 39 hospitals and over 700 other clinical facilities; and the Permanente Medical Groups, self-governed physician group practices that exclusively contract with Kaiser Foundation Health Plan and its health plan subsidiaries to meet the health needs of Kaiser Permanente’s members.

drug.

Section 30.1 – Identification of Qualifying Single Source Part D Drugs for Initial Price Applicability Year 2026

Although CMS is issuing the guidance in Section 30 as final without comment solicitation, we support how CMS intends to identify potential qualifying single source drugs for selection. Specifically, we agree that all dosage forms and strengths of a drug with the same active moiety or active ingredient and the same holder of a New Drug Application (NDA) or Biologics License Application (BLA) should be treated as one potential qualifying single source drug.

This interpretation is consistent with the statutory intent and will appropriately capture products offered by the same NDA/BLA holder that encompass several dosage forms and routes of administration of the same active moiety or active ingredient. Adopting a narrower interpretation would allow pharmaceutical manufacturers to shift more and more products outside the purview of the Negotiation Program based solely on modifications that do not materially differentiate the products.

Section 40.2.1 – Confidentiality of Proprietary Information

Manufacturers of a selected drug must submit certain information to CMS as part of the Negotiation Program. Within the Initial Guidance, CMS identifies which information will be treated as confidential and proprietary. This includes: (1) information on non-Federal average manufacturer price (“non-FAMP”); (2) research and development costs and recoupment; (3) unit costs of production and distribution; (4) pending patent applications; and (5) market data and revenue and sales volume data.

We support the confidentiality policy described in this section. Recognizing the proprietary and confidential nature of non-FAMP information, in particular, is critical to protect competition and the ability of purchasers to negotiate discounts. Publicly disclosing this information could lead to anticompetitive effects and higher drug prices for non-Medicare members, creating a chilling effect on manufacturers that might otherwise be willing to negotiate discounts.

Section 40.4 – Providing Access to the MFP

CMS intends to require that manufacturers provide access to the maximum fair price (MFP) by “ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP” or “providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP.” Further, manufacturers must reimburse pharmacies, mail order services, intermediaries such as wholesalers, and other dispensers in a timely manner—within 14 days—the full amount of the difference between their acquisition cost for the selected drug and the MFP.

Although we support placing the responsibility on manufacturers to ensure the MFP is made available to MFP-eligible individuals and to pharmacies, mail order services, intermediaries and other dispensers, we urge CMS to provide flexibility for how manufacturers work with these entities to effectuate this requirement. For example, we do not recommend prescribing a specific mechanism, such as a chargeback or 340B-like process, to provide the retrospective reimbursement. For entities with limited or no participation in the 340B program, adopting such

processes would likely require significant technological infrastructure investments to incorporate new inventory and billing mechanisms. We are concerned with any prescriptive requirements that would entail such large systems changes. In many cases, purchasers may have existing rebate or other payment mechanisms that could be tailored to accommodate the new MFP requirements, and manufacturers should be able to work with their purchasers to find a solution that is least burdensome for both parties.

Section 50 – Negotiation Factors

Evidence About Therapeutic Alternatives for the Selected Drug

Kaiser Permanente strongly supports CMS' approach, as part of the negotiation process, to consider evidence about therapeutic alternatives to the selected drug as submitted by members of the public, including manufacturers, Medicare beneficiaries, academic experts, clinicians and other interested parties. We also support the use of nondiscriminatory health measures and versions of cost-effectiveness analysis to help CMS develop offers and review counteroffers under the Negotiation Program. CMS should be equipped with as much data and information as possible to inform their negotiations and drive toward the lowest price.

Evaluating data and evidence on therapeutic alternatives, including cost-effectiveness analysis, is integral to how Kaiser Permanente makes drug purchasing decisions and sets and manages our own formularies. We employ a rigorous, evidence-driven processes in close collaboration with Permanente Medical Group physicians and clinical pharmacists. On an ongoing basis, our pharmacists review and develop an objective, evidence-based analysis of a drug or therapeutic class. Our physician experts then review the evidence associated with each drug, including clinical trial data and the drug's efficacy among members within our system. Once we identify a preferred therapy based on such evidence, our pharmacy contracting team uses the data and information to inform their negotiations with the drug manufacturer. Once the processes of clinical evaluation and negotiations with drug manufacturers are complete, our clinician-led Pharmacy & Therapeutics (P&T) committees finalize the formulary and make updates as new information becomes available. Because prescribers within our system are not paid on a fee-for-service or pass-through basis, there is no incentive to structure our formularies in ways that result in higher use of expensive medications when less expensive medications have the same clinical efficacy. Prescribers trust our formularies because they are grounded in clinical evidence and developed through partnership with their peers. Based on this trust, clinicians tend to prescribe consistently with our formularies in the vast majority of cases.

It is important that evidence submitted to CMS about a drug's clinical benefit is strong, verified, and reliable. The quality and quantity of data submitted will vary by drug, such as by study design, population, and length of time since approval. It is our opinion that CMS will need proper parameters in place to curate the robust data collected on relevant drugs, for example, through a data collection framework, required template, or required executive summary. Data from entities other than from manufacturers should be identified and harnessed to inform drug value. To that end, we recommend considering a consortium to aggregate and verify data on drug outcomes from a variety of sources tracking this information. CMS can look to other countries for how they require manufacturers to submit data on comparative clinical evidence and pharmacoeconomic evaluation.

When considering evidence about alternative treatments to the selected drug, we recognize that

CMS may not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an individual who is elderly, disabled or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled or not terminally ill. Often, this includes studies which rely on quality-adjusted life-years (QALYs). Concerns and prohibitions on the use of QALYs have led researchers to develop alternative comparative effectiveness measures that do not differently value life extension based on the specified characteristics. These measures, which include the equal-value life year gained (evLYG) and others, are important metrics for CMS to consider when assessing the comparative effectiveness of the negotiation-eligible drug relative to therapeutic alternatives. Comparative effectiveness metrics and research are a critical tool to ensure drugs are priced fairly and serve as a check on manufacturers' long-standing practice of pricing drugs far above their value. We strongly urge CMS to affirmatively recognize that non-QALY metrics are appropriate, and indeed necessary, components of a meaningful negotiation process.

Manufacturer-Specific Data

As part of CMS' information collection process, we recognize that manufacturers will be submitting data on research and development (R&D) costs and the extent to which manufacturers have recouped those costs for selected drugs. While CMS is required to consider these data, we recommend placing greater weight on other data, primarily comparative effectiveness research that demonstrates clinical benefit and cost information on therapeutic alternatives. Given the lack of external, non-biased resources to help verify manufacturer R&D cost data, CMS should exercise caution in attributing significant weight to this information. As CMS evaluates ways to ensure the long-term success of the Negotiation Program, we recommend considering research and partnership with external stakeholders to gather unbiased data on manufacturer R&D costs that could help inform the negotiation process in future years.

Additionally, when considering manufacturer R&D cost information, CMS should be careful to ensure manufacturers are not overestimating such costs. For example, we are concerned about common scenarios where one manufacturer acquires another and may attribute R&D spending by the acquired manufacturer toward their total R&D costs, even when there are similar platforms or shared costs that do not warrant such inclusion. We are also skeptical in the instance where a manufacturer might claim their selected drug has not recouped its R&D costs. It seems highly unlikely that a manufacturer of a drug or biological product that has been on the market for seven or 11 years and is included among the 50 drugs with the highest total expenditures in Medicare has not recouped its costs.

Section 60.1 – Establishment of a Single Proposed MFP for Negotiation Purposes

For the purposes of determining a single price included in an initial offer, CMS intends to base the single price on the cost of the selected drug per 30-day equivalent supply (rather than per unit – such as tablet, capsule, injection – or per volume or weight-based metric), weighted across dosage forms and strengths, as applicable. CMS believes this approach aligns with the statutory requirement to negotiate an MFP across dosage forms and strengths and will also allow for a more direct comparison with therapeutic alternatives. CMS intends to translate the finalized MFP from an average price per 30-day equivalent supply back into per unit prices for the purposes of publishing per unit MFPs.

We support CMS in using a price per 30-day equivalent supply for the purpose of negotiating the MFP. In our view, a 30-day equivalent supply is a commonly understood metric that can be easily calculated and compared across drug therapies. This approach will simplify and enhance the negotiation process.

Section 60.3 – Methodology for Developing an Initial Offer

When determining an initial offer to manufacturers for a selected drug, CMS intends to: (1) identify therapeutic alternative(s), if any, for the selected drug; (2) use the Part D net price or the Part B average sales price (ASP) for the therapeutic alternative(s) to determine a starting point for developing an initial offer; (3) evaluate the clinical benefit of the selected drug, including whether the selected drug meets an unmet medical need and the selected drug's impact on specific populations (resulting in the "preliminary price"); and (4) further adjust the preliminary price by the enumerated negotiation factors. If there are multiple therapeutic alternatives, CMS intends to consider the range of net prices and/or ASPs as well as the utilization of each therapeutic alternative to determine the starting point.

When there are multiple therapeutic alternatives, we recommend that CMS choose the lowest net price and/or ASP among the range of prices as the starting point. When developing a starting price for an initial offer, CMS should also consider evaluating other relevant pricing metrics in addition to Part D net prices or Part B ASP such as prices paid by other public payers within the United States, as well as prices paid by other comparable countries. If the selected drug has no therapeutic alternative, if the price of the therapeutic alternatives identified is above the statutory ceiling for the MFP, or if there is a single therapeutic alternative with a price above the statutory ceiling, then CMS intends to determine the starting point for the initial offer based on the Federal Supply Schedule (FSS) or "Big Four Agency" price ("Big Four price"). If the FSS and Big Four prices are above the statutory ceiling, then CMS intends to use the statutory ceiling as the starting point for the initial offer.

While we agree that this approach is generally reasonable, we recommend that if the FSS and Big Four prices are above the statutory ceiling, CMS begin with a starting point that is a specified percentage below the statutory ceiling price (e.g., 20 percent lower than the statutory ceiling price). This specified percentage could be determined by examining other selected drugs in the Negotiation Program, for example as the average difference between the statutory ceiling price and the initial offer for other selected drugs with therapeutic alternatives. We believe that in no case should CMS begin with the statutory ceiling price as the starting point for the negotiation process as this leaves no room for a true negotiation.

Section 110 – Part D Formulary Inclusion of Selected Drugs

The Initial Guidance reiterates the statutory requirement that Medicare Part D plans shall include each selected drug on their formularies during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period. Importantly, the IRA did not specify *how* selected drugs must be included on a Part D formulary. Therefore, Part D plans should continue to have flexibility in designing evidence-based formularies that support appropriate, safe and cost-effective access to covered drugs. This includes retaining the ability to remove a selected drug from the formulary when a therapeutically equivalent generic drug becomes available to the extent permitted under the IRA and Part D

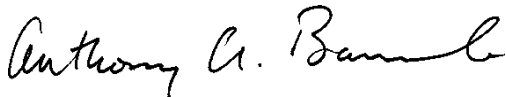

regulations. Also, when a generic drug or biosimilar becomes available, Part D plans should retain the existing flexibility to modify the brand name drugs' preferred or tiered cost-sharing status.

We strongly urge CMS to reiterate support for these flexibilities and refrain from applying any special formulary treatment toward selected drugs, such as establishing selected drugs as a protected class or requiring preferred placement within Part D formularies. We anticipate instances where Kaiser Permanente may have negotiated significant discounts on a therapeutic alternative to a selected drug, perhaps lower than the negotiated MFP, and requiring us to place the higher-priced selected drug in a preferred position on our formulary would lead to increased costs for members and jeopardize our ability to secure continued discounts on the alternative product. The Negotiation Program should not serve as a mechanism to reduce competition and create winners in certain drug classes.

* * *

We appreciate your consideration of our comments, and we look forward to working together to ensure the successful implementation of the IRA and the Negotiation Program. Please feel free to contact me at (510) 271-6835 or anthony.barrueta@kp.org or Simon Vismantas at (425) 677-1267 or simon.p.vismantas@kp.org with any questions or concerns.

Sincerely,

Anthony A. Barrueta

Dr. Meena Seshamani, M.D. Ph.D.,
CMS Deputy Administrator and Director of the Center for Medicare
Centers for Medicare & Medicaid Services
U.S. Department of Health & Human Services
7500 Security Boulevard
Baltimore, MD 21244

Re: Medicare Drug Price Negotiation Program Guidance

Dear Deputy Administrator Seshamani:

Kalderos appreciates the opportunity to submit comments on the Centers for Medicare & Medicaid Services' ("CMS") Initial Memorandum on the Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026 (hereinafter, "Guidance").

Kalderos is building unifying technologies that bring transparency, trust, and equity to the entire healthcare community. We are on a mission to solve systemic problems of the healthcare system, redefining how the business of healthcare performs. Kalderos seeks to solve the problems in drug discount and rebate programs by connecting the stakeholders; enabling simple, streamlined communication; and applying machine learning to create smart data science tools. We are genuinely committed to being an honest broker administering a fair, balanced process assisting payers, providers, and manufacturers to ensure the right drug price is applied to the right transaction, in compliance with laws and contract terms.

I. Kalderos's Role in Discount and Rebate Compliance

Kalderos builds solutions to ensure that stakeholders comply with all statutory and regulatory requirements of discount and rebate programs, including those imposed by the Inflation Reduction Act of 2022 ("IRA") and other federal and state laws concerning drug pricing and reimbursement. To that end, Kalderos supports the goals outlined by CMS in the Guidance, particularly those goals related to program integrity.

The essence of Kalderos's honest-broker approach is to be fair to payers, providers, and manufacturers in a manner that is consistent with all applicable laws and regulations. To that end, Kalderos evaluated and developed solutions to facilitate coordination between dispensers and manufacturers, while simultaneously ensuring that there are systems in place to identify, dispute, and resolve noncompliance with drug discount and rebate programs.

However, despite years of attempts to educate providers and payers about how to prevent noncompliant discounts and rebates from happening, we continue to identify hundreds of millions of dollars each year in noncompliance. This fact leads us to conclude that traditional chargeback and rebate solutions are unlikely to be successful at preventing drug discount and rebate noncompliance. Accordingly, it is of vital importance that CMS' guidance regarding the Medicare Drug Price Negotiation Program ("Price Negotiation Program") adequately addresses the manner by which noncompliant Maximum Fair Price transactions can be prevented from occurring, and in

cases where noncompliance is unable to be prevented, provide a manner to identify and resolve disputes. Failure to do so would significantly weaken the purpose and intent of the Price Negotiation Program, as without effective safeguards against these issues, CMS will be unable to ensure that eligible individuals receive access to products at the Maximum Fair Price (“MFP”), without triggering a duplicate discount, consistent with the statute. Such failure could also open the Price Negotiation Program to challenge based on an arbitrary and capricious implementation of the Program.

It is with this background in mind that we offer the following comments:

- Guidance to Covered Entities Regarding Duplication of MFP Price & 340B Price: We are concerned that the Guidance does not make it clear that combining an MFP and a 340B discount on the same dispense is not permitted. Without CMS clearly stating that it is not permitted to obtain both an MFP and 340B discount on the same unit sold, covered entities and their contract pharmacies may not adequately adjust their systems and businesses processes to prevent the “stacking” of 340B and MFP prices on the same unit sold, which is clearly prohibited by the IRA statute.
- Mechanisms to Provide Access to the MFP Price: We appreciate CMS’ recognition that manufacturers must have the ability to offer the MFP through a retrospective rebate in order to ensure compliance with the statute. We agree that manufacturers should have the flexibility to determine how to provide access to the MFP and that such process should be reported to CMS to ensure transparency.
- Need for Claims Data: We are concerned that the Guidance does not provide effective mechanisms for identifying when a sale from a manufacturer is an MFP-eligible sale or preventing a single dispense from being subject to the MFP and a 340B discount. As a result, pharmacies, 340B covered entities, manufacturers, contract pharmacies, and other stakeholders will face significant confusion (and, potentially, time-consuming and expensive administrative burdens) when attempting to comply with the MFP provisions of the IRA in 2026. CMS should clarify that limited claims data must be submitted with a request for the MFP to ensure compliance.
- Auditing of Data Provided When Requesting MFP: While we appreciate CMS’ recognition that manufacturers should have the flexibility to implement MFP via chargeback or rebate mechanisms, we are concerned that unless manufacturers are permitted to include commercially reasonable and standard audit terms in agreements with dispensing entities relating to the mechanisms through which MFPs will be provided, there will exist a high risk of errors where dispensing entities may submit false or inaccurate information when requesting a MFP.
- Monitoring of Access to MFP: We are concerned that the process CMS relies on to ensure access to the MFP does not allow stakeholders to equally participate in program integrity measures. Specifically, we are concerned that CMS has not established a formal reporting process that would allow manufacturers to report

duplicate discounts, making it increasingly difficult for stakeholders to resolve duplicate discount issues.

I. Guidance to Covered Entities Regarding Duplication of MFP Price & 340B Price

We appreciate that the statutory language found in § 1193(d) of the IRA makes clear that the Primary Manufacturer of a selected drug is not required to provide access to the MFP for a selected drug to MFP-eligible individuals who are also eligible to receive the drug at the 340B discounted price if the 340B discounted price is lower than the MFP for such selected drug.

However, we are concerned that the Guidance does not expressly prohibit covered entities or their contract pharmacies from “accumulating” a transaction where a 340B-eligible beneficiary receives a product at MFP, potentially leading to a covered entity or contract pharmacy receiving both a MFP rebate and a 340B chargeback on the same unit sold. Instead, the Guidance places the burden on the manufacturer for preventing an MFP and 340B discount applying to the same dispense.

This is a particular issue in the context of the inventory management systems that many covered entities utilize, which are usually based on a replenishment model. Covered entities that utilize replenishment models, generally use accumulator software to tally the number of drugs dispensed to each type of patient (i.e, 340B-eligible patients and non-340B-eligible patients) and reorder the drug based on the utilization from each patient account. As HHS has previously recognized, replenishment models, and specifically the use of accumulator software, is an area ripe for duplicate discounts and other areas of noncompliance:

Some covered entities use software, referred to as accumulators, to track drug use for each patient type. The accumulator software would indicate which drugs are available to reorder on various accounts. In this example, the covered entity counts the units or amounts received by each 340B eligible patient. Once the covered entity has dispensed enough of a certain drug to equal an available package size, the covered entity could reorder that drug at the 340B price. **Once drugs are received in inventory, the drugs lose their identity as 340B drugs. . . . If the covered entity improperly accumulates or tallies 340B drug inventory, even if it is prior to placing an order, the covered entity has effectively sold or transferred drugs to a person who is not a patient, in violation of section 340B(a)(5)(B) of the PHSA. A similar violation would occur if the recorded number of 340B drugs does not match the actual number of 340B drugs in inventory, if the covered entity maintains a virtual or separate physical inventory.**¹

Additionally, we have experienced instances where covered entities have refused to work with manufacturers in good-faith when the manufacturer suspects that the covered entity may have

¹ HHS, 340B Drug Pricing Program Omnibus Guidance, 80 Fed. Reg. 52300, 52308 (proposed Aug. 28, 2015) (emphasis added).

caused the manufacturer to pay both a 340B price and a Medicaid rebate related to beneficiaries covered by a Managed Medicaid plan. These covered entities have stated that they believe the statutory language of the 340B program only prohibits covered entities from causing a duplicate discount related to FFS Medicaid programs, and as such, they refuse to engage in good-faith discussions related to Managed Medicaid rebates. As such, we believe that unless CMS expressly prohibits duplicating MFP and 340B prices on the same unit sold, some covered entities may not adequately adjust their pharmacy management systems and processes to prevent duplicating MFP and 340B prices.

Finally, we are concerned that service providers, including 340B third-party administrators, who offer what is referred to as “340B Recovery Services”² – services designed to re-examine transactions originally considered 340B-ineligible and reclassify certain transactions as 340B eligible – may not adjust their processes to ensure that prior transactions which received an MFP are not eligible to be re-qualified as 340B eligible without a clear and explicit prohibition set by CMS.

II. Mechanisms to Provide Access to the MFP Price

Section 40.4 of the Guidance addresses manufacturers’ obligation to provide access to selected drugs at the MFP to “pharmacies, mail order services, and other dispensers” with respect to MFP-eligible individuals, meaning, in practice, that manufacturers must ensure that “the amount paid by the dispensing entity for the selected drug is no greater than the MFP.”³ CMS requires manufacturers to provide access to the MFP by either “ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP” or “providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP.”⁴ Further, manufacturers must submit their process for providing access to CMS.⁵

We appreciate CMS’ recognition that identifying when the MFP should apply at the point-of-sale, and ensuring that 340B pricing is not provided on the same dispense, will be a challenge. Manufacturers must have the ability to review claims data after a dispense, confirm the applicable price, and provide a retrospective rebate to the end customer. We further appreciate that manufacturers may take different approaches and agree that manufacturers should share their process with CMS to ensure transparency for all stakeholders.

Kalderos has developed rebate mechanisms to ensure program compliance in other government pricing programs. We are looking forward to using those experiences and learnings to help all stakeholders develop compliant systems to provide access to the MFP, consistent with the statute.

² See CloudMed, 340B Recovery, available at <https://www.cloudmed.com/government-navigation-suite/340b-recovery/> for an example of 340B Recovery Services.

³ See CMS, “Initial Memorandum on the Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026” at 31–32 (March 15, 2023).

⁴ *Id.* at 32. We further appreciate CMS’ confirmation that the use of “chargeback payments and rebate mechanisms among the pharmaceutical stakeholders in the private sector” are appropriate and that “the private sector may make modifications to these existing mechanisms to effectuate access to the MFP.” *Id.* at 65.

⁵ *Id.* at 32.

III. Need for Claims Data

CMS intends to leverage the use of plan identifiers to identify when the MFP applies. Namely, CMS states that the “use a unique Part D processor identification number (RxBIN) and Part D processor control number (RxPCN) combination” “will ensure that the pharmacy is able to identify at the point of sale whether the individual is an MFP-eligible individual.”⁶ The Guidance does not identify how 340B duplicates will be prevented and instead states “CMS intends to work with the Health Resources and Services Administration, which administers the 340B Drug Pricing Program, to help to ensure that the MFP is made available to 340B covered entities where appropriate.”⁷

Identifying when the right discount applies to the right sale, without triggering duplicate discount provisions, is a challenging task and costs significant time, money, and resources. Over the years, stakeholders have implemented several different approaches to prevent duplicate discounts, including modifiers, all of which have failed to be effective. Our experience with the use of modifiers finds them to be inadequate to consistently identify claims. For example, 340B covered entities must submit a code when seeking reimbursement from a state to identify when the entity dispensed a 340B drug. If a code were used on a claim, the state would exclude that claim when seeking rebates from the manufacturer. Despite the apparent benefits of using claims-level code data rather than dispensing entity claim data, modifiers have been largely ineffective in preventing duplicate discounts. For example, even if a 340B covered entity correctly identifies a claim as a 340B claim as opposed to a MFP claim, which does not occur consistently, that modifier may be removed at some point given the many touchpoints of a pharmacy, third-party administrator, or pharmacy benefit manager, among others. We understand that thirty-eight (38) states require claims modifiers from covered entities when submitting claims to Medicaid for reimbursement. For these states, Kalderos has identified approximately \$150,000,000 of 340B duplicate discounts over the last six years.

In light of these challenges, we urge CMS to not rely exclusively on modifiers and to encourage the sharing of claims level data to allow clear review of claims among stakeholders. In the context of the MDRP, stakeholders have repeatedly discussed the need for the transparent provision of robust claims data to improve dispute resolution processes. In fact, CMS itself has repeatedly emphasized the importance of claims data in disputes.⁸ CMS noted that providing claims level data may reduce the state’s administrative burden and expense of researching manufacturer dispute issues.⁹

Namely, rebate or chargeback requests for the MFP should include a minimum level of claims data. For example, claims covered by Part D should include, at minimum, the following data points: RxID; Date of Service; Pharmacy NPI or NCPDP ID; Prescriber NPI; NDC11;

⁶⁶ *Id.* at 65.

⁸ CMS, Best Practices for Avoiding 340B Duplicate Discounts in Medicaid (Jan. 8, 2020), available at <https://www.medicaid.gov/sites/default/files/Federal-Policy-Guidance/Downloads/cib010820.pdf> (stating ““when states provide claims level data to manufacturers, we would expect there to be a reduction in number of disputes due to more accurate information being provided” and that “manufacturers likely need claims level data for true invoice validation purposes.”).

⁹*Id.*

quantity dispensed; and actual acquisition price. Without manufacturers receiving claims data and using the claims data to validate and identify duplicate claims to CMS, accurately providing the MFP will be impossible.

IV. Auditing of Data Provided when Requesting MFP

Data inaccuracies related to the Medicare and Medicaid programs remain a significant challenge, with some estimating that such errors cost the Medicare and Medicaid programs up to \$100 billion dollars per year.¹⁰ CMS must permit drug manufacturers to audit the data submitted by dispensing entities when requesting an MFP rebate to reduce the risk of the submission of inaccurate data.

We note that it is standard commercial practice to permit drug manufacturers to audit the data provided by parties who request a rebate or chargeback. For example, contracts between manufacturers and wholesalers typically permit the manufacturer to audit supporting evidence relating to chargebacks. Similarly, rebate agreements between manufacturers and Pharmacy Benefit Managers (“PBMs”) typically permit the manufacturer to audit supporting evidence related to commercial rebates. These audits reduce the risk of inaccurate data being submitted by allowing the manufacturer the ability to verify the accuracy and legitimacy of discount or rebate requests.

In addition to the commercially standard practice allowing manufacturers to audit wholesalers and PBMs, similar audit language is typically included in contracts between wholesalers and pharmacies, as well as audit language found in contracts between PBMs and pharmacies. Should a manufacturer choose to contract with wholesalers or PBMs to effectuate MFPs between the manufacturer and beneficiaries/dispensing entities, the manufacturer’s standard audit language, combined with the audit language contained in wholesaler and PBM agreements with dispensing entities, will allow the manufacturer the ability to audit data submitted by dispensing entities.

We ask that CMS explicitly permit manufacturers and other shareholders, like Kalderos who are not wholesalers or PBMs, to enter into agreements with dispensing entities to audit the data submitted by dispensing entities requesting a MFP rebate.

V. CMS Must Provide an Adequate Process for Manufacturers to Report Issues in the MFP Process

The Guidance notes that CMS intends to establish a toll-free phone line and email by which “beneficiaries, dispensing entities, and other providers and suppliers” may report to CMS instances where an MFP was not made available.¹¹ Subsequent to reporting by these parties, CMS intends to investigate manufacturers and, if necessary, impose civil monetary penalties on manufacturers that have violated the MFP provisions. By contrast, while CMS “expect[s] manufacturers and other stakeholders”¹² to report instances of dispenser noncompliance, the Guidance does not provide any formalized reporting process that such parties may use, nor does it describe any action

¹⁰ See CNBC, “Inside the mind of criminals: How to brazenly steal \$100 billion from Medicare and Medicaid,” (Mar. 9, 2023) available at: <https://www.cnbc.com/2023/03/09/how-medicare-and-medicaid-fraud-became-a-100b-problem-for-the-us.html>.

¹¹ See Guidance, at pg. 66.

¹² *Id.*

kalderos

CMS will take to investigate claims against dispensers, nor does it describe what penalties, if any, will be imposed against dispensers found to be in noncompliance.

While we support CMS' intent to monitor the Price Negotiation Program, we are concerned that the Guidance does not provide manufacturers with an adequate opportunity to participate in program integrity. Specifically, we are concerned that the lack of a formalized process for manufacturers to report duplicate discounts or other MFP dispensing issues to CMS will limit manufacturers' ability to implement effective safeguards against such risks. Effective program integrity requires the participation of all parties with obligations under the IRA. We urge CMS to issue guidance establishing a process for manufacturers and other stakeholders to formally engage in the program integrity process.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Kinnate Biopharma Inc. appreciates the opportunity to submit comments on the Medicare drug price negotiation program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the CMS website on March 15, 2023.

Kinnate is a Nasdaq-listed US-based precision oncology company dedicated to developing new, targeted small molecule medicines for patients with advanced cancer, many of whom have been treated with multiple available therapies, but whose disease has progressed and have no other treatment options.

Traditional cancer therapies, such as chemotherapy, are a blunt instrument, often causing serious and sometimes irreversible side effects while treating the cancer. By contrast, targeted cancer medicines are a surgical scalpel, uniquely designed to target specific genetic drivers of cancer, and can spare the patient from most side effects. A more tolerated medicine means patients can be treated with higher doses, for longer durations, and have better outcomes and even functional cures.

Drug development is inherently risky, for small molecules and biologics alike

Small molecule medicines are a critical part of the inventory of therapies available to cancer physicians, and often complement and partner with biologics. Small molecules can access parts of the body which larger biologic molecules typically cannot (for example, passing through the blood-brain barrier to treat cancers that have spread to the brain). Many small molecule medicines can also be taken in pill form (orally), so patients can conveniently and privately treat themselves at home, without the costs and life disruptions associated with healthcare provider-administered medicines (biologics must be injected, typically infused over many hours at a treatment facility).

However, despite the fact that the costs and risks of developing small molecule drugs are the same as biologics, by reducing the amount of time drug developers have to recoup their investment prior to obligatory price negotiations, the Inflation Reduction Act of 2022 (the IRA) actively disincentivizes drug developers like Kinnate from investing in innovative new small molecules, and is likely to result in many fewer treatments for patients, not only in the next decade, but for all future generations.

We strongly support alignment of the timing for selection for pricing negotiations for small molecules to the 13-year provision for biologics, and encourage CMS to advocate for corresponding amendments to the IRA.

103 Montgomery Street, Suite 150
The Presidio of San Francisco
San Francisco, CA 94129

Website: www.kinnate.com 
LinkedIn: [Kinnate Biopharma Inc.](https://www.linkedin.com/company/kinnate-biopharma-inc) 

Subtypes of cancer are often very rare, and each subtype requires orphan incentives

Modern medicine has shown that cancer is not one disease, but hundreds of sub-diseases. For example, there are dozens of different subtypes of lung cancer, each with their own unique genetic drivers, and the most advanced and effective treatment utilizes a custom-designed medicine. Although lung cancer is not rare, many sub-types of lung cancer are very rare, affecting less than 5% of all patients with lung cancer.

A single drug has the potential to treat multiple rare subtypes of cancer, but per FDA regulations, each subtype requires its own development path and associated financial investment.

The IRA, as written, perversely disincentivizes drug developers from pursuing the full potential of medicines that could treat multiple, very rare diseases. The IRA's orphan drug exclusion applies only if there is one orphan designation per drug; a second designation would invalidate the exclusion, even if the designation is withdrawn or the drug is never developed for the second designated disease. As an example, a drug with a single orphan designation that could treat a US patient population of 180,000 would be exempted from price negotiation, whereas a drug with 4 orphan designations for populations of 10,000 patients each (40,000 patients total) would not be excluded and could be subjected to the IRA's price negotiation provisions.

Clearly this is nonsensical and contradictory to the intent of the Orphan Drug Act. This effect may be an unintended consequence of the IRA, as it actively discourages drug developers from pursuing important new therapies for US patients with rare conditions. We strongly believe revisions to the orphan exclusion provision are warranted as described in Annex 1 attached hereto, and encourage CMS to advocate for corresponding amendments to the IRA.

We are now in the age of precision oncology, and increasingly rare cancer subsets, so society needs more targeted therapies, not fewer. When patients are genetically matched with a targeted therapy and are spared the side effects of blunt instrument treatments, the clinical outcomes can be truly incredible. CMS's implementation of the IRA should promote the development of many more new treatments for rare diseases, not discourage it.

We appreciate your consideration of our comments as you develop the Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact the undersigned by telephone at (858) 299-4699 or by e-mail at mark@kinnate.com if you have any questions regarding our comments.

Yours sincerely,

A handwritten signature in black ink, appearing to be "Mj" or "Mark", written in a cursive style.

Mark Meltz
Chief Operating Officer and General Counsel

Annex 1

Section 30 Comments

Note: We recognize that CMS is not inviting comments to Section 30. However, we believe that comments to this section are warranted.

Provision	Harm Caused	Recommendation
(30.1) Medicare negotiation for small molecule and other NDA-path drugs at nine- years post-launch.	<p>Diversion of investment away from NDA-path drugs (small molecules, peptides, oligos, etc.) is likely to result in fewer therapeutic options for generations to come. For an overview of the harms of this provision see this open letter from Peter Kolchinsky (RA Capital) and Peter Thompson (Orbimed).</p> <p>Also, enclosed is a much more detailed yet plainly written explanation of how price setting at nine years post-launch dissuades investment.</p>	<p>Amend the IRA timing for NDA- path negotiations from 9- years to the same 13-year period as for BLA-path drugs.</p> <p>While 13 years is less than the typical 14 years of marketing exclusivity afforded by patent protection, investment can recalibrate slightly to one less year with very slightly higher launch prices so as to keep drug R&D a viable investment.</p>
(30.1.1) To be considered for the orphan drug exclusion, the drug or biological product must (1) be designated as a drug for only one rare disease or condition under section 526 of the FD&C Act and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition.	<p>This provision perversely discourages companies from developing a single drug or biological product for than one orphan disease, especially where the patient population for secondary orphan indications are much smaller than the primary orphan indication, thus denying patients with very rare diseases the possibility of a life-changing treatment or cure.</p>	<p>The harms from IRA's treatment of orphan drugs could be mostly alleviated by amending the IRA to create small- and large- molecule parity for negotiation at 13 years (see above).</p> <p>CMS should broadly interpret the orphan drug exclusion to allow for multiple active orphan designations and multiple orphan approved indications for a single drug, provided that the cumulative prevalence of all orphan conditions remains within the orphan drug criteria.</p> <p>To help mitigate the harms to orphan drug development incentives, CMS should consider only active orphan drug designations for the</p>

		purposes of determining eligibility for the orphan drug exclusion (not including withdrawn orphan drug designations).
Other Comments		
(50.2) CMS' processes for determining the Maximum Fair Price for individual medicines as well as the relevance of "therapeutic alternatives" to the drugs it selects for negotiation.	Calculating cost-effectiveness, as embraced by ICER in the US and other HTA bodies elsewhere (e.g., NICE in the UK), is so simplified that it does not consider many demonstrable benefits of medicines (e.g., benefits to caregivers, reduction of risk for healthy people), resulting in extreme under-estimations of the value of new medicines. These calculations can then serve as rationale for plans to refuse coverage.	<p>CMS should acknowledge the value that a medicine brings to society before it decides how aggressively to lower its price (particularly in the case of NDA-path drugs that experience negotiation far sooner than they would experience generic competition). CMS should broadly account for a medicine's value elements, using a dynamic stacked cohort model that accounts for value to patients, to caregivers, and to the rest of the population whose risk is reduced by having the drug (i.e., if CMS is going to conduct a cost-effectiveness analysis (CEA), it should conduct a generalized CEA, not an over-simplified CEA).</p> <p>CMS should consider key product attributes like efficacy, safety, and ease-of-use in determining relevant "therapeutic alternatives" (the basis for CMS' opening bid).</p>
(40.2.2) CMS prohibitions on data disclosure and destruction of related documents.	The lack of transparency around the negotiation process makes it impossible for companies to understand which value components CMS is measuring in determining MFP, which in turn makes it more difficult to determine which documents will be needed by CMS and to develop projections regarding what a future MFP might be.	<p>CMS's process for determining value and cost- effectiveness should be transparent (vs. gag order and document destruction that is currently proposed). CMS should be able to publicly defend what it considers to be a "fair price."</p> <p>This can be achieved without disclosing company confidential information.</p>

Re: Comments on *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026*

Dear Dr. Seshamani:

Life Sciences Pennsylvania appreciates the opportunity to provide comments on the *Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026* (the “Guidance”). Life Sciences Pennsylvania is comprised of more than 880 members representing the entire life sciences industry – medical device companies, pharmaceutical companies, investment organizations, research institutions, and myriad service industries that support the life sciences in Pennsylvania. Pennsylvania is a global leader in researching and developing new therapies, devices and diagnostics that help patients live longer, healthier lives. This innovation is due in part to the policy and regulatory ecosystem we enjoy in the United States.

Life Sciences Pennsylvania supports policies in the Inflation Reduction Act (IRA) like the out-of-pocket cap for Medicare beneficiaries, that reduce costs for patients at the pharmacy counter. However, our membership has also expressed concerns that implementation could significantly inhibit investment in the research and development of new medicines as well as potentially impact patient access. At this time, we ask CMS for additional clarification in the guidance surrounding the following:

Preservation of incentives for innovation:

- Convene stakeholder panels to help inform key decision points (e.g., therapeutic alternatives, unmet needs, therapeutic advances, patient, and societal benefits) (Sections 50.2, 60.3)
- Establish Maximum Fair Prices (MFPs) for products addressing unmet needs or advancing patient care at the ceiling price (Section 60.3)
- Only consider manufacturer-specific data in instances where the selected product provides fewer benefits than therapeutic alternatives (Section 60.3)
- Clarify that products will be excluded from the MDPNP if they are approved for a sole orphan indication at time of selection, regardless of how many orphan designations the product may have (Section 60)

Ensure patient benefit and access:

- Establish standards that ensure patients will be no worse off in terms of access and cost-sharing, under the Negotiation Program than they were previously (Section 110)
- Provide meaningful opportunity for patient and stakeholder feedback, including on key decision points and on CMS's analyses (Sections 60.3, 40.2.2)

Thank you for considering these comments from Life Sciences Pennsylvania regarding preserving incentives for innovation as well as ensuring patient benefit and access. If you have any questions or concerns, please contact our Senior Director, Federal Policy and Public Affairs, Lara Flynn at lflynn@lifesciencespa.org.

Sincerely,

Christopher P. Molineaux
President & CEO

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Meena Seshamani,

We are writing to provide comments on the Initial Memorandum on Implementation of the Medicare Drug Price Negotiation Program published by the Centers for Medicare & Medicaid Services (CMS) on March 15, 2023. We are academic researchers with expertise in conducting pharmaceutical economics, outcomes, and/or policy research. Two of us are physicians and one is a pharmacist and health economist by training.

The Inflation Reduction Act mandates CMS to consider several factors in determining an initial price offer to the manufacturer of each selected drug. A key factor is “the extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.” In our comments below we identify and discuss specific complications that deserve careful consideration within the context of CMS’ proposed approach to handling this factor.

- (1) The appropriate selection of therapeutic alternatives is critical in determining the value and pricing of a drug. The initial guidance from CMS proposes to “begin by identifying therapeutic alternatives within the same drug class based on properties such as chemical class, therapeutic class, or mechanism of action before considering therapeutic alternatives in other drug classes.” Following this, the initial guidance proposes to determine CMS’s starting point for developing an initial offer via the average 30-day net price and/or average sales price (ASP) of the single therapeutic alternative (or the range of net prices and/or ASPs and utilization of each treatment in the case of multiple therapeutic alternatives).

While this proposed approach to selecting therapeutic alternatives seems reasonable, we are concerned about several downstream consequences. First, drugs from the same class with similar mechanisms of action often have similar clinical benefits, and they are often never compared in a randomized trial. From a practical perspective, high-quality evidence allowing for differentiating their relative benefits is often unavailable. Second, many drugs from the same class as the drug selected for negotiation may have been approved either contemporaneously or after the approval of the selected drug. In these cases, this means that the drug of interest does not actually represent a “therapeutic advance” over the therapeutic alternatives which are in the same therapeutic class. Finally, therapeutic alternatives within the same drug class are likely to have similar prices. Existing brand-name drugs have an anchoring effect on new drug launch prices in the same drug class in the United States. From a drug price negotiation perspective, CMS's proposed approach to selecting therapeutic alternatives from the same drug class may result in defaulting to setting prices based on the minimum discounts specified in the IRA in most cases (i.e., 25% for short monopoly drugs to 60% for long monopoly drugs).

Ideally, we believe that CMS should consider the entire universe of therapeutic alternatives, including older generation drugs, contemporaneous drugs, and recently approved next-generation therapies, without preference for starting with drugs of the same class. At a minimum, we recommend that CMS give priority to therapeutic alternatives with randomized trial evidence, particularly those that established the extent to which the selected drug represents a therapeutic advance for the disease. These should include the pivotal clinical trials that the U.S. Food and Drug Administration used for each drug approval.

- (2) Many of the drugs projected to be selected for negotiation have multiple indications, some even within the same disease. CMS appropriately plans to identify therapeutic alternatives for each indication. CMS should also consider various stages or lines of treatment within the same disease as multiple indications (e.g., first-line vs third-line treatment in cancer), identifying relevant therapeutic alternatives for each, and evaluating the extent to which the drug represents a therapeutic advance in each of those separate indications. CMS has also proposed to “adjust the initial offer based on the clinical benefit for an individual indication in cases where the clinical benefit of the selected drug is notably different than the therapeutic alternative for that specific indication.”

We recommend a modification to this approach when utilization volume varies substantially across its multiple indications. For instance, it is possible that a selected drug has large clinical benefit in relatively low-volume indications, and smaller benefits in high-volume indications. We suggest that CMS use Medicare claims data to identify the distribution of the selected drug’s volume across each indication. After developing a maximum fair price for each indication when compared with the relevant therapeutic alternative(s), an average price weighted by the frequency of that drug’s use in each indication can be calculated.

- (3) The selected drug and therapeutic alternatives may be administered over different durations than the selected drug (for example, treat to progression vs. fixed-duration cancer treatments). Hence, CMS’ proposed focus on comparing 30-day prices for the selected drug and its therapeutic alternatives is problematic and may misrepresent the “true” cost comparison between the selected drug and therapeutic alternatives. In addition to accounting for the length of treatment in calculating drug costs, we believe cost (beyond drug price) should be a part of assessing the extent to which a drug represents a therapeutic advance, including drug costs (incorporating duration of therapy), costs of managing side-effects, downstream treatments, and cost savings from avoiding side effects and/or other health complications.
- (4) The guidance document states that to adjust the starting point for the initial offer based on the therapeutic advance offered by the drug “CMS considered employing both a qualitative approach (e.g., adjusting the starting point upward or downward relative to the clinical benefit offered by the selected drug compared to its therapeutic alternatives) and a more thoroughly pre-specified quantitative approach. CMS intends to use a qualitative approach to preserve flexibility in negotiation, including the ability to consider nuanced differences between different drugs, for example interactions with other treatments commonly prescribed simultaneously for a condition or disease, and other factors that might not be captured in a more thoroughly pre-specified quantitative approach.”

We strongly recommend that even if CMS decides to use a qualitative approach to adjust the initial offer, it should still be informed using quantitative approaches that estimate value-based prices using decision-analytic methods in addition to qualitatively accounting for other nuances that may

not be captured in such quantitative approaches. Ideally, CMS should compute all dimensions of benefit and costs, strongly weighting the ones that patients value most. If impossible to account for all dimensions in the first year of negotiation, they should prioritize those that patients value most, for the disease(s) a drug is indicated for. Recently developed metrics, such as expected value of life years gained or health years in total, in conjunction with the Generalized Risk-Adjusted Cost-Effectiveness, can assess survival benefit and quality-of-life simultaneously without discriminating against the “elderly, disabled, or terminally ill.”

In summary, we recommend that CMS consider a broader range of therapeutic alternatives within and across indications for each selected drug and use established decision-analytic approaches to help account for multiple therapeutic alternatives and synthesize the multi-dimensional benefit and cost impacts of each comparison, integrating them into fair price recommendations.

RE: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

The MAPRx Coalition (MAPRx) appreciates the opportunity to provide the Centers for Medicare & Medicaid Services (CMS) with comments regarding the implementation of the Medicare Drug Price Negotiation Program (MDPNP) for initial price applicability year (IPAY) 2026, published March 15, 2023.¹

Our group, MAPRx, is a national coalition of beneficiary, caregiver, and healthcare professional organizations committed to improving access to prescription medications and safeguarding the well-being of Medicare beneficiaries with chronic diseases and disabilities. The undersigned members of the MAPRx Coalition are pleased to provide CMS with our official commentary in response to your efforts to negotiate maximum fair prices (MFPs) for certain high-expenditure, single-source drugs and biological products.

MAPRx appreciates the opportunity to comment on how Medicare intends to negotiate with pharmaceutical manufacturers for lower prices on selected high-cost drugs. MAPRx believes it is critically important for beneficiaries to have access to innovative therapies and wants to ensure that MDPNP efforts do not exacerbate barriers to patient access.

MAPRx thanks CMS for seeking feedback on the negotiation process guidance, a step that was not explicitly required in the Inflation Reduction Act (IRA) statute. However, we remain concerned about the short 30-day comment period for the initial guidance, especially without knowing which products will be negotiated. The comment period provides little time to review the guidance and to consider and draft constructive feedback on the process by which CMS will negotiate drug prices for the first time in its history. Additionally, the inability of stakeholders to engage CMS while the agency is developing proposed regulations further limits the time permitted to provide input.

While we would have preferred an official Notice and Comment opportunity that would have facilitated an agency response directly to stakeholder feedback, we appreciate the opportunity

¹ Seshamani M. Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments. March 15, 2023. Accessed March 30, 2023. <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

to share our concerns related to the MDPNP guidance. Overall as a coalition, we are focused on ensuring the following:

- Patient organizations have ample opportunity and ability to provide feedback on the negotiation process;
- CMS is transparent into how the agency factors external data into its final decisions (including the methodology deployed by the agency);
- The agency maintains access to a wide range of drugs within Part D and looks to minimize affordability challenges; and
- The agency establishes appropriate guardrails and ongoing oversight processes to continually evaluate the program for the purposes of refining when needed.

To that end, MAPRx is submitting comments on the following issues CMS addressed in the initial guidance:

- Highlighting the need for patient input to effectively maintain oversight and explore necessary program changes
- Maintaining beneficiary protections while implementing the new process
- Excluding orphan drugs from qualifying single-source drugs
- Excluding the utilization of Quality-Adjusted Life-Years in the negotiation process
- Offering feedback on future program guidance
- Reviewing the evidence about therapeutic alternatives for the selected drug
- Ensuring clear communication regarding the explanation for the MFP
- Exploring the future operation of the MDPNP
- Offering additional comments on the drug selection process

Patient Input Essential to Oversight and Continuous Improvement

As CMS initiates the implementation process, MAPRx requests the agency provide robust oversight to prevent unintended adverse patient impacts. Given the significant effect this new program and other changes, such as the redesign of the Part D benefit, will have on the drug delivery system, CMS must have proper systems in place to monitor impacts to ensure the program has the intended effect of increasing access and affordability for patients. At a minimum, CMS should monitor whether beneficiaries actually realize the expected savings, are not steered toward negotiated drugs inappropriately, do not face increased utilization management on either negotiated or non-negotiated drugs, and do not face other barriers to access.

In addition, it will be important for CMS to monitor the impact of negotiation on launch prices, inadvertent incentives for plans to prefer higher-priced drugs if they are able to achieve greater rebates (or inappropriate steering toward higher-priced drugs when Part B negotiation begins, due to higher provider fees), and disincentives to follow-on research on additional indications or new formulations that can demonstrate additional benefit such as greater adherence or reduced side effects.

Given that this guidance applies to the first year of negotiation, CMS will likely need to implement a mechanism for making needed adjustments. As such, we recommend CMS explore a formal process for seeking input from patients on the impacts of IRA implementation following the full implementation and on an ongoing basis.

MAPRx also requests guidance on how the patient community can best engage via the various information collection requests (ICRs). MAPRx appreciates the agency engaging with various stakeholder groups and is hopeful that the collaboration will continue with beneficiaries. To that end, we recommend CMS consider convening stakeholder panels or establishing other mechanisms to engage the beneficiary community and inform key decision points, including to obtain patient perspectives related to therapeutic alternatives and therapeutic advances, unmet need, considerations related to subpopulations and minorities, and patient experience and preference. MAPRx is committed to improving access to prescription medications and safeguarding the well-being of Medicare beneficiaries with chronic diseases and disabilities and welcomes the opportunity to provide CMS with patient-level data to ensure the best outcomes for patients.

Maintaining beneficiary protections while implementing the new process

MAPRx emphasizes the need for beneficiary protections and access to care while CMS is undergoing the new drug price negotiation process. We appreciate the Inflation Reduction Act's provision requiring all Part D plans to cover each drug with negotiated MFPs for all years for which the price is in effect during the price-applicability period. This provision helps ensure beneficiaries will benefit from the negotiation process and have access to the lowest-price drugs. MAPRx encourages CMS to monitor Part D plans to ensure beneficiaries have access to all negotiated drugs and provide opportunities to comment on beneficiary protections in the future. In addition, we urge CMS to provide strong monitoring and oversight of beneficiary access to both negotiated and non-negotiated drugs. For example, changes in formularies, tiering and cost sharing can impact a beneficiaries' ability to access prescription drugs under Part D.

Specifically, we seek clarification on CMS' interpretation of the requirement that negotiated drugs be covered by plans and if Part D plans will be allowed to apply utilization management (UM) tools or high cost sharing for the negotiated drugs. The initial guidance did not address UM techniques (e.g., step therapy, prior authorization, etc.) or cost-sharing requirements employed by Part D plans with respect to drugs with negotiated MFPs. While the patient community is incredibly supportive of the Part D redesign and out-of-pocket cap, we understand plans will face higher liability moving forward and therefore likely restrict coverage and/or access. Such UM techniques and cost-sharing requirements can create significant barriers and increase costs for patients by delaying the start or continuation of necessary treatment and negatively affecting patient health outcomes.^{2,3,4} Given this likely plan reaction to the higher liability, it is more important than ever that CMS create guardrails to ensure access to medicines by limiting burdensome barriers such as prior authorization and step therapy. By defining coverage requirements, CMS reduces the risk of plans denying coverage for products vital to a patient's comprehensive care plan. We also believe ensuring open access to negotiated drugs is simply the right thing to do. If a plan is receiving a lower price based on a maximum *fair* price, the benefit should be fully conveyed to beneficiaries through *fair* access. Conversely, it is crucial

⁴ US Congress. House of Representatives. Utilization Management: Barriers to Care and Burdens on Small Medical Practices. 116th Cong, 1st sess. September 11, 2019. Accessed April 4, 2023. <https://www.govinfo.gov/app/details/CHRG-116hhrg37560/CHRG-116hhrg37560>

that CMS does not allow plans to prefer non-negotiated drugs by applying utilization management on negotiated drugs.

Excluding orphan drugs from qualifying single-source drugs

MAPRx appreciates the agency's openness for additional approaches on the orphan drug exemption. Our coalition is concerned the new law may hinder innovation, particularly for orphan drug indications. The Orphan Drug Act and other statutes, regulations and guidance create incentives to encourage the development of treatments for rare diseases. Rare diseases need incentives to encourage manufacturers to invest in developing treatments, however, MAPRx is concerned that the implementation of the IRA may undermine these incentives.

The law states CMS must exclude from price negotiations a drug for only one rare disease or condition and for which the only approved indication (or indications) is for such disease or condition. Unfortunately, if a manufacturer obtained an orphan designation to conduct research into treatment for another rare disease, the drug could be subject to price negotiation, even if it only has one approved indication. The law and its implementation thus remove the incentive for manufacturers to even conduct basic research and development into multiple rare diseases.

This disincentive has already been activated. Two manufacturers have stated they have cancelled further research of drugs, due to the disincentives built into the law and its implementation.⁵

MAPRx is concerned about the potential impact to investments in rare disease, and patients will suffer the most from such decisions.

Excluding the utilization of Quality-Adjusted Life-Years in the negotiation process

MAPRx is pleased that the Inflation Reduction Act (IRA) prohibits CMS from using the quality-adjusted life year (QALY) metric in the negotiation process. Any evidence that values extending the life of some individuals less than extending the life of other individuals based on disability status or age is completely inappropriate. All patients deserve to be treated equally, and thus we laud CMS' adherence to the statute and decision to separate out and exclude QALY metrics from evaluations of research that otherwise factor in QALYs. However, we are concerned that CMS may not effectively eliminate QALYs from analysis, or that CMS may over-exclude analyses that are otherwise helpful in establishing the value of a drug. Thus, we request that CMS offer more clarity into exactly how the agency will exclude QALY-based metrics from analysis of certain evidence. We also request that CMS highlight when and how the agency removes QALY-based metrics from consideration in MFP justification documentation. MAPRx is concerned that, unless CMS outlines a rigorous process for how the agency will consider evidence stemming from the use of QALY so as to not discriminate against individuals who are elderly, disabled, or terminally ill, such evidence could be inadvertently used that would be disadvantage said populations.

⁵ Endpoints News. Updated: Eli Lilly blames Biden's IRA for cancer drug discontinuation as the new pharma playbook takes shape. November 1, 2022. Accessed April 11, 2023. <https://endpts.com/eli-lilly-rolls-snake-eyes-as-it-axes-two-early-stage-drugs-including-a-40m-cancer-therapy-from-fosun/>

Fierce Pharma. As Amvuttra makes inroads in ATTR, Alnylam scraps heart disease trial interim analysis, rethinks another rare disorder plan. October 27, 2022. Accessed April 11, 2023 <https://www.fiercepharma.com/pharma/amvuttra-makes-inroads-attr-alnylam-scraps-heart-disease-trial-interim-analysis-rethinks>

While it is clear both in the statute and this guidance that QALYs will not be used as a base for evaluations, CMS requested input on what other measures might be appropriate or inappropriate. While we do not have a position on a specific measure, we do think that it is important that CMS rely on more than a single metric and explore a wide variety of sources by taking a holistic approach to this data. Patient value is multi-faceted, and any attempts to distill important dimensions of patient value and benefit into a single number is fraught.

Reviewing the evidence about therapeutic alternatives for the selected drug

MAPRx appreciates CMS considering different methods to evaluate the value of a prescription drug for patients. However, MAPRx cautions that this approach may not be appropriate for many drugs due to the difficulty in determining equivalence among drugs and biologics. Many times, it can be difficult to determine whether one pharmaceutical intervention is better than another for a patient. Throughout the coalition's existence (since 2005), we have consistently stated that the ultimate decision between available therapies should be left to the physician and the patient for this very reason. Patient experience needs to inform determinations of therapeutic equivalence. Additionally, while a selected drug may have therapeutic alternatives, the selected drug and any alternatives may not share the same specific indication or be used by the same population groups. Finally, some drugs may lack therapeutic alternatives as they are the only therapies in a given class to treat a specific condition. While MAPRx welcomes robust competition and options for patients, we support patient access to these critical therapies.

MAPRx is concerned about the unintended consequence that this specific provision may have on future access. Choosing lower-cost, therapeutic alternatives to drive down the price of the selected drug could disincentivize manufacturers from investing in therapies to treat specific indications or specific populations. With the potential to be linked to a lower-cost product with a questionable efficacy in a narrower population, manufacturers may opt against focusing on innovations for certain population groups or exploring additional indications to determine if their products have further benefits.

Offering feedback on future program guidance

We appreciate the opportunity to comment on initial program guidance for IPAY 2026 and seek clarification on processes for soliciting feedback moving forward. We request visibility into the opportunities to provide input into adjusting future program guidance and if there will be a comment opportunity to inform negotiation for IPAY 2027 and beyond. We believe that CMS may need to reevaluate its methodology for various pieces of the negotiation process, including aggregating drugs to determine MFP. As this is a new program implemented in a non-traditional manner, we believe CMS should be nimble and responsive to feedback from stakeholders as the policy is implemented year over year. To that end, CMS should establish a meaningful process for 1) patients and other stakeholders to provide consistent feedback on the experience of IPAY 2026, and 2) CMS to evaluate policy decisions made for the initial year of negotiation and incorporate necessary changes quickly for future years.

Ensuring clear communication regarding the explanation for the MFP

The explanation for the MFP will be a critical tool in the continuous improvement of the negotiation program, as well as a tool for the patient advocacy community to learn and improve our ability to participate in the process. We urge CMS to assure that these explanations are clear, accessible, and transparent. We also ask that CMS include critical information about what data was used to develop the MFP and how specifically it was used. We are especially

interested in information about how patient experience data was incorporated. Including this information in the explanation will help patient advocates develop the most useful data for future negotiations.

Exploring the future operation of the MDPNP

MAPRx respectfully requests further information on how the 2026 negotiation process will inform Part B negotiations in future years. Such information will enable stakeholders to have greater clarity into the future operations of the MDPNP and to plan accordingly.

Offering additional comments on the drug selection process

Although we are aware that you are issuing Section 30 on drug selection as final, we have a few comments we hope CMS will consider as the agency implements the drug-selection process for negotiation.

For example, we are concerned about the effects that the aggregation of drugs with the same active moiety or active ingredient in the selection process could have on subsequent research. We worry that aggregation could disincentivize research into additional indications or potential reformulations that improve patient adherence and/or outcomes. Without appropriate guardrails such as more nuanced definition, this initial guidance may discourage these types of improvements. While we understand the desire to eliminate potential gaming of extending patent life or time before negotiation, we fear this may be an overly broad approach that does not consider the patient perspective on whether reformulations demonstrate an improvement to patient care and feel there are better approaches to address this issue. We caution the agency against advancing this approach without appropriately assessing the impact it may have on incremental treatment improvements that can greatly benefit patients. If CMS is unable to reconsider this approach, we request that you undertake future notice and comment processes with adequate time for stakeholders to consider the impact of selection criteria as the negotiation process is implemented.

Conclusion

We strongly uphold that decisions on value are best taken when patient organizations can engage in the process and when patients are not limited by coverage policies that restrict access to products that best meet their individual needs. Thus, we urge CMS to carefully consider these comments for this and future guidance and allow for patient voices to be heard and emphasized throughout the negotiation process.

Thank you for your consideration of comments on the initial guidance of the implementation of the MDPNP for calendar 2026. The undersigned members of MAPRx appreciate your leadership to improve beneficiaries' access to products in Medicare Part D. For questions related to MAPRx or the above comments, please contact Bonnie Hogue Duffy, Convener, MAPRx Coalition, at (202) 540-1070 or bduffy@nvgllc.com.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear. Dr. Seshamani:

The Massachusetts Biotechnology Council (MassBio) appreciates this opportunity to submit comments on the initial guidance regarding implementation of the Medicare Drug Price Negotiation Program (the “Negotiation Program”) established by section 11001 and 11002 of the Inflation Reduction Act (IRA) (the “Guidance”).

MassBio represents the premier global life sciences and healthcare hub of Massachusetts, which has a vibrant biomedical research and development community that is a global leader for medical discovery and innovation. MassBio’s 1,600+ member organizations are dedicated to preventing, treating, and curing diseases through transformative science and technology that brings value and hope to patients. MassBio’s mission is to advance Massachusetts’ leadership in the life sciences to grow the industry, add value to the healthcare system, and improve patient lives.

MassBio is deeply concerned about the impact the Negotiation Program will have on the future development of innovative and life-saving therapies, as well as on the world-leading small and emerging biotech companies based in Massachusetts. Through both a member survey and the collection of anecdotal evidence, MassBio has already identified concerning signals with respect to the IRA’s impact on innovation in Massachusetts. Based on these early signals, we believe the program’s framework will likely lead to less investment in biotech companies that work on the most difficult and risky science, and thus ensure significantly fewer resources are dedicated to the development of rare disease drugs and the hardest to treat diseases such as Alzheimer’s disease, cancer, and diabetes.

Given the potential impact on innovation and thus on vulnerable patient access to life-saving therapies, we urge CMS to adopt a “do no harm” approach in implementing this program that errs on the side of mitigating against the potential disincentives created by the program’s framework, and that allows the agency to make corrections as needed to preserve innovation.

We also urge CMS to carefully examine the impact of the law in Massachusetts. In light of Massachusetts’ unique role as the hub of companies directly engaged in research, development, and manufacturing of innovative products that improve the lives of people in the United States, Massachusetts

will be a “canary in the coal mine” in terms of changes to the system, and will thus be a good test case to see how IRA implementation affects the biotech industry. MassBio also plans to continue to survey our membership and perform other data-driven approaches to monitor the impact of the law, and we look forward to serving as a resource for CMS as the agency begins to track the impact of the IRA, particularly in Massachusetts.

Below we provide an overview of the innovation ecosystem in Massachusetts, as well as our comments on specific aspects of the Guidance, which are informed by the initial survey of our diverse and extensive membership. We would also appreciate the opportunity to meet with CMS to further develop and explain these ideas.

I. Background: The Innovation Ecosystem in Massachusetts

The innovation ecosystem is crucial to bringing a biopharmaceutical product to market and is composed of three, interrelated parties that interact in collaborative processes to move products from bench to bedside. These parties include: (1) small biotech companies and academia; (2) venture capital firms; and (3) larger pharmaceutical companies. Each of these parties serves a unique and vital role:

- Small biotech companies and the academic research community often partner to gather the necessary talent, engage in research, and pursue the latest scientific discoveries with the potential to develop viable treatments for a wide range of diseases and medical conditions.
- Venture capital firms provide equity investments in new and emerging biotech companies, to allow these companies to have the necessary capital and resources to advance through the different stages of the drug research and development process, particularly from proof of concept to actual clinical development.
- Large pharmaceutical companies help with the costly and burdensome process of bringing a new drug to market by contributing expertise and additional resources to the drug development pipeline, particularly through the use of diverse arrangements with emerging biotech companies, including acquisitions, licensing, and co-promotion.

All of these parties are essential components of the drug development and commercialization process. However, as the recent collapse of the Silicon Valley Bank has shown, this ecosystem is fragile and can be significantly disrupted if just one of the parties suffers a setback. For instance, while not a direct target of the law, venture capital investment choices do not operate in a vacuum, and are significantly impacted by long-term market dynamics, the ability to obtain a return on investment, and the inherent opportunity cost of specific investment decisions.

As noted above, in early 2023, MassBio surveyed its membership regarding the IRA’s immediate impacts, as well as member perspectives regarding certain regulatory and legislative policies that could mitigate those impacts.¹ A diverse cross-section of members responded to this survey, with a third of respondents having 10 employees or less. The majority of respondents indicated that they have already reconsidered their business strategy as a result of the IRA, and the vast majority also indicated that they have seen a shift in how investors are generally approaching biotech investments. This is consistent with other reports showing evidence that the IRA may be causing companies to reconsider their current approach to the drug development process, such as by cancelling early-stage pipeline projects, focusing

¹ Survey results on file at MassBio. We would be happy to provide the survey results to CMS, upon request.

on larger indications, developing fewer uses for existing medicines, and shifting away from small-molecule products.²

The MassBio member survey also asked about policy priorities to help maintain the biotech ecosystem as CMS implements the IRA, supplemented by qualitative input by a diverse group of executives from members. We describe these policy priorities in greater detail as part of our comments, below.

II. Section 30: Identification of Selected Drugs for Initial Price Applicability Year 2026

While MassBio understands that CMS has limited time to implement the Negotiation Program for initial price applicability year 2026, we are deeply concerned that CMS is issuing section 30 of the Guidance as “final.” The identification of selected drugs is among the most significant policies for the Negotiation Program, and many of the policies CMS outlines in the Guidance are inconsistent with the statute and likely to result in operational issues. By issuing these policies as final, CMS has denied interested stakeholders the opportunity to provide input, and further denied itself the opportunity to learn from those comments. MassBio is submitting comments in the hopes that CMS will reconsider elements of its approach going forward.

A. Section 30.1: CMS’s Qualifying Single Source Drug Definition is Overbroad and Not Supported by the Statute.

CMS is defining the term “qualifying single source drug” (QSSD) to include all dosage forms and strengths of the drug with the same active moiety (or, for biologics, active ingredient) and the same holder of a New Drug Application (NDA) (or, for biologics, a Biologics License Application (BLA))—inclusive of products that are marketed pursuant to different NDAs/BLAs. In addition, for purposes of counting the 7(drugs)/11(biologics) years that must elapse, CMS will use the earliest date of approval of the initial FDA application number assigned to the NDA/BLA holder for the active moiety/active ingredient.

CMS’s interpretation of the term QSSD is overly broad and is not supported by the statute. For both small-molecule drugs and large-molecule biological products, the underlying statute clearly sets the QSSD definition to the *singular* approval by the Food and Drug Administration (FDA) under which the product is marketed.³ The statute does not give CMS the authority to expand the statute’s focus on a singular FDA approval to a definition that encompasses multiple different FDA approvals through the addition and utilization of an “active moiety/ingredient” test.

Furthermore, this overly broad interpretation is at odds with the practical reality of the drug development process. Given the high cost to run clinical trial for a new product and the limited success rate for wholly new therapies, drugs are generally developed by initially seeking approval for and launching smaller or more limited indications—such as orphan diseases—to show proof-of-concept. Then, as the data and science advance, developers seek additional approvals for larger indications, as well as new dosage forms, strengths and formulations. This approach is consistent with the iterative approach to clinical advancement generally applied in medicine, and also mitigates some of the risk of clinical development.

² See R. Wolrath, *How the Inflation Reduction Act is already changing how biotechs do business*. Boston Business Journal (March 13, 2023); see also J. Waldrop, *Inflation Reduction Act undermines rare disease research*. Boston Herald (Feb. 28, 2023); see also D. Beasley, *Drug companies favor biotech meds over pills, citing new U.S. Law*, Reuters (Jan. 13, 2023).

³ See section 1192(e)(1) of the Social Security Act.

Because drugs are developed in this stepwise fashion, some of the most critical drugs have—over time—received FDA approval for multiple indications that continue to treat patients across multiple disease states. However, CMS’s interpretation significantly interferes with this approach by defining QSSD overly broadly, such that CMS will use the earliest approval date across an array of products grouped together by active moiety/active ingredient, in some cases grouping products approved under separate NDAs/BLAs. This will lead to a pre-negotiation period for a given product that starts *before that product was even approved*, creating a significant disincentive to pursue additional approvals, to the detriment of certain patient populations. In addition, going forward, drug developers may seek ways to obtain approval for larger indications from the outset, dampening the rate of therapeutic innovation for smaller patient populations with unmet need. This is not ideal for patients.

For these reasons, MassBio strongly urges CMS to revise the agency’s QSSD definition to instead focus on the approval standard required by statute.

B. Section 30.1.1: CMS Should Implement the Orphan Drug Exclusion in a Manner that Continues to Incentivize the Development of Rare Disease Therapies.

In the Guidance, CMS states that to be considered for the IRA’s orphan drug exclusion, a drug or biological product must (1) be designated as a drug for only one rare disease or condition under section 526 of the FD&C Act; and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition. Notably, to qualify for the orphan drug exclusion, *all dosage forms and strengths and different formulations of the QSSD must meet the criteria for exclusion.*

MassBio is concerned that the narrow scope of the orphan drug exclusion, combined with CMS’s overly broad QSSD definition, creates a strong disincentive for developers to continue to develop new indications and formulations for existing orphan therapies. However, we support CMS’s commitment to “consider[] whether there are additional actions the agency can take in its implementation of the Negotiation Program to best support orphan drug development,” and urge the agency to adopt policies along these lines.

Rare diseases, as defined by the FDA are conditions that impact fewer than 200,000 patients nationwide, and are inherently under-researched, under-diagnosed, and under-treated. Although much progress has been made since the enactment of the Orphan Drug Act (ODA) 40 years ago, over 90 percent of known rare diseases do not have therapies or treatments. This scarcity in therapies is due to a variety of reasons, including the resource and time investment needed to generally design, develop and bring a drug to market,⁴ as well as the low success rate of this process.⁵ There are also plethora of challenges specific to developing drugs for rare diseases, as the low number of actual patient numbers for certain diseases makes it difficult to establish an adequately sized and diverse patient population for a clinical trial, as well as obtain the high-quality patient data necessary to evaluate clinical trial outcomes.

That said, there has fortunately been a recent surge in the development of drugs for rare disease populations,⁶ with much of this development occurring in Massachusetts.⁷ Today, 40 percent of therapies

⁴ It can take 10 to 15 years and \$1-2B for a drug to be designed, developed and approved for use in patients. I.V. Hinkson, B. Madej, E.A. Stahlberg. *Accelerating therapeutics for opportunities in medicine: a paradigm shift in drug discovery Front Pharmacol*, 11 (2020), p. 770

⁵ 90 percent of developed drugs are unsuccessful. H. Dowden, J. Munro. *Trends in clinical success rates and therapeutic focus Nat Rev Drug Discov*, 18 (2019), pp. 495-496.

⁶ The annual number of orphan drug designation requests has steadily increased from 2012 through 2016 and has remained greater than 500 annually since 2016. In 2020, the Office of Orphan Products Development received 753 new requests for designation, a 41% increase from 2019. See <https://www.fda.gov/news-events/fda-voices/rare-disease-day-2021-fda-shows->

in the pipeline are in rare disease. Furthermore, given the nature of rare diseases, therapies developed for a particular rare disease can often be the starting point in the translation of new scientific discoveries to clinical medicine. Thus, as new data emerge, developers are able to identify promising new uses, including additional orphan indications, for existing therapies. For example, many new therapies are gene-based, and each genetically defined disease is a new indication for a particular therapy.

However, these new indications still require costly clinical trials, regulatory approvals and adherence to regulatory requirements and the narrow scope of the orphan drug exclusion creates a strong disincentive to undertake these investments, even though the science is there and could benefit vulnerable populations. Furthermore, because of the limited scope of the exclusion, companies may be disincentivized from developing therapies for rare diseases to begin with, and to instead prioritize indications with larger patient populations from the outset.

MassBio urges CMS to implement the orphan drug exclusion in a way that promotes and is consistent with the underlying purposes and goals of the ODA: to create the necessary financial incentives to accelerate the development of rare disease drug development. Specifically, in addition to narrowing the agency's QSSD definition, as described above, CMS should exercise its regulatory discretion to start the pre-negotiation period for orphan drugs upon loss of the orphan drug exclusion (i.e., when the product obtains approval for a new indication for a different disease or condition), rather than when the QSSD was initially approved. This approach is within CMS's discretion to implement the statute and would shield the product from the IRA's negotiation provisions for the entire time the orphan drug exclusion applies.

III. Section 50: Negotiation Factors.

A. Section 50.1: CMS Define R&D Costs More Broadly.

The IRA directs CMS, for purposes of negotiating the MFP of a selected drug, to consider certain "manufacturer-specific data," which includes: research and development (R&D) costs; current unit costs of production and distribution; prior Federal financial support for novel therapeutic discovery and development; data on pending and approved patent applications; exclusivities recognized by the FDA and FDA applications and approvals; and market data and revenue and sales volume data in the United States. In implementing this requirement, we urge CMS to define R&D costs more broadly. In the Guidance, CMS states that it "is considering R&D costs to mean a combination of costs incurred by the Primary Manufacturer for all FDA-approved indications of a drug falling into" certain categories, which include basic pre-clinical research costs, post-investigational New Drug (IND) application costs, completed FDA-required phase IV trials, post-marketing trials, abandoned and failed drug costs, and all other R&D costs. However, CMS's proposed approach overlooks certain investments critical to drug development.

First, by focusing solely on R&D expenditures made by the Primary Manufacturer, CMS's proposed definition overlooks contributions made by the Secondary Manufacturer and others. As noted above, drug development is often a collaborative process, involving investments by both small biotech companies and larger pharmaceutical companies. This can take the form of licensing arrangements, co-promotion agreements, and other arrangements. By looking only at the expenditures made by the manufacturer that holds the NDA/BLA, CMS is ignoring a large portion of R&D costs. We also note that

[sustained-support-rare-disease-product-development-during-public#:~:text=The%20annual%20number%20of%20orphan,a%2041%25%20increase%20from%202019.](#)

⁷ D. Seiffert, *Massachusetts owns the orphan drug market. Here's the proof*, Boston Business Journal (Nov. 9, 2015), <https://www.bizjournals.com/boston/blog/bioflash/2015/11/massachusetts-owns-the-orphan-drug-market-here-s.html>.

this approach is not supported by the statute, which looks at research costs of the “manufacturer,” a term that’s defined quite broadly to refer to:

any entity which is engaged in—

(A) the production, preparation, propagation, compounding, conversion, or processing of prescription drug products, either directly or indirectly by extraction from substances of natural origin, or independently by means of chemical synthesis, or by a combination of extraction and chemical synthesis, or

(B) in the packaging, repackaging, labeling, relabeling, or distribution of prescription drug products.⁸

CMS should therefore consider R&D spend from across the innovation ecosystem. However—contrary to CMS’s proposals in the Guidance—it should not be the responsibility of the Primary Manufacturer to collect this information from Secondary Manufacturers or others. Not only is there no statutory basis for this approach, Primary Manufacturers generally lack access to information regarding the business operations of other manufacturers, and requiring companies to share this sensitive information amongst themselves would add burden and create legal risk. Therefore, CMS should instead enter into a Negotiation Agreement with each manufacturer—including Secondary Manufacturers—to govern the submission, use, and disclosure of the data CMS needs for the Negotiation Program.

In addition, CMS’s proposed definition for abandoned or failed drug costs suggests the agency will only consider failed or abandoned product costs for products with some relation to the selected drug at issue (i.e., same active moiety, active ingredient, mechanism of action and therapeutic class). Although these categories capture many of the costs incurred in the development of a given drug, MassBio urges CMS to clarify that it will also allow manufacturers to allocate R&D costs for abandoned and/or failed research *that is not attributable to any particular product* across a manufacturer’s selected drugs. Developers often incur significant costs in the early stages of the pre-clinical discovery and development process that may not be tied to any particular product, but that were instrumental in moving the needle of scientific discovery forward and laying the groundwork for subsequent innovations that do lead to life-saving therapies. This aspect of R&D is a vital component to the larger process, and should be a material factor considered by the agency.

B. Section 50.2: CMS Should Consider Robust Data on Therapeutic.

The IRA further directs CMS to consider “evidence about therapeutic alternatives.” This includes the extent to which the selected drug represents a therapeutic advance and the extent to which the selected drug and the therapeutic alternatives address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy. CMS must also consider the FDA-approved prescribing information for the selected drug and therapeutic alternatives, and evidence on the comparative effectiveness of the selected drug and its therapeutic alternatives.

There are several factors and sources that CMS should consider in assessing a drug’s comparative effectiveness, whether it represents a therapeutic advance, or addresses an unmet need. We provide the following recommendations, and would welcome the opportunity to meet with the agency to further discuss these and other factors and sources the agency should consider as part of this assessment:

- Patient-centered definitions of value;

⁸ Social Security Act (SSA) § 1191(c)(1) (referencing SSA § 1847A(c)(6)(A), which in turn references SSA § 1927(k)(5)).

- Real-world evidence;
- Multiple-criteria decision analysis that considers multiple conflicting criteria in decision-making;
- Clinical effectiveness ratings, such as those issued by the United States Preventive Services Task Force (USPSTF); and
- Clinical compendia

We also recommend—consistent with the statutory requirement to consider FDA-approved prescribing information—that CMS focus solely on the approved indications for a given therapy.

C. Section 50.2: CMS Should Consider Data on Therapeutic Alternatives in a Non-Discriminatory Manner.

MassBio strongly supports CMS’s proposal not to use information found by CMS that treats extending the life of individuals in these populations as of lower value, for example certain uses of quality-adjusted life-years (QALYs), in the negotiation process. This policy aligns with prohibitions set forth in statute, and will help ensure that CMS is not evaluating the value of a given therapy in a manner that discredits its benefit to the neediest and most vulnerable populations. However, we are concerned that certain data sources may violate this prohibition in a discrete way, for example, by describing the research methodology without use of the term “QALY,” or by including a QALY analysis as a component of the research methodology without disclosing as much. MassBio therefore recommends that CMS disclose to manufacturers, as part of the negotiation process, all evidence that was considered by CMS in developing the initial MFP offer. A manufacturer can then use that information to ensure that any such data that involves QALYs and other similarly problematic metrics—either directly or indirectly—are not included in the manufacturer’s counteroffer.

IV. Section 60: Negotiation Process

A. CMS Should Adopt Certain Guiding Principles for Implementation of Negotiation Provisions to Promote Innovation.

As CMS proceeds with implementation of the Negotiation Program, MassBio urges the agency to pursue an approach that creates the greatest degree of certainty for developers by adopting a predictable, transparent methodology for applying the relevant negotiation factors, which should then be updated over time to recognize the value of continued innovation. As explained above, investment in the drug development process and the innovation ecosystem is significantly impacted by the long-term market dynamics at play. Thus, to enable developers and their investors to make informed investments today, CMS’s methodology should reflect the value that a product provides over its lifecycle and create incentives to invest in new therapeutic areas with unmet need.

For example, in the context of determining whether a selected drug represents a therapeutic advance as part of the negotiation process, MassBio urges the agency to consider the recent renaissance in the development of small-molecule drugs, which are increasingly complex, and to reject the common misconception that small-molecule drugs are not inherently innovative, or as innovative as biologics.⁹ CMS should similarly reject the notion that small-molecule drugs are less innovative or represent less of a therapeutic advance in the treatment of disease. Furthermore, it should be noted that small molecule

⁹ H. Boehm, *The Renaissance of Small Molecule Drug Discovery*, Pharmacy Times (Aug. 9, 2022), <https://www.pharmacytimes.com/view/the-renaissance-of-small-molecule-drug-discovery>.

drugs are often reproduced as generics, once the original drug patent expires, which can in turn further increase the availability of treatment options for vulnerable patient populations. However, as mentioned above, recent reports suggest that the IRA may be causing developers to shift away from small-molecule products to begin with. If this disincentive leads to less development of small-molecule drugs, it follows that it will also negatively impact the availability of generics, to the detriment of patients.

Thus, to in order to preserve access to small-molecule products and biologics alike, CMS should adopt an approach that ensures that maximum fair price (“MFP”) is set at or near the ceiling price for products that represent a therapeutic advance or address an unmet need. This approach would both create predictability and enable long-term investment in innovative small-molecule products as well as biologics. This will be especially important during the early years of the Negotiation Program, while there is significant uncertainty and a very short window for implementation. During this time, CMS can and should err on the side of mitigating against the potential harm resulting from the disincentives created by the program’s framework.

In that vein, CMS should also ensure that application of the negotiation factors is designed to promote health equity and reduce health disparities. Indeed, under the IRA, CMS must consider “the extent to which the selected drug and the therapeutic alternatives to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy.” CMS can do this by placing greater weight on the promotion of health equity and reduction of health disparities, which are accomplished in part by creating and maintaining incentives for investment in therapies that address unmet need for underserved patient populations, including patients suffering from rare disease.

B. CMS Should Continually Monitor the IRA’s Impact on the Innovation Ecosystem.

As mentioned above, in early 2023, MassBio surveyed its membership regarding the IRA’s immediate impacts, and member perspectives regarding certain regulatory and legislative policies that could mitigate those impacts. MassBio plans to continue to survey our membership and perform other data-driven approaches to monitor the impact of the law, and we hope to have the opportunity be a resource for CMS as it begins to track the impact of the IRA.

Likewise, as CMS proceeds with implementation of the law, MassBio urges the agency to similarly prioritize building the necessary infrastructure to track the impact of the IRA on the innovation ecosystem. This will be vital given the long-standing relationship between innovation and increased access to life-saving therapies, and the need for the agency to “do no harm” in the implementation of this new program. For instance, CMS could track the following metrics, using CMS’s own data and certain data available from the FDA, to assess the IRA’s impact over time.

- Number of new technology add-on payment (NTAP) applications for drugs and biologics;
- Requests for pass-through status under the Hospital Outpatient Prospective Payment System (OPPS);
- Number of new NDCs in average sales price (ASP) reporting data;
- Number of NDA/BLA submissions (tracking proportion of small-molecule vs. large-molecule over time);
- Number of supplemental BLA/NDA submissions;
- Number of applications for orphan drug designation (ODD);
- Percent of products with an ODD that are approved by FDA;
- Number of applications for breakthrough therapy designation;

- Number of applications for fast-track designation; and
- Number of applications for regenerative medicine advanced therapy designation.

We further urge CMS to publicly report these data to inform both the public and policymakers in Congress, and to establish a dynamic framework pursuant to which significant decreases in the metrics captured above trigger reconsideration of the negotiation process implemented by the agency.

V. Conclusion

MassBio thanks CMS for your consideration of our comments. As the IRA will have a significant impact across our diverse membership, we would appreciate the opportunity to meet with CMS to discuss these comments and other IRA-related issues of interest to our members.

**Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial
Price Applicability Year 2026, and Solicitation of Comments**

McKesson Corporation ("McKesson") is pleased to provide comments on the Centers for Medicare and Medicaid Services' ("CMS") initial guidance on the implementation of the Medicare Drug Price Negotiation Program ("Negotiation Program"). We appreciate the opportunity to share our perspectives on how CMS can achieve its goals of improving access to affordable, innovative treatment with minimal patient, provider, and supply chain disruption. Our comments focus on the foundational aspects of the new program and the more immediate considerations impacting effectuation of Part D maximum fair prices ("MFPs") across the pharmaceutical value chain.

About McKesson

McKesson is a global leader in healthcare supply chain management solutions, retail pharmacy, community oncology and specialty care, and healthcare information solutions. McKesson partners with pharmaceutical manufacturers, providers, pharmacies, governments, and other organizations in healthcare to help provide the right medicines, medical products, and healthcare services to the right patients at the right time, safely and cost-effectively. As a mission-driven company, McKesson is focused on working with customers and partners to advance health outcomes for all. McKesson strives to ensure that its views on improving healthcare prioritizes what's best for the patient. Its public policy platform is driven by the core belief that the **Patient Comes First**.

McKesson is also a leader in physician and pharmacy technology solutions. CoverMyMeds® solutions seamlessly connect the healthcare network to improve medication access, thereby increasing speed to therapy and reducing prescription abandonment. CoverMyMeds' network includes 75% of electronic health record systems (EHRs), 50,000+ pharmacies, 750,000 providers and most health plans and pharmacy benefits managers (PBMs). Ontada®'s oncology technologies, including the oncology-specific iKnowMedsm electronic health record (EHR), are utilized at the point of care and support clinical and operational excellence, generating claims, reimbursement, and labs oncology data across more than 2,700 oncology providers in 40 states.

General Comments

We share the Administration's belief that *all* patients must have access to affordable medicines and care to improve outcomes and reduce both patient and health system costs. McKesson's unique 360-degree view of the healthcare system offers a distinctive vantage point to examine key considerations impacting the effectuation of the MFP. Our industry-leading subject matter experts have carefully examined the initial guidance and engaged key partners across the pharmaceutical value chain to explore the data and payment processes critical to the effectuation of the MFP. We recognize that seamless effectuation of the MFP is central to the success of the new Negotiation Program. We appreciate the opportunity to share our perspective on how CMS may advance a minimally disruptive process to meet its goals.

First, it is important to recognize that CMS' proposed dual use of the MFP as a payer reimbursement benchmark (i.e., Part D negotiated price) and pharmacy acquisition benchmark is a significant departure from current practice. Today, for pharmacy benefit drugs (e.g., Part D), these two processes—acquisition from wholesalers and reimbursement by Part D plans—are not linked and represent distinct contractual agreements. Additionally, adjustments to acquisition costs are made through the wholesaler *prior* to the drug being dispensed and apply to all drugs a pharmacy may purchase, regardless of the payer type (e.g., Medicare, Medicaid, commercial, cash-pay). The transactions contemplated by CMS better align with manufacturer 'refund' transactions, which may include post-dispense retrospective adjustments to reimbursement, but would not work with pre-dispense prospective adjustments to acquisition cost.

Second, we appreciate that CMS intends to "leverage existing mechanisms" to ensure the MFP is made available to MFP-eligible individuals and dispensing entities. While we think the private sector can be a solutions partner, this is only effective if CMS plays an active role in defining and governing core operations necessary to effectuate the MFP. Experience shows that when left to solve common business challenges individually, private sector entities will implement unique policies and processes relevant only to their own business models, which fuels market confusion, fragmentation, and disruption.

Last, we appreciate that while the statute places primary responsibility of MFP availability on manufacturers, CMS has the authorities and an inherent responsibility to ensure new programs and benefits are implemented with the appropriate level of transparency, oversight, and compliance protections for beneficiaries, pharmacies, and the Medicare program.

Specific Comments: Minimizing Disruptions

We believe the following are vital to the success of the Negotiation Program and MFP effectuation:

- **CMS must define, construct, and oversee core functions of the data and payment processes critical in effectuating the MFP across all stakeholders.** CMS guidance and oversight is critical to building trust across all stakeholders and mitigating potential barriers due to competing business interests and misaligned incentives.
- **CMS must require manufacturers and impacted entities to adopt a singular, standardized approach.** Consistency will ensure that pharmacies are not forced to navigate manufacturer-specific programs with varying requirements. Effectuating the MFP should not come at the cost of diverting pharmacy time, resources, and attention

away from patient care or adding undue financial / administrative burden to already-stretched pharmacist workforce capacity.

- **CMS must provide detailed operational guidance and resources to support uniformity, including minimum data standards.** The Inflation Reduction Act (IRA) requires CMS to implement the Negotiation Program “by program instruction or other forms of program guidance.” CMS must consider the unintended consequences of erring on the side of too little—rather than too much—guidance.
- **CMS must hold pharmacies harmless and reduce administrative and financial risk.**
 - **Pharmacies should not be on the hook to “prefund”** the retrospective MFP-model and face “pay and chase” hurdles as they pursue payment for the “MFP refund.” CMS should explore alternative opportunities to prefund transactions.
 - **CMS should require the MFP refund be processed in the same manner and timeframe as the Part D manufacturer discounts.** This approach would align all claims-related transactions and ensure timely 14-day payment post-dispense.
 - **CMS must reframe the “providing access to the MFP” definition** from “ensuring that the amount paid by the dispensing entity for the selected drug is *no greater than the MFP*” to “ensuring that the amount reimbursed to the dispensing entity for the selected drug is *no less than the MFP*.” Disassociating the MFP refund calculation from acquisition cost (which is confidential, highly variable across pharmacies, and prone to dynamic change even for a given pharmacy) will allow entities other than the pharmacy to calculate the MFP refund. **Making the MFP refund “knowable and portable” is the start to automating the effectuation process.**

The remainder of this document provides an overview of the key considerations we believe to be critical across stakeholders, offers specific comments on leveraging the existing supply chain, and presents tactical comments on better effectuating the MFP.

Overview: MFP Effectuation: Aligning Interests and Operational Imperatives¹

As we examined the operational considerations for effectuating the MFP, McKesson identified guiding principles to bridge the common goals across key stakeholders. We also explored operational ambiguities remaining from the initial guidance that must be addressed prior to program implementation.

Patients must have timely and robust access to critical medicines and benefit from lower cost sharing from MFP at the point of sale (“POS”).

Medicare must provide robust access to innovative treatments while lowering costs and safeguarding program success.

Pharmacies² must be held harmless for timely payments and face minimal administrative burden and financial risk.

Manufacturers need timely, complete, and accurate data reporting critical to ensuring the auditability of MFP financial transactions and compliance with program requirements (e.g., manufacturer agreement, non-duplication of 340B discounts).

Wholesalers must provide timely and uninterrupted delivery of critical medicines to customers.

340B Covered Entities must have access to the lowest acquisition cost – MFP or 340B ceiling price.

Technology entities must access shareable, portable data to support diverse stakeholders across the supply chain.

Common Guiding Principles Across All Stakeholders

- Ensure minimal disruption to current product, data, and financial flows
- Leverage existing roles and capabilities, where possible
- Be selective when introducing new entities and process
- Have necessary guidance and resources for a coordinated and consistent approach

Operational Imperatives: Framework Overview and Sample Questions

Identify Least Disruptive Approach: Between prospective versus retrospective, which approach minimizes pharmacy administrative and financial risk? Which mitigates inventory challenges and diversion risk?

Better Define MFP Effectuation and Intersection with 340B: How can the process be automated to ensure timely pharmacy payment? How should the “MFP refund” be defined and calculated? Who should prefund the financial transactions? How is the process impacted by 340B?

Determine Optimal Roles Based on Real-World Solutions: Should a single entity manage both data and financial transactions? Should these entities be governed and paid for by CMS, by manufacturers, or by an independent third party?

¹ Content not meant to be exhaustive, but reflective of priority needs.

² Please note that we often use the term “pharmacy” as shorthand for all dispensing entities that may be impacted under the Negotiation Program.

Specific Comments: Leveraging Existing Supply Chain Capabilities

McKesson believes there are numerous pathways through which the MFP may be effectuated. CMS' willingness to be an active partner in the process and in the provision of detailed direction, standardization, and automation will impact feasibility, timing, willingness of stakeholders to partner, and ultimately a successful program. The barriers to creating new operational processes are not insurmountable and can be done by relying on existing infrastructure and business relationships across the primary stakeholders in the supply chain (i.e., pharmacy, plan, pharmacy switch, manufacturer). However, private-sector leaders need the Administration's guidance to ensure new solutions do not unduly fragment the supply chain, reduce efficiency, or lead to disruption.

CMS must also safeguard against the competing business priorities and misaligned incentives that may create undue burden on pharmacies. Pharmacies are at the epicenter of effectuating the MFP and will be required to navigate significant changes to their drug management processes and economics. They should not *also* be tasked with taking on the brunt of the administrative and financial risk. For example, without CMS intervention, pharmacies may be forced to take on primary responsibility of identifying MFP-eligible patients at the POS, confirming dispensing of MFP-selected drugs, calculating and submitting the MFP refund, 340B reconciliation, financial reconciliation, and related compliance requirements. While we appreciate CMS' intent to prohibit manufacturers and their contracted partners from charging fees for the retrospective MFP payment process, this will not fully insulate pharmacy risk, nor does this account for the costs and burden of the ancillary activities critical to supporting MFP effectuation. It is not practical or appropriate to place the greatest administrative and financial risk on pharmacies, especially independent pharmacies who have limited resources to manage such sweeping reforms.

Minimally Disruptive Pathway

The least disruptive approach in effectuating the MFP is to leverage systems and entities already performing similar roles. The Medicare Coverage Gap Discount Program (CGDP) and use of a CMS-financed and governed third-party administrator (TPA) is a trusted and proven approach. In the CGDP, manufacturer discounts are seamlessly effectuated at the POS, in real time and within workflow. The model also allows for regular data and financial reconciliation across the key stakeholders in the Part D claims and reimbursement system (pharmacy, Part D plan, CMS, manufacturer, patient). CMS has already indicated that this same model will be used to operationalize the new Manufacturer Discount Program ("MDP") that will be effective under the new Part D benefit starting in 2025. We urge CMS to examine the potential overlapping needs and functions necessary to effectuate the manufacturer discount relative to the manufacturer MFP refund. Synergies may mitigate costs of deploying a new TPA model just for MFP effectuation. This model also mitigates pharmacy financial risk by removing their burden to prefund the MFP refund. We urge CMS to explore financing models that would allow manufacturers to seamlessly pay MFP refund amounts to pharmacies at the POS.

Defining Critical Functions

In determining a path forward, it is important to first determine the key functions or capabilities needed to process the core transactions, and the ability of entities already involved with these transactions to expand their role to address the new requirements to effectuate the MFP.

Based on our understanding of similar flows in the supply chain today, we believe there are two distinct needs in effectuating the MFP: Data Facilitation and Payment Facilitation.

Data Facilitation

The statute mandates that manufacturers make the MFP for selected drugs available to both MFP-eligible individuals and dispensing entities. Per CMS' initial guidance, this requires the manufacturer to ensure that the selected drug was dispensed to eligible patients and that the pharmacy's purchase price is no greater than the MFP. When not purchasing the selected drug at MFP, which is most likely, dispensing entities will need an MFP refund from the manufacturer. Additionally, manufacturers must guard against 340B discount duplication and ensure covered entities are able to purchase selected drugs at the lesser of the MFP or 340B ceiling price.

These requirements necessitate the coordination and reconciliation of several disparate data elements. Examples of core data transactions include, but are not limited to:

- ✓ Part D Verification: Determine patient and drug MFP eligibility
- ✓ Identify 340B transactions that would not be MFP-eligible
- ✓ Calculate MFP refund
- ✓ Determine total pharmacy payment across responsible entities: patient, Part D plan and manufacturer

Payment Facilitation

As noted above, as part of the MFP effectuation process, manufacturers may owe pharmacies an MFP refund that must be reconciled, at the claim level, against dispensing of the MFP drug. Examples of core financial transactions include, but are not limited to:

- ✓ Pay pharmacy amount determined through data facilitation process
- ✓ Manage all related transactions and needed true-ups (reversal of refund if claim reversed, post-refund 340B ceiling price reconciliation)
- ✓ Coordinate financial transaction to claim transactions

Leveraging Existing Supply Chain Capabilities

As noted earlier, there are numerous pathways in which the MFP may be effectuated but additional direction and guidance is needed from the Administration. As we examined the opportunity to leverage existing supply chain capabilities, we identified attributes necessary for entities to function as a Data and Payment Facilitator.

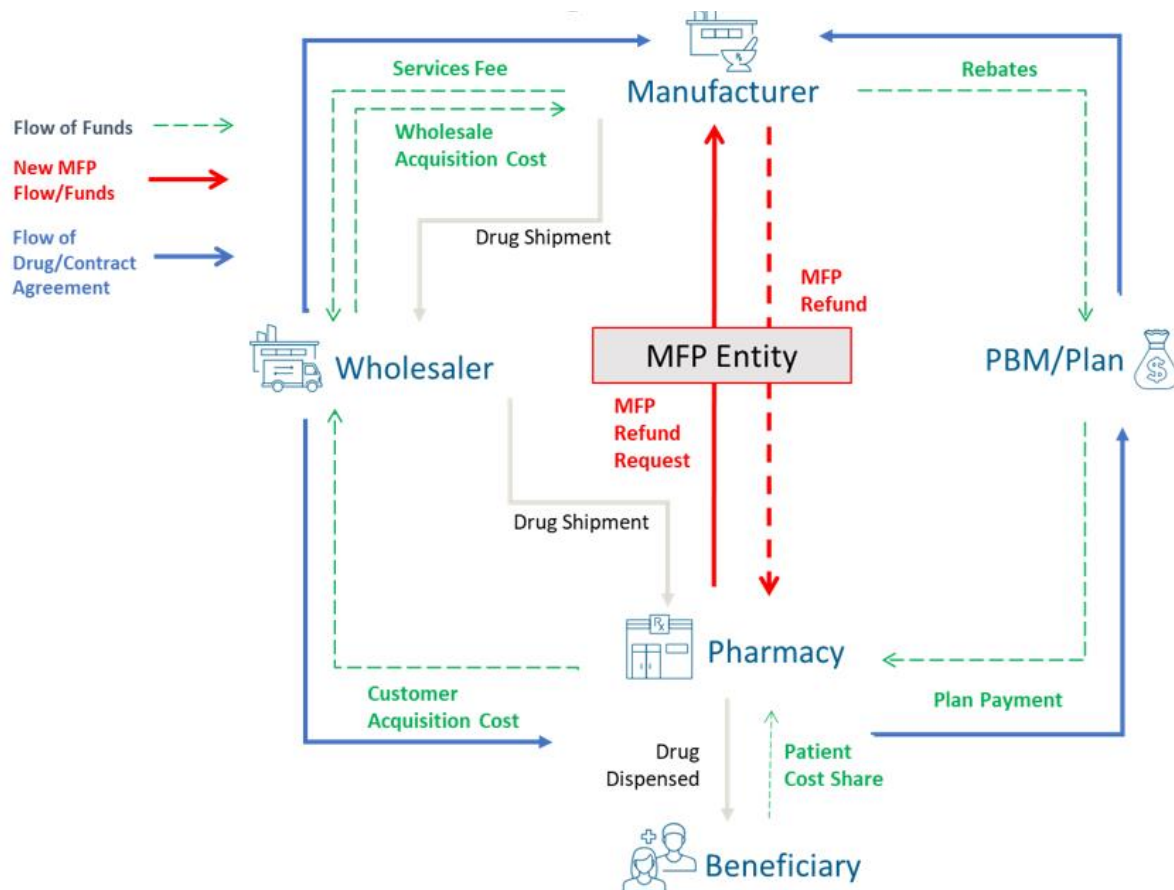

Data Facilitator	Payment Facilitator
<p>Entities best positioned for this role</p> <ul style="list-style-type: none"> ✓ Can validate Part D eligibility ✓ Already have access to Part D claims data in their current workflow ✓ Already have or could be granted access to 340B data to enable identification of ineligible claims for 	<p>Entities best positioned for this role</p> <ul style="list-style-type: none"> ✓ Able to link financial payments claims as critical to ensuring compliance of MFP effectuation ✓ Already function as pharmacy claims, billing, and operating solution

www.mckesson.com

Data Facilitator	Payment Facilitator
MFP, and operationalize true-ups when MFP is lower	✓ Able to identify and initiate refund automatically within workflow

Ideally, a single entity would serve both roles, but it is also plausible to split those roles between two different entities. For the payment facilitator role, there are two possible entities that are currently part of financial flows to pharmacy – the Part D plan or the pharmacy switch. For the data facilitator role, possible entities could be Palmetto (CGDP TPA), the pharmacy switch or a new data clearinghouse.

Figure 1. Intersection of the MFP Entity in Current Supply Chain

It is important to note that the success of any private sector solution or partnership will require additional guidance and direction from the Administration. Critical areas for consideration:

- Define roles and responsibilities for key activities and transactions in the MFP effectuation process (e.g., Part D plan required to verify MFP eligibility, pharmacy required to determine refund amount if based on purchase price)

- Clarify which entities can play a role in effectuating the MFP based on required capabilities (e.g., only Health Insurance Portability and Accountability Act (HIPAA) covered entities are able to manage claims-based level transactions)
- Define minimum data standards for core transactions (e.g., refund request must include claim number, NDC, units dispensed, etc.)
- Clarify financial accountabilities across stakeholders to mitigate unintended consequences and cost shifting to pharmacies

Specific Comments: Better Define MFP Effectuation and Intersection with 340B

Pharmacy Reimbursement vs. Acquisition under MFP

Current Considerations: Pharmacies purchase drugs agnostic to patient insurance designation. Pre-POS discounts from manufacturer to pharmacy are highly uncommon in the Part D flows today. Therefore, wholesaler chargebacks are the exception, not the rule, in Part D scripts that flow primarily through retail pharmacies and specialty pharmacies. Pharmacy acquisition cost is based on contractual agreements between wholesalers and the purchasing pharmacy entity; they are not driven by payer or patient designation.

MFP Considerations: Per the initial guidance, CMS intends to require that manufacturers of selected drugs provide access to the MFP in one of two ways: (1) prospectively by ensuring the price paid by the dispensing entity at acquisition is “no greater than the MFP;” or (2) providing a retrospective reimbursement between the pharmacies’ acquisition cost and the MFP. See Figure 2 below.

Figure 2. Understanding Acquisition Dynamics Based on CMS Example

	Prospective		Retrospective
	Some Inventory Bought as Usual	Some Inventory Bought at MFP Price	All Inventory Bought as Usual
Pharmacy purchases MFP-eligible medication bottle for...	\$100	\$80	\$100
MFP-eligible patient identified with \$0 cost-sharing	Medication cannot be dispensed to qualifying Part D patient ... even if MFP acquired supply runs out	\$0	\$0
The MFP applied to this selected package is...		\$80	\$80
Part D plan doesn't negotiate discount below acquisition or the MFP. Negotiated price...		Equals MFP (\$80) + dispensing fee	Equals MFP (\$80) + dispensing fee
Plan + Patient Pays Pharmacy		\$80 + dispensing fee	\$80 + dispensing fee
Pharmacy Owed (Purchase \$ - MFP)		\$0	\$20 “MFP-refund”

A prospective MFP approach creates undue burden for pharmacies by requiring them to manage dual inventories and also creates diversion / financial risk for manufacturers due to lack of visibility, transparency, and auditability of appropriate use of MFP-priced product for eligible Part D enrollees.

Under this approach, pharmacies would be required to acquire some drugs at the “no greater than the MFP” amount and others under their standard acquisition rates (e.g., wholesale acquisition cost minus [WAC-minus]). Split billing and management technology solutions typically used by 340B covered entities are unlikely to solve challenges unique to community pharmacy (e.g., limited space to manage dual physical inventories).

A retrospective MFP approach is the least disruptive for pharmacies and for manufacturers but requires CMS to implement a transparent and consistent process to facilitate the “MFP refund.”

Under this approach, pharmacies would continue to acquire all of their drugs under their standard acquisition rates (and contracts). The retrospective approach allows pharmacies to more effectively manage their drug supplies and ensure timely access for patients. It also allows manufacturers to receive granular, transparent, and timely data on eligible transactions and to validate the MFP refund owed to dispensing pharmacies. It does necessitate provision of an “MFP refund,” which, if not implemented with the necessary safeguards, may place undue financial risk and administrative burden on the pharmacy.

Pharmacies should not be on the hook to “prefund” the retrospective MFP model and face “pay and chase” hurdles as they pursue payment for the “MFP refund.”

Numerous challenges make this the least desirable and reliable option for pharmacies, particularly independents already facing economic and cash flow challenges, which will be exacerbated in the post-DIR reform landscape. First, without a clearly defined and standardized process, pharmacies may be forced to navigate different refund programs with varying manufacturer requirements. Second, use of actual acquisition cost to determine the refund amount places the burden on pharmacies to calculate, submit, and justify the refund, creating uncertainty in payment. Additionally, sharing of proprietary pharmacy acquisition data may impact competitive market dynamics. Third, manufacturers and pharmacies do not typically exchange data or dollars directly. Discounts may be contracted between the two entities but are usually effectuated by the wholesaler. Pharmacy payments through manufacturer cost-sharing programs are usually effectuated through pharmacy switch-based solutions. CMS currently effectuates CGDP discounts through partners it has contracted with and oversees, namely Part D plans and Palmetto (the TPA of the CGDP). While Part D plans may be able to play the role of payment facilitator, they would not be able to play the role of the data facilitator as they lack access to robust and timely 340B data. Moreover, if Part D plans were to play the role of data facilitator, it would be quite concerning to other stakeholders in the supply chain due to the opaqueness of the PBM model and misaligned incentives that could exacerbate financial pressures on pharmacies and manufacturers.

CMS should explore alternative ‘prefunding’ pathways that will minimize both pharmacy administrative burden and financial risk.

Notwithstanding outstanding questions regarding CMS authorities and funding pathways, we think it is vital that CMS have direct oversight of the MFP effectuation process and, specifically, that CMS govern the necessary data and financial flows. CMS is expected to terminate the CGDP under the new Part D benefit. However, the new MDP is expected to be managed in a

similar manner. Appreciating the limitations of using the current CGDP partners to perform the MFP process, we nonetheless believe CMS can use a similar model to effectuate the “MFP refund” but utilize alternative funding and payment mechanisms to mitigate resultant overburdening of Agency resources.

Ascertain MFP Eligibility

Current Considerations: Today, patient insurance status and drug choice does not impact pharmacy acquisition costs. They do, however, impact the pharmacy’s plan payment and patient out-of-pocket cost sharing.

MFP Considerations: Per the initial guidance, CMS intends to leverage existing mechanisms to ensure the MFP for selected drugs is made available to MFP-eligible individuals and their dispensing entities. Existing mechanisms fail to automate the necessary processes and create operational hurdles that limit the seamless initiation and execution of the “MFP refund.”

CMS must automate the MFP eligibility process and enable seamless identification of “MFP refund” eligible claims at the POS.

Per the initial guidance, CMS indicates that the combination of the RxBIN and RxPCN will enable pharmacies to identify MFP-eligible patients at the POS. CMS must also ensure selected drugs are easily identifiable based on the range of applicable National Drug Codes (NDCs). Further, rather than leave these mappings to pharmacies and their technology vendors, CMS should automatically flag claims that meet the core requirements (MFP-eligible individual and MFP-selected drug). This will ensure pharmacies are made aware in real-time that the “MFP refund” process should be initiated as part of the initial claims adjudication process.

Unrelated to the “MFP refund” process, we note that pharmacies will continue to rely on Part D plans to accurately reflect MFP-adjusted cost sharing as appropriate. This determination becomes more complex at the POS if the patient is also enrolled in the plan’s cost-sharing smoothing program. CMS must ensure that this information is readily available at the POS and that data standards and pharmacy systems allow for the exchange of this information.

Determining Payment Responsibilities

Current Considerations: Today, the pharmacy switch enables pharmacies and plans to automate the real-time flow of billing transactions, streamline the workflow process, resolve claims submission discrepancies that cause payment delays, and help ensure accurate and timely reimbursement to the pharmacies. When a patient presents a script at the pharmacy counter, the switch routes the billing claim from the pharmacy to the plan for adjudication, and then delivers the plans payment response back to the pharmacy in real-time. Based on this response, the pharmacy knows it will receive its full compensation under its contract with the plan and can track the payment due from the plan versus the out-of-pocket cost sharing for the patient based on the plan’s benefit design.

Under the current CGDP, manufacturers are required to provide eligible beneficiaries in the Part D coverage gap access to discounted prices for brand drugs at the POS. Today, Part D plans automatically include the manufacturer-required discount amount as part of the plan’s payment obligation. The manufacturer discount obligation is seamlessly integrated into existing pharmacy claims and payment processes. The pharmacy knows its full compensation amount for the

submitted claim at the POS. The pharmacy knows it will be paid in full by all entities within the standard 14-day claims adjudication process. Manufacturers repay Part D plans through the CGDP TPA (Palmetto). CMS, Part D plans, and manufacturers reconcile financial transactions independently without disrupting patient access or pharmacy economics.

MFP Considerations: Per the initial guidance, CMS indicates that it will define “providing access to the MFP” as ensuring the dispensing entity’s acquisition cost is no greater than the MFP. As such, in effectuating the “MFP refund,” CMS intends to require manufacturers to reimburse dispensing entities the difference between their acquisition cost and the MFP. Separating the MFP financial transaction from existing real-time Part D transactions will create significant disruptions for pharmacy (e.g., uncertainty in full payment at the POS, revenue cycle management hurdles).

A retrospective MFP approach only works if we can create an automated, transparent, and predictable process for ensuring timely payment of the “MFP refund.” A standardized approach will mitigate pharmacy burden, and ensure manufacturers have timely access to data to ensure compliance with program requirements. Existing solutions can only be leveraged if we automate the “MFP refund” determination process as is done today with other pharmacy payment responsibility determinations.

In order to automate the “MFP refund” process, the refund amount must be “knowable and portable” – necessitating use of a standardized and transparent calculation (i.e., WAC minus MFP).

As noted earlier, CMS intends to require that manufacturers reimburse dispensing entities the difference between their acquisition cost and the MFP. We appreciate CMS’ intent to “make pharmacies whole” but believe use of acquisition cost as the benchmark to determine the “MFP refund” is problematic and places undue burden on pharmacies. Only the pharmacy knows its actual acquisition cost, and many may not be able to make this determination in a timely manner or at the unit levels necessary to determine the “MFP refund.” Wholesalers have a partial view into pharmacy acquisition cost, as they only know the price at which they sold the drug to the pharmacy. However, there can be additional discounts paid directly from the manufacturer to the pharmacy that could be proprietary and not transparent to wholesalers. There also could be thousands of different acquisition costs for the same drugs as each pharmacy in the United States has different contract terms with wholesalers and manufacturers. Finally, this would expose proprietary pharmacy acquisition costs to other entities in the industry.

WAC may be used as a proxy for acquisition cost as it is generally accepted that brand drugs are acquired at or near this transparent and publicly available benchmark. Use of a WAC minus MFP calculation would streamline the process and allow multiple entities across the supply chain to calculate and apply the refund amount. WAC and MFP are both publicly available and, as such, create a predictable and auditable MFP refund amount for all stakeholders, including pharmacies, manufacturers, and CMS.

Payer Claims and MFP Refund Requests

Current Considerations: As noted earlier, the pharmacy switch enables pharmacies and plans to automate the real-time flow of billing transactions. The CGDP process shows how

manufacturer-discount obligations can be seamlessly integrated into these workflows and transactions, thus minimizing pharmacy administrative burden and financial risk. Inclusion in established claims processes also ensures that pharmacies will be paid in full by all entities within the standard 14-day claims adjudication process.

MFP Considerations: In the initial guidance, CMS notes that manufacturers must reimburse pharmacies the MFP refund within 14 days. However, there is no clarity on when the clock starts or what hoops pharmacies may be required to jump through to get the refund. Without specificity in how the refund should be operationalized within 14 days, industry alignment on how best to utilize existing solutions is unlikely.

“MFP refund” payment standards should align with established Part D payment requirements – within 14 days of claims adjudication.

Pharmacies should not have to navigate financial uncertainty and cash flow hurdles due to the Negotiation Program or perceived operational challenges by CMS, manufacturers, or other supply chain entities. Community pharmacies continue to face economic challenges due to reduced reimbursements and the evolving payer / PBM landscape. Divorcing the “MFP refund” from the standard payment processes and revenue cycle management solutions opens the door for DIR 2.0 claw backs. Precedent exists for CMS to mandate and support operationalization of manufacturer discounts within the CGDP within these same timeframes.

340B Reconciliation

Current Considerations: 340B patient and claims identification is an ongoing challenge. Without binding direction from HHS, stakeholders tackling the same challenges have operationalized a wide array of solutions. This 340B data fragmentation across multiple entities prevents the identification of 340B claims at the POS and makes post-POS reconciliation challenging. While standards issued by the National Council for Prescription Drug Programs (NCPDP) allow for use of a 340B modifier, it is intended to be used at the POS. Nothing prohibits the pharmacy from reporting this information post-POS, and the lack of clarity and length of time to make such determinations do not make use of this modifier practical or reliable.

Contract Entities Have Significant Latitude in Determining 340B Eligibility: The regulatory definition of “patient” allows for wide interpretation. So, while preliminary eligibility may occur by matching the patient’s prescription at a contract pharmacy to a prescriber and encounter at a 340B covered entity (CE), additional “rules” are applied after the POS to maintain 340B compliance. These “rules” or “algorithms” vary by CEs and their perspectives on issues such as 340B compliance, optimization of the program, etc. Examples of additional qualifying criteria: evaluation of referral pathway and alignment of diagnosis with prescription.

340B Eligibility May Not Translate into Use of 340B Discount: Covered entities typically use 340B TPAs as an intermediary between covered entities and contract pharmacies for a range of services, including but not limited to: identifying 340B-eligible prescriptions; managing financial payments between both entities; managing inventory; and performing compliance checks. The 340B TPA is also one of the few, if not only, entities that is able to determine if 340B eligibility was pulled through and replenished as a 340B ceiling price acquired product. For example, a contract pharmacy that dispensed a seasonal medicine may choose not to “replenish” a product months later if it is not likely to be used until the following season.

www.mckesson.com

MFP Considerations: The IRA creates statutory dependencies on the 340B Program relative to both effectuating the MFP process within the supply chain, as well as for calculating inflationary rebate calculations for both Part D and B drugs. While the dependencies are different, they both underscore the need to describe how the current 340B claims adjudication process works in the supply chain today, and the issues that must be solved for in implementation, to ensure 340B claims are utilized as prescribed by statute.

CMS clarifies for the purposes of effectuating the MFP and non-duplication of 340B discounts, that the manufacturer must ensure a covered entity's acquisition cost is the lesser of the MFP or 340B ceiling price.

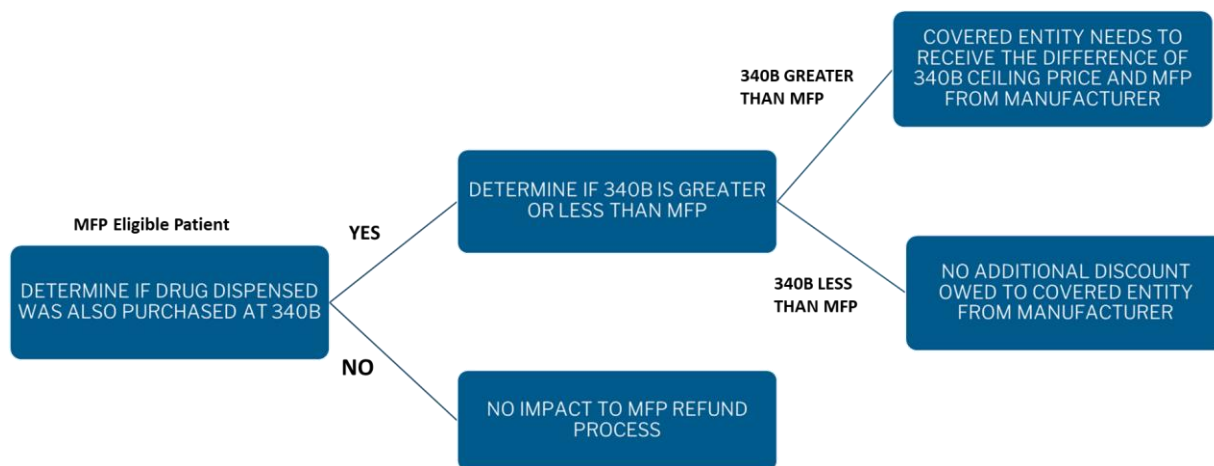

340B unit identification should remain a post-POS designation.

It is impractical to force designation at the POS when there is considerable variability in identification of the 340B unit.

For the purposes of MFP reconciliation, CMS should identify drugs whose 340B ceiling price is lower than the MFP at the POS to flag these claims for prioritized 340B eligibility determination and pull through.

The intersection between MFP and 340B creates significant complexities in dollar flows between both pharmacy and manufacturer (and the plan as well, if they are part of the MFP refund). CMS should consider the below challenges as they develop the process for 340B units that are also MFP eligible. Foundational questions that will need to be solved are included in Figure 3.

Figure 3. Understanding Complexities of MFP and 340B

Challenges to consider

www.mckesson.com

As stated above, the identification of a 340B transaction is not known at the POS. In all scenarios, the patient's cost sharing must be off MFP at the POS. In addition, for pharmacies to be held harmless and paid within 14 days, the MFP refund must be paid at the time of reimbursement. As 340B is generally not known until well after 14 days, there will need to be a financial true-up, in which pharmacies will need to repay manufacturers for the MFP collected but should not have as it was 340B unit. The repayment true-up to manufacturers will be determined if 340B is greater or less than MFP.

CMS should create a robust true-up process for manufacturers to ensure there are no duplicate discounts for MFP eligible drugs that were purchased at a 340B ceiling price.

Conclusion

McKesson thanks CMS for its consideration of these comments and for recognizing our shared interest to provide all patients access to affordable medicines and care. To further our common goal to find solutions that bring minimal disruption to the pharmaceutical supply chain, we urge CMS to take a leadership role and commit to resolving the following key issues:

- Defining, constructing, and overseeing core functions of the data and payment processes critical in effectuating the MFP across all stakeholders;
- Investing in the resources of both a data and payment facilitator, overseen by CMS, to ensure the integrity of supply chain data and the MFP program itself;
- Requiring manufacturers and impacted entities to adopt a singular standardized approach;
- Providing detailed operational guidance and resources to support uniformity, including minimum standards;
- Ensuring that pharmacy is held harmless without elevated administrative and financial risks;
- Reframing the definition of "providing access to the MFP" to enable workable solutions; and
- Solving the critical intersections between 340B and MFP to ensure the integrity of both programs.

We look forward to future opportunities to collaborate with the Agency as it implements and oversees the Negotiation Program. Should you have questions about our comments or need further information, please contact Fauzea Hussain, Vice President of Public Policy, at Fauzea.Hussain@McKesson.com.

Sincerely,

Pete Slone

Good Morning,

I am writing in response to the request for comments regarding the Inflation Reduction Act.

Meadville Medical Center and Titusville Area Hospital respectfully request that CMS consider excluding safety net providers such as sole community hospitals and critical access hospitals from the proposed negotiated manufacturer price methodology.

Our health system, which consists of a sole community hospital, a critical access hospital, and several rural health clinics is in an under-served area in northwest Pennsylvania. We are the only remaining independent health system in our area, with most smaller hospitals succumbing to acquisition by larger health systems. Our health system provides much needed behavioral health, endocrinology, and medical and radiation oncology in addition to many other services to patients within our community. Prior to providing an oncology service, our community members had to travel hundreds of miles to a larger facility to receive their treatments. This was difficult for patients especially after receiving chemotherapy treatments and unfortunately there is a large volume of cancer patients in our area.

In addition, pharmacy manufacturer mandates within the 340B program, the PHE, increased nursing staff expense, labor shortages, payer reimbursement policy changes, increases in denials, etc. have caused significant financial and operational hurdles to overcome.

The Inflation Reduction Act, as currently written, will also have unfavorable ramifications to our health system in several ways. First, regarding 340B, our savings from contract pharmacies is based upon the contract pharmacies' reimbursement. The reimbursement for the selected drugs for Medicare patients will cause a decrease in our 340B savings. Second, when the Act expands to Part B in 2026, not only will we see a decrease in our Medicare reimbursement for the selected drugs, our commercial reimbursement will also decrease for these same drugs because most of our commercial reimbursement contracts are based upon a mark up above Medicare rates.

For these reasons and more, we respectfully request that CMS exclude SCHs and CAHs from the MFP methodology.

Thank you for your consideration.

Respectfully,
Ellie Amory

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani,

The Medicare Rights Center (Medicare Rights) appreciates this opportunity to comment on initial guidance from the Centers for Medicare & Medicaid Services (CMS) regarding the **Medicare Drug Price Negotiation Program** (Negotiation Program). Medicare Rights is a national, nonprofit organization that works to ensure access to affordable and equitable health care for older adults and people with disabilities through counseling and advocacy, educational programs, and public policy initiatives. Each year, Medicare Rights provides services and resources to over three million people with Medicare, family caregivers, and professionals, including through our national helpline.

General Comments

Based on this experience, we know people with Medicare are uniquely impacted by high and rising drug prices. This is partly due to utilization and health status. Over two-thirds of Medicare beneficiaries have multiple chronic conditions¹ and Part D enrollees take 4 to 5 prescriptions per month, on average.² Many live on fixed or limited incomes that cannot keep pace with rapidly escalating drug prices. Half of all beneficiaries, nearly 30 million people, live on \$29,650 or less per year, and one quarter have less

than \$8,500 in savings.³ Health care costs comprise a large and disproportionate share of beneficiaries' limited budgets: nearly 30% of Medicare households spend 20% or more of their income on health care, compared to only 6% of non-Medicare households.⁴ Out-of-pocket costs for prescription drugs represent a significant share of this amount, accounting for nearly one out of every five beneficiary health care dollars.⁵ Most people with Medicare cannot afford to pay more for care.

Callers to our national helpline regularly report struggling to afford the prescription medications they need to maintain their health and well-being. And they are not alone. In 2021, over 5 million people with Medicare are estimated to have had difficulty paying for their prescriptions, with Black and Latino beneficiaries being disproportionately affected.⁶ That same year, nearly twenty percent of older adults said they had not filled a prescription in the past two years, most due to affordability concerns.⁷ Yet, drug costs continue to climb—price hikes on brand name medications have exceeded the rate of inflation every year since at least 2006.⁸

The Inflation Reduction Act's (IRA) Negotiation Program could provide much-needed relief, lowering prices, increasing medication adherence, and improving outcomes. We commend CMS for this timely initial guidance, and respectfully offer the following comments on bolstering **Affordability, Accuracy, and Transparency**.

Affordability

We ask CMS to revisit plans to base aspects of the initial maximum fair price on Part D net prices for therapeutic alternatives. Evidence consistently shows these prices are inflated; Medicare Part D pays significantly higher drug prices than other health programs in the U.S. and abroad.⁹ According to the Government Accountability Office, Part D net prices were up to four times higher than comparable countries in 2020.¹⁰ Using these flawed payments as anchor points would bake overpayment into the

¹⁰ Government Accountability Office, "Prescription Drugs: U.S. Prices for Selected Brand Drugs Were Higher on Average than Prices in Australia, Canada, and France" (April 28, 2021) <https://www.gao.gov/products/gao-21-282>.

Negotiation Program and undermine the IRA’s ability to achieve meaningful cost savings for current and future beneficiaries.

Instead, we urge CMS to use a cost-effectiveness approach. We recommend establishing targets for a preliminary price range which could then be adjusted based on relevant factors (such as comparative effectiveness research, the prices of therapeutic alternatives, and other manufacturer-specific data) to arrive at a maximum fair price.

Accuracy

CMS notes that in calculating maximum fair prices, the agency will rely on cost and projection data from drug manufacturers. However, CMS does not discuss plans to independently verify these “assumptions and calculations.” This is problematic. As for-profit companies, drug manufacturers will necessarily be incentivized to create a financially favorable environment. Past industry behavior even provides a template. An OIG review of the Medicaid Drug Rebate Program found manufacturer reports misclassified drugs in ways that benefitted their bottom line, but cost Medicaid over one billion dollars.¹¹

Not all drug companies are bad actors and not all profit-seeking behaviors are deliberate. Guardrails are therefore needed to prevent similarly intentional, as well as inadvertent, cost-shifting and rebate losses in Medicare. We strongly urge CMS to rely on independent information, to carefully review all collected data, and to conduct both random and for-cause audits .

Transparency

We recognize the IRA affords CMS discretion in releasing information and feedback requests. We applaud CMS for soliciting these and other public comments and encourage the agency to maximize transparency throughout the implementation process.

Accordingly, we ask CMS to reconsider restricting access to information regarding the maximum fair price methodology. While we understand the desire to avoid revealing details the drug manufacturers consider to be proprietary, they must not be allowed to use this as a shield; our health system needs more transparency and accountability, not less.

Program integrity and implementation obligations demand CMS release as much data as possible. This includes the factors and value frameworks used to determine a maximum fair price, as well as any information received from drug manufacturers. These details are necessary to advance general and payer understanding of the cost and value of the negotiated drugs. Without it, other insurers will be unable to effectively negotiate—limiting downward pricing pressure and the IRA’s impact, potentially derailing opportunities for further reform.

¹¹ Department of Health and Human Services, Office of Inspector General “Potential Misclassifications Reported by Drug Manufacturers May Have Led to \$1 Billion in Lost Medicaid Rebates” (December 2017) <https://oig.hhs.gov/oei/reports/oei-03-17-00100.pdf>.

Publicizing this information would also serve as a mechanism for oversight and help encourage accurate, complete manufacturer reporting. The IRA's landmark Negotiation Program must not be shrouded in secrecy.

Conclusion

Thank you again for the opportunity to provide comment. For additional information, please contact me at LCopeland@medicarerights.org or 202-637-0961 or Julie Carter, Counsel for Federal Policy at JCarter@medicarerights.org or 202-637-0962.

Sincerely,

A handwritten signature in cursive script that reads "Lindsey Copeland".

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani,

FasterCures thanks the leadership of the Centers for Medicare & Medicaid Services (CMS) for the opportunity to comment on the initial guidance for the implementation of sections 11001 and 11002 of the Inflation Reduction Act (IRA) (P.L. 117-169) which established the Medicare Drug Price Negotiation Program (Negotiation Program). The Negotiation program represents a landmark opportunity to reduce the financial burden of drug costs on Medicare beneficiaries while also curbing CMS' spending on Part D and Part B drugs. However, the tight timeline specified in the IRA for implementation could pose problems for how well CMS is able to obtain feedback from stakeholders, especially patient communities that will be directly impacted by these changes. We offer some considerations to CMS in this letter to ensure that the perspective of patients is effectively incorporated into the Negotiation Program and to guarantee that the overarching goals of reducing the financial burden and improving access to much-needed medical products for patients are met.

FasterCures, a center of the Milken Institute, is driven by a singular goal: to save lives by speeding scientific advancements to all patients. With an independent voice, FasterCures is working to build a system that is effective, efficient, and driven by a clear vision: collaborating with our partners to build a patient-centric system where science is accelerated, unnecessary barriers are overcome, and lifesaving and life-enhancing treatments get to those who need them as rapidly and as safely as possible.

Patient communities have a critical perspective to consider in the medical product development and coverage process. Decision-makers across the continuum, including regulators, are leading the charge in engaging patients, and we consider the Negotiation Program as an important opportunity for CMS to put in place systems that adequately weigh and incorporate factors that matter to patients as part of its decision-making. The initial guidance released by CMS for the Negotiation Program indicates when CMS will consider patient-reported data and insights. We urge CMS to provide details around its approach for doing so in the ways discussed below.

Ensure sufficient timing and process for patient input. The current timeline for stakeholders to provide input to CMS for the Negotiation Program might be prohibitive for patient organizations, most of whom are already dealing with capacity constraints and are balancing competing demands on their limited time and resources. As such, we are concerned that these organizations may not have sufficient time to gather meaningful data to inform CMS' processes. A key example of one such restrictive timeline is the 30-day comment period that is offered for stakeholders to respond to the list of drugs selected by CMS for negotiations. Recognizing that the initial guidance document applies to drugs selected for the initial year 2026 of the Negotiation Program, we urge CMS to establish an ongoing process for soliciting and receiving patient feedback. We applaud CMS's efforts to diligently solicit input from different stakeholder groups all along the way. CMS can formalize that process specifically for patient groups. Such a process

could provide valuable patient insight that can be used to refine guidance for the subsequent years of the Negotiation Program as well as flagging unintended consequences that could be detrimental to patients and counter to the program's intended goals. The FDA offers a roadmap for how it has instituted systems and programs for ongoing patient input over time. Starting as early as 1998 with the establishment of the Office of AIDS Coordination, through the launch of the Patient Focused Drug Development program in 2012, and continuing to the present day, the FDA has multiple opportunities for patients and patient communities to engage with FDA staff and provide input. We urge CMS to consider a formal system for ongoing input from patient communities as part of the Negotiation Program. This may include dedicated staff and a channel for the patient community to engage with CMS staff.

Provide clarity about use of patient experience data. We are pleased with CMS's incorporation of patient experience data into the Negotiation Program process. Patients offer valuable insights into outcomes that matter to them, tolerability and side effects of products, and their perspective on the risks and benefits associated with medical products. As such, they can inform the identification of therapeutic alternatives for selected products for the Negotiation Program. While Section 50.2 of the guidance calls for broad input of stakeholders, including Medicare beneficiaries in the identification of alternative therapies and Section 60.3.3 mentions that CMS will use patient experience data in considering the clinical benefits of selected drugs and their therapeutic alternatives, the guidance currently lacks important details. Specifically, the guidance does not include details on the kinds of data, e.g., registry, natural history studies, patient preferred outcomes and others, that CMS will find beneficial, and how much patient experience data will weigh into its decision regarding revising its offer price for selected products. This kind of detail will help patient communities streamline their efforts as they gather data to share with CMS. We encourage CMS to provide more details to this effect in the final guidance and to prioritize patient input as a substantial part of its consideration.

The use of patient experience data as part of the Negotiation Program also offers an opportunity for CMS and FDA to be aligned in their evidentiary requirements, especially as it pertains to the collection and use of patient input as part of regulatory and coverage decisions. While this particular point may have longer-term implications, we believe that this kind of alignment could galvanize the move toward more patient-centricity in medical product research, development, and access. In the last few years, product manufacturers have recognized the importance of engaging patients from the onset of the drug research and development process. With FDA encouragement, manufacturers are already actively gathering patient input that they are considering in the application process. Some medical product manufacturers have not accepted patient engagement as a core function of their product development lifecycle and may struggle to capture the value in engaging patients in a way that aligns with their organizational priorities. By providing details on the types of patient input that it will be considering as part of its review in the drug negotiation process, CMS will be helping manufactures preempt, align, and address the needs of the regulatory and drug negotiation process from the onset of drug research and development. This could also result in efficiencies for patient organizations that have to respond to multiple demands from medical product manufacturers, often for the same information.

Thank you for the opportunity to provide comments on this important program. We look forward to the updated guidance with stakeholder feedback and welcome any opportunities to support CMS in your efforts as you implement the Negotiation Program.

Sincerely,

Esther Krofah

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Mineralys Therapeutics, Inc. appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Mineralys Therapeutics, Inc. is a clinical-stage biopharmaceutical company focused on developing medicines to target diseases driven by abnormally elevated aldosterone with our novel aldosterone synthase inhibitor, lorundrostat. Our mission is to bring lorundrostat to the market to address the significant unmet needs in hypertension, chronic kidney disease, heart failure and other disease conditions driven by abnormal aldosterone elevation. Uncontrolled blood pressure is the leading cause of heart disease, stroke and chronic kidney disease, all of which represent significant economic burden to the healthcare system and are also leading causes of death or disability in the United States.

The provisions of the IRA materially impact Mineralys and our plans to develop lorundrostat, a small molecule. The Hatch-Waxman act provided a clear path for efficiently introducing generic medicines into the U.S. healthcare system. As a former employee of Teva, the world's leading generic medicine manufacturer, I saw the symbiotic relationship of brands, bringing innovative solutions to healthcare, and generics, bringing economic benefits. This developed into an efficient system with small molecules that has not been as easily translated with large molecules such as antibodies. The disparity of treatment in the IRA with small molecules relative to large molecules, completely neglects this efficiency and penalizes small molecule developers. The IRA further hinders drug development with small molecules such as lorundrostat, that may provide significant medical value beyond the initial indication.

Applying the 13 year rule to small molecules, the same as large molecules, enables companies like Mineralys to commit additional capital to fully elucidate the value of their development candidate with the opportunity to achieve a return on that broader investment. These broader innovations stand to benefit patients in the near-term and longer term once generics are available. Our development candidate, lorundrostat, is an excellent case study. Our initial indication is hypertension, but there is a high probability of benefit with lorundrostat in chronic kidney disease and heart failure given the role of aldosterone in these diseases. Unfortunately, the shift to a nine-year period would

force companies like Mineralys to abandon further investigation of their compound as the economics do not support this effort. This would represent a significant loss to the healthcare system and further constrain innovation.

While I recognize that CMS is not accepting comments to Section 30, I am compelled to provide my recommendations in the hopes of impacting the ultimate outcome of this new law.

- I. Section 30.1: Change the timing for the NDA-path negotiations from 9 years to the same 13 year period as for BLA-path drugs. While 13 years is less than the typical 14 years of marketing exclusivity afforded by patent protection, investment can recalibrate slightly to one less year with very slightly higher launch prices so as to keep drug R&D investible. The harms from IRA's treatment of orphan drugs could be mostly alleviated by creating small- and large-molecule parity for negotiation at 13 years. CMS should look to only active orphan drug designations for the purposes of determining eligibility for the orphan drug exclusion (not including withdrawn orphan drug designations).
- II. Section 50.2: To the extent that CMS wants to appreciate the value that a medicine brings to society before it decides how aggressively to lower its price (particularly in the case of NDA-path drugs that experience negotiation far sooner than would have gone generic), CMS should broadly account for a medicine's value elements, using a dynamic stacked cohort model that accounts for value to patients, to caregivers, and to the rest of the population whose risk is reduced by having the drug (i.e., if it's going to do CEA, do generalized CEA, not conventional over-simplified CEA). CMS should consider key product attributes like efficacy, safety, and ease-of-use in determining relevant "therapeutic alternatives" (the basis for CMS' opening bid).
- III. Section 90.4: The IRA threatens to make generic business models unsustainable for drugs that treat Medicare populations. One might think this doesn't matter because price reduction will be achieved via negotiation. However, because generic competition often drives costs down not only by eroding the gross margins of the original drug but also spurring manufacturing improvements that lower cost of goods, the IRA threatens to leave society paying more for old drugs in the long run by deterring generic competition. This could increase overall costs across market segments (Medicare and commercial payers).
- IV. Section 40.2.2: CMS's process for determining value and cost-effectiveness should be transparent (vs. gag order and document destruction that they propose today). It should be able to defend what it considers to be a "fair price." Furthermore, this prohibition violates company First Amendment rights. Companies subject to the negotiation process need to be able to disclose to their boards and their investors what occurred in the negotiation process.

CEO

Mineralys Therapeutics, Inc.

Section 30.1.1 of the initial guidance outlines CMS’s interpretation of the Orphan Drug Exclusion (ODE) from the broader qualifying single-source drug definition. Our understanding of the provision enacted under Section 1192(e)(3)(A) of the Social Security Act, as amended by the Inflation Reduction Act (IRA), was that orphan drugs would qualify for the ODE so long as they had received FDA approval for just one rare disease or condition, even if approved for multiple indications across a single disease (i.e. multiple age groups for a rare blood disorder). We would contend that this interpretation comports with the **original public understanding** of the legislation, as enacted, in keeping with core principles of statutory interpretation. For example:

- In an [August 10, 2022 article in *Health Affairs*](#) explaining the prescription drug provisions in the IRA, scholar Rachel Sachs described the ODE in a manner consistent with our understanding, noting that “[c]ertain products, **such as drugs whose only approved indication(s) are for a single rare disease or condition**, or plasma-derived products, are categorically excluded from negotiation” (**emphasis mine**).
- An [April 7, 2022 report from the Institute for Clinical and Economic Review \(ICER\)](#) described an essentially identical ODE provision from an earlier iteration of the legislation as “exclud[ing] drugs with only one orphan indication from Medicare price negotiation.”
- A [January 27, 2023 *JAMA Health Forum*](#) study simulating drug price negotiation under the law asserts that eligible drugs “cannot be approved to treat a single rare condition (as designated under the Orphan Drug Act),” referencing the ODE provisions.
- A [January 24, 2023 Kaiser Family Foundation issue brief](#) outlining the law’s drug pricing provision specifies that the ODE encompasses “[d]rugs with an orphan designation as their only FDA-approved indication.”
- A [February 27, 2023 *Avalere* piece](#) discussing orphan drugs echoes this same interpretation, noting that the ODE “applies only to those orphan drugs with an approved indication (or indications) for a single rare disease or condition.”
- An [October 11, 2022 summary from Akin Gump](#) notes, “Among those excluded [from negotiation eligibility] are products with only one Orphan Drug indication.”
- A [March 1, 2023 piece](#) from the Council on Affordable Health Coverage describes the ODE using this same interpretation, noting the disincentive the legislation triggers for receiving additional orphan indication approvals (a concern we share, but one that we acknowledge would require a legislative remedy).
- An [August 18, 2022 summary](#) from DLA Piper characterizes the ODE as applying to “[o]rphan drugs that treat only one rare disease.”

As illustrated by these and other examples, the public has, since even before final enactment, understood the ODE under the IRA to apply on the basis of **approved indications**, irrespective of designations for unapproved or not-yet approved indications. We share this common understanding. Insofar as the language in the law contains ambiguity, we encourage CMS, consistent with basic principles of statutory interpretation, to resolve any ambiguous phrasing in favor of the standard reading of the provision's purpose, intent, and scope, as outlined by the experts, scholars, legal minds, and stakeholders referenced above, among numerous others.

This general public understanding also aligns with a **contextual interpretation** of the scope of the ODE, lending additional credence to our reading of the language in question. Notably, for instance:

- The clear aim of the provision in question is to preserve incentives for orphan drug development, consistent with the Orphan Drug Act policies and other incentives provided by Congress (on a bipartisan basis) to encourage and reward research and development regarding rare disease treatments (an otherwise challenging and fraught enterprise—and still a high-risk endeavor, given the erosion of many of these statutory and regulatory incentives), without enabling manufacturers to a) bypass negotiation eligibility by pursuing orphan indications for high-profit products (i.e. a rare cancer indication for a blockbuster, multipurpose cancer drug) or b) effectively 'stack' orphan indications in order to avert negotiation eligibility while capturing a high patient volume (with high prices) across a range of rare conditions. Regardless of the merits or deficiencies of this policy approach, the scope of the ODE clearly hinges on an effort to balance orphan drug development incentives with potential abuses. Lending support to this interpretation, Anna Kaltenboeck, my former counterpart and the lead Senate Democrat staffer on the legislation (as enacted) has described this dynamic and perception in public commentary, [noting](#), in one rare disease-focused discussion: "The question is how to create a system of incentives where you do encourage these smaller companies and continue to protect them without also keeping monopolistic and anticompetitive behavior and protecting that — you have this tension always in that system."
- In other words, without *approval*, under the drafters' view of pricing dynamics, a *designation* holds no potential for pricing abuse or "gaming" of the negotiation system, since approval provides the primary avenue for generating patient volume, and thus revenue. For off-label uses, existing statute presents substantial guardrails that make patient uptake a challenge (and potential liability) from a coverage and regulatory

standpoint. In context, the provision here, even if drafted with some degree of ambiguity, clearly aims to prevent drugs **approved** to treat multiple indications from sidestepping negotiation indefinitely.

- From a CMS coverage and payment standpoint, a designation has virtually no meaning unless attached to an FDA-approved indication. Interpreting the ODE as we have aligns, for instance, with other CMS-specific treatment of orphan drug products. In one illustrative example, under the Competitive Acquisition Program, CMS [specified](#), “Approved CAP vendor may request that CMS allowed it to supply **single indication orphan drugs** under the CAP.” Interpreting the ODE as excluding orphan drug products with indications for a single rare disease would align with this approach, grounded in CMS agency precedent.
- For CMS to bar ODE eligibility on the basis of multiple **designations**, even if only one such designation has resulted in an **approval**, would represent a substantial anomaly and departure from precedent on the part of CMS, which has no role in the orphan designation process. Orphan designations do not, in and of themselves, trigger **any meaningful action on the part of CMS**, whereas FDA-approved indications generally result in automatic coverage (or, in the case of certain products, a coverage determination process). In interpreting the ODE consistent with the general public understanding, CMS would thus maintain its current scope and statutory (and regulatory/sub-regulatory) roles and responsibilities, lending additional support to this contextual interpretation.
- The ODE refers to a categorical exclusion, and so reading any one piece of the language in isolation could produce an ambiguous or self-contradictory interpretation. “Designation,” when read in the context of the rest of the provision in question, seems designed to stipulate that the exclusion captures only drugs with an FDA-granted orphan designation.

As CMS finalizes the guidance for the Drug Price Negotiation Program, we encourage the agency to resolve this apparent ambiguity by exercising its authority to interpret the ODE as applying only to orphan drugs with approved indications for a single rare disease or condition, and we urge CMS to consider avenues to interpret “rare disease or condition” with sufficient breadth to capture sub-conditions under an adequately sizable ‘disease or condition’ category so as to preserve incentives for drug development across sub-conditions, where a single product can have significant productive capacity. These steps would align with CMS’s stated goal “to best support orphan drug development.” Interpreting the ODE as applying only to drugs with a single orphan **designation**, regardless of FDA approval(s), would conflict with the general public understanding of the ODE, as well as a contextual reading of the provision in question. Such a narrow interpretation would conflict with basic principles of statutory interpretation, stifle rare disease drug development, and penalize medication developers for pursuing

clinical programs for indications that may well result in failure, limiting the potential of discovery and development initiatives.

We also encourage CMS to work with Congress to remedy the existing ODE's problematic scope, which discourages manufacturers from pursuing new uses of existing orphan drugs, as approved indications for multiple rare diseases would improve the lives of patients. Under the current framework, investors and innovators may forego the research and development needed to identify and seek approval for these indications, recognizing that doing so would risk exposing them to the negotiation program's mandatory and escalating price reductions.

Re: Medicare Drug Prescription Pricing Negotiation Program

Dear Ms. Brooks-LaSure and Dr. Seshamani,

In service of the neuromuscular disease (NMD) patient community, the Muscular Dystrophy Association (MDA) thanks the Center for Medicare and Medicaid Services (CMS) for the guidance released on March 15th 2023, about the Medicare Prescription Drug Negotiation Program (The Program) as required by the *Inflation Reduction Act of 2022* (IRA).

MDA is the nation's leading nonprofit organization dedicated to empowering the lives of individuals living with neuromuscular diseases through innovations in science and innovations in care. MDA fulfills its mission by funding biomedical research, providing access to expert clinical care and support through its national MDA Care Center Network, and championing public policies and programs that benefit those we serve. Since its inception, MDA has invested more than \$1 billion in research grants to accelerate treatments and cures for neuromuscular disorders, making MDA the largest source of neuromuscular disease research funding in the U.S. outside of the federal government.

Background:

The Maximum Fair Price (MFP) provisions of the IRA provide the CMS with the authority to negotiate with drug companies for certain medications reducing drug prices for Medicare beneficiaries. CMS's guidance recognizes that the MFP provisions of the law also include provisions to protect patients and support patient centered action. CMS has the opportunity to continue advancing this crucial goal throughout the implementation of The Program.

Given the relatively few rare diseases that have an FDA approved treatment, continued research and innovation will remain vital. Therefore, as CMS continues to implement this provision of the IRA, we ask that you continue to further consider the unique perspective brought and challenges

faced by those with rare neuromuscular diseases. To best support these communities, we offer the following recommendations:

Patient Access:

MDA emphasizes the need for beneficiary protections in access to care while CMS undertakes the new drug price negotiation process. We are optimistic that the provisions of the IRA which require products within the Medicare Part D, and eventually Part B, plans to be included in negotiations have the potential to reduce out-of-pocket expenses for Medicare beneficiaries. However, with these negotiations come various concerns relating to patient access. We encourage CMS to protect beneficiary access to eligible drugs to ensure that there are as few barriers to access to them as possible. This protection should include both negotiated drugs, and ensuring unintended deleterious effects toward access to non-negotiated drugs do not occur.

This oversight should include monitoring changes to formularies and utilizing the highest practicable specialty tier to reduce out-of-pocket costs. Additionally, we would ask that CMS eliminate denials or delays of treatment for the rare neuromuscular disease community. Eliminating these denials is particularly important for those with rare neuromuscular diseases as many of these conditions are progressive. If there is a delay in appropriate care due to utilization management, a patient's disease state could irreversibly progress further. Those with rare diseases and their healthcare providers are best positioned to decide on the best course of treatment. This combined with CMS's determination that the drugs under covered by The Program have been priced fairly should mean that utilization management tools such as step therapy or prior authorization can and should be limited or eliminated by CMS for these products.

Orphan Drug Exemption:

MDA appreciates that the IRA includes a limited exemption for orphan drugs that only treat one rare disease from drug price negotiation. However, we are concerned CMS's current interpretation of this rare disease exemption, which makes products eligible for negotiation if they have been designated for two or more orphan diseases, even if the drug is not actually FDA approved to treat the second orphan disease, will disincentivize drug companies from conducting even the basic research necessary to develop a drug for additional rare diseases. We have already potentially seen this disincentive in real time. Two companies, Eli Lilly¹ and Alnylam², have, if nothing else, both cited concerns with the IRA's consideration of the orphan drug exemption as cause for halting their development. While the IRA may not be the sole reason for their

¹ Gelman, Updated: Eli Lilly blames Biden's IRA for cancer drug discontinuation as the new pharma playbook takes shape. Endpoints News, Nov. 2022. <https://endpts.com/eli-lilly-rolls-snake-eyes-as-it-axes-two-early-stage-drugs-including-a-40m-cancer-therapy-from-fosun/>

² Liu, As Amvuttra makes inroads in ATTR, Alnylam scraps heart disease trial interim analysis, rethinks another rare disorder plan. Fierce Pharma Oct. 2022. <https://www.fiercepharma.com/pharma/amvuttra-makes-inroads-attr-alnylam-scraps-heart-disease-trial-interim-analysis-rethinks>

hesitation, it is, at a minimum, noteworthy. We urge CMS to clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by FDA to treat a second disease or condition.

Excluding the utilization of Quality-Adjusted Life-Years (QALYs) in the negotiation process:

MDA applauds the IRA's prohibition of CMS's use of QALYs in The Program. QALYs rely on an inherently ableist and utilitarian concept of quality of life and assumes outcomes for able-bodied patients in perfect health. Such ableist assumptions about what constitutes a "good" quality of life in determining treatment effectiveness for patients with disabilities fail to consider other factors such as emotional wellbeing, the personal wishes, and aspirations of the patient, the will to live, the personal beliefs of the patient among others. As such, we are grateful for CMS's adherence to the IRA in their implementation and their willingness to further underline their exclusion of these metrics in the proposed guidance. However, CMS's proposal may exclude other helpful metrics in their establishing the value of a drug which will be crucial in the negotiation process (see below). Therefore, we ask that CMS offer additional information for how CMS will consider its approach to gathering information as to the effectiveness of therapies.

Comparative effectiveness:

MDA supports CMS's considerations of differing methods to evaluate the value of a prescription drug for patients. Among the different methods for valuation we ask that CMS consider, as discussed above, the value of slowing or halting disease progression. Given the relatively few options available to treat many neuromuscular diseases it is important to note that many drugs in this space may not share the exact same indications or be used by the same patient populations. Similarly, some drugs in this space may be the only therapy in a specific class to treat a condition while also falling outside of orphan drug exclusions. We urge CMS to approach these considerations holistically rather than myopically focusing on the lower cost drug. Doing so may disincentivize manufacturers from investing in further innovations in these disease areas.

MDA does not singularly support any one metric. Specifically for gene and cell-based therapies, one potentially applicable value assessment method is one such as those for "Single or Short-Term Transformative Therapies" (SSTs). SSTs "are defined as therapies that are delivered through a single intervention or a short-term course of treatment that demonstrate a significant potential for substantial and sustained health benefits extending throughout patients' lifetimes."³ Regarding SSTs, it is important to note from the outset that, first, SSTs are mostly only used for gene therapies and cell-based therapies, and therefore are likely inapplicable to other classifications. Second, The Institute for Clinical and Economic Review (ICER) uses QALYs in

³ Institute for Clinical and Economic Review, Value Assessment Methods Such as Those for "Single or Short-Term Transformative Therapies" (SSTs), Aug. 2019. https://icer.org/wp-content/uploads/2020/10/ICER_SST_ProposedAdaptations_080619-2.pdf

its consideration of SSTs. As noted above, MDA roundly rejects the use of QALYs and we would only support the use of a method such as SSTs if QALYs were removed from consideration. With this background, however, given the rarity of the conditions SSTs consider and particularly the expense of these medications, the metrics by which these medications are considered may prove useful to CMS's current considerations. As MDA noted,⁴ in recent comments to ICER there are areas in assessing the value of neuromuscular disease therapies that warrant better consideration methods.

Particularly, we rejected ICER's concerns about "added dimensions of value." One such value to highlight the value of hope. ICER initially highlighted the importance of choice with an eye toward a risk benefit analysis with choices between therapies. We, however, see the value of hope as the potential for a more healthy and happy life in the future than was previously expected. SSTs offer patients the possibility of substantially healthier lives many years into the future, and with this brings the hope of attending college, getting married, and other important life experiences. In addition, we raised other concerns with ICER's perspective on scientific spillover which relates somewhat to our comparative effectiveness discussion above and flexible cost-valuation thresholds (though we reject the use of QALYs), and patient-focused expectations (see below). All of these metrics could prove useful for CMS's future consideration for comparative effectiveness.

We further discourage CMS from relying on equal-value Life Years Gained (evLYGs) as an alternative metric to QALYs. While evLYGs avoid the most egregiously discriminatory aspects of QALYs, they are an imperfect measure that inherently devalues the health and wellbeing benefits an intervention may bring the beneficiary by disregarding quality-of-life improvements entirely.

Evaluation approaches exist that do not discriminate against those with disabilities while also capturing quality-of-life benefits. For example, one such method similar to QALYs are Health Years Total (HYT). HYT is a valuation method which modify QALYs by separating evaluations of life expectancy and quality of life improvement whereas QALYs consider these concepts as a single consideration. Additionally, HYTs do not consider utility values in its evaluation of life expectancy. However, HYTs do, unfortunately, still consider utility to values to discount quality of life improvement.⁵ While not a perfect solution, HYTs do still represent an improvement compared to using QALYs. One method which eschews QALY's methodology altogether is The Efficiency Frontier (EF). EF takes into consideration condition-specific measures. EF benchmarks the price and benefit of the new therapy being considered against the value provided

⁴ See generally, [MDA Comments on ICER's SST Adaptations](#)

⁵ Gallegos, *Alternatives to QALY-Based Cost-Effectiveness Analysis for Determining the Value of Prescription Drugs and Other Health Interventions*, National Council on Disability, 7, Nov. 2022. https://ncd.gov/sites/default/files/NCD_Alternatives_to_the_QALY_508.pdf See also, Disability Rights Education & Defense Fund, *ICER Analysis Based on the QALY Violate Disability Nondiscrimination Law*, 27, Sep. 2021. <https://dredf.org/wp-content/uploads/2021/09/ICER-Analyses-Based-on-the-QALY-Violate-Disability-Nondiscrimination-Law-9-17-2021.pdf> [hereinafter referred to as DREDF]

by existing drugs to calculate cost per outcome unity which then informs the recommendation for the cost of the new drug.⁶ In addition to these two methods there are methodologies such as Generalized Risk-Adjusted Cost-Effectiveness (GRACE) and Burden Augmented by Deadliness and Impact (BADI) among *many* others.⁷ To reiterate, MDA does not recommend at this time any one non-discriminatory valuation technique over another, and only seeks to posit options outside of the use of QALYs for CMS's consideration.

Patient Input for Future Improvement:

The implementation of The Program will be a long and complex one and we are heartened that CMS has shown themselves to be open to feedback. We hope that this attitude will continue. We ask that CMS will monitor the program to ensure that it has the intended effects of increasing access to affordable medications, and again ensuring that lower out of pocket costs are, in fact, realized, and that barriers to access are minimized if not removed entirely.

To that end, we would suggest that CMS implement any of several metrics to continue listening to the voices of those with rare neuromuscular diseases. CMS should continue to utilize patient experience data to ensure effective services are delivered. To best utilize this data, CMS should make use of Requests for Information and listening sessions to ensure the collection of representative data. These processes should allow for as long a timeline as possible and should also streamline and simplify the process for submitting data and information to ensure stakeholders have adequate time to supply information. Similarly, granular summaries of the data and assumptions on which each negotiation was based should be made available to the public.

Finally, as is currently stated in the guidance by CMS the dispute resolution and compliance process under section 1145 of the IRA asks for evidence submitted by the manufacturers and holds that the negotiation and compliance processes will occur between manufacturers and CMS. We ask that CMS consider the voices of neuromuscular disease patients and other stakeholders should either be included in, or at a minimum made aware of, the metrics used in these negotiation and compliance processes. This will not only allow CMS to keep abreast of the voice of the neuromuscular disease community but will also allow the community to better understand the methods by which CMS makes its decisions both with regard to enforcing the requirements of The Program as well the factors they consider in the negotiation process. This information will allow the neuromuscular disease community to better communicate with CMS to improve the process going forward.

Conclusion:

MDA is committed to ensuring that individuals with rare neuromuscular diseases have access to FDA approved therapies to promote safe and healthy lives. We encourage CMS to heed the above feedback as they consider the implementation of The Program.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Narrow River Management, on behalf of River 2 and River 2 Renal Corp., appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Narrow River Management is engaged in the founding and management of companies that develop novel pharmaceutical products for the treatment of serious diseases without adequate current therapies. It has recently founded two companies, River 2 and River 3 Renal Corp., each of which is developing drugs for Orphan indications in the field of kidney disease. Since these companies are developing a peptide and a small molecule, respectively, the implementation of the instant legislation will have a deleterious effect on the companies' prospects going forward.

River 2 Renal Corp. is developing a peptide molecule for hepato-renal syndrome, a disease of acute kidney failure secondary to liver cirrhosis. It is a serious condition with mortality of about 50% at 90 days. Currently, there is only one drug approved for this indication and its efficacy and safety make it a last resort for patients and caregivers. Surviving patients will need a liver transplant and possibly a kidney transplant. If our drug works, it could reduce the number of required kidney transplants, in addition to saving lives. This is an Orphan indication and the proposed limitation on one designation could cause us to reconsider developing the drug in this indication. We are also potentially developing the molecule for heart failure. This latter indication could be considered a disease of aging. As a peptide, R2R's molecule could be subject to price negotiation at 9 years, which would significantly limit the period for return on investment. This is the case, notwithstanding the fact that if the drug should work, it will significantly reduce hospitalization time for patients and, consequently, cost of therapy. As this drug is at an early stage of development and we rely on venture capital investment to fund clinical development, this legislation could adversely affect our ability to raise capital.

River 3 Renal Corp. is developing a small molecule pill for two Orphan diseases – Alport Syndrome (AS) and Focal Segmental Glomerulosclerosis (FSGS). AS causes early kidney failure in mostly adolescent

males. FSGS is a multicausal disease of the kidney which can only be cured with a transplant. The goal of these therapies is to delay renal replacement for as long as possible. Each of these is an Orphan disease, but the proposed legislation would allow us a designation for only one disease, creating a complex and confusing proposition that might cause is to develop the drug for only one. There is currently no drug approved in either indication. The drug may also be efficacious in diabetic kidney disease, which could be considered a disease of aging, possibly subjecting this drug to price negotiation at 9 years should it be approved. As this is a drug at an early stage of development and we rely on venture capital investment to fund clinical development, this legislation could adversely affect our ability to raise capital.

As a result of the above and, more importantly, the many similarly situated companies, we believe it would be in the best interests of the country to modify the current legislation in the following fashion:

- I. Section 30.1. Elimination the arbitrary distinction between biologics and other molecules and make the NDA path to price negotiation 13 years.
- II. Section 30.1.1 Allow Orphan designation for multiple indications.

We appreciate your consideration of our comments. Please feel free to contact me by telephone at +1 917 981 8200 or by e-mail at dmadden@narrowrivermgmt.com if you have any questions.

Very truly yours,

Dave Madden

RE: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure,

The National Academy for State Health Policy (NASHP) appreciates this opportunity to submit this letter of support for the Medicare Drug Price Negotiation Program Guidance issued on March 15, 2023.

Summary of Comments

NASHP developed these comments in consultation with state officials. Comments focus specifically on the intersections of the Medicare Drug Price Negotiation Program (Negotiation Program), state Prescription Drug Affordability Boards (PDABs), and state drug price transparency programs. Ideally, states would like to be able to align with the Negotiation Program and to build upon its work. Key areas for doing so discussed further in comments below include the following:

- Maximizing data sharing and transparency while protecting genuinely proprietary manufacturer data;
- Identifying and realizing opportunities for aligning methodologies, for example, methodologies to address multiple dosage forms and strengths for a single drug; and,
- Exploring the proposed pharmacy chargeback system to implement MFPs in the supply chain as a potential model for states implementing upper payment limits (UPLs).

Overview of NASHP

NASHP is a non-partisan forum of state policy makers that works to develop and promote innovative health care policy solutions at the state level. In 2017 NASHP created its Center for Drug Pricing to work with states to develop strategies to address high prescription drug prices and the impact they have on consumers, the overall cost of health care, and state budgets.

Working with states, and through our Center for Drug Pricing, NASHP developed model policy for Prescription Drug Affordability Boards, enabling states to conduct affordability reviews and to establish upper payment limits for drugs within a state when appropriate. We have worked closely with the six states that have enacted PDABs and are moving forward with implementation, convening them for monthly work group calls for the past several years.

Background

Through implementing PDABs, states have already embarked on work similar, though with important differences, to what CMS is taking on through the Medicare Drug Price Negotiation Program. As such, PDAB states are closely watching implementation of the Negotiation Program, both to learn how these federal efforts might help support state efforts, and also to share how state experiences might help inform the Negotiation Program.

More than a dozen states have also enacted drug price transparency programs, many of which require reporting from drug manufacturers, including data similar to what the Centers for Medicare and Medicaid Services (CMS) requires from manufacturers as part of the Negotiation Program.

Beyond PDABs and drug price transparency programs, legislation has been introduced this session that, if enacted, would allow a state to reference Medicare-negotiated Maximum Fair Prices (MFPs). These proposals indicate both support for the Negotiation Program, and an interest in leveraging the MFPs, once available, at the state-level.

Comments

40.2.1 Confidentiality of Proprietary Information (pgs. 28-29)

This section describes measures CMS will take to safeguard confidential information submitted by drug manufacturers as part of drug price negotiations. States understand and respect the need to maintain such confidentiality, however, some of the information collected (*e.g., “research and development costs and recoupment, unit costs of production and distribution, pending patent applications, and market data and revenue and sales volume data to be proprietary”*) could support state PDABs’ work conducting thorough, accurate affordability reviews to set appropriate upper payment limits.

Final guidance including guardrails for sharing relevant data with states under strict parameters for maintaining the confidentiality of that data, could enable state PDABs to leverage Negotiation Program data while also minimizing reporting burdens on drug manufacturers who may have to report similar data to states.

States that require drug manufacturers to report drug pricing data have encountered manufacturers seeking to classify a very broad range of data as confidential or proprietary, including even data that are already clearly in the public domain. Overly broad requests to treat data as confidential can unnecessarily limit transparency and create the time-consuming task of adjudicating confidentiality claims.

Non-confidential information, including that which might be shared in the explanation of an MFP, could also be instructive for PDABs as described in the comment on Section 60.6.1 below. As CMS seeks to strike the appropriate balance in protecting genuinely confidential information, along with achieving transparency by sharing information publicly through the explanations of MFPs, states would be happy to share more on their relevant experience.

50.1 Manufacturer-Specific Data (pg. 35)

Data submitted by primary manufacturer:

- “1. Research and development costs of the Primary Manufacturer for the selected drug and the extent to which the Primary Manufacturer has recouped those costs;*
- 2. Current unit costs of production and distribution of the selected drug, averaged across the Primary Manufacturer and any Secondary Manufacturer(s);*
- 3. Prior Federal financial support for novel therapeutic discovery and development with respect to the selected drug;*
- 4. Data on pending and approved patent applications, exclusivities recognized by the FDA, and applications and approvals under section 505(c) of the FD&C Act or section 351(a) of the PHS Act for the selected drug; and*
- 5. Market data and revenue and sales volume data for the selected drug in the United States for the Primary Manufacturer and any Secondary Manufacturer(s) (with the exception of costs related to the acquisition of the selected drug, which would be reported only for the Primary Manufacturer).”*

The data listed above does not include a request for manufacturers to share data on rebates provided to pharmacy benefit managers (PBMs) for specific drugs. State PDABs and drug price transparency programs have identified rebates as essential yet challenging data to obtain. The Negotiation Program may benefit from a requirement for manufacturers to report rebate data at the drug level.

50.2 Evidence About Therapeutic Alternatives for the Selected Drug (pg. 36)

“CMS will not use QALYs or evidence from comparative clinical effectiveness research in a manner that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill.”

Most PDABs share similar prohibitions on the use of quality-adjusted life years (QALYs) per their statutes. However, states remain committed to the use of robust health economics and outcomes research in implementing PDABs, including research using expressly non-discriminatory measures such as the Equal Value of Life Years Gained.

60.1 Establishment of a Single Proposed MFP for Negotiation Purposes (pg. 38)

“CMS intends to identify a single price for use at each step in the negotiation process...., even for a selected drug with multiple dosage forms and strengths. Once the MFP has been determined, section 1196(a)(2) of the Act direct CMS to establish procedures to compute and apply the MFP across different dosages forms and strengths of a selected drug, as applicable.... CMS intends to base the single price on the cost of the selected drug per 30-day equivalent supply (rather than per unit – such as tablet, capsule, injection – or per volume or weight-based metric), weighted across dosage forms and strengths, as applicable. For example, if the selected drug is available in a tablet form taken daily as well as an injection form taken every other month, CMS would base the single price for the initial offer on the average cost of (1) 30 tablets and (2) one injection divided by 2 (half the cost of one injection), weighted by number of 30-day equivalents for each presentation as reflected in Medicare Part D utilization during the 12-month period ending May 31, 2023.”

This standardization/weighting process has been challenging for PDABs as well as for state drug price transparency programs. Any additional insight and guidance CMS can share that might enable aligning methodologies concerning how best to address multiple dosage forms and strengths for a single drug and how to appropriately weight them would be helpful for states.

60.3.4 Consideration of Manufacturer-Specific Data (pg. 52)

Data that CMS will consider includes *“research and development cost of the manufacturer for the drug and the extent to which the manufacturer has recouped research and development costs.”*

State drug price transparency programs have sought similar data from drug manufacturers due to the important nature of this component of drug pricing, however, reporting has not yielded the type of meaningful, drug-level data that states were hoping for to better understand how research and development investments relate to drug pricing.

60.5 Application of the MFP Across Dosage Forms and Strengths (pg. 58)

“In order to ensure that the MFP is made available to MFP-eligible individuals at the point of sale (and to pharmacies, mail order services, or other dispensers, with respect to such MFP-eligible individuals) ... CMS intends to publish the MFP at the per unit (e.g., tablet) level for each dosage form and strength associated with the selected drug.”

The publication of MFPs at the per unit-level will be instrumental for state PDABs as well as for states that might wish to reference Medicare MFPs in the future. Additionally, PDABs may wish to align with the methodology for conversation across all relevant dosage forms and strengths.

60.6.1 Explanation for the MFP (pg. 60)

This section describes how and when CMS will share explanations for the MFP, including *“factors that had the greatest influence in determining the MFP and other factors, as applicable....CMS intends to make high-level comments on the data submitted to CMS without sharing any proprietary information.”*

The published explanations for MFPs could provide important data for the work of state PDABs and drug price transparency programs. The explanations will be most useful with the highest level of detail possible that CMS can share without revealing genuinely proprietary information. In making determinations about what to consider proprietary, CMS may wish to consult states on the experiences of their drug price transparency programs, in which drug manufacturers have aggressively classified data as proprietary, including even data that are already available publicly.

The guidance requires the explanation for the MFP to be published no later than March 1 of the year prior to the initial price applicability year. If final guidance might consider an earlier publication schedule, these explanations would be most beneficial to states if made available as soon as possible.

90.2 Monitoring of Access to the MFP (pg.65/66)

The chargeback mechanism by which a pharmacy could be made whole for dispensing a drug with an MFP could be instructive for states and create an opportunity for potential alignment for implementation of MFPs through the supply chain with state implementation of upper payment limits set by PDABs. States will seek to learn from the experience of CMS and stakeholders implementing MFPs and seek to apply that knowledge for state UPLs as appropriate.

NASHP appreciates this opportunity to comment on the Medicare Drug Price Negotiation Program and commends the Administration and HHS for taking this important step towards

lowering drug costs. We look forward to continued engagement with the Administration and HHS on the Negotiation Program and on the important issue of lowering drug costs. Please contact Jennifer Reck, Director, NASHP Center on Drug Pricing, at jreck@nashp.org with any questions on these comments.

Respectfully submitted,

The National Academy for State Health Policy

Re: Medicare Drug Price Negotiation Program Guidance: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure:

The National Association of Chain Drug Stores (NACDS) appreciates the opportunity to comment on CMS' Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026. On March 15, 2023, CMS issued a memorandum to provide initial guidance regarding the implementation of sections 11001 and 11002 of the Inflation Reduction Act (IRA), which establishes the Medicare Drug Price Negotiation Program ("Negotiation Program") to negotiate maximum fair prices (MFPs) for certain high expenditure, single source drugs and biologics for initial price applicability year of 2026.

NACDS represents traditional drug stores, supermarkets and mass merchants with pharmacies. Our chains operate nearly 40,000 pharmacies across the United States, and NACDS' chain member companies include regional chains, with a minimum of four stores, and national companies. They fill over 3 billion prescriptions yearly and help people use medicines correctly and safely, while offering innovative services that improve patient health and healthcare affordability.

I. Introduction

Under the initial guidance, CMS will select 10 negotiation-eligible Part D drugs for 2026 and publish a list of those drugs not later than September 1, 2023. The number of affected drugs will increase annually until reaching a total of 60 drugs for years 2029 and beyond. CMS intends to require that Primary Manufacturers, defined as the entity that holds the NDAs and BLAs of the selected drugs, provide two options to access to the MFP including ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP or issuing a retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP. As part of this obligation, the Primary Manufacturer

must ensure the MFP is made available to pharmacies for units of the selected drug for which there is a Secondary Manufacturer.

As CMS works to implement this Negotiation Program, CMS must utilize its full breadth of authority to ensure transparency, consistent oversight, and proper governance to protect all contracted entities in the MFP supply chain against unnecessary burdens, discriminatory practices, and arbitrary remuneration/fees (e.g., effective rates, transaction fees), particularly community pharmacies. To do this, CMS should use its authority to provide detailed guidance through program instruction.

CMS must not delegate authority to other stakeholders (e.g., manufacturers, pharmacy benefit managers) as this would be contrary to the intent of the IRA for CMS to negotiate lower prices with manufacturers and to provide patients with more affordable prescription drugs, and to do so without imposing burdens on other stakeholders in the prescription drug supply chain. To successfully achieve this, CMS must take the lead, be more prescriptive, and remove ambiguity about the operationalizing of this program and should continue to work with stakeholders after the April 14th deadline to resolve any outstanding issues in the supply chain. In other words, providing what is perceived to be free range to manufacturers would be contrary to the intent of the IRA.

Furthermore, the initial guidance has several gaps that need to be addressed that will require more than the allotted time to assess and resolve. As such, these comments represent our initial thoughts on CMS' initial guidance.

CMS also intends to require that a Primary Manufacturer ensure that pharmacies as well as intermediate entities, such as wholesalers, as applicable, are reimbursed timely for the full amount of the difference between their acquisition cost for the selected drug and the MFP within 14 days. **CMS is clear that manufacturers or their contracted entities shall not charge any transaction fee for this process.**

II. CMS Possesses the Authority to Collect MFPs Directly from Manufacturers

As mentioned above, in the initial guidance, CMS states its intention to require that Primary Manufacturers provide access to the MFP in one of two ways: (1) ensuring pharmacies can access the prescription drug at a price no greater than the MFP, or (2) providing retrospective payment for the difference between the pharmacy's acquisition cost and the MFP. CMS is proposing these two pathways because CMS is also proposing to define "providing access to the MFP," as required by section 1193(a)(1)(A), by ensuring that the amount paid by the pharmacy for the selected drug is no greater than the MFP.

NACDS respectfully requests that CMS reconsider these proposals and we offer workable alternatives that CMS should adopt. While NACDS recognizes that "ensuring that the amount paid by the pharmacy . . . is no greater than the MFP" could be achieved by options (1) or (2) above, these options would pose unnecessary burdens on the prescription drug supply chain, and most directly on pharmacies. We provide more detail about the unnecessary burdens in Section IV below.

Our recommendation is that CMS should collect directly from the Primary Manufacturer the difference between the MFP and the price CMS would pay but for the existence of the MFP (i.e., price without MFP or MFP rebate). This would be the simplest, cleanest, and most cost-effective mechanism for manufacturers to provide access to the MFP for the selected drug to pharmacies, mail-order facilities, and other dispensers with respect to MFP individuals who are dispensed the drugs, as it would impose the minimal possible burden on wholesalers, Part D plans, pharmacies and, most importantly, patients.

CMS clearly possesses the authority to require manufacturers to provide access to the MFP in this manner. On page 31 of the initial guidance, CMS states the following:

Under section 1860D-2(d)(1)(D) of the Act, as amended by section 11001(b) of the IRA, the negotiated prices used in payment by each Part D plan sponsor for each selected Part D drug must not exceed the applicable MFP plus any dispensing fees for such drug. In Part D, the negotiated price of a Part D drug is the basis for determining beneficiary cost-sharing and for benefits administration at the point of sale. Therefore, the requirement that the price used for beneficiary cost-sharing and benefits administration cannot exceed the MFP (plus dispensing fees) ensures that Part D MFP-eligible individuals will have access to the MFP at the point of sale. **Therefore, while section 1193(a)(1)(A) of the Act specifies that manufacturers must provide access to the MFP to MFP-eligible individuals, as a practical matter that will be accomplished by Part D plan sponsors without additional steps required of the manufacturer** (emphasis added).

Here, CMS recognizes that although the IRA requires manufacturers to provide access to the MFP to MFP-eligible individuals, the IRA does allow this to be accomplished by Part D plan sponsors without additional steps required of the manufacturer. Our proposed recommendation would follow a similar approach—manufacturers would provide access to the MFP to CMS, and then CMS would work with Part D plan sponsors not only without additional steps required by the manufacturer but also without additional steps required by other members of the supply chain and beneficiary care team.

III. Alternatively, CMS Should Bifurcate the Guidance so that Affected Industry Stakeholders may take the Time Necessary to Determine the Mechanics of how the MFP Should Flow to MFP-Eligible Individuals

NACDS respectfully requests that CMS consider providing stakeholders additional time to determine the best path forward with minimal pharmacy risk and burden (administrative and compliance) to implement the mechanics of the MFP. In the event that CMS chooses not to adopt our recommendation under Section II above, NACDS is requesting that the National Council for Prescription Drug Programs (NCPDP) convene a meeting of all relevant MFP implementation stakeholders to ensure all the stakeholders' concerns are addressed so that patients are not negatively impacted in 2026. NACDS appreciates CMS' willingness to continue working with stakeholders on MFP implementation after the April 14 comment

deadline, as CMS officials expressed on an April 5 pharmacy sector stakeholder call.

IV. NACDS' Third Alternative to Address Specific Concerns with the CMS Initial Guidance

Should CMS decide to reject both of NACDS' recommendations to either (1) collect MFPs directly from the Primary Manufacturer, or (2) bifurcate the initial guidance to give the industry time to determine the mechanics of the MFP flow to MFP-eligible individuals, then NACDS asks that CMS address our concerns by continuing to work with us to implement the recommendations and features below that will set the necessary guardrails to help ensure seamless experiences for beneficiaries at the point-of-sale and to help ensure their access to the pharmacy of their choice.

A. CMS Must Be Prescriptive in its Approach

CMS intends to require that the Primary Manufacturer ensure that pharmacies have access to the MFP. To implement this requirement, CMS proposes that a Primary Manufacturer would be required to submit its process for making the MFP available at least 30 days before the start of the price applicability year for the selected drug. CMS further intends to monitor compliance and audit, as needed, to ensure that the MFP is made available. NACDS finds CMS' proposals woefully inadequate and unworkable for pharmacies, for the numerous reasons detailed below.

1. For the Benefit of MFP-Eligible Individuals, CMS Must Establish Guidelines and Oversight

Under CMS' proposal, each manufacturer could impose its own process for making the MFP available to pharmacies. Pharmacies potentially would have to reconfigure their operations to accommodate multiple different processes from each manufacturer. Pharmacies do not have the resources and bandwidth to do this. Moreover, under CMS' proposal, pharmacies would have as few as 30 days to implement any necessary accommodations dictated by the manufacturers. Frankly, we are astounded that CMS believes that the nation's approximately 60,000 pharmacies, not to mention other dispensers, could accomplish these feats in as few as 30 days.

Rather than grant manufacturers *carte blanche* to design the MFP-availability processes using whatever discretion they desire, it is incumbent upon CMS to ensure a smooth, standardized, and seamless experience for MFP-eligible individuals by defining and establishing the MFP-availability process. Instead of delegating the responsibility of determining the MFP-availability process to each manufacturer, CMS itself should establish one process that all manufacturers must follow. CMS must impose manufacturer guardrails and retain oversight of the process to maintain the statute's intent and program integrity. Unless CMS determines specific roles and responsibilities that are standardized among and across manufacturers and throughout the pharmaceutical supply chain, including Part D plans and their associated PBMs, we cannot be certain that all pharmaceutical supply stakeholders would be able to comply to provide MFP-eligible individuals with timely access to the MFPs. The CMS-determined MFP process must provide specific guardrails to ensure consistent processes, payments, reporting, calculations,

protocols, timelines, and dispute resolution. Said another way, CMS should ensure accountability over the entity or entities that are responsible for ensuring that beneficiaries receive the MFP.

2. Pharmacy-Specific Concerns

To help ensure continued beneficiary access to the pharmacy of their choice, CMS needs to provide clarity on a number of matters that could affect pharmacy reimbursement so that pharmacies can remain confident in their ability to continue to serve Part D beneficiaries.

First, CMS must address the matter of acquisition cost versus reimbursement cost under the MFP model. CMS should clarify and establish guidelines on how pharmacies will receive transparent and reasonable reimbursement that includes a dispensing fee, as required under the IRA.

Second, CMS must clarify how the MFP mechanics and the prescription drug acquisition cost will be determined (e.g., WAC, NADAC) and fit into the MFP reimbursement structure for pharmacies. CMS should continue to work with stakeholders to ensure the intent of the IRA is accomplished and pharmacies are not forced to accept unreasonable and unfair reimbursements.

Third, CMS must establish protections to ensure that claims paid to pharmacies at the MFP are excluded from “effective rates” that Part D plans and PBMs impose on pharmacies. Of note, including the MFP claims in effective rate agreements would severely disadvantage pharmacies and lead to artificially low reimbursements by diluting pharmacies’ effective rates.

To help ensure continued beneficiary access to their preferred pharmacy, CMS must take steps that would minimize financial and operational burdens on all affected stakeholders, including pharmacies. Specifically, CMS:

- Must ensure pharmacies are not responsible for the compliance of other stakeholders in the process of providing the MFP to MFP-eligible individuals. In other words, CMS’ guardrails and oversight should allow pharmacies to be confident that beneficiaries’ coinsurance is accurately and properly calculated at the point-of-sale; and that pharmacies will be adequately and properly reimbursed pursuant to their Part D contracts.
- Must ensure that entities dispensing the MFP funds and involved in the MFP supply chain are held accountable and not imposing any direct or indirect fees or other remuneration demands or obligations on pharmacies. Of note, penalty guardrails may need to be considered to protect pharmacies from unsavory behavior in the prescription drug supply chain.
- Must ensure pharmacies can easily know and access MFP. All relevant information should be provided in a user-friendly manner that does not disrupt patient care.
- Must ensure there is a transparent and consistent appeals and dispute resolution processes for MFP if funds do not align with posted MFP calculations.

- Must ensure pharmacies are not pre-funding any of the MFP transactions under any circumstance. This responsibility should be delegated to those identified to effectuate the MFP.

3. NACDS Recommends a Retrospective Approach Instead of a Prospective Approach

As mentioned above, CMS' initial guidance proposes two mechanisms by which Primary Manufacturers would provide access to the MFP, (1) ensuring pharmacies can access the prescription drug at a price no greater than the MFP — a *prospective approach*; or (2) providing retrospective payment for the difference between the pharmacy's acquisition cost and the MFP — a *retrospective approach*.

CMS' proposed prospective approach would not be workable for NACDS member companies. When pharmacies purchase medications, they do not know which products ultimately will be dispensed to which patients. More specifically, when pharmacies purchase medications, they cannot predict which of those medications will be dispensed to MFP-eligible beneficiaries. Consequently, under CMS' proposed prospective approach, pharmacies would have to maintain separate inventories for MFP-eligible beneficiaries, either by maintaining a physical dedicated inventory or a virtual inventory for MFP-eligible beneficiaries. Either type of separate inventory would introduce undue burdens into pharmacy operations and financial positions. Moreover, this could lead to pharmacies' having to defend against potential claims of mismanagement and calls for greater oversight, as has been the experience with similar programs that utilize multiple pharmacy inventories. For these reasons, we urge CMS to reject a prospective approach.

Instead, NACDS recommends that CMS adopt a retrospective approach, as this type of approach would have fewer impacts on pharmacy operations and financials. Notably, a retrospective approach would maintain current pharmacy purchasing procedures. NACDS cautions, however, that a retrospective approach should not require pharmacies to fund the MFP upfront and then be reimbursed at a later date, and should not require pharmacies to have to pursue reimbursement from other stakeholders, whether it be from a manufacturer or another entity.

We propose a retrospective approach in which a refund is paid to the pharmacy upon claims submission so that the pharmacy is fully reimbursed at the point of sale through standard claims processes. We further propose that CMS establish an entity, similar to the TrOOP facilitator, which works with all relevant stakeholders to ensure that necessary processing and funding occur in real time following a pharmacy submitting a reimbursement claim. Such an entity could be referred to as an "MFP refund facilitator." This entity could track patients and eligibility, calculate pharmacy refunds, and do so in a timely manner so that pharmacies do not have to engage in "pay-and-chase" in order to be fully reimbursed. Moreover, manufacturers could pre-fund the "MFP refund facilitator," similar to how the TrOOP facilitator is presently pre-funded in the Coverage Gap Discount Program (CGDP). Finally, we would highlight for CMS that the CGDP has been a success largely because it is one standard process over which CMS has authority. We believe that CMS has the authority to establish an "MFP refund facilitator" or to expand the duties of an existing entity such as the TrOOP facilitator.

B. Additional Considerations

1. Reimbursement Timing

CMS' initial guidance indicates that pharmacies must be paid within 14 days. We appreciate CMS' addressing the need for a reasonable reimbursement timeframe upon which pharmacies may rely. However, in the initial guidance, CMS does not indicate when the 14-day clock would start. NACDS asks that CMS clarify that the 14-day clock would start when the pharmacy adjudicates the qualifying prescription drug claim to the Part D plan. This recommendation to begin at the point of adjudication is consistent with Part D prompt pay requirements and the language of the IRA that requires pharmacies to be reimbursed within a certain timeframe after the dispensing of a drug, which typically is contemporaneous with the adjudication of the drug claim.

2. 340B Program Concerns

In the initial guidance, CMS expresses a number of concerns about the operation of the MFP program with respect to the 340B Program, and most notably concerns about preventing duplicate discounts and procedures to determine which price is lower, the 340B Program price or the MFP.

As CMS works to issue final guidance, NACDS wishes to reiterate the comments we submitted to CMS on March 10, 2023, in response to CMS' "Initial Memorandum Implementation of Section 1860D-14B of the Social Security Act regarding Medicare Part D Drug Inflation Rebates paid by manufacturers," that CMS issued on February 9, 2023. Specifically, we urge CMS not to implicate pharmacies in the process of identifying and reconciling 340B claims for the manufacturer. Pharmacies should not be required to shoulder the responsibilities of manufacturers.

We wish to recommend, once again, that CMS establish a central clearinghouse to identify 340B transactions dispensed to Medicare Part D patients, similar to the model in Oregon. The 340B clearinghouse would function as a claims verifier by reviewing transactions to determine if the claim is subject to the 340B price. This is a role that 340B TPAs (third-party administrators) and split-billing vendors currently provide the market today. We believe the establishment of a 340B clearinghouse will be critical in the identification of 340B transactions. There is precedent for CMS using a clearinghouse in the Part D program, as CMS has contracted with a clearinghouse to serve as the TrOOP facilitation contractor since 2005. In fact, these functions could be accomplished by the MFP facilitator that we have recommended above.

Moreover, the 340B clearinghouse should be responsible for working with CMS and manufacturers to determine the lesser of the MFP or the 340B discount price for each MFP-eligible drug and provide the outcome of this analysis to all relevant entities, including manufacturers and pharmacies. CMS should provide oversight of the determination process and subsequent reconciliation and reporting processes so that there is assurance that 340B covered entities are providing the necessary data to CMS or the clearinghouse. This CMS oversight should also protect pharmacies from disruptive reimbursement

behaviors that could occur during the reconciliation of the MFP versus the 340B price. Please keep in mind the appropriate roles of the contract pharmacies and covered entities to ensure pharmacies are not inadvertently disadvantaged by the determination and reconciliation processes.

Finally, we note that the entity that operates the clearinghouse must be free from conflicts of interest. The contractor should have no incentive to minimize the use of 340B drugs for Part D beneficiaries and should be prohibited from using 340B claims information for purposes other than preventing duplicate discounts on Part D claims. In fact, the clearinghouse could be the same entity as our proposed MFP facilitator.

3. Data Sharing Requirements

As CMS considers our recommendations, we also ask that CMS be prescriptive and outline what specific data elements are needed for stakeholders to effectuate the MFP while being mindful of the administrative burden this could impose on pharmacies and others in the supply chain if new data elements are required.

Specifically, CMS should outline the minimum data requirements for the purpose of the MFP transaction and limit any attempt for plan sponsors, intermediaries, and other contracted entities in the MFP supply chain from broadening those data requirements and assessing fees to the pharmacy. Without the minimum standardized data requirements being set, entities at their discretion could request additional, unnecessary information from pharmacies for myriad reasons. This would likely impose unnecessary burdens on pharmacies and likely the entire supply chain. Additionally, data should be exclusive and confidential to the relevant entities for the purpose of the MFP transaction.

V. Conclusion

NACDS appreciates the opportunity to provide our perspectives and workable solutions to CMS' Negotiation Program beyond what is outlined in the initial guidance. Overall, the pharmacy community would like to see a path that involves the least disruptive option with minimal pharmacy risk and burden (administrative and compliance), and that incorporates the features outlined above to ensure patients maintain access to the lower MFP prices and the pharmacy of their choice. For questions or further discussion, please contact NACDS' Christie Boutte, Senior Vice President, Reimbursement, Innovation, and Advocacy, at CBoutte@NACDS.org or 703-837-4211.

Sincerely,

NCHR Public Comment – CMS Inflation Reduction Act

The National Center for Health Research (NCHR) appreciates the opportunity to submit public comments on the Centers for Medicare & Medicaid Services (CMS) Inflation Reduction Act (IRA) Initial Program Guidance. NCHR is a non-profit think tank that conducts, analyzes, and scrutinizes research on a range of health issues, with particular focus on which prevention strategies and treatments are most effective for which patients and consumers. We do not accept funding from companies that make products that are the subject of our work, so we have no conflicts of interest.

We greatly appreciate the efforts of CMS to fully implement the authorities provided by Congress in the Inflation Reduction Act (Pub. L. 117-169) to lower the costs of prescription drugs for beneficiaries through drug price negotiations. We have focused our comments below on key items within the initial program guidance including criteria to select drugs for negotiations, data reporting requirements for selected drug manufacturers, use of real-world evidence, and inclusion of research using surrogate endpoints to demonstrate effectiveness of alternative therapeutics and have highlighted specific considerations for CMS.

Use of Real-World Evidence

We agree with the inclusion of pharmaceutical alternative therapies to assist with establishing initial negotiated price. It is important to consider to what extent the selected drug and alternative therapies have been shown to be safe and effective among the Medicare population and to consider the quality of the data used to make the determinations. The guidance document states that CMS will review real-world evidence (RWE) in considering clinical benefit of a selected drug and evidence of therapeutic alternatives. RWE can be a valuable tool when used properly, however there are limitations that should be considered. The use of RWE requires access to unbiased data of a substantial number of patients that are demographically and medically similar to the U.S. Medicare population. Patient registries have been excellent sources of information in other countries, but there are numerous shortcomings for their use in the U.S. Registries have the potential to include a matched control group to evaluate a product's effectiveness and safety, but are unlikely to make such comparisons. Research has indicated that registries often miss confounding patient and medical center variables that were not evaluated but influenced outcomes.^[1] Further, access to information from registries is a major problem in the U.S., as most if not all registries are controlled by medical societies. These societies control the data collected as well as the data that they will make public to government agencies, or other researchers. Lastly, these registries typically include little, if any patient-reported outcomes, such as pain or quality of life, as well as lacking data on other adverse events which are needed to evaluate outcomes that truly matter to patients.

“Big Data” from billing records and electronic health records can also be used to determine very serious adverse events, but have several limitations.^{[2],[3]} It is not possible to determine if patients took medication as instructed or complied with instructions. Additionally, when patients report adverse effects, especially those that are subjective and relatively common, that

information is not always included in billing records or EHR, making it difficult to accurately evaluate the frequency of those events.

Use of Surrogate Endpoints

The document also states that CMS will consider “validated surrogate endpoints that predict a relevant health outcome” to determine the clinical benefit of the selected drug and therapeutic alternatives. There is not always agreement whether a surrogate endpoint is a consistently accurate predictor of clinical outcomes and CMS should take this into consideration when reviewing data based on surrogate endpoints, and rely on the preponderance of solid scientific evidence. Surrogate endpoints are used by manufacturers to obtain approval by the Food and Drug Administration (FDA). They are especially common for obtaining accelerated approval, almost always with the requirement that efficacy will be validated by confirmatory trials completed at a later date. For example, the drugs aducanumab and lecanumab were granted accelerated approval based on a reduction of amyloid plaque in the brain of patients with Alzheimer’s disease. However, numerous studies have suggested this endpoint does not reliably predict changes in cognition.^{[4],[5]} Additionally, confirmatory trials for drugs granted accelerated approval are often significantly delayed and fail to demonstrate meaningful, patient-centered outcomes, while the drug remains on the market.^{[6],[7]} We recommend CMS only use surrogate endpoint data to determine clinical benefit if there is data using patient-centered outcomes and very strong scientific evidence.

Drug Selection Criteria

We strongly agree with the process described in the guidance document detailing how eligible drugs will be determined. Specifically, we agree with the inclusion of any dose, delivery method, indication for different patient populations, or authorized generic drug as one single source drug. Manufacturers have often used changes in dosing, delivery method, or indication to extend the life of patents on a drug, often blocking access to lower cost generic competition for years. We also agree that CMS should select the drug exclusivity timeframe based on the initial indication of the product. This will help prevent manipulating the negotiation process through harmful practices of patent abuse in the future.

Data Reporting for Selection

We appreciate the extent to which CMS will consider different data items received by drug manufacturers to determine the maximum fair price (MFP). In addition to providing information publicly, it should be made clear how these various data items are being used to justify decision making. For example, how will data submitted by the manufacturer that shows they have yet to recoup the costs of Research and Development be used by CMS? The use of the data and information required to be reported by drug manufacturers must be clearly explained to the public to promote true transparency in the process.

Meena Seshamani, M.D., Ph.D.
CMS Deputy Administrator and
Director of the Center for Medicare
7500 Security Boulevard
Baltimore, Maryland 21244-1850

Dear Ms. Brooks-LaSure and Dr. Seshamani,

Thank you for the opportunity to respond to your Solicitation of Comments for the March 15, 2023 initial guidance regarding the Medicare Drug Price Negotiation Program established under the Inflation Reduction Act (IRA).

By way of introduction, I am a senior fellow at the National Center for Public Policy Research, a nonprofit foundation dedicated to advancing free market solutions to public policy problems. I hope to provide insights that can help ensure the Negotiation Program's implementation does as little harm as possible to patients, providers, and researchers. To that end, I would like to raise several concerns about the guidance released last month.

First, the guidance imposes secrecy requirements that, at best, are at odds with good governance and, at worst, represent an unconstitutional infringement on free speech.

As you know, the [guidance dictates](#) that any information that CMS shares with a drug manufacturer during the negotiation process must remain confidential, and also that once a drug is no longer eligible for negotiations, the company must destroy all related documents -- including their own emails and other written communications -- within 30 days. CMS presumably proposed these requirements

to prevent manufacturers from communicating with each other, and the public, about the government's negotiating strategy and priorities. If the guidance is implemented, there'd be virtually no way for companies to document or publicize what they deem to be repeat abuses or flaws in the negotiation process.

Similarly, outside stakeholders -- especially patient groups and good governance watch dogs -- would have almost no insight into whether CMS is taking their viewpoints into account. The guidance would unreasonably restrict companies' First Amendment right to free speech, and would deprive the public at large of any real-time insight into the negotiation process, despite CMS's decisions having potentially life-or-death implications for millions of patients.

In fact, the lack of transparency -- coupled with the fact that the IRA prohibits judicial or administrative review of CMS's negotiating decisions -- is so egregious that it arguably deprives companies of due process.

It's very possible that decisions made under the Negotiation Program will force Medicare patients to stop taking medicines that are essential to maintaining their health in favor of far less effective alternatives. For this reason, I implore the agency to give patients and providers, in particular, a larger voice in how prices are determined.

The use of therapeutic reference pricing as the main basis for determining a drug's "maximum fair price" (MFP) is another cause for concern. To begin with, the guidance offers no clear criteria for judging what medicines count as "therapeutic alternatives." This makes it highly likely that the reference pricing process will ignore important clinical differences between a selected drug and what CMS deems a therapeutic alternative.

There's also nothing in the initial guidance to stop CMS from referencing a generic therapeutic alternative when setting the MFP for a brand-name drug, a comparison that will enable the agency to systematically undervalue state-of-the-art medicines.

Furthermore, according to the initial guidance, CMS "intends to consider the length of the available patents and exclusivities," when setting a medicine's price and that, in cases where a "selected drug has patents and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward."

One consequence of this policy is that it will discourage companies from doing additional research on medicines already approved by the FDA. Should a firm find a new application for an existing medicine -- and secure a new patent for that post-approval indication -- they could be vulnerable to more severe CMS price cuts

under the Negotiation Program. As a result, firms will have a significant disincentive to engage in such work.

This would have devastating consequences for innovation, as some of the most important and needed indications are often discovered after a drug has earned FDA approval. In the case of oncology drugs specifically, it's incredibly [common](#) for a medicine approved for one form of cancer to earn approval for treating another form of the disease. For these kinds of advances to occur, however, drug firms need to invest in expensive, time-consuming post-approval research. Under the current guidance, that research would dry up.

The IRA's Medicare Drug Price Negotiation Program has already introduced massive uncertainty into the drug development ecosystem. The initial guidance only adds to the uncertainty by establishing an unpredictable, non-transparent drug-pricing process in which patients, providers, and countless other stakeholders have almost no voice.

Thank you for the opportunity to share these concerns.

Sincerely,

Drew Johnson

Re: Medicare Drug Price Negotiation Program Guidance

Deputy Administrator Seshamani,

The National Community Pharmacists Association (NCPA) appreciates the opportunity to provide feedback on CMS' *Medicare Drug Price Negotiation Program: [Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments.](#)*

NCPA represents America's community pharmacists, including 19,400 independent community pharmacies. Almost half of all community pharmacies provide long-term care services and play a critical role in ensuring patients have immediate access to medications in both community and long-term care (LTC) settings. Together, our members represent a \$78.5 billion healthcare marketplace, employ 240,000 individuals, and provide an expanding set of healthcare services to millions of patients every day. Our members are small business owners who are among America's most accessible healthcare providers.

NCPA supports the intention of the Inflation Reduction Act to lower patient's out-of-pocket costs. To further that end, NCPA supports having PBMs pass through rebates and discounts that they receive directly to patients, and has long supported state and federal legislation to require PBMs to implement a pass-through pricing model. Under the Medicare Drug Price Negotiation initial guidance, the basis for calculating patient cost sharing will be maximum fair price (MFP), not list price, which would be good for patients' out-of-pocket costs.

Community pharmacies are eager to serve an active role in implementing the Inflation Reduction Act. But for this initial guidance to work, and to preserve patient access to beneficiaries' pharmacy of choice to drugs under this guidance, pharmacies must be made whole to remain economically viable and maintain patient access to MFP drugs.

Independent pharmacies are integral to Part D plan network accessibility. The average independent pharmacy derives 36% of script volume from Part D, and LTC pharmacies derive 60 – 70% of script volume from Part D. Hundreds of pharmacies are closing each year, and the majority of these are independents, leading to pharmacy deserts. There are many causes for this, including vertical integration, PBMs steering to their affiliate pharmacies, below-cost reimbursement from PBMs, and restricted/preferred networks that block independent pharmacies.

At the same time, independent pharmacies are in pain and at an inflection point with increased stress from pharmacy DIR fees. Medicare Part D pharmacy DIR fees now account for approximately 5-6 percent of gross prescription revenue from *all* payers, representing the third highest expense after COGS (78%) and payroll (13.1%). According to MedPAC's March 2023 Report to Congress, pharmacy DIR fees were \$12.6 billion for 2021 (a \$3.1 billion (+33%) increase from \$9.5 billion in 2020).¹

Harmful DIR trends are only getting worse. For Medicare Part D CY24 contract offerings, our members are seeing approximate reimbursements at AWP-26% + \$0 dispensing fee (30ds) and AWP-31% + \$0 dispensing fee (90ds) for brands. These reimbursement rates represent pricing significantly below community pharmacies' cost to purchase brand drugs. Rates such as this coupled with year-over-year double-digit increases in DIR fees will make the first 3-6 months of 2024 unbearable for independent pharmacies, as they continue to pay DIR fees from CY23. Pharmacies will have to draw from more lines of credit/building reserves, and cash flow is a dire concern.

After reviewing the guidance, NCPA is unclear how pharmacies will ultimately be reimbursed for MFP-eligible drugs. For example, NCPA is unclear how pharmacies would be protected from losing money under the Medicare Drug Price Negotiation program. NCPA is concerned that pharmacies could experience negative cashflow when the actual acquisition cost of the medication to the pharmacy is more than reimbursement based on MFP. As MFP is the Part D negotiated price ceiling, the MFP could (and likely will) go lower at pharmacies' expense.

NCPA is concerned that this is essentially a pass-through model for pharmacy payment, without professional dispensing fee protections. We notice that pharmacies will be paid MFP plus "any" dispensing fee, making dispensing fees to pharmacies optional. It is crucial that CMS require dispensing fees that adequately cover the actual costs of dispensing the prescriptions. We believe that it is essential that pharmacy be engaged and compensated to cover costs of acquiring and dispensing drugs to make this program successful. Lastly, since there is no formal rulemaking, CMS will not conduct a small business impact analysis. How does CMS know the true impact of this guidance on small business community pharmacy?

¹ See [MedPAC March 2023 Report to the Congress: Medicare Payment Policy](#), page 399.

Below are our initial comments, subject to change as CMS develops its policy. When CMS has a more definitive policy on the Medicare Drug Price Negotiation program, the National Council for Prescription Drug Programs (NCPDP), could be a forum to discuss how NCPDP's standards can be used to effectuate these policies.

It will be important to identify new business processes that would be the most viable for the industry to operationalize to ensure that pharmacies have access to the MFP by 2026, and are made financially whole.

The Inflation Reduction Act created an exception to the non-interference in Part D clause in Section 1860D–11(i) of the Social Security Act (42 U.S.C. 1395w–111(i)), so that the Secretary of HHS “may not institute a price structure for the reimbursement of covered part D drugs, except as provided under part E of title XI” [the Medicare Drug Price Negotiation Program provisions].²

NCPA requests that CMS use this exception to establish a price structure for the Medicare Drug Price Negotiation Program, specifically a financially viable model of pharmacy reimbursement including but not limited to an MFP that accounts for margin on the ingredient cost of the drug, plus a required and economically viable professional dispensing fee, and to ensure that supply chain entities cannot impose terms on pharmacy including but not limited to pharmacy DIR fees on MFP drugs.

NCPA supports the following guiding principles to protect beneficiary access to independent pharmacy in the Medicare Drug Price Negotiation program:

- Pharmacy should not be responsible for the costs and related risks of operationalizing any MFP effectuation options
- Any entities responsible for payment effectuation should have a fiduciary responsibility to pharmacies
- CMS should consistently apply any MFP with CMS oversight, guardrails and governance
- All manufacturers must follow the same MFP structure of payment
- This guidance and its implementation should cause no disruption to pharmacy
- Plans, PBMs, manufacturers and wholesalers should not be able to disadvantage pharmacy
 - CMS should implement this guidance into seamless point of sale transactions
 - Pharmacies should not report acquisition cost nor reimbursement
 - Supply chain entities cannot impose additional MFP terms in pharmacy contracts
 - Plans/PBMs cannot steer or limit coverage of MFP drugs to affiliate pharmacies
 - Pharmacies should have reimbursement protections against egregious contracting practices such as BER (brand effective rate) clawbacks

² See Section 1198(b)(1)(C), at <https://www.congress.gov/117/plaws/publ169/PLAW-117publ169.pdf>, page 36.

- Pharmacies should not be loaning or floating money
- Pharmacy should not pay any fees to effectuate MFP
- Pharmacies should not be reporting using spreadsheets; any reporting should use NCPDP standards with automation in mind to maximize efficiencies
- Pharmacies should not fall victim to underwater payment on claims for MFP drugs/protections if MFP goes lower
- Pharmacies should be reimbursed commensurate professional dispensing fees
- Clear dispute resolution process for pharmacies regarding any grievances with supply chain entities
- Reimbursement for MFP drugs should not be subject to DIR fees/retrospective clawbacks

40.4 Providing Access to the MFP

According to the initial guidance, CMS intends to require that Primary Manufacturers provide access to the MFP in one of two ways: (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP.

Feedback on option #1 (ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP)

NCPA has some reservations about this option, especially the likely need for pharmacies to have separate virtual inventory, like what exists under the 340B program. NCPA would appreciate CMS guidance on how it envisions the role of a virtual inventory as part of this option. NCPA is also aware that some partners in the supply chain would not favor option #1.

What our members do appreciate about this option is that it allows pharmacies to conserve cashflow and not be subjected to paying the wholesaler's regular price for the drug being dispensed for an MFP-eligible claim. Our members appreciate this option in that pharmacies would not be subject to loaning or floating money (i.e., through pharmacy paying a surplus payment that is later credited back to the pharmacy from the wholesaler, as highlighted in the Initial Guidance's "chargeback" example). Many of our members pay staff daily and weekly and have carrying costs. Furthermore, due to inflation and the time value of money, such chargebacks work against pharmacies.

If CMS moved forward with option #1, NCPA advises that CMS should ensure that plans pay a reasonable reimbursement rate that factors in the MFP, the actual costs of dispensing the drug, to avoid merely creating a product cost pass-through program that does not actually cover the pharmacy's operating costs. What is labeled a "dispensing fee" in the vast majority of Part D contracts is not adequate to cover the actual costs of dispensing a prescription. Claims paid under any option should be excluded from pharmacy direct and indirect remuneration (DIR) fees or retrospective clawbacks.

Concerns with option #2 (providing retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP)

NCPA has the following concerns with a wholesaler chargeback program to provide retrospective reimbursement.

Concerns with growing managerial control of pharmacy by wholesalers. With the implementation of DSCSA and controlled substance laws, among other factors, independent pharmacists are seeing wholesalers' managerial control of pharmacies grow. Furthermore, generic and brand compliance rates requiring a certain percentage of drugs be purchased from a given wholesaler make it so that pharmacies contract with wholesalers in a bundled, non-transparent fashion. If option #2 is done through a reconciliation process with the wholesalers, wholesalers will have even more managerial control over the revenue of pharmacies, and pharmacies would need to have added protections.

Concerns with wholesaler chargeback model. If CMS were to implement a wholesaler chargeback model, CMS should structure it so that pharmacy is assured it will be made financially whole. NCPA is concerned with the potential lack of transparency of a wholesaler chargeback model, with potential varying, convoluted, and non-transparent wholesaler fees, administrative costs, rebates and metrics. Furthermore, wholesalers are not HIPAA-covered entities and in the absence of a business associate agreement, do not have access to pharmacies' patient-specific claim-level transaction data. Entering into business associate agreements to disclose HIPAA protected health information is a risk as well as administrative burden for pharmacies, and they are justifiably wary of sharing claim data with wholesalers. Additionally, one pharmacy may have multiple wholesalers, which would greatly complicate the viability of a wholesaler chargeback model.

CMS provides the following example of how a chargeback would work:

For example, a pharmacy may purchase a medication for \$100 per bottle and the MFP as applied to this selected package is \$80. The Medicare beneficiary is enrolled in a Part D plan under which coverage of the selected drug is available, thus the beneficiary is an MFP-eligible individual. For this example, the plan has not negotiated a lower price for the medication. The pharmacy provides the negotiated price (i.e., MFP plus a dispensing fee) at the point of sale to the Medicare beneficiary. As a result of this transaction, the pharmacy is owed \$20 by the manufacturer. **The pharmacy would submit the information regarding the \$20 chargeback amount to its wholesaler and receive a credit from the wholesaler for that amount.** The wholesaler would be compensated by the manufacturer after billing the manufacturer for the chargeback amount. **[NCPA emphasis]**

Protections needed under wholesaler chargeback model. If CMS decides to go forward with such a model, NCPA strongly advocates for protections for pharmacy from wholesalers. NCPA would suggest the following:

- Wholesalers should bear the financial risk of creating, maintaining and operating any wholesaler clearinghouse and/or chargeback model;
- Pharmacies should be able to freely lodge complaints to CMS about wholesalers and others;
- Pharmacies should be paid with interest for the time between dispensing the MFP prescription and the time they are made whole, given the time value of money and inflation;
- CMS should integrate any chargebacks with the claims process, so as not to unduly burden pharmacies; and
- The chargeback should be automatically initiated following the pharmacy submission of a claim.
 - The pharmacy should not be burdened with initiating the chargeback process, as is given in CMS' example above (see bold text).
 - It is not feasible for pharmacies to evaluate RxBIN and RxPCN numbers to manage the process; pharmacies should not be expected to identify which BIN-PCN combinations tie to a Part D Plan and indicate in the claim they do or do not claim MFP reimbursement for the claim, as the list of combinations is large.³

In sum, NCPA does not support a wholesaler chargeback model to effectuate the MFP.

NCPA's Alternative Recommendations to Effectuate MFP

Proposal #1 - Central clearinghouse

The Medicare Drug Price Negotiation program could be processed by a central clearinghouse managed and governed by CMS, similar to Palmetto in the Medicare Part D coverage gap discount program. This would entail CMS providing PDE data to the facilitator, who then calculates the amount owed to the respective pharmacy, and then invoices the manufacturer, while pharmacies are paid at the same time the claim is adjudicated. The manufacturer could prefund payments for pharmacies. Pharmacy would be reimbursed based on the actual cost of dispensing the drug. This reimbursement would be based on publicly available benchmarks, where the clearinghouse would only need the NDC number, quantity dispensed, and claim identifier for each drug. No Protected Health Information under HIPAA, nor reimbursement fields, would be or need be shared. A fair and commensurate professional dispensing fee is needed, because Part D dispensing fees are oftentimes zero to pennies, offered in take it or leave it contract terms. Using a reference price established by the manufacturer such as WAC protects the confidential nature of an individual pharmacy's actual acquisition cost and is simpler to administer than trying to account for an individual pharmacy's prescription medication purchasing arrangements.

Such a clearinghouse should be a disinterested party, and should not be either a PBM or a wholesaler or related party. With a clearinghouse, a payment processor would be responsible for

³See <https://www.cms.gov/files/zip/binpcn2023.zip>.

processing and facilitating payment from the manufacturer to pharmacies. Payments should be transparent to the pharmacy and itemized at the claim-level on the 835 remittance advice. Pharmacies should not be charged any administrative or transaction fees.

Proposal #2 – Secondary claims adjudicator/MFP refund facilitator

The NCPDP Telecommunication standard is currently leveraged to offer an electronic voucher program for manufacturer copay discounts in the commercial plan marketplace. If pharmacies transmit a claim for a brand medication that is eligible for an electronic voucher, the switch knows it is a Medicare Part D claim (based on the Part D processor identification number (RxBIN) and Part D processor control number (RxPCN)), and the pharmacy receives a message that it is ineligible for an electronic voucher. The electronic voucher is currently unavailable in Medicare Part D.

The existing system could, through modified computer language and programming, similarly act to identify drugs in the Medicare Drug Price Negotiation program. A claims switch or processing facilitator could continue to reject Medicare Part D drugs, but not the drugs in the Medicare Drug Price Negotiation program. Claims could be adjudicated at point of sale, without needing full disclosure to PBMs and wholesalers.

A secondary claims adjudicator/MFP refund facilitator will not hurt cash flow for pharmacies. If set up correctly, no additional work is needed by the wholesalers, this process is very easy for pharmacies, and pharmacies are not required to submit additional data. However, this proposed electronic voucher program would need cooperation from the switch(s) and manufacturers.

Proposal #3 – CMS collects MFP directly from manufacturer

As an alternative option to the electronic voucher proposal above, CMS could collect directly from the Primary Manufacturer the difference between the MFP and the price CMS would pay but for the existence of the MFP (i.e., price without MFP or MFP rebate). This would be the simplest, cleanest, and most cost-effective mechanism for manufacturers to provide access to the MFP for the selected drug to pharmacies with respect to MFP individuals who are dispensed the drugs, as it would impose the minimal possible burden on wholesalers, Part D plans, pharmacies and, most importantly, patients. However, NCPA has concerns that pharmacy reimbursement would essentially be a product cost pass-through model in this proposal.

Proposal #4 – Separate NDC numbers

Manufacturers could create secondary NDCs for the drugs in the Medicare Drug Price Negotiation program, and make those NDCs available to wholesalers and system vendors at the MFP. Pre- and post- editing would catch them on matching, and using RxBIN and RxPCN numbers, these drugs could be paid on MFP plus a dispensing fee. We understand the concerns from manufacturers with setting up separate Medicare and non-Medicare NDCs, which is historically burdensome. We also understand the concerns manufacturers have with making this a prospective payment system that can result in misidentifying product resulting in mis-applied discounts.

NCPA Additional Comments, Concerns, and Recommendations

Pharmacy cannot be collateral damage to patients having access to MFP. NCPA has concerns about the economic viability of this guidance for pharmacies. Reimbursement for brand drugs is often solely based off AWP while purchasing of brand drugs is often based on the WAC published price. NCPA is concerned that pharmacy reimbursement for MFP eligible drugs may be inadequate for pharmacies, especially if there are not mandatory dispensing fees to factor in the actual cost of dispensing. Additionally, the MFP is the maximum negotiated price for these drugs in the Medicare Drug Price Negotiation Program, and CMS stated in the guidance that manufacturers can offer a price lower than the MFP for these drugs.

NCPA is concerned that the MFP is not financially sustainable for pharmacies. For example, NCPA does not see protections in this guidance preventing the PBM from reimbursing below MFP, nor preventing wholesalers from selling to pharmacy above MFP, nor preventing manufacturers for negotiating discounts off MFP which can lead to the MFP going lower than the negotiated price at the pharmacies' expense, all of which will affect pharmacy reimbursement and the ability of pharmacies to be made whole.

NCPA also has concerns that PBMs and commercial plans could adopt the MFP, which will be public, for those drugs, causing similar financial concerns for pharmacy stated above in non-Medicare Part D plans. Nevada has introduced [AB 250](#) which would broaden the applicability of MFP to apply to purchasers within the state, and similar states may follow.

Dispensing fees must be required and economically viable. **NCPA is concerned that under this guidance, pharmacies will not be compensated with a fair and commensurate professional dispensing fee.** According to CMS' Contract Year 2023 Policy and Technical Changes to the Medicare Advantage and Medicare Prescription Drug Benefit Programs final rule,⁴ effective January 1, 2024, the negotiated price includes any dispensing fees.⁵ CMS also stated in the initial guidance that "Under section 1860D-2(d)(1)(D) of the Act, as amended by section 11001(b) of the IRA, the negotiated prices used in payment by each Part D plan sponsor for each selected Part D drug must not exceed the applicable MFP plus any dispensing fees for such drug."

Dispensing fees may be included in current Part D contracts, but are not adequate to cover the cost of dispensing. Furthermore, Medicare Part D contracts are take-it-or-leave it to the

⁴ [2022-09375.pdf \(govinfo.gov\)](#), at 27899.

⁵ 423.100 Definitions. Negotiated price means the price for a covered Part D drug that— (1) The Part D sponsor (or other intermediary contracting organization) and the network dispensing pharmacy or other network dispensing provider have negotiated as the lowest possible reimbursement such network entity will receive, in total, for a particular drug; (2) Meets all of the following: (i) Includes all price concessions (as defined in this section) from network pharmacies or other network providers; (ii) Includes any dispensing fees; and (iii) Excludes additional contingent amounts, such as incentive fees, if these amounts increase prices; and (3) Is reduced by non-pharmacy price concessions and other direct or indirect remuneration that the Part D sponsor passes through to Part D enrollees at the point of sale.

pharmacy, leaving the pharmacy little choice but to accept unfair dispensing fees, however there may be opportunity for margin on the ingredient cost of the drug being dispensed to partially offset the virtually non-existent dispensing fees in Part D. However, not having a fair dispensing fee when there is no markup on the ingredient cost for MFP eligible drugs could result in pharmacies not stocking the drugs and therefore reducing access, as is the case with pharmacies reluctant to stock Paxlovid (pharmacies are not allowed to charge for the drug and thus rely solely on dispensing fees that more often than not do not cover the cost of dispensing the drug). Dispensing fees should be adequate as in fee-for-service Medicaid programs to cover the pharmacy's business operation costs, especially when dispensing MFP eligible drugs may lead to a complete pass-through reimbursement model for pharmacy on the ingredient cost portion of pharmacy reimbursement.

LTC pharmacy concerns. NCPA has additional concerns that LTC pharmacies will be disproportionately affected by this guidance, given LTC pharmacy's higher dispensing costs compared to the retail setting, based on following CMS' ten criteria for LTC pharmacy.

Acquisition cost. In its guidance, CMS states that it intends to require that Primary Manufacturers provide access to the MFP in one of two ways: (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity's acquisition cost and the MFP.

NCPA opposes using pharmacy acquisition cost as proposed in the guidance. The acquisition cost proposal is a pass-through model which does not leave room to cover operating costs for the pharmacy, as pharmacies would be trued up to cost and most part D plans currently do not pay a dispensing fee, much less one based on the actual cost of dispensing the drug. Plus, pharmacy purchasing arrangements with their wholesaler vary. Trying to track down acquisition costs to the penny for nearly 20,000 independent pharmacies would be logistically difficult and burdensome. Using acquisition cost would cause disruption to the supply chain, and create misaligned incentives. For example, pharmacies disclosing acquisition costs would undermine contracting and could result in lower pharmacy reimbursement. Also, as discussed above, NCPA members are not supportive of a wholesaler chargeback model that would presumably be based on actual pharmacy acquisition cost. **Instead, we support CMS using a more widely reported reference price - WAC.**

Reasonable rate of reimbursement. In the Contract Year 2023 Policy and Technical Changes to the Medicare Advantage and Medicare Prescription Drug Benefit Programs final rule, CMS noted that many commenters requested that CMS establish safeguards to guarantee that pharmacies participating in Medicare Part D receive a "reasonable rate of reimbursement."⁶ CMS noted that these commenters urged the administration to ensure that the negotiated price at a minimum cover the pharmacy's costs of purchasing and dispensing covered items and providing covered services, and that some commenters requested that CMS establish a flat dispensing fee or an

⁶ See [2022-09375.pdf \(govinfo.gov\)](#) at 27845.

alternative such as pharmacy reimbursement based on a public drug pricing benchmark such as national average drug acquisition costs (NADAC) plus a fair dispensing fee in line with those in state Medicaid fee-for-service programs. In response, CMS stated that it would consider these suggestions for future rulemaking. **NCPA urges CMS to take this into consideration as the agency moves forward with implementation of the Medicare Drug Price Negotiation program.**

Reasonable and relevant terms and conditions. Furthermore, Part D plans are required to provide “reasonable and relevant terms and conditions of participation whereby any willing pharmacy may access the standard contract and participate as a network pharmacy.”⁷ **NCPA likewise urges CMS to take this into consideration as the agency moves forward with implementation of the Medicare Drug Price Negotiation program.**

Timely Reimbursement

NCPA appreciates CMS stating in the guidance that it intends to require that a Primary Manufacturer ensure that pharmacies and others are reimbursed timely for the full amount of the difference between their acquisition cost for the selected drug and the MFP within 14 days. **NCPA asks CMS clarification as to what the 14-day timeframe measures specifically. Does the 14-day clock start when the pharmacy adjudicates the qualifying prescription drug claim to the Part D plan?** This recommendation to begin at the point of adjudication is consistent with Part D prompt pay requirements and the language of the IRA that requires pharmacies to be reimbursed within a certain timeframe after the dispensing of a drug, which typically is contemporaneous with the adjudication of the drug claim.

Community pharmacies operate with very tight cashflows and cannot afford to float and loan money to supply chain entities. NCPA asks CMS to elaborate on the 14-day timeframe to ensure prompt payment to pharmacies, consistent with current Part D policy.

No Transaction Fee

CMS also states that manufacturers or their contracted entities shall not charge any transaction fee for this process, of which NCPA is appreciative. NCPA advises CMS to be wary of supply chain entities to circumvent the provision against transaction fees by charging “general claims processing” or “switch” fees. **NCPA advises that CMS elaborate on what constitutes a transaction fee for purposes of effectuating the MFP and have a clear mechanism for enforcement.**

40.4.1 Nonduplication with 340B Ceiling Price

NCPA believes it is imperative to avoid duplication of discounts between the 340B program and the Medicare Drug Price Negotiation program. Many of our members act as Contract Pharmacies for Covered Entities (CEs) but pharmacies are not the source of truth for determining the drug dispensed was eligible for 340B pricing. The way the 340B program is currently administered is too complicated to rely on an indicator for prescription claims and will result in inaccurate information. The current NCPDP Telecommunications Standard Version D.0 for pharmacy claims

⁷ [eCFR :: 42 CFR 423.505 -- Contract provisions.](#)

does not require a pharmacy to identify which prescription claims were dispensed using drugs purchased at a discount under the 340B program. Although the standard does include a field where a 340B indicator could be provided, it is optional for pharmacies to use, based on trading partner agreements. To proactively include a 340B identifier on a prescription claim, a pharmacy needs to know at the point of sale that the patient, their prescription and the parameters of their arrangement with the covered entity, qualify for the 340B program drug pricing. The indicator exists but there is a significant operational challenge to identifying when pharmacies should use it. Due to the multiple factors that go into determining that a drug dispensed is eligible for 340B pricing, it is not common for a pharmacy to know at the point of sale that a prescription could be dispensed with a 340B-priced drug.

CE Administrators are responsible for preventing our members from contributing to duplicate discounts. The CE should bear sole liability for any duplicate discounts, not the Contract Pharmacy. However, as NCPA has explained to CMS in past comments,⁸ there is significant administrative burden posed to pharmacies identifying 340B units both proactively and retroactively. **Instead, NCPA advises CMS either have a third-party administrator identify 340B units for CMS, or have manufacturers report aggregate, approximate 340B units to CMS.**

90.2 Monitoring of Access to the MFP

CMS states that it is the Primary Manufacturer's responsibility to ensure access to the MFP, and mentions that there are various methods by which pharmacies can determine whether they are accessing the MFP for a selected drug.

For example, the MFPs for selected drugs will be published by CMS, giving pharmacies an opportunity to know the MFP for each selected drug, as well as the explanation for each MFP. The MFPs for selected drugs for initial price applicability year 2026 must be published by September 1, 2024. In addition, CMS anticipates that pharmaceutical database companies will publish the MFPs such that they would become more readily accessible to pharmaceutical purchasers. CMS believes such transparency of the MFPs for selected drugs will help pharmacies to know the MFP for a selected drug and determine whether they are able to access the MFP. CMS is seeking comments on additional ways that CMS could help dispensing entities and MFP-eligible individuals know the MFP for a selected drug and determine whether they are able to access it.

First, if MFP is added to compendia drug files, the pharmacy dispensing system could also display the MFP. **Secondly, NCPA believes that wholesalers can put MFP information on their invoices and wholesaler catalogues.**

Chargebacks. CMS states that there is widespread use of chargeback payments and rebate mechanisms among the pharmaceutical stakeholders in the private sector, which allows for entities to receive rebates or discounts on their purchases after those purchases are made, based on the specific population to whom the drug or biological is dispensed. CMS also states that the

⁸ [comments-cms-part-d-inflation-rebatesL.pdf \(ncpa.org\)](https://www.ncpa.org/wp-content/uploads/2023/07/comments-cms-part-d-inflation-rebatesL.pdf)

private sector may make modifications to these existing mechanisms to effectuate access to the MFP. As referenced above, NCPA does not support a wholesaler chargeback model to effectuate the MFP. However, **in any chargeback structure of reimbursement, NCPA requests that credit memos must be available, and include claim reference identifiers to reconcile discounts. Remittance advices in the industry standard format (NCPDP standard 835) must be provided.**

Reporting issues. CMS stated that it intends to establish a process by which pharmacies would be able to report instances to CMS in which the MFP should have been made available to them but was not. CMS is seeking comment on how such a process would operate most effectively. **Under any wholesaler chargeback model, NCPA suggests that CMS communicate directly with wholesalers for this information, as most wholesalers have PSAOs, purchase drugs, and will control chargebacks in “option 2.” NCPA also requests that CMS provide guidance on what pharmacies should do if they believe that the chargebacks are inaccurate.**

NCPA also advises that CMS should provide guidance on a dispute/complaint process where pharmacies can initiate complaints for any model used to effectuate the MFP. CMS must have a streamlined, effective complaint process to ensure that disputes are resolved promptly to keep pharmacy’s solvent. No matter what model CMS decides to incorporate, chargeback or otherwise, pharmacies must have a way to report issues promptly and efficiently.

Conclusion

In summary, this initial guidance is being issued at a time when pharmacies are on the brink of closure. Medicare Part D plans and PBMs rarely pay dispensing fees, and Part D contracts are worsening. We have additional concerns that LTC pharmacies will be disproportionately affected by this guidance. NCPA is concerned that inadequate reimbursement could result in pharmacies not stocking drugs under the Medicare Drug Price Negotiation Program, which would reduce access.

NCPA thanks CMS for the opportunity to provide feedback, and we stand ready to work with CMS to offer possible solutions and ideas. Should you have any questions or concerns, please feel free to contact me at ronna.hauser@ncpa.org or (703) 838-2691, and my colleague Steve Postal, Director of Policy and Regulatory Affairs, at steve.postal@ncpa.org or (703) 600-1178.

Sincerely,

Ronna B. Hauser, PharmD
Senior Vice President, Policy & Pharmacy Affairs
National Community Pharmacists Association

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments
Introduction

Dear Administrator Brooks-LaSure:

The National Health Council (NHC) thanks the Centers for Medicare & Medicaid Services (CMS) for the opportunity to comment on initial guidance for implementation of the Medicare Drug Price Negotiation Program for initial price applicability year (IPAY) 2026 as established by the Inflation Reduction Act (IRA).

Created by and for patient organizations over 100 years ago, the NHC brings diverse organizations together to forge consensus and drive patient-centered health policy. We promote increased access to affordable, high-value, equitable, and sustainable health care. Made up of more than 155 national health-related organizations and businesses, the NHC's core membership includes the nation's leading patient organizations. Other members include health-related associations and nonprofit organizations including the provider, research, and family caregiver communities; and businesses and organizations representing biopharmaceuticals, devices, diagnostics, generics, and payers.

As a patient advocacy organization whose mission is to promote increased patient access to affordable, high-value, sustainable, and equitable health care, we submit these comments regarding the impact of the negotiation program on patients. Our comments are informed by our concern for both patient access and affordability.

The NHC would first like to thank CMS for seeking feedback on the negotiation process guidance, a step that was not explicitly required in the IRA statute. While we would have preferred a more traditional Notice and Comment rulemaking opportunity that would ensure the Agency directly responds to stakeholder feedback, we welcome this opportunity to express our reactions to CMS' thinking on the negotiation program. As overarching priorities, the NHC urges CMS to craft the negotiation process to assure:

- Patient organizations have ample opportunity and ability to provide feedback on the negotiation process;

- CMS communicates how external data was factored into decisions, including methodology used;
- Patients have greater access and affordability of needed medicines; and
- Appropriate guardrails and ongoing oversight processes are established to study the impact of the negotiation program to protect patients and inform refinement of the program.

§10: External Data Submission Timing

The NHC understands the tight timeline for the drug selection and price negotiation processes. However, for patients to fully realize benefits of the negotiation program and to limit unintended consequences, CMS must provide ample time for patients to share data and experiences pertaining to selected drugs. The NHC is concerned that 30 days to submit data after CMS releases the list of drugs to be negotiated is insufficient time for organizations, who do not have research and/or data analysis departments and staff to collect information, to submit data that is most beneficial to CMS. We ask CMS to take the burden of data collection and submission into account as it evaluates the proposed timeframe for data submissions.

The NHC believes that CMS should extend the timeframe for stakeholders to submit requested data. At a minimum, the NHC requests that information can still be submitted throughout the negotiation process and could inform “second/final offer” decisions. CMS must consider the patient voice and perspective as vital to the negotiation process.

§50.2 and §60.3.3: Patient Engagement and Utilizing Patient Experience Data

The NHC has long championed the incorporation of patient perspectives in medical product research, development, and coverage. Patient engagement is an important step to better understand the burden of their condition, desired treatment outcomes, and views on benefits and risks. Driven by the work of the Food and Drug Administration on patient-focused drug development (PFDD), many companies in the biopharmaceutical community have devoted significant resources to better understand patient populations and are working to bring to market products that best suit their needs. While patients will benefit from lower-priced medicines, it is important for CMS to consider the positive impact it can have on PFDD if companies are rewarded for demonstrating that their products represent therapeutic advancements over other products and meet unmet needs identified as the most important to patients.

In addition to our earlier expressed concern about the short timeframe for data submissions, we ask CMS to provide more clarity on how the agency intends to leverage negotiation data elements outlined in §50.2 to ensure that the agency is evaluating these elements with the patients' experiences, preferred outcomes, and needs in mind. For instance, we ask CMS to transparently outline a consistent methodology for how data related to therapeutic alternatives will result in changes to an initial or final offer. As part of this methodology, we ask that CMS ensure data explicitly related to patient value is prioritized. We also ask CMS to emphasize patient experience and value in the evaluation of data.

We applaud CMS's reference to patient experience in its discussion of the clinical benefits of selected drugs and their therapeutic alternatives in § 60.3.3. Defining patient experience in this context and appropriately translating it to a drug's MFP is incredibly important. The NHC urges CMS to consider the following six domains of patient centered engagement and methodological practices as included in the NHC [*Rubric to Capture the Patient Voice: A Guide to Incorporating the Patient Voice into the Health Ecosystem*](#). The rubric was designed through a multi-stakeholder process to elevate meaningful patient engagement and ensure patient voice inclusion is seen in studies and that engagement includes:

- Patient Partnership;
- Transparency;
- Representativeness;
- Diversity;
- Outcomes Patients Care About;
- Patient-Centered Data Sources and Methods; and
- Timeliness.

Additionally, the NHC urges CMS to prioritize patient experience and patient experience data among the many factors the Agency identifies in the guidance as sources that will inform an initial/final offer. Specifically, CMS should ensure that among the data sets that inform any initial or final offer, patient experience data should have an outsized impact. CMS should also articulate how patient experience data influenced initial and final offers.

The NHC appreciates that CMS will consider evidence about alternative treatments to the selected drug, specifically on the categories included in the statute and identified in the guidance, including whether it is a therapeutic advance, FDA approval, effects on specific populations, and addressing unmet needs.

While we understand CMS must adhere to the requirements of the statute, we feel the approach taken in this guidance may represent a very narrow interpretation and could be defined in a way that takes a more holistic view to determine patients' views on the value of drugs compared to their alternatives. CMS is required to consider evidence about therapeutic alternatives to the selected drug, as available. This includes whether it represents a therapeutic advance; prescribing information; comparative effectiveness, including effects on specific populations; and whether it addresses an unmet need. We encourage CMS to consider what evidence may be needed for each identified category and support the broadest scope of evidence that may be considered. For example, when considering whether a product represents a therapeutic advance, it is important to consider whether the advance is based on outcomes important to patients, including non-clinical outcomes such as productivity or independence. The patient community is well suited to collect and provide this type of information, though a more thorough approach to patient engagement, as explained below, will help CMS better understand a range of elements important to patients to help direct patient organizations toward data that will best suit CMS' needs.

Need for Broader, Consistent Patient Engagement

In addition to the opportunity to submit data, the NHC urges CMS to develop further initiatives to solicit feedback from the patient community. These processes could be comparable to the FDA's work in PFDD.¹

CMS should develop a patient engagement infrastructure that creates an ongoing dialogue about IRA implementation and systemic issues with those most affected by them. This can include:

- Creating a patient ombudsman charged with oversight of implementation;
- Convening public roundtables of disease or treatment-specific experts from the patient and disability communities for each drug selected for MFP negotiation; and
- An Administrator-level Patient Advisory Committee to provide overall feedback on this program and other work of the Agency.

This infrastructure could help patients and caregivers provide input to CMS about domains that will inform negotiations such as:

- The impact of the condition on patients and their family caregivers, and how it affects their daily activities, physical functions, and quality of life – overall and across key domains: social, physical, emotional, and functional;
- Outcomes that are most important to the patient, both clinical and non-clinical (e.g., goals, daily activities, symptom reduction, or a standard of quality of life);
- Patients' preferences for treatment delivery methods and views on beneficial and negative aspects of treatment effects; and
- Experience on treatment(s) including symptoms and side effects and how the treatment impacts their daily activities, physical functions, and quality of life.

Throughout this process, CMS should be sure to solicit input from diverse communities in order to gain information about the differences among subpopulations and their needs, outcomes, and preferences.

NHC Resources

In addition to the Rubric mentioned above, the NHC has several tools that can help identify and infuse the patient experience into the value discussion. These include the [Patient Experience Mapping Toolbox](#), which was developed to help researchers capture patient experience data more holistically and in a standardized manner across chronic diseases. The Toolbox includes project planning and data collection tools.² We have also created a Blueprint for the development of [Patient-Centered Core Impact Sets \(PC-CIS\)](#), which address

¹ "Externally-Led Patient-Focused Drug Development Meetings." U.S. Food and Drug Administration, FDA, 29 July 2022, <https://www.fda.gov/industry/prescription-drug-user-fee-amendments/externally-led-patient-focused-drugdevelopment-meeting>

² All patient-facing tools in the Toolbox were reviewed externally by health literacy experts and refined through patient interviews. To encourage uptake, the Toolbox is made available free for public use.

inconsistencies between what is important to patients and the information that is typically collected in research and care. A PC-CIS is a standardized, patient-derived, and patient-prioritized list of the most important impacts - both clinical and non-clinical - a disease and/or its treatments have on a patient's health and daily life, and that of their family and caregivers.

§50.2 and §60.3.3: Utilization of Quality-Adjusted Life-Years (QALYs) in the Negotiation Process

The NHC greatly appreciates CMS stating that it will not use metrics such as QALYs. Any evidence that values extending the life of some individuals less than extending the life of other individuals based on disability status, age, or other special populations (e.g., children or those of marginalized status, including the patient community of color) is completely inappropriate. All patients deserve to be treated equally, and thus we laud CMS' adherence to the statute and decision to separate out and exclude QALY metrics from data that otherwise factor in QALYs. However, we are concerned that CMS may not effectively eliminate QALYs from analysis by utilizing studies that use QALY-related data from secondary sources, or that CMS may over-exclude analyses that are otherwise helpful in establishing the value of a drug. Therefore, the NHC requests that CMS offer more clarity into exactly how it will exclude QALY-based metrics from analysis of certain evidence in value-based decisions. The NHC also requests that CMS highlight when and how the agency removed QALY-based metrics from consideration in MFP justification documentation.

While it is clear both in the statute and this guidance that QALYs will not be used as a base for evaluations, CMS requests input on what other measures might be appropriate or inappropriate. While the NHC does not have positions on other specific measures, we do think that it is important that CMS not rely on a single metric and look at a wide variety of sources to take a holistic approach to this data. One potential approach to aggregate the different dimensions of value is multi-criteria decision analysis. As discussed in the NHC's 2020 white paper on the topic,³ patient value is multi-faceted, and any attempts to distill important dimensions of patient value and benefit into a single number is fraught. We recommend the negotiation process leverage metrics that are driven by patient experience data and patient input and are patient-centered.

§60: Input Process for Future Program Guidance

The NHC appreciates the opportunity to comment on initial program guidance for IPAY 2026 and seeks clarification on processes for seeking feedback moving forward. The NHC requests insight on what opportunities CMS plans to put forward for stakeholders to provide formal input into adjusting future program guidance and whether there will be a comment opportunity to inform negotiation for IPAY 2027 and beyond. The NHC believes that CMS may need to reevaluate methodology for various pieces of the negotiation process, including aggregating drugs to determine MFP. The negotiation program is a new policy that is being implemented in a non-traditional manner. As such, the NHC believes CMS should be nimble and responsive to

³ <https://nationalhealthcouncil.org/additional-resources/patient-centered-multi-criteria-decision-analysis/>

feedback from stakeholders and the policy is implemented in future years. To do so, CMS should establish a meaningful process for 1) patients and other stakeholder to provide consistent feedback on the experience of IPAY2026 and 2) CMS to evaluate policy decisions made for the initial year of negotiation and incorporate necessary changes quickly for future years.

§ 60.6.1 Explanation for the MFP

The explanation for the MFP will be a critical tool in the continuous improvement of the negotiation program, as well as a tool the patient advocacy community will use to learn and improve our ability to participate in the process. We urge CMS to assure that these explanations are clear, accessible, and transparently available. We also ask that they include critical information about what data was used to develop the MFP and how specifically it was used. We are especially interested in information about how patient experience data was incorporated and weighed against other factors. Including this information in the explanation will help patient advocates develop the most useful data for future negotiations.

We also note that CMS' March 1, 2025 deadline for publishing explanations of 2026 MFPs coincides with deadlines for stakeholders to submit information on selected drugs for IPAY 2027, which will make it difficult for stakeholders to glean insight from the explanations to refine and improve their data. We urge CMS to reevaluate the timeline for releasing the explanation to encourage improved stakeholder submissions.

§110: Requirements for Coverage

While the patient community is incredibly supportive of the Part D redesign and out-of-pocket cap, we understand plans will face higher liability moving forward. These shifting incentives, combined with potentially changed market dynamics created by the negotiation process, make it more important than ever that CMS ensure access to medicines and create guardrails such as limiting burdensome barriers such as prior authorization and step therapy. While some utilization management protocols may be grounded in sound clinical decision making, such as prior authorization to limit drug-to-drug interactions or to prevent overprescribing of potentially addictive medication, the development of such protocols is typically done without much or any patient input, and the rationale for such decisions is not typically made public. By defining coverage requirements more explicitly, CMS reduces the risk of plans denying coverage for products vital to a patient's comprehensive care plan. If a plan is receiving a lower price based on a maximum *fair* price, the benefit should be fully conveyed to beneficiaries through *fair* access. Conversely, it is crucial CMS continuously work to ensure access and remove barriers to both negotiated and non-negotiated drugs that providers and patients agree are necessary and appropriate.

Moving forward, the NHC believes that it will be important for CMS to clearly outline a definition of coverage requirements, either in this guidance and/or in any upcoming Part D regulations and payment rules. Appropriate guardrails should be established to assure that patients are, at the very least, no worse off in terms of access than they previously were.

Overarching Comment: Oversight and Continuous Improvement

Given the significant impact this new program and other changes such as the redesign of the Part D program will have on the drug delivery system, CMS must have proper systems in place to monitor impacts to ensure implementation of the IRA achieves our shared goal of increasing access and affordability for patients. At a minimum, CMS should monitor whether people see the savings they are expecting, whether future plan designs inappropriately restrict access to either negotiated or non-negotiated drugs, including through increased utilization management, and the creation of other barriers to access. And while this guidance only applies to Part D drugs, one additional consideration for the Part B program will be monitoring prescribing behaviors to ensure there are not incentives for providers to prescribe non-negotiated products. Furthermore, CMS should monitor the impact of drug selection criteria to ensure it is not creating disincentives to conduct follow-on research on additional indications or new formulations that can demonstrate additional benefit such as greater adherence or reduced side effects.

CMS has made it clear that this guidance is only for the first year of negotiation, and there likely will be the need for adjustment as the mechanisms are put in place. We recommend CMS undertake a formal process for seeking input from patients on the impacts of IRA implementation soon after full implementation and regularly after that. This will help identify areas of concern such as those listed above and identify any needed adjustment.

Additional Comments on Drug Selection

Although we are aware that you are issuing Section 30 on drug selection as final, we have a few comments we hope CMS will consider as you implement the drug selection process for negotiation.

For example, we are concerned about the effects that aggregation of drugs with the same active moiety or active ingredient in the selection process could have on subsequent research. We want to make sure that manufacturers aren't discouraged from developing new indications and forms of administration that may improve patient adherence and/or outcomes. Without appropriate guardrails, CMS' broad definition of drugs eligible for negotiation may discourage these types of improvements. While manufacturers would ideally bring products to market with as many indications as possible, one potential consequence could be a significant delay in initial market entry and access. The NHC is aligned with CMS' desire to eliminate potential gaming of extending patent life or time before negotiation. However, we fear this may be an overly broad approach that does not consider the patient perspective on whether new formulations or forms of administration improve patient care and believe there are better approaches to address this issue. If CMS is unable to reconsider this approach, we request that you undertake future notice and comment processes with adequate time for stakeholders to consider the impact of selection criteria as the negotiation process is implemented.

Conclusion

The NHC strongly upholds that decisions on value should be driven by the patient perspective. The best results occur when patient organizations can engage and when patients are not limited by policies that restrict access to products that best meet their individual needs. The NHC urges CMS to carefully consider these comments for this and future guidance and allow for patient voices to be heard and emphasized throughout the negotiation process.

The NHC thanks CMS for the opportunity to provide input on this important issue. Please do not hesitate to contact Eric Gascho, Senior Vice President of Policy and Government Affairs, if you or your staff would like to discuss these comments in greater detail. He is reachable via e-mail at egascho@nhcouncil.org.

Sincerely,

A handwritten signature in black ink that reads "Randall L. Rutta". The signature is written in a cursive, flowing style.

Re: Medicare Drug Price Negotiation Program Guidance

Submitted via email: IRAREbateandNegotiation@cms.hhs.gov

Dear Administrator Seshamani:

The National Hispanic Council on Aging (NHCOA) urges you to reconsider your released implementation guidance for the Drug Price Negotiation Program within the Inflation Reduction Act (IRA). This program adversely impacts medical innovation and access to critical medicines relied upon by countless seniors under Medicare Part D. Minority communities, including Hispanic seniors, would unduly suffer as a result of fewer medical breakthroughs. The IRA's price-setting program works against the scientific community's charge in bringing about new medicines that help underserved communities overcome barriers to higher-quality healthcare. As an organization dedicated to the well-being of older Hispanic Americans, our concerns with CMS' implementation of the IRA are numerous.

For one, the guidance fails to take into account the health equity learnings in recent years. As we emerged from the COVID-19 pandemic, the unique health challenges faced by minority communities were made evident to many. In 2022, NHCOA conducted a poll of Black and Hispanic voters in which we found that half of voters of color experience barriers to care when it comes to our healthcare.¹ Price setting provisions in the IRA would drastically disincentivize innovations in medicines, which can be helpful in overcoming barriers to care for certain conditions. Our country must work hard to ensure that minority communities, including Hispanic seniors, are able to better access the medicines they need. This guidance does not provide details on how it would remove barriers to care.

In addition, the language surrounding Medicare Part D, in particular, would greatly harm Hispanic seniors enrolled in the program. By artificially mandating drugs to be sold at a certain price, the ability of manufacturers to produce at levels to meet critical demands would be significantly strained. With fewer incentives to invest in innovation, research and development efforts would be

¹ National Hispanic Council on Aging & National Minority Quality Forum (2022). Results for 2022 Poll Among National Voters. <https://nhcoa.org/wp-content/uploads/2022/05/NHCOA-and-NMQF-Polling-Memo-2.pdf>

reined in, and Medicare beneficiaries would ultimately have fewer treatment and therapy options available to them.

This disruption of Medicare Part D, as outlined, demonstrates a failure to recognize the true ways we can address the challenges older Hispanics face when it comes to healthcare. Our government ought to ensure that drug middlemen pass discounts and rebates to patients, that copay accumulators are eliminated, and that PBM price hiking practices are thwarted. If we are serious about helping seniors afford their treatments, implementing these meaningful solutions would be prioritized.

Once again, we urge you to reconsider the elements of this guidance and take into consideration the potential consequences it will have on communities of color, especially seniors. We urge you to work closely with stakeholder and patient groups to find ways to truly explore solutions to address the barriers to care in the healthcare system, particularly those of communities of color and older adults.

Sincerely,

Dr. Yanira Cruz
President and CEO

RE: Medicare Drug Price Negotiation Program Guidance

Submitted via IRAREbateandNegotiation@cms.hhs.gov

The National Infusion Center Association (NICA) is a nonprofit organization formed to support non-hospital, community-based infusion centers caring for patients in need of provider-administered medications. To improve access to medical benefit drugs that treat complex, rare, and chronic diseases, we work to ensure that patients can access these drugs in safe, more efficient, and cost-effective alternatives to hospital care settings. NICA supports policies that improve drug affordability for beneficiaries, increase price transparency, reduce disparities in quality of care and safety across care settings, and enable care delivery in the highest-quality, lowest-cost setting.

Thank you for the opportunity to comment on the March 15, 2023 Memorandum entitled "Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments."

As we expressed to the Congress throughout the legislative process leading to enactment of *Build Back Better*, we are concerned that, if the Medicare Drug Price Negotiation Program is administered on a prospective basis for Part B drugs, providers will be left underwater for medications subject to the new maximum fair price (MFP) mechanism. While the legislation attempted to ensure that purchasing providers can access the MFP, there is no guarantee of that in the complex world of pharmaceutical middlemen, nor is there any way to ensure that providers who cannot access the MFP are made financially whole. In light of these concerns, we urge CMS to implement the MFP mechanism in a retrospective manner, by which the drug company would reimburse Medicare for the amount by which its average sales price (or other metric as specified by the legislation) exceeds the MFP.

Office-based and ambulatory infusion centers play a key role as the most efficient setting for drug administration, compared to hospital outpatient departments and, in many cases, even compared to the home. Recently, the Employee Benefit Research Institute (EBRI) quantified the cost differences in healthcare services by site of treatment, including for the delivery of specialty medications. The EBRI report found that, "[I]f site-of-treatment price differentials for specialty medications were eliminated,

employers and workers would save as much as 36 percent, depending on the medication.”¹ Reducing our nation's in-office drug administration capacity would be a counterproductive step if the goal is to reduce drug spending while still ensuring that patients can access complex drug administration in high-quality, low-cost settings. We are concerned that leaving providers underwater for MFP medications would cause such a reduction in capacity. A loss or consolidation of community-based infusion access points would have the effect of driving patients into the hospital for infusion, which is by far the most expensive setting: for some of the medications studied by EBRI, the hospital outpatient department charges were *more than double* those of office-based administration. This has an impact on our overall drug spending, but it also impacts patients, whose cost-sharing reflects these differentials.

That is why we urge CMS to administer the MFPs via a retrospective rebating process, which would avoid inadvertent disruptions to the office-based delivery channel by leaving providers out of the mechanism entirely. That would meet the twofold goal of delivering deep savings for Medicare, while protecting patient access to provider-administered medications.

Thank you for your consideration. If there is any additional information I can provide, please do not hesitate to contact me.

Sincerely,

A handwritten signature in black ink that reads 'Brian Nyquist'. The signature is fluid and cursive, with the first name 'Brian' and last name 'Nyquist' clearly legible.

Re: "Medicare Drug Price Negotiation Program Guidance."

Submitted via email: IRAREbateandNegotiation@cms.hhs.gov

Dear Administrator Seshamani:

The National Minority Quality Forum (NMQF) welcomes this opportunity to share perspectives and comments for improving the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026.

NMQF is a research and educational organization dedicated to reducing patient risk by assuring optimal care for all. We are a not-for-profit, nonpartisan organization that integrates data and expertise in support of initiatives to eliminate health disparities. NMQF's vision is an American health services research, delivery, and financing system whose operating principle is to reduce patient risk for amenable morbidity and mortality while improving quality of life.

We come to these comments with the historic knowledge that the voices of concern from the Health Equity Movement about design failures in major Medicare initiatives have largely been ignored. As a result, structural flaws have translated into increased risk for poor health outcomes for millions of minorities and persistent inequities in the program are common. There is an extensive body of peer-reviewed literature that documents these disparities in nearly all phases of the program. By way of an example, attached is an annotated bibliography with over 10,000 references to racial and ethnic disparities in the Medicare program dating back to the 1970s.

Against this backdrop, we are encouraged by President Biden's January 20, 2021 "Executive Order on Advancing Racial Equity and Support for Underserved Communities Through the Federal Government," and February 16, 2023 "Executive Order on Further Advancing Racial Equity and Support for Underserved Communities Through The Federal Government" which state,

April 14, 2023

“Our Nation deserves an ambitious whole-of-government equity agenda that matches the scale of the opportunities and challenges that we face...It is therefore the policy of my Administration that the Federal Government should pursue a comprehensive approach to advancing equity for all, including people of color and others who have been historically underserved, marginalized, and adversely affected by persistent poverty and inequality. Affirmatively advancing equity, civil rights, racial justice, and equal opportunity is the responsibility of the whole of our government. Because advancing equity requires a systematic approach to embedding fairness in decision-making processes, executive departments, and agencies (agencies) must recognize and work to redress inequities in their policies and programs that serve as barriers to equal opportunity.”

This comprehensive approach must mean an enduring collaboration between the Center for Medicare and Medicaid Services (CMS) and all the communities that it serves. The Biden administration’s commitment to equity has given us great hope.

The Inflation Reduction Act (IRA) of 2022 is bringing sweeping changes to Medicare including the new Medicare Drug Price Negotiation Program¹. The IRA offers an opportunity to advance equity in the Medicare program. We support, for example, the IRA provisions that could benefit patients, including a \$2,000 cap on out-of-pocket-expenses, the expansion in eligibility of the Part D low-income drug subsidy, and the elimination of enrollee cost-sharing for vaccines. Yet, there is still more that can be done to address inequities in Medicare.

In this comment letter, we want to not only remind CMS administrators that historic inequities exist in the program that were not resolved by prior administrations and that their work should be guided by the President’s executive order. What gives us pause is that the released guidance offers little insight as to whether equity will be addressed in the implementation, and how success in that regard will be measured. Certainly, the significant changes contemplated by the drug negotiation provisions offer an opportunity to address longstanding disparities in Medicare.

NMQF respectfully requests that CMS align its implementation plans with the President’s executive orders. CMS has an opportunity to improve equity in Medicare, and if done, it should release to the public documentation that celebrates this historic change. CMS in its planning and implementation should ensure that it is not elevating risks of poor outcomes for minorities as demonstrated in decades of evidence. Most importantly, beneficiary risk mitigation must be the prime directive. By this commitment to equity, CMS can move us toward cementing an end to disparities in healthcare by providing better care for all Americans.

We hope that this comment letter invites a shared dialogue on how we can better examine and

address disparities in the program. We offer here to be a resource to help ensure that Inflation Reduction Act implementation does not expand the peer-reviewed literature on inequities in Medicare.

Sincerely,

Gary A. Puckrein, PhD

Meena Seshamani, M.D., Ph.D.
Deputy Administrator and Director of the Center
for Medicare
Centers for Medicare & Medicaid Services
7500 Security Boulevard
Baltimore, Maryland 21244-1850

Dear Administrator Brooks-LaSure and Dr. Seshamani,

On behalf of the more than 25 million Americans living with one or more of the over 7,000 known rare diseases, the National Organization for Rare Disorders (NORD) thanks the Centers for Medicare and Medicaid Services (CMS) for their extensive engagement with the rare disease community around implementation of the Inflation Reduction Act (IRA). NORD appreciates this opportunity to provide comments on the draft guidance 'Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191- 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments,' hereafter referred to as the "Negotiation Program" guidance.

NORD is a unique federation of non-profits and health organizations dedicated to improving the health and well-being of people living with rare diseases. NORD was founded 40 years ago, after the passage of the Orphan Drug Act (ODA), to formalize the coalition of patient advocacy groups that were instrumental in passing that landmark law. Our mission has always been and continues to be to improve the health and well-being of people with rare diseases by driving advances in care, research, and policy.

NORD appreciates CMS' willingness in the Negotiation Program guidance (Section 30.1.1) to consider additional actions to "best support orphan drug development" and is pleased to submit these comments to help CMS make good on its commitment to the rare disease community. These comments are intended to supplement and expand on the April 14th comment letter submitted by NORD and 100 other patient advocacy organizations that support rare disease patients (available in the appendix).

For many Americans living with a rare disease, out of pocket prescription drug costs create significant financial barriers and hinder patient access to needed therapies. Key provisions in the IRA, including the \$2,000 annual and amortized monthly caps on out-of-pocket costs for Medicare Part D beneficiaries, as well as expanded eligibility for financial assistance for low-income beneficiaries, ensure that more rare disease patients on Medicare will be able to afford the life-altering therapies they need. Robust patient education, particularly about the opt-in requirement to the smoothing mechanism, will be critical to ensuring patients have access to and benefit from these provisions of the IRA. While outside the scope of this guidance, NORD would welcome the opportunity to partner with CMS to help educate the rare disease community as IRA-authorized benefits become available to Medicare beneficiaries at the appropriate time.

As implemented under the draft guidance, however, the Negotiation Program may adversely impact rare disease drug development. Before the Orphan Drug Act was enacted in 1983, fewer than 40 Food and Drug Administration (FDA) approved therapies were available to treat rare diseases.¹ Thanks to the ODA, rare disease therapies now consistently account for more than half of FDA approvals for new molecular entities.² Still, more than 90% of the more than 7,000 known rare diseases do not have an FDA approved treatment, making continued investment in rare disease research and innovation critical to the rare disease community.³ The section 1192(e)(3) exclusion for orphan drugs approved to treat a single rare disease could help sustain this innovation, as will the broader exclusion for “low spend” drugs with less than \$200 million in annual Medicare spending. However, the small patient populations and medical complexity associated with rare diseases create unique challenges to drug development. These small population sizes and complex, heterogenous disease manifestations also result in a more limited availability of data on issues such as clinical benefit and therapeutic alternatives, making it more difficult to determine a fair negotiated price for drugs that treat rare diseases compared to other therapies. Therefore, NORD appreciates the opportunity to highlight additional ways that CMS, consistent with the statute, can further support rare disease drug development in implementing the Negotiation Program.

Successful Negotiation Program implementation hinges on a careful balance between greater affordability and maintaining appropriate incentives for continued rare disease drug development. NORD urges CMS to address four areas of concern in future guidance:

1. Actively engage patients and create opportunities to provide meaningful data and insights;
2. Ensure rare disease patients have access to the negotiated therapies;
3. Further clarify the scope and timing of the orphan drug exclusion; and
4. Begin tracking the impact of the IRA on innovation and patient outcomes now.

Specifically, CMS should take the following steps to support rare disease patients and families:

1. Expand and strengthen data collection and engagement opportunities to ensure patients can meaningfully contribute their unique insights on the negotiated drug and its alternatives.

NORD commends CMS’ efforts to consider data on clinical benefit, therapeutic alternatives, and unmet medical need in the negotiation process and to incorporate relevant patient and provider perspectives. NORD thanks CMS for recognizing, in section 60 of the draft guidance, the unique and nuanced value orphan drugs can bring to specific subsets of the patient population, including those with few or no therapeutic alternatives. The agency’s stated objective to assess value in an indication-specific manner, including some off-label uses, is critical for CMS to fully understand and account for the complex treatment trade-offs and unmet needs that exist within the rare disease patient community.

Moreover, we are encouraged that the draft guidance explicitly recognizes the value of patient experience data, including its nuances, in section 60.3.3, and that not all patients are necessarily sharing the same

Innovations in Therapy Development for Rare Diseases Through the Rare Disease Cures Accelerator-Data and Analytics Platform. *Ther Innov Regul Sci*. 2022 Sep;56(5):768-776. doi: 10.1007/s43441-022-00408-x.

views and experiences. For instance, the science of patient engagement has long recognized that patient experience data may reflect differences depending on disease progression or a patient's cultural, geographic, and socio-economic background. While we are grateful CMS recognizes the value of patient experience data, we strongly encourage CMS to expand the opportunities and strengthen the processes for providing such input to the agency as part of the negotiation process.

NORD is concerned that CMS' proposed approach would make it essentially impossible for patients and providers to submit meaningful data. CMS plans to largely rely on voluntary, public data submissions, on very short timelines, without meaningful data standardization, using complicated forms written at too-advanced reading levels and through hard-to-navigate processes that are neither intuitive nor patient-friendly. Patients will either not become aware of data collection efforts in time, or struggle to navigate the complex submission process. In addition, the required attestations are worded in a way that will likely discourage many patients from submitting data. To the extent patients will feel compelled to submit data containing Personal Identifiable Information (PII) and Personal Health Information (PHI), the data collection also raises privacy concerns.

Moreover, NORD foresees challenges in aggregating and analyzing individual patient and provider experience data submitted through this process. The data will be collected without a sampling frame and likely not representative while the collection method essentially makes it impossible to determine or account for such inherent biases in the data. In addition, the lack of standardized questions and scientific rigor will likely render this data largely anecdotal. This would contrast sharply with appropriate qualitative and/or quantitative research methodologies that would collect information in a scientifically rigorous and reproducible manner. A good example of such rigorous approaches is data collected through the FDA's patient-focused drug development (PFDD) meetings or patient surveys. Specifically, FDA's "Patient-Focused Drug Development: Collecting Comprehensive and Representative Input" guidance⁴ provides detailed and tangible advice on operationalizing and standardizing data collection and data management in ways that are feasible for the rare disease patient community.

CMS will have to refine its proposed approach to incorporate meaningful external data sources. CMS plans to supplement the aforementioned data submitted by the public with relevant published data retrievable through literature searches. Unfortunately, for many rare diseases, data relevant to determine a negotiated drug's clinical benefit, therapeutic alternatives, or unmet medical need does not currently exist in peer-reviewed journals or consensus treatment guidelines. Additionally, the lack of disease-specific International Classification of Disease (ICD-10) codes for most rare diseases makes Real-World Data (RWD) sources such as Electronic Health Records (EHRs) or medical claims data largely infeasible for many rare diseases. This is a recognized challenge within rare diseases.

FDA's Voice of the Patient (VOIP) reports are designed to address this data scarcity and are critical to patient-focused drug development by assembling meaningful information on how patients evaluate therapeutic alternatives or characterize the unmet need and clinical benefit of alternatives. However, these data are not indexed in a way that would clearly find them in a traditional literature search. CMS should consider all relevant data collected as part of the FDA approval process in the negotiation process. Moreover, patient and provider engagement will be critical to ensure CMS is aware of and able to leverage all other available and relevant data sources regardless of how they are indexed.

⁴ FDA GFI: Patient-Focused Drug Development: Collecting Comprehensive and Representative Input; available at <https://www.fda.gov/media/139088/download>; accessed 4/2023

CMS will consequently have to collect data on treatment alternatives, clinical benefits, and unmet medical need for rare diseases *de novo*, including from patients, caregivers, and providers. Patients and caregivers have key insights on issues such as determining the value of a therapy and how it compares to potential alternate treatment options. Rare disease patients are often uniquely positioned to share the challenges associated with unmet medical needs - when there are no or very few options available to treat their condition - and the benefits to themselves, their families, and the community from a safe and effective therapy. Patient experience data will be particularly important given CMS' desire to evaluate drug prices on an indication-specific level including certain off-label uses, which are common in the rare disease space albeit notoriously hard to study.⁵ Because published data to assess these specific uses remain scarce, patients and providers are often the best experts from which to elicit such information related to rare disease treatments.

For the reasons outlined above, NORD urges CMS to:

a. Simplify and streamline the data submission process for patients, caregivers, and providers to eliminate barriers to their providing the requested information. This should include pre-testing the forms, attestations, and instructions with representatives of the relevant community to ensure they are clearly understood and easy to navigate, including by individuals with visual and other impairments. Because this data submission is voluntary and not subject to the 30-day statutory data submission timeline for mandatory manufacturer-provided data, CMS should work with the patient community to establish feasible timelines that will be workable for the community. FDA listening sessions, PFDD meetings, and other FDA-led initiatives routinely collect meaningful patient experience data in ways that works for rare disease patients and families and can serve as another valuable guide and resource for CMS, including all applicable attestations and data protections.

b. Clarify what information the agency is seeking from patients to allow data standardization and aggregation. The short time for submitting data makes it imperative to provide detailed instructions as early as possible, before the negotiation period begins, to facilitate and streamline the collection and submission of meaningful data. Clarifying the key data elements ahead of time will also empower patient advocacy groups and other important stakeholders to proactively collect and collate relevant information in a way that is scientifically rigorous and representative of the relevant patient community.

c. Organize CMS-led patient listening sessions specific to selected drugs to collect representative data within the different drug indications to inform CMS' initial offer for a negotiated drug. In planning for these sessions, CMS should use FDA patient listening sessions as a roadmap and work closely with the various impacted patient communities to develop a representative and meaningful data collection effort. For instance, while we appreciate why CMS intends to only focus on pharmaceutical alternatives and to primarily consider alternatives in the same drug class, we recognize non-pharmaceutical options such as surgery are often the only viable alternative for our patient populations and that therapeutic alternatives in other drug classes and with other mechanisms of actions may in fact be the most appropriate alternatives for some of our patients. Engaging the patient community in planning the listening sessions will help ensure that these alternatives are appropriately considered. Close collaboration with FDA will enable CMS to benefit from FDA's relevant best practices and extensive experience.

⁵ Fung A, Yue X, Wigle PR, Guo JJ. Off-label medication use in rare pediatric diseases in the United States. *Intractable Rare Dis Res.* 2021 Nov;10(4):238-245. doi: 10.5582/irdr.2021.01104. PMID: 34877235; PMCID: PMC8630459.

d. Include consistent and granular summaries of the data and assumptions on which each negotiation was based, including patient experience data. We urge CMS to report a detailed and standardized summary of the data relied upon in the negotiation process including the therapeutic alternatives, clinical benefit, off-label use, and unmet need for each indication and the data sources relied upon. CMS should further break out the use of patient experience data and patient-reported outcomes; list data identified by CMS through literature searches and guideline review; and identify primary data, such as claims, electronic health record (EHR), or other real-world-evidence, generated and collated by CMS. This level of transparency will be important to create consistency and trust in the negotiation process. Clearly breaking out the use of different data sources will also motivate the creation of valuable data sources including patient experience data for future negotiation years. In fact, much of the data for rare diseases collected through this process will be unique and have value beyond this specific negotiation process.

2. Give negotiated drugs a preferred place on the formulary and minimize utilization burdens to ensure patients have ready access to the negotiated drugs.

NORD supports section 1860D-4(b)(3)(I) of the Social Security Act which will require Medicare Part D negotiated drugs to be included on Part D plan formularies. However, we encourage CMS to take additional steps to ensure rare disease patients benefit from reduced out-of-pocket expenses associated with better formulary tier placement and to better assure their timely access to negotiated drugs through reduced utilization management processes.

Often, rare disease drugs are placed on the non-preferred or specialty tiers of Medicare Part D plan formularies, resulting in significant out-of-pocket costs and access delays. For instance, a study published in the *American Journal of Managed Care* (AJMC) in 2020 found “on average, 85% of orphan drugs on a [Medicare Part D] formulary were placed on its highest cost-sharing tier.”⁶ Similarly, a KFF analysis of 2023 Medicare Part D plans found that in 12 of the 16 the national prescription drug plans, coinsurance amounts for non-preferred drugs range from 40% to 50%, showing similar trends as in previous plan years.⁷ Moreover, 44% of these plans’ enrollees will face coinsurance ranging from 15% to 25% for preferred brands⁸, meaning less predictable and often higher out of pocket costs for patients compared to flat copays. KFF also found that the median coinsurance for drugs on the specialty tier was 25%.⁹

Another common source of treatment delays or denials for rare disease patients is related to prior authorization and step therapy. NORD believes health care providers, in partnership with their patients, are best positioned to choose the right therapy to treat the often-complex health care challenges faced by those with a rare disease. Yet, a 2020 study found that a staggering 76% of orphan drugs on Medicare Part D formularies were subject to prior authorization.¹⁰ Similarly, a 2021 study¹¹ found that nearly 40

⁶ Yehia, F., Segal, J.B. Predictors of Orphan Drug Coverage Restrictions in Medicare Part D. 2020 Sep; AJMC 26(09); accessible at <https://www.ajmc.com/view/predictors-of-orphan-drug-coverage-restrictions-in-medicare-part-d>

⁷ Kaiser Family Foundation (KFF): Medicare Part D: A First Look at Medicare Drug Plans in 2023; available at: <https://www.kff.org/medicare/issue-brief/medicare-part-d-a-first-look-at-medicare-drug-plans-in-2023/>; accessed 4/2023

⁸ Kaiser Family Foundation (KFF): Medicare Part D: A First Look at Medicare Drug Plans in 2023; available at: <https://www.kff.org/medicare/issue-brief/medicare-part-d-a-first-look-at-medicare-drug-plans-in-2023/>; accessed 4/2023

⁹ Ibid.

¹⁰ Yehia, F., Segal, J.B. Predictors of Orphan Drug Coverage Restrictions in Medicare Part D. 2020 Sep; AJMC 26(09); accessible at <https://www.ajmc.com/view/predictors-of-orphan-drug-coverage-restrictions-in-medicare-part-d>

¹¹ Lenahan, K.L., Nichols, D.E., Gertler, R.M., Chambers, J.D.: Variations in Use and Content of Prescription Drug Step Therapy Protocols, Within and Across health Plans. 2021, Nov; Health Affairs 40(11); <https://doi.org/10.1377/hlthaff.2021.00822>; available at <https://www.healthaffairs.org/doi/full/10.1377/hlthaff.2021.00822>

percent of the specialty drugs offered within the 17 largest commercial health plans included step therapy in the drug coverage plan. Additionally, 55.6 percent of the step therapy protocols were found to be more stringent than clinical guidelines,¹² delaying timely patient access to appropriate care.¹³

From CMS' perspective, negotiated drugs will have been appropriately valued and therefore, we encourage CMS to:

a. Require that a negotiated drug be placed on a higher formulary tier to improve patient access through further reduced patient out-of-pocket costs. While the \$2,000 annual out-of-pocket cap and the smoothing mechanism to spread a patient's out-of-pocket costs out over the plan year will be tremendously helpful to Medicare patients living with a rare disease, coinsurance makes it more difficult for patients to predict their out-of-pocket expenditures. Requiring a negotiated drug's placement on formulary tiers that typically have copays instead of coinsurance can assist patients with both planning for prescription drug expenses and their ability to pay for their medications at the time they need them.

b. Significantly reduce or eliminate step therapy and prior authorization barriers in Medicare Part B and Medicare Part D for negotiated drugs. To further ensure timely access to these drugs, NORD urges CMS to include utilization management protections for negotiated drugs that have been determined by CMS to be appropriately priced. In the 2024 Medicare Advantage and Part D Final Rule (CMS-4201-F) released on April 5, 2023, and effective for the CY 2024 plan year, CMS will require "an approval granted through prior authorization processes must be valid for as long as medically necessary to avoid disruptions in care in accordance with applicable coverage criteria, the patient's medical history, and the treating provider's recommendation, and that plans provide a minimum 90-day transition period when an enrollee who is currently undergoing an active course of treatment switches to a new MA plan."¹⁴ NORD encourages the adoption of these or similar requirements for negotiated drugs offered on traditional Medicare Part D plan formularies as well.

3. Ensure CMS' interpretation of the orphan drug exclusion protects vital incentives for rare disease drug development

While the IRA includes a limited exclusion for orphan drugs that only treat one rare disease from drug price negotiation, NORD is greatly concerned with the potential impact of CMS' proposed interpretation of the exclusion on future innovation in rare disease drug development. Today, about 60 percent of all orphan drugs have a single FDA-approved indication, whereas only about 20 percent are FDA-approved for both orphan and non-orphan indications.¹⁵ Among the drugs that only have orphan indications, fewer than a quarter have more than one FDA-approved indication and fewer than 10 percent have three or more approved indications.¹⁶ Similarly, among the drugs that have both orphan and non-orphan indications, less than 20 percent have 3 or more orphan indications. This indicates that to date, relatively few orphan drugs have been successfully developed for more than one disease.

¹⁵ IQVIA: Orphan Drugs in the United States. 2020; Dec; available at: <https://rarediseases.org/wp-content/uploads/2022/10/orphan-drugs-in-the-united-states-NRD-2020.pdf>; accessed 4/2023

¹⁶ Ibid.

Still, developing already-approved therapies to treat additional rare diseases is a critical strategy to address the rare disease community's significant unmet need because these drugs have already proven to be safe for humans. In fact, according to a recent analysis, over 3,000 unique drugs have been FDA-designated as rare disease drugs and studied, with about a quarter of these drugs being designated for more than one rare disease.¹⁷ Serial innovation and the investigation and development of multiple rare disease indications of use is an increasingly important dimension of orphan drug development, making the preservation of incentives to further develop drugs to treat additional orphan diseases after they have entered the market particularly important.

NORD also recognizes that relatively few orphan-only drugs will meet the annual revenue threshold of \$200,000,000 in combined expenditures under Medicare Parts B and D to make a drug negotiation-eligible. However, due to the complexity and long timeline from initial drug discovery and early research and development to FDA approval, drug sponsors are making decisions today that will impact their investments and drug development pipeline for decades to come. Remaining uncertainty about if, when, and how rare disease drugs will become negotiation eligible creates real business risks that work as strong disincentives to develop drugs for the limited populations impacted by rare diseases. Therefore, as part of the negotiation process, NORD urges CMS to make clear that research and development efforts in support of innovative therapies that help address unmet needs will be treated favorably in the price negotiation process.

We thank CMS for clarifying in the draft guidance that an orphan drug with multiple FDA-approved indications within the scope of an orphan drug designation for one rare disease (i.e., multiple indications tied to one orphan designation as shown in **Example 1**) remains excluded from negotiation. As a result, drug sponsors will consequently not be discouraged or penalized for further developing a rare disease drug for new sub-populations, such as children, or specific disease subtypes.

Example 1 - Orphan drug with one designation & multiple associated approved indications; CMS already clarified this is excluded from negotiation; this example was selected to be illustrative while reflecting common trends in orphan drug approvals.

Drug 1 (one designation, multiple FDA-approved indications)			
Designations		FDA Approved Indications	
Disease	Year	Year	Population
Rare Disease A	2014	2015	12 years and older
		2016	6 years and older
		1018	2 years and older
		2022	1 year and older

However, NORD is gravely concerned that CMS' interpretation of the orphan drug exclusion might contravene the intent of the ODA by discouraging drug sponsors from developing their drug for additional rare diseases. Specifically, CMS' interpretation of the IRA makes drugs eligible for negotiation as soon as they have been designated under section 526 of the Federal Food, Drug, and Cosmetic Act

¹⁷ Miller, KL, Kraft, S, Ipe, A, and Fermaglich, L. Drugs and biologics receiving FDA orphan drug designation: an analysis of the most frequently designated products and their repositioning strategies. Expert Opin Orphan Drugs. 2022 Mar 1;9(11-12):265-272. doi: 10.1080/21678707.2021.2047021.

(FFD&C) for more than one orphan disease – even if the drug is not actually FDA approved (or indicated) to treat more than one of the designated orphan diseases. For instance, consider **Example 2** and the many other rare disease drugs with similar regulatory history; although this drug has been designated for five different rare diseases, it is only FDA approved to treat a single orphan disease.

Example 2: Orphan drug with multiple designations and one FDA-approved indication; CMS should clarify that that this drug will be excluded from negotiation because while it has five designations, it only has one approved indication.

Drug 2 (multiple designations, one FDA-approved indication)

Disease	Designation Year	FDA Approval Year
Rare Disease B	2007	2017
Rare Disease C	2009	-
Rare Disease D	2016	-
Rare Disease E	2018	-
Rare Disease F	2019	-

Designating an orphan drug under section 526 of the FFD&C Act is done early in the drug development process and much earlier than submission of a New Drug Application (NDA) or Biological License Application (BLA). Orphan drug designation is critical to access to ODA incentives such as funding and tax credits for clinical research to help de-risk this phase of drug development. However, an orphan drug designation does not allow the company to market the drug; it is only the first in many steps towards approval and marketing. In fact, FDA’s Orphan Drug Designations and Approvals database currently contains 6,445 orphan drug designations (including withdrawn designations) compared to only 1130 approved orphan indications, demonstrating that a vast majority of orphan drug designations do not result in any FDA-approved indications – and therefore are largely irrelevant to the pricing considerations central to the Negotiation Program.¹⁸

NORD understands that the language of section 1192(e)(3), due to the manner in which it was drafted, is ambiguous and therefore open to CMS interpretation. CMS states that to qualify for the orphan drug exclusion, “the drug or biological drug must (1) be designated as a drug for only one rare disease or condition under section 526 of the FFD&C Act and (2) be approved by the FDA for only one or more indications within such designated rare disease or condition.”¹⁹ This two-prong test, embodying two separate and distinct criteria, is a possible interpretation of the statute. But under the canons of legislative drafting, if the congressional authors had intended the two clauses to be read *independently*, the proper legislative drafting would have structured the two clauses separately and in sequence. Instead, Congress did not separate the clauses, intending them to be read *together*: that a drug designated for a given “rare disease or condition” has “only [one] approved indication” or multiple “approved... indications” *within the scope of that designation*. CMS substantiates this plain meaning²⁰ of the provision in accepting that

¹⁸ US FDA Orphan Drug Designations and Approvals database; available at <https://www.accessdata.fda.gov/scripts/opdlisting/oopd/index.cfm>; accessed 4/2023

¹⁹ Meena Seshamani, Memorandum to Interested Parties: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments, March 15, 2023, at 10-11.

²⁰ E.g., *Sebelius v. Cloer*, 569 U.S. ___, No. 12-236, slip op. (May 20, 2013).

an orphan drug with **multiple** (“one or more”) FDA-approved indications qualifies for the exclusion provided all such approved indications are within the scope of a **single** (“only one”) **designation**.

A two-prong test also does not best reflect and advance the purposes and function of the Negotiation Program. The cardinal rule of statutory construction is that the whole statute should be drawn upon as necessary, with its various parts being interpreted within their broader statutory context in a manner that furthers statutory purposes.²¹ The proper interpretation of the orphan drug exclusion “in a manner consistent with [the] legislative purposes”²² of the Negotiation Program preserves an intentionally narrow class of qualifying orphan drugs determined upon the basis of a drug’s FDA **approval history** – not on orphan drug designations which have no bearing on, or applicability to, prescription drug marketing or pricing.

In considering the regulatory history for the drug shown in **Example 3**, the approval for Disease H in 2014 should trigger the drug becoming negotiation eligible (assuming it meets the other statutory requirements outlined in the IRA), rather than the Designation for Diseases H or I in 2010, thus preserving vital rare disease research and development incentives. One of the critical “additional actions” that CMS can take to support rare disease research and development would be to revise its guidance to reflect a sound statutory interpretation more fully in line with congressional intent to make an orphan drug negotiation eligible once it has been approved (or indicated) to treat a second disease.

Example 3: Orphan drug with multiple designations and multiple FDA-approved indications; CMS should clarify that an orphan drug with multiple designations and approved indications becomes negotiation eligible when the drug is approved for the second disease (in this example 2014) – NOT upon second designation in 2010.

Drug 3 (multiple designations & multiple FDA-approved indications)

Disease	Designation Year	FDA Approval Year
Rare Disease G	2008	2011
Rare Disease H	2010	2014
Rare Disease I	2010	-
Rare Disease J	2013	-

NORD is also concerned about the potential chilling effect residual uncertainty about CMS’s implementation of the orphan drug exclusion will have on rare disease drug development. CMS remains silent as to when orphan drugs that receive FDA approval for a second disease and therefore lose eligibility for the orphan drug exclusion would become negotiation eligible. Qualifying single-source drugs must have been approved at least 7 years and qualifying single-source biologics must have been licensed at least 11 years to qualify, but CMS has not yet clarified if the 7 or 11 years will be counted beginning on the date of the FDA approval for the second disease that made the drug negotiation eligible or based on the first orphan drug approval. CMS should clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by

²¹ See, e.g., *King v. Burwell*, No. 14-1158 (4th Cir. July 22, 2014) (various provisions of the Affordable Care Act sufficiently indicate an expectation that tax credits will be available to participants in all health exchanges to cast doubt on whether provision specifically making credits available to participants in state exchanges implicitly denies credits to participants in federal exchanges).

²² Robert A. Katzman, *Judging Statutes* 31 (2016), at 10.

FDA for 7 or 11 years to treat the second disease or condition and in doing so, would provide meaningful incentives for continued rare disease drug development.

Considering the **Example 4**, CMS should clarify that – assuming the drug meets the other statutory requirements to become negotiation eligible as outlined in the IRA – the drug would become negotiation-eligible 7 or 11 years from the approval date for Disease O (i.e., in 2026 or 2030, 7 or 11 years from 2019).

Example 4: Orphan drug with multiple designations and multiple FDA-approved indications; CMS should clarify that the statutory period (i.e., 7 or 11 years) before negotiation starts at the approval that made the drug negotiation eligible (in this example 2026 or 2030, 7 or 11 years from 2019) – and not first approval (in this example 2021 or 2026, 7 or 11 years from 2014)

Drug 4 (multiple designations & multiple sequential FDA-approved indications)

Disease	Designation Year	FDA Approval Year
Rare Disease N	2011	2014
Rare Disease O	2016	2019
Rare Disease P	2016	-

For the reasons outlined above, NORD urges CMS to:

a. Clarify that if a drug has been designated under section 526 of the FFD&C Act for a second rare disease but has not been approved under section 505 (c) of the FFD&C Act or licensed under section 351(a) of the PHS for such disease, the drug will remain excluded from negotiation. As outlined above and illustrated in Examples 2 and 3, NORD believes this interpretation is consistent with the statute, maintaining Congressional intent to keep the orphan drug exclusion limited and will help protect the ODA incentives that have proven crucial for rare disease drug development.

b. Clarify that when a previously-excluded orphan drug becomes negotiation-eligible the statutory timeline for negotiation will begin from the time of the approval or licensure that made the drug negotiation-eligible, rather than from the very first approval or licensure in the drug’s regulatory history. As outlined above and illustrated in Example 4, this will provide regulatory predictability and ensure continued investments in orphan drug development so that rare disease patients can meaningfully benefit from the price negotiation process.

c. Continue to work closely with FDA on the implementation of the orphan drug exclusion. As outlined above, the negotiation program may impact orphan drug development and as a result FDA in a variety of ways; at the same time, CMS will base regulatory decisions on a history of FDA actions and databases that were not originally designed for these uses. Close alignment between the two agencies will be important to maximize the positive impacts of the negotiation program while minimizing unintended consequences.

4. Begin tracking the impact of the IRA on patient outcomes and innovation now to support a data-driven program evaluation

The IRA will impact patients and the larger healthcare ecosystem in complex and somewhat unpredictable ways; some of these impacts, such as greater affordability of life-altering therapies through out-of-pocket caps, will be unequivocally beneficial, while others, such as the impact on innovation, remain less clear. Some impacts on the healthcare ecosystem may begin long before the first negotiated price takes effect while others may not occur until many years later. Baseline data will be important to track and truly understand the impact of the drug negotiation program and to document its successes and challenges. Now is the time to ensure appropriate IT systems exist and robust data are collected and analyzed to evaluate these impacts today and for years and decades to come. In the rare disease space, data scarcity and limited populations available for study make tracking the impact of the IRA on orphan drugs even more challenging, requiring additional thought and attention be given to the tracking of intended and unintended consequences on rare disease patients.

NORD is concerned additional efforts are needed to meaningfully track IRA impacts on patient outcomes and the healthcare system. The IRA may impact the healthcare ecosystem in complex way. For instance, the new law may increase healthcare utilization and improve medication adherence because out-of-pocket costs are capped, possibly adding years to the life of impacted patients; physician prescribing behavior may be influenced by IRA-associated changes in reimbursement rates under Medicare Part B, with uncertain impacts on overall cost savings and patient costs and outcomes; changing incentives may impact the relative placement of negotiated drugs on formularies; and the healthcare ecosystem may be impacted in a many other ways, some we may not even anticipate, and possibly with wide-reaching ramifications beyond the patients directly utilizing the negotiated Medicare Part B and D drugs.

CMS has long taken a leadership role in developing and reporting quality measures that lead to better-quality healthcare and improved health outcomes through robust, consistent, and data-driven accountability.²³ Many of the lessons learned will be directly applicable and should inform IRA tracking efforts, including selecting metrics that are person-centered and meaningful to patients and caregivers; engaging stakeholders early and often in the measure development process; minimizing the burden associated with measurement; prioritizing outcome-based metrics where possible; and guarding against unintended consequences of measure implementation.²⁴ In addition, CMS processes for rigorously evaluating metrics against established criteria and gathering robust stakeholder feedback at every step of the measure lifecycle are some of the additional areas where quality measures can inform IRA tracking efforts.²⁵

NORD is also concerned additional efforts are needed to meaningfully track IRA impacts on innovation. Drug sponsors make decisions today that will impact the drug pipeline for decades to come. The IRA is likely to ultimately impact these decisions in a myriad of complex, interdependent, and hard-to-predict ways. NORD encourages CMS to work closely with FDA and other public and private-sector experts to establish meaningful metrics and monitor impacts on innovation. Tracking efforts will necessarily be limited by the available data systems and their ability to capture meaningful data, while many key data

²³ CMS: Quality Measures: How they are developed, used, & maintained; available at: <https://mmshub.cms.gov/sites/default/files/Guide-Quality-Measures-How-They-Are-Developed-Used-Maintained.pdf>; accessed 4/2023

²⁴ Ibid.

²⁵ Ibid.

sources to evaluate innovation in early research and development are proprietary and not readily available to the public. Moreover, consensus on appropriate metrics to capture pharmaceutical innovation during early research and development phases is largely lacking.²⁶ Given these challenges it appears likely that strategies to capture IRA impacts on pharmaceutical innovation will have to consider a relatively broad set of metrics in concert, looking at trends over time and across disease areas and geographic regions.

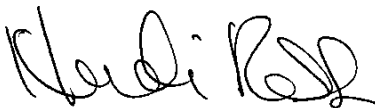

For the reasons outlined above, NORD urges CMS to:

a. Begin tracking key metrics to monitor and measure impacts on innovation and patient outcomes to ensure baseline data are available and as robust as possible. This will help lay a foundation for future evidence-based assessments of the IRA and draw thought and attention to the issue of data collection and tracking as well as help identify current key data gaps.

b. Engage with CMS quality metrics experts and other measurement experts within CMS, HHS, as well as government-wide and within the private and non-profit sector and issue requests for information (RFI) as applicable to reach agreement on what to measure and how to measure including key performance indicators (KPIs) and the data systems that generate the needed data. This will help lay the foundation for a resilient and sustainable tracking system to rigorously track and measure the impacts, intentional and unintentional, beneficial, and potentially harmful, of the IRA.

We thank CMS again for the opportunity to comment and look forward to working with CMS to ensure rare disease patients can fully participate in and benefit from the Negotiation Program. For questions related to this letter, please contact Heidi Ross, Vice President of Policy and Regulatory Affairs at HRoss@rarediseases.org or Karin Hoelzer, Director of Policy of Regulatory Affairs at KHoelzer@rarediseases.org

Baltimore, Maryland 21244-1850

Dear Administrator Ms. Brooks-LaSure and Dr. Seshamani,

The 101 undersigned organizations, representing patients living with rare diseases and their families, thank you for the guidance released on March 15, 2023, specific to the Medicare Drug Price Negotiation

Program as required by the Inflation Reduction Act of 2022 (IRA). As the Centers for Medicare and Medicaid Services (CMS) continues to implement the provisions of this law, we urge you to further consider the unique perspective and challenges faced by rare disease patients and provide the following recommendations to ensure this law best serves the needs of the rare disease community.

As part of the IRA, and for the first time, CMS will negotiate the price of some prescription drugs available through the Medicare program. This will have significant impacts for some rare disease patients on their ability to afford needed treatments but could also impact broader rare disease drug development. For many of the more than 25 million Americans living with a rare disease, out of pocket prescription drug costs create significant financial barriers and hinder access to needed therapies. Key provisions in the IRA, including the \$2,000 annual and amortized monthly caps on out-of-pocket costs for Medicare Part D beneficiaries, ensure that more rare disease patients will be able to afford the life-altering therapies they need.

At the same time, the vast majority of the more than 7,000 known rare diseases do not have an FDA approved treatment. This makes continued research and innovation especially important to the rare disease community. Unfortunately, the small patient populations and medical complexity associated with rare diseases creates unique challenges to rare disease drug development. These same factors result in a scarcity of the data necessary to determine a fair negotiated price for products that treat rare diseases.

While CMS' most recent guidance includes several elements that positively impact the rare disease community, our organizations urge CMS to incorporate several changes into future guidance and program implementation to ensure the rare disease community fully benefits from the IRA.

Patient Engagement

We appreciate CMS' effort to incorporate the patient perspective into the negotiation program. Patients and caregivers have key insights on issues such as determining the value of a therapy and how it compares to potential alternate treatment options. For instance, rare disease patients are often uniquely positioned to share the challenges associated with unmet medical needs - when there are no or very few options available to treat their condition - and the benefits to themselves, their families and the community from a safe and effective therapy. Patient experience data will be particularly important given CMS' desire to evaluate price on an indication-specific level. We commend the agency for recognizing the unique value that drugs can bring to specific parts of the treated patient population, including patients that have few or no therapeutic alternatives.

In the rare disease community, published data to assess these specific uses remain scarce and patients and providers are often the best experts from which to elicit such information. While we are grateful CMS recognizes the value of patient experience data in the guidance we strongly encourage the agency to expand the opportunities available to patients to provide such input. We worry that the short timelines and limited proposed mechanisms for providing this input essentially make it impossible for patients to provide meaningful data. We urge CMS to 1) simplify and streamline the data submission process for patients and caregivers; 2) to clarify ahead of time what information the agency is seeking from patients and in what format to allow data standardization and aggregation, 3) to organize patient listening sessions specific to selected drugs to collect representative data while CMS is preparing the initial offer for a negotiated drug; and 4) include consistent and granular summaries of the data and assumptions on which each negotiation was based, including patient experience data.

Patient Access to Negotiated Drugs

We are supportive of the provision that requires negotiated products within the Medicare Part D program to be included on Part D plan formularies. However, we encourage CMS to take additional steps to ensure rare disease patients benefit from associated reduced out-of-pocket expenses and have timely access to negotiated products. Often, therapies that treat rare diseases are placed on the specialty tier of plan formularies, resulting in significant out-of-pocket costs and access delays for Medicare beneficiaries. Once a drug is negotiated it has been shown to be appropriately priced from CMS' perspective and should be placed on a higher formulary tier to reduce patient out-of-pocket costs.

Another common source of treatment delays or denials for our community are utilization management tools, such as prior authorization and/or step therapy. Health care providers, in partnership with their patients, are best positioned to choose the right therapy to treat the often-complex health care challenges faced by those with a rare disease. Given negotiated drugs will have been appropriately valued from CMS' perspective, we encourage CMS to require Medicare Part B and Medicare Part D plans to reduce or eliminate utilization management tools, including step therapy and/or prior authorization barriers to ensure patients are able to quickly access a negotiated drug.

Orphan Drug Exclusion

We acknowledge that the IRA includes a limited exclusion for orphan drugs that only treat one rare disease from drug price negotiation. However, we are concerned CMS' current interpretation of this rare disease exclusion, which makes products eligible for negotiation if they have been designated for two or more orphan diseases – even if the drug is not actually FDA approved to treat the second orphan disease - will disincentivize drug companies from conducting even the basic research necessary to develop a drug for additional rare diseases. Designating a drug for a rare disease is done very early on in the drug development process and does not allow the company to market the drug because it has not been proven to be safe and effective to treat that specific disease. We urge CMS to clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by FDA to treat a second disease or condition.

From the rare disease patient community's perspective, successful IRA implementation hinges on a careful balance between greater affordability and maintaining appropriate incentives for continued investment in rare disease specific drug development. We thank CMS for the opportunity to comment on this latest IRA guidance and look forward to working with CMS to ensure rare disease patients and patient advocacy organizations can fully participate within this important effort and benefit from the law.

Dear Administrator Brooks-LaSure and Dr. Seshamani,

On behalf of the more than 25 million Americans living with one or more of the over 7,000 known rare diseases, the National Organization for Rare Disorders (NORD) thanks the Centers for Medicare and Medicaid Services (CMS) for their extensive engagement with the rare disease community around implementation of the Inflation Reduction Act (IRA). NORD appreciates this opportunity to provide comments on the draft guidance ‘Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191- 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments,’ hereafter referred to as the “Negotiation Program” guidance.

NORD is a unique federation of non-profits and health organizations dedicated to improving the health and well-being of people living with rare diseases. NORD was founded 40 years ago, after the passage of the Orphan Drug Act (ODA), to formalize the coalition of patient advocacy groups that were instrumental in passing that landmark law. Our mission has always been and continues to be to improve the health and well-being of people with rare diseases by driving advances in care, research, and policy.

NORD appreciates CMS’ willingness in the Negotiation Program guidance (Section 30.1.1) to consider additional actions to “best support orphan drug development” and is pleased to submit these comments to help CMS make good on its commitment to the rare disease community. These comments are intended to supplement and expand on the April 14th comment letter submitted by NORD and 100 other patient advocacy organizations that support rare disease patients (available in the appendix).

For many Americans living with a rare disease, out of pocket prescription drug costs create significant financial barriers and hinder patient access to needed therapies. Key provisions in the IRA, including the \$2,000 annual and amortized monthly caps on out-of-pocket costs for Medicare Part D beneficiaries, as well as expanded eligibility for financial assistance for low-income beneficiaries, ensure that more rare disease patients on Medicare will be able to afford the life-altering therapies they need. Robust patient education, particularly about the opt-in requirement to the smoothing mechanism, will be critical to ensuring patients have access to and benefit from these provisions of the IRA. While outside the scope of this guidance, NORD would welcome the opportunity to partner with CMS to help educate the rare disease community as IRA-authorized benefits become available to Medicare beneficiaries at the appropriate time.

As implemented under the draft guidance, however, the Negotiation Program may adversely impact rare disease drug development. Before the Orphan Drug Act was enacted in 1983, fewer than 40 Food and Drug Administration (FDA) approved therapies were available to treat rare diseases.¹ Thanks to the ODA, rare disease therapies now consistently account for more than half of FDA approvals for new molecular entities.² Still, more than 90% of the more than 7,000 known rare diseases do not have an FDA approved treatment, making continued investment in rare disease research and innovation critical to the rare disease community.³ The section 1192(e)(3) exclusion for orphan drugs approved to treat a single rare disease could help sustain this innovation, as will the broader exclusion for “low spend” drugs with less than \$200 million in annual Medicare spending. However, the small patient populations and medical complexity associated with rare diseases create unique challenges to drug development. These small population sizes and complex, heterogenous disease manifestations also result in a more limited availability of data on issues such as clinical benefit and therapeutic alternatives, making it more difficult to determine a fair negotiated price for drugs that treat rare diseases compared to other therapies. Therefore, NORD appreciates the opportunity to highlight additional ways that CMS, consistent with the statute, can further support rare disease drug development in implementing the Negotiation Program.

Successful Negotiation Program implementation hinges on a careful balance between greater affordability and maintaining appropriate incentives for continued rare disease drug development. NORD urges CMS to address four areas of concern in future guidance:

1. Actively engage patients and create opportunities to provide meaningful data and insights;
2. Ensure rare disease patients have access to the negotiated therapies;
3. Further clarify the scope and timing of the orphan drug exclusion; and
4. Begin tracking the impact of the IRA on innovation and patient outcomes now.

Specifically, CMS should take the following steps to support rare disease patients and families:

1. Expand and strengthen data collection and engagement opportunities to ensure patients can meaningfully contribute their unique insights on the negotiated drug and its alternatives.

NORD commends CMS’ efforts to consider data on clinical benefit, therapeutic alternatives, and unmet medical need in the negotiation process and to incorporate relevant patient and provider perspectives. NORD thanks CMS for recognizing, in section 60 of the draft guidance, the unique and nuanced value orphan drugs can bring to specific subsets of the patient population, including those with few or no therapeutic alternatives. The agency’s stated objective to assess value in an indication-specific manner, including some off-label uses, is critical for CMS to fully understand and account for the complex treatment trade-offs and unmet needs that exist within the rare disease patient community.

Moreover, we are encouraged that the draft guidance explicitly recognizes the value of patient experience data, including its nuances, in section 60.3.3, and that not all patients are necessarily sharing the same

³ Larkindale J, Betourne A, Borens A, Boulanger V, Theurer Crider V, Gavin P, Burton J, Liwski R, Romero K, Walls R, Barrett JS. Innovations in Therapy Development for Rare Diseases Through the Rare Disease Cures Accelerator-Data and Analytics Platform. *Ther Innov Regul Sci*. 2022 Sep;56(5):768-776. doi: 10.1007/s43441-022-00408-x.

views and experiences. For instance, the science of patient engagement has long recognized that patient experience data may reflect differences depending on disease progression or a patient's cultural, geographic, and socio-economic background. While we are grateful CMS recognizes the value of patient experience data, we strongly encourage CMS to expand the opportunities and strengthen the processes for providing such input to the agency as part of the negotiation process.

NORD is concerned that CMS' proposed approach would make it essentially impossible for patients and providers to submit meaningful data. CMS plans to largely rely on voluntary, public data submissions, on very short timelines, without meaningful data standardization, using complicated forms written at too-advanced reading levels and through hard-to-navigate processes that are neither intuitive nor patient-friendly. Patients will either not become aware of data collection efforts in time, or struggle to navigate the complex submission process. In addition, the required attestations are worded in a way that will likely discourage many patients from submitting data. To the extent patients will feel compelled to submit data containing Personal Identifiable Information (PII) and Personal Health Information (PHI), the data collection also raises privacy concerns.

Moreover, NORD foresees challenges in aggregating and analyzing individual patient and provider experience data submitted through this process. The data will be collected without a sampling frame and likely not representative while the collection method essentially makes it impossible to determine or account for such inherent biases in the data. In addition, the lack of standardized questions and scientific rigor will likely render this data largely anecdotal. This would contrast sharply with appropriate qualitative and/or quantitative research methodologies that would collect information in a scientifically rigorous and reproducible manner. A good example of such rigorous approaches is data collected through the FDA's patient-focused drug development (PFDD) meetings or patient surveys. Specifically, FDA's "Patient-Focused Drug Development: Collecting Comprehensive and Representative Input" guidance⁴ provides detailed and tangible advice on operationalizing and standardizing data collection and data management in ways that are feasible for the rare disease patient community.

CMS will have to refine its proposed approach to incorporate meaningful external data sources. CMS plans to supplement the aforementioned data submitted by the public with relevant published data retrievable through literature searches. Unfortunately, for many rare diseases, data relevant to determine a negotiated drug's clinical benefit, therapeutic alternatives, or unmet medical need does not currently exist in peer-reviewed journals or consensus treatment guidelines. Additionally, the lack of disease-specific International Classification of Disease (ICD-10) codes for most rare diseases makes Real-World Data (RWD) sources such as Electronic Health Records (EHRs) or medical claims data largely infeasible for many rare diseases. This is a recognized challenge within rare diseases.

FDA's Voice of the Patient (VOIP) reports are designed to address this data scarcity and are critical to patient-focused drug development by assembling meaningful information on how patients evaluate therapeutic alternatives or characterize the unmet need and clinical benefit of alternatives. However, these data are not indexed in a way that would clearly find them in a traditional literature search. CMS should consider all relevant data collected as part of the FDA approval process in the negotiation process. Moreover, patient and provider engagement will be critical to ensure CMS is aware of and able to leverage all other available and relevant data sources regardless of how they are indexed.

⁴ FDA GFI: Patient-Focused Drug Development: Collecting Comprehensive and Representative Input; available at <https://www.fda.gov/media/139088/download>; accessed 4/2023

CMS will consequently have to collect data on treatment alternatives, clinical benefits, and unmet medical need for rare diseases *de novo*, including from patients, caregivers, and providers. Patients and caregivers have key insights on issues such as determining the value of a therapy and how it compares to potential alternate treatment options. Rare disease patients are often uniquely positioned to share the challenges associated with unmet medical needs - when there are no or very few options available to treat their condition - and the benefits to themselves, their families, and the community from a safe and effective therapy. Patient experience data will be particularly important given CMS' desire to evaluate drug prices on an indication-specific level including certain off-label uses, which are common in the rare disease space albeit notoriously hard to study.⁵ Because published data to assess these specific uses remain scarce, patients and providers are often the best experts from which to elicit such information related to rare disease treatments.

For the reasons outlined above, NORD urges CMS to:

a. Simplify and streamline the data submission process for patients, caregivers, and providers to eliminate barriers to their providing the requested information. This should include pre-testing the forms, attestations, and instructions with representatives of the relevant community to ensure they are clearly understood and easy to navigate, including by individuals with visual and other impairments. Because this data submission is voluntary and not subject to the 30-day statutory data submission timeline for mandatory manufacturer-provided data, CMS should work with the patient community to establish feasible timelines that will be workable for the community. FDA listening sessions, PFDD meetings, and other FDA-led initiatives routinely collect meaningful patient experience data in ways that works for rare disease patients and families and can serve as another valuable guide and resource for CMS, including all applicable attestations and data protections.

b. Clarify what information the agency is seeking from patients to allow data standardization and aggregation. The short time for submitting data makes it imperative to provide detailed instructions as early as possible, before the negotiation period begins, to facilitate and streamline the collection and submission of meaningful data. Clarifying the key data elements ahead of time will also empower patient advocacy groups and other important stakeholders to proactively collect and collate relevant information in a way that is scientifically rigorous and representative of the relevant patient community.

c. Organize CMS-led patient listening sessions specific to selected drugs to collect representative data within the different drug indications to inform CMS' initial offer for a negotiated drug. In planning for these sessions, CMS should use FDA patient listening sessions as a roadmap and work closely with the various impacted patient communities to develop a representative and meaningful data collection effort. For instance, while we appreciate why CMS intends to only focus on pharmaceutical alternatives and to primarily consider alternatives in the same drug class, we recognize non-pharmaceutical options such as surgery are often the only viable alternative for our patient populations and that therapeutic alternatives in other drug classes and with other mechanisms of actions may in fact be the most appropriate alternatives for some of our patients. Engaging the patient community in planning the listening sessions will help ensure that these alternatives are appropriately considered. Close collaboration with FDA will enable CMS to benefit from FDA's relevant best practices and extensive experience.

⁵ Fung A, Yue X, Wigle PR, Guo JJ. Off-label medication use in rare pediatric diseases in the United States. *Intractable Rare Dis Res.* 2021 Nov;10(4):238-245. doi: 10.5582/irdr.2021.01104. PMID: 34877235; PMCID: PMC8630459.

d. Include consistent and granular summaries of the data and assumptions on which each negotiation was based, including patient experience data. We urge CMS to report a detailed and standardized summary of the data relied upon in the negotiation process including the therapeutic alternatives, clinical benefit, off-label use, and unmet need for each indication and the data sources relied upon. CMS should further break out the use of patient experience data and patient-reported outcomes; list data identified by CMS through literature searches and guideline review; and identify primary data, such as claims, electronic health record (EHR), or other real-world-evidence, generated and collated by CMS. This level of transparency will be important to create consistency and trust in the negotiation process. Clearly breaking out the use of different data sources will also motivate the creation of valuable data sources including patient experience data for future negotiation years. In fact, much of the data for rare diseases collected through this process will be unique and have value beyond this specific negotiation process.

2. Give negotiated drugs a preferred place on the formulary and minimize utilization burdens to ensure patients have ready access to the negotiated drugs.

NORD supports section 1860D-4(b)(3)(I) of the Social Security Act which will require Medicare Part D negotiated drugs to be included on Part D plan formularies. However, we encourage CMS to take additional steps to ensure rare disease patients benefit from reduced out-of-pocket expenses associated with better formulary tier placement and to better assure their timely access to negotiated drugs through reduced utilization management processes.

Often, rare disease drugs are placed on the non-preferred or specialty tiers of Medicare Part D plan formularies, resulting in significant out-of-pocket costs and access delays. For instance, a study published in the *American Journal of Managed Care* (AJMC) in 2020 found “on average, 85% of orphan drugs on a [Medicare Part D] formulary were placed on its highest cost-sharing tier.”⁶ Similarly, a KFF analysis of 2023 Medicare Part D plans found that in 12 of the 16 the national prescription drug plans, coinsurance amounts for non-preferred drugs range from 40% to 50%, showing similar trends as in previous plan years.⁷ Moreover, 44% of these plans’ enrollees will face coinsurance ranging from 15% to 25% for preferred brands⁸, meaning less predictable and often higher out of pocket costs for patients compared to flat copays. KFF also found that the median coinsurance for drugs on the specialty tier was 25%.⁹

Another common source of treatment delays or denials for rare disease patients is related to prior authorization and step therapy. NORD believes health care providers, in partnership with their patients, are best positioned to choose the right therapy to treat the often-complex health care challenges faced by those with a rare disease. Yet, a 2020 study found that a staggering 76% of orphan drugs on Medicare Part D formularies were subject to prior authorization.¹⁰ Similarly, a 2021 study¹¹ found that nearly 40

⁷ Kaiser Family Foundation (KFF): Medicare Part D: A First Look at Medicare Drug Plans in 2023; available at: <https://www.kff.org/medicare/issue-brief/medicare-part-d-a-first-look-at-medicare-drug-plans-in-2023/>; accessed 4/2023

⁸ Kaiser Family Foundation (KFF): Medicare Part D: A First Look at Medicare Drug Plans in 2023; available at: <https://www.kff.org/medicare/issue-brief/medicare-part-d-a-first-look-at-medicare-drug-plans-in-2023/>; accessed 4/2023

⁹ Ibid.

¹⁰ Yehia, F., Segal, J.B. Predictors of Orphan Drug Coverage Restrictions in Medicare Part D. 2020 Sep; AJMC 26(09); accessible at <https://www.ajmc.com/view/predictors-of-orphan-drug-coverage-restrictions-in-medicare-part-d>

¹¹ Lenahan, K.L., Nichols, D.E., Gertler, R.M., Chambers, J.D.: Variations in Use and Content of Prescription Drug Step Therapy Protocols, Within and Across health Plans. 2021, Nov; Health Affairs 40(11); <https://doi.org/10.1377/hlthaff.2021.00822>; available at <https://www.healthaffairs.org/doi/full/10.1377/hlthaff.2021.00822>

percent of the specialty drugs offered within the 17 largest commercial health plans included step therapy in the drug coverage plan. Additionally, 55.6 percent of the step therapy protocols were found to be more stringent than clinical guidelines,¹² delaying timely patient access to appropriate care.¹³

From CMS' perspective, negotiated drugs will have been appropriately valued and therefore, we encourage CMS to:

a. Require that a negotiated drug be placed on a higher formulary tier to improve patient access through further reduced patient out-of-pocket costs. While the \$2,000 annual out-of-pocket cap and the smoothing mechanism to spread a patient's out-of-pocket costs out over the plan year will be tremendously helpful to Medicare patients living with a rare disease, coinsurance makes it more difficult for patients to predict their out-of-pocket expenditures. Requiring a negotiated drug's placement on formulary tiers that typically have copays instead of coinsurance can assist patients with both planning for prescription drug expenses and their ability to pay for their medications at the time they need them.

b. Significantly reduce or eliminate step therapy and prior authorization barriers in Medicare Part B and Medicare Part D for negotiated drugs. To further ensure timely access to these drugs, NORD urges CMS to include utilization management protections for negotiated drugs that have been determined by CMS to be appropriately priced. In the 2024 Medicare Advantage and Part D Final Rule (CMS-4201-F) released on April 5, 2023, and effective for the CY 2024 plan year, CMS will require "an approval granted through prior authorization processes must be valid for as long as medically necessary to avoid disruptions in care in accordance with applicable coverage criteria, the patient's medical history, and the treating provider's recommendation, and that plans provide a minimum 90-day transition period when an enrollee who is currently undergoing an active course of treatment switches to a new MA plan."¹⁴ NORD encourages the adoption of these or similar requirements for negotiated drugs offered on traditional Medicare Part D plan formularies as well.

3. Ensure CMS' interpretation of the orphan drug exclusion protects vital incentives for rare disease drug development

While the IRA includes a limited exclusion for orphan drugs that only treat one rare disease from drug price negotiation, NORD is greatly concerned with the potential impact of CMS' proposed interpretation of the exclusion on future innovation in rare disease drug development. Today, about 60 percent of all orphan drugs have a single FDA-approved indication, whereas only about 20 percent are FDA-approved for both orphan and non-orphan indications.¹⁵ Among the drugs that only have orphan indications, fewer than a quarter have more than one FDA-approved indication and fewer than 10 percent have three or more approved indications.¹⁶ Similarly, among the drugs that have both orphan and non-orphan indications, less than 20 percent have 3 or more orphan indications. This indicates that to date, relatively few orphan drugs have been successfully developed for more than one disease.

¹⁶ Ibid.

Still, developing already-approved therapies to treat additional rare diseases is a critical strategy to address the rare disease community's significant unmet need because these drugs have already proven to be safe for humans. In fact, according to a recent analysis, over 3,000 unique drugs have been FDA-designated as rare disease drugs and studied, with about a quarter of these drugs being designated for more than one rare disease.¹⁷ Serial innovation and the investigation and development of multiple rare disease indications of use is an increasingly important dimension of orphan drug development, making the preservation of incentives to further develop drugs to treat additional orphan diseases after they have entered the market particularly important.

NORD also recognizes that relatively few orphan-only drugs will meet the annual revenue threshold of \$200,000,000 in combined expenditures under Medicare Parts B and D to make a drug negotiation-eligible. However, due to the complexity and long timeline from initial drug discovery and early research and development to FDA approval, drug sponsors are making decisions today that will impact their investments and drug development pipeline for decades to come. Remaining uncertainty about if, when, and how rare disease drugs will become negotiation eligible creates real business risks that work as strong disincentives to develop drugs for the limited populations impacted by rare diseases. Therefore, as part of the negotiation process, NORD urges CMS to make clear that research and development efforts in support of innovative therapies that help address unmet needs will be treated favorably in the price negotiation process.

We thank CMS for clarifying in the draft guidance that an orphan drug with multiple FDA-approved indications within the scope of an orphan drug designation for one rare disease (i.e., multiple indications tied to one orphan designation as shown in **Example 1**) remains excluded from negotiation. As a result, drug sponsors will consequently not be discouraged or penalized for further developing a rare disease drug for new sub-populations, such as children, or specific disease subtypes.

Example 1 - Orphan drug with one designation & multiple associated approved indications; CMS already clarified this is excluded from negotiation; this example was selected to be illustrative while reflecting common trends in orphan drug approvals.

Drug 1 (one designation, multiple FDA-approved indications)			
Designations		FDA Approved Indications	
Disease	Year	Year	Population
Rare Disease A	2014	2015	12 years and older
		2016	6 years and older
		1018	2 years and older
		2022	1 year and older

However, NORD is gravely concerned that CMS' interpretation of the orphan drug exclusion might contravene the intent of the ODA by discouraging drug sponsors from developing their drug for additional rare diseases. Specifically, CMS' interpretation of the IRA makes drugs eligible for negotiation as soon as they have been designated under section 526 of the Federal Food, Drug, and Cosmetic Act

¹⁷ Miller, KL, Kraft, S, Ipe, A, and Fermaglich, L. Drugs and biologics receiving FDA orphan drug designation: an analysis of the most frequently designated products and their repositioning strategies. Expert Opin Orphan Drugs. 2022 Mar 1;9(11-12):265-272. doi: 10.1080/21678707.2021.2047021.

(FFD&C) for more than one orphan disease – even if the drug is not actually FDA approved (or indicated) to treat more than one of the designated orphan diseases. For instance, consider **Example 2** and the many other rare disease drugs with similar regulatory history; although this drug has been designated for five different rare diseases, it is only FDA approved to treat a single orphan disease.

Example 2: Orphan drug with multiple designations and one FDA-approved indication; CMS should clarify that that this drug will be excluded from negotiation because while it has five designations, it only has one approved indication.

Drug 2 (multiple designations, one FDA-approved indication)

Disease	Designation Year	FDA Approval Year
Rare Disease B	2007	2017
Rare Disease C	2009	-
Rare Disease D	2016	-
Rare Disease E	2018	-
Rare Disease F	2019	-

Designating an orphan drug under section 526 of the FFD&C Act is done early in the drug development process and much earlier than submission of a New Drug Application (NDA) or Biological License Application (BLA). Orphan drug designation is critical to access to ODA incentives such as funding and tax credits for clinical research to help de-risk this phase of drug development. However, an orphan drug designation does not allow the company to market the drug; it is only the first in many steps towards approval and marketing. In fact, FDA’s Orphan Drug Designations and Approvals database currently contains 6,445 orphan drug designations (including withdrawn designations) compared to only 1130 approved orphan indications, demonstrating that a vast majority of orphan drug designations do not result in any FDA-approved indications – and therefore are largely irrelevant to the pricing considerations central to the Negotiation Program.¹⁸

NORD understands that the language of section 1192(e)(3), due to the manner in which it was drafted, is ambiguous and therefore open to CMS interpretation. CMS states that to qualify for the orphan drug exclusion, “the drug or biological drug must (1) be designated as a drug for only one rare disease or condition under section 526 of the FFD&C Act and (2) be approved by the FDA for only one or more indications within such designated rare disease or condition.”¹⁹ This two-prong test, embodying two separate and distinct criteria, is a possible interpretation of the statute. But under the canons of legislative drafting, if the congressional authors had intended the two clauses to be read *independently*, the proper legislative drafting would have structured the two clauses separately and in sequence. Instead, Congress did not separate the clauses, intending them to be read *together*: that a drug designated for a given “rare disease or condition” has “only [one] approved indication” or multiple “approved... indications” *within the scope of that designation*. CMS substantiates this plain meaning²⁰ of the provision in accepting that

¹⁸ US FDA Orphan Drug Designations and Approvals database; available at <https://www.accessdata.fda.gov/scripts/opdlisting/oopd/index.cfm>; accessed 4/2023

¹⁹ Meena Seshamani, Memorandum to Interested Parties: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments, March 15, 2023, at 10-11.

²⁰ E.g., *Sebelius v. Cloer*, 569 U.S. ___, No. 12-236, slip op. (May 20, 2013).

an orphan drug with **multiple** (“one or more”) FDA-approved indications qualifies for the exclusion provided all such approved indications are within the scope of a **single** (“only one”) **designation**.

A two-prong test also does not best reflect and advance the purposes and function of the Negotiation Program. The cardinal rule of statutory construction is that the whole statute should be drawn upon as necessary, with its various parts being interpreted within their broader statutory context in a manner that furthers statutory purposes.²¹ The proper interpretation of the orphan drug exclusion “in a manner consistent with [the] legislative purposes”²² of the Negotiation Program preserves an intentionally narrow class of qualifying orphan drugs determined upon the basis of a drug’s FDA **approval history** – not on orphan drug designations which have no bearing on, or applicability to, prescription drug marketing or pricing.

In considering the regulatory history for the drug shown in **Example 3**, the approval for Disease H in 2014 should trigger the drug becoming negotiation eligible (assuming it meets the other statutory requirements outlined in the IRA), rather than the Designation for Diseases H or I in 2010, thus preserving vital rare disease research and development incentives. One of the critical “additional actions” that CMS can take to support rare disease research and development would be to revise its guidance to reflect a sound statutory interpretation more fully in line with congressional intent to make an orphan drug negotiation eligible once it has been approved (or indicated) to treat a second disease.

Example 3: Orphan drug with multiple designations and multiple FDA-approved indications; CMS should clarify that an orphan drug with multiple designations and approved indications becomes negotiation eligible when the drug is approved for the second disease (in this example 2014) – NOT upon second designation in 2010.

Drug 3 (multiple designations & multiple FDA-approved indications)

Disease	Designation Year	FDA Approval Year
Rare Disease G	2008	2011
Rare Disease H	2010	2014
Rare Disease I	2010	-
Rare Disease J	2013	-

NORD is also concerned about the potential chilling effect residual uncertainty about CMS’s implementation of the orphan drug exclusion will have on rare disease drug development. CMS remains silent as to when orphan drugs that receive FDA approval for a second disease and therefore lose eligibility for the orphan drug exclusion would become negotiation eligible. Qualifying single-source drugs must have been approved at least 7 years and qualifying single-source biologics must have been licensed at least 11 years to qualify, but CMS has not yet clarified if the 7 or 11 years will be counted beginning on the date of the FDA approval for the second disease that made the drug negotiation eligible or based on the first orphan drug approval. CMS should clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by

²¹ See, e.g., *King v. Burwell*, No. 14-1158 (4th Cir. July 22, 2014) (various provisions of the Affordable Care Act sufficiently indicate an expectation that tax credits will be available to participants in all health exchanges to cast doubt on whether provision specifically making credits available to participants in state exchanges implicitly denies credits to participants in federal exchanges).

²² Robert A. Katzman, *Judging Statutes* 31 (2016), at 10.

FDA for 7 or 11 years to treat the second disease or condition and in doing so, would provide meaningful incentives for continued rare disease drug development.

Considering the **Example 4**, CMS should clarify that – assuming the drug meets the other statutory requirements to become negotiation eligible as outlined in the IRA – the drug would become negotiation-eligible 7 or 11 years from the approval date for Disease O (i.e., in 2026 or 2030, 7 or 11 years from 2019).

Example 4: Orphan drug with multiple designations and multiple FDA-approved indications; CMS should clarify that the statutory period (i.e., 7 or 11 years) before negotiation starts at the approval that made the drug negotiation eligible (in this example 2026 or 2030, 7 or 11 years from 2019) – and not first approval (in this example 2021 or 2026, 7 or 11 years from 2014)

Drug 4 (multiple designations & multiple sequential FDA-approved indications)

Disease	Designation Year	FDA Approval Year
Rare Disease N	2011	2014
Rare Disease O	2016	2019
Rare Disease P	2016	-

For the reasons outlined above, NORD urges CMS to:

a. Clarify that if a drug has been designated under section 526 of the FFD&C Act for a second rare disease but has not been approved under section 505 (c) of the FFD&C Act or licensed under section 351(a) of the PHS for such disease, the drug will remain excluded from negotiation. As outlined above and illustrated in Examples 2 and 3, NORD believes this interpretation is consistent with the statute, maintaining Congressional intent to keep the orphan drug exclusion limited and will help protect the ODA incentives that have proven crucial for rare disease drug development.

b. Clarify that when a previously-excluded orphan drug becomes negotiation-eligible the statutory timeline for negotiation will begin from the time of the approval or licensure that made the drug negotiation-eligible, rather than from the very first approval or licensure in the drug's regulatory history. As outlined above and illustrated in Example 4, this will provide regulatory predictability and ensure continued investments in orphan drug development so that rare disease patients can meaningfully benefit from the price negotiation process.

c. Continue to work closely with FDA on the implementation of the orphan drug exclusion. As outlined above, the negotiation program may impact orphan drug development and as a result FDA in a variety of ways; at the same time, CMS will base regulatory decisions on a history of FDA actions and databases that were not originally designed for these uses. Close alignment between the two agencies will be important to maximize the positive impacts of the negotiation program while minimizing unintended consequences.

4. Begin tracking the impact of the IRA on patient outcomes and innovation now to support a data-driven program evaluation

The IRA will impact patients and the larger healthcare ecosystem in complex and somewhat unpredictable ways; some of these impacts, such as greater affordability of life-altering therapies through out-of-pocket caps, will be unequivocally beneficial, while others, such as the impact on innovation, remain less clear. Some impacts on the healthcare ecosystem may begin long before the first negotiated price takes effect while others may not occur until many years later. Baseline data will be important to track and truly understand the impact of the drug negotiation program and to document its successes and challenges. Now is the time to ensure appropriate IT systems exist and robust data are collected and analyzed to evaluate these impacts today and for years and decades to come. In the rare disease space, data scarcity and limited populations available for study make tracking the impact of the IRA on orphan drugs even more challenging, requiring additional thought and attention be given to the tracking of intended and unintended consequences on rare disease patients.

NORD is concerned additional efforts are needed to meaningfully track IRA impacts on patient outcomes and the healthcare system. The IRA may impact the healthcare ecosystem in complex way. For instance, the new law may increase healthcare utilization and improve medication adherence because out-of-pocket costs are capped, possibly adding years to the life of impacted patients; physician prescribing behavior may be influenced by IRA-associated changes in reimbursement rates under Medicare Part B, with uncertain impacts on overall cost savings and patient costs and outcomes; changing incentives may impact the relative placement of negotiated drugs on formularies; and the healthcare ecosystem may be impacted in a many other ways, some we may not even anticipate, and possibly with wide-reaching ramifications beyond the patients directly utilizing the negotiated Medicare Part B and D drugs.

CMS has long taken a leadership role in developing and reporting quality measures that lead to better-quality healthcare and improved health outcomes through robust, consistent, and data-driven accountability.²³ Many of the lessons learned will be directly applicable and should inform IRA tracking efforts, including selecting metrics that are person-centered and meaningful to patients and caregivers; engaging stakeholders early and often in the measure development process; minimizing the burden associated with measurement; prioritizing outcome-based metrics where possible; and guarding against unintended consequences of measure implementation.²⁴ In addition, CMS processes for rigorously evaluating metrics against established criteria and gathering robust stakeholder feedback at every step of the measure lifecycle are some of the additional areas where quality measures can inform IRA tracking efforts.²⁵

NORD is also concerned additional efforts are needed to meaningfully track IRA impacts on innovation. Drug sponsors make decisions today that will impact the drug pipeline for decades to come. The IRA is likely to ultimately impact these decisions in a myriad of complex, interdependent, and hard-to-predict ways. NORD encourages CMS to work closely with FDA and other public and private-sector experts to establish meaningful metrics and monitor impacts on innovation. Tracking efforts will necessarily be limited by the available data systems and their ability to capture meaningful data, while many key data

²³ CMS: Quality Measures: How they are developed, used, & maintained; available at: <https://mmshub.cms.gov/sites/default/files/Guide-Quality-Measures-How-They-Are-Developed-Used-Maintained.pdf>; accessed 4/2023

²⁴ Ibid.

²⁵ Ibid.

sources to evaluate innovation in early research and development are proprietary and not readily available to the public. Moreover, consensus on appropriate metrics to capture pharmaceutical innovation during early research and development phases is largely lacking.²⁶ Given these challenges it appears likely that strategies to capture IRA impacts on pharmaceutical innovation will have to consider a relatively broad set of metrics in concert, looking at trends over time and across disease areas and geographic regions.

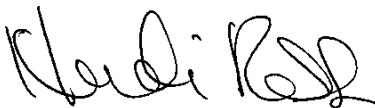

For the reasons outlined above, NORD urges CMS to:

a. Begin tracking key metrics to monitor and measure impacts on innovation and patient outcomes to ensure baseline data are available and as robust as possible. This will help lay a foundation for future evidence-based assessments of the IRA and draw thought and attention to the issue of data collection and tracking as well as help identify current key data gaps.

b. Engage with CMS quality metrics experts and other measurement experts within CMS, HHS, as well as government-wide and within the private and non-profit sector and issue requests for information (RFI) as applicable to reach agreement on what to measure and how to measure including key performance indicators (KPIs) and the data systems that generate the needed data. This will help lay the foundation for a resilient and sustainable tracking system to rigorously track and measure the impacts, intentional and unintentional, beneficial, and potentially harmful, of the IRA.

We thank CMS again for the opportunity to comment and look forward to working with CMS to ensure rare disease patients can fully participate in and benefit from the Negotiation Program. For questions related to this letter, please contact Heidi Ross, Vice President of Policy and Regulatory Affairs at HRoss@rarediseases.org or Karin Hoelzer, Director of Policy of Regulatory Affairs at KHoelzer@rarediseases.org

Washington, DC 20201

Meena Seshamani, M.D., Ph.D.
Deputy Administrator and Director of the Center
for Medicare
Centers for Medicare & Medicaid Services
7500 Security Boulevard
Baltimore, Maryland 21244-1850

Dear Administrator Ms. Brooks-LaSure and Dr. Seshamani,

The 101 undersigned organizations, representing patients living with rare diseases and their families,
thank you for the guidance released on March 15, 2023, specific to the Medicare Drug Price Negotiation

Program as required by the Inflation Reduction Act of 2022 (IRA). As the Centers for Medicare and Medicaid Services (CMS) continues to implement the provisions of this law, we urge you to further consider the unique perspective and challenges faced by rare disease patients and provide the following recommendations to ensure this law best serves the needs of the rare disease community.

As part of the IRA, and for the first time, CMS will negotiate the price of some prescription drugs available through the Medicare program. This will have significant impacts for some rare disease patients on their ability to afford needed treatments but could also impact broader rare disease drug development. For many of the more than 25 million Americans living with a rare disease, out of pocket prescription drug costs create significant financial barriers and hinder access to needed therapies. Key provisions in the IRA, including the \$2,000 annual and amortized monthly caps on out-of-pocket costs for Medicare Part D beneficiaries, ensure that more rare disease patients will be able to afford the life-altering therapies they need.

At the same time, the vast majority of the more than 7,000 known rare diseases do not have an FDA approved treatment. This makes continued research and innovation especially important to the rare disease community. Unfortunately, the small patient populations and medical complexity associated with rare diseases creates unique challenges to rare disease drug development. These same factors result in a scarcity of the data necessary to determine a fair negotiated price for products that treat rare diseases.

While CMS' most recent guidance includes several elements that positively impact the rare disease community, our organizations urge CMS to incorporate several changes into future guidance and program implementation to ensure the rare disease community fully benefits from the IRA.

Patient Engagement

We appreciate CMS' effort to incorporate the patient perspective into the negotiation program. Patients and caregivers have key insights on issues such as determining the value of a therapy and how it compares to potential alternate treatment options. For instance, rare disease patients are often uniquely positioned to share the challenges associated with unmet medical needs - when there are no or very few options available to treat their condition - and the benefits to themselves, their families and the community from a safe and effective therapy. Patient experience data will be particularly important given CMS' desire to evaluate price on an indication-specific level. We commend the agency for recognizing the unique value that drugs can bring to specific parts of the treated patient population, including patients that have few or no therapeutic alternatives.

In the rare disease community, published data to assess these specific uses remain scarce and patients and providers are often the best experts from which to elicit such information. While we are grateful CMS recognizes the value of patient experience data in the guidance we strongly encourage the agency to expand the opportunities available to patients to provide such input. We worry that the short timelines and limited proposed mechanisms for providing this input essentially make it impossible for patients to provide meaningful data. We urge CMS to 1) simplify and streamline the data submission process for patients and caregivers; 2) to clarify ahead of time what information the agency is seeking from patients and in what format to allow data standardization and aggregation, 3) to organize patient listening sessions specific to selected drugs to collect representative data while CMS is preparing the initial offer for a negotiated drug; and 4) include consistent and granular summaries of the data and assumptions on which each negotiation was based, including patient experience data.

Patient Access to Negotiated Drugs

We are supportive of the provision that requires negotiated products within the Medicare Part D program to be included on Part D plan formularies. However, we encourage CMS to take additional steps to ensure rare disease patients benefit from associated reduced out-of-pocket expenses and have timely access to negotiated products. Often, therapies that treat rare diseases are placed on the specialty tier of plan formularies, resulting in significant out-of-pocket costs and access delays for Medicare beneficiaries. Once a drug is negotiated it has been shown to be appropriately priced from CMS' perspective and should be placed on a higher formulary tier to reduce patient out-of-pocket costs.

Another common source of treatment delays or denials for our community are utilization management tools, such as prior authorization and/or step therapy. Health care providers, in partnership with their patients, are best positioned to choose the right therapy to treat the often-complex health care challenges faced by those with a rare disease. Given negotiated drugs will have been appropriately valued from CMS' perspective, we encourage CMS to require Medicare Part B and Medicare Part D plans to reduce or eliminate utilization management tools, including step therapy and/or prior authorization barriers to ensure patients are able to quickly access a negotiated drug.

Orphan Drug Exclusion

We acknowledge that the IRA includes a limited exclusion for orphan drugs that only treat one rare disease from drug price negotiation. However, we are concerned CMS' current interpretation of this rare disease exclusion, which makes products eligible for negotiation if they have been designated for two or more orphan diseases – even if the drug is not actually FDA approved to treat the second orphan disease - will disincentivize drug companies from conducting even the basic research necessary to develop a drug for additional rare diseases. Designating a drug for a rare disease is done very early on in the drug development process and does not allow the company to market the drug because it has not been proven to be safe and effective to treat that specific disease. We urge CMS to clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by FDA to treat a second disease or condition.

From the rare disease patient community's perspective, successful IRA implementation hinges on a careful balance between greater affordability and maintaining appropriate incentives for continued investment in rare disease specific drug development. We thank CMS for the opportunity to comment on this latest IRA guidance and look forward to working with CMS to ensure rare disease patients and patient advocacy organizations can fully participate within this important effort and benefit from the law.

For questions related to this comment letter, please contact Heidi Ross, Vice President of Policy and Regulatory Affairs at the National Organization for Rare Disorders at HRoss@rarediseases.org.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani:

The National Pharmaceutical Council (NPC) appreciates the opportunity to submit comments regarding the Centers for Medicare & Medicaid Services (CMS) Guidance, *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments* (Guidance or the Guidance).

NPC is a health policy research organization dedicated to the advancement of good evidence and science and to fostering an environment in the United States that supports medical innovation. We have rich experience conducting research and disseminating information about the critical issues of evidence, innovation and the value of medicines for patients. Our research helps inform important healthcare policy debates and supports the achievement of the best patient outcomes in the most efficient way possible.

NPC's research and that of others have found that public policies that reduce the incentives to invest in research and development result in less innovation, fewer treatment options, and lower life expectancy.¹ The Inflation Reduction Act (IRA or the Act) creates a new price-setting

¹ Ciarametaro M and Buelt L. Assessing the effects of biopharmaceutical price regulation on innovation. 2022. <https://www.npcnow.org/resources/assessing-effects-biopharmaceutical-price-regulation-innovation>; Thomas A. Abbott & John A. Vernon, 2007. "The cost of US pharmaceutical price regulation: a financial simulation model of R&D decisions," Managerial and Decision Economics, John Wiley & Sons, Ltd., vol. 28(4-5), pages 293-306.; Leonard D. Schaeffer Center for

mechanism that will change the economic incentives for bringing new medicines to market, and evidence suggests manufacturers are already responding to those incentives.²

An important goal in implementation of the Act should be to set guidance that, to every extent possible, minimizes the deleterious impact of the IRA on the incentives for the development of innovative therapies as well as patient access. Unfortunately, we believe the Guidance does the opposite.

The price-setting mechanism described in the Guidance, incorrectly portrayed as “negotiation,” lacks clear standards for the evidence that will be used in the process and the transparency necessary for the public to reproduce or evaluate CMS’s process and decisions. It also minimizes the opportunity for patients, providers and other clinical experts to inform and participate continuously in the process. Furthermore, the effectuation of the Maximum Fair Price (MFP) and Part D formulary inclusion of selected drugs are built on a chassis ripe with perverse incentives and opportunities for fraud and abuse and provide minimal opportunity to prevent and detect unsavory activities.

The importance of implementing the price-setting provisions of the IRA in a manner that accurately values medicines and maintains patient access cannot be overstated. This new process forces manufacturers to accept CMS’s final price, face an unreasonable excise tax, or exit the market – all of which threaten the development of, and patient access to, new treatments or cures.

We understand that CMS has a statutory requirement to implement the IRA. We also note that many NPC members have long argued that the underlying structure of the negotiation program, as set forth by the statute and implemented here by CMS, is legally flawed. In review of the punishing penalties for non-compliance, and the general inflexibility of the process for product selection and maximum fair price (MFP) implementation, these legal flaws cannot be overcome through general guidance clarity at this stage.

Nevertheless, NPC appreciates the opportunity to provide input and provides herein several suggestions for CMS to consider that might be helpful in the transparency objective of the Agency as it implements this program. None of these resolve the more fundamental legal infirmities of the overall program, nor could they. NPC’s recommendations are summarized on the following pages:

I. (Section 40) Requirements for Manufacturers of Selected Drugs

- Allow the public to review the comments provided in response to the Guidance, as soon as possible after the end of the comment period while protecting the confidentiality and security of proprietary information.
- Remove the restrictions on manufacturers disclosing written or verbal information from CMS's offers or counteroffers, and the requirement that manufacturers destroy this information after the process is complete. This requirement deprives the public from learning about CMS's process and priorities and disadvantages manufacturers who may someday need to renegotiate with CMS.
- Provide manufacturers with Prescription Drug Event (PDE) data to verify the MFP is being provided only to MFP-eligible individuals.
- Commit to ensuring that providers report a "minimally necessary"³ data set to the manufacturer or its vendor to be entitled to access the MFP.
- Abandon the burdensome and unworkable Primary/Secondary Manufacturer policy.

II. (Sections 50 and 60) Negotiation Factors and Process

- Implement these sections with maximum transparency to provide manufacturers and other stakeholders the opportunity to inform, evaluate, and predict CMS's process and priorities in the overall negotiation process and the individual negotiations for selected drugs.
- Provide clarity on the choices of therapeutic alternative for each approved indication of selected drugs and ground those choices in current, evidence-based clinical practice. CMS should focus on clinical benefits and cost offsets when comparing treatments and determining value, and not reduce the preliminary price by information unrelated to the value of a treatment (e.g., cost-recovery, remaining exclusivity, etc.).
- Develop, communicate, and implement clear definitions of unmet need consistent with relevant patient populations' needs for each indication of selected drugs.
- Engage with patients and caregivers throughout the process to gain insights into the value, preferences for appropriate treatment, and the indirect costs that patients and their families bear, to inform the evaluation of the clinical benefit of a selected drug (evaluation process). It is essential to gain patient input to identify unmet needs, therapeutic alternatives, clinical and humanistic benefits.
- Create and implement a consistent framework that provides more information about how CMS will make decisions during the negotiation process, including the identification of therapeutic alternatives, a broader definition of unmet medical need, stakeholder involvement, and the evidence used to support CMS decisions. This information should be well-known before CMS begins its process, and the relative importance of these factors should be published in the final determination of the MFP.
- Apply well-established best practices for evidence evaluations from organizations including the Innovation and Value Initiative and ISPOR, the Professional Society for Health Economics and Outcomes Research. Provide clarity into the evidence standards

³ <https://www.hhs.gov/hipaa/for-professionals/faq/455/does-hipaa-permit-health-plans-to-disclose-information-to-pharmaceutical-manufacturers/index.html>

that CMS will use at all steps of the process, including when working with external organizations.

- CMS is making significant changes to Medicare policy and seeking to implement a complicated process in a short amount of time. In the interest of not harming patients' access to medicine – and the innovation ecosystem that creates new medicine - we encourage CMS to take the time needed to build a transparent and consistent process and methodology and to set prices at the ceiling price for initial price applicability year (IPAY) 2026.

III. **(Section 110) Part D Formulary Inclusion of Selected Drugs**

- At a minimum, CMS should ensure people with Medicare do not experience decreased formulary access as a result of implementation.

We elaborate on these recommendations below.

(Section 40) Requirements for Manufacturers of Selected Drugs

A. Improving Transparency in the Implementation Process

The implementation of the Inflation Reduction Act (IRA) is the most significant prescription drug pricing intervention in the history of the Medicare program. It is being closely followed by those who invest in, research, and develop new cures. It is also being closely watched by health policy experts, pharmacoeconomic researchers, patient advocates, and others. CMS has a long history of publishing and responding to information provided by stakeholders when implementing new policies. Though the IRA text permitted implementation of the price-setting process via guidance, this Guidance opens CMS to criticism for creating an opaque process giving the agency maximum flexibility and latitude while failing to provide adequate clarity and details about how it will implement important provisions (e.g., identification of therapeutic alternatives, weighting of factors for initial offer, etc.).

We appreciate CMS communicating separately from the Guidance that it will make comments in response to the Guidance publicly available. CMS should allow the public to review the comments provided in response to the Guidance as soon as possible after the comment period ends, while protecting the confidentiality and security of proprietary information. Furthermore, CMS should respond to suggestions and comments provided in response to the Guidance to allow experts to evaluate the decisions made by CMS and the information on which these decisions were made. Depriving researchers and the public of the opportunity to learn from and provide continued input to this process is contrary to CMS's historical transparency and stakeholder engagement.

CMS should abandon the proposed data use provisions to enhance transparency, increase public confidence, and facilitate collaboration with manufacturers. Specifically, CMS should abandon the "data use provisions and limitations" that would prohibit manufacturers from disclosing information exchanged verbally or in writing about the agency's MFP decision-

making process. Scientific sessions attended by pharmacoeconomic researchers, managed care pharmacists, actuaries, and others are already rich with IRA content, and audiences are asking important questions about how the law will be implemented. Understanding what information CMS reviews, values, or excludes in the context of individual negotiations as well as with regard to the general process is essential to the advancement of learning in these disciplines.

More clarity about and transparency into this process also encourages industry scientists to create good pharmacoeconomic evidence during the drug development process. As useful pharmacoeconomic evidence takes time and money to create, it is important for all manufacturers to know what information CMS did or did not value during previous negotiations. Restricting the use of this information also prevents manufacturers from referring to these discussions when participating in the renegotiation process described in the statute but not included in this guidance.

Simply stated, squelching conversation between these disciplines not only hurts science; it also undermines the credibility of the agency's decision-making and further exposes it to public criticism.

B. Decreasing the Potential for Payment Errors, Fraud, and Perverse Incentives

We commend CMS for its desire to provide patients with access to the MFP at point of sale and for providing flexibility for manufacturers with MFP agreements to provide access to the MFP. As CMS heard in comments provided in response to the Office of the Inspector General's regulations to remove the safe harbor protection for prescription drug rebates, it is important to contemplate the workability of these new mechanisms.

NPC has a deep understanding of the pharmaceutical supply chain. As such, we have concerns and suggestions about the flow of funds and lack of data described in Section 40.4 (and the corresponding paragraphs in Section 90.2). Simply stated, the Guidance robustly describes manufacturer noncompliance, yet only offers one sentence about dispenser noncompliance. CMS should clarify that manufacturers require access to data or other mechanisms to verify eligibility or otherwise evaluate the process for providing access to MFP. Manufacturers should not be the only stakeholders (e.g., pharmacies, mail order services, and other dispensers) in the supply chain identified if an MFP is not made available to beneficiaries. CMS should monitor compliance across all parties if they proceed with establishing a toll-free phone line and email box that accepts claims of MFP non-compliance.

The pharmacy's actual acquisition cost is not known to or controlled by manufacturers, and the existing chargeback payments and rebate mechanisms are currently inadequate to effectuate the MFP, given the statutory responsibilities to provide access to the MFP and the 340B nonduplication provision. If, in the example CMS provides, the pharmacy's purchase price increased (or was reported to be higher) and the MFP remained constant, the amount of the reimbursement required from the manufacturer would increase. Likewise, if a prescription was

filled, billed, and returned to stock within the 14-day time frame proposed by CMS, the Part D plan would have the information necessary to reverse their payment to the pharmacy, but the manufacturer would not be aware of the need to reverse the MFP effectuation payment. This creates a significant economic incentive that could encourage inadvertent duplicate discounts or outright diversion or fraud that threatens the integrity of IRA implementation.

As such, we believe the 14-day timeframe proposed is unreasonable for manufacturers, and CMS should provide manufacturers with access to Prescription Drug Event (PDE) data to verify eligibility and base the MFP discount on a consistent, more widely available metric like Wholesale Acquisition Cost. CMS could also consider designating a third-party administrator to oversee this process for manufacturers choosing a retrospective approach.

Likewise, a lack of transparency in the 340B Drug Pricing Program, the potential for mixing mechanisms of chargebacks and rebates of 340B and MFP on the same National Drug Code (NDC), and the inconsistent timeframe and methods by which pharmacy claims are determined as 340B eligible, creates a significant potential for MFP and 340B duplicate discounts. Without additional verification from CMS, manufacturers will need to validate that 340B entities are only providing the MFP to eligible individuals.

To avoid duplication of 340B and MFP prices, CMS should require identification of 340B units at the point of sale at the time of dispensing (when the claim is created). The Agency should also commit to ensuring that providers report a “minimally necessary” data set to the manufacturer or its vendor to be entitled to access the MFP and for the purposes of validating their right to access in a timely manner, according to standard business practices and consistent with non-duplication requirements. CMS should expressly acknowledge that manufacturers will establish, receive, review, and, as necessary, audit MFP validation data to ensure MFP access is provided in accordance with the statute.

Given the complex interactions of the processes described above, CMS could establish a clearinghouse-type organization to identify 340B units dispensed or administered to Medicare enrollees. The 340B clearinghouse would act as a claims verifier, reviewing Part D PDE data as well as data submitted by 340B covered entities (or entities acting on their behalf) to confirm whether a claim is subject to a 340B agreement, similar to the role played by 340B third-party administrators (TPAs) and split-billing vendors today.

C. Primary/Secondary Manufacturer Definition

NPC suggests that CMS abandon the Primary/Secondary Manufacturer policy. The primary and secondary manufacturer concept developed by CMS is unworkable, impractical, and not supported by the statute. Requiring one manufacturer to enter into an agreement with CMS that holds them responsible for the actions of another manufacturer (and potentially a competitor) unnecessarily complicates implementation and exposes manufacturers to potentially significant burden.

I. (Sections 50 and 60) Negotiation Factors and Process

As stated earlier, many stakeholders are closely watching CMS's IRA implementation process. The price-setting process adopted for the first IPAY will be closely studied not just by manufacturers, but by the broader pharmacoeconomic, health policy, and patient advocacy communities. The credibility of CMS's process will be judged by the agency's use of good evidence and appropriate methods in a transparent and patient-centered process.

CMS has described a domestic reference price-setting mechanism that begins by identifying a therapeutic alternative and using its price as an initial starting point before adjusting for clinical benefits to achieve a preliminary price that is further adjusted by a variety of other factors unrelated to the value of a treatment.

We do not believe the Guidance describes a satisfactory process to determine the value of a medicine or set its price and note that it resembles processes used by countries outside of the United States that face significant delays in accessing innovation. We believe that only clinical benefit, health improvement and cost offsets associated with the treatment may be used to determine the value of a medicine. Adjusting reimbursement by the elements described in the manufacturer data elements (e.g., R&D costs, cost of production, patent life or exclusivity) will have disastrous effects on innovation and deny patients future treatments or future indications for existing treatments.

The statute requires CMS to use a "consistent methodology and process" for negotiation.⁴ More clarity is needed than is provided in the Guidance to achieve that goal, especially related to the identification of therapeutic benefit and the weighting of factors used to determine the preliminary price and initial offer. Only when such clarity is provided can manufacturers and external stakeholders build their own models to anticipate, inform, and evaluate the process CMS operationalizes. Manufacturers in particular need more clarity to accurately prepare their submissions and meaningfully participate in the process.

As previously stated, CMS is making significant changes to Medicare policy and seeking to implement a complicated process in a short amount of time. In the interest of not harming patients' access to medicine – and the innovation ecosystem that creates new medicine – we encourage CMS to take the time needed to build a transparent and consistent process and methodology and to set prices at the ceiling price for IPAY 2026. Specific recommendations follow.

A. Development of a Transparent and Rigorous Evaluation and Price-Setting Process

NPC encourages CMS to implement a transparent and inclusive evaluation process to promote credibility and support for their price-setting and counteroffer process. The agency is introducing comparative effectiveness to the Medicare program and making value determinations when establishing a "preliminary price" for selected drugs. A large and growing

⁴ SSA § 1194(b)(1).

body of research and guidance emphasizes the critical nature of transparency and methodological rigor during value assessment.⁵ CMS should pursue analytic transparency by carefully considering data assumptions and highlighting the limitations and uncertainties of analyses to the public. By providing robust information about its evaluation criteria and the factors considered during the price-setting process, CMS can help build trust with all stakeholders and allow others to evaluate their process. Specifically, NPC encourages:

- **Engagement with key stakeholders throughout the assessment process** to ensure all perspectives are considered and have the opportunity to inform the assessment.⁶ CMS should specifically seek and incorporate stakeholder feedback about their choice of therapeutic alternatives for each selected drug; the benefits of a selected drug to each stakeholder (including patients, clinicians, caregivers, manufacturers and other scientists); the meaning of unmet need to each stakeholder and the extent to which a selected drug meets that unmet need.⁷

CMS should seek patient input via a variety of mechanisms as the Information Collection Request process may not be the best way to reach this important stakeholder community. Given the important perspectives of patients and caregivers, we provide additional recommendations on meaningful patient input to the CMS process determining clinical benefit throughout this comment. Furthermore, manufacturers should be able to inform the selection of evidence about their products and verify information provided about their products from others.

- **The use of public comment periods during the negotiation process** with sufficient time to review materials and submit comments as well as transparency around how comments are considered and used or not used by the agency. The public has been given the ability to provide comments and read agency responses on policies with far

⁷ Khavjou O, Bradley C, D'Angelo S, Buell N, Giombi K, Honeycutt A. Landscape Review and Summary of Patient and Stakeholder Perspectives on Value in Health and Health Care. August 2022. Available at: <https://www.pcori.org/sites/default/files/PCORI-Landscape-Review-Summary-Patient-Stakeholder-Perspectives-Value-Health-Health-Care-August-2022.pdf>

less patient impact, presumably not solely because of the Administrative Procedures Act but because it is the right thing to do. Public comments should be sought and published in an annual docket containing all key documents and decision points in an evaluation such as scoping documents, analytic protocols, and draft reports. Allowing sufficient time for interested stakeholders, including manufacturers of selected drugs, to review materials and prepare comments ensures that stakeholders can thoughtfully and comprehensively respond to the comment request. Providing transparency around how comments are addressed builds credibility and trust in the process.

- **Transparent and reproducible methods and results** to the extent possible, given the confidentiality required for proprietary information, methods, models (including all calculations). Assumptions should be transparent to interested stakeholders. This transparency, combined with the ability to reproduce results, will further build credibility and trust in the process.⁸ Importantly, before negotiation begins, CMS should create and publish its decision-making framework – both generally and for selected drugs – which should include, at a minimum, information on:
 1. the therapeutic alternative(s) considered for each indication for selected drugs and the rationale for selection;
 2. the definition(s) of unmet need for each indication of selected drugs;
 3. the full range of benefits and impacts considered for each indication;
 4. the internal process and rationale for determining which benefits and impacts were included;
 5. a list of each stakeholder consulted;
 6. the source(s) of evidence considered, particularly clinicians and patients;
 7. how each benefit and impact considered influenced the final MFP, to include any algorithms, calculations, or modeling that related to MFP determination, as well as rationale for evidence that was not considered; and
 8. the limitations of the data collected and uncertainties in CMS’s decision-making. As is common in any rigorous, evidence-based process, this information should also be made clear when reported to the public.

These elements of CMS’s evaluation and MFP determination should be made public at distinct phases of evaluation. First, this draft framework should be made public as a scoping document prior to initiating stakeholder engagement and beginning data collection for CMS’s evaluation process. Secondly, preliminary results should be shared with manufacturers of selected drugs at least 60 days prior to initiating the negotiation process. Finally, results of this framework should be revealed to the public to explain the final MFP. Importantly, CMS should publish the required IPAY 2026 MFP explanations before IPAY 2027 negotiations begin.

Principles for planning and conducting comparative effectiveness research. *J Comp Eff Res*. 2012 Sep;1(5):431-40.

- **Robust engagement with manufacturers** consistent with the practices and policies of other payers and regulators.⁹ Given their vast knowledge of their products and therapeutic areas, pharmaceutical manufacturers and their pharmacoeconomic researchers are critically important sources of information on the value of treatments for payer decision-making. Recognizing this, Congress and the U.S. Food and Drug Administration (FDA) have provided guidelines on how healthcare economic information (HCEI) can be provided to payers' pharmacy and therapeutics committees.¹⁰ We encourage CMS to similarly provide opportunities for meaningful engagement with manufacturers. Existing industry best practices suggest the *minimum level* of engagement with manufacturers of selected drugs would be to meet with agency staff at three specific points during the MFP process: 1) after drug selection but prior to initiation of the price-setting process; 2) prior to CMS presenting the initial offer; and 3) the three meetings described by CMS as occurring after CMS presents the initial offer. All meetings should be offered as in-person, and we refer back to our comments on Section 40 about the importance of lessons learned during this process.

1. Evaluation of data on product value for quality, particularly information on patient experience

The Guidance states that CMS will accept information on the benefits of selected drugs from the public and conduct its own literature reviews and database analyses. Open public submission of evidence is laudable and helpful, as stakeholders may have pertinent evidence that is not available in the published literature, or evidence which was not properly identified in the initial literature review. However, public submission comes with a cost of sorting through and identifying studies that are both high quality and relevant to the therapeutic alternatives and patient population.¹¹

The results of an assessment depend on the evidence that underlies it, and the burden is on CMS to use and develop evidence in a systematic, transparent, and robust manner. To maximize credibility and trust in the assessment process, the procedures by which evidence is identified and included in the assessment should be objective, systematic, transparent, robust, reproducible, and made public as part of the scoping process. Not following widely accepted scientific best practices erodes trust in the process.

Accordingly, we encourage CMS to develop robust, transparent standards for both submitted and internally generated data to ensure that evidence is methodologically rigorous and apply these same rigor and transparency standards to the agency's internal claims analysis and review when adjusting the MFP initial starting point based on clinical evidence. These standards can be informed by using accepted rubrics for evaluating study quality.¹² Evidence can be of varying quality and certainty, and the findings from individual studies can conflict with each other. To produce a meaningful and credible assessment, accepted methods should be used to evaluate quality and certainty of evidence and to determine how to handle conflicting evidence.¹³ Grading rubrics should be fit for purpose and most appropriate for the type of evidence (e.g., clinical versus economic data). Procedures for evaluating evidence quality should be included in scoping documents, and the results should be made available through the value assessment.

We encourage CMS to follow and tailor as necessary consensus guidance on the conduct and evaluation of comparative effectiveness research (CER) that is both submitted and internally conducted.¹⁴ Principles of good CER adopt elements of high-quality research methods, including: clear statements of objectives; transparency of process, data and methods; engagement of stakeholders and analytic perspectives reflecting multiple stakeholders; use of comparators relevant to current clinical practice; evaluation of outcomes relevant to the stated objectives; and explicit treatment of heterogeneity and uncertainty.

2. Inclusion of Treatment Costs and Cost Offsets

Costs should be representative of the net price most relevant to the user. Cost offsets are a driving component of drug value and actual transaction costs, and care should be taken to ensure that costs are as representative of the actual net cost to the payer and net revenue realized by the manufacturer as possible in order to achieve an accurate assessment. For biopharmaceuticals, following ISPOR good research practices for measuring drug costs can help

achieve this objective.¹⁵ In the case of MFP, CMS must ensure that cost data reflects discounts and rebates provided to Medicare and recognize that the net cost to the payer does not always represent the net revenue realized by the manufacturer.

We encourage CMS to also include comprehensive assessments of the economic benefits of selected drugs, in addition to the costs of the treatments themselves. In any assessment of the value of medical treatments, all healthcare costs and cost offsets should be included.¹⁶ Treatments may have up-front costs that lead to long-term improvements in patient health. Those improvements may yield “cost offsets,” or savings due to reductions in resource needs, such as reduced hospitalizations. The full value of treatment can only be assessed by including both the treatment costs and cost offsets it may produce. Only considering the treatment costs but not the potential cost offsets would lead to an incomplete assessment of value.

When evaluating cost data, the time horizon should be long enough to incorporate the benefits of the treatment and the lower costs of medications when they become generic. Many of the cost-offset benefits of treatment, such as costs of avoided hospitalizations, show up in the longer-term. To measure the full value of a treatment, the time horizon for costs should be long enough to capture these cost offsets,¹⁷ and to account for the lower costs of medications when generics and biosimilars are introduced.

3. Utilization of Best Practices Relevant to CMS’s Proposed Evidence Evaluation

We have cited in this response several publications on research best practices relevant to the agency’s evidence evaluation proposed in the Guidance. We encourage CMS to review and, wherever possible, utilize the guiding principles listed below to ensure the transparency, validity, and credibility of the annual price-setting process. In our foregoing recommendations, we have emphasized methodological issues that are relevant to the price-setting process proposed by CMS. We encourage CMS to consider these tools to the extent that the principles are appropriate for Medicare:

- *NPC’s Guiding Practices for Patient-Centered Value Assessment* includes 28 specific elements surrounding six key aspects of value assessment, including the assessment process, methodology, benefits, costs, evidence, and dissemination and utilization.¹⁸
- *Principles for planning and conducting comparative effectiveness research*, published by NPC researchers alongside a team of international collaborators, highlights thirteen principles for planning and conducting comparative effectiveness research.¹⁹

- The NHC also created a Patient-Centered Value Model Rubric for healthcare stakeholders to assess the use of patient centeredness in value model development and to guide model developers on how to implement patient engagement throughout the value modeling process.²⁶

B. Identification of Therapeutic Alternatives

The IRA instructs CMS to consider “the extent to which [a selected drug] represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives”; however, it does not suggest that the cost of those alternatives should be used as a benchmark for an initial offer. The Guidance diverges from the statute because CMS intends to rely on Part D net price(s) or the Part B ASP of therapeutic alternatives “to determine a starting point for developing an initial offer.”²⁷

²⁷ SSA § 1194(e)(2)(A).

In any assessment of the relative clinical or economic benefits of a drug, the choice of the comparator is a fundamental driver in the outcomes and validity of the assessment with significant implications for patients, payers, and prescribers.²⁸ NPC recommends that the choice of comparators/therapeutic alternatives be driven by clinical appropriateness, informed by current treatment practices among a relevant patient population, and selected from potential comparators with the same treatment modality and class, rather than be dictated by cost, other concerns or implicit goals.²⁹ The selection of a less-costly therapeutic alternative lacking the safety, efficacy, and other clinical benefits of a selected drug – solely to lower the initial starting point of the price-setting process – fails to recognize the value of modern treatments and threatens to reverse the incentives that currently encourage innovation and access.

The use of a comparator that is not consistent with current clinical practice for given patients injects significant biases into the results and recommendations of a comparative assessment. Real world treatment decisions are based on numerous factors associated with the underlying disease and its severity, general health status or frailty, quality of life, and patient preferences.

The Agency for Healthcare Research and Quality's (AHRQ) Effective Health Care Program has produced guidance that may be helpful for CMS.³⁰ Specifically, the book reviews comparator selection in observational CER, noting that comparators “should reflect clinically meaningful choices in real-world practice and be chosen based on the study question being addressed.” AHRQ details how treatment selection bias (i.e., confounding by indication) may arise when disease severity, age, or other underlying health status differ between patients prescribed the drug being evaluated and the drug used as a comparator. The biases introduced by these factors can be minimized by choosing a comparator that has the same indication, similar contraindications, similar adverse effects, and the same treatment modality, class, and mechanism of action.

AHRQ also notes that selection of a comparator of the same treatment modality and class may result in less bias than comparison across modalities or classes.³¹ We appreciate CMS's intent to begin identifying therapeutic alternatives within the same drug class based on chemical class, therapeutic class, or mechanism of action before considering therapeutic alternatives in other classes, and encourage CMS to prioritize reducing bias in treatment comparisons by identifying

therapeutic alternatives from potential comparators with the same treatment modality, class, and mechanism of action.

Furthermore, NPC encourages CMS to consult not only current disease-specific clinical guidelines created by physicians and peer-reviewed studies to identify potential therapeutic alternatives but also solicit input from clinicians with expertise in the disease or indication being considered, manufacturers, and patients. Guidelines are a very useful source of information, yet CMS should ensure the guidelines are up-to-date and incorporate the latest evidence.³² CMS should also consider the use of market share data, comparative effectiveness studies and real-world evidence to support the selection of therapeutic alternative.

NPC cautions against using cost to determine a selected drug's therapeutic alternative(s). Rather, during selection of therapeutic alternatives, we encourage CMS to:

- Publicly communicate proposed therapeutic alternatives and permit feedback from manufacturers, clinicians with specific expertise in the treating the disease, patients and caregivers, and other stakeholders before proceeding with comparative effectiveness analyses that inform the initial offer.
- Include patient preferences and priorities that inform shared decision-making between appropriate treatment options.³³
- Invite manufacturers to proactively present clinical information focused on the relative clinical benefit of their products compared to therapeutic alternatives during the process of comparator selection and give manufacturers the opportunity to respond to CMS' choices of therapeutic alternatives (which would also require advanced notice from CMS on which alternatives they will consider). Broad stakeholder engagement, including opportunities for technical input throughout the assessment and clear rules for manufacturer communication of evidence, have been identified as important steps in high-quality value assessment.³⁴ Early manufacturer communication is also consistent with practices employed by state Medicaid agencies, other federal agencies and commercial payers.
- Seek input from clinicians with specific expertise in treating the indication of the selected drug to define appropriate therapeutic alternatives among Medicare patient sub-populations, including patients with multiple comorbidities and varying levels of disease severity.³⁵ There is a long history of guidance to gain this information,³⁶ and

NIH's National Center for Advancing Translational Sciences provides tools to help elicit valuable information from practicing clinicians.³⁷

- Limit the choice of therapeutic alternative to drugs and biologics with FDA-approved indications and exclude off-label use from being compared to FDA-approved indications of selected drugs.

C. Prioritize Patient and Caregiver Input

Patients' and caregivers' view of the drugs they take and the benefits they receive is essential to understanding "the full range of clinical and patient-centered outcomes",³⁸ as PCORI stated in their recent multi-stakeholder research initiative. The centrality of direct patient input is echoed in best practices for comparative effectiveness research and value assessment that underpin the concept that the price of pharmaceuticals should be based on the value they provide to patients, caregivers, healthcare systems, and society. Value encompasses the balance of benefits and costs experienced by patients and society over time. There are a multitude of specific benefits that constitute "value," from reducing mortality and improving patient functioning, quality of life, and productivity to outcome equity and societal value of scientific innovation, among others.³⁹

Measures of "indirect costs" such as patient productivity, caregiver time, and treatment burden (such as travel times for repeated hospitalization) are very important to patients and their families but are often poorly captured in administrative claims databases. This misalignment between patient concerns and priorities surrounding the impact of a disease or its treatment and the outcomes data collected in research and care is well documented.⁴⁰ As stewards of the Medicare program accountable to the health of people with Medicare, CMS should include these issues throughout discussions with patients and patient groups and seek and utilize observational studies or real-world evidence that includes these outcomes.

Systematically and rigorously incorporating patient perspectives on the value of selected drugs is essential to ensure that patients have a voice in decisions that affect their health and wellbeing.⁴¹ We are mindful of the federal prohibition on CMS's use of QALYs in coverage and reimbursement decisions. We also emphasize that direct engagement with patients identifies the measures of treatment benefit that patients and their families value, and therefore can avoid the potentially discriminatory nature of aggregate and limited measures such as the QALY. Thus, CMS should take tangible steps to capture the patient voice with validity and

fidelity, engaging with patient groups directly to understand their perspective on the value of different pharmaceuticals at the following stages of the negotiation process:

1. Defining Unmet Need

The Guidance states that CMS intends to define unmet medical need “as treating a disease or condition in cases where very limited or no other treatment options exist.” This definition is substantially narrower than definitions of unmet need found in the peer-reviewed literature and promulgated by FDA as well as international agencies.

First, the CMS definition incorporates only one of ten elements of unmet medical need identified in a published scoping review (i.e., number of available treatments), an approach considered inadequate in published multi-stakeholder discussions.⁴² The CMS definition of unmet need excludes remaining morbidity from alternative treatments, severity and burden of the disease, and size of the population, among other elements; by excluding treatments that address remaining morbidity from alternative treatments from the definition of unmet need, CMS ignores the considerable value of incremental innovation to patients.

Second, it significantly narrows FDA’s definition of unmet need, as outlined in its guidance for expedited programs. The FDA includes in its definition of unmet need improved efficacy, reduced toxicity and/or potential drug-drug interactions, and improvements in other benefits such as adherence.⁴³ Notably, the FDA definition of unmet need also highlights conditions for which there is significant heterogeneity in response to existing treatment options. Patients may respond differently to available treatment options due to pharmacologic differences, genetic risk, or social determinants of health, creating unmet need despite existing treatments.⁴⁴

Finally, the CMS definition is even narrower than some international practices, which often evaluate unmet need in the context of broader concepts of novelty. These novel considerations include new methods of administration and dosing schedules as well as provision of benefits not captured in conventional measures of health gain (e.g., caregiver benefit, equity, and patient dignity).⁴⁵

We believe assessments of unmet medical need should go beyond simply identifying the number of treatment alternatives in a therapeutic area and encourage CMS to expand their definition of unmet medical need to include a multifaceted definition informed by the patient perspective. Rigorous methods can be used to elicit consensus from clinician experts and have

been used to identify unmet medical needs to achieve optimal treatment goals throughout the natural history of a disease.⁴⁶ These methods have identified patient-centered unmet needs, including patient quality of life, poor adherence, severe stages of a disease that are hard to treat, and patient preferred routes of administration.⁴⁷ Failure to capture the value of treatments that address patient-centered unmet needs disincentivizes innovations that meet those needs, in turn exacerbating disparities in health outcomes among patients receiving treatments less effective in their subgroups and/or unaligned with their preferences.

2. Selecting alternatives

As discussed above, the choice of comparator is the fundamental driver of any value assessment and its implications for patients and caregivers. Accordingly, patient preferences and priorities that inform shared decision-making between appropriate treatment options should be incorporated into CMS's process for selecting treatment alternatives.⁴⁸ Prioritizing the patient voice in defining unmet medical need promotes patient access to not only *any* treatment alternative but *satisfactory* and *appropriate* treatment options aligned with patient preferences.⁴⁹

3. Determining clinical benefit

We encourage CMS to make use of resources to capture the patient's voice when selecting outcomes for evaluation of relative clinical benefit and to emphasize patient-centered benefits throughout its evaluation process. People with Medicare may prioritize different outcomes, such as symptom relief, improved quality of life, or indirect benefits such as caregiver burden, compared to clinical outcomes like survival or disease progression.⁵⁰ Subgroups of people with Medicare may also have different priorities. Our research has identified heterogeneous patient preferences for both treatment characteristics and outcomes,⁵¹ demonstrating the benefits associated with novel drugs and formulations that provide patients and providers with preference-aligned treatment options. Accordingly, patient preferences regarding the benefits and risks of a product, its available dosage forms, and any innovative delivery systems should be included early in the assessment. Patient preference information can inform many aspects of evaluation of benefit in value assessment, including defining what benefits are most important to patients, selecting measures to quantify benefits, and supplementing health state

utilities.⁵² The FDA has created useful backgrounders and issued guidance on collection and use of patient preference information.⁵³

In evaluating relative clinical benefit, we encourage CMS to consider patient-reported outcomes that are complete, comprehensive, and fit for purpose, as opposed to limited, QALY utility-based approaches, including QALYs in or outside of a life-extension context.⁵⁴ Fit-for-purpose tools may include disease-specific measures in addition to overarching measures, as well as other outcomes that are meaningful to patients, including productivity, treatment and caregiver burden, and downstream healthcare utilization. Societal benefits, including scientific spillover, limiting the fear and risk of contagion for infectious diseases, and increasing equity have also been recognized as important elements of value.⁵⁵

Comprehensive approaches to measuring patient-centered value, including incorporation of factors beyond effectiveness and side effects, will result in more meaningful comparisons.⁵⁶ Multi-criteria decision analysis (MCDA) is widely recognized and accepted methodology to aggregating different dimensions of value for patient-centered value assessment.⁵⁷ Importantly, MCDA addresses many of concerns of discrimination against disabled and elderly patient that are inherent in utility-based QALYs. While MCDA has important advantages over CEA and other non-consensus methods, it is simply one input to payer decision-making.

CMS has a longstanding commitment to beneficiary engagement. By engaging with patients through surveys, advisory panels, and other forms of direct engagement, CMS can ensure that they are receiving comprehensive and representative information directly from patients to better inform CMS evaluations. We also encourage CMS to emphasize its commitment to patient engagement by including, in its initial offer and price justification, how the patient experience was considered in the evaluation of unmet need, selection of treatment alternatives, and evaluation of clinical benefit.

II. (Section 110) Part D Formulary Inclusion of Selected Drugs

The IRA requires Part D plan sponsors to include on their formularies drugs for which an MFP is available. However, the perverse incentives that remain in the ecosystem could be exacerbated because the MFP process will occur concurrently with Part D redesign; more so if selected drugs are in competitive classes and may be priced below the ceiling price. This could lead to adverse tiering impacting patient copayments and/or formulary-driven switching, increased utilization management, or other reductions in beneficiary access thwarting the intent of the MFP process and undermining the competition that has made Medicare Part D a success.

Experts have already warned that the intersection of MFP and Part D redesign provisions are likely to increase formulary exclusions.⁵⁸ CMS should provide additional guidance about how to ensure selected and non-selected treatments are included in Part D formularies. CMS should also consider the risk of Medicare Prescription Drug Plans (PDPs) penalizing selected drugs compared to non-selected drugs in the same therapeutic class with adverse tiering or overly burdensome utilization management. CMS should also redefine Part D negotiated price to include all manufacturer price concessions, which would put less pressure on plan sponsors in the catastrophic phase of the benefit and decrease beneficiary coinsurance for both selected and non-selected drugs.

NPC and others will be closely monitoring changes to patient access as a result of IRA and encourages the agency to pay close attention to decreased access or discriminatory behavior.

III. General Comments

A. Adjusting the preliminary price downward for existing patents and exclusivities

In section 60.3.4, Consideration of Manufacturer-Specific Data, the Guidance specifies that the agency intends to “*consider the length of the available patents and exclusivities before the selected drug may no longer be single source. For example, if the selected drug has patents and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward.*” The IRA statute establishes an applicable percentage of non-FAMP ceiling price based on the length of time since a selected drug was approved. Because that formula already factors in historical exclusivity periods, adjusting the price downward represents a double counting not expressly permitted in the statute.

NPC disagrees with CMS’ proposal to adjust the preliminary price downward for selected drugs that have existing patents and exclusivities, including Orphan Drug Exclusivity and Pediatric Exclusivity. Patents and regulatory exclusivity are critical mechanisms to accelerate innovation and incentivize research and development for both existing and emerging products, particularly

⁵⁸ Kelly C. Medicare Part D Redesign Could Expand Rebate-Driven Formulary Exclusions in Program. The Pink Sheet. January 26, 2023. <https://pink.pharmaintelligence.informa.com/PS147634/Medicare-Part-D-Redesign-Could-Expand-Rebate-Driven-Formulary-Exclusions-In-Program>

when addressing unmet needs in orphan and pediatric populations.⁵⁹ Accordingly, this proposal will hinder innovation in areas where vital momentum to develop clinically important therapies has increased over time.

Orphan drug development has accelerated over the past four decades, resulting in more novel treatments for patients with rare diseases, particularly in the therapeutic areas of oncology, neurology, and infectious disease.⁶⁰ Pediatric research has also grown considerably, with nearly all drugs granted exclusivity for pediatric research receiving new pediatric labeling, most often a new or expanded pediatric indication.⁶¹

B. Orphan drug development

Though CMS published Section 30 of the guidance as final, we are encouraged that the agency *“is considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development.”* People with rare diseases face significantly higher health care costs,⁶² and these patients and their families highly value the current and future treatments that meet their needs. Furthermore, the small patient populations for which orphan drugs are indicated are highly sensitive to changes in the research and development landscape, and the companies that develop orphan drugs are additionally highly sensitive to changes in the reimbursement landscape – especially those that threaten their ability to bring new orphan treatment to market and conduct post-approval research and development.

As such, we encourage CMS to broadly interpret the discretion provided by the IRA statute to exclude orphan drugs from negotiation and when determining the number of designations and indications that exempt an orphan product from selection. For example,

- CMS should incorporate the definition in the Orphan Drug Act and exclude from negotiation a drug intended to treat a condition affecting fewer than 200,000 persons in the United States. CMS’s too-narrow orphan drug exclusion jeopardizes the development of rare disease therapies that treat fewer than 200,000 patients across multiple indications.
- CMS should support orphan drug development by clarifying that for orphan drugs the 7- or 11-year period that must elapse before a drug can be considered for negotiation begins upon the date that the orphan drug exclusion no longer applies.

C. Application of MFP across dosage forms and strengths

NPC appreciates that CMS is seeking comments under section 60.5 on approaches to the application of the MFP across dosage forms and strengths that could accurately and fairly compensate manufacturers and other entities. As stated earlier in this document, our research demonstrates how novel formulations provide patients and providers with treatment options that account for heterogeneous patient preferences⁶³ and promote medication adherence through reduced regimen complexity.⁶⁴ Given the documented value of dosage form innovation on patient-centered care and outcomes, NPC encourages CMS to incorporate the value of novel formulations in its price determination and negotiation process.

We also recommend that CMS provide more clarity in the calculation of 30-day equivalent supplies. The use of loading doses, weight-based dosing, and severity-based dosing are common clinical practices that result in the amount of medicine being used by one patient being different than that used by others. This is yet another reason why CMS should consult with manufacturers early and often in its process, and openly communicate important information such as the agency's estimation of a 30-day equivalent supply and how that compares with actual use across the Medicare population.

NPC is disappointed that CMS chose a broad and sweeping approach to defining qualifying single-source drugs in Section 30 and did not invite stakeholder feedback on that process. The definition ignores the value of novel formulations and delivery systems, which should be considered at the selection phase of the process not the MFP application phase.

IV. Conclusion

The National Pharmaceutical Council appreciates the opportunity to submit comments in response to this Guidance and looks forward to additional opportunities to engage with CMS as it implements the Medicare Drug Price Negotiation Program. Please contact me at john.obrien@npcnow.org or (202) 827-2080 if we may provide any additional information.

Sincerely,

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani,

Thank you for the opportunity to provide comment on the guidance for the Medicare Drug Price Negotiation Program (Program) for initial price applicability year 2026. I write on behalf of the National Psoriasis Foundation (NPF) to submit feedback on the initial guidance. In addition, we encourage the Centers for Medicare & Medicaid Service (CMS) to design the Program to ensure it improves patient access as well as treatment affordability.

Psoriatic disease is a heterogeneous, immune-mediated condition that affects over eight million Americans. While psoriatic disease primarily affects the skin, most patients have evidence of systemic inflammation which increases their risk for the development of many comorbidities. For example, approximately one-third of psoriasis patients have or will go on to develop psoriatic arthritis with severe pain and/or irreversible bone loss. Psoriatic disease is also associated with several co-occurring conditions such as cardiovascular disease including stroke and hypertension, diabetes, metabolic syndrome, depression/anxiety, and cancer.

Patients living with psoriatic disease need consistent and timely access to treatment to reduce symptoms and mitigate the harmful systemic effects of this condition. Treatments include prescription topical therapies, UV-based light therapy, oral medicines, and biologics.

For over 55 years, the NPF has been the leading advocacy voice in the effort to cure psoriatic disease and improve the lives of those affected. The NPF supports the psoriatic disease community through state and federal advocacy efforts, provider and patient education, patient support, research, and the development of treatment recommendations and guidelines. We are also committed to supporting the work of government and policymakers to address and advance solutions to improve health outcomes for individuals living with chronic disease.

Utilization Management

As CMS develops the Medicare Drug Price Negotiation Program, NPF urges CMS to evaluate policy decisions based on how it will affect patient access to needed treatments. The NPF urges CMS to consider our [position statement on access to care](#) as this process develops. For example, formulary design may change, which could lead to utilization management protocols that destabilize patients with ongoing treatment or further delay access to needed prescriptions. CMS should go above and beyond to establish guardrails in the implementation of the Program to ensure that patient treatment plans are not negatively affected.

In addition, between now and 2026, NPF encourages CMS to:

- Assess the current impact of utilization management, including prior authorization and step therapy, on patient access to prescription drugs as well as health outcomes
- Ensure that existing guardrails are working, such as the step therapy exceptions process and prohibiting step therapy for treatments that patients are stable on
- Consider additional patient protections that could ensure appropriate and timely access, such as extending the prohibition of step therapy for stable patients to Part D

Finally, NPF encourages CMS to monitor and report on whether utilization management like prior authorization and step therapy increased/decreased as a result of the Program, and how timely patient access to prescriptions was affected.

Patient Engagement and Value Assessment

Engaging the patient community to understand the perspectives of people living with chronic diseases and disabilities is vital to the success of IRA implementation. The NPF has long been a leader in engaging our community to [best understand their perspectives](#) on the development of a treatment and in the [health technology assessment/value](#) conversation.

We appreciate CMS stating that it will not use metrics such as QALYs. All individuals living with chronic diseases deserve to be treated equally regardless of age, disability status, or other special populations. The NPF joins others in our community to express concern over the external data submission timing. Thirty days to submit data after release of the list of drugs to be negotiated is a significant challenge and is likely to present a challenge in truly assessing the value of a treatment. We believe CMS should extend the timeframe for stakeholders to submit requested data or provide additional opportunities in the process to accept data from the patient community.

Section 30.3 – Selection of Drugs for Negotiation for Initial Price Applicability Year 2026

NPF appreciates that the outlined policies related to biosimilars closely match the statute. Where CMS has flexibility, we encourage CMS to favor policies that support a robust biosimilars market that drives down prices for patients. We encourage CMS to consider any unintended consequences that may hinder a robust biosimilars market or that disincentive the development of biosimilars.

Section 50 – Negotiation Factors

NPF applauds CMS for allowing the public, including patients, to submit data for the Negotiation Data Elements Information Collection Request (ICR). In addition, we encourage CMS to consider additional ways to engage the patient community as it collects information to support negotiating the maximum fair price. For example, opportunities for patients to provide live testimony have been impactful in other government decision related to access to care.

Section 60 – Negotiation Process

When reviewing therapeutic alternatives, please consider the following:

- It is important for patient communities to have access to a broad array of treatment options. Each patient is unique in the way they respond to therapy, and there is no ‘one size fits all’ approach.
- Stable patients should not be switched to different treatments, unless prescribed by their physician or where the alternative is a generic or biosimilar. Switching patients may destabilize their health, and patients may develop immunogenicity to the treatment that was working for them. It is critical to ensure the treating physician and patient are informed of any switches with ample time to appeal as necessary.
- Stable patients should not be exposed to increased drug cost sharing because they were unwilling to switch treatments.

When reviewing clinical efficacy, please consider the following:

- The drug’s delivery mechanism can significantly impact treatment adherence and patient quality of life.
- NPF applauds CMS for considering patient reported outcomes (PROs) and encourages CMS to deepen its engagement with patient communities to ensure adequate communication of PROs.

Section 90.2 – Monitoring Access to the Maximum Fair Price

NPF agrees that patient cost-sharing should be based on the MFP. If a lower price is negotiated via rebates or other mechanisms, then the cost sharing should be based on the lowest price.

To help ensure that MFP-eligible communities have access to the MFP, CMS should include the MFP in the plan holder’s statement of benefits. This would enable the beneficiary to confirm whether their cost-sharing was based on the MFP. In addition, to illustrate the direct impact of the Program for beneficiaries, CMS could include information on how the MFP compares to the drug price prior to inclusion in the Program.

Conclusion

Thank you for your consideration of our views on the initial guidance for the Drug Price Negotiation Program. We hope for the opportunity to continue to engage with CMS via comments as well as in person meetings as the agency implements the prescription drug provisions of the Inflation Reduction Act. For additional information, please contact Sarah Buchanan, Director of Government Relations and Health Policy, at sbuchanan@psoriasis.org.

Sincerely,

A handwritten signature in black ink, appearing to read "Jason Harris". The signature is fluid and cursive, with the first name "Jason" being more prominent than the last name "Harris".

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani,

The National Council for Prescription Drug Programs (NCPDP) is a not-for-profit American National Standards Institute (ANSI) accredited Standards Developer (ASD) consisting of more than 1,500 members representing entities including, but not limited to, claims processors, data management and analysis vendors, federal and state government agencies, insurers, intermediaries, pharmaceutical manufacturers, pharmacies, pharmacy benefit managers, professional services organizations, software and system vendors and other parties interested in electronic standardization within the pharmacy services sector of the healthcare industry. NCPDP provides a forum wherein our diverse membership can develop business solutions, including ANSI-accredited standards and guidance for promoting information exchanges related to medications, supplies and services within the healthcare system.

For over 40 years, NCPDP has been committed to furthering the electronic exchange of information between healthcare stakeholders. The NCPDP Telecommunication Standard is the standard used for eligibility, claims processing, reporting and other functions in the pharmacy services industry as named in Health Insurance Portability and Accountability ACT (HIPAA). The NCPDP SCRIPT Standard and the Formulary and Benefit Standard are the standards in use in electronic prescribing as named in Medicare Modernization Act (MMA).

NCPDP requests an extension for additional comments to the *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments*, released March 15, 2023.

NCPDP additional comments will be submitted no later than May 31, 2023. NCPDP needs additional time to engage the wide range of impacted stakeholders, such as wholesalers, pharmacies, drug data compendia, payers/plans, intermediaries/software vendors, PBMs/processors and providers or pharmacy claim reconciliation services.

The initial NCPDP comments are as follows:

Section 90.2 Monitoring of Access to the MFP

...

“For example, a pharmacy may purchase a medication for \$100 per bottle and the MFP as applied to this selected package is \$80. The Medicare beneficiary is enrolled in a Part D plan under which coverage of the selected drug is available, thus the beneficiary is an MFP-eligible individual. For

this example, the plan has not negotiated a lower price for the medication. The pharmacy provides the negotiated price (i.e., MFP plus a dispensing fee) at the point of sale to the Medicare beneficiary. As a result of this transaction, the pharmacy is owed \$20 by the manufacturer. The pharmacy would submit the information regarding the \$20 chargeback amount to its wholesaler and receive a credit from the wholesaler for that amount. The wholesaler would be compensated by the manufacturer after billing the manufacturer for the chargeback amount.”

NCPDP Comment: There is not a current NCPDP standard to facilitate this requirement. NCPDP would welcome the opportunity to work with impacted industry partners such as CMS, wholesalers and pharmacies to develop a standards solution for the MFP requirements.

Appendix C: Definitions for Purposes of Collecting Manufacturer-Specific Data

Current Unit Costs of Production and Distribution (pages 85-86 and page 89)

“For the purposes of describing current unit costs of production and distribution to be collected for use in the Negotiation Program for the selected drug, as described in section 1194(e)(1) of the Act and section 50.1 of this memorandum, CMS intends to adopt the definitions described in this subsection.

- *In accordance with section 1191(c)(6) of the Act, the term ‘unit’ means, with respect to a drug or biological product, the lowest identifiable amount (such as a capsule or tablet, milligram of molecules, or grams) of the drug or biological product that is dispensed or furnished.*
- *Units must be reported in one of the three National Council for Prescription Drug Programs (NCPDP) Billing Unit Standards (BUS): each (EA), milliliter (ML), or gram (GM). The unit reported must be specified for each of the NDC-9s included in the selected drug. Selections of EA, ML or GM must be made as follows:*
 - *“EA” is used when the product is dispensed in discrete units. These products are not measured by volume or weight. The Billing Unit of “EA” is also used to address exceptions where “GM” and “ML” are not applicable. Examples of products defined as “EA” include, but are not limited to:*
 - *Tablets;*
 - *Capsules;*
 - *Suppositories;*
 - *Transdermal patches;*
 - *Non-filled syringes;*
 - *Tapes;*
 - *Devices/Digital Therapies;*
 - *Blister packs;*
 - *Oral powder packets;*
 - *Powder filled vials for injection;*
 - *Kits; and*
 - *Unit-of-use packages of products other than injectables with a quantity less than one milliliter or gram should be billed as “one each,” for example, ointment in packets of less than 1 gram or eye drops in dropperettes that contain less than 1 mL.*
 - *“ML” is used when a product is measured by its liquid volume. Examples of products defined as “ML” include, but are not limited to:*
 - *Liquid non-injectable products of 1 mL or greater;*
 - *Liquid injectable products in vials/ampules/syringes;*

- *Reconstitutable non-injectable products at the final volume after reconstitution except when they are in powder packets; and*
- *Inhalers (when labeled as milliliters on the product).*
- *“GM” is used when a product is measured by its weight. Examples of products defined as “GM” include, but are not limited to:*
 - *Creams (of 1 GM or greater);*
 - *Ointments (of 1 GM or greater); and*
 - *Inhalers (when labeled as GM on the product.*

NCPDP Comment: NCPDP reviewed this section of the initial memorandum and recommends making an addition to the second bullet, first sub-bullet at the eleventh sub-sub-bullet which states “Kits; and”. Since NCPDP has a specific definition for “Kits” and pharmaceutical manufacturers sometimes have a different view regarding what constitutes a kit, NCPDP recommends adding the following quote from the NCPDP Billing Unit Standard (*NCPDP Billing Unit Standard Implementation Guide Version 4.0 (January 2022), Section 5.5.1, page 14*) to specifically define the term “Kits” as used in this list:

- “Kits are defined as products that contain one of the following:
 - 1) at least two distinct items with different billing units
 - 2) one product packaged with medicated or unmedicated swabs, wipes and/or cotton swabs/balls
 - 3) meters packaged with test strips”

NCPDP understands that CMS used the publicly available *NCPDP BILLING UNIT STANDARD FACT SHEET* (June 2020) as the reference for the list in Appendix C and the “Kits” definition is not included on the Fact Sheet. However, to avoid any possible confusion regarding kits stemming from the initial memorandum, NCPDP recommends this addition.

NCPDP thanks CMS for the consideration of our initial comments and our request for an extension to provide additional comments. NCPDP looks forward to continuing its work with CMS.

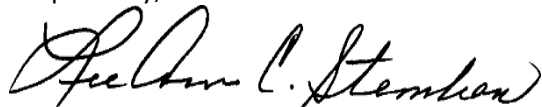

For direct inquiries or questions related to this letter, please contact:

Teresa Strickland

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator La-Sure,

Thank you for the opportunity to comment on the “Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026.”

I am writing on behalf of No Patient Left Behind (NPLB), a non-profit organization comprised of biotech investors, innovators, researchers, physicians, and patient advocates dedicated to three guiding principles: 1) prescribed treatments authorized by an insurer should be affordable to patients through zero or low out-of-pocket costs; 2) drug prices should not stay high for too long; and 3) sufficient R&D incentives must remain in place to ensure continued U.S. biotech innovation.

NPLB believes CMS can improve the Inflation Reduction Act (IRA) on behalf of patients, innovators, payors, and society with three proposed modifications. I also hope you review the more detailed [supplemental comments](#) at the end of this letter to assist CMS’ successful implementation of the new law.

Recommendations to improve IRA:

- 1) Small molecule parity.** We urge the administration to work to limit IRA’s harmful impact on new small molecule R&D by initiating negotiation of New Drug Application (NDA) path therapies 13 years after Food and Drug Administration (FDA) approval. NPLB’s presentation, “[How IRA makes new small molecule R&D uninvestable](#)”, lays out in detail with specific examples from development stage biotech CEOs and patient advocates of how IRA’s penalty against new drug application treatments vs. biologics license application treatments (NDAs vs. BLAs) will result in fewer new therapies, particularly a meaningful reduction in oncology treatments. By prioritizing R&D in physician-administered shots over self-administered pills, IRA also will result in higher costs to patients, employers, and the federal government, which likely will miss out on significant future savings and lower out-of-pocket costs achieved through the proven market competition and reliable interchangeability of abbreviated new drug application (ANDAs) “generic” therapies. For Medicare beneficiaries, the IRA incentivizing BLAs over NDAs also means that many future therapies will be covered by Medicare Part B that lacks IRA’s new \$2000 annual catastrophic out-of-pocket cost limit.
- 2) Incorporate Generalized Cost-effectiveness Analysis (GCEA) Methodologies.** When determining the value of an innovative medicine during the price-setting process, CMS should not rely on faulty and outdated math used by foreign governments, the Institute for Clinical and Economic Review (ICER), and vertically integrated U.S. health plans. These entities use traditional CEA math to deny patients access to innovative medicines via lack of coverage or unreasonably high out-of-pocket costs that health economists know deter patient access to prescribed treatments. Traditional CEA models purposefully omit real-world values of medicine impactful to patients, their families, and society. For example, ICER’s faulty and outdated math does not include simple,

demonstrable values, and basic facts, such as that medicines go generic, the likelihood of therapeutic competition, population changes, that caregivers and spouses are liberated and increase productivity when a patient gets better, and that medicines reduce risk for everyone worried about getting sick, incapacitated, or killed by a horrible condition. Furthermore, ICER's outdated methodology stubbornly relies on a 3% discount rate when even the [U.S. Office of Management & Budget is proposing economists use a 1.7% discount rate to determine the future value of innovations](#).

Please take the time to consider incorporating elements from [this updated value "flower"](#) in your health technology assessment calculations. It highlights which limited factors traditional CEAs use, the calculable values that updated CEAs could easily take into account today, and what additional values stakeholders should consider using in the future. The differentiation between traditional CEA and updated GCEA math also is explained [via this brief animation](#).

- 3) Low or no beneficiary cost-sharing for government negotiated drugs:** It is vital that CMS implements the law so that beneficiaries, not vertically integrated health plans and their sister organizations, benefit from a government price negotiation process that effectively transforms patent protected therapies into functionally generic government price set commodities. CMS has both the legislative requirement and strategic expertise in the negotiation process to require Medicare Advantage (MA), MA-PD plans, and Pharmacy Benefit Managers (PBMs) that take advantage of government negotiated prices to meaningfully lower both Part D and Part B beneficiaries' out-of-pocket costs.

Requiring government "negotiated" savings be passed on to beneficiaries in the form of low or no out-of-pocket costs similar to how plans treat generic therapies is necessary to maximize the IRA's benefits to Part D beneficiaries. For example, the Kaiser Family Foundation reported that "[most Part D enrollees pay less than \\$10 for generic drugs, but many pay \\$40-\\$100 \(or coinsurance of 40%-50%\) for brand-name drugs](#)." The IRA will not fulfill both its legislative requirement and intended impact unless CMS contractually assures manufacturers and requires MA plans to similarly limit beneficiary out-of-pocket costs to less than \$10 at Tier 1 copayments for all government negotiated drugs.

Similarly for Part B, while there is a 20% coinsurance limit per service, beneficiaries lack a catastrophic out-of-pocket cost cap. CMS should contractually require purchasers of Part B services that benefit from IRA's new government negotiation process to charge no coinsurance or copayments in order to ensure that beneficiaries see commensurate out-of-pocket savings due to government intervention and price-setting.

Regarding health plan prior authorization requirements, we appreciate CMS' recent efforts to end some of the unethical ways health plans have recently begun to use prior authorization to arbitrarily deny care and make it administratively burdensome for sick patients to access covered prescribed therapies at an affordable cost. Once again, NPLB recommends CMS requires plans use an expedited prior authorization process or prohibit prior authorization altogether for generic and government negotiated drugs.

In conclusion, NPLB supports IRA’s intent to achieve biotech affordability and innovation. We believe CMS and the Administration have an opportunity to help improve IRA so that it 1) treats all innovative therapies fairly at 13 years after FDA approval, 2) improves and updates traditional CEA methodology to help determine a medicine’s true value, and 3) requires MA plans to actually reduce beneficiary out-of-pocket costs for government negotiated drugs equivalent to a plan’s existing lowest-tier generic drug copayment.

Sincerely,

Peter Rubin
Executive Director
No Patient Left Behind (NPLB)
prubin@nopatientleftbehind.org

Supplemental Guidance Comments

Section 30 – Overarching Comment		
It is unfortunate that CMS considers the selection process for drugs for the first year of the program final. It is important that regulators also consider comments to Section 30 knowing that CMS rulemaking can often change or delay before, after, and during a plan year -- particularly when implementing a new program.		
Provision	Concern	Recommendation
(30.1) Medicare negotiation for NDA-path drugs at nine-years post-launch.	Erosion of the R&D case for all NDA-path drugs (small molecules, peptides, oligos, etc.) for diseases of aging. See NPLB’s open letter from leading biotech investors and innovators for a better understanding of how IRA makes new small molecule R&D uninvestable.	CMS should seek parity for NDA-path and BLA-path drugs by initiating government price “negotiation” 13 years after FDA approval. NPLB supports CMS seeking a larger minimum discount as necessary to ensure budget neutrality resulting from an NDA negotiation timing change.
(30.1.1) Orphan drug “exclusion” for only one indication.	Drugs approved for a second orphan indication under a separate ODD will be subject to negotiation. This prevents	The harms from IRA’s treatment of orphan drugs could be mostly alleviated by creating small- and large-molecule parity for

	<p>companies from trying to treat multiple orphan diseases and hampers orphan drug development.</p> <p>This article illustrates how IRA already is reducing orphan drug R&D for patients whose indications have unmet medical needs.</p>	<p>negotiation at 13 years (see above).</p> <p>CMS should look to only active orphan drug designations for the purposes of determining eligibility for the orphan drug exclusion (not including withdrawn orphan drug designations).</p>
--	--	--

Provision	Concern	Recommendation
<p>(30.1.1) orphan drug exclusion, all dosage forms and strengths and different formulations (active moiety) of the qualifying single source drug described in section 30.1 of this memorandum must meet the criteria for exclusion.</p> <p>[CMS looks to the orphan drug designations (ODDs) of all approved dosage forms, strengths, formulations of a drug (active moiety) and only grants a negotiation exemption if all of them fall under one ODD.]</p> <p>(90.4) For the purposes of determining if a drug can be selected (or should still be subject to negotiation once selected), CMS will look to whether there is an approved generic or biosimilar under 505(j) or 351(k), and also bona fide marketing/robust and meaningful competition of a generic or biosimilar brand.</p> <p>CMS will categorize drugs by</p>	<p>CMS's guidance presents an impediment to drug repurposing that will deprive patients from benefiting from new uses of old medicines that require radically different formulations.</p> <p>NPLB opposes gimmicks used to inappropriately delay generic market entry. However, there are limited cases where innovators see a R&D opportunity to add risk and develop a generic drug in a novel way, in a novel formulation, to treat a new orphan disease that could not possibly be treated using the existing generic (e.g., too toxic or doesn't reach high enough concentrations in the target tissue).</p> <p>To justify funding the development of the new formulation, innovators would count on the orphan exemption (again, because nine years is too short), and yet, the old generic drug, while functionally irrelevant to the treatment of the new disease, would</p>	<p>Ideally, NDA-path drugs would be negotiated 13 years after FDA approval – thus mitigating IRA's harms and the complexity of CMS' rulemaking.</p> <p>Until then, investors and innovators need to know if the old generic drug's approvals serve to invalidate the orphan exemption of the new formulation. CMS then would consider the availability of generics to also serve as a basis for not selecting the new innovative formulation for negotiation (at least not until year 11 for price reduction after 13 years).</p> <p>Furthermore, the bona fide marketing standard is extra-statutory in nature with no basis in the law, which defines the standard simply as "marketed". The standard is ambiguous and subjective. The appropriate test, as specified in the IRA, is an objective, point-in-time determination of whether a drug has been "marketed," which can be determined by reference to the "market date"</p>

<p>active moiety to determine eligibility for negotiation.</p>	<p>invalidate the new formulation's orphan exemption, deterring investment in its development.</p> <p>However, the presence of the generics could also serve as a basis for the moiety in all its forms (including the new formulation) to not be selected for negotiation, which investors would find reassuring for their funding of the new formulation. In practical contradiction, CMS' guidance suggests it may apply its arbitrary standard to determine that the original generic is not "bona fide" competition, thus making the new drug eligible for Medicare price negotiation at nine years, thereby deterring investment in its development.</p>	<p>reported by the manufacturer to the Medicaid Drug Rebate Program. It is defined as the date on which the drug is first sold in the US, and is the standard that CMS is using to determine whether a drug is marketed for purposes of the MDRP, the Part D inflation rebate guidance, and ASP (where the standard is articulated slightly different as the "first sale date."</p>

Provision	Concern	Recommendation
<p>(50.2) CMS' processes for determining the Maximum Fair Price for individual medicines as well as the relevance of "therapeutic alternatives" to the drugs it selects for negotiation.</p>	<p>Cost-effectiveness math embraced by ICER in the US and other HTA bodies elsewhere (e.g., NICE in the UK) is so simplified that it excludes many demonstrable benefits of medicines (e.g., they liberate caregivers, they reduce risk for healthy people, they go generic yet keep on working), resulting in extreme under-estimations of the value of new medicines. This math can then serve as an excuse for plans to refuse coverage, essentially telling patients that the medicines aren't worth their prices instead of admitting that the plan just doesn't want to cover or reimburse for the prescribed</p>	<p>To the extent that CMS wants to appreciate the value that a medicine brings to society before it decides how aggressively to set its price (particularly in the case of NDA-path drugs that experience negotiation far sooner than would have gone generic), CMS should broadly account for a medicine's value element, using a dynamic stacked cohort model that accounts for value to patients, to caregivers, and to the rest of the population whose risk is reduced by having the drug (i.e., if it's going to do CEA, do generalized CEA, not conventional over-simplified CEA).</p>

	<p>treatment.</p> <p>Considering that drugs can go generic and keep us out of hospitals and nursing homes, which do not go generic. ICER-like over-simplified CEA math that undervalues drugs would signal to investors and innovators that the value of new medicines will be willfully underestimated to justify not rewarding their development, which will turn investors away from funding future biomedical R&D.</p>	<p>CMS should consider key product attributes like efficacy, safety, and ease-of-use in determining relevant "therapeutic alternatives" (the basis for CMS' opening bid).</p>
Provision	Concern	Recommendation
<p>(90.4) For the purposes of determining if a drug can be selected (or should still be subject to negotiation once selected), CMS will look to whether there is an approved generic or biosimilar under 505(j) or 351(k), and also bona fide marketing/robust and meaningful competition of a generic or biosimilar brand.</p> <p>CMS will categorize drugs by active moiety to determine eligibility for negotiation.</p>	<p>CMS' broad discretion in determining what is "bona fide competition" suggests it favors the ability to determine drug price via its negotiation process rather than letting true competition play out in the marketplace.</p> <p>The "bona fide" generic competition standard will reduce the reward for first filer generics and hurt generic competition.</p> <p>Nowhere does the guidance specify what share or availability metrics may qualify as "bona fide."</p> <p>CMS is basically looking to the slowest adopters of generics (part D plans) to determine if competition is real.</p>	<p>The IRA threatens to make generic business models unsustainable for drugs that treat Medicare populations. One might think this does not matter because price reduction will be achieved via negotiation. However, because generic competition often drives costs down not only by eroding the gross margins of the original drug but also spurring manufacturing improvements that lower cost of goods, the IRA threatens to leave society paying more for old drugs in the long run by deterring generic competition.</p> <p>This could increase overall costs across market segments (Medicare and commercial payers).</p>

<p>(40.2.2) CMS prohibitions on data disclosure and destruction of related documents.</p>	<p>The lack of transparency around the negotiation process makes it impossible for companies to understand which value components CMS is measuring in determining MFP.</p>	<p>CMS’s process for determining value and cost-effectiveness should be transparent (vs. gag order and document destruction that they propose today). It should be able to defend what it considers to be a “fair price.”</p> <p>Furthermore, this prohibition violates company First Amendment rights. Companies subject to the negotiation process need to be able to disclose to their boards and their investors what occurred in the negotiation process.</p>

VIA ELECTRONIC DELIVERY

The Honorable Chiquita Brooks-LaSure
Administrator, Centers for Medicare & Medicaid Services
Department of Health and Human Services
Hubert H. Humphrey Building, Room 445-G
200 Independence Avenue, SW
Washington DC 20201

Re: Medicare Drug Price Negotiation Program Proposed Guidance: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure,

Novartis Services, Inc. submits this letter on behalf of Novartis Pharmaceuticals Corporation and its affiliates referred to collectively herein as “Novartis” and appreciates the opportunity to comment on the initial guidance regarding the Drug Price Negotiation Program (“Negotiation Program”) issued by the Centers for Medicare & Medicaid Services (“CMS”) on March 15, 2023 (“Initial Guidance”).¹

Novartis provides health care solutions that address the evolving needs of patients and societies worldwide. We are a focused medicines company concentrated on the core therapeutic areas of cardiovascular, immunology, neuroscience, solid tumors, and hematology. At Novartis, we are united by a single purpose to reimagine medicine to improve and extend lives. Through innovative science and technology, we address some of society’s most challenging health care issues. We work to discover and develop breakthrough treatments and find new ways to deliver them to as many people as possible. Our vision is to be the most valued and trusted medicines company in the world.

Novartis remains concerned that the Negotiation Program, as prescribed by the Inflation Reduction Act (“IRA”), will have profoundly detrimental effects on the development of innovative medicines in the U.S. The program is not structured as a negotiation, akin to the market-based negotiations that occur in Medicare Part D today, but rather as a blunt price setting tool arbitrarily applied to innovative medicines after a certain number of years on the market. The far-reaching consequences of the IRA go well beyond impacts to the Medicare program and risk threatening the innovation ecosystem that has brought life-changing medicines to the U.S. market. Over just the past six years, Novartis is proud to have advanced ground-breaking science across rare diseases such as Spinal Muscular Atrophy (“SMA”), brought to market the first CAR T cell therapy in a pediatric cancer indication, and pioneered the development of radioligand therapies for hard-to-treat cancers such as castration resistant metastatic prostate cancer. The commercial success of predecessor products made these incredible medical advancements possible, and that virtuous cycle continues to fuel the discovery of new medicines. In 2022 alone, Novartis had forty-four ongoing phase III programs and invested more than \$10 billion in research and development.²

OVERVIEW OF NOVARTIS COMMENTS

We recognize that CMS is required to implement the Negotiation Program on a timeline prescribed by statute. But, given the complexity of a program of this size and scope, with significant consequences across the multitude of stakeholders in the prescription drug supply chain, it is critical that CMS proceed carefully and deliberately in its approach to implementation to avoid further exacerbating the negative effects the law will have on future innovation and access to medicines in the U.S.

¹ CMS, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (Mar. 15, 2023), available [here](#).

² Novartis, Novartis in Society: Integrated Report 2022 at 4 (Jan. 31, 2023), available [here](#).

Novartis' recommendations seek meaningful policy changes within CMS's authority under the statute to protect innovation, ensure patients have broad access to selected drugs, and construct robust safeguards to avoid diversion and facilitate access to the maximum fair price ("MFP") as required under the law. Novartis recognizes that, despite committing to "collaborating and engaging with the public" and "prioritiz[ing] transparency and robust engagement" in implementing the Negotiation Program,³ CMS finalized the fundamental policies set forth in Section 30 of the Initial Guidance, which govern the selection of drugs for negotiation for initial price applicability year ("IPAY") 2026, without providing any opportunity for public comment. Novartis objects to the agency's failure to allow for comment on Section 30, which would have allowed for public participation before the agency policies were finalized. Set forth below are comments that Novartis would have made had the agency provided an opportunity for comment on such policies, along with Novartis' comments on the sections in the Initial Guidance on which CMS is soliciting comment.

As detailed below, Novartis makes the following recommendations:

- Define a qualified single source drug by reference to its New Drug Application ("NDA") or Biologics License Application ("BLA");
- Protect orphan drug development within the framework of the statute;
- Replace the bona fide marketing standard with the Medicaid Drug Rebate Program ("MDRP") standard;
- Clarify that a selected drug should have preferred formulary placement;
- Set the MFP at the MFP ceiling where a small molecule drug is less than thirteen years post-approval or where the ceiling is based on the "plan specific enrollment weighted amount";
- Protect against the disclosure of confidential commercial information;
- Rescind the proposals to impose overly broad confidentiality obligations on manufacturers;
- Finalize the proposal to permit manufacturers to provide access to the MFP through a rebate model and ensure that manufacturers have the requisite information to do so;
- Ensure accurate use of 340B claims modifiers;
- Allow manufacturers to rely on reasonable assumptions with respect to information submission requirements;
- Consider only appropriate therapeutic alternatives as comparators; and
- Commit to further enabling real dialogue during the negotiation process.

As a member of Pharmaceutical Research and Manufacturers of America ("PhRMA") and the Biotechnology Innovation Organization ("BIO"), Novartis also supports their comments on the Initial Guidance.

SECTION 30 – IDENTIFICATION OF SELECTED DRUGS FOR IPAY 2026

- I. **CMS should rescind its policy governing the identification of a qualifying single source drug by reference to common active moiety (drugs) or common active ingredient (biologics), and instead identify such a drug by reference to its NDA or BLA, as required by statute.**

In the Initial Guidance, CMS states that it will identify a qualifying single source drug, and its dosage forms and strengths, by reference to common active moiety (drugs) or common active ingredient (biologics).⁴ **This policy will have devastating effects on innovation and patient access, and is irreconcilable with the statute, which dictates that a qualifying single source drug, and its dosage forms and strengths, be identified by reference to its NDA or BLA. CMS should therefore rescind this approach and instead adopt an application-based standard for distinguishing among qualifying single source drugs.**

Under section 1192, only "qualifying single source drugs" are eligible for selection for negotiation. Subject to certain exclusions, "qualifying single source drugs" are drugs or biologics for which there is no generic or biosimilar on the market and for which a statutorily prescribed time period has elapsed since approval or licensure.⁵ For drugs, "at least 7 years [must] have elapsed since the date of such approval" as of the selected drug publication date.⁶ And, for biologics, "at least 11 years [must] have elapsed since the date of such licensure" as of the selected drug publication date.⁷

³ Initial Guidance at 2.

⁴ *Id.* at 8.

⁵ Social Security Act ("SSA") § 1192(e)(1).

⁶ *Id.* § 1192(e)(1)(A)(ii).

⁷ *Id.* § 1192(e)(1)(B)(ii).

The statute clearly defines a “qualifying single source drug” by reference to a “covered Part D drug,” as that term is defined in the Medicare statute.⁸ The definition of a “covered Part D drug,” in turn, cross-references the definition of a “covered outpatient drug” in the MDRP statute.⁹ And, under such definition, whether a single source drug is a distinct “covered outpatient drug” is based on whether the product is approved pursuant to a distinct NDA or BLA.¹⁰ The only exception to this rule under the MDRP comes in the context of line extensions. There, Congress specifically amended the MDRP statute to enable line extensions to be grouped with innovator products across distinct NDAs or BLAs.¹¹ In contrast, Congress chose not to group drugs across distinct NDAs or BLAs under the Negotiation Program.¹²

In addition, the statutory definition of a “qualifying single source drug” also specifies that a qualifying product is subject to a statutory seven- or eleven- year clock tied to each “approval” or “licensure” of a product. It follows, then, that each qualifying single source drug corresponds to a distinct approval or licensure, *i.e.*, a distinct NDA or BLA. Any other reading—including one based on common active moiety or common active ingredient—contradicts the plain text of the statute.

Finally, the statutory “qualifying single source drug” definition is grounded in the Food and Drug Administration’s (“FDA’s”) framework for approving and licensing drugs and biologics, and such framework distinguishes among drugs and biologics via distinct applications.¹³ The FDA has spoken directly to the types of changes to an approved product that should be approved via a supplement to an existing NDA or BLA, and those that should be approved via a new NDA or BLA.¹⁴ By expressly cross-referencing the FDA framework in the “qualifying single source drug” definition, Congress clearly intended that CMS rely on such framework in distinguishing among qualifying single source drugs.

The use of NDAs and BLAs as the standard for distinguishing among qualifying single source drugs helps balance the twin interests in pharmaceutical and biotechnology innovation and lowering prescription drug prices. The statute seeks to ensure that the latter does not unduly outweigh the former by, among other things, establishing a period of time after approval or licensure during which a drug or biologic is not eligible for selection for negotiation, thereby preserving an incentive for manufacturers to research and develop next-generation products that will ultimately benefit patients. In contrast, CMS’s policy will greatly exacerbate the disincentive to develop next-generation therapies inherent in the Negotiation Program, to the detriment of patients in need.

II. CMS should act to protect orphan drug development.

The statute excludes from the definition of “qualifying single source drug” a drug that is “designated as [an orphan drug] for only one rare disease or condition . . . and for which the only approved indication (or indications) is for such disease or condition.”¹⁵ This orphan drug exclusion is aligned with Congress’s long-standing recognition of the profound governmental interest in facilitating the development of orphan drugs to meet needs that would otherwise go unmet, including through the Orphan Drug Act (“ODA”).¹⁶ The IRA provides that a drug loses its status as an excluded orphan drug where an orphan indication for a second rare disease or condition is approved; a non-orphan indication is approved; or the drug is designated as an orphan drug for a second rare disease or condition. Manufacturers commonly seek indication approvals and orphan designations sequentially as new clinical evidence is developed. Therefore, drugs qualifying for the orphan drug exclusion can lose eligibility for the exclusion with a subsequent indication and thereby become eligible for selection for negotiation.

Novartis appreciates CMS’s commitment in the Initial Guidance to “consider whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development.”¹⁷ CMS should clarify that, where a drug loses its status as an excluded orphan drug, the seven- or eleven-year selection clock starts on the date on which the drug loses such status. Without such a policy, the orphan drug exclusion would further disincentivize the development of multi-rare disease orphan drugs and cause companies to reprioritize their product pipelines accordingly. CMS should not needlessly erect additional barriers to the development of multi-rare disease orphan drugs. Even with the

⁸ *Id.* § 1192(e)(1).

⁹ *Id.* § 1860D-2(e)(1).

¹⁰ *Id.* §§ 1127(k)(2), (k)(7)(A)(iv).

¹¹ Patient Protection and Affordable Care Act of 2010, Pub. L. No. 111-148, § 1206 (Mar. 23, 2010) (codified at SSA § 1927(c)(2)(C)).

¹² Notably, Congress did do so as to another provision of the IRA: The Part D inflation rebate provision specifically directs CMS to establish an inflation rebate formula for line extensions consistent with the formula under the MDRP. SSA § 1192(e)(1).

¹³ FDA, Guidance for Industry: Submitting Separate Marketing Applications and Clinical Data for Purposes of Assessing User Fees (Dec. 2004), available [here](#).

¹⁴ *Id.* at 3.

¹⁵ SSA § 1192(e)(3)(A).

¹⁶ ODA, Pub. L. No. 97-414, §§ 1, 2, 96 Stat. 2049, 2049-2051 (1983), as amended by Pub. L. 98-551, 98 Stat. 2815, 2817 (1984).

¹⁷ Initial Guidance at 11.

ODA, most people suffering from rare diseases and conditions do not have an FDA-approved treatment option.¹⁸ Designing and completing clinical trials that satisfy FDA standards for such small populations present unique challenges and thus require significant investment of resources in a drug that, by definition, will be furnished or dispensed to a small number of patients.¹⁹ We urge CMS to take steps to mitigate this particular disincentive for multi-rare disease orphan drug development by clarifying that the seven- or eleven-year selection clock starts on the date on which a drug loses its status as an excluded orphan drug.

III. CMS should replace its bona fide marketing standard for determining whether a generic or biosimilar product is on the market with the MDRP market date standard.

In the Initial Guidance, CMS specifies the standard by which a drug is rendered ineligible for selection for negotiation due to a generic or biosimilar product entering the market. CMS states that it intends to review prescription drug event (“PDE”) data to determine whether a generic or biosimilar satisfies a “bona fide marketing” standard, under which the agency makes a subjective judgment as to whether the degree of utilization of the generic or biosimilar represents “robust and meaningful competition.”²⁰ Novartis is deeply concerned with this approach, which lacks a logical nexus to the actual date of marketing and will introduce unnecessary complexities and confusion into the Negotiation Program. CMS should abandon the bona fide marketing standard and instead specify that both (1) the date on which an approved generic or biosimilar is marketed and (2) the date on which CMS determines that an approved generic or biosimilar has been marketed are the product’s “market date” for MDRP purposes.

As a definitional matter, marketing is “[t]he act[] . . . of bringing or sending a product or commodity to market.”²¹ As such, once the “action of buying or selling” has occurred, a product has necessarily been “marketed.”²² CMS itself has recognized that when a product is “marketed” is an objective point-in-time determination based on when the product enters the commercial marketplace for sale. For purposes of the IRA’s Part D inflation rebates, CMS proposed to determine when a product is “marketed” by reference to its “market date” as reported under the MDRP.²³ In turn, CMS’s longstanding policy under the MDRP has been to define “marketed” by reference to the date on which a product enters commercial distribution.²⁴ And, under the Part D program, which will source the PDE data on which CMS intends to rely in effectuating its bona fide marketing standard, CMS has recognized that the date on which a product is “release[d] onto the market” triggers certain coverage-related obligations²⁵—which means that CMS will have already recognized that a product has been released onto the market by the time PDE data show product utilization.

There is no basis for CMS to override the clear bright-line test imposed by the statute in favor of a subjective standard that effectively gives the agency unlimited discretion to determine whether and when a product is subject to an MFP. This is especially so given Congress has demonstrated that it knows how to establish a subjective “bona fide” standard yet declined to do so here.²⁶ “[W]here Congress knows how to say something but chooses not to, its silence is controlling.”²⁷

CMS’s unlawful bona fide marketing standard will also necessarily result in a delay between the actual date of marketing and the date of CMS’s determination because it takes time for sales to be reflected in PDE data. Indeed, as CMS permits Part D plan sponsors 180 days after a newly approved drug is released onto the market to determine whether to add the drug to their formulary, PDE data will rarely reflect when the drug came to market with accuracy. Many Part D plan sponsors will not add a newly approved drug to their formulary until the 180-day mark (or may not add it at all), and, thus, the first six months of PDE data following the market entry of the drug will necessarily reflect only very limited uptake.²⁸ Even where

²⁵ CMS requires that Part D plan sponsor P&T committees “make a reasonable effort to review a new FDA approved drug product (or new FDA approved indication) within 90 days of its release onto the market and . . . make a decision on each new FDA approved drug product (or new FDA approved indication) within 180 days of its release onto the market, or a clinical justification will be provided if this timeframe is not met.” Prescription Drug Benefit Manual, ch. 6 § 30.1.5.

²⁶ SSA § 1927(k)(1)(B)(i)(II) (as amended by Pub. L. No. 111–148, § 2503(a) (2010)) (amending the MDRP statute to specify that only “bona fide” service fees are exempt from the calculation of average manufacturer price).

²⁷ *Animal Legal Def. Fund v. U.S. Dep’t of Agric.*, 789 F.3d 1206, 1217 (11th Cir. 2015).

²⁸ While plan enrollees may access a non-formulary drug via an exceptions process, access may not be immediate under such process; moreover, exception processes typically yield only a very small volume of utilization.

plan sponsors add the drug to their formulary, there is typically a gradual transition by providers and patients to such product as they become increasingly familiar with its benefits relative to alternatives.²⁹ Such a product is in fact **marketed** during this uptake period, but CMS's standard ignores this fact and focuses instead on whether the product is adequately **utilized**.³⁰ ***Such changes in utilization patterns over time do not mean that the market is not working as intended.***

CMS's standard is all the more concerning given the agency's intent to review PDE data only **once per month** for purposes of determining when the MFP terminates,³¹ which compounds the lag between the actual date of marketing and the date of CMS's determination.

It is especially critical that CMS equate the date of CMS's determination of marketing with the MDRP's "market date." If there is a lag of even one day between the date of CMS's determination and the actual date of marketing, the selected drug may be subject to the MFP for an additional twelve months. This risk would materially disincentive generic and biosimilar entry because a potential generic or biosimilar manufacturer would be concerned about its product's ability to compete with the selected drug's MFP for an unduly extended time. This outcome would run contrary to Congress's objective in promoting generic and biosimilar market competition under the Negotiation Program.

SECTION 40 – REQUIREMENTS FOR MANUFACTURERS OF SELECTED DRUGS FOR IPAY 2026

I. CMS should ensure robust safeguards are in place to protect against disclosure of confidentiality commercial information.

Novartis welcomes CMS's stated commitment to confidentiality in the Initial Guidance but asks CMS to establish more robust safeguards to protect a manufacturer's confidential commercial information from disclosure. Manufacturers will be required to submit a host of highly sensitive information to CMS, including research and development costs, production and distribution costs, and revenue and sales volume data.³² Novartis asks CMS to adopt the following measures to protect against the disclosure of confidential commercial information.

A. Scope of protection of confidential commercial information

The statute provides that whether information submitted by a manufacturer is proprietary is left to the discretion of the agency. In "implement[ing] a confidentiality policy that is consistent with existing requirements for protecting proprietary information,"³³ Novartis asks CMS to ensure protections comparable, not only to those under the Freedom of Information Act ("FOIA"), but also to those under other federal programs including Medicare, Medicaid, and the 340B Program.

B. Storage and access requirements

CMS should also commit to ensuring that all confidential commercial information, including information in the Health Plan Management System ("HPMS") and in electronic communications with the agency, will be stored in a secure manner, accessible only by those CMS staff who have a program-based reason to access the information. CMS has instituted similar measures with respect to product and pricing data submitted by manufacturers under the MDRP.³⁴

C. Confidentiality safeguards regarding the public explanation of the MFP

The statute requires CMS to publish an "explanation for the maximum fair price with respect to the factors as applied under section 1194(e) for such drug."³⁵ Without sufficient safeguards in place, Novartis is concerned with the potential for improper disclosure of confidential commercial information. Novartis welcomes CMS's commitment in the Initial Guidance to provide only high-level comments regarding manufacturer-submitted data and to refrain from disclosing proprietary information, but this alone is insufficient to protect against the inadvertent disclosure of confidential commercial information that is protected

²⁹ See A. Lubby, *Factors Affecting the Uptake of New Medicines: A Systematic Literature Review*, 14 BMC HEALTH SERVICES RESEARCH 469 (2014) (describing the various factors that affect early uptake of new medicines).

³⁰ Other examples of deficiencies in CMS's approach include circumstances where low utilization is driven by uncontrollable factors such as supply shortages.

³¹ Initial Guidance at 62.

³² SSA § 1194(e)(1).

³³ Initial Guidance at 29.

³⁴ CMS, *Medicaid Drug Programs ("MDP") User Manual* 1 (Nov. 3, 2021). In particular, data submitted by manufacturers under the MDRP are uploaded to an online interface that is used by states and manufacturers. States do not have access to quarterly or monthly pricing records or all product information because some of this information is confidential.

³⁵ SSA § 1195(a)(2).

under the statute.³⁶ CMS should commit to affording manufacturers a reasonable opportunity to review the intended explanation of the MFP in advance of publication.

II. CMS should rescind its proposals to impose overly broad confidentiality obligations on manufacturers.

CMS proposes to impose significant restrictions on what information a manufacturer may disclose and what records a manufacturer may keep regarding the negotiation process. These restrictions raise significant legal and policy concerns and betray the core principles animating our nation. Ensuring that the nation's public policy is fully informed, which is to the benefit of all, requires that manufacturers be enabled to speak freely about their direct experiences with the government's administration of its programs, especially one as consequential as the Negotiation Program. And such open exchange furthers the efficient administration of the Negotiation Program by ensuring that manufacturers can participate with the benefit of insight into past experiences of other manufacturers.

To start, CMS's chilling restrictions on manufacturer expression violate manufacturers' basic First Amendment "right to speak freely" and are therefore unconstitutional.³⁷ The Initial Guidance would compel manufacturer silence through the threat of civil monetary penalties ("CMPs") of \$1 million per day for as long as the negotiation agreement is in effect.³⁸ This prospect of effectively limitless CMPs raises grave concerns under the Eighth Amendment's prohibition against excessive fines.

Moreover, CMS's proposals cannot be reconciled with the obligations of manufacturers to their boards, shareholders, and other relevant constituents. Manufacturers have obligations to make material information available to shareholders and must maintain records to facilitate this obligation;³⁹ CMS's proposals could result in liability for manufacturers under federal and state securities laws. A manufacturer would be prohibited from using what it learns during the negotiation process to update its stated expectations. Such prohibition could expose the manufacturer to liability for failing to provide material information to investors. CMS's proposals are also inconsistent with securities law requirements to maintain appropriate disclosure controls and procedures, which are often predicated on record-keeping.

In addition, CMS's post-negotiation agreement termination record destruction proposal is unenforceable. The requirement imposes an extreme burden on manufacturers that far outweighs any purported benefit in keeping such information confidential post-termination. In particular, the destruction obligation would interfere with manufacturers' ability to comply with their record-keeping obligations and engage truthfully with their regulators, affiliates, contract parties, customers, and the market at large. CMS's record destruction proposal is also unlawful because it would prevent manufacturers from retaining records that they may need to protect against mistaken, yet significant, CMPs for noncompliance.⁴⁰ Requiring manufacturers to destroy such records raises fundamental concerns under the Due Process Clause of the Fifth Amendment.⁴¹

III. CMS should finalize its proposal to allow manufacturers to provide access to the MFP through a rebate model but ensure access to claims data that will allow manufacturers to appropriately verify MFP eligibility.

Novartis applauds CMS's proposal to permit manufacturers to provide access to the MFP through a rebate model, which is essential in safeguarding against diversion of MFP units. There are two ways that a rebate model could be effectively implemented: (1) a manufacturer-administered model; and (2) a CMS-established third-party administrator ("TPA")-administered model. ***CMS should enable manufacturers to effectuate MFP rebates through either model, at their election.***

For both the manufacturer-administered model and the TPA-administered model, it is critical that manufacturers have access to the claims data needed to appropriately verify MFP eligibility. Under the manufacturer-administered model, the provider or pharmacy would need to submit to the manufacturer the necessary Medicare claims data in order to qualify for the rebate. And, under the TPA-administered model, the TPA would need to have access to the necessary Medicare claims

³⁶ Initial Guidance at 29.

³⁷ *Wooley v. Maynard*, 430 U.S. 705, 714 (1977).

³⁸ Initial Guidance at 69.

³⁹ Almost all states require corporations to maintain records and permit shareholders to inspect their books and records. See, e.g., 8 Del. C. § 220 (describing the power of a shareholder to demand inspection of a corporation's books and records).

⁴⁰ Initial Guidance at 69–70.

⁴¹ Courts have recognized that "the essence of due process is fundamental fairness," and little could be more fundamentally unfair than requiring destruction of the very records that a manufacturer needs to verify its innocence against the imposition of an erroneous penalty. *Evans v. Wilkerson*, 605 F.2d 369, 371 (7th Cir. 1979).

data in order to validate claims and invoice MFP liability. The TPA would also need to serve as a Medicare claims data clearinghouse through which manufacturers can obtain all such data, including the 340B claims modifier information discussed below, in order to validate the propriety of the TPA-invoiced MFP rebate liability. Access to such data for claims validation is standard practice in the commercial marketplace today. CMS should ensure both MFP rebate models leverage such existing best practices to ensure that all necessary data are available to verify MFP eligibility and support the integrity of the Negotiation Program.

By statute, a pharmacy or provider may not purchase a unit of a selected drug at the MFP and then dispense or furnish it to an MFP-ineligible individual. Even though there is a clear prohibition against MFP diversion, neither manufacturers nor CMS has a statutory right to audit pharmacies and providers to validate proper dispensing and furnishing of MFP units. There is also no statutory means through which pharmacies and providers can be penalized for improperly dispensing or administering MFP units to MFP-ineligible individuals, such as by terminating the pharmacies' or provider's access to the MFP. Given the lack of a retrospective mechanism to protect against diversion of MFP units to MFP-ineligible individuals, the need for a rebate model to provide prospective protection against such diversion is imperative.

Additionally, a rebate model is easy to implement because stakeholders are well familiar with this model in the commercial sector and under the Part D program. And the MFP rebate model would not jeopardize Medicare beneficiary access to reduced MFP-based cost-sharing, as pharmacies and providers will know at the time a unit of a drug is dispensed or furnished that the drug is a selected drug and will be able to adjust cost-sharing accordingly.

However, to effectuate a functional rebate model, it is essential that CMS clarify that the proposed fourteen-day period during which a rebate must be paid runs from the date on which the manufacturer validates eligibility for the rebate.⁴² The Initial Guidance is silent on when the fourteen-day clock begins to run. If the clock were to run from the date on which the rebate is requested, the diversion safeguard provided by the proposed rebate model would be rendered meaningless. There would be no incentive for a provider or pharmacy to provide any validating Medicare claims data.

Finally, while Novartis applauds CMS's recognition of the need for a rebate model, we recognize that the precise details of how a rebate model would be operationalized will require further development through collaboration among all affected stakeholders. We urge CMS to support that collaboration by facilitating engagement across industry to help ensure that the rebate process works efficiently.

IV. CMS should ensure accurate use of 340B claims modifiers.

By statute, a manufacturer of a selected drug has no obligation to offer both the MFP and the 340B price on the same unit.⁴³ The manufacturer is obligated only to offer the lower of the two prices. It is therefore vital that CMS put in place a mechanism to prevent 340B-MFP duplicate discounts.

While CMS has already taken welcome steps to require the use of a 340B claims modifier for drugs reimbursed under Part B starting on January 1, 2024,⁴⁴ and is proposing to require the same for Part D drugs,⁴⁵ no comparable steps have been taken for Part B drugs reimbursed under Medicare Advantage ("MA") or to protect against 340B-MFP duplicate discounts. And, in the Initial Guidance, CMS includes no meaningful proposal as to how the prohibition on MFP-340B duplicate discounts will be effectuated.⁴⁶ To help ensure that 340B units can be identified, it is imperative that CMS require the use of either a 340B or a non-340B claims modifier on a claim for reimbursement for a selected drug, across Part B, MA, and Part D, and to make such requirement enforceable, by conditioning payment of such claim on the accurate use of such modifier.

The statutory prohibition against 340B-MFP duplicate discounts obligates CMS to establish a meaningful mechanism for identifying 340B units,⁴⁷ which is especially critical given the long and well-documented history of widespread 340B covered

⁴² Initial Guidance at 40.

⁴⁵ CMS, Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum 18 (Feb. 9, 2023), available [here](#).

⁴⁶ See Initial Guidance at 66.

⁴⁷ See *United States v. Markgraf*, 736 F.2d 1179, 1183 (7th Cir. 1984) ("An administrative agency cannot abdicate its responsibility to implement statutory standards under the guise of determining that inaction is the best method of implementation.").

entity non-compliance with the 340B-MDRP duplicate discount prohibition.⁴⁸ And, unlike 340B-MDRP duplicate discounts, there is no statutory audit, dispute resolution, or penalty process to remediate 340B-MFP duplicate discounts.⁴⁹ Given that the risk of 340B-MFP duplicate discounts is even higher than that of 340B-MDRP duplicate discounts, it is that much more vital that CMS establish a meaningful mechanism to protect against such duplicate discounts. We therefore strongly urge CMS to mandate that payment of a claim for reimbursement for a selected drug is conditioned on accurate use of either a 340B or a non-340B claims modifier, under Part B, MA, and Part D.

V. CMS should allow manufacturers to rely on reasonable assumptions with respect to information submission requirements.

As part of the negotiation process, manufacturers will be required to submit a wide range of information to CMS.⁵⁰ Because there may inevitably be ambiguities in how complex information submission requirements interface with equally complex business practices, and to ensure the process can be operationalized, CMS should clarify that manufacturers may rely on reasonable assumptions when interpreting statutory terms regarding the submission of data under the Negotiation Program. This is consistent with CMS's long-standing policy to allow manufacturers to use reasonable assumptions in the ASP and MDRP reporting contexts.⁵¹ CMS can and should adopt a similar framework here and enable manufacturers to make reasonable assumptions when submitting required information under the Negotiation Program. A framework permitting reasonable assumptions is far preferable to the rigid standardization that CMS proposes, and that the agency should abandon.⁵²

SECTION 60 – NEGOTIATION PROCESS

Novartis has serious concerns that the negotiation process as outlined in the Initial Guidance falls short of the level of transparency and engagement that would be appropriate given the significant consequences associated with the outcome of this process. CMS should adopt the following recommendations to enhance its proposed negotiation process.

I. CMS should consider only appropriate therapeutic alternatives as comparators.

Prior to the start of any negotiations, CMS should conduct a comprehensive review and publish guidance on the processes and criteria that will be used for selection of therapeutic alternatives. This review should include the relevant stakeholders, namely patient groups, health care professionals, clinical societies, and manufacturers. The establishment of the process and criteria for selection of appropriate therapeutic alternatives should allow time for public review and comment. The creation of robust criteria and process should be based solely on the scientific consensus around which products are truly therapeutically equivalent in both clinical effectiveness and patient treatment burden. This will help to ensure that patients' access to needed medications is driven by balanced clinical considerations and not based solely on cost differences between medications that are not truly equivalent.

Novartis encourages CMS to clarify that therapeutic alternatives to a selected drug would be those in the same drug class, have the same methods of action, and are approved for the same indications and patient population and consistent with nationally recognized, evidence-based guidelines. Additionally, they should have comparable efficacy and safety, and be administered through the same route of administration with similar dosing schedules. Finally, proposed therapeutic alternatives should have comparable real-world patient use to the comparator product. This would help increase the likelihood that the therapeutic alternatives that serve as comparators for purposes of the MFP negotiation are truly appropriate.

During the process of selecting specific therapeutic alternatives for individual drug negotiations, Novartis strongly encourages CMS to provide a fully transparent process on the criteria used to select therapeutic alternatives and the actual proposed alternatives and allow for public comment on those proposed alternatives. CMS should specifically seek input

⁴⁸ See, e.g., Government Accountability Office ("GAO"), Drug Discount Program: Federal Oversight of Compliance at 340B Contract Pharmacies Needs Improvement, GAO-18-480 (2018), available [here](#); see also 42 U.S.C. § 256b(a)(5)(A).

⁴⁹ Compare SSA § 1193(d) with Public Health Service Act § 340B(a)(5)(C), (d)(2)(v), (3).

⁵⁰ SSA § 1194(e)(1); see also *id.* §§ 1193(a)(4), 1194(b)(2)(A).

⁵¹ See, e.g., 71 Fed. Reg. 69,624, 69,667 (Dec. 1, 2006) (reasonable assumptions regarding ASP reporting); 83 Fed. Reg. at 12,785 (MDRP agreement provision governing reasonable assumptions).

⁵² See Initial Guidance at 82-91.

from patients currently on those medications, patient advocacy groups, health care providers, health care guidance committees, manufacturers, and other key stakeholders on the appropriateness of those comparators.

II. CMS should set the MFP at the MFP ceiling for small molecule drugs until at least thirteen years post-approval.

As noted at the outset of our letter, given the complexity and consequences associated with the Negotiation Program, Novartis strongly recommends specifying circumstances under which the MFP of a selected drug will be set at the MFP ceiling.

To be selected for negotiation, biologics (large molecules) must be at least eleven years post-licensure, while drugs (small molecules) must be at least seven years post-approval.⁵³ Because of the approximately two-year time lag between selection for negotiation and application of the MFP, an MFP cannot apply to a biologic until at least approximately thirteen years post-licensure and to a drug until at least approximately nine years post-approval. To help preserve small molecule innovation in parity with large molecule innovation, we urge CMS to specify that, for a small molecule drug, the MFP will not be set below the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

We are concerned that the nine- and thirteen-year price applicability distinction arbitrarily promotes large molecule biologic innovation to the detriment of small molecule drug innovation. Studies have showed that most products (whether small or large molecules) achieve modest levels of annual sales in their first five years on the market.⁵⁴ Disincentivizing manufacturers from investing in small molecule drugs presents serious risk to patient access to effective treatment. And, while patients benefit from access to both types of products, small molecule drugs figure more prominently in the treatment plans of most Americans because they are more easily administered and utilized by patients.⁵⁵ For these reasons, we ask that CMS act to better balance the incentives regarding small molecule drug and biologic development by setting the MFP for a small molecule drug at the MFP ceiling until at least the first year of the price applicability period that starts after the date on which the drug is thirteen years post-approval.

III. Where the MFP ceiling is based on the “plan specific enrollment weighted amount,” CMS should set the MFP at the ceiling price.

In designing the Part D program, Congress sought to establish a market-based system to provide Medicare beneficiaries with affordable drug coverage while maintaining robust access to diverse medicines needed to best manage their health conditions. Due to these market mechanisms, beneficiaries can now select from numerous plan options based on their premiums, formularies, and benefit designs. In addition, manufacturers of drugs with brand-brand competition negotiate substantial rebates to Part D plan sponsors, which enables greater patient access through improved formulary coverage and tier placement. These price concessions have grown over the years; the Medicare Payment Advisory Commission (“MedPAC”) noted that they reduced gross Part D expenditures by twenty-two percent in 2020.⁵⁶ As a share of brand expenditures, these rebates can reduce gross expenditures much more, particularly in highly competitive therapeutic areas.

Under the statute, the MFP ceiling for a Part D drug may not exceed the lesser of three distinct price points, one of which is the sum of each “plan specific enrollment weighted amount” for each Part D prescription drug plan (“PDP”) or MA prescription drug (“MA-PD”) plan.⁵⁷ When this price point is used to set the MFP ceiling, the MFP ceiling will reflect pre-existing price competition in the Part D marketplace, such that CMS should avoid disrupting such market competition by setting the MFP for such drug at the MFP ceiling. This would allow beneficiaries to share in the savings generated by competition in the Part D program while maintaining the underlying market signals to innovator companies.

IV. CMS should commit to further enabling real dialogue during the negotiation process.

⁵³ SSA § 1192(e)(1).

⁵⁴ QuintilesIMS Inst., *Lifetime Trends in Biopharmaceutical Innovation: Recent Evidence and Implications*, at 2 (Jan. 2017).

⁵⁵ T. Morrow & L. H. Felcone, *Defining the Difference: What Makes Biologics Unique*, 1 *Biotechnology Healthcare* 24 (2004).

⁵⁶ MedPAC, *Analysis of Part D Data on Drug Rebates and Discounts* (Sep. 30, 2022), available [here](#).

⁵⁷ SSA § 1194(c)(1).

CMS proposes that, as part of the negotiation process, it will invite the manufacturer to meet only where the agency rejects a counteroffer.⁵⁸ Novartis appreciates CMS's recognition of the importance of real dialogue, as opposed to a superficial paper process. Real dialogue between CMS and the manufacturer comports with Congress's intent in mandating a "negotiation" process for setting the MFP and would benefit both parties to the negotiation by promoting greater transparency and information sharing, and thus a fairer and better-informed negotiation process. That said, Novartis is concerned that CMS is arbitrarily restricting its engagement with the manufacturer by (1) limiting meetings to the period after a counteroffer is rejected and (2) permitting no more than three meetings.⁵⁹ There is no logical basis for imposing such restrictions on the negotiation process, as engagement between CMS and the manufacturer can equally inform an initial offer, potentially sparing the parties the need to consider a counteroffer. Moreover, the parties may agree that one or more additional meetings would be helpful and productive in setting the MFP. Therefore, CMS should modify its proposal to enable real dialogue between the parties **throughout** the negotiation process, and specify that, where the agency rejects a counteroffer, additional meetings may be held **without limit** where both parties agree that they would be helpful.

SECTION 110 – PART D FORMULARY INCLUSION OF SELECTED DRUGS

CMS should act to ensure broad access to selected drugs for Medicare Part D beneficiaries. While the statute requires Part D plans place selected drugs on formulary, CMS must take additional steps to ensure improved patient access for these drugs.⁶⁰ Without these steps, the Negotiation Program has potential to disrupt the competitive landscape in Part D and cause beneficiaries to face higher—not lower—barriers to accessing selected drugs in 2026.

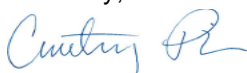

Stakeholders have long noted Part D plan preferences for products with higher prices and higher rebates; however, under the IRA, point-of-sale ("POS") prices for selected drugs in Part D will decrease to reflect the MFP plus any applicable dispensing fee. This decrease in POS prices for selected drugs may cause plans to prefer other drugs in their respective classes that are not selected, due to the potential for higher rebates. In response, plans may move selected drugs to tiers with higher cost-sharing or impose more restrictive utilization management in order to steer patients away from the selected drugs and toward alternatives that are able to provide more substantial rebates. This would run contrary to the intent of the Negotiation Program to ensure that Medicare beneficiaries will be able to access a selected drug at lower cost-sharing.

While formulary coverage is essential for providing beneficiaries access to selected drugs, CMS can and must go beyond the minimum requirements in the IRA. Specifically, we urge CMS to make clear that plans should not impose utilization management requirements, including prior authorizations and step therapy, that go beyond a selected drug's FDA-approved label. These requirements are clinically unnecessary, increase physician burden, and stand in the way of patients seeking to access selected drugs. Furthermore, we urge CMS to make clear that plans should place selected drugs on tiers requiring patient copayments rather than coinsurance. For selected drugs with monthly costs below the specialty tier cost threshold, this should be on the lowest generic tier on the plan's benefit design, while selected drugs with costs above this threshold could be placed on a higher copayment tier.

Taking these steps to improve patient access to selected drugs aligns with the intent of the Negotiation Program and stands to improve patient adherence to therapy. Furthermore, many of the drugs likely to be selected for IPAY 2026 treat chronic conditions where improved adherence is critical to improving patient outcomes and reducing non-drug costs under the Medicare program.

Novartis appreciates this opportunity to comment on the Initial Guidance and CMS's consideration of our feedback. We would be happy to discuss our comments at greater length. If you have any questions, please contact me by e-mail at courtney.piron@novartis.com.

Sincerely,

Courtney Piron

RE: Novo Nordisk Comments on Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani,

Novo Nordisk Inc. (“Novo Nordisk”) appreciates the opportunity to provide comments in response to the memorandum issued by the Centers for Medicare & Medicaid Services (“CMS”), entitled *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments*.

Novo Nordisk is a global health care company committed to improving the lives of those living with serious chronic conditions, including diabetes, rare bleeding disorders, growth disorders, and obesity. The Novo Nordisk Foundation, our majority stakeholder, is among the top five largest charitable foundations in the world. Accordingly, our company’s mission and actions reflect the Foundation’s vision to contribute significantly to research and development that improves the lives of people and sustainability of society.

Novo Nordisk is a member of the Pharmaceutical Research and Manufacturers of America (“PhRMA”), and generally is aligned with PhRMA’s comments, and incorporates those comments herein, except in areas where our comments below diverge slightly.

As PhRMA’s comments and those in this letter demonstrate, CMS’s guidance lacks necessary detail and is inconsistent with the statute and Constitutional requirements that it, in its current form, cannot be finalized or used to implement the relevant provisions of the Inflation Reduction Act (“IRA”). Novo Nordisk believes that the guidance should be rescinded, and that CMS should start over in accordance with proper rulemaking that meets statutory and Constitutional requirements. However, reserving its rights to raise further objections as CMS continues to implement the IRA’s provisions, Novo Nordisk provides the following comments specific to certain aspects of the guidance and to assist CMS in properly implementing the IRA’s provisions.

CMS’S GUIDANCE UNLAWFULLY EXCEEDS THE SCOPE OF CMS’S DELEGATED AUTHORITY

Many of the provisions in CMS’s guidance exceed the scope of authority Congress granted to the agency and violate clear and specific statutory mandates. As the Supreme Court has recognized, when an agency takes actions that go “beyond what Congress has permitted it to do,” the agency has engaged in *ultra vires* conduct. *City of Arlington, Tx. v. FCC*, 569 U.S. 290, 299 (2013). An agency’s actions are *ultra vires* when it has exceeded the powers conferred upon it by law. See *Leedom v. Kyne*, 358 U.S. 184, 188 (1958); cf. *Compton v. Alpha Sorority, Inc.*, 64 F. Supp. 3d 1, 18 (D.D.C. 2014); *Central Transp. Co. v. Pullman’s Palace Car Co.*, 139 U.S. 24 (1891). An agency’s actions will also be struck down as *ultra vires* if they are “utterly unreasonable” or “contravene[] a clear and specific statutory mandate.” *Federal Express Corp. v. U.S. Dept. of Commerce*, 39 F.4th 756, 766 (D.C. Cir. 2022); see also *United States v. Cortez*, 930 F.3d 350, 357 (4th Cir. 2009) (noting that “any ‘improper[]’ agency action is ‘ultra vires’”).

Novo Nordisk is deeply concerned that CMS has not sought comment on certain parts of its guidance and, as described in more detail below, has not complied with basic notice-and-comment rulemaking requirements, even though the guidance seeks to impose substantive obligations on regulated parties that cannot be derived from the statute’s language. Deviating from proper procedures and deeming consequential parts of the guidance final with no opportunity for public comment is emblematic of a broader problem—CMS is using its guidance to rewrite the IRA. The IRA’s unprecedented price-control provisions present serious constitutional concerns on their own. Congress has not granted CMS free rein to rewrite statutory text and devise its own structure for imposing price controls on drugs and biologic products that Congress never intended.

Because CMS is unwilling to consider public feedback on certain sections of the guidance, including section 30, Novo Nordisk is not providing all of its comments on those parts of the guidance. Novo Nordisk instead reserves its rights to comment at an appropriate time and takes the position that any substantive obligations imposed by CMS that have not been promulgated through proper rulemaking procedures are invalid and cannot be enforced. Nonetheless, because many of the substantive requirements that CMS has deemed final have reverberating effects that extend throughout its guidance, including with respect to sections of the guidance for which CMS has solicited comment, Novo Nordisk will comment on certain aspects of the guidance that cut across its different sections. Indeed, many of the new requirements imposed by the guidance extend far beyond the scope of authority granted by Congress and violate specific statutory commands. A few examples are highlighted here:

First, CMS’s guidance purports to redefine “qualifying single source drug” (“QSSD”) in a way that contravenes the statutory definition prescribed by Congress. Congress granted no authority for CMS to rewrite the statutory definition or to expand the drugs potentially subject to price controls. Under the IRA, a “drug product” or “biological product” must satisfy several criteria to fall within Congress’s statutory definition of QSSD: (1) it must

be a “covered part D drug ... or a drug or biological product for which payment may be made under part B,” (2) it must be FDA approved (for drugs) or licensed (for biologics), (3) it must have been marketed pursuant to that approval or licensure for at least 7 years (for drugs) or 11 years (for biologics), and (4) it must not be the reference listed drug for an approved and marketed generic drug or the reference product for an approved and marketed biosimilar. *See* IRA § 1192(e). The IRA’s definition of QSSD does not expressly state or contemplate aggregating broad groupings of drug products as single QSSDs—and indeed, as detailed below, forecloses any such interpretation. Nor does it mention—anywhere in the IRA—the use of either active ingredient or active moiety as a defining characteristic.

CMS’s guidance effectively re-writes the statute and disregards the IRA’s unambiguous mandates by subjecting certain drugs to government-imposed price controls that the statute’s plain, unambiguous language made clear should not be subject to those controls. Redefining QSSD as an aggregation of products containing the same active moiety based on the date on which the *earliest* drug product with that active moiety (or the earliest biological product with that active ingredient) was approved, CMS’s guidance purports to sweep in innovative products that represent true advances for patient care that have not been marketed for the 7 or 11 years required by the statute. *See* IRA § 1192(e)(A)(ii) (defining QSSD as “[a] drug ... for which, as of the selected drug publication date with respect to such initial price applicability year, *at least 7 years will have elapsed since the date of such approval*) (emphasis added); *see also id.* at § 1192(e)(B)(ii) (defining QSSD as a “biological product” for which “as of the selected drug publication date with respect to such initial price applicability year, *at least 11 years will have elapsed since the date of such licensure*”) (emphasis added). In contravening the statutory definition of QSSD, CMS’s guidance improperly attempts to dramatically expand the number of drug and biologic products that are subject to price controls, eviscerating the incentives for continued innovation of previously approved active moieties and active ingredients ultimately to the detriment of patient health.

Second, CMS’s guidance seeks to override the IRA’s clear instructions on when a drug or biologic product no longer qualifies for price controls because a generic drug or biosimilar product has been marketed. *See* IRA § 1192(e)(1)(A); *id.* § 1192(c)(1), (2). Despite the statute’s plain terms specifying when a selected drug must be removed from negotiation, CMS’s guidance suggests that the agency intends to disregard the statute’s command unless and until CMS makes its own qualitative and subjective determination that there is “robust” and “meaningful” competition presented by the generic or biosimilar product. CMS’s guidance also suggests that it intends to expand its powers to determine when a competitor has engaged in “bona fide” marketing of a generic drug or biosimilar product.

The statute suggests that Congress did not intend to grant CMS such authority. To the contrary, Congress limited CMS’s authority by specifying which drugs qualify for negotiation. In particular, Congress was clear that (1) a drug will no longer be a QSSD once a generic drug or biosimilar is approved and marketed that relies on that drug as a reference listed drug (§ 1192(e)(1)(A)(iii)) or a reference product (§ 1192(e)(1)(B)(iii)), and (2) a negotiation-eligible drug will no longer be a selected drug for the initial price applicability year that begins

at least 9 months after a generic drug or biosimilar is approved and marketed (§ 1192(c)). In light of these plain statutory commands, the IRA does not grant CMS implicit authority to regulate competition between drug manufacturers.

The IRA also does not support the vague terms and arbitrary lines CMS seeks to draw by establishing metrics like “sufficient quantities” and “market share.” To the contrary, “commercial marketing” is a well-established and well-defined term: meaning the introduction or delivery for introduction into interstate commerce of a drug product. Indeed, in Appendix C of the guidance, CMS defines marketing plainly as “the introduction or delivery for introduction into interstate commerce of a drug product.”

“Marketing” is already defined in this way elsewhere in FDA and CMS regulations and guidance. *See, e.g.*, 21 C.F.R. § 314.3 (defining “commercial marketing” as “the introduction or delivery for introduction into interstate commerce of a drug product described in an ANDA, outside the control of the ANDA applicant”); 21 C.F.R. § 330.14(b)(2) (describing market history requirements for inclusion in the OTC drug monograph system); Medicaid Drug Rebate Data Guide for Labelers §4.15 (August 2018) (“Market Date: For S, I, and N drugs marketed under an FDA-approved application (e.g., BLA, NDA, ANDA), the earliest date the drug was first marketed under the application number by any labeler.”). Congress did not intend for CMS to adopt a new definition of “marketed” that is inconsistent with the definition previously and repeatedly established by HHS.

Third, CMS’s guidance impermissibly seeks to require the entity that holds an NDA/BLA for a selected drug (the “Primary Manufacturer”) to be responsible for collecting and submitting to CMS confidential and propriety information of *other* manufacturers, and enforcing pricing requirements on *other* manufacturers, including re-packers and re-labelers of the selected drug (“Secondary Manufacturers”). This new requirement presents significant Constitutional and practical concerns, and it also violates the statute. Nothing in the IRA distinguishes between “Primary Manufacturers” and “Secondary Manufacturers.” To the contrary, section 1191(c)(1) of the IRA states: “[t]he term ‘manufacturer’ has the meaning given that term in section 1847A(c)(6)(A) [of the SSA].” That definition cross-references section 1927(k)(5) of the Social Security Act, which also does not distinguish between primary and secondary manufacturers. *See* 42 U.S.C. § 1396r-8(k)(5). There is no indication that Congress intended to impose obligations on certain manufacturers—on threat of massive penalties—to be responsible for the submission of data and proprietary information of other manufacturers, especially given the enormous public policy and practical concerns that result from CMS’s approach. At a minimum, that extra-statutory obligation should not be imposed without complying with proper notice-and-comment rulemaking procedures.

CMS’s guidance ignores the enormous practical and/or legal problems that will result from CMS’s deviation from the statutory requirements. CMS’s guidance does not provide any mechanism for Primary Manufacturers to collect information from Secondary Manufacturers or to control the prices at which Secondary Manufacturers sell their goods. Thus, com-

pliance with such requirements cannot be ensured, placing manufacturers at risk of significant fines and penalties. Nor can CMS guarantee the confidentiality of the Secondary Manufacturers' proprietary information and data. Secondary Manufacturers who may be in contractual privity are still competitors (*e.g.*, authorized generic manufacturers) and ordinarily sharing this type of information risks violating the antitrust laws. CMS has previously recognized that forced sharing of data and information between competitors for price reporting purposes is not appropriate. *See* 81 Fed. Reg. 5267, 5266 (Feb. 1, 2016) ("We understand the [legal and logistical] challenges of obtaining pricing information from unrelated manufacturers. Therefore ... we have decided to limit the line extension provision to provide that a drug by one manufacturer will not be treated as a line extension of a drug by a different manufacturer, unless there is a corporate relationship between the manufacturers. This will limit the obligation of manufacturers to collect pricing information from unrelated parties."). The same consideration should apply here, especially because nothing in the statute supports CMS's proposed approach.

Fourth, CMS's guidance requires manufacturers to disclose significant confidential information that goes beyond the disclosures required by the statute. The manufacturer-specific data submission requirements outlined by section 50.1 and defined further in Appendix C greatly expand the scope of section 1194(e)(1) of the IRA by adding new data sub-elements and reporting requirements for each of the statute's requisite five data points. For example, CMS has broken the statutory requirement to report "research and development costs of the manufacturer for the [selected] drug and the extent to which the manufacturer has recouped research and development costs" into seven unique sub-elements (*e.g.*, "R&D: Basic Pre-Clinical Research Costs"), six of which include additional definitions, instructions, and de-facto sub-requirements. *See* Guidance Appendix C. In addition, CMS proposes to require that manufacturers report more than ten distinct product price points, six of which are not defined by the IRA, any other law, or otherwise required to be devised or reported by manufacturers (*e.g.*, "U.S. commercial average net unit price — without patient assistant program"). The guidance thus seeks to impose new substantive obligations on manufacturers without any explanation for these additional requirements and, contrary to the statute, fails to provide sufficient guarantees that the information provided by manufacturers will be held in strict confidence and protected from disclosure under all circumstances.

Fifth, CMS's guidance purports to institute a "gag" rule, precluding manufacturers from speaking truthfully about the "negotiation" process and the initial offers provided by CMS when setting the "maximum fair price" for a drug. CMS's guidance also proposes to require that manufacturers destroy negotiation information if the drug or biologic no longer qualifies as a selected drug. Nowhere in the IRA does Congress authorize CMS to impose these mandatory non-disclosure and information destruction provisions. These prior restraints on truthful speech are not contained in the statute. CMS has failed to provide any explanation why this proposal is necessary for purposes of administering the program.

CMS's guidance exacerbates First Amendment concerns already presented in the statute by silencing any dissent or even neutral information sharing about the "negotiation"

process. Indeed, because prior governmental restraints on speech “are the most serious and the least tolerable infringement on First Amendment rights,” *Nebraska Press Ass’n v. Stuart*, 427 U.S. 539, 559 (1976), they are subject to a “heavy presumption against [their] constitutional validity.” *Org. for a Better Austin v. Keefe*, 402 U.S. 415, 419 (1971) (quotation marks omitted). That principle applies with special force to restraints on the disclosure of “truthful information about a matter of public significance”—such as the data subject to use restrictions in section 40.2.2. Those types of restrictions are almost never permissible under the First Amendment. *Bartnicki v. Vopper*, 532 U.S. 514, 527 (2001).

**CMS’S GUIDANCE IS UNLAWFUL BECAUSE IT
DOES NOT COMPLY WITH ESSENTIAL
NOTICE-AND-COMMENT RULEMAKING REQUIREMENTS**

Even if the guidance were not in excess of CMS’s authority (which as outlined above, it clearly is), the guidance would be invalid because it seeks to impose substantive obligations on regulated parties and was not promulgated through proper notice-and-comment rulemaking procedures. The law is clear that an agency may not impose legal obligations on regulated parties through policy guidance. Guidance documents, like interpretive rules, are “not supposed to ‘have the force and effect of law’—or, otherwise said, to bind private parties.” *Kisor*, 139 S. Ct. at 2420 (quoting *Perez v. Mortgage Bankers Assn.*, 135 S. Ct. 1199, 1204 (2015) (internal quotation marks omitted)). They “are meant only to advise the public of how the agency understands, and is likely to apply, its binding statutes and legislative rules.” *Id.* (internal citation and quotation marks omitted).

In contrast, when an agency imposes substantive obligations that go beyond a statute’s express requirements, the agency must employ quasi-legislative rulemaking procedures with an opportunity for public notice and comment. *See Hoctor v. U.S. Dep’t of Agric.*, 82 F.3d 165, 170-71 (7th Cir. 1996); *see also Catholic Health Initiatives v. Sebelius*, 617 F.3d 490, 495 (D.C. Cir. 2010). These procedural requirements—as reflected in both the Administrative Procedure Act, *see* 5 U.S.C. § 553 *et seq.*, and the Social Security Act, *see* 42 U.S.C. § 1395hh(a)(2)—are essential to securing “the values of government transparency and public participation,” *Iowa League of Cities v. EPA*, 711 F.3d 844, 873 (8th Cir. 2013), by ensuring that agencies provide reasoned explanations for their decisions after evaluating and responding to comments. *See Azar v. Allina Health Servs.*, 139 S. Ct. 1804, 1816 (2019). They are also an essential part of a compromise that has allowed executive agencies to wield legislative rulemaking powers while accounting for the significant separation-of-powers concerns that arise from delegating such authority to executive agencies.

Congress has directed CMS to implement the statute’s requirements through guidance. *See* IRA § 1198(c). But that does not mean that CMS may read the word “guidance” to be a blank check that allows it to avoid all proper rulemaking procedures when it seeks to impose additional binding obligations on regulated parties. Nor is there good cause to waive essential notice-and-comment rulemaking requirements. The exceptions to rulemaking procedures are “narrowly construed and reluctantly countenanced.” *Mack Trucks*,

Inc. v. EPA, 682 F.3d 87, 93 (D.C. Cir. 2012). As a result, good cause for dispensing with rulemaking requirements never exists absent a showing of an emergency with the risk of “real harm.” *NRDC v. Evans*, 316 F.3d 904, 911 (9th Cir. 2003). That is especially true where, as here, Congress has not imposed “mandatory” deadlines, because it has not specified any consequences for CMS’s failure to comply with the suggested statutory deadlines. *Gottlieb v. Pena*, 41 F.3d 730, 734 (D.C. Cir. 1994). The statute does not provide for any sanction against CMS or HHS were the government to miss IRA implementation deadlines. Because there are no consequences specified in the statute, CMS is free to impose its own deadlines without any risk of a “coercive sanction” being imposed by the courts. *United States v. James Daniel Good Real Prop.*, 510 U.S. 43, 63 (1993). There is accordingly no reason CMS should not take the time needed to undertake proper rulemaking proceedings, including allowing public comment and responding to those comments before promulgating a final rule that is properly subject to judicial review.

**CMS’S GUIDANCE IS UNLAWFUL BECAUSE IT DOES NOT ADEQUATELY
PROTECT CONFIDENTIAL DATA AND PROPRIETARY INFORMATION,
AND IT UNDERMINES CONGRESSIONALLY-MANDATED INCENTIVES**

CMS’s guidance improperly lacks adequate safeguards to protect manufacturers’ confidential trade secret and other proprietary information. The guidance’s provisions call for the submission of confidential and trade secret information beyond what the IRA authorizes. While CMS’s guidance states that it will treat all such information as confidential, *see* Guidance § 40.2.1, there are multiple ways in which the data will not or cannot be held in confidence under the guidance.

Any unauthorized and unwarranted use or disclosure of a manufacturer’s proprietary information would be directly contrary to the IRA’s terms and would constitute an uncompensated taking of the manufacturer’s intellectual property. *See Ruckelshaus v. Monsanto*, 467 U.S. 986, 1001-04 (1984); *see also Philip Morris, Inc. v. Reilly*, 312 F.3d 24, 26 (1st Cir. 2002) (en banc) (holding that Massachusetts law allowing public disclosure of tobacco product ingredients resulted in an unconstitutional taking). It would also conflict with the government’s World Trade Organization trade secret and proprietary information obligations under the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS Agreement) and FDA’s prohibition on disclosure of commercial confidential and trade secret information, *see* 21 U.S.C. § 331(j), 21 C.F.R. §§ 20.61, 314.430. Those provisions make clear that manufacturers have important property interests in their proprietary information, and those private rights must be protected and cannot be arbitrarily taken away by the government for its own benefit. In addition, any public disclosure of proprietary information would create serious antitrust and anticompetitive concerns that CMS should avoid.

More broadly, CMS’s guidance undermines statutory incentives for ongoing innovation of drugs and biologics. For example, CMS says that it will consider each broadly defined “drug” or “biologic” to be marketed based on the “earliest” approval of that active moiety or active ingredient. But by considering each active moiety (or active ingredient) to

be a QSSD, CMS captures for negotiation products that are still protected by regulatory exclusivity, regardless of whether the drug or biological product has been marketed for the requisite 7 or 11 years. This approach undermines the careful balance between innovation and competition that Congress has struck in the FDCA and PHSA, which carefully assigns market exclusivity based on *both* entry of a new active ingredient *and* continuing research and development into the potential of that active ingredient after approval. As a result, drug developers typically innovate in phases. Advancement in science is dependent on additional research for an initially developed product. Maintaining the economic value of incentives that result from incremental innovation by studying a molecule's mechanism of action, modified formulations of a previously approved product, and other product enhancements are critical to provide advancement in treatment and increased patient convenience (*e.g.*, oral vs injection, heat stable vs cold-chain supply, daily vs monthly treatment). This is precisely why Congress chose to incentivize incremental research under the FDCA and PHSA. But as described in more detail below, the statutory provisions designed by Congress, and overseen by FDA, to provide market exclusivity to certain products are wholly incompatible with CMS's rewrite of the IRA. *See* 42 U.S.C. § 262(k)(7) (reference product exclusivity); 21 U.S.C. § 355(c)(3)(E)(ii) and 21 U.S.C. § 355(j)(5)(F)(ii) (NCE exclusivity); 21 U.S.C. § 360cc(a) (orphan drug exclusivity); 21 U.S.C. § 355(c)(3)(E)(iii)-(iv) and 21 U.S.C. § 355(j)(5)(F)(iii)-(iv) (3-year exclusivity); 21 U.S.C. § 355a(b)(1)(A)(i)(I), 21 U.S.C. § 355a(c)(1)(A)(i)(I), 21 U.S.C. § 355a(b)(1)(A)(i)(II), 21 U.S.C. § 355a(b)(1)(A)(ii), 21 U.S.C. § 355a(b)(1)(A)(i)(II), 21 U.S.C. § 355a(c)(1)(A)(ii), 42 U.S.C. § 262(m)(2)(A), 42 U.S.C. § 262(m)(2)(B), 42 U.S.C. § 262(m)(3)(A), and 42 U.S.C. § 262(m)(3)(B) (pediatric exclusivity); 21 U.S.C. § 355f(a) (GAIN exclusivity).

CMS MUST RECOGNIZE AND ACCOMMODATE THE COMPLEXITIES ASSOCIATED WITH MANUFACTURER-SPECIFIC DATA SUBMISSIONS

Through section 50.1 and Appendix C of its guidance, CMS seeks to expand the five manufacturer-specific data elements enumerated in section 1194(e)(1) of the IRA into ten pages of additional definitions, imposing a slew of extra data gathering and submission requirements on manufacturers, many of which manufacturers have never devised, determined, calculated, or produced. CMS also envisions that Primary Manufacturers would have only 30 days to produce this information from not only their own records but also to collect and report much of this same information from Secondary Manufacturers. *See* Guidance § 50.1. The guidance notes that these requirements must be fulfilled within the specified timeframe to avoid a steep civil monetary penalty of \$1,000,000 per day of violation. *See id.* § 100.2. CMS will also require manufacturers to submit certifications regarding the completeness and accuracy of their data submissions.

Novo Nordisk is concerned that the manufacturer-specific data elements set forth in Appendix C of the guidance (1) would in part impose new substantive requirements on manufacturers that exceed the scope of the authority granted by Congress (among other problems, CMS requests pricing metrics that are not set forth in the IRA and that have never before been

established or devised); (2) cannot be implemented without notice-and-comment rulemaking because the IRA itself does not possess the requisite level of clarity to facilitate implementation of the manufacturer-specific data requirements through non-binding guidance; (3) would be misused by CMS for its own procurement purposes as a market participant and not for any regulatory reasons; and (4) would not be sufficiently protected from unauthorized use or disclosure beyond the negotiation program (CMS provides no details regarding its plans to protect this highly sensitive, proprietary information from unauthorized use or disclosure).

Besides being unlawful, the expansive requirements set out in Appendix C would pose a significant logistical challenge for manufacturers. Much of the information requested is not maintained in the ordinary course of business. The sheer quantity of the information that CMS proposes to extract from manufacturers may be both impractical and unfeasible within the short timeframe that CMS expects. For many companies, especially larger companies with complex operations, compiling this information would necessitate a coordinated and highly time- and resource-intensive approach. These efforts will be even more complicated for global companies like Novo Nordisk with headquarters that are based outside the United States, where information underlying many of the required data elements is spread across multiple individuals in various locations throughout the world. U.S. stakeholders would need to connect with global colleagues and other affiliates to access necessary information. These concerns would be further exacerbated if Primary Manufacturers would need to compile their own information while also coordinating data-gathering and reporting with Secondary Manufacturers, who may not be cooperative or responsive (and who will have significant concerns about providing their proprietary data to Primary Manufacturers, who often will be their competitors).

CMS should recognize that ensuring such a data set is complete and accurate will require considerable effort and time by manufacturers, greatly surpassing a limited period of 30 days. These complications will be particularly acute during the first year of negotiations for price applicability year 2026, when CMS will publish its list of 10 selected drugs on September 1, 2023 and expect Primary Manufacturers to submit the detailed data set out in Appendix C by October 2, 2023. Both manufacturers and CMS are sure to encounter complications and complexities that cannot be reasonably anticipated or accounted for until the process unfolds. Accordingly, Novo Nordisk has significant concerns that manufacturers will be able to provide the detailed data set out in Appendix C within just 30 days, especially for purposes of negotiations for initial price applicability year 2026.

Novo Nordisk believes that CMS has flexibility to implement the data submission timelines with respect to the manufacturer-specific data elements enumerated in section 1194(e)(1). CMS should afford manufacturers necessary and adequate time to prepare and submit data regarding the section 1194(e)(1) factors, and not implement a strict 30-day submission requirement envisioned by the guidance. The Agency should permit manufacturers to make rolling data submissions with respect to the section 1194(e)(1) factors, based on timelines that would be agreed to by CMS and each affected manufacturer. Such an approach would recognize the reality that there will be unavoidable circumstances in which more time is necessary to appropriately compile and provide accurate and complete data to the Agency. Moreover, CMS must

recognize and appreciate that manufacturers will need to make and rely on reasonable assumptions in providing much of the data to the Agency. The need to determine and rely on assumptions will be greater in the absence of informed and detailed guidance from CMS that meaningfully addresses the decisions and related complications that manufacturers will face in compiling and providing this data. (This issue also underscores the need for CMS to pursue notice-and-comment rulemaking.) Accordingly, CMS must afford manufacturers reasonable discretion to make assumptions in preparing their data submissions and cannot impose civil monetary penalties in relation to data submissions that are based on reasonable assumptions, especially if the Agency does not provide clear and detailed guidance that would directly conflict with a manufacturer's reasonable assumption.

**CMS'S GUIDANCE DOES NOT CONTAIN SAFEGUARDS
NECESSARY TO ENSURE THAT THE "MAXIMUM FAIR PRICE"
IS PROVIDED ONLY TO ELIGIBLE INDIVIDUALS**

Novo Nordisk respectfully suggests that the only way to operationalize access to the MFP consistent with the statute's terms is by providing a rebate to the dispensing entity, after validation of MFP-eligibility by a third-party administrator ("TPA"). For this process to work, the manufacturer and TPA will need sufficient claims-level data (please see Exhibit A of PhRMA's comment letter) and longer than the 14 days proposed by CMS. *See* Guidance at §40.4.

The nation's dispensaries are not equipped to maintain duplicative segregated inventories of MFP-priced selected drugs and non-MFP-priced selected drugs to serve the MFP-eligible and MFP-ineligible customers (respectively) who walk through their doors. Even a virtually segregated inventory will likely be too complex and onerous for this purpose. That is why dispensaries, which generally purchase at a common list price, effectuate the various discounts afforded to customers (via their insurance plans) not by purchasing at various discounts, but through after-the-fact rebates. The chargeback solution proposed by CMS in section 90.2 is not workable or appropriate. Chargebacks, based on saleable packages, support discounts when dispensaries are able to purchase from a wholesaler at a single point-of-purchase discount for all patients. Chargebacks are not an appropriate mechanism for extending discounts at the individual patient level.

Dispensaries should therefore access MFP by rebate, payable by the manufacturer on verified utilization by MFP-eligible individuals. The verification of MFP-eligibility is the key. Absent strong procedures to ensure that access to MFP be limited only to those individuals entitled to the price—consistent with the clear statutory language limiting MFP eligibility to individuals "enrolled in a prescription drug plan under part D ... or Medicare Advantage-prescription drug plan under part C"—the program risks operational failure and substantial abuse. Novo Nordisk urges CMS to be clear to participating dispensaries that diversion will not be tolerated.

CMS should require dispensaries to submit to a neutral TPA rebate claims with data sufficient to establish the MFP-eligibility of the patient to whom the selected drug was dispensed. The RxBIN and RxPCN data suggested by CMS at section 90.2 of the guidance are necessary but insufficient elements to achieve this purpose. Use of a TPA would standardize this process across manufacturers, which would eliminate the need for manufacturers to submit individual processes in writing to CMS. However, should CMS finalize its proposed approach, CMS should confirm that each manufacturer of a selected drug may make clear in its written process before the price applicability year what data elements are to be required to substantiate a claim for the MFP, such data elements not to be unduly onerous or inconsistent with standard business practices. Regarding a manufacturer's written process (if ultimately required), NNI urges CMS to treat such written process as proprietary and confidential, particularly as it could amount to disclosure of trade secret information. CMS should not publicize manufacturer processes.

Novo Nordisk agrees that dispensaries should be reimbursed timely when they are entitled to MFP rebates. The 14-day interval recommended in the guidance, however, is so tight as to be operationally infeasible. The IRA does not dictate a 14-day rebate mechanism, and CMS should not adopt one. In other government programs requiring eligibility verification and rebating, the timetable for rebates is more than twice as long (38 days in the Medicaid Drug Rebate Program and 38 days in the Part D Coverage Gap Discount Program). Novo Nordisk suggests that CMS require that dispensaries report their minimally necessary data sets to a TPA within a reasonable timeframe after the date of dispense, and that the manufacturer must pay the rebate (or issue a credit) to the dispensary within thirty-eight days of receipt of the complete MFP and 340B validation data from the TPA. Disputed or incomplete claims could be held pending resolution or completion.

Furthermore, the statute is clear that manufacturers may not be subjected to both the MFP and the 340B discount on the same unit. §1193(d). Rather, manufacturers of selected drugs must provide the lower net price to eligible patients. Many factors complicate application of this nonduplication requirement:

- 340B-covered entities purchase at both (a) the 340B price for 340B-eligible patients and (b) a non-340B price for ineligible patients (*e.g.*, Medicaid carve-out).
- Covered entities (and their TPAs) choose to identify eligible 340B patients well after a dispense to such patient has occurred, including sometimes many months after a dispense has occurred.
- There are no consistent, minimum standards or documentation requirements currently being enforced to ensure appropriate, transparent 340B patient identification.
- 340B-covered entities often utilize commercial contract pharmacies, outsourced dispensaries to patients of the covered entity made whole via replenishment.

- Covered entities and commercial contract pharmacies resist providing transparency and data to confirm 340B patient eligibility.
- Only some 340B pharmacy fills are to 340B-eligible patients, only some 340B fills are to MFP-eligible patients, and those populations only sometimes overlap.

Development of a mechanism that will address these varied complexities will be difficult, unless a TPA is used. It will therefore be necessary for CMS to coordinate with the Health Resources and Services Administration (“HRSA”) to ensure that manufacturers are subject to neither duplication of discounts nor diversion to ineligible patients.

In addition to these MFP-related concerns, a much larger issue exists with regard to 340B patient eligibility when drugs are dispensed through contract pharmacies. Manufacturers do not have adequate insight into which prescriptions are designated as 340B-eligible by a covered entity and why. Covered entity software vendors review contract pharmacy dispensing data in an effort to identify prescriptions associated with “patients of the covered entity;” however, this is defined at each covered entity. These software programs can even make strategic financial decisions and choose not to designate prescriptions as 340B-eligible if they are not sufficiently profitable. In many instances, multiple covered entities will claim 340B eligibility for the same prescription, leaving the manufacturer to pay a 340B chargeback multiple times for the same dispensed unit. These 340B program deficiencies, left unaddressed, will hinder the proper administration of the MFP.

CMS’s MFP guidance suggests that it may not yet be fully aware of the complexities of, or potential for ambiguity associated with, covered entities identifying 340B-eligible patients. Failure to appreciate and address these complexities could result in covered entities receiving both the MFP and a 340B discount for the same patient in violation of the IRA’s express requirements. CMS coordination with HRSA should focus on key areas that reduce the risk of duplicative discounts, including: (1) requiring that the identification of 340B-eligible patients and MFP-eligible patients must occur and be documented at the time of dispense; (2) establishing clear minimum documentation requirements for covered entities to support the identification of a 340B-eligible patient; and (3) for drugs subject to an MFP, requiring 340B discounts be paid as a rebate (as is currently the case with ADAPs) conditioned on the provision of adequate data to allow manufacturers to confirm the appropriateness of the discount and avoid duplicative MFP and 340B discounts.

**CMS SHOULD CLARIFY THAT PART D PLANS
MAY NOT IMPOSE PRIOR AUTHORIZATION OR STEP THERAPY
REQUIREMENTS FOR SELECTED DRUGS**

Novo Nordisk appreciates CMS's acknowledgement in the guidance that "[i]n accordance with section 1860D-4(b)(3)(I) of the Act, Medicare Part D plans shall include each covered Part D drug that is a selected drug on Part D formularies during [CY] 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period." Guidance §110.

We urge CMS to specify that Part D plans may not impose utilization management requirements, such as prior authorization and step therapy, which effectively can result in non-coverage of a selected drug for a Part D beneficiary. That a product is "on formulary" does not mean beneficiaries will be able to obtain coverage for that therapy. As described further below, Medicare Part D plans are increasingly subjecting products on their formularies to prior authorization or step therapy requirements. Such restrictions violate the IRA when they are imposed on selected drugs.

Section 11001(b)(1)(E) of the IRA, which provides that "the PDP sponsor offering a prescription drug plan shall include each covered part D drug that is a selected drug..." is titled "Coverage of Selected Drugs." This language makes clear that Congress intended for selected drugs to be included on formulary such that they are actually covered for Part D beneficiaries. See *INS v. National Center for Immigrants' Rights*, 502 U.S. 183, 189-90 (1991) (citing *Mead Corp. v. Tilley*, 490 U.S. 714, 723 (1989) ("[T]he title of a statute or section can aid in resolving an ambiguity in the legislation's text....[Here] [t]he text's generic reference to 'employment' should be read as a reference to the 'unauthorized employment' identified in the paragraph's title.")). The statutory scheme further reinforces this direction from Congress. Specifically, section 1860D-2(d)(1)(D) of the Social Security Act, as amended by section 11001(b) of the IRA, provides that the benefits of the MFP for a selected drug must flow through to Part D beneficiaries by reducing the negotiated prices used in payment by each Part D plan sponsor for each selected Part D drug (which in turn form the basis for determining beneficiary cost-sharing). Guidance §40.4. Legislative history further describes that purpose of these provisions as "lowering costs for seniors and the Federal Government." H.R. Rep. No. 117-130, at 5 (2021). Medicare Part D beneficiaries (and the government) cannot realize the cost savings from the MFP for a selected drug if they are not able to obtain coverage for that selected drug.

Prior authorization and step therapy can result in non-coverage, even if a drug is included on a Part D plan formulary. Prior authorization requirements permit coverage denials for failure to seek and obtain prior authorization and step therapy mandates that a beneficiary try and fail on a different therapy before the Part D plan will cover the patient's prescribed

therapy. Both of these restrictions can deny coverage for prescribed therapies, potentially making them unavailable when a patient needs them, and place extra burdens on providers that discourage them from prescribing and dispensing these medically necessary medicines to patients. CMS has previously recognized that prior authorization and step therapy requirements can have the same effect on patients as non-coverage. In the context of Part D transition coverage, the Medicare Part D manual explains:

CMS defines non-formulary Part D drugs to mean: (1) Part D drugs that are not on a sponsor's formulary, (2) drugs previously approved for coverage under an exception once the exception expires, and (3) Part D drugs that are on a sponsor's formulary but require prior authorization or step therapy, or that have an approved QL lower than the beneficiary's current dose, under a plan's utilization management requirements. *This is because a formulary drug whose access is restricted via UM requirements is essentially equivalent to a non-formulary Part D drug to the extent that the relevant UM requirements are not met for a particular enrollee.*

Medicare Prescription Drug Benefit Manual, Chapter 6, § 30.41 (emphasis added).

CMS has also previously recognized that these types of utilization management impose barriers to patients' access to the particular treatment prescribed to them, which could adversely affect the progression of a patient's disease and their overall health. For example, in its 2018 proposed rule regarding the Part D protected classes, CMS cited a number of studies that suggested step therapy may be costly, both economically and with regard to patient health. *See* 83 Fed. Reg. 62152, 62187 (Nov. 30, 2018). CMS acknowledged that "[s]everal studies show that enrollees become discouraged when step therapy is used" and that the delay caused by step therapy "may cause a worsening of conditions leading to increased medical costs." *Id.* Such a result is not only harmful to beneficiaries, but it runs counter to Congress's goals in enacting the IRA: to help patients afford the medicines they need.

Accordingly, CMS should clarify in its revised guidance that Part D plans must provide coverage for selected drugs by including them on formulary without prior authorization or step therapy restrictions.

ADDITIONAL COMMENTS

1. Appropriate Therapeutic Alternatives

The guidance states that to "identify potential therapeutic alternatives...of a selected drug, CMS intends to use data submitted by the Primary Manufacturer and the public, FDA-approved indications, indications included in CMS-approved Part D compendia, widely accepted clinical guidelines, and peer-reviewed studies." Guidance §60.3.1. Further, CMS "intends to begin by identifying therapeutic alternatives within the same drug class as the selected drug based on properties such as chemical class, therapeutic class, or mechanism of action before considering therapeutic alternatives in other drug classes." *Id.*

Identification of therapeutic alternatives must be guided by widely accepted clinical guidelines. Widely accepted clinical guidelines should be the authoritative sources for identifying therapeutic alternatives, superior to other sources of information. Failing to do so would be to the detriment to the lives and well-being of Medicare beneficiaries and would challenge broadly-established scientific consensus.

Clinical guidelines are developed by committees of experts who have analyzed the totality of the evidence, assessed and graded its quality according to accepted standards, and come to well-accepted and scientifically-grounded treatment recommendations. Such guidelines are unbiased, unsponsored, and driven by an analysis of clinical benefit conducted by practitioners who have experience treating patients with specific conditions. CMS has acknowledged the importance of well-respected organizations that develop clinical practice guidelines. For example, the American Diabetes Association (ADA) is one of two organizations with accreditation power within its Diabetic Self-Management Training Accreditation Program.

Additionally, in multiple instances within the guidance, CMS notes its intention to prioritize the consideration of evidence relevant to Medicare populations, including adults over age 65, patients with end-stage renal disease, and disabled persons. To fully accomplish this, CMS must take into consideration the differing clinically-appropriate therapeutic alternatives for relevant subpopulations with large presence in Medicare such as multi-morbid Type 2 diabetes patients who may be living with chronic kidney disease (CKD) or those with atherosclerotic cardiovascular disease ASCVD. For example, while the American Diabetes Association (ADA) guidelines are the lodestar for diabetes patients broadly, there are separate clinical guidelines developed by Kidney Disease – Improving Global Outcomes (KDIGO) that risk stratify diabetes patients with chronic kidney disease which specify different treatment options for patients at various stages of the disease.

2. 30-Day Equivalent Supply

CMS proposes to calculate the MFP across dosage forms and strengths based on a “30-day equivalent supply.” Guidance §60.1. This approach is not feasible for medications such as insulin, as dosing is based on numerous factors not readily reduced to a common 30-day supply. For example, patients with Type 1 diabetes will use a larger amount of insulin in a 30-day timeframe than will patients with Type 2 diabetes. Patients who have diabetes and are living with obesity will have a higher starting dose per day than people with diabetes who have an “average” BMI. Type 2 patients can also become insulin resistant as they progress along their disease state and may require more dosing than a patient earlier in their disease state. Finally, patients will titrate their dosage differently based on their A1c values. CMS should re-evaluate their proposal to use a standard 30-day supply for applying the MFP across dosage forms and strengths to account for the wide variation in dosing for medications like insulin.

3. Use of FSS Price as MFP Reference

Novo Nordisk objects to the use of the Federal Supply Schedule (FSS) or Big 4 price as a reference point for the initial offer. Guidance §60.3.2. The FSS/Big 4 price contains negotiated discounts offered specifically to the Veterans Administration and the Department of Defense; discounts that are generally not available commercially. Reference to FSS and Big 4 prices could have the unintended consequence of reducing or eliminating voluntary manufacturer discounts that lead to lower prices for those government channels. CMS will remember a similar situation that occurred after the creation of Best Price in the MDRP in 1990. By failing to exclude prices to these government purchasers from Best Price, many of the voluntary discounts were withdrawn. See N. Fisher, *The 340B Program: A Federal Program in Desperate Need of Revision After Two-And-A-Half Decades of Uncertainty*, 22 J. Health Care L. & Policy 25 (2019). CMS should preserve the ability of the VA to negotiate deep discounts by removing the FSS price from the set of prices considered when developing an initial offer.

* * * *

The IRA's unprecedented drug pricing provisions raise serious constitutional and rule-of-law concerns. If prices for medications are not set at appropriate levels, the resulting market distortions could undermine innovation, discourage research and development, deprive patients of life-saving medications, and undermine the nation's healthcare system. In these circumstances, it is imperative that CMS comply with constitutional requirements and remain within the bounds of its proper authority. It must ensure that it follows rulemaking procedures, provides notice and opportunities for public comment, and responds meaningfully to objections. And it must respect and protect manufacturers' private rights. Instead of complying with these essential requirements, however, CMS has exceeded its authority, issuing vague and ill-considered guidance that, as explained above, is infected with errors. Because the guidance cannot be salvaged, and because rulemaking is required, CMS should start over by rescinding its guidance and following the procedures needed to implement the IRA in a responsible and lawful fashion.

Thank you for considering Novo Nordisk's comments. We would be pleased to discuss these comments with you in further detail. If you have questions, please contact Jennifer Duck, VP, Public Affairs at JEDK@novonordisk.com.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

OMass Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

OMass Therapeutics is preclinical small molecule company based in Oxford in the United Kingdom. To date, we have raised ~\$150M in private financing and will require additional rounds of funding before our products are approved and launch. The US is likely to be one of the largest market for the drugs we are developing, so we have been following the recent developments related to the inflation reduction act with interest and trying to understand what their potential impact on our company strategy may be

Below is a summary on our comments to CMS' Medicare Drug Price Negotiation Program.

- (A) **Section 30.1:** Medicare negotiation for NDA-path drugs at nine-years post-launch
 - a. This disproportionately erodes the investment case for all NDA-path drugs in diseases that affect the elderly or are related to aging
 - b. As a small molecule preclinical company, we believe this provision will have a large impact on our ability to continue to fund our drug discovery platform, as investors and large pharmaceutical companies begin to prefer BLA-path drugs for these types of indications
 - c. For diseases that primarily affect the elderly, small molecules are actually preferred, as they tend to be orals (vs. subcutaneous or IV administration), with a much easier burden of administration- this provision is likely to hamper innovation but also have a detrimental effect on patients
- (B) **Section 30.1.1:** To be considered for the orphan drug exclusion, the drug or biological product must (1) be designated as a drug for only one rare disease or condition under section 526 of the FD&C Act and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition
 - a. As long as a drug remains an orphan drug approved for a single orphan indication, it will be exempt from price negotiation under the IRA. But drugs approved for a second orphan indication under a separate ODD will be subject to negotiation.
 - b. As a company focused on rare diseases, we believe this provision provides perverse incentives and will ultimately reduce the total number of approvals in rare diseases – companies should not be penalized for studying their products in multiple orphan indications

- (C) **Section 50.2:** CMS' processes for determining the Maximum Fair Price for individual medicines as well as the relevance of "therapeutic alternatives" to the drugs it selects for negotiation
- a. Cost-effectiveness math embraced by ICER in the US and other HTA bodies elsewhere (e.g., NICE in the UK) is so simplified that it excludes many demonstrable benefits of medicines (e.g., they liberate caregivers, they reduce risk for healthy people, they go generic yet keep on working), resulting in extreme under-estimations of the value of new medicines. This math can then serve as an excuse for plans to refuse coverage, essentially telling patients that the medicines aren't worth their prices instead of admitting that the plan just doesn't want to pay
 - b. To the extent that CMS wants to appreciate the value that a medicine brings to society before it decides how aggressively to lower its price (particularly in the case of NDA-path drugs that experience negotiation far sooner than would have gone generic), CMS should broadly account for a medicine's value elements, using a dynamic stacked cohort model that accounts for value to patients, to caregivers, and to the rest of the population whose risk is reduced by having the drug (i.e., if it's going to do CEA, do generalized CEA, not conventional over-simplified CEA)
 - c. CMS should consider key product attributes like efficacy, safety, and ease-of-use in determining relevant "therapeutic alternatives" (the basis for CMS' opening bid)
- (D) **Section 40.2.2:** CMS prohibitions on data disclosure and destruction of related documents.
- a. The lack of transparency around the negotiation process makes it impossible for companies to understand which value components CMS is measuring in determining a new price
 - b. Companies need to understand how pricing decisions will be made to inform their clinical development plans and what they need to demonstrate to differentiate their drug vs. competitors
- (E) Additional Comments:
- a. We understand that CMS has stated its guidance in Section 30 is final and that CMS is not seeking or accepting comments on this section
 - b. We recognise that CMS is not permitting comments but we are including these given the significance of the topics incorporated in those sections

We appreciate your considerations of our comments as you develop the Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact me on ros.deegan@omass.com if you have any questions regarding our comments.

Best,

PARTNERSHIP TO FIGHT CHRONIC DISEASE

April 14, 2023

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of
Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026

Submitted via email: IRAREbateandNegotiation@cms.hhs.gov

Dear Dr. Seshamani:

The Partnership to Fight Chronic Disease and the 23 undersigned organizations, representing patients, caregivers, providers, and other stakeholders, appreciate the opportunity to share comments, concerns, and opportunities for improving the Medicare Drug Price Negotiation Program: Initial Memorandum.

The Inflation Reduction Act (IRA) of 2022 involves sweeping changes to Medicare including the new Medicare Drug Price Negotiation Program. Given the wide-ranging implications for Medicare beneficiaries today and in the future and the vulnerability of the individuals affected, care to identify and avoid unintended consequences is paramount. These changes also do not occur in a vacuum but are made more complex by challenges with workforce shortages and other access issues that adversely affect many and risk worsening existing health disparities. We urge the Centers for Medicare & Medicaid Services (CMS) to remain vigilant and avoid unintended consequences given the significant changes implementation of the drug negotiation program represents.

Development and implementation of Medicare Drug Price Negotiation Program should accommodate meaningful engagement opportunities for beneficiaries and caregivers.

Given the significance of the changes involved, CMS should seek and allow for more significant and meaningful beneficiary, caregiver, patient, and provider engagement. However, the proposed process and timelines described in the IRA guidance significantly limit those opportunities. When comments are allowed, they involve extremely short timelines for a response. In the guidance, CMS notes that it seeks to include “patient experience” and “factors

PARTNERSHIP TO FIGHT CHRONIC DISEASE

that are of importance to a person”. Additionally, CMS seeks to include evidence, including the consideration of real-world evidence, from “Medicare populations, including on individuals with qualifying disabilities, patients with end-stage renal disease (ESRD), and Medicare-aged populations, as particularly important.”¹ To do so meaningfully, however, allowing sufficient opportunity to analyze the requests, gather evidence to respond, and draft a response takes time.

Given the time, staff, and expertise needed to respond in a timely manner, the short 30-day timeframes for comment will disenfranchise many—particularly those who are already underrepresented and under-resourced. Providing greater transparency in the process and building in more opportunities for engagement, including opportunities to shape data collection, analysis, policy development and ultimately implementation, should be a priority, not just a motion to collect responses to proposed policies. The importance of doing things “right now” should not surpass the importance of doing things “right”. Seeking input on this guidance document instead of allowing for more formal engagement from experts outside of CMS through a more typical proposed rulemaking and comment period, for example, means less input on the program from stakeholders. Further, the 91-page guidance limits areas open for comment and offers a tight timeframe within which the public may comment. These actions are indicative of emphasizing implementation speed over beneficiary impact and public trust.

We urge CMS to consider the proposed process and identify opportunities for public comment and feedback that will not only facilitate implementation of this new program, but more importantly assist CMS in avoiding preventable adverse consequences. For example, though this letter identifies several areas where patient-centric perspectives would enhance the proposed guidance, **the fact that the 91-page guidance does not once mention the health disparities or health equity challenges within Medicare and potential effects of this program is a gross oversight.** That would not have occurred had CMS engaged with patients and beneficiaries earlier in the process.

We are also concerned that the guidance from CMS fails to acknowledge the role of caregivers in supporting patients and the importance of their perspective in the value of treatment they receive. We urge CMS to account for factors that caregivers view as important to them and engage caregivers in the process established in the Drug Price Negotiation Program.

CMS too narrowly defines “unmet medical need.”

Section 1194(e)(2) of the IRA directs CMS to consider evidence of “unmet medical need” of the drug subject to price negotiations and any therapeutic alternatives: “The extent to which the selected drug and the therapeutic alternative to the drug address unmet medical needs for a condition for which treatment or diagnosis is **not addressed adequately by available therapy.**”

¹ Center for Medicare. Medicare Drug Price Negotiation Program: Initial Memorandum. March 15, 2023.

PARTNERSHIP TO FIGHT CHRONIC DISEASE

(Emphasis added). In the guidance, CMS states that it “intends to define [unmet medical need] as treating a disease or condition in cases where very limited or no other treatment options exist.” Adequacy, however, is a much different concept than “very limited or no other treatment options.” Adequacy in terms of unmet medical need should be defined more broadly given the heterogeneity of the populations which Medicare serves, the commonality of comorbidities (76% of beneficiaries have three or more chronic conditions), and the significant health disparities that factor into patient need and preference considerations.

The heterogeneity of populations served by Medicare, their needs, and treatment effects should be primary considerations for unmet medical need. Elsewhere in the guidance, CMS notes that information about heterogeneity of treatment affects and the population which CMS plans to consider but ignores “individuals with disabilities, the elderly, individuals who are terminally ill, children, and other patient populations represented among Medicare beneficiaries.” Similarly, the guidance notes that in consideration of clinical benefits, CMS will consider potential risks, harms, or side effects, including “any unique scenarios or considerations related to clinical benefit, safety, and patient experience.” CMS should not ignore those same considerations and the diversity of needs among Medicare beneficiaries as a significant consideration within unmet medical need.

A more robust, patient-centered definition and approach to evaluating unmet medical need is available in the authorizing statute for the Patient-Centered Outcomes Research Institute (PCORI) where federal law requires consideration of the “needs, outcomes and preferences” of patients.² Unmet medical need should incorporate consideration of both the needs and preferences of people living with one or more chronic conditions who may value a treatment with fewer side effects and contraindications. People, particularly those living with disabilities or with limited transportation options or health care access (e.g., in rural areas or care deserts), may need and prefer modes of administration that do not require traveling and involve less frequent administration. A narrow definition of unmet need may also further lead to the undervaluing of communities of color who may have pre-existing health deficits due to numerous inequities including the negative consequences of social determinants of health³ and

PARTNERSHIP TO FIGHT CHRONIC DISEASE

racism,⁴ including reduced access to care,⁵ reduced quality of care,⁶ and higher prevalence of disease and disease-related mortality.⁷

There is also an important opportunity for considering unmet medical need as being more encompassing of patient needs and realities in evaluating the adequacy of existing therapeutic options. In FDA's Guidance for Industry on Expedited Programs for Serious Conditions—Drugs and Biologics, the FDA defines unmet medical need as a “condition whose treatment or diagnosis is not addressed adequately by available therapy.”⁸ FDA further describes a new treatment as addressing an unmet medical need if it, “has an improved effect on a serious outcome(s) of the condition compared with available therapy.”⁹ Other considerations include having “an improved effect on a serious outcome(d) of the condition compared with available therapy,” “has an effect on a serious outcome of the condition in patients who are unable to tolerate or failed to respond to available therapy,” or “provides safety and efficacy comparable to those of available therapy but has a documented benefit, such as improved compliance, that is expected to lead to an improvement in serious outcomes.” None of these factors are captured in CMS's currently proposed definition of “unmet medical need”.

Also, reliance on averages to define unmet medical need misses the needs of subpopulations for whom therapeutic options are more limited because of their health status or considerations of social determinants of health. This is especially relevant for millions managing multiple chronic conditions. For example, research provides evidence of racial and ethnic health disparities in outcomes and prevalence of chronic illness among Medicare beneficiaries. Many report poorer health status, higher rates of ED visits and hospitalizations, but fewer doctor's visits.¹⁰ All of these realities factor into consideration of choice and success of prescription drug regimens, adherence, and outcomes. Failure to consider these factors in unmet medical need may further exacerbate existing health disparities and outcomes for Medicare beneficiaries.

PARTNERSHIP TO FIGHT CHRONIC DISEASE

By articulating a clear and patient centered definition of “unmet medical need” CMS has an opportunity to create standards and send signals for the types of medical advances that will support the needs of patients for years to come.

The Quality-Adjusted Life Year (QALY) has no place in the guidance given its inherent bias against older adults and people living with disabilities.

We appreciate CMS’s recognition of the problems with QALYs and pledge to not consider QALYs outside of clinical effectiveness as noted in the IRA Guidance. For a program designed to primarily serve older adults and people living with qualifying disabilities, however, QALYs and evidence based on QALYs should not be a factor for consideration at all. As noted in the seminal report by the National Council on Disabilities, the QALY discriminates against these populations¹¹ and pledges to limit their use do not fully eliminate this reality. The QALY undervalues interventions intended for populations with shorter life spans, which include many of the communities for which CMS has expressed a particular interest: older populations and people living with disabilities, as well as people of color. We strongly encourage CMS to adopt the prohibition of reliance on the QALY in Medicare as required as part of the Affordable Care Act and avoid using either metric in evaluating clinical effectiveness or factoring these metrics into developing a fair maximum price.

CMS should protect patient access beyond requiring coverage.

Coverage does not equate to access. Utilization management techniques including, “fail first” or non-clinical step therapy, and prior authorization erect significant barriers to access for patients. We strongly encourage CMS to monitor benefit design and address potential barriers to access in addition to requiring coverage for drugs subject to the drug pricing program.

We appreciate the complexities involved in implementing this significant shift in Medicare and financing of prescription drug coverage. We also appreciate the opportunity to provide comments we hope will aid implementation in ways that protect and enhance beneficiary access to the medicines they need to maintain and enhance their health. We stand ready to assist in that regard and urge CMS to re-evaluate the proposed process for evaluating drugs and determining pricing to allow for additional, meaningful public input and beneficiary engagement in the process. Please contact Candace DeMatteis, candace.dematteis@fightchronicdisease.org for additional information.

Dear Deputy Administrator Seshamani:

Thank you for this opportunity to comment on the Initial Memorandum for Implementation of the Medicare Drug Price Negotiation Program. Our organizations represent the public stakeholders referenced in the guidance – the patients and people with disabilities impacted by this negotiation process. Our comments will focus on the role that we hope to play in ensuring that the agency centers its considerations on outcomes that matter to patients and people with disabilities as it implements this important new program to ensure drug affordability for individuals under Medicare.

The Maximum Fair Price (MFP) provisions of the Inflation Reduction Act (IRA) provide the Centers for Medicare & Medicaid Services (CMS) with significant new authority to reduce drug prices for Medicare beneficiaries. As your guidance recognized, the MFP provisions of the law also include provisions to protect patients and support patient centered action. CMS has the opportunity to continue advancing this crucial goal throughout the implementation of the Medicare Drug Price Negotiation Program. As CMS makes decisions to improve drug affordability, it is vital for the agency to center its decisions around patients and people with disabilities.

Specifically, this important new program gives CMS an opportunity to advance patient-centeredness in health care decision making while improving medical affordability through lower drug prices. While we commend the agency for the steps it has already taken in this direction, such as soliciting stakeholder input at the beginning of the decision-making process, we urge the agency to include additional measures to ensure the program is truly centered on the needs of patients and people with disabilities.

Our recommendations below center on three pillars: 1) creating additional procedures to meaningfully engage with patients and ensure that the evidence CMS relies on is transparent; 2) establishing patient-centered standards and outcomes; and 3) more definitively rejecting the use of Quality-Adjusted Life Years (QALYs) and other discriminatory cost-effectiveness standards. We believe these recommendations will be useful to CMS in developing evidentiary standards and engagement practices that ensure patient benefits are central to decision-making.

We Urge Meaningful Engagement of Patients and People with Disabilities

Allowing members of the public to provide input into the decision-making process, particularly the Medicare beneficiaries directly impacted by this work, will best position CMS to identify all available unbiased and nondiscriminatory evidence for the factors described in section 1194(e)(2). We appreciate that CMS is inviting patients and other public stakeholders to provide input in an initial 30-day period for information collection. Further, we are aware that CMS also released an information collection request (ICR) on Negotiation Data Elements which describes how CMS intends to collect the data described, including information relevant to section 1194(e)(2). We are reviewing this and will provide additional comments as pertinent. As CMS considers the tactics that will be used to gather information, we provide the following recommendations:

- CMS should create an **ombudsman** for the Medicare Drug Price Negotiation Program to act as a central point of input for patients and people with disabilities, similar to the Food & Drug Administration's (FDA's) Patient Affairs Office or the Patient-Centered Outcomes Research Institute's (PCORI's) Director of Patient Engagement. The ombudsman should be an individual with significant experience in patient engagement, familiar with the organizations representing patients and people with disabilities and responsible for ensuring that input is disseminated to decision-makers at CMS and responses are given back to those providing said input.
- ***CMS should incorporate additional procedures to obtain and respond to input from patients and people with disabilities early*** in the drug price negotiation process, giving stakeholders time to collect and provide meaningful comments. CMS likely will need to begin seeking input from patients and caregivers very early in the process so that CMS can consider it along with other inputs before the agency makes an "initial offer" of a Maximum Fair Price. This should go beyond written comments provided through a single, open-ended Information Collection Request, and could include, for example, CMS convening ***public roundtables*** of disease or treatment-specific experts from the patient and disability communities, as well as their caregivers, for each drug selected for MFP negotiation.
 - This process should look similar to the process used by the FDA to engage patients as part of Patient-Focused Drug Development, both as part of externally led meetings¹ and FDA-led meetings.²
 - Another potential reference point is the engagement process used by PCORI to identify the outcomes that the organization values. CMS should similarly engage patients and people with disabilities to establish a predictable process for engagement related to its consideration of data elements about a selected drug, the

¹ "Externally-Led Patient-Focused Drug Development Meetings." U.S. Food and Drug Administration, FDA, 29 July 2022, <https://www.fda.gov/industry/prescription-drug-user-fee-amendments/externally-led-patient-focused-drug-development-meetings>

² "Externally-Led Patient-Focused Drug Development Meetings." U.S. Food and Drug Administration, FDA, 29 July 2022, <https://www.fda.gov/industry/prescription-drug-user-fee-amendments/externally-led-patient-focused-drug-development-meetings>

evidence used in consideration of factors in statute used to assess therapeutic value, and its alternative therapies.

- CMS should share the non-proprietary evidence that they are considering for unmet need, including comparative research and therapeutic advance. The agency should then solicit feedback about its relevance to the needs, and outcomes and preferences of patients. CMS should also solicit other patient sources from patients and people with disabilities that may have their own resources for collecting data.
- CMS should solicit input from **diverse** communities, in order to gain information about the differences among subpopulations and their needs, outcomes, and preferences.
- CMS should provide patients and people with disabilities the **resources needed for effective engagement**.
 - Resources may include providing financial assistance to facilitate participation in meetings and roundtables, making meetings accessible to people with disabilities, providing informational materials in accessible formats, funding surveys and other forms of real-world evidence generation, and/or allowing an extended amount of time for input and comments.
 - This recommendation is consistent with best practices supporting engagement, particularly supporting the engagement of those historically not engaged, as consistently reflected in the work of PCORI.³
- CMS should **seek input on topics that are relevant to people with disabilities, patients, and caregivers**, and should clearly describe these topics to these stakeholders in advance. This engagement could include, for example, feedback on relevant treatment alternatives, outcomes that matter to patients, and the relative importance of these outcomes.
- CMS decisions should be **sufficiently transparent** so that people with disabilities, patients, and caregivers can see the extent to which their input was considered in the agency's decisions, ideally during the deliberation process before a final decision is made.
- CMS should **ensure that information gathered during public comment periods and meetings is reflected in the final guidance** that CMS publishes in advance of the first year of negotiations, advancing the principle of transparency that is supported across organizations.

³ PCORI, "Financial Compensation of Patients, Caregivers, And Patient/Caregiver Organizations Engaged in Pcori-Funded Research as Engaged Research Partners," Patient-Centered Outcomes Research Institute, published June 10, 2015, <https://www.pcori.org/sites/default/files/PCORI-Compensation-Framework-for-Engaged-Research-Partners.pdf>.

- CMS should engage patients and people with disabilities ***to assess any unintended consequences***, including the impact on access to treatment, cost-sharing implications, or otherwise.
 - Organizations such as the Partnership to Improve Patient Care,⁴ the National Council on Disability (NCD),⁵ and the Disability Rights Education and Defense Fund (DREDF)⁶ have identified restricted access implications experienced in countries relying on methods for assessing value that fail to capture the real-world value to patients.

We urge CMS to Explicitly Recognize, Without Exception, the Existing Statute Barring Use of QALYs and Similar Measures, Consistent with Current Law and Recommendations of the National Council on Disability Against Reliance on Cost-Effectiveness.

The initial CMS guidance recognized the agency’s authorization to consider evidence about the selected drug, including whether the selected drug represents a therapeutic advance, its alternatives, comparative effectiveness and effects on specific subpopulations, and extent to which unmet medical needs are addressed. This reflects the IRA’s focus on driving significant discounts in drug prices through the use of comparative clinical effectiveness research and cost data vs. one-size-fits-all cost-effectiveness analyses, consistent with the concerns of the NCD^{7, 8} and other disability rights organizations.^{9, 10}

CMS acknowledged that the agency may not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an individual who is elderly, disabled or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill. However, the initial CMS guidance did not reference

⁵ National Council on Disability. (November 16, 2019). Quality-Adjusted Life Years and the Devaluation of Life with Disability. https://ncd.gov/sites/default/files/NCD_Quality_Adjusted_Life_Report_508.pdf

⁶ DREDF, ICER Analyses Based on the QALY Violate Disability Nondiscrimination Law , September 21, 2021 at <https://dredf.org/wp-content/uploads/2021/09/ICER-Analyses-Based-on-the-QALY-Violate-Disability-Nondiscrimination-Law-9-17-2021.pdf>

⁷ The NCD recommended that Congress, “Avoid creating provisions of any bill that would require the agency with management and oversight responsibilities (such as, for example, HHS) to cover only the most cost-effective drugs and treatments, or to require the agency to impose restrictions on less cost-effective treatments.” https://ncd.gov/sites/default/files/NCD_Quality_Adjusted_Life_Report_508.pdf

⁸ The NCD recommended Medicaid guidance, “The guidance should specifically discuss how these authorities apply to benefits and reimbursement decisions, and that payment decisions should not rely on cost-effectiveness research or reports that are developed using QALYs.” https://ncd.gov/sites/default/files/NCD_Quality_Adjusted_Life_Report_508.pdf

⁹ Joint letter from advocates to Oregon HERC, “Most cost-effectiveness analyses rely on data from randomized clinical trials (RCTs) and health utility preference weighting surveys, data sources that primarily rely on inputs from non-disabled, white, Caucasian populations. This systematically biases available therapies to favor covering those that are effective for white people to the detriment of covering treatments effective for people of color and people with disabilities.” http://www.pipcpatients.org/uploads/1/2/9/0/12902828/herc_letter.pdf

¹⁰ Joint letter to CMS, October 23, 2022, “More broadly, we also support the NCD recommendation that federal programs, including Medicaid, should not rely on cost-effectiveness research or reports that gather input from the public on health preferences that do not include the input of people with disabilities and chronic illnesses.”

the Affordable Care Act (ACA) which specifically bars the use of the QALY and includes the language, “The Secretary shall not utilize such an adjusted life year (or such a similar measure) as a threshold to determine coverage, reimbursement, or incentive programs under title XVIII.”¹¹

We deeply appreciate the statement made by Secretary Becerra on March 29, 2023, reaffirming that CMS will not use QALYs or similar measures, and look forward to the agency strengthening its guidance to reaffirm this.¹² We urge CMS to use language in its final guidance clarifying that existing law bars the use of QALYs and similar measures, not just QALYs as used in the context of life extension, and to state explicitly that, as directed in the IRA, it will rely on the factors of comparative clinical effectiveness outlined in section 1194(e)(2).

At a recent hearing in the House Energy and Commerce Committee, Ranking Member Frank Pallone, a primary author of the Inflation Reduction Act’s health care provisions, stated that the Congress had passed a landmark law allowing for Medicare Drug Price Negotiation “while also explicitly prohibiting the use of QALYs in this process.”¹³ The ACA passed in 2010 and barred Medicare from using QALYs and similar metrics throughout Medicare, including the drug negotiation process. The IRA went a step further, ensuring that no evidence would be considered that valued life extension for older adults, people with disabilities, and people at the end of life as less than their counterparts, which Ranking Member Pallone and others have recognized to include QALYs.¹⁴

Therefore, we urge CMS to provide clarity that its drug negotiation process will be grounded in evaluation of comparative clinical effectiveness and patient-centered health outcomes and not use or consider QALYs or other cost-effectiveness standards that frequently discriminate against subgroups and devalue the needs and preferences of patients. This includes biased non-QALY measures such as the Equal Value of Life Years Gained (evLYG), a metric recently created by the Institute for Clinical and Economic Review (ICER) to supplement the QALY that similarly discriminates based on age and has shortcomings in accounting for quality-of-life improvements.¹⁵ The NCD and DREDF have each analyzed the QALY and the evLYG to conclude neither are suitable measures for assessing treatments.

¹⁴ Ranking Member Anna Eshoo stated, “Democrats included a ban on QALYs in Medicare and the Affordable Care Act in 2010. Last year, Democrats further clarified that QALYs could not be used as part of Medicare’s prescription drug price negotiations in the IRA.” “Full Committee Markup of 19 Bills (Part 2),” 24 March 2023.

¹⁵ “Cost-Effectiveness, the QALY, and the Evlyg.” ICER, Institute for Clinical and Economic Review, 28 Mar. 2023, <https://icer.org/our-approach/methods-process/cost-effectiveness-the-qaly-and-the-evlyg/>

Recommendation:

- CMS should ***clarify in guidance and/or regulations that it will not use or consider QALYs or similar measures in any way.***
 - This recommendation is consistent with ACA’s statutory ban on the use of QALYs and similar measures in coverage, reimbursement, and incentive programs in Medicare decisions.
 - This recommendation would also uphold the IRA’s requirement that the comparative clinical effectiveness research factored into determinations of therapeutic benefit do not discriminate.
- With regard to CMS solicitation of information on other specific measures that discriminate, ***CMS should avoid consideration of any evidence that is informed by QALYs or similar measures such as the evLYG^{16 17} or Disability Adjusted Life Years (DALYs).^{18,19}***

Consideration of Non-QALY Evidence in Reports Using QALYs

While we appreciate CMS’s assurance that it will not consider QALYs, we are concerned that the guidance leaves the door open to submission of QALY-based analysis within other clinical or cost-effectiveness assessments. We urge transparency in how these assessments are ultimately used by the agency.

It is important to understand that most of the components that make up the calculation of QALY estimates may also be used in a particular study’s assessment of comparative clinical

¹⁶ The NCD described the eLYG in its report as, "There are other challenges to the evLYG that indicate that it is not a suitable alternative to the QALY. First, as evidenced by the assessment of Spinraza, denial of coverage is possible under the QALY/evLYG system, even where a drug would provide significant clinical benefit, including life extension. Second, the QALY/evLYG system still relies on health utility weights to measure quality of life improvements, despite the fact that such measures are typically derived from survey data and do not account for the complexity of the preferences and experiences of people with disabilities. Third, the QALY/evLYG system affords no opportunity to account for clinical knowledge not reflected in the research literature, a significant concern articulated in Chapter 1. Finally, even within the narrow emphasis on life extension, ICER provides no guidance to payers as to which reimbursement level to prioritize—the one derived from the QALY or the one derived from the evLYG." https://ncd.gov/sites/default/files/NCD_Quality_Adjusted_Life_Report_508.pdf

¹⁷ DREDF concluded the following about evLYG, "Thus, adding the evLYG is not a solution; it merely forces payers to choose between one measure that undervalues life extension (the QALY) and one that affords no value to quality of life improvements (the evLYG). Neither account for both the full value of life-extension and the value of quality-of-life improvement." <https://dredf.org/wp-content/uploads/2021/09/ICER-Analyses-Based-on-the-QALY-Violate-Disability-Nondiscrimination-Law-9-17-2021.pdf>

¹⁸ Coelho, Tony. "PCORI Comments on Value Letter." Received by Dr. Nakela Cook, 3 Mar. 2023. http://www.pipcpatients.org/uploads/1/2/9/0/12902828/pcori_comments_on_value.pdf

¹⁹ Grosse, Scott D et al. "Disability and disability-adjusted life years: not the same." Public health reports (Washington, D.C. : 1974) vol. 124,2 (2009): 197-202. doi:10.1177/003335490912400206

effectiveness and therefore could be subject to the same biases inherent in the QALY totals themselves. Simply cherry-picking the components of these QALY estimates that are included a study of comparative clinical effectiveness is not an effective route to avoiding their biases.

Instead, we urge CMS to identify with greater detail and transparency the acceptable input data variables to be taken from comparative clinical effectiveness research, in order to ensure that the methods used will not result in bias against older adults, people with disabilities, and people at the end of life. For example, CMS should recognize that the use of value or utility weights in comparative clinical effectiveness research may also be used in the QALY calculation and therefore also subject to bias and validity challenges.²⁰ These weights are often constructed by a very small subgroup of a country's population²¹ despite purporting to represent all.²² Yet, there is considerable empirical evidence that treatments impact people differently and that society strongly disagrees with treating all conditions, disease states, and patient types with the same priority.^{23,24}

The QALY can introduce bias into a study of a treatment's effectiveness in several ways. For example, life expectancy estimates for the population being treated may be calculated from an older population or from a population that has co-existing conditions or disabilities, thereby creating weights for the potential life year gains that could accrue to a successfully treated individual that give a biased view of life-years gained. Another example is the quality of life (QOL) part of the equation - the source data for the weights that turn life years into quality-adjusted life years. We are concerned that the patient-reported outcome measures (PROs) in the commonly used EuroQoL instrument (EQ-5D) do not meet the FDA's definition:

*PRO instrument item generation is incomplete without a range of patients with the condition of interest to represent appropriate variations in severity and in population characteristics such as age or sex.*²⁵

The EQ-5D is the most commonly used PRO within QALY calculations, yet it relies upon weightings constructed by populations unfamiliar with the conditions being evaluated and therefore does not have the accuracy that is obtained by consulting with patients. Recent studies have provided strong evidence to suggest that there is a public bias against people with

disabilities.²⁶ Criticism of the inherent bias of the EQ-5D is widespread and growing.^{27,28} It is also widely critiqued for failing to represent any consensus about the value of health states, as surveys of the general public reveal enormous heterogeneity (i.e., disagreement) within surveyed populations.²⁹

Selective use of QALYs or selective use of the components of data inputs that make up QALY calculations in studies of comparative clinical effectiveness raise many of the same dangers as the blanket use of QALYs for measuring the therapeutic benefit or “value” of a drug to a patient or to society. The biases that CMS emphasizes that it needs to avoid are built into the methodological construction of QALYs at multiple levels. Attempts by CMS to pick their way around these biases by selectively choosing components of QALY estimates where convenient would have significant risks for bias and discrimination.

Recommendation:

- CMS should clarify in the final guidance that ***evidence relying on the same biased or discriminatory inputs, particularly the value sets or weights used to measure life extension or quality of life, will not be relied on*** as evidence for the factors of therapeutic benefit that CMS is authorized to consider in section 1194(e)(2).

Consideration of Comparative Clinical Effectiveness Research and Appropriate Comparators

We appreciate that CMS clearly states in its guidance its intent to consider “health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience when reviewing the clinical benefit of the selected drug and its therapeutic alternative(s).” As directed by current law, this includes a bar on any use of the QALY. We strongly urge CMS to directly engage affected stakeholders – the patients, people with disabilities and clinicians with practicing experience in the condition being treated – as the experts in determining the therapeutic benefit of treatments based on outcomes that are valued by patients.

Recommendations:

- ***CMS should clearly define comparative clinical effectiveness research*** in a manner consistent with the existing definition in the ACA.

²⁹ Bansback N, Tsuchiya A, Brazier J, Anis A. “Canadian valuation of EQ-5D health states: preliminary value set and considerations for future valuation studies”. *PLoS One*. 2012;7:e31115.

- The ACA stated, “The terms ‘comparative clinical effectiveness research’ and ‘research’ mean research evaluating and comparing health outcomes and the clinical effectiveness, risks, and benefits of 2 or more medical treatments, services, and items...” and makes it clear that such research does not involve cost comparisons or cost-effectiveness.
- In determining what comparative clinical effectiveness research to rely on, CMS should consider engaging patients and people with disabilities to understand their perspectives on the quality of the research available and whether it represents their preferred outcomes and experiences.
- The comparator matters and should reflect a clinically comparable treatment as indicated by patients and their clinicians as opposed to selecting a comparator based on its cost, a lesson learned from countries such as Germany and a key component of efforts to advance innovative methods.³⁰ We do not recommend that the initial offer rely solely on the price of a therapeutic alternative, but instead reflect the negotiated drug’s therapeutic benefit.

Therapeutic Advance and Unmet Need

We appreciate that CMS specifically stated its intention to review real-world evidence. Data generated by registries and other sources of real-world data, particularly for subpopulations such as people with disabilities, should be treated as highly relevant to the factors listed in section 1194(e)(2) as they provide current evidence of the experience of patients that may not yet be reflected in other research literature or clinical trial data. When developing its offer for MFPs, CMS should ensure it is prioritizing feedback from patients, people with disabilities, and clinicians with practicing experience with the condition, as well as assessments of therapeutic benefit, thereby considering value through the lens of how patients and people with disabilities experience and value their health care. Doing so will require a strong commitment to engagement.³¹

Recommendations:

- CMS should determine whether a treatment reflects a ***therapeutic advance*** based not only on the clinical trial data but also on evidence that reflects what patients and people with disabilities value about their care and outcomes.
 - CMS will need to engage specific patient and disability communities with the condition treated by a selected drug to determine their specific priorities for

³¹ Smith, Theo. “Real-World Evidence Classroom.” National Health Council, 28 Feb. 2023, <https://nationalhealthcouncil.org/additional-resources/real-world-evidence-classroom/>

improving their quality of life with treatment, a theme consistent in calls for improved patient engagement in research and decision-making.^{32,33}

- CMS should specifically call for studies related to therapeutic advancements that reflect the diversity of the patients being treated.^{34,35}
- CMS should define **unmet need** based on the patient perspective and whether a treatment meets their needs, outcomes, and preferences in a manner unmet by other treatments, consistent with the PCORI's statutory charge to address the “needs, outcomes and preferences” of patients.³⁶
 - Unmet need should be defined in a manner that acknowledges the experiences of people living with a condition who may value a treatment with fewer side effects, modes of administration that do not require travel, frequency of administration, etc. The CMS definition should prioritize how a treatment advances adherence and improved quality-of-life as indicated by engaging patients and people with disabilities and by use of patient-level data.
 - Unmet need should not be defined by the averages, but instead take into consideration the subpopulations that may not benefit from existing therapies due to their unique characteristics or for whom those therapies are not accessible due to social determinants of health (SDOH).

CMS Should Set a High Bar for the Quality of Evidence to be Considered.

CMS stated its intent to consider the “source, rigor of the study methodology, current relevance to the selected drug and its therapeutic alternative(s), whether the study has been through peer review, study limitations, degree of certainty of conclusions, risk of bias, study time horizons, generalizability, study population, and relevance to the negotiation factors listed

³⁶ House of Representatives, Congress. 42 U.S.C. 1320e - Comparative clinical effectiveness research. U.S. Government Publishing Office, , <https://www.govinfo.gov/app/details/USCODE-2010-title42/USCODE-2010-title42-chap7-subchapXI-partD-sec1320e>

in section 1194(e)(2) of the Act to ensure the integrity of the contributing data within the negotiation process.” CMS has also stated its intent to incorporate real-world evidence into its considerations. We urge CMS to prioritize research that is rigorous, as well as real-world feedback from patients, people with disabilities, and practicing clinicians. Randomized clinical trials and studies relying on the existing literature to make conclusions about the effectiveness of drugs should themselves be peer reviewed and rigorous. It is also important to recognize that real-world evidence from the lived experience of patients, people with disabilities, and clinicians may be observational but is nonetheless also relevant to understanding the impact of treatments that may not have been subject to recent rigorous clinical trials. It will be important for CMS to have high standards that drive the rigorous study of therapeutic benefits in a manner that captures the diversity of people on treatment, the differences among subpopulations, and a focus on outcomes that are valued by patients as communicated to CMS by patients, people with disabilities, and practicing clinicians.

Recommendations:

- CMS should set standards for high-quality, patient-centered evidence that will drive investment in the development and testing of innovative methodologies that are inclusive and advance health equity.
 - Standards established by CMS should recognize and address the ***shortcomings of historic methods that are biased or discriminatory***.
 - CMS should rely on ***standards developed by leading patient and disability organizations*** to determine whether the evidence that it intends to rely on for the development of an initial MFP offer is centered on patients and people with disabilities.^{37,38}
 - To determine what evidence meets standards for quality and patient-centeredness, the agency ***should look to the organizations representing affected patients and people with disabilities as well as the clinical experts*** among practicing physicians and providers, as they would be most familiar with the usefulness of the evidence base for making decisions and its potentially inherent biases.
 - As previously stated, CMS should ***prioritize evidence that is patient-centered*** and captures value for patients, caregivers, and persons with disabilities.

Conclusion

We appreciate CMS’ consideration of our recommendations. CMS has an important task ahead in setting up a process to implement the negotiation provisions of the IRA. For CMS to meet its

obligations to beneficiaries, it will be critically important for CMS to be thoughtful in how it assesses therapeutic benefit to affected patients. CMS must ensure that patients and people with disabilities are granted a seat at the table and a clear and robust path to engagement throughout the process.

Dr. Meena Seshamani, M.D., Ph.D.
CMS Deputy Administrator, Director of the Center for Medicare
Centers for Medicare & Medicaid Services
200 Independence Avenue SW
Washington, DC 20201

Dear Dr. Seshamani,

The undersigned organizations representing a variety of individuals including survivors, and caregivers impacted by cancer diagnoses would like to thank you for the opportunity to provide comments on proposed guidance implementing provisions in the Inflation Reduction Act (IRA). We applaud Congress and the administration for passing and implementing policy to assist individuals who struggle to afford lifesaving and life-enhancing care. However, like many other stakeholders, we also have concerns that some of these policy changes may have unintended negative consequences.

Centers for Medicare & Medicaid Services (CMS) has the opportunity, now, to implement the IRA in such a way that many of these externalities can be prevented. Equally important, however, CMS also has the opportunity to articulate how it will benchmark and assess implementation and monitor its impact on insurance premiums, industry investments, and development of new therapies. In failing to set up an infrastructure to evaluate down-stream impacts, CMS is inviting the worst. The patient community cannot afford to wait for regulators to notice that the patient community is struggling. We have to equip ourselves with the right tools, now, to ensure everyone is kept safe.

Because the IRA is being implemented through sub-regulatory guidance, CMS will have the opportunity to offer timely corrections before unintended downstream consequences and accidental loopholes become permanent features of these new policies. This will only work if CMS sets up the infrastructure to collect that feedback and act on it in a timely manner. As we have seen with policies like prior authorization in the Medicare Advantage program, adjusting or clarifying existing policy after it is already firmly in place, can be difficult, if not impossible to accomplish.

Drug Price Negotiations

In this guidance, CMS outlines a plan for how drug prices will be negotiated. In separate guidance, CMS explains how it will evaluate a drug's "clinical benefit." However, neither of these documents demonstrate how patient needs will be incorporated in this process. It makes sense that the needs of patients and caregivers will change over time, and it makes sense that two individuals might experience the same events in entirely different ways, yet policy consistently dictates that patient feedback is static and standardized.

CMS must use this opportunity to build a new system that acknowledges and responds to these truths. ***To be clear: asking for comment letters at this stage and allowing for submission of evidence once drugs have been selected for negotiation is not enough.*** Patients must have the opportunity to share their care preferences, impacts on quality of life, and what they value about our treatment.

- 1) We call on CMS to host a town hall meeting with patient stakeholders prior to finalizing guidance to inform how CMS will establish the definition of clinical benefit used in drug price negotiations and discuss the infrastructure for continuing patient engagement.**

- 2) **We respectfully ask that CMS consider the following:**
 - a. **For each drug assessed, a panel of patients and caregivers should be convened to provide input and feedback at multiple steps in the evaluation of a drug's benefits. There should be an open and transparent process for patients and caregivers to apply to be part of these panels.**
 - b. **Patient input should not just be considered qualitative and described in written form. Rather, it should be quantified and incorporated into any methodology used to assess product value.**
 - c. **CMS should be transparent and clearly outline how patient input was considered and impacted the negotiation process.**
- 3) **We endorse recommendations explained in more detail in the patient- and disability-community letter penned by the Partnership to Improve Patient Care (PIPC).**

Patient Access

According to the recent guidance, Medicare Part D plans shall include each covered Part D drug that is a selected drug on Part D formularies during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period. While patient groups are optimistic that these changes will allow patients to afford needed treatments, we remain cautious. Historically, health plans have used creative formulary design, onerous prior authorization schemes, and step therapy delays to limit plan liabilities, all of which adversely affect patient access to medicines. We are disappointed that CMS did not proactively address these patient access concerns in the guidance. We are also concerned that without appropriate guardrails and patient protections on utilization management, health plans will expand their inappropriate overutilization of these tools to recoup their perceived losses.

We urge CMS to ensure that health plan utilization management techniques follow clinical guidelines, provide timely and transparent responses to patients, and allow for physician/patient choice based on individual patient medical needs and desired outcomes. In addition, we urge CMS to establish a feedback mechanism to monitor overutilization of these cost control tools, particularly as they apply to Part D drugs subject to this policy. CMS must also proactively address how Part D redesign changes will impact patient access to both negotiated and non-negotiated cures.

Out of Pocket Caps

The IRA caps the out-of-pocket costs paid annually by Medicare beneficiaries for prescription drugs at \$2,000 and allows patients to spread those costs across 12 months through a "smoothing" mechanism. The redesign also eliminates the coverage gap discount program. If implemented correctly, and in collaboration with patient advocacy organizations like those included on this letter, these policies could help to deliver essential treatments to Medicare beneficiaries and help them avoid the financial toxicity that frequently accompanies a cancer diagnosis. **CMS must invest in education and assistance programs to ensure that they are well understood.** We stand ready to help CMS to build education tools, assist in education, and outreach efforts to ensure that the smoothing process does not end up adding to more confusion and unexpected and compounded healthcare debt.

The Impact to Oncology Research and Development

The IRA allows Medicare to set prices on small molecule drugs after they have been on the market for nine years. That is much shorter than the 13-year window granted to large molecule "biologic" drugs,

which are typically injected or infused in doctors' offices, clinics, and hospitals and are subject to Medicare Part B.

Clinical trials are resource-intensive endeavors that take years to complete. The trials that drug developers run to assess whether an FDA-approved drug can be used to treat an earlier stage of a disease, in combination with another therapy, or in a different cancer type or population, can take more than three years to finish on average. Over 60 percent of oncology drugs approved between 2010-2012 received an additional FDA indication, and more than 70 percent of these additional approvals occurred seven or more years after initial approval.¹ We are concerned that pharmaceutical companies will determine that it is not viable to invest in clinical research supporting approval for additional indications if they cannot count on the same return – which can only limit treatment options for patients who might have otherwise benefitted from existing, sound, and life-saving or life-improving science.

CMS must articulate how it will monitor industry investment and drug development and this plan has to provide an opportunity for patient engagement. None of us can afford to watch lifesaving or life-enhancing treatments languish.

This year, nearly two million Americans will be diagnosed with cancer.² Life-saving treatments for some of those patients may already be on the market. But the IRA's timelines could prevent scientists and doctors from discovering new uses for those already-approved drugs. Since 1991, the cancer death rate has declined by 33 percent.³ This is in large part due to advances in treatment.

While the passage and implementation of IRA represents a positive step for patients and caregivers, the opportunity for negative consequences demands that CMS establish an infrastructure that monitors predicted trends and ensures the opportunity for feedback. We are ready and eager to assist in this process and look forward to collaboration. Please contact Courtney Yohe Savage, MPP at cysavage@cancersupportcommunity.org or 202-680-8985 with any questions or follow-up.

PATIENTS FOR AFFORDABLE DRUGS NOW™

Comments of

Patients For Affordable Drugs Now to

The Centers For Medicare & Medicaid Services on the

Medicare Drug Price Negotiation Program Guidance

April 13, 2023

Patients For Affordable Drugs Now (P4ADNow) is pleased to offer these comments in support of effective, patient-centered implementation of the [Medicare Drug Price Negotiation Program Guidance](#) provided by the Centers for Medicare & Medicaid Services (CMS) as enacted in the Inflation Reduction Act of 2022.

P4ADNow is the only national patient advocacy organization exclusively focused on lowering prescription drug prices. P4ADNow is independent, bipartisan, and does not accept funding from any organizations that profit from the development or distribution of prescription drugs.

We applaud the timely work by CMS to implement the Medicare negotiation program in accordance with enacted law. According to the [Congressional Budget Office](#) (CBO), this program will benefit the health and financial well-being of patients across the United States – especially those living with acute and chronic illnesses.

We're pleased to offer comments on elements of the guidance that are particularly consequential to patients: transparency, closure of potential loopholes in order to maximize inclusion of as many products as possible, and an easily accessed fair price.

Section 30: Identification of Selected Drugs for Initial Price Applicability Year 2026

We understand CMS issued *Section 30* as final guidance in order to implement negotiation in a timely manner, we want to take the opportunity to commend the agency on the three elements within the section that will benefit patients by closing potential loopholes that could have limited the positive impact of the law on patient and public health. Major pharmaceutical corporations have a well-documented track record of predatory business strategies, anti-competitive tactics, abusive pricing, and market manipulation. For this reason, we applaud CMS for developing guidance that minimizes the opportunity of manufacturers to undermine the Secretary's negotiation authority to the detriment of patients.

Defining Single Source Drugs

P4ADNow welcomes CMS' process, in accordance with statute, for defining a qualifying drug by aggregating across all dosage forms and strengths, thus preventing potential gaming through "product hopping." Likewise, we appreciate that "time elapsed" since approval will be counted from the year of earliest approval among all products with that active ingredient. We are concerned that because a competing product [ANDA or 351(k) BLA] for any dosage or strength of the drug exempts a drug from selection under this section, manufacturers will game the process. Therefore, when determining whether the manufacturer of the competing product is engaging in "bona fide" marketing, we urge CMS to apply a stringent threshold to ensure the competing product has made meaningful market penetration and is easy for patients to access. CMS should issue precise definitions of this threshold to ensure robust competition is occurring and limit unnecessary exclusions from the negotiation process.

Low-Spend Medicare Drug Exclusion from Qualifying Single Source Drugs

P4ADNow commends CMS' approach to excluding "low spend" drugs. Namely, defining drug spending based on gross expenditures instead of net spending will maximize the number of drugs that can be eligible and therefore maximize patient benefit.

Delay in the Selection and Negotiation of Certain Biologics with High Likelihood of Biosimilar Market Entry

P4ADNow appreciates the scrutiny required by CMS in order to grant "delay requests" under this section. Specifically, we applaud the following elements designed to ensure a biosimilar manufacturer seeking the delay is not working on behalf of or in conjunction with a brand-name biologic manufacturer seeking to avoid selection for negotiation:

1. The biosimilar product must be approved *and marketed* within one year of FDA approval.
2. The biosimilar manufacturer cannot be the same as the reference product (branded biologic) manufacturer.
3. The biosimilar and reference product manufacturer cannot have entered into settlements that require or induce the biosimilar to limit market share.
4. The biosimilar manufacturer must demonstrate that patents will not be a barrier to market entry for the competing product.
5. The biosimilar manufacturer must demonstrate it is operationally ready to market the drug in time.

P4ADNow appreciates the stringent processes developed by CMS for carrying out #3, #4, and #5 and encourages the agency to apply equivalent levels of scrutiny to all areas of implementation where proof of competition is required, including the definitions of a qualifying single source drug.

Section 40: Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026

Confidentiality of Proprietary Information

CMS is seeking comments on “the proper balance between the public’s interests in transparency and the protection of business information.” In the case of treatment of proprietary information, we urge that in every instance, CMS defaults to greater transparency, not less.

We are concerned that CMS will treat research and development (R&D) data as proprietary information (except in the cases where prior federal funding is involved). Independent researchers [have found](#) that R&D costs for a new drug range from \$100 million to \$1 billion while pharmaceutical industry-supported studies estimate the cost at more than \$2.87 billion. The widely disparate estimates carry grave implications for drug pricing in the United States. Every product approved by the Food and Drug Administration (FDA) [has](#) some measure of federal support and the Defense Advanced Research Projects Agency (DARPA), the Biomedical Advanced Research and Development Authority (BARDA), and the National Institutes of Health (NIH) play an integral role in the development of many breakthrough drugs. As a result, taxpayers are investors with a substantial interest in identifying an accurate total cost for development of a drug. Orphan drugs [receive](#) additional special benefits, including tax credits for clinical trials, exemptions from user fees, exemptions from 340B discounts, and priority review vouchers. At the minimum — and where legally permitted — CMS should aggregate estimates or publish deidentified data on R&D costs so researchers, policymakers, and advocates can obtain accurate information on drug development costs, free from the bias of pharma-funded research.

While projected market data, revenue, and sales volumes may be proprietary, we urge CMS to provide data publicly on *historic* sales, revenue, and market data. In many cases, such data are public but practically impossible or cumbersome for researchers, policymakers, and advocates to locate and use. *Again, as investors in nearly [every](#) FDA-approved drug, taxpayers are entitled to have access to as much information as legally permissible when considering drug products subject to negotiation in a public insurance program.*

P4ADNow urges CMS to likewise organize and publish data not treated as proprietary, including information on prior federal funding, approved patent applications, exclusivities, and approvals. While much of this data is available to the public in theory, there are numerous barriers to access, including the need for technical expertise, to locate and analyze. The pharmaceutical supply chain contains many complicated inputs, variables, and players, making it indecipherable to a lay person or patient seeking information on their medication. In many cases, the complexity is intentional because it prevents consumers from discovering and revealing information on unjust drug prices. Through its new negotiation authority, CMS can make the playing field slightly

more level by ensuring that data is public and more easily accessible at every possible opportunity.

Section 50: Negotiation Factors

Evidence About Therapeutic Alternatives for the Selected Drug

P4ADNow is pleased that CMS will consider information on therapeutic alternatives submitted by any interested party, including patients, clinicians, and academic experts, as well as real-world evidence. By relying on evidence submitted by entities without a financial stake in the negotiation process, CMS is increasing trust in the negotiation process, since consumers have [well-documented mistrust](#) of research that is sponsored by the manufacturer of a product; and because research sponsored by the drug manufacturer [often results](#) in outcomes [favorable](#) to the sponsor and biased towards its products. We appreciate the agency's factors for scrutinizing evidence, especially the prioritization of peer review, risk of bias, and study population as it compares to Medicare beneficiaries.

Use of Comparative Clinical and Cost Effectiveness Measures

As a patient group, we know that the clinical value of a drug is the most important factor in determining a fair price. One common objection to value analysis as practiced around the world is that it sometimes relies on a measure called the Quality Adjusted Life Year — or QALY. There [is concern](#) in the disability community that “the QALY metric puts a lower value on the life of an individual living with a disability, and, as such, value assessments using this metric devalue treatments for people with disabilities.” P4ADNow supports clear protections against discrimination such as those included in the Inflation Reduction Act that state: “...the Secretary shall not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, nondisabled or not terminally ill.”

We agree with CMS' approach to the use of QALYs in research when considering therapeutic alternatives and believe it does not discriminate against people with disabilities, the terminally ill, or the elderly. In fact, all of CMS' efforts to “achieve the lowest maximum fair price for each selected drug” will improve the lives of millions of disabled, elderly, and/or chronically ill people in this country whose health is harmed by high drug prices. We encourage the agency's use of explicitly non-discriminatory measures such as the equal value of life years gained (evLYG).

Section 60: Negotiation Process

Methodology for Developing an Initial Offer

In cases of robust generic competition among therapeutic alternatives, P4ADNow supports CMS starting negotiations with an average net price or average sales price (ASP) of those alternatives. But where therapeutic alternatives exist as branded products (or generic or biosimilar products with little to no price competition), we are concerned this approach ties starting prices to prices that are already the [highest](#) in the world. And while net prices are appropriate in cases where the manufacturers of therapeutic alternatives are providing rebates, net prices are not discounted significantly from list prices in cases where a manufacturer offers only small rebates or does not offer rebates, such as cases where there is minimal competition.

In cases where the net price or ASP is greater than the statutory ceiling or where no therapeutic alternative exists, we encourage CMS to use the cost of manufacturing and adjust up or down depending on clinical benefit and Big Four pricing.

Considering Manufacturer Data

We're glad that CMS will be considering R&D cost and the extent of federal financial support for the selected drug product during negotiations in accordance with statute. We implore CMS to use the broadest possible definitions for "preclinical" and "novel discovery" in order to capture taxpayer-funded grants that occur far before a manufacturer acquires a viable drug product.

Publication of the Maximum Fair Price (MFP)

Section 60.6 details CMS' intention to post on the CMS website the name of the selected drug, the initial price application year and an annually updated "MFP file" showing the inflation-adjusted price for the drug. P4ADNow applauds the transparency and accessibility of this intended practice and urges CMS to explore the most effective ways in which to ensure that this data are presented in an accessible way so that consumers can best understand the information. We also suggest a webpage intended for consumers that should display at minimum: (1) Brand and generic names for the drug; (2) Price equivalent for all dosage forms; (3) Date the price is in effect; (4) Method for accessing the price and process if MFP is not honored.

Section 70: Removal from the Selected Drug List Before or During Negotiation, or After an MFP is in Effect

Section 70 details the process through which a drug selected for negotiation is removed from the list of selected drugs when it is no longer subject to the negotiation process. P4ADNow is concerned that a selected drug will not be replaced on the list when a competitor to the drug comes to market. If permitted by statute, we encourage CMS to institute a practice in which it replaces each drug removed from the list in a timely manner with another selected drug. This practice would minimize the ability of manufacturers to game this loophole and enhance the opportunity for negotiated prices to benefit patients.

Section 90: Manufacturer Compliance and Oversight

Making MFP Available to Patients

In order to maximize the benefit of the drug price negotiation program, it is critical that the maximum fair price (MFP) is made available to patients effectively and transparently. We want to emphasize the importance of CMS' attention to ensuring that beneficiaries are aware that they deserve access to a specific MFP and that CMS puts in place a straightforward process for patient reimbursement in the event they are charged more than the MFP. We encourage CMS to create materials to educate patients on MFP and to proactively notify patients taking selected drugs when they can expect the lower price and, if overcharged, when and how they might expect to be reimbursed.

Patients who are prescribed a negotiated drug will be at the mercy of the dispensing entity (local pharmacy or mail order pharmacy) to make sure they can obtain the correct price. For this reason, we urge facility, transparency, and a clearly articulated process for pharmacies of all types. CMS presented two equal methods for primary manufacturers to ensure MFP is provided to patients — one prior to the point of sale and one after the point of sale. Providing an option of retroactive reimbursement to the dispensing entity could be administratively burdensome or costly to pharmacies, especially small, independent pharmacies. We are concerned that this difficulty may inadvertently result in patients not being able to access the fair price at the point of sale due to uncertainty about MFP. Instead of offering a proactive and retrospective process to manufacturers as equal options, we urge CMS to incentivize use of the MFP at the point of acquisition by the pharmacy. The agency could, in the event a manufacturer opts for retroactive reimbursement, require the manufacturer to offer written explanation to the agency for why that option was used.

Access to the MFP at the point of sale is critical to patients who are already burdened by paying excessive prices for drugs while managing illness. Uncertainty at the pharmacy counter or processes that require additional paperwork, inconvenience, or onerous self-advocacy will greatly harm the positive impact of negotiated prices for patients. Wherever possible, it should be the duty and responsibility of CMS to remove unnecessary administrative barriers to access for patients.

Section 100: Civil Monetary Penalties

P4ADNow appreciates the extent to which CMS has gone to craft a process for levying civil monetary penalties for manufacturers that attempt to hide or falsify information in order to maximize compliance with the law and enforce penalties for non-adherence. The strong financial consequences will help to ensure that manufacturers cannot hide pertinent information and will

maximize the likelihood that patients actually have access to the fair price at the pharmacy counter.

Section 110: Part D Formulary Inclusion of Selected Drugs

P4ADNow agrees that formulary inclusion is critical, especially as opponents of Medicare negotiation disparage the law by claiming patients will lose access to needed medications. As a patient group, P4ADNow understands that implementation of this provision is designed to preserve access to all beneficiaries. Furthermore, mandatory formulary inclusion counters the drug industry's arguments that the Inflation Reduction Act will cause disastrous results to the industry's financial viability.

The Medicare program is the largest purchaser of prescription drugs and pays the highest prices in the world. While negotiation will meaningfully lower prices for patients on selected drugs, the government will still pay some of the highest prices in the world for *all* non-selected Medicare covered products, which total [more than 3,500 drugs](#). Required formulary inclusion guarantees the manufacturers of selected drugs access to a market of [nearly 50 million individuals](#), thus countering the industry claim that the law threatens manufacturers' pipelines and patient access.

Conclusion

We appreciate the opportunity to offer comments that emphasize the patient perspective. We urge CMS to prioritize the following elements that are most consequential to patients:

- **Patient-centered:** A comprehensive and fair negotiation process does not help patients unless they are able to obtain the negotiated price at the pharmacy counter. In every instance, we encourage CMS to engage in proactive beneficiary education and consumer-focused processes.
- **Transparency:** Taxpayers play a pivotal role in research behind every drug approved by the FDA and the negotiation process ultimately determines the price paid by taxpayer funds. For this reason, we urge CMS to opt for transparency in every instance, especially relating to R&D costs and other manufacturer-provided data.
- **Accountability:** Recent congressional [investigations](#) have demonstrated that the pharmaceutical industry engages in unscrupulous tactics that undermine the law, artificially prolong monopolies, and harm patients. Big drug companies have not earned the benefit of the doubt, so we urge CMS to continue to implement the negotiation process under the assumption that pharmaceutical companies will exploit loopholes wherever possible.

RE: Medicare Drug Price Negotiation Program Guidance Memo

Dear Dr. Seshamani,

On behalf of Patients Rising Now, thank you for allowing comments regarding the Centers for Medicare and Medicaid Services' (CMS) implementation of the Medicare Drug Price Negotiation Program provisions of the Inflation Reduction Act (IRA). Congress failed to make this law patient-centered, but CMS can still place the voice of the seniors the Agency serves first in drug pricing decisions and the law's implementation.

Formed in 2015, Patients Rising Now has developed a significant following of over 110,000 patients and caregivers and has guided them on their journeys to advocate for themselves and their loved ones to get the care and treatments they need to live a fulfilling life. As a patient advocacy organization, PRN supports reforms and legislation aimed at advancing patient access to affordable, quality healthcare.

While nothing in the Inflation Reduction Act requires a patient-centered approach, it is important that CMS understand that it is the patient that has the best understanding of what constitutes value when assessing a medicine. It is critical for seniors that CMS not follow the flawed model of organizations like the Institute for Clinical and Economic Review (ICER), which simulate cost-effectiveness from the payer's perspective. Patients frequently experience benefits from a therapy that are not captured by the health system. ICER's generalized, unscientific, and assumption-based models do not capture patient experience with any individual treatment. Patient engagement should be at the core of the IRA implementation and any decision on drug pricing. Relying on a small cadre of health economists, academics, and bureaucrats will create a narrow perspective that is evident in the initial guidance memo from CMS. How CMS is considering drugs based on unmet medical need is far too limited and unsophisticated.

Per the initial guidance memo, CMS "...intends to define [unmet medical need] as treating a disease or condition in cases where very limited or no other treatment options exist." This definition, as written, is shortsighted and increases the probability for misapplication or politicization of the term unmet medical need for diseases and their respective treatments in the future. This goes beyond a matter of semantics. A definition such as this will inform CMS' decisions on and interpretation of the IRA in the years to come. To that end, it is important that CMS amends this definition to be more in line with existing definitions of unmet medical need, not the least of which being the definition in the IRA: the very law that this guidance memo is seeking to implement.

PATIENTS RISING NOW

The FDA, as part of its Guidance for Industry on Expedited Programs for Serious Conditions – Drugs and Biologics (section III, subsection C), defines unmet medical as “...a condition whose treatment or diagnosis is not addressed adequately by available therapy.” This definition is far more comprehensive, more accurately reflects the healthcare landscape for many rare & chronic disease patients, and it creates more potential for better treatments to find their way to the patients who need them most. The definition of unmet medical need, as stated in the IRA, is nearly identical to the FDA definition, so any Agency action on this law must be more in keeping with the bill text.

In the guidance memo, we are pleased to see that the quality-adjusted life year (QALY) will not be used in the negotiation process. However, that is the extent of the prohibition. It does not extend to other areas of CMS such as Medicaid and the Children’s Health Insurance Program, both of which have been known to utilize the QALY in coverage and reimbursement decisions. The QALY is highly subjective and notorious because it discounts the lives of the elderly, the disabled and others who cannot achieve maximum QALY scores - and, thus, will never achieve the highest “quality of life. Given that the QALY is inherently discriminatory against rare disease patients, chronic disease patients, disabled patients, and seniors, its use in Federal and State health programs should be prohibited across the board. While it is encouraging that the new Negotiation Program will not allow QALYs, Patients Rising Now would like to see a similar ban for the rest of the Agency’s activities.

Solicitation of public comments on matters such as these are a critical aspect of Agency function and ensure any actions taken aren’t in direct contrast with the public and relevant stakeholders. In this guidance memo, CMS expresses the intention to solicit public comments on numerous facets of this complex law. However, in reference to section 30 of this memo (the implementation of the Negotiation Program for years 2026, 2027, and 2028), CMS not only declines to permit the customary notice-and-comment period but cites it as “...impractical, unnecessary, and contrary to the public interest.”

We understand that Congress did not craft the IRA as a patient-centric law, but excluding patient engagement is wrong. The drug price negotiation provisions of the IRA are unquestionably the most important part of the IRA and represent the most sweeping changes to Medicare since the implementation of Part D. Unilateral measures such as this are troubling to say the least and do not bode well for Agency implementation of Congressionally passed legislation in the future.

To that end, CMS must adopt a patients-first culture, where all decisions begin and end with their interest in mind. It is imperative that CMS develop clear, transparent processes for making decisions that are patient-centered and promote collaboration with patients in the decision-making processes. CMS must support the use of value-based coverage recommendations driven by the clinical value of the treatments, patient input, and real-world evidence. How patient experience and related data are quantitatively applied in the determination of a drug’s value and price in Medicare should always be publicly disclosed.

PATIENTS RISING **NOW**

Thank you again for holding a comment period on implementation of the IRA. These recommendations and others would not be possible without dedicated and frequent comment periods. Solicitation of comments from the public and relevant stakeholders is key to Agency making sound and informed decisions. And it is of the utmost importance that it continues so no missteps or unintended consequences occur as key provisions of this law take effect.

Sincerely,

A handwritten signature in black ink that reads "Rachel Derby". The script is fluid and cursive, with the first letters of each word being capitalized and prominent.

**Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for Initial
Price Applicability Year 2026, and Solicitation of Comments**

Dear Deputy Administrator Seshamani:

The Personalized Medicine Coalition (PMC), a multi-stakeholder group comprising more than 220 institutions from across the health care spectrum, thanks the Centers for Medicare & Medicaid Services (CMS) for the opportunity to submit comments on the *Medicare Drug Price Negotiation Program Initial Guidance* for the initial price applicability year (IPAY) of 2026.¹ CMS' implementation of the drug price negotiation program established by the *Inflation Reduction Act (IRA)* represents an unprecedented new federal authority that will significantly alter how personalized medicine will be evaluated and incentivized under Medicare. We believe the initial guidance lacks clear descriptions for CMS procedures and methodology that will be used to negotiate a drug's maximum fair price (MFP). Because few details are provided on how personalized medicine will be considered, we are concerned about how CMS' implementation of the new program may impact patient access to new and existing treatments underpinning this approach to care.

Personalized medicine is an evolving field in which physicians use diagnostic tests to determine which medical treatments will work best for each patient or use medical interventions to alter molecular mechanisms that impact health. By combining data from diagnostic tests with an individual's medical history, circumstances, and values, health care providers can develop targeted treatment and prevention plans with their patients. Personalized medicine is playing an important role in transforming care and patient outcomes for a range of serious and life-threatening diseases and conditions, helping to shift patient and provider experiences away from trial-and-error toward a more streamlined process for making clinical decisions.

After initial approval of a targeted therapy by the U.S. Food and Drug Administration (FDA), further research provides greater understanding of patients' responses to treatment based on results from molecular diagnostics and other biomarkers. This

research leads to new or improved treatment indications that contribute to progress in personalized medicine. Of particular importance is the role that research conducted after approval of a new drug plays in advancing the frontiers of personalized medicine and the potential downstream impacts of the negotiation program on this research.

We believe PMC and CMS share the goal of achieving better health outcomes and lowering costs for patients. The following comments express concerns over how the drug price negotiation program could disrupt the innovation ecosystem for and patient access to personalized medicine. As overarching priorities, PMC urges CMS to refine its negotiation process to ensure:

- CMS' methodology to determine a selected drug's MFP recognizes the clinical and societal benefits of personalized medicine and incorporates patients' perspectives on care value;
- CMS' methodology and negotiation process establish consistency and transparency by communicating how factors considered are weighed and how external data is factored into its decisions;
- CMS establishes procedures that allow a robust exchange of information with manufacturers, patient organizations, and other stakeholders in determining the MFP throughout the negotiation process, as well as procedures that allow information about negotiations to be shared publicly to help establish precedents and consistency across negotiations;
- Patients do not face additional barriers in accessing negotiated medicines and their treatment alternatives, as well as non-negotiated medicines; and
- CMS establishes processes to monitor any unintended, downstream impacts of the program on patient access to personalized medicine and on pipelines for new personalized medicine treatments and expanded indications.

Statement of Neutrality

Many of PMC's members will present their own responses to the *Medicare Drug Price Negotiation Program Initial Guidance* and will actively advocate for those positions. PMC's comments are designed to provide feedback so that the general concept of personalized medicine can advance, and are not intended to impact adversely the ability of individual PMC members, alone or in combination, to pursue separate comments with respect to the initial guidance and/or any that follows.

Recognizing the Clinical and Societal Value of Personalized Medicine

Drugs with personalized medicine treatment strategies create considerable benefits for patients and society since they are used in a manner that directs them toward patients who are most likely to benefit and away from those who are not. Value assessment frameworks (VAFs) often draw sweeping conclusions, however, about the economic worth of a particular treatment, typically based on analysis of its safety and effectiveness at a population level. In many cases, value assessment methodologies fail to adequately account for the safety and effectiveness benefits that may be realized by individual patients or patient subpopulations. When assessing value, it is important to consider the holistic benefits of a treatment at the patient, subpopulation, and societal levels.

PMC appreciates CMS' reference to patient experiences in its discussion of the clinical benefits of selected drugs and their therapeutic alternatives in Sec 60.3.3. However, as we discuss later in this letter, it is still unclear how patients, caregivers, and providers will influence the selection of therapeutic

alternatives or if CMS will seek guidance throughout the MFP-setting process from these key stakeholders. Considering patient experiences in this context is paramount to ensure that patient perspectives of value are appropriately accounted for during the drug price negotiation process. In 2017, PMC published a white paper titled [*Personalized Medicine and Value Assessment Frameworks: Context, Considerations, and Next Steps*](#).ⁱⁱ The paper outlines factors that value assessment frameworks should consider to help ensure a focus on patient experiences and patient access to optimal care. **In general, PMC urges CMS to consider the following aspects of clinical and societal value related to personalized medicine that advance patient-centered care, ensuring that the value of personalized medicine to direct patients toward or away from treatments based on their likelihood to benefit from them is factored into determining the MFP for a selected drug:**

- 1. Diagnostic testing strategies:** Diagnostic tests can help guide treatment decisions and determine which treatments will be most effective and safest to use in any given patient and are a crucial element of the personalized treatment regimen. For example, the use of companion diagnostics can help define subpopulations of patients who may benefit from a treatment, and those that will not. The availability of diagnostic tests and consideration of test results that help inform treatment decision-making for drugs with biomarker implications must be figured into the value assessment methodology for personalized medicines. **PMC encourages CMS to consider the value of applicable diagnostic strategies in its evaluation of unmet medical need and clinical effectiveness.**
- 2. Heterogeneity of treatment effects:** Some patients will experience more or less benefit from a treatment than suggested by the averages reported within clinical trials and population-based data. Health care policies based on average, population-based rates for treatment response may unduly restrict access to treatments that could be the most effective option for some patients. Thus, personalized medicines may be misjudged or undervalued simply because the data required for value-based decision-making do not account for patient subpopulations or because long-term efficacy data is not yet available. **PMC encourages CMS to consider the full range of patient outcomes and benefits that may not be represented in population average-based data.**
- 3. Patient values and circumstances:** Personalized medicine depends not only on the consideration of a patient's molecular characteristics and biological characteristics but also on individual values, clinical and economic circumstances, and the potential impact of a therapy for that patient over the long term. Fundamental patient values and preferences, including the impact of treatment on quality of life, quantity vs. quality of time, functional ability related to illness or treatments, cost of supportive care, and other patient costs of treatment are weighed by patients and their caregivers when deciding on a treatment in consultation with health care providers. **To appropriately assess the value personalized medicines provide to patients with unmet medical needs, PMC encourages CMS to not use the narrow definition of "unmet medical need" proposed in guidance and instead formally consider a broad range of patient outcomes and impacts, including unmet medical needs unique to individual patients and to patient subpopulations.**
- 4. Treatment efficiency:** Although value assessments generally focus on improvements in effectiveness, they do not generally consider treatment efficiency. Treatment efficiency involves avoiding ineffective or harmful treatment options and reducing the downstream expenses

associated with rapid disease progression and/or adverse events. In order to capture economic as well as clinical value, value assessments need to consider costs and outcomes across health care. **As CMS evaluates the costs and benefits of personalized medicines to society, PMC encourages the agency to formally consider a broad range of economic impacts, including broader cost offsets and societal benefits.**

As discussed in the following section, we recommend that when these factors are taken into consideration, the MFP for a selected drug, including any selected personalized medicines or targeted therapies, be set at the ceiling if it demonstrates significant clinical and societal benefit.

It is clear both in the statute and in CMS' initial guidance that quality-adjusted life years (QALYs) will not be used as a basis for evaluations. The QALY does not sufficiently account for the broad heterogeneity of clinically relevant characteristics and preferences across patients and diseases, nor does it consider aspects of value defined by patients and their families. The measure relies on population averages that do not consider the heterogeneity of patient populations, even within the same condition.

While CMS states it will follow statute, the guidance indicates that CMS still plans to separate and exclude QALY metrics from evaluations of research that otherwise factor in QALYs. PMC is concerned that this approach may not effectively separate QALYs from CMS' analysis because CMS may continue to rely on studies that employ QALY-related data from secondary sources, or that CMS may exclude analyses that are otherwise helpful in establishing the value of a drug for a patient. **Therefore, PMC requests that CMS make clear how it will exclude QALY-based metrics from its analysis of such evidence, when this evidence may be used, and how this evidence would be weighed. PMC also requests that CMS highlight when and how the agency removed QALY-based metrics from consideration in its public explanation of a drug's MFP. In addition, regarding CMS' *Negotiation Data Elements Information Collection Request* that asks the public to submit information on a selected drug, PMC asks CMS to make sure that data submitters attest to removing the QALY and other potentially discriminatory metrics from their submission, instead of using the proposed checkbox.**

CMS requests input on what alternative measures to QALYs might be appropriate or inappropriate. PMC believes the agency would be better served by focusing on the factors related to comparative clinical outcomes and unmet need that are described in statute, which can better capture the benefits of personalized medicine, rather than seeking an alternative to the QALY. There is not one measure of value or one VAF that holistically captures the value of a treatment and the benefits of any medical treatment including personalized medicine. VAFs have strengths and limitations relative to different stakeholder perspectives and circumstances that can bolster or undermine their usefulness and applicability to personalizing patient care. A single measure will not be sufficiently comprehensive. **We encourage CMS to consider a wide variety of measures consistent with CMS' statutory focus on comparative effectiveness research and unmet need, especially those driven by patient experience data, patient input, and patient-centeredness.**

Establishing a Consistent and Transparent Process for Gathering and Evaluating Evidence

PMC appreciates that CMS will consider real-world evidence (RWE), evidence from peer-reviewed research, white papers, expert reports, clinician expertise, patient experiences, intermediate outcomes, surrogate endpoints, and patient-reported outcomes when reviewing the clinical benefit of a selected drug

and its therapeutic alternatives (Sec. 60.3.3). Considering that all medicines for which CMS will set an MFP have a minimum of seven years since their original FDA approval, **PMC encourages CMS to consider as broad an array of evidence sources and outcomes as possible to help fill gaps in population-based data sources and capture the full range of benefits and impacts from personalized medicine discussed above.**

Although CMS' initial guidance lists aspects related to the quality and completeness of evidence sources it will consider, such as peer review, study limitations, risk of bias, and study population, among others, CMS does not describe requirements for the quality and completeness of this data, nor how CMS would consistently evaluate this evidence in determining the MFP. For example, since studies using RWE are designed fit-for-purpose, CMS' methodology should consider the extent to which the evidence it considers was designed to answer the value questions it is asking. The approach outlined in the initial guidance is too vague to create consistency across negotiations. **To ensure that the agency is evaluating these elements in a way that considers the value of personalized medicine to patients, CMS should refine its methodology through notice and comment rule-making to provide more clarity on how the agency intends to leverage negotiation data elements outlined in Sec. 50.2.** For RWE in particular, CMS should describe what data sources they plan to use and create guidelines to ensure that the data used is robust and correctly utilized.

Specifically, CMS should outline a consistent methodology for how it will synthesize evidence and for how data related to therapeutic alternatives will result in changes to an initial offer or final negotiated MFP. In addition, CMS should leverage clinicians' and patients' expertise and not use cost as a criterion for selecting therapeutic alternatives. While multi-criterion decision analysis (MCDA) may not be feasible for CMS because it requires extensive time, resources, and expertise, CMS may be able to incorporate elements from, for example, the cost-consequence approach model to compare evidence on outcomes for certain therapies. As part of CMS' methodology, we ask CMS to prioritize data related to the factors described above for recognizing the full range of personalized medicine's benefits to patients and the health care system. Given the discount already reflected in a selected drug's ceiling price, **we recommend that when these factors are taken into consideration, the MFP for a selected drug be set at the ceiling if it demonstrates significant patient benefit.**

Furthermore, CMS' methodology should clearly explain how each data element is weighted in determining the initial offer and final MFP. **To account for the clinical and societal benefits of personalized medicine and incentivize continued research and development for this field, CMS should place more weight on the factors related to the benefits of the selected drug for patients, caregivers, and society over, for example, non-clinical manufacturer-specific data elements.**

Establishing a consistent process for gathering and evaluating evidence can help manufacturers, patient groups, and other third parties better understand the evidence they may need to discount, prioritize, or collect for CMS' future consideration. Transparency can also build beneficiaries' confidence that their preferences and values are important to the agency.

Facilitating Meaningful Stakeholder Engagement

We recognize that CMS has a tight timeline for drug selection and price negotiation. But in order to ensure MFPs adequately reflect the value of selected treatments for patients and to limit unintended consequences on patients' access to personalized medicine, CMS must provide ample time for third

parties, including patients and patient organizations, to share data and experiences related to selected drugs.

CMS' initial guidance only allows 30 days from when the list of selected drugs is announced for the public to provide information on the selected drug and therapeutic alternatives to inform CMS' initial offer. We believe this short and singular timeframe for public input does not allow a sufficient window for stakeholders who may have information on the value of a treatment to their patient population to collect and provide information that could improve CMS' decision-making. In addition, this timeframe will disadvantage patients and caregivers from or organizations working with underserved communities who have fewer resources and may find it challenging to respond in such a short timeframe. **CMS should consider the burden of data collection and submission on stakeholders. We ask CMS to allow patients, caregivers, clinicians, and organizations representing these groups additional time to submit the requested data after the list of selected drugs is published. In addition to informing CMS' initial offer for a selected drug, CMS should allow this information to be submitted during subsequent steps of the negotiation process, if initiated, to inform CMS' decision-making.**

Flexibility with the submission of public information would facilitate the inclusion of a broad range of patient perspectives, including those of communities underrepresented in existing studies and published literature.

Noticeably, the proposed negotiation process does not allow for additional engagement with third parties beyond the initial 30-day window to submit data. CMS' final public explanation of the MFP is released six months after the only opportunity for public input. This does not build confidence that patient and stakeholder input will be reflected in the final MFP. **Patients, caregivers, providers, manufacturers, and regulators should all be engaged meaningfully throughout the negotiation process. These parties should be allowed ample opportunities to submit relevant information. And they should be informed by CMS about how their input is being used during the negotiation process.** In addition, although we appreciate CMS' intention to consult with clinical and academic experts to help evaluate clinical benefit of a selected drug, **we ask CMS to outline how clinical and academic experts would be identified and consulted during the negotiation process.** For example, CMS could establish a panel of patients, clinicians, and other stakeholders to provide feedback throughout each drug negotiation.

We appreciate CMS' request for input on striking the proper balance between the public's interests in transparency and the protection of confidential business information. CMS' initial guidance proposes that any information the manufacturer receives from CMS about the initial offer and negotiation factors during the negotiation process must be kept confidential and must later be destroyed (Sec. 40.2). Although we agree CMS needs to preserve the confidentiality of a manufacturer's proprietary information, the confidentiality and compliance requirements around the information manufacturers receive from CMS creates an opaque negotiation process. These requirements would prevent setting precedents and sharing lessons learned across negotiations, potentially undermining manufacturers' and the public's confidence in the consistency of negotiations and the determination of MFPs across selected drugs. **We ask CMS to allow manufacturers to publicize information related to the negotiation while still protecting private trade information.** This will not only help build public trust in the process, but will ensure transparency and predictability that will help inform stakeholder data submissions during future years of the negotiation program.

In order to improve their ability to participate in the negotiation process, stakeholders must understand how the information they submit was considered. We thank CMS for intending to publish an explanation

of the factors that had the greatest influence in determining a drug's MFP (Sec. 60.6.1). We are concerned, however, that the explanation may not provide adequate detail to be meaningful to the public and that its timing, six months after the initial opportunity for public input, may make it irrelevant for stakeholders. **In CMS' explanation for the MFP, we ask the agency to explain which information submitted by the manufacturer and the public was or was not considered in the final MFP; the benefits and impacts considered; the data sources considered; how evidence influenced the MFP up or down, including the extent to which RWE and patient-centered data elements like patient experience data were used; which third parties were engaged, both formally and informally by CMS; and, as discussed above, the extent to which and how any evidence used to inform the MFP was separated from a QALY-based metric. In addition, we recommend CMS make explanations for the MFP clear, accessible, and transparently available for the public.**

Ensuring Coverage Policies Facilitate Patient Access to Negotiated Drugs

PMC requests CMS clarify how it will interpret the requirements identified in Sec. 110 that negotiated drugs be covered by plans, specifically the extent to which any utilization management will be permitted for negotiated drugs. PMC has previously submitted comments to CMS on the difficulties utilization management practices, such as prior authorization and step therapy, can create for patients in accessing the latest treatments and standards of care informed by personalized medicine.^{iii,iv} Without additional clarification and guardrails, PMC is concerned that plans could use utilization management to prefer non-negotiated drugs or deny coverage for negotiated products vital to a patient's personalized health care. Because negotiated drugs are being offered to plans at a lower price, **PMC believes negotiated drugs should not face additional cost-control practices that could limit eligible Medicare beneficiaries' access to them. To ensure patients are protected from plan attempts to offset costs, CMS should establish robust guardrails and conduct oversight to ensure the clinical appropriateness of any utilization management and formulary changes and to mitigate unintended consequences on beneficiaries' access to both negotiated and non-negotiated drugs and the narrowing of patients' treatment options.**

Monitoring Unintended Impacts on Personalized Medicine

Now an important part of health care, personalized medicines have accounted for at least a quarter of new drug approvals for each of the past eight years.^v Over the past eight years, PMC has also identified more than 120 expanded indications significant to advancing personalized medicine.

Multiple analyses, including those from the Congressional Budget Office, have called attention to the potential consequences of the Medicare drug price negotiation program, such as canceled research and development and disincentives to invest in small molecule medicines and therapeutic areas that require incremental innovation.^{vi,vii,viii,ix} Due to smaller patient subpopulations, personalized medicines that address the root causes of disease can be expensive and riskier to develop. In 2022, over half of FDA-approved personalized medicines were indicated for certain cancers, and over one-third were indicated for rare diseases.^x Treatment pipelines in both therapeutic areas are expected to be impacted by Medicare's drug price negotiation program.^{xi,xii} In addition, over the past eight years, the expanded indications listed in PMC's annual analyses of FDA approvals have had an upward trend in the average time since a drug's initial approval. Given this trend, PMC is concerned that implementation of the negotiation program, which by statute makes drug products eligible for negotiation after seven years (or

11 years for biological products), could curtail post-approval research for expanded indications that provide patients with personalized medicine treatment options.

Since Medicare's drug price negotiation program could have an outsized effect in discouraging the pharmaceutical industry from bringing additional personalized medicines and expanded indications to the market, CMS should take every step possible to prevent and monitor for potential unintended impacts of the program on patients and the health care system. **PMC asks CMS to collect information on unintended impacts to ensure the negotiation program does not create disincentives to develop new treatments for unmet medical needs; disincentives to conduct research on expanded indications that provide additional benefits to patients; or barriers for patient access to personalized medicine.** Related data CMS could consider tracking include changes in new drug applications (NDAs) and supplemental NDAs; changes in formulary placement and utilization management for negotiated versus non-negotiated drugs; and other barriers to patient access.

Conclusion

PMC appreciates CMS' commitment to lowering health care costs for Medicare beneficiaries. As the agency implements the drug price negotiation program, we urge CMS to carefully consider these comments for this and future guidance. We look forward to working with you and your colleagues to ensure the program maintains the ecosystem for innovation in personalized medicine and fosters patient access to needed personalized medicine treatments. If you have any questions about the content of this letter, please contact me at 202-499-0986 or cbens@personalizedmedicinecoalition.org, or David Davenport, PMC's Manager of Public and Science Policy, at ddavenport@personalizedmedicinecoalition.org or 804-291-8572.

Sincerely yours,

Cynthia A. Bens

Baltimore, MD 21244-8016
Attn: PO Box 8016

Re: Medicare Drug Price Negotiation Program: Draft Guidance, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani:

Pfizer Inc. appreciates the opportunity to submit comments on the Centers for Medicare and Medicaid Services' (CMS) *Medicare Drug Price Negotiation Program: Draft Guidance, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026*¹ (henceforth referred to as the “Guidance”). Pfizer Inc. is a research-based, global biopharmaceutical company. We apply science and our global resources to bring therapies to people that extend and significantly improve their lives through the discovery, development and manufacture of medicines and vaccines.

The Inflation Reduction Act established the so-called “Medicare Drug Price Negotiation Program”, which in fact, is not a true “negotiation” framework, but a dangerous price setting policy that will significantly harm patient access to medicines and threaten U.S. leadership in biopharmaceutical research and development. These threats are inherent to the law, which requires the Secretary of Health and Human Services (HHS) to disrupt the very real negotiations between manufacturers and Part D plans by setting the price for any top spend small molecule drug that has been on the market 9 years or more without generic competition and any top spend biologic that has been on the market for 13 years or more without biosimilar competition. As such, the law requires HHS to intervene in private market negotiations well before most products have reached the end of their patent and other legally provided exclusivity periods. This ill-conceived policy is already leading to shifts in biopharmaceutical investment and is likely to impact the pace of innovation in the U.S.

We refer to this new program as government price setting rather than a true “negotiation” because manufacturers who do not enter into the process are subject to per-day excise taxes starting at almost twice the sales of the selected drug and increasing to 1,900 percent of a drug’s total revenues. Further, the only way to avoid those excise taxes would require that a manufacturer terminate coverage in Medicaid and Medicare Parts B and D for all the manufacturer’s products – not just the selected product – when almost half of annual nationwide spending on prescription medicines is through Medicare and Medicaid.

¹ In addition to the comments included here, Pfizer fully supports the additional, comprehensive comments submitted by the Pharmaceutical Research and Manufacturers of America (PhRMA).

We know what happens when governments set prices for medicines – investment and innovation in biopharmaceutical research diminishes and people in those countries have less access to vital medications that could save their lives. For example, to the extent that patients in other developed countries with price controls on drugs have access to medicines, they have to wait longer to access those medicines compared to patients in the United States (e.g., 3 months on average in US vs. 20 months in Australia, 18 months in France, 16 months in Japan, 15 months in Canada, and 11 months in the UK).² In addition, recent research has found that 60% of FDA approved medicines from 2011- 2020 originated in the United States. The FDA approved 363 new medicines over that time period, and the US was solely responsible for the origination of 223 of those medicines.³ There is robust evidence that America’s free market approach to drug development and pricing fosters leadership in the global biopharmaceutical industry and simultaneously encourages broad and timely access to new and existing innovations in pharmacologic treatments.

As CMS is implementing this law, the agency has the opportunity to mitigate some of the negative consequences that can result when governments set prices for medicines through thoughtful, detailed, and careful rulemaking and guidance. However, we are concerned that the policies outlined in the Guidance instead will impose requirements difficult for manufacturers and other stakeholders to fulfill, exacerbate manufacturer burdens, and most important, threaten the ability of manufacturers to develop the best innovations in pharmacological treatments that save improve lives in the U.S. and around the world.

In addition to inherent flaws associated with price setting, CMS’ Guidance is laden with misconceptions, burdensome requirements, and a significant lack of clarity. The flaws in the Guidance do not simply burden Pfizer and other manufacturers, but instead place biopharmaceutical manufacturers in an impossible position, caught in tight timeframes, buried in mounds of paperwork to piece together ultimately unattainable data, and narrowly focused on government price reporting instead of innovations for patients.

Pfizer hopes to partner with CMS to lend our firsthand experience and deep understanding of the US biopharmaceutical industry to develop a thoughtful approach to implementation of the drug price setting program in a way that mitigates harm to American leadership in drug discovery and development and to American patients. Pfizer is deeply troubled by the Guidance and how it will exacerbate the effects of a flawed policy. The value of American biopharmaceutical innovation is felt by millions of Americans, as evidenced by the dramatic progress we were able to make against the COVID-19 pandemic in recent years. Thanks to decades of investment in mRNA technology, Pfizer and other companies were able to quickly bring innovative vaccines and treatments to market that transformed the trajectory of the pandemic. The new approach to price setting in Medicare threatens the pace and impact of innovations like these. Accordingly, we strongly urge CMS to revise its Guidance to lessen these risks. While our comments on each section of the Guidance are provided in more detail later in this letter, we highlight a few key issues here:

- **The Guidance confirms concerns that CMS will have unfettered power to set prices based on subjective judgements.**
 - The lack of specificity in how CMS will define and weigh the individual manufacturer and product specific “factors” about selected drugs, combined with opaque procedures, results in a price setting process that will appear subjective and arbitrary in direct violation of the legal requirement for a clear and reasonable framework. We urge CMS to

² PhRMA analysis of IQVIA Analytics Link. June 2020; PhRMA analysis of Food and Drug Administration (FDA), European Medicines Agency (EMA), Pharmaceuticals and Medical Devices Agency (PMDA), Health Canada, and Therapeutic Goods Administration (TGA) data. June 2020.

³ [The US Ecosystem for Medicines: How new drug innovations get to patients Government, Academia, Small firms, and Large firms, 2011 – 2020](#). Vital Transformations. March 2023

make changes to provide needed clarity and specificity in the price-setting methodology and factor definition.

- CMS' starting point for the initial offer amounts to therapeutic reference pricing and gives CMS the ability to make judgments about clinical similarity without sufficient opportunities for stakeholder input.
 - We are concerned this will result in prices that don't reflect the value these medicines bring to patients and society, and thus Pfizer recommends that CMS undertake a scoping process and engage with manufacturers prior to determining an initial offer.
- **The Guidance creates legal obligations on companies that may be impossible to meet.**
 - CMS proposes to establish separate categories of "primary" and "secondary" manufacturers, and to hold primary manufacturers responsible for other distinct corporate entities. Primary manufacturers of a selected drug would be required, among other things, to collect and submit data from any secondary manufacturer, ensure that any secondary manufacturer make the government-set price available, and pay any civil monetary penalties for violations (including those stemming from noncompliance by any secondary manufacturer). This proposal is impractical and opens any manufacturer engaging in the price-setting process with CMS to myriad procedural and legal difficulties. Pfizer urges CMS to negotiate separate Agreements with any distinct manufacturer.
 - CMS proposes to require primary manufacturers to provide access to the MFP and describes of two options that are not viable without the necessary supporting supply chain infrastructure and data reporting necessary for manufacturers to verify claims eligibility. In particular, we urge CMS to designate a third-party administrator (TPA) to facilitate this process for manufacturers.
 - Attributing R&D costs to a particular drug or combination of drugs presents a significant challenge. Manufacturers and investors typically invest in research & development for "programs" in a specific disease area, not simply discrete drugs. A program can have many drugs or biologicals at different stages of development each with multiple indications, and all which would factor into the research and development costs for an FDA-approved or licensed therapy. Additionally, since R&D requires paying for failure, Pfizer would assume significant burdens in being required to sort out which costs apply to which products.
 - Thirty days is a wholly inadequate period for manufacturers to gather and submit all the data CMS is requiring for the price setting process. Pfizer recommends that CMS read the statute in a manner that ensures adequate time to gather information and submit data on the 1194(e) factors, and not to adhere to an arbitrary and rigid deadline of October 2nd if there are other, more reasonable ways to interpret the language.
 - **Guidance does not provide transparency, consistency, and predictability.**
 - Rather than describing a "consistent methodology and process," CMS proposes a framework for setting prices that is not transparent, predictable, and there is no way to judge consistence.
 - Among other things, CMS is proposing to place limits on what a manufacturer can use or disclose from CMS' offers, including the ceiling price in the first offer, the information contained in any concise justification provided with an offer, and any information exchanged verbally during the "negotiation" period. These overly broad restrictions go against core First Amendment principles supporting freedom of speech and inhibit transparency and government accountability.

- These policies send the message that CMS wants to make its decisions in secrecy and protect them from outside scrutiny. They also fail to recognize the importance of openness and transparency to maintaining public support for the program. Pfizer urges CMS to abandon its unconstitutional proposals and to adopt evenhanded data policies that respect the freedom of speech and that support transparency – including for Medicare beneficiaries and all industry stakeholders.
- **Guidance lacks sufficient opportunities for patient, provider, and manufacturer input.**
 - The process described in the Guidance signals that CMS intends to provide only the most limited opportunities for stakeholders, such as patients and clinicians, to have input and a voice in this completely new program.
 - CMS should create a process to solicit input and advice from stakeholders including caregivers, patients, and clinicians before the price-setting process occurs. CMS should solicit stakeholder input on topics such as therapeutic alternatives, benefits and impacts of a selected product, how a drug meets unmet needs, subpopulations to consider when evaluating benefits and impacts, and sources of evidence.
 - Manufacturers should be able to meet with CMS before an offer and counteroffer ever would be rejected and counterproposals are issued. During these meetings, CMS should be able to discuss the data CMS uses to determine an MFP and allow manufacturers to provide context to inform the approach used to arrive at calculations, correct data errors, and discuss counter proposals.

###

Requirements for Manufacturers of Selected Drugs (Section 40)

Pfizer has significant concerns with many provisions in this section, which focuses on the “Agreement” that manufacturers must enter with CMS under the program.

Primary/Secondary Manufacturer Definition (Section 40)

CMS proposes to define two categories of manufacturers: “primary” and “secondary.” The “primary manufacturer” would be the entity that holds the NDA/BLA for the selected drug. Any other entity involved in the sale or distribution of the product approved under the NDA/BLA -- and meeting the definition of “manufacturer” found at Social Security Act (“SSA”) 1847A(c)(6)(A) -- would be considered a “secondary” manufacturer.

CMS proposes to require the primary manufacturer of a selected drug, among other things, to collect and submit data from any secondary manufacturer, ensure that any secondary manufacturer make the MFP available, and pay any civil monetary penalties for violations (including those stemming from noncompliance by any secondary manufacturer). This proposal is impractical and opens any manufacturer negotiating an MFP with CMS to myriad procedural and legal difficulties. **Pfizer urges CMS to negotiate separate Agreements with any distinct manufacturer.**

CMS’ proposals present legal challenges for so-called “primary” manufacturers. Historically, CMS did not require primary manufacturers to report data on behalf of secondary manufacturers. In fact, in a 2007 rule governing the Medicaid Drug Rebate Program, CMS concluded that requiring one manufacturer to collect and aggregate from a second manufacturer for price reporting purposes could violate antitrust laws

and administrative accounting processes. Pfizer agrees with the concerns that led CMS in 2007 to conclude that such information sharing would be problematic. Thus, Pfizer's view is that compliance with CMS' proposed process to establish "primary" and "secondary" manufacturers for purposes of the MFP could conflict with federal law.

Indeed, many primary and secondary manufacturers are direct competitors and a substantial amount of information and data related to drug development, particularly in the early stages, may be applicable to multiple products and held across different manufacturers -- including competitors. Additionally, while shared research may lead to products developed collaboratively, it also is possible that the research process could lead to development of products that individual manufacturers market separately. CMS' proposals create the potential for negative externalities that CMS must consider, such as whether the process envisioned by CMS may have a chilling effect on future collaborations between manufacturers due to practical challenges, such as primary manufacturers determining it would be overly burdensome to be responsible for collecting and submitting information from secondary manufacturers or, conversely, secondary manufacturers deciding collaborations are overly burdensome or a desire not to share sensitive data with the primary manufacturer. Furthermore, primary manufacturers potentially would have to aggregate data not only from secondary manufacturers, but also from various suppliers for each manufacturer. Pfizer also believes that such data sharing would be problematic.

It also is a misconception to think that compliance monitoring is easier with a single, "primary" manufacturer. Indeed, in addition to the legal considerations noted above, Pfizer believes that CMS' oversight goals would be better accomplished by negotiating separate Agreements with distinct manufacturers. In that way, CMS would not need to monitor compliance through a separate legal entity -- but instead would have a direct Agreement with each manufacturer for that purpose. Indeed, Pfizer believes that the Inflation Reduction Act requires CMS to negotiate separate Agreements with distinct manufacturers. The text of that law indicates that the "Secretary shall enter into Agreements" with "manufacturers" -- thus confirming that Congress did not intend a "primary" / "secondary" manufacturer framework. Any attempt to ensure compliance through only a so-called "primary" manufacturer could rely on multiple steps, difficult processes, and lengthy delays.

Ultimately, requiring a primary manufacturer to collect, aggregate, and submit data from among different entities on selected drugs is misguided and CMS should not adopt this model in final guidance. Instead, we recommend that CMS enter into separate Agreements with each manufacturer that is associated with a selected drug.

Entrance into Agreement with CMS, Compliance with Administrative Actions (Sections 40.1 and 40.5)

The statute instructs CMS to enter into Agreements with manufacturers of selected drugs for IPAY 2026 by October 1, 2023, which is a month after the deadline for CMS to publish the list of selected drugs (September 1). However, in the guidance CMS states that it intends to use the Health Plan Management System (HPMS) to identify relevant points of contact, effectuate the Agreement, and store the Agreement, and that within "5 days following publication by CMS of the list of selected drugs for an initial price applicability year, if the Primary Manufacturer of a selected drug elects to enter into an Agreement with CMS...the Primary Manufacturer must submit to CMS all names, titles, and contact information for representatives authorized to execute the Agreement and conduct the negotiation." CMS also stated that while it will try to make the actual text of the Agreement available in advance, it will not likely seek comments on the Agreement itself. If an Agreement is not fully executed by October 1, 2023, a noncompliance period would begin on October 2, 2023, which could result in excise tax liability.

Pfizer recommends that CMS drop the proposal that manufacturers must enter information into HPMS within 5 days following the publication by CMS of the selected drugs, because the proposal conflicts with the statute, which sets a deadline of October 1 for effectuating the Agreement and it is unreasonable to expect manufacturers to comply with that timeframe. Manufacturers should be afforded the full 30 days to review an Agreement (although we also assert that the statutory deadline is a significant concern) particularly since we are unlikely to have had a chance to review the full text of the Agreement in advance. CMS consistently characterizes the negotiation Agreement as voluntary, which we believe it not an accurate characterization. Manufacturers do not have viable options besides signing the Agreement given the harsh excise taxes that are imposed every day past the required date for Agreement signature or the option to remove all products from Medicare and Medicaid.

We also request that CMS publicly share the Agreement text, for a meaningful public comment period, in order to give patients, providers, and other stakeholders the opportunity to weigh in on the terms of the Agreement and how it may impact access to care. The American people should be able to see what the Agreement entails, especially in IPAY 2026 as this is the first year of the price setting program.

As with any legal contract, manufacturers should not be bound by any ambiguous or undefined terms within the Agreement. The Guidance is untenably vague pertaining to compliance with the Agreement. CMS states in §40.5 that “after entering into an Agreement with CMS...the Primary Manufacturer must comply with requirements determined by CMS to be necessary for purposes of administering the Negotiation Program and monitoring compliance with the Negotiation Program.” This language leaves numerous unstated potential requirements for which manufacturers would be neither legally nor practically privy to prior to signing the negotiation Agreement.

Submission of Data to Inform Negotiation (Section 40.2)

Thirty days is a wholly inadequate period for manufacturers to gather and submit all the data CMS is requiring for the price setting process. While the statute directs manufacturers of selected drugs to submit certain data to CMS by October 2, 2023 (30 days after publication of the list of selected drugs), we believe that CMS has authority to allow room for flexibility in this area. Some of these data points are not currently collected or maintained by manufacturers. Others, such as research and development costs, require manufacturers to look back multiple decades. Still others depend on the cooperation of third-party entities, who would not be penalized in the event CMS’ deadline is not met. Building in additional flexibility would also be to the benefit of CMS as there may be questions or the need to resolve issues around data interpretation. **Pfizer recommends that CMS read the statute in a manner that ensures adequate time to gather information and submit data on the 1194(e) factors, and not to adhere to an arbitrary and rigid deadline of October 2nd if there are other, more reasonable ways to interpret the language.**

Confidentiality of Proprietary Information (Section 40.2.1)

Pfizer urges CMS to take additional steps to secure the vast amount of data manufacturers will be submitting. The Guidance does not provide sufficient details on the confidentiality policy that CMS will adhere to after it receives the proprietary data, and therefore we are troubled by the lack of a public comment period. **CMS’ confidentiality policy should be shared for comments by manufacturers and members of the public and address both use and disclosure of information.**

Though CMS states that the confidentiality policy would be “consistent with existing requirements for protecting proprietary information, such as Exemption 4 of the Freedom of Information Act,” the referenced exemption addresses only the disclosure of information, and not the use of such information. CMS’ vague explanation of a confidentiality policy does not provide any assurances to manufacturers of selected drugs that their proprietary data will be adequately protected.

- **Any confidentiality policy should require that the data submitted by manufacturers are available to the smallest number of personnel possible via a secure portal.**
- **CMS must also propose a cybersecurity policy that addresses necessary safeguards.**
- **Access to data should be inventoried and monitored and data should be immediately destroyed upon the termination of an Agreement.**
- **CMS should also inform manufacturers of any breach or erroneous use of the data and present a solution to remedy any misuse or improper disclosure. CMS should also ensure that referrals are made to the Department of Justice regarding violations of criminal laws prohibiting the publication, divulging, disclosure, or making known in any manner or to any extent not authorized by law, trade secret or confidential commercial information.**

CMS must also clarify that the existence of and status of a pending NDA or BLA, in addition to information contained in a pending NDA or BLA, will be treated as proprietary information under SSA section 1193(c) and as trade secret and/or confidential commercial information that is protected from disclosure under Exemption 4 of the FOIA, 5 U.S.C. § 552(b)(4). This clarification is needed because section 40.2.1 of the Guidance states that “CMS intends to treat the data on prior Federal funding and approved patent applications, exclusivities, and *applications and approvals* under section 505(c) of the Federal Food, Drug, and Cosmetic (FD&C) Act or section 351(a) of the Public Health Services Act as non-proprietary because CMS believes *these data are available publicly* [emphasis added].”

Pfizer disagrees that “these data are available publicly.” Information in pending marketing applications is typically proprietary and highly sensitive and is protected from disclosure by federal law. This sensitivity remains after approval, with much data and information in approved applications remaining protected confidential commercial information and trade secrets exempt from disclosure. Under FDA’s regulations, the existence and status of a pending application, in addition to information contained in a pending NDA or BLA, generally are protected from public disclosure. CMS should consider simply asking the manufacturer to indicate what information is already in the public domain and what, if any, is proprietary and then treat it accordingly, including other manufacturer-submitted data under Section 50.1 of the guidance.

Data Use Provisions and Limitations (Section 40.2.2)

Pfizer urges CMS to abandon the proposal to bar manufacturers from disclosing information and communications exchanged throughout the price-setting process and adopt an approach that promotes transparency and accountability in government decision-making while protecting proprietary and confidential information. Among other things, CMS is proposing to place limits on what a manufacturer can use or disclose from CMS’ offers, including the ceiling price in the first offer, the information contained in any concise justification provided with an offer, and any information exchanged verbally during the “negotiation” period. CMS would prohibit audio or video recording of any oral conversations between CMS and a manufacturer, and even limit use – stating that manufacturers could use government information only for purposes of the Program, and as required by applicable state or federal law. CMS also proposes a “Certificate of Data Destruction,” to be submitted within 30 days of a

drug or biologic no longer qualifying as a selected drug. Under such certificate, a manufacturer would certify that all information received from CMS during the “negotiation” period and potential “renegotiation” period(s), including the initial offer and any subsequent offers, and the concise justification(s), and any of the manufacturer’s written notes or emails pertaining to “negotiation” (or “renegotiations”) with CMS, have been destroyed.

These overly broad restrictions go against core First Amendment principles supporting freedom of speech and inhibit transparency and government accountability. While CMS will publish a justification of MFP at the end of the price setting process, the agency proposes depriving manufacturers of a voice. They also will deny manufacturers the ability to garner year-to-year learnings that will be important to the effective implementation of and manufacturer compliance with the Program. These policies send the message that CMS wants to make its decisions in secrecy and protect them from outside scrutiny. They also fail to recognize the importance of openness and transparency to maintaining public support for the program.

Pfizer urges CMS to abandon its unconstitutional proposals and to adopt evenhanded data policies that respect the freedom of speech and that support transparency --including for Medicare beneficiaries and all industry stakeholders.

Effectuation of the MFP (Section 40.4)

Under section 1193(a) of the SSA, manufacturers entering into an Agreement with CMS must provide access to the MFP for selected drugs that are covered under Part D to (1) MFP-eligible individuals and (2) pharmacies, mail order services, and other dispensers with respect to such MFP-eligible individuals who are dispensed such drugs. CMS intends to require primary manufacturers to provide access to the MFP in one of two ways: (1) by ensuring that the price paid by the dispensing entity is no greater than the MFP; or (2) by providing retrospective reimbursement for the difference between the dispensing entity’s actual acquisition cost and the MFP.

Pfizer is deeply concerned with CMS’ proposed two options, absent the necessary supporting supply chain infrastructure and data reporting necessary for manufacturers to verify MFP claim eligibility and 340B drug status. **Pfizer requests that CMS articulate viable processes by which manufacturers of selected drugs will be provided access to Medicare claims data to verify claims for prospective and retrospective MFP discounts. To assist CMS with this process, we have included backgrounder in the Appendix to this letter which more fully describes concerns and potential solutions for manufacturers to provide access to the government-set price (MFP).**

Specifically, Pfizer urges CMS to:

- **Provide manufacturers of selected drugs with Part D prescription drug event (PDE) records to ensure that the patient is MFP-eligible.**
- **Remove the requirement for manufacturers to provide reimbursement to intermediate entities within 14 days.**
- **Utilize wholesale acquisition cost (WAC) to define the amount of MFP discounts rather than actual acquisition cost (AAC).**
- **Assign a third-party administrator to oversee the MFP effectuation process for manufacturers that elect to provide retrospective reimbursement to dispensing entities.**

We are very concerned about the lack of assurance that manufacturers will receive proof of MFP eligibility and 340B drug status prior to reimbursement. A manufacturer will need appropriate data to provide 340B covered entities (CEs) with the lesser of the MFP and 340B ceiling price, as well as to

prevent payment of both an MFP statutory discount and a 340B discount on the same unit as is expressly prohibited under the MFP/340B nonduplication clause.

Additionally, the requirement for manufacturers (who choose the retrospective route of effectuating the MFP) to reimburse applicable intermediate entities within 14 days is wholly unattainable without eligibility verification. Instead, to meet the required payment deadline to pharmacies and other dispensers, manufacturers could contract with intermediate entities to facilitate payments to pharmacies, provided those intermediate entities are given access to claims-level transaction data. However, manufacturers need more time than the 14 days proposed by CMS to review claims and verify patient eligibility for the MFP. Thus, we strongly recommend that CMS eliminate the requirement to reimburse intermediate entities within 14 days and instead provide flexibility for intermediate entities and manufacturers to develop processes and set contractual terms related to timing of payment.

Another issue with effectuating MFP is CMS' proposed use of actual acquisition costs (AAC) to determine the magnitude of the discount. AAC is an opaque and inappropriate metric to define the MFP discount that manufacturers must reimburse to dispensing entities, as it is difficult to track and is only known to the dispensing entity. Additionally, perverse contracting incentives could result from dispensing entities reporting the AAC for each prescription, as plans or PBMs could undercut a pharmacy in reimbursement negotiations if the AAC were known to the plan or PBM. CMS should define a retrospective MFP discount using a widely available metric such as WAC.

Finally, we urge CMS to improve effectuation of the MFP and minimize stakeholder burden by designating a third-party administrator (TPA) to facilitate this process for manufacturers choosing a retrospective approach. This will best ensure consistent patient access to the MFP at the point-of-sale, enable full reimbursement to pharmacies through a standardized process within the 14-day timeframe proposed by CMS, protect program integrity, promote efficiency and accuracy, and minimize stakeholder burden.

Nonduplication with 340B Ceiling Prices (Section 40.4.1)

The statute includes a provision that prevents duplicate MFP and 340B discounts for selected drugs. In section 40.4.1 of the Guidance, CMS states that a primary manufacturer is required to provide access to the MFP to 340B covered entities (CEs) if the MFP is below the 340B ceiling price for a selected drug when the CE (or a pharmacy on its behalf, in appropriate cases) dispenses a selected drug to a 340B patient of the CE who is also a Medicare beneficiary. CMS further states that if the 340B ceiling price is "subsequently determined" to be below the MFP, then the manufacturer is responsible for providing the 340B CE the difference between the MFP and 340B ceiling price.

However, Pfizer has significant concerns that these proposed requirements do not describe the nonduplication clause correctly and conflict with CMS' proposal to require reimbursement within 14 days. In fact, this is likely to result in manufacturers providing duplicate discounts instead of preventing them.

Pfizer asks that CMS revise its guidance to address the potential for duplicate MFP and 340B discounts. Solutions may include (1) clarifying that manufacturers can choose to make the MFP the default payment and converting the 340B discount for selected drugs to a rebate to the covered entity or (2) requiring that 340B units be identified at the point of sale.

Most 340B drugs are managed in a virtual inventory and replenishment model in which dispensing entities receive the medication upfront at the 340B price and virtually track patient 340B eligibility. The software used for the 340B virtual inventory system is prone to lags in identifying 340B-eligible claims, rendering dispensing entities unable to determine the appropriate acquisition price in time for manufacturers to meet the 14-day reimbursement requirement. As a result, manufacturers will likely be liable to provide unlawful duplicate discounts (e.g., MFP and 340B ceiling price) absent further action from the agency.

If CMS cannot resolve these critical issues, we urge you to withdraw sections 40.4 and 40.4.1 from the revised Guidance and continue to work with the appropriate stakeholders to develop a workable solution.

Identifying Units Subject to 340B Agreements

For manufacturers to provide the lower of MFP or the 340B ceiling price to 340B patients who are Medicare beneficiaries, it is critical that CMS adopt a methodology by which all Part D claims that are subject to 340B pricing are identified accurately and in a timely manner. **Pfizer supports CMS' proposal included in the Part D inflation rebate guidance to require all PDE and pharmacy claims to append a 340B modifier. Further, a non-340B modifier should be required such that every claim reports 340B status.** This requirement would align with CMS' approach for the discarded drug modifier in the Medicare Part B program. However, Pfizer is concerned that even with a requirement for claims to include a 340B or non-340B modifier, compliance by covered entities may not be sufficient to ensure that all 340B claims are identified.

Negotiation Factors (Section 50)

The statute requires CMS to “develop and use a consistent methodology and process” to negotiate the MFP. Thus, all negotiations should be subject to a clear and predictable framework. Sections 50 and 60 of the Guidance describe numerous, closely related elements of the price-setting process (statutory factors, price setting methodology and process, respectively). Unfortunately, Pfizer believes that the process described by CMS in these sections does not create the required clear framework envisioned by Congress.

The lack of specificity in how CMS will define and weigh individual factors, combined with an opaque process, results in a price setting process that will appear subjective and arbitrary in direct violation of the legal requirement for a clear and reasonable framework. We urge CMS to make changes to provide needed clarity and specificity in the MFP methodology and factor definition.

Fundamentally, we are concerned that CMS has proposed an approach that:

- defines the negotiation factors in ways that seem explicitly designed to drive the MFP to excessively low “cost-plus” pricing levels;
- doubles down on the inherent flaws in the statute’s unprecedented inclusion of “R&D recoupment;” and
- penalizes rather than rewards manufacturer investments in continued R&D following a drug’s approval.

Requirements for Submission of Manufacturer Submitted Data Generally (Section 50.1)

In section 50.1 of the Guidance implementing the “manufacturer-specific data” provisions of the IRA, CMS states that it intends to require a primary manufacturer to submit data regarding R&D costs of the primary manufacturer and whether the primary manufacturer has recouped those costs; current unit costs of production and distribution; prior federal financial support for the drug’s discovery and development; data on pending and approved patent applications, patent exclusivities, and NDA/BLA approvals; and market data and revenue and sales volume data in the U.S. for the primary and secondary manufacturer. Appendix C of the Guidance includes a list of definitions that describe the data to be collected for the Program.

CMS proposes to require the primary manufacturer to aggregate data from both the primary manufacturer and secondary manufacturer on the non-FAMP, current unit costs of production and distribution, market data, and revenue and sales volume. As noted earlier in our comments, it is not workable for primary manufacturers to report these data on behalf of secondary manufacturers since primary manufacturers may lack access to such data from secondary manufacturers, either legally or practically. **In addition to rescinding its proposal to adopt the primary and secondary manufacturer model – and instead enter into separate Agreements with each manufacturer that is associated with a selected drug – Pfizer, at a minimum, strongly recommends CMS exercise its discretion to allow additional data submission after the October 2, 2023 deadline.**

Pfizer also notes that CMS can obtain some of the requested information from government sources to alleviate unnecessary burden on manufacturers. **For example, Pfizer recommends that CMS obtain information about approved patent applications from the FDA’s Orange and Purple Book listings, information about approved applications from Drugs@FDA, and information about unexpired regulatory and patent-based exclusivities for NDAs from the FDA Orange Book, and explicitly allow companies to reference such sources in their submissions to CMS.** Conversely, manufacturers should be able to provide as much supporting information as required to support the negotiation process. **Accordingly, Pfizer requests that CMS abolish any text limits (on the data submission forms or portals) for manufacturer submissions to ensure we can submit all information relevant to the negotiation.**

Research and Development Costs (Appendix C)

With regard to R&D costs and the recoupment of investment, CMS states in the Guidance that it will review a combination of costs incurred by the primary manufacturer for all FDA-approved indications of a drug, such as basic pre-clinical research costs, post-Investigational New Drug (IND) application costs, FDA Phase IV clinical trials, post-marketing trials, abandoned and failed drug costs, and all other R&D costs. CMS proposes to calculate “recoupment” of R&D costs by comparing them to global, total lifetime net revenue for the selected drug. CMS would then increase or decrease the preliminary MFP it calculates depending on whether costs have been “recouped.”

This approach is problematic for several reasons. First, it is important to understand that manufacturers and investors typically invest in research & development for “programs” in a specific disease area, not simply discrete drugs. A program can have many drugs or biologicals at different stages of development each with multiple indications, and all which would factor into the research and development costs for an FDA-approved or licensed therapy. This can include thousands and sometimes millions of compounds that could be screened early in the research and development process, going back many years, with a success rate of less than 12%. And once a drug is on the market, it’s not a guarantee that it will be a huge

commercial success due to many factors, including significant competition from other medicines. It is the revenue that comes from the commercial successes that support continued investment in the high-risk effort to discover new medicines and help to recoup costs of the many failures across an entire portfolio.

In addition, the task of submitting the R&D costs for the selected drug will be extremely difficult if not impossible for manufacturers to perform since, as we just described, R&D costs are a difficult metric to capture. The cost of delivering a drug to market reflects only a fraction of total pipeline expense, not just the direct costs for a successful approval. R&D costs should include all costs required to discover and market a drug from discovery through launch and end-of-life, which includes R&D costs, support costs, and financing.

It is extremely difficult for Pfizer to completely and accurately account for such a wide variety of costs. Attributing R&D costs to a particular drug or combination of drugs presents a significant challenge. Pfizer pursues multiple drugs simultaneously for the same indication -- to identify the highest impact medicine for patients. Additionally, since R&D requires paying for failure, Pfizer would assume significant burdens in being required to sort out which costs apply to which products. Additionally, support for R&D comes from a range of functions including commercial, medical, value and access, technology, finance, strategy, and operational support currently not necessarily captured in R&D expenses.

In addition to these difficulties, CMS would require Pfizer to account for secondary manufacturer R&D costs. This would require that Pfizer - within 30 days - capture all of their investments that could have been made over 20 years ago and recorded through any number of various technologies or paper forms. To provide this level of detail is an extremely challenging task.

In light of all these challenges, we recommend that CMS place minimal weight on this factor and specify that whether a manufacturer “recouped” its costs will not be used to reduce an MFP that is more appropriately determined on the basis of a drug’s therapeutic and clinical attributes. In addition, in lieu of the proposed standardized definitions, CMS should allow manufacturers to use reasonable assumptions (with accompanying justifications) regarding the information they submit on manufacturer-specific data related to R&D costs. Further, we urge CMS to modify the proposal to limit required submission of R&D costs to data available to the manufacturer that can be directly attributable to the selected drug, while allowing companies to voluntarily provide supplemental data.

Current Unit Costs of Production and Distribution (Appendix C)

The Guidance defines costs of production to include all direct and indirect costs related to purchasing raw ingredients, including intermediates, active pharmaceutical ingredients, excipients, and other bulk chemicals; formulating and preparing the finished drug product; performing quality control and testing of the drug; and operating costs for personnel, facilities, transportation, any importation, and other expenses related to preparing the finished drug product. Distribution costs would include all direct and indirect costs related to packaging and materials; labeling; shipping to any entity that acquires the drug from the primary or secondary manufacturer; and operating costs for any of the above. Current unit costs would include only costs incurred by the primary and secondary manufacturer and only units produced and distributed for sale in the U.S. R&D costs and marketing costs would not be included.

Pfizer is concerned with CMS’ definition of production and distribution costs for a number of reasons, including that Pfizer may not be able to obtain some of these data from secondary manufacturers or our supply chain partners. **Pfizer requests that CMS allow manufacturers discretion to include which**

production and distribution costs are available and permit manufacturers to provide a narrative rationale for any factor they may be unable to include.

Prior Federal Financial Support (Appendix C)

The Guidance defines prior federal financial support to include tax credits, direct financial support, grants or contracts, and any other funds provided by the federal government to support discovery, research, and/or development of the selected drug – all during the time period from when initial research began or when the drug was acquired by the primary manufacturer, through the date the most recent NDA/BLA was approved. CMS states that it may consider decreasing the preliminary price if funding for the drug’s discovery and development was received with federal financial support.

Pfizer objects to CMS’ proposal to include tax credits as “federal financial support” for the purpose of reducing drugs’ MFP. This runs contrary to the goal of these tax credits. Credits such as the orphan drug tax credit promote American innovation, foster American expertise, and help manufacturers develop products that save lives. These credits don’t necessarily ladder up to a specific drug product, which further complicates accounting of them in R&D costs. Congress established these credits with specific innovation and economic goals, and their inclusion as a factor to drive down the MFP runs contrary to these broader objectives.

Pfizer requests that CMS remove tax credits from the definition of federal financial support. Pfizer also requests that CMS limit consideration of federal financial support to only products with a patent application containing a Government Interest Statement and/or research where a patent assignee was a government agency.

Patents, Exclusivities, and Approvals (Appendix C)

In the Guidance, CMS considers relevant patents to be those that are pending or approved and linked to the selected drug as of September 1st, 2023, as well as pending and approved applications for which a claim of patent infringement could reasonably be asserted against a person engaged in the unlicensed manufacture, use, or sale of the selected drug. CMS notes that FDA exclusivity periods include Orphan Drug Exclusivity and Pediatric Exclusivity. CMS states that it will consider the length of the available patents and exclusivities before the selected drug may no longer be single source and may consider decreasing the preliminary price if the selected drug has patents and exclusivities that will last for a number of years.

Pfizer opposes CMS’ proposal to decrease the MFP for selected drugs that have remaining patents and exclusivities. Patent rights are a form of IP protection and are critical to the continued investment in R&D, including for new medicines and improvements for existing medicines. CMS’ proposal to penalize manufacturers for the lengthy, costly, and risky R&D (including post-approval R&D) that has resulted in patents and exclusivities will undermine U.S. leadership in biopharmaceutical innovation and weaken the intent of the IP system. As a matter of course, drugs selected for price setting at 7 or 11 years will have remaining patents and exclusivities. In fact, any remaining patents and exclusivity – including exclusivities from innovations such as for orphan products and post-approval innovations – should serve to increase the MFP in order to reflect these dynamics.

Additionally, CMS should acquire patent data not from manufacturers, but from public Orange and Purple Book listings as other data collection is already a massive burden on manufacturers and the 30-day timeframe is extremely short.

Finally, CMS should explicitly confirm that “pending applications” for submissions purposes do not include abandoned applications, which would not be relevant for CMS’ price setting process and are considered neither pending nor approved patent applications. CMS should further clarify that manufacturers are not required to submit non-public patent information, including information about pending applications that have not been published, given the highly confidential nature of this information. Manufacturers should also be permitted to refer CMS to the Orange and Purple Book for exclusivity data and Drugs@FDA for information about approved applications. Manufacturers could then supplement those sources with information about pending applications, such as ongoing R&D efforts which may result in additional periods of exclusivity (pediatric programs or new indications).

Market Data and Revenue and Sales Volume Data (Appendix C)

CMS proposes to require that manufacturers report more than 20 metrics relating to drug prices and sales:

- WAC unit price
- National Council for Prescription Drug Programs (NCPDP) billing unit standards
- 340B ceiling price
- Medicaid Best Price
- Average manufacturer prices (AMP)
- 340B prime vendor program price
- Federal supply schedule (FSS) price
- Big Four price
- U.S. commercial average net unit price, without patient assistance (and possibly with patient assistance) and “best”
- Manufacturer average net unit price to Part D Plan sponsors without patient assistance (and possibly with patient assistance) and “best”
- Total U.S. gross revenue
- Total U.S. net revenue with and without patient assistance
- Quarterly total U.S. unit volume.

In most cases CMS would require the primary manufacturer to aggregate its own data on the selected drug from both the primary manufacturer and data from any secondary manufacturer. Like all the other submission requirements, the Guidance specifies that all of these data with explanations must be submitted to CMS within 30 days of selection – by October 2, 2023.

Pfizer is concerned with the broad and burdensome requirements to submit market data, revenue, and sales volume data. Along with many currently available prices, manufacturers would have to report a new U.S. commercial average net unit price and a manufacturer average net unit price to Part D Plan sponsors in three ways (i.e., with patient assistance, without patient assistance, and best price). **Pfizer requests that CMS withdraw these new metrics in revised guidance.**

There are multiple problems with these new metrics:

- Flawed assumptions about manufacturer patient assistance: patient assistance is financial assistance intended to reduce patients’ out-of-pocket costs and is not considered a price

concession offered to customers. In other words, patient assistance does not constitute “market” data under SSA §1194(e)(1). But this is the rubric under which CMS would require manufacturers of selected drugs to report their patient assistance amounts.

- Guidance is silent (and thus creates additional confusion) on whether a “patient assistance program” is meant to include a manufacturer’s charitable free drug programs (which it should not). The fact that CMS refers to “patient assistance” in a Part D context where manufacturers do not provide cost-sharing assistance to patients causes further questions about what CMS means by “patient assistance.” Yet there is language in the data elements ICR that seems to consider only “coupons and copay assistance” as the patient assistance that CMS is asking manufacturers to report.

If CMS does not withdraw these new metrics, we ask CMS to delete all items asking for manufacturers to report “patient assistance” from the guidance (and the related data elements ICR). Failing that, we request that CMS explicitly clarify that (1) “patient assistance program” does not include manufacturer charitable free drug programs, and (2) wherever a definition does not include the qualifier “without patient assistance program,” that definition excludes manufacturer charitable free drug programs.

CMS also should clarify treatment of products that may have multiple WAC prices per NDC-9. Pfizer anticipates scenarios in which some products do not have a single WAC price per lowest dispensable unit. For example, there could be a product with the same strength and form (which would be the same NDC-9 – for example, 20 mg tablets) but a bottle of 100 tablets has a WAC of \$100 and a bottle of 1,000 tablets has a WAC of \$900.

Quality Adjusted Life Years and Cost Effectiveness Analysis (Section 50.2)

Pfizer appreciates that CMS will not use QALYs in determining MFPs, but requests that CMS be more specific about the prohibition. While we agree with CMS’ statement that the language set forth in the IRA prohibits CMS’ reliance on QALYs or similar metrics, we are concerned that CMS fails to reference the existing prohibition on Medicare reliance on QALYs or similar metrics found in the SSA. Specifically, the Affordable Care Act prohibited Medicare from making decisions based on QALYs and similar metrics, a key statutory measure that CMS should explicitly mention in revised guidance. This prohibition would prevent CMS from using QALYs as part of its determination of MFPs, including in a “life extension context.” We ask CMS to explicitly acknowledge this additional statutory prohibition in its revised Guidance, and refrain from using QALYs or any similar metric, in any context.

QALYs are discriminatory against disabled and elderly Medicare beneficiaries -- a concern reflected in CMS’ Guidance. In addition, QALY-based cost effectiveness analyses often assign lower value to Black lives and undervalue other communities of color, including due to the lower life expectancy within communities of color.⁴ The government price setting process be careful not to use methodologies that exacerbate existing racial and ethnic disparities in health.

Pfizer is concerned by CMS’ statement that it will use research that has “separated” evidence or assessments based on QALYs from other outcomes. We believe this is not realistic, and CMS should require that any entity submitting information to CMS attest that it removed QALY-based research, including any comparative effectiveness research that may have been intrinsically affected by use of QALYs in a related analysis.

⁴ Arias E, Tejada-Vera B, Ahmad F, Kochanek KD. (2021). “Provisional Life Expectancy Estimates for 2020.” Vital Statistics Rapid Release.

Beyond our concerns about QALY-based assessments, we urge CMS to commit to not relying on or over-emphasizing cost-effectiveness analyses (CEA) to determine the price for a selected drug, because it risks further discriminating against underserved and underrepresented people of color who are already at higher risk of not receiving the care they need. In addition, CEA based on any metric can present significant concerns beyond those issues related to discrimination, as it often fails to capture benefits and impacts that matter to patients or patient subgroups.

Standards for Review of Literature and Research (Section 50.2)

CMS should specify robust standards for literature and research reviews and clarify that internal analytics will be required to meet quality standards like those of outside analysis. CMS can borrow standards from other groups such as academic organizations (e.g., the International Society for Pharmacoepidemiology (ISPE) and the International Society for Pharmacoeconomics and Outcomes (ISPOR)) that have developed standards and best practices for analyses and health technology assessments. Medicare drug price setting is too important for CMS to not have robust and public analysis standards.

Standards for Third Parties Providing Evidence (Section 50.2)

The Guidance states that CMS will “consult subject matter experts as part of its process to set [drug prices] for selected drugs, in addition to considering evidence from “the Primary Manufacturer and members of the public, including other manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties.”

We urge CMS to develop robust standards for the third parties CMS engages or that serve as resources to provide evidence on selected drugs and assist CMS in the price setting process. Such standards should ensure these organizations apply methodological rigor in their approach and have a patient-centered focus to their research. CMS should generally avoid relying on any technology assessment organizations that cannot demonstrate clear independence and patient-centeredness. Further, while CMS can be considered a payer, the agency has a broader mission than other payers. Thus, CMS should exclude organizations with a payor-focused mission or funding as well as organizations that historically focus on CEA that relies on QALYs when determining a selected drug’s MFP. This is important because of statutory prohibitions against certain types of CEA as well as the need to avoid analysis driven by a payor focus on cutting costs over patient needs that discounts clinical and non-clinical benefits that matter to patients, caregivers and society.

At a minimum, CMS should publicly disclose the identity and contributions of third parties and ask for them to disclose potential conflicts of interest.

Consideration of Real-World Evidence (RWE) (Section 50.2)

Pfizer appreciates that CMS will consider RWE in setting Medicare drug prices. However, CMS should clarify the standards that CMS will use and how RWE will be weighed. Real-world evidence can come from myriad sources, including electronic health records, claims data, and patient surveys. CMS should consider evidence from all these sources, but the agency must establish clear standards for the type of RWE and the weighting of these data. **Real-world evidence can help provide a more accurate**

assessment of the value to patients and society of Pfizer's innovations, and we hope CMS will strongly consider rigorous RWE generated after FDA approval of a drug.

Consideration of Specific Patient Populations (Section 50.2)

CMS states that it will consider research on and RWE relating to Medicare populations -- including individuals with disabilities, end-stage renal disease (ESRD) and aged populations -- as particularly important. In addition, CMS will prioritize research specifically focused on these populations over studies that include outcomes for these populations, but in which these populations were not the primary focus. CMS states that it will consider the effects of the selected drug and its therapeutic alternative(s) on specific populations, including individuals with disabilities, the elderly, the terminally ill, and children.

While the sub-populations listed above are important, Pfizer urges CMS to consider all relevant subpopulations to fully understand the value of the selected medicines. Other patient subpopulations differ in therapy preferences and responses as well as the value they place on various outcomes. For example, studies have long shown that patients place significant emphasis on benefits other than prolonged survival or cost, although these preferences vary considerably depending on factors such as type and severity of disease and individual life circumstances.

Negotiation Process (Section 60)

Price Setting Methodology

Section 1194 of the SSA, requires a “consistent methodology and process” for setting MFPs, and that these prices be “fair.” However, CMS’ Guidance provides no assurance that the Agency will meet this standard. Rather than describing a “consistent methodology and process,” CMS proposes a framework for setting MFPs that is not transparent, predictable, and there is no way to judge consistence. Furthermore, the process for price-setting signals that CMS intends to provide only the most limited opportunities for stakeholders, such as patients and clinicians, to have input into the process.

CMS’ starting point for the initial offer amounts to therapeutic reference pricing and gives CMS the ability to make judgments about clinical similarity without sufficient opportunities for stakeholder input. We note that therapeutic reference pricing, which resembles the “least costly alternative (LCA)” policies previously attempted by CMS, would give CMS authority to make judgments about clinical “similarity” for a broad range of medicines. It could also overlook significant differences in the needs of patients, many of whom don’t fit value judgments based on broad, average results.

We are concerned this will result in prices that don’t reflect the value these medicines bring to patients and society, and thus Pfizer recommends that CMS undertake a scoping process and engage with manufacturers prior to determining an initial offer. As discussed further below, we also recommend that CMS leverage a Multi-Criteria Decision Analysis methodology as part of its approach to establishing a price for selected drugs. Such a methodology should be patient-centered and consider the holistic value of a medicine, including humanistic and societal benefits. We recommend that CMS follow several critical principles of value assessment in its methodology for establishing an MFP, including ensuring that the methodology is patient-centric, is transparent, takes a holistic view of value, recognizes that value is dynamic, is supportive of innovation, and addresses access.

The scoping document should be informed by a range of key stakeholders and a public consultation period at the start of each selected drug evaluation. It should include:

- 1) therapeutic alternative(s) considered for each indication for selected drugs and the rationale for selection**
- 2) patient population and subgroups to be considered**
- 3) definition(s) of unmet need for each indication of selected drugs**
- 4) full range of benefits and impacts considered for each indication**
- 5) internal process and rationale for determining which benefits and impacts were included**
- 6) list of each stakeholder consulted**

This document would clarify how each treatment will be assessed and under what conditions. It would also offer an opportunity to develop a more advanced and detailed methodology to support the negotiation process. For example, it remains unclear how CMS will assess “clinical benefit” and how this will translate to the preliminary price. In the document, CMS should clarify the methodology it will use to assess clinical benefit across different sources of evidence (e.g., randomized control trial, real-world data, indirect treatment comparison, etc.) and expert opinions.

The negotiation process will have significant implications for patient access and affordability and should include a clear and precise process for patient involvement. Patients offer a unique perspective regarding health conditions, existing therapies, and the value therapies bring – perspectives that CMS should take into account during the negotiation process. Simply asking stakeholders to provide information through an ICR is an insufficient means of engaging stakeholders on this key issue.

CMS should create a comprehensive and deliberative process to solicit input from patients and caregivers at the start of the price setting process and invite comprehensive feedback from patients and caregivers on a range of elements of its decision-making, including but not limited to 1) identification of therapeutic alternatives or comparators for a selected drug, 2) benefit and impacts of a selected drug, 3) the extent to which CMS has determined a selected drug meets and unmet need, 4) specific subpopulations to consider when determining the benefits and impacts of a selected drug, and 5) sources for evidence supporting CMS decision-making and weighing of evidence.

CMS also relies heavily on the federal supply schedule (FSS) or “Big 4” prices, which are not intended to create pricing benchmarks for drugs. This kind of domestic reference pricing is not appropriate for a number of reasons. Average prices across government programs cannot be compared, due to varying storage, distribution, and dispensing practices. Additionally, FSS and “Big 4” prices already reflect inflation and rebates provided and using them as a benchmark would lead to double counting inflation. This approach was also rejected during the debate on the IRA when Senator Bernie Sanders offered an amendment to tie drug prices in Medicare to those used in the U.S. Department of Veterans Affairs (VA). This amendment failed overwhelmingly by a vote of 99 to one.

Pfizer recommends that CMS adopt a methodology in the initial years of the program that acknowledges the extraordinary complexity of establishing a price setting program for the first time -- where all relevant stakeholders do not have experience in this type of novel government price setting program. There is also a tremendous burden on manufacturers to submit data and engage in this complicated process with little information or advance notice. Given these factors, we recommend CMS set the MFP at the statutory ceiling price starting with IPAY 2026 and for several subsequent price applicability years.

Weighting of Factors

The statute establishes two sets of factors that CMS must consider when determining the offers and counteroffers to set the price for the selected drug: “manufacturer-specific data” and evidence regarding alternative treatments. But it does not specify how CMS should determine an initial offer nor how or to what degree each factor should be considered. **We believe CMS should clarify in the Guidance how it will use its discretion in considering and weighting the factors, and we strongly urge CMS to place greater emphasis on the factors related to the benefits products offer to patients, caregivers, and society.**

Conversely, CMS should place less importance on factors that would stifle innovation if overweighted. This includes most of the factors listed in section 1194(e)(1), such as cost of production, costs of R&D, and federal funding toward the development of a selected drug. **CMS should avoid a “cost recovery model” where manufacturers only recoup the cost of producing the drug. In order to mitigate the effect of government price setting on innovation, factors used to support a higher government-determined price should include patent protections, regulatory data exclusivities, labeled and pending indications, and ongoing clinical development programs.**

Therapeutic Alternatives

CMS states that for IPAY 2026 it will identify the selected drug’s FDA-approved indications that are neither excluded from coverage nor otherwise restricted. CMS will then identify pharmaceutical therapeutic alternative(s) for each indication of the selected drug, using data submitted by the primary manufacturer and the public, along with widely accepted clinical guidelines and peer-reviewed studies. CMS also will consider clinical evidence via literature searches.

We urge CMS to utilize manufacturers, clinicians, and patients as the primary resources for determining therapeutic alternatives. The clinically appropriate standard should be used for decision making, meaning CMS should (1) engage with manufacturers on potential therapeutic alternatives and comparators, (2) reference clinician guidance as a resource, (3) reference recognized, science-based, evidence-informed resources to identify alternatives and (4) engage with patients/patient groups.

Additionally, CMS should not consider off-label use when evaluating therapeutic alternatives. Inclusion of off-label use could diminish the value of drugs that were approved for the indication and impact future innovation.

Benefits and Impacts

In assessing comparative effectiveness between a selected drug and therapeutic alternative(s), CMS plans to identify outcomes to evaluate for each of the selected drug’s indications and consider the safety profiles. When evaluating clinical benefits of the selected drug and its therapeutic alternative(s), CMS intends to consider health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience.

Pfizer urges CMS to consider the benefits and impacts of a selected drug that are important to patients, caregivers, and society. In evaluating relative clinical benefit, Pfizer urges CMS to consider patient-centric methodologies that are complete, comprehensive, and fit-for-purpose, as opposed to QALY-based approaches. Multi-criteria decision analysis (MCDA), for example, is a

widely recognized and accepted methodology for aggregating different dimensions of value for patient-centered value assessment. MCDA can account for a range of perspectives and values such as those outlined by CMS: health outcomes, intermediate outcomes, “validated” surrogate endpoints, patient-reported outcomes, and patient experience. Incorporating the patient experience is critical to ensuring clinical benefit is captured however, it is important to ensure we also capture impacts to others effected by the disease/condition such as family members and informal caregivers. Importantly, MCDA addresses many of the concerns of discrimination against disabled and elderly patients that are inherent in utility-based metrics such as QALYs.

Following the negotiation data elements information collection request (ICR) and before CMS’ initial offer, CMS should have direct conversations with manufacturers and stakeholders to share the benefits and impacts it flagged as meaningful. Additionally, in its explanation of a selected drug’s price, CMS should publicize the benefits and impacts considered in the determination of a drug’s price, the process for determining benefits and impacts, evidence sources, and how each benefit and impact determined the final price.

Cost of Selected Drug and Therapeutic Alternatives

The statute includes as a factor “the extent to which such [MFP] drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives,” to the extent such information is available.

We urge CMS to interpret that language broadly, to include a range of direct and indirect costs and cost savings associated with appropriate use of a selected drug. For example, costs should include real-world costs, such as lost wages for caregivers, costs of traveling to a center of excellence for diagnosis and drug administration or acquisition, and the cost of any side effect burden. And medicines not only improve and save lives, but also frequently help avoid other, often costly, health care services, such as emergency room visits, hospital stays, surgeries, and long-term care.

In addition, data CMS uses to understand drug costs should reflect the true net costs after rebates, including those paid to Medicare Part D plans and as well as the 340B program.

Clinical Benefit & Unmet Medical Need

CMS states that it will consider a selected drug as filling an unmet medical need if it treats a disease or condition where there are very limited or no other treatment options.

This is a very narrow definition of unmet need and assumes a one-size-fits-all approach, not considering differences between patient groups and subgroups. Determining unmet need should be a collaborative process with a range of stakeholders -- and the patient at the center. The assessment of unmet needs should be carefully evaluated as the treatment is now multiple years post launch and has been bridging an important unmet need gap throughout this time. That is, CMS should consider the status of “unmet need” at the time the drug was first FDA approved. Unmet need should also reflect morbidity and mortality for the respective therapeutic area. If CMS fails to fully acknowledge innovation that addresses unmet patient needs, it will send signals that disincentivize ongoing innovation in areas where patients desperately need options.

CMS should look to the FDA definition of unmet need: FDA defines unmet medical need as “a condition whose treatment or diagnosis is not addressed adequately by available therapy” that includes either “an immediate need for a defined population” or “a longer-term need for society.” FDA further clarifies that such a drug will treat a condition:

- where there is no available therapy;
- where there is available therapy, but the drug presents additional benefits; and
- where the only available therapy was approved under the accelerated approval program and clinical benefit against the primary endpoint has not yet been verified.

Furthermore, CMS should recognize other types of unmet need, including, but not limited to:

- personalized medicines for certain subpopulations;
- progress against rare and hard-to-treat illnesses;
- treatments that improve patient adherence and quality of life;
- need for additional treatments in a therapeutic area, such as a curative treatment;
- treatments that improve the health of underserved and vulnerable communities who face health disparities, particularly communities of color;
- treatments that benefit multiple common comorbidities at once; and
- the stepwise nature of progress in which significant gains for patients are achieved via advances that build on one another.

Therapeutic Advance

The statute requires CMS to consider “[t]he extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.”

For the purpose of encouraging R&D and mitigating against the negative impacts of this law to innovation, CMS should look at the alternatives that were available at the time of the drug’s approval. At a minimum, it should weight such drugs higher than later introduced alternatives.

In addition, CMS could consider examples within existing Medicare reimbursement policy that can assist in defining and assessing selected drugs against this criterion. For example, one appropriate factor would be the **New Technology Add-On Payment (NTAP)** designation, which exists to ensure adequate reimbursement for certain new products that demonstrate, among other things, enhanced clinical improvement over existing technologies. In order to receive an NTAP designation, a product must demonstrate a substantial clinical improvement over existing services or technologies (in addition to two other distinct criteria), which is defined as “an advance that substantially improves, relative to...technologies previously available, the diagnosis or treatment of Medicare beneficiaries.”

Another resource for determining whether a treatment represents a therapeutic advance could be highly credible, physician-driven oncology compendia, such as the **National Comprehensive Cancer Network (NCCN)’s Drug and Biologics Compendium**. CMS already relies on this Compendium in other contexts.

Manufacturer Engagement

CMS states that if the primary manufacturer does not accept CMS’ written initial offer and proposes a written counteroffer, which is not accepted by CMS, CMS will invite the primary manufacturer to an in-

person or virtual meeting that would take place within 30 days of CMS' receipt of the primary manufacturer's written counteroffer. After this initial meeting, each party would have the opportunity to request one additional meeting, for a maximum of three meetings between CMS and the primary manufacturer. In addition, all meetings must occur during a narrow time period – approximately four months' time between the primary manufacturer's written counteroffer to CMS and the end of the price setting period.

We urge CMS to allow manufacturers to engage with CMS much earlier in the process. Manufacturers should be able to meet with CMS before an offer and counteroffer ever would be rejected and counterproposals are issued. During these meetings, CMS should be able to discuss the data CMS uses to determine an MFP and allow manufacturers to provide context to inform the approach used to arrive at calculations, correct data errors, and discuss counter proposals.

Patient/Clinician Engagement

As stated earlier in our comments, we urge CMS to create a process to solicit input and advice from stakeholders including caregivers, patients, and clinicians before the price-setting process occurs. CMS should solicit stakeholder input on topics such as therapeutic alternatives, benefits and impacts of a selected product, how a drug meets unmet needs, subpopulations to consider when evaluating benefits and impacts, and sources of evidence. CMS' current approach, particularly for patient and provider groups, is particularly challenging for patient and provider groups and will prevent meaningful engagement when such input should be essential to this process.

Initial Justification

The written initial offer from CMS, which must be made no later than February 1, 2024, must include a "concise" justification for the offer based on the negotiation factors and the methodology CMS lays out for developing an initial offer. **CMS should describe the template it will use for the concise price justification and, when issuing the initial offer, CMS should discuss the evidence considered, how products met unmet needs, how stakeholders were engaged, the benefits and impacts CMS considered, and mathematical calculations that flow into the price.**

Explanation for the MFP

CMS states that it will publish an explanation for the MFP no later than March 1st of the year prior to the IPAY year. The intent of the published explanation is to summarize how the relevant factors were considered during the price setting process and would focus on the factors that had the greatest influence in determining the MFP. The published explanation will include high-level comments on the submitted data, without any proprietary information. The published explanation will list the selected drug, discuss contributing price setting factors, and note any factors or circumstances that may be unique to the selected drug. If the MFP is not agreed upon, CMS will indicate that no Agreement was reached.

The explanation for the MFP should be released before IPAY 2027 negotiations begin to allow manufacturers to better understand CMS's decision-making process. This is important because, again, the process should be transparent and predictable so that manufacturers (and investors) can incorporate it into their R&D decisions. The explanation should discuss how CMS identified comparators

and therapeutic alternatives for selected drugs, how factors were weighted in CMS' decision-making, evidence sources considered, stakeholders engaged, and benefits and impacts CMS considered.

Average Non-Federal Average Manufacturer Price (Non-FAMP) (Section 60.2.3)

Calculation of Average Non-FAMP

Pfizer recommends that CMS rely upon the existing Veterans Health Care Act (38 U.S. Code § 8126) framework when defining “Average Non-FAMP” values for manufacturer reporting and use in determining MFP. Pfizer strongly opposes CMS’ overly burdensome proposal for a completely new, CMS averaging methodology, relying on quarterly non-FAMP values, to derive unique, “average non-FAMP” calendar year values as the basis for MFP.

In CMS’ proposed guidance, sections 60.2.1, and 60.2.3 with reference to section 50.1, CMS intends to use the non-FAMP of each NDC-11 for the selected drug for each quarter of calendar year 2021 that is submitted to CMS by a manufacturer pursuant to section 1193(a)(4)(A) of the Act, and 1194 (c)(6):

1193(a)(4) ...” (A) information on the non-Federal average manufacturer price (as defined in section 8126(h)(5) of title 38, United States Code) for the drug for the applicable year or period;”

1194 (c)... “(6) AVERAGE NON-FEDERAL AVERAGE MANUFACTURER PRICE. —In this part, the term ‘average non-Federal average manufacturer price’ means the average of the non-Federal average manufacturer price (as defined in section) of title 38, United States Code) for the 4 calendar quarters of the year involved.

In defining the average non-FAMP, the IRA does not specify which four quarters are “the 4 calendar quarters of the year involved” but notably cross-references 38 U.S.C. § 8126(h)(5). To clarify, “the non-FAMP of each NDC-11 for the selected drug for each quarter of calendar year 2021”, should be read as the Annual Non-FAMP value defined in 38 U.S. Code § 8126(h)(5), reported by manufacturers to the Department of Veterans Affairs (VA) by November 15, 2021. Unlike Medicaid Drug Rebate Program quarterly price metrics that determine manufacturer rebate payment amounts for each calendar quarter, only the Annual and Q3 Non-FAMP values are used to determine the Federal Ceiling Price value in effect for the following full calendar year. Therefore, it makes sense to use those same Annual non-FAMP values calculated by manufacturers and reported to the VA by November 15, 2021, as the average annual non-FAMP values for 2021 the IPAY.

Pfizer strongly recommends that CMS revise its approach and adopt Annual Non-FAMPs as the “Average Non-Federal Average Manufacturer Price,” calculated based on four quarters of the federal fiscal year, under VHCA 38 U.S. Code § 8126.

The CMS proposal to “average” four, estimated quarterly non-FAMP values is not used in the VA pricing program. Manufacturers have large volumes of eligible non-FAMP transactions that cross calendar quarters due to the lagged timing necessary for appropriate processing of chargebacks and price adjustments. The purpose of the VA’s annual non-FAMP weighted average calculation methodology is to collect the full data set of all transactions for the applicable 12 months – 4 calendar quarters -10/01 thru 9/30. The overly burdensome, completely new, CMS proposed averaging method, relying on four calendar quarters of quarterly non-FAMP estimated values, which are used only as indicators for pricing trends or, for Q3 Non-FAMPs, as comparators for the FCP additional discount, will result in unreliable

starting values for MFP determination. Manufacturer-reported Annual Non-FAMP values are already subject to VA OIG audit as well as Civil Monetary Penalties for false or late reporting. There is no reasonable basis to not use those values.

CMS Process to Account for Non-FAMP Restatements and Anomalies

The CMS initial guidance does not address the usual processes recognized by the VA as necessary to address situations in which a non-FAMP is restated by the manufacturer or when an anomalous non-FAMP value arises due to a misalignment of sales dollars and units. Manufacturers are able to restate a non-FAMP where the reported non-FAMP is determined to be inaccurate (e.g., sales data flaws, data system problems), or apply VA developed and approved exceptions to address non-FAMP anomalies. Revised Non-FAMP values are not uncommon, and the VA approves adjustments to contract pricing based upon manufacturer restated non-FAMPs and FCPs.

Pfizer recommends CMS adopt MFP calculation exceptions processes to account for Average non-FAMP restatements and anomalies and to clarify how such processes will affect MFP ceiling determination.

Application of the MFP Across Dosage Forms and Strengths (Section 60.5)

In section 60.5 of the Guidance, CMS provides its intended approach to applying a single price across each dosage form and strength of a selected drug in accordance with section 1196(a)(2) of the Act. A key piece of this proposed approach (and indeed, a key piece of the methodologies CMS lays out in sections 60.2.2, 60.2.3, and 60.3 as well) rests on defining 30-day equivalent supplies for each dosage form and strength of a selected drug and therapeutic alternative(s).

CMS should clarify how it will calculate 30-day equivalent supplies, particularly when drugs are used on an as-needed basis and when a 30-day supply cannot provide a reasonable comparison between therapeutic alternative(s). For example, when comparing two products where the treatment duration varies significantly (e.g., an oncology medicine that is administered on an ongoing basis until disease progression vs. a fixed-dose therapy), comparing the cost of a 30-day equivalent supply would not accurately capture the total cost of comparable outcomes. CMS should also give careful thought to how best account for starting dosages of medicines, where a patient's dosage increases over a period of time upon first starting a medication before reaching a steady, long-term dosage amount (i.e., titration). Pfizer and many manufacturers have experience with calculating 30-day equivalent supplies under certain state drug price transparency reporting requirements, and there are certain vendors that assist manufacturers with these calculations. We encourage CMS to discuss with expert stakeholders examples of how 30-day equivalent supplies are calculated for medicines, particularly medicines falling into one of the more complicated situations.

We also request that CMS make available to manufacturers of selected drugs:

- **the Agency's calculated 30-day equivalent supply for each NDC-9;**
- **the total number of units dispensed for each NDC-9 in the 2022 Part D PDE data; and**
- **an Excel template with the Agency's 10-step calculation approach for applying the MFP across different dosage forms and strengths.**

In providing this information to manufacturers of selected drugs, CMS will help to ensure that manufacturers have full transparency into the Agency's calculations.

Dispute Resolution

We are disappointed that CMS does not discuss mechanisms for dispute resolution in the Guidance and urge CMS to establish informal dispute resolution procedures to adjudicate disputes and correct errors in the MFP decision-making process. CMS has significant discretion in establishing informal procedures to resolve disputes and correct errors that will inevitably arise during the MFP decision-making process, and we encourage CMS to exercise this discretion.

Removal from the Selected Drug List (Section 70)

For purposes of a selected drug's exit from the Program, "CMS will consider an approved generic drug or licensed biosimilar biological product to be marketed when [prescription drug event (PDE)] data reveal that the manufacturer of the generic drug or biosimilar biological product has engaged in bona fide marketing of that drug or product." **There is no statutory basis for CMS' proposed "bona fide marketing" standard. Nevertheless, while Pfizer assumes for the purposes of commenting only that CMS's proposed definition of "marketing" is final, Pfizer's view is that CMS' timeline in section 70 for removing a selected drug is overly restrictive.**

Pfizer requests that CMS clarify that the MFP does not apply to a drug that was selected for IPAY 2026 if a generic or biosimilar product is approved and marketed by December 31, 2025. Congress drafted the IRA to enable CMS to set prices for single source products. However, CMS' current position, which is that the agency will continue to set a price for products that become multisource, contradicts Congress' intent and directly undermines generic and biosimilar competition and incentives for pursuing approval of these products.

Manufacturer Compliance and Oversight (Section 90)

Monitoring of Access to the MFP (Section 90.2)

Please refer to our comments on section 40.4 for a discussion of CMS' proposals in section 90.2 of the Guidance.

Monitoring for Bona Fide Marketing of Generic or Biosimilar Product (Section 90.4)

CMS' proposed monitoring of the status of competition in the drug marketplace is unauthorized and unnecessary. There is no statutory basis for CMS' proposal "to monitor whether robust and meaningful competition exists in the market once it makes such a determination [that a generic drug or biosimilar biological product has been marketed]." The Federal Trade Commission (FTC) has the authority and expertise to monitor the status of competition in the drug marketplace. The FDA's Biosimilars Action Plan and Drug Competition Action Plan also supplement the FTC's efforts in addition to joint statements and workshops. CMS should avoid adding another layer of burdensome enforcement.

The statute defines a QSSD in relevant part as a drug for which a generic or biosimilar product is not "marketed." The guidance instead refers to a new term "bona fide marketing," providing that, "[i]n accordance with 1192(c) and (e) of the Act for the purpose of identifying [QSSDs] for [IPAY] 2026, CMS will review PDE data for a given generic drug or biosimilar . . . and will consider a generic drug or biosimilar biological product to be marketed when that data reveal that the manufacturer of that drug or

product has engaged in bona fide marketing of that drug or product.” **While Pfizer assumes for purposes of these comments only that CMS’ proposed definition of “marketing” is final, the statute does not provide CMS a role in monitoring generic and biosimilar competition.**

Civil Monetary Penalties (CMPs) (Section 100)

In section 100 of the Guidance, CMS addresses the civil monetary penalty (CMP) provisions set forth in section 1197 of the SSA (the Program-related CMPs) and briefly describes the “procedures” CMS intends to follow to impose these CMPs on manufacturers.

Notice-and-Comment Rulemaking on Program-Related CMPs

Basic notions of fairness and due process should encourage CMS to complete notice-and-comment rulemaking before imposing Program-related CMPs on manufacturers. Section 1197 of the Social Security Act authorizes the highest CMP amount related to any federal healthcare enforcement regime. The maximum CMP amount set forth in section 1197(a) is equal to 10 times the difference between the price the manufacturer charges and the MFP. The maximum CMP amount set forth in section 1197(c) of \$1 million per day exceeds other “per-day” CMP amounts in the SSA (such as the maximum \$10,000 per day penalty in section 1927(b)(3)(C)(i) for the similar failure of a manufacturer to provide timely information relevant to Medicaid drug rebates).

CMS rulemaking should include clear and detailed procedures CMS intends to use to levy CMPs, the scope of a manufacturer’s CMP liability in regard to the acts and omissions of third parties, and factors CMS will use to determine whether to assess the CMP and the amount of the CMP.

Combined Rulemaking on CMP Procedures

CMS should undergo a single rulemaking process leveraging well-established precedents to implement IRA drug-pricing related CMP procedures. There is overlap between the CMP provisions governing the program, Part B rebatable drugs, and Part D rebatable drugs. As a result, CMS should undertake notice-and-comment rulemaking. CMS should leverage CMP procedures for Medicare Advantage Organizations and prescription drug plans issued by HHS Office of the Inspector General. CMP procedures should include informal mechanisms such as pre-enforcement letters before formal procedures take effect.

Third-Party Non-Compliance

CMS should not levy CMPs on drug manufacturers for third-party non-compliance. The nature of the pharmaceutical supply chain makes it difficult for primary manufacturers to ensure that the MFP is available to MFP-eligible individuals. Additionally, doing so would force manufacturers to assume more legal liability and disrupt the allocation of risk across contractual Agreements among manufacturers and the supply chain. **At a minimum, CMS should issue a non-enforcement policy to ensure primary manufacturers are not levied CMPs following issuance of the final guidance. If primary manufacturers are penalized due to third parties, CMS should weigh that level of culpability to seek lower penalties.**

CMS Explanation of Factors Used in Assessing CMPs

CMS should articulate the factors used when in assessing CMPs through notice-and comment rulemaking. These factors could include:

- the manufacturer’s conduct;
- the degree of the manufacturer’s culpability;
- the extent of the manufacturer’s knowledge of a violation;
- clarity of existing guidance;
- efforts by the manufacturer to obtain guidance from CMS on compliance-related matters;
- good faith efforts to comply with program submission deadlines and requests for extensions;
- and
- the degree to which manufacturers could exercise control over third parties which a manufacturer relied on in satisfying program requirements.

CMS should construe these factors in favor of manufacturers and in a way that would not trigger CMPs.

Threshold for Manufacturer CMP Liability

CMPs that require manufacturers to “act knowingly” should only apply if manufacturers have actual knowledge of the violation. Given the absence of an applicable statutory definition for the term “knowingly,” CMS should define this term based on its plain meaning -- which requires one to act with actual and specific knowledge of a violation.

Part D Formulary Inclusion of Selected Drugs (Section 110)

Price setting will have significant impacts on the structure of Part D and could reduce patient access to medicines. As plans take on more liability through Part D redesign, plans may tighten formularies as a strategy to manage costs. While Part D plans are still held to the protected classes and two drug per class coverage requirements, plans could elect to cover fewer drugs if they’re currently covering more drugs than required. Additionally, plans may also increase their use of exclusive contracts with manufacturers for preferred tier placement -- resulting in significant risk to patients needing some of the most innovative medicines to treat difficult to treat conditions such as cancer and autoimmune conditions. Plans may seek new flexibility from CMS to reform beneficiary protections (e.g., protected class requirements) in response to higher plan liability under Part D redesign. To ensure patients are protected from various plan attempts to offset costs, CMS should (through the formal notice-and-comment rulemaking process) re-examine and update rules around coverage determinations, appeals, and tiering exceptions to ensure patient access. Additionally, CMS should conduct aggressive formulary oversight to guard against growing utilization management or the narrowing of patient treatment options, including exclusion of medicines.

The Medicare drug price setting process implemented by CMS should have as a key goal expanded access to medicines for Medicare beneficiaries – including coverage, access, and affordability that is as good as or better than what is in place today – rather than more restrictions in coverage. CMS’ process for calculating a final MFP should minimize class effects that result in narrower formularies and fewer treatments for patients. To preserve patient access to drugs, CMS should review and update formulary review standards and monitor tiering, cost-sharing, and out-of-pocket exposure decisions. CMS should

also redefine Part D negotiated price to include all manufacturer price concessions, protect current Part D coverage standards, enforce existing formulary requirements and non-discrimination controls, and re-examine and update rules surrounding coverage determinations, appeals, and tiering exceptions.

APPENDIX A

Manufacturer Concerns and Suggestions for CMS' Options to Provide Access to the Medicare Part D Maximum Fair Price (MFP)

I. Program Integrity Challenges Associated with Upfront Price Concessions

There are two main approaches manufacturers use to provide access to differential prices for various end customers, such as providers, pharmacies, and health plans. Under the first approach, manufacturers provide access to discounted prices upfront, either through an entity purchasing a medicine at a discounted price directly from the manufacturer, or by an entity purchasing at a discounted price from a wholesaler. In the latter case, the manufacturer then effectuates the discounted price via a chargeback payment to the wholesaler.

Under the second approach, manufacturers provide access to discounted prices retrospectively through a rebate or statutory discount. A key feature of the retrospective approach is that the manufacturer is providing the price concession after a medicine has been dispensed or administered to a patient, enabling the eligibility of the claim for the price concession to be verified.

Both of these approaches work well in different circumstances, largely based on whether a patient's insurance status is a key determinant in how a claim should be processed. The upfront discount approach works well in situations where price concessions are not payer- or patient-dependent. For example, upfront discounts are commonly used by manufacturers to offer price concessions to groups of providers. In this instance, the price concession does not vary by patients' insurance status, but is instead a blanket discount, regardless of the patients the provider group treats. The retrospective approach works well in situations where price concessions do vary based on the payer or patient. For example, retrospective rebates are typically used by manufacturers to offer price concessions to health plans. The post-dispensing or post-administration claim for the rebate enables the manufacturer and the health plan to match eligible claims with the correct rebate amount.

Problems arise when the upfront approach is utilized for discounts that are payer- or patient-dependent, because the eligibility of a claim for a payer- or patient-specific discounted price is generally unknown to the manufacturer at the time the price concession is given. Pharmacies and providers typically serve a mix of patients with different insurance coverage, only some of whom may be eligible for price concessions. In these instances, there are program integrity risks when a unit of medicine is purchased upfront at a discounted price and is then administered or dispensed to a patient who is not eligible for the price concession.

Providers and pharmacies usually track inventory purchased upfront at differential prices by either physically distinguishing or separating it (i.e., a physical inventory model) or by utilizing a virtual inventory tracking system (also known as a replenishment model). Under the physical inventory model, pharmacies or providers maintain a separate or distinguished stock of medicines purchased at discounted prices. When medicines are dispensed to a patient eligible for the discounted price, units are pulled from the separate stock. Under the replenishment model, no separate or distinguished inventories of medicines are maintained. Rather, the pharmacy or provider will track, typically with a computerized system, units

of medicines dispensed to eligible patients. When a certain threshold of units is reached, the pharmacy or provider places an order to replenish that stock at the discounted price.⁵

Despite these inventory management systems, which are complex to manage and can impose a significant burden on providers and pharmacies, there is substantial evidence that diversion is occurring in programs that currently utilize the upfront approach for payer- or patient-specific price concessions. A notable example is the 340B Drug Pricing Program (340B program). The 340B program requires drug manufacturers participating in the Medicaid Drug Rebate Program to provide discounted outpatient drugs to eligible health care entities (known as covered entities or CEs).⁶ CEs often also use outside contract pharmacies to dispense drugs purchased on behalf of CEs through the 340B program. CEs must ensure drugs purchased at 340B prices are only administered or dispensed to individuals who qualify as 340B patients.

Despite the statutory diversion prohibition – which prohibits CEs from reselling or otherwise transferring 340B-discounted drugs to anyone except patients of the CE⁷ – both the HHS Office of Inspector General (OIG) and the Government Accountability Office (GAO) have found significant diversion issues in the 340B program. For example, according to a 2020 GAO report, of the 1,536 340B findings of noncompliance issued by the Health Resources and Services Administration (HRSA) for audits between fiscal years 2012 and 2019, 546 noncompliance findings (over one-third of the total) were related to diversion. This includes 463 noncompliance findings for dispensing 340B drugs to ineligible individuals.⁸

Additional program integrity challenges can arise when the upfront and retrospective approaches to price concessions are mixed. For example, federal law prohibits subjecting drug manufacturers to both a 340B discount and a Medicaid rebate on the same unit of a medicine (a situation known as a duplicate discount).⁹ But because 340B discounts are provided upfront and Medicaid rebates are provided retrospectively, both the GAO and OIG have noted the risk for duplicate discounts.¹⁰ Proper identification of claims subject to 340B pricing is critical for avoiding duplicate discounts, but this transparency does not exist sufficiently for the current 340B program.¹¹

Given the significant risk of diversion demonstrated when payer- or patient-specific price concessions are provided upfront, we strongly urge CMS to utilize a retrospective statutory discount to effectuate the MFP, similar to how CMS utilizes a retrospective discount approach for the Part D CGDP. This would also lessen the burden on pharmacies and Part D plans, which already have extensive experience with the CGDP model, helping to ensure a smooth implementation of the MFP in 2026. The addition of required 340B claims modifiers in Part D and Part B MA for units subject to 340B pricing would help to avoid

⁵ For an overview of the physical inventory model and the replenishment model, as utilized by contract pharmacies in the 340B program, please see: OIG. Memorandum Report: Contract Pharmacy Arrangements in the 340B Program. February 4, 2014. Available at: <https://oig.hhs.gov/oei/reports/oei-05-13-00431.pdf>

⁶ OIG. Memorandum Report: Contract Pharmacy Arrangements in the 340B Program. February 4, 2014. Available at: <https://oig.hhs.gov/oei/reports/oei-05-13-00431.pdf>

⁷ Public Health Service Act (PHSA) § 340B(a)(5)(B).

⁸ Of the remaining 83 diversion noncompliance findings, 76 findings were for failure to ensure proper inventory management of 340B drugs and 7 findings were for systematic errors in software used to determine 340B eligibility. See GAO. Drug Pricing Program: HHS Uses Multiple Mechanisms to Help Ensure Compliance with 340B Requirements. December 2020. Available at: <https://www.gao.gov/assets/gao-21-107.pdf>

duplicate MFP and 340B discounts as required under the IRA.¹² This is similar to an OIG recommendation to minimize the risk of duplicate 340B discounts and Medicaid rebates.¹³

II. Overview of the Part D Coverage Gap Discount Program

For drugs to be covered under Medicare Part D, manufacturers must provide applicable beneficiaries with access to discounted prices for brand drugs filled in the Part D coverage gap at the POS. The CGDP was created by the passage of the Patient Protection and Affordable Care Act (ACA) in March 2010 and became effective less than nine months later in January 2011.¹⁴ The ACA required CMS to use a TPA to operationalize the CGDP,¹⁵ and Palmetto GBA (Palmetto) has served in this role since the beginning of the program.

The CGDP operates seamlessly at the POS for patients. At the time a pharmacy claim is adjudicated for an eligible Part D enrollee in the coverage gap, the Part D plan (or pharmacy benefit manager (PBM) acting on its behalf) includes the manufacturer coverage gap discount amount as part of the plan's reimbursement to the pharmacy, maintaining a POS patient benefit and ensuring the pharmacy receives full reimbursement on the same schedule as it would otherwise. To cover this additional payment from the Part D plan to the pharmacy on behalf of the manufacturer, CMS provides plans with an additional prospective per member per month (PMPM) payment based on projections in plan bids and plan enrollment.¹⁶

Part D plan payments of coverage gap discounts at the POS are captured on the Prescription Drug Event (PDE) record. Through authority granted by CMS, Palmetto accesses the PDE data and tabulates coverage gap discount liability for each manufacturer. Palmetto then invoices manufacturers on a quarterly basis and provides claims-level data to manufacturers for verification. Manufacturers pay Part D plan sponsors through a direct payment process managed by Palmetto.¹⁷ Part D plan sponsors and CMS then reconcile received manufacturer payments against the prospective PMPM CMS payments at the end of the Part D contract year.¹⁸

The CGDP has a proven track record of providing a POS benefit to patients and is a model well known to CMS, health plans, pharmacies, and manufacturers. This makes the CGDP an ideal model for effectuating the MFP.

III. Effectuating the MFP in Medicare Part D

CMS can operationalize a model similar to the CGDP to offer enrollees the benefit of the MFP at the POS in Part D (see Appendix A). For a discussion of how the MFP statutory discount amount should be defined for the Part D program, please see the “Calculating the MFP Statutory Discount” section later in this paper.

Available at: https://www.cms.gov/Medicare/Prescription-Drug-Coverage/PrescriptionDrugCovContra/Downloads/2011CoverageGapDiscount_Revised-Guidance-052110.pdf

Patient cost sharing at the pharmacy counter for selected drugs dispensed to Part D enrollees would be based on the MFP.¹⁹ Much like the CGDP, Part D plans (or PBMs acting on their behalf) would pay the MFP statutory discount amount to the pharmacy on behalf of drug manufacturers at the time of claim adjudication. This would ensure that the pharmacy receives its full reimbursement on the same schedule as it would otherwise, a crucial protection for independent community pharmacies that may not be able to financially sustain a negative balance on purchased medicines for a prolonged period of time. In addition, this approach builds upon existing direct financial links between Part D plans and pharmacies (whereas manufacturers do not typically have direct financial links to pharmacies). To cover Part D plan liability for paying the MFP statutory discounts on manufacturers' behalf, CMS would include an additional, prospective PMPM payment to Part D plans based on projections in plan bids and plan enrollment.²⁰

The MFP statutory discount payments would be captured on the Part D PDE data record. A TPA would receive access to the PDE for the purpose of tracking and tallying MFP statutory discount liabilities for each drug manufacturer. Manufacturers would be invoiced on a quarterly basis and the MFP TPA would facilitate the distribution of payments to Part D plans.²¹ CMS and Part D plans would then reconcile the PMPM prospective payments against manufacturer payments at the end of the Part D contract year.

This operational approach is highly similar to the current CGDP, making it straightforward and efficient for CMS to implement quickly and ensuring POS availability for Part D enrollees.

Under the CGDP today, manufacturers may access limited claims-level data from Palmetto to help verify that manufacturers are being invoiced for the appropriate amount. We urge CMS to provide similar access to data through the MFP TPA and to continue to allow manufacturers to dispute invoice errors.²²

In addition, we encourage CMS to consider a few key changes under a future MFP statutory discount process. Specifically:

- The data fields made available to manufacturers should be expanded beyond those currently available under the CGDP. A minimum list of data fields that should be made available to manufacturers is included as Appendix B.
- Detailed claims-level data should be made available to manufacturers at the time of invoicing to help manufacturers effectively verify eligible claims and statutory discount amounts. Data included in the invoice and the detailed claims-level data should be made available to manufacturers in a more easily accessible format that does not require external technology to decode, along with an accompanying data dictionary with descriptions of all data fields.
- If a manufacturer files a dispute, the MFP TPA should be transparent and provide clear reasoning and detailed data to support the status of the dispute and resolution. The dispute process should also ideally be shortened relative to the length of the dispute process that can occur under the CGDP today.

¹⁹ The “negotiated price” for a Part D selected drug may not exceed the MFP plus a dispensing fee. SSA § 1860D-2(d)(1)(B)(as amended by the IRA). Long-standing CMS guidance provides that the Part D “negotiated price” is the basis for patient coinsurance and patient payments for a drug in the deductible.

²⁰ CMS should look to SSA § 1196(a)(3) to pre-pay these amounts. We welcome additional discussion with CMS on approaches for the prospective payment of the statutory discount amounts.

²¹ Pub. L. No. 111-148, § 3301(b) prohibited CMS from receiving manufacturer CGDP payments directly, resulting in the structure where manufacturers submit payment to Part D plans who then reconcile with CMS against the prospective PMPM payments. In contrast, the IRA does not prohibit CMS from receiving manufacturer MFP statutory discount payments. Accordingly, CMS could also consider having manufacturers reimburse the Agency directly instead of Part D plans.

²² It is important to recognize that the IRA’s limitation on administrative review does not prohibit CMS from establishing such a dispute resolution process – which would be more akin to reconsideration, as opposed to a formal administrative appeal.

When applied to the IRA MFP process, these minimal changes are expected to result in an improved invoicing, dispute, and appeals process and would not be unduly burdensome to operational stakeholders.

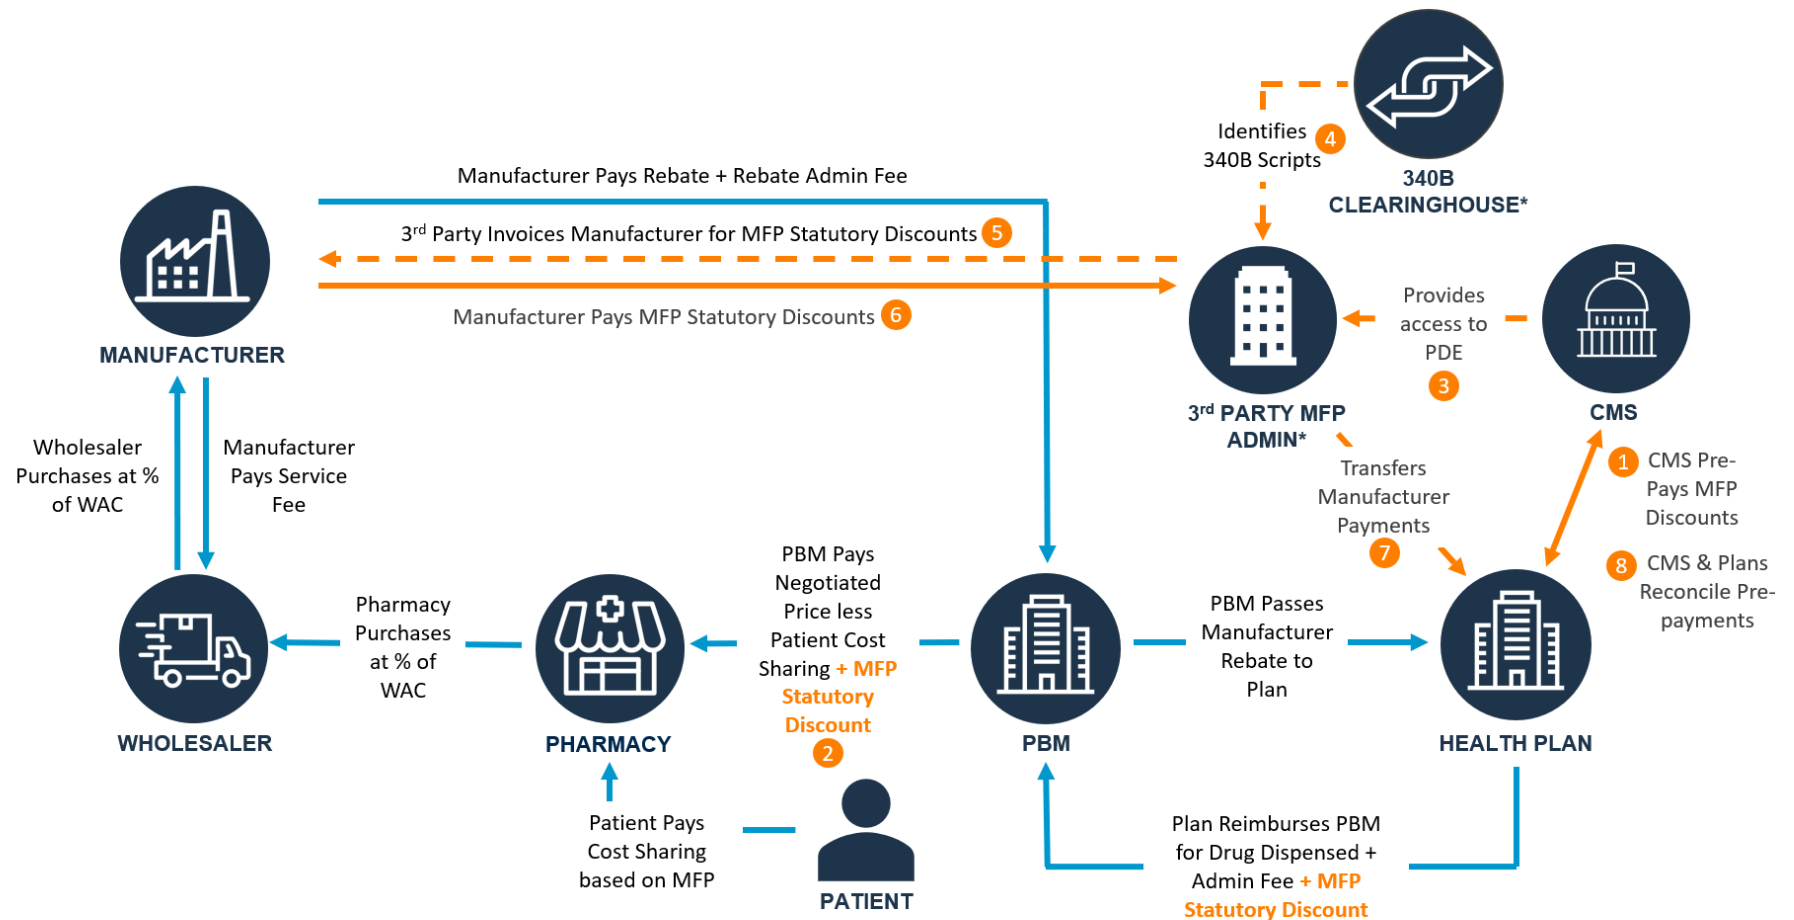

IV. Principles for Selecting an MFP TPA

While there is an array of entities capable of serving as the MFP TPA, we recommend some principles for the Agency to follow in choosing these entities:

- The TPA entity should have demonstrated expertise in working with Part D PDE data, Part B CMS-1500/837P claims, and MA Encounter Data.
- The same entity would ideally be able to serve as TPA across Part D, Part B FFS, and Part B MA to minimize operational differences.
- The TPA entity should be able to serve as the MFP TPA without creating conflicts of interest with existing business lines and without creating the potential for misaligned incentives that may increase costs for patients and the health care system.
- The TPA entity should provide invoices and detailed data to manufacturers for verification in a format that is easy to access and should commit to not utilizing these data (or selling them) for other purposes.
- The TPA entity should be committed to transparency in invoicing and a robust dispute resolution process with manufacturers.
- The TPA entity should meet performance metrics established by CMS, including metrics related to sharing detailed data with manufacturers within the required timeframe.

Appendix B – Effectuating the MFP in Part D with a Third-Party MFP Administrator

This schematic shows a typical operational flow between stakeholders in Part D today and how the operational model for effectuating the MFP as a retrospective discount would factor in. There is some variation in the operational flow today not captured here (for example, not all Part D plans have a PBM operate on their behalf, in which case the Part D plan would reimburse the pharmacy and receive manufacturer rebates directly).

Appendix B – Part D Required Data Fields

In order to verify the calculation of MFP statutory discount amounts owed by the manufacturer, at a minimum the third-party MFP administrator should make the following data fields available to manufacturers on a detailed claims-level basis at the time of invoicing. The majority of these data fields are already available through the PDE record, reducing the burden of sharing these fields with manufacturers. Additional data fields beyond those listed below could be helpful to manufacturers, and we welcome the opportunity to discuss these with the Agency.

- Date of Service (i.e., date filled)*
- Prescription ID Number*
- Part D Contract ID and Part D Plan Benefit Package ID
- De-identified Part D Beneficiary ID
- Prescriber National Provider Identifier (NPI)
- Pharmacy NPI*
- 340B Covered Entity ID/NPI
- National Drug Code (NDC)*
- Days Supply*
- Quantity Dispensed*
- Fill Number*
- Paid Date (date the Part D plan paid the pharmacy)
- Claim Status (whether the claim was paid or reversed)
- 340B Claims Modifier Field
- Clearinghouse Determination of 340B Claim
- 340B Ceiling Price (received from clearinghouse)
- Maximum Fair Price (MFP)
- MFP Statutory Discount Amount (and any supporting fields utilized in calculating the MFP statutory discount amount)

* These fields are already provided to manufacturers as part of the detailed data reports under the CGDP.

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear. Dr. Seshamani:

The Pharmaceutical Care Management Association (PCMA) appreciates the opportunity to submit comments on the Centers for Medicare & Medicaid Services' (CMS) initial guidance regarding implementation of sections 11001 and 11002 of the Inflation Reduction Act (IRA), as published on March 15, 2023, which established the Medicare Drug Price Negotiation Program (hereafter referred to as "Negotiation Program") to negotiate prices for certain single source drugs and biological products.¹

PCMA is the national association representing America's pharmacy benefit managers (PBMs), which administer prescription drug plans and operate specialty pharmacies for more than 275 million Americans with health coverage through Fortune 500 companies, health insurers, labor unions, Medicare, Medicaid, the Federal Employees Health Benefits Program, and through the exchanges established by the Affordable Care Act. Our members work closely with plans and issuers to secure lower costs for prescription drugs and achieve better health outcomes.

Our comments on CMS's initial guidance on the Negotiation Program for Initial Price Applicability Year (IPAY) 2026 can be summarized as follows:

- **The Negotiation Program is not intended to disincentivize manufacturers from negotiating price concessions with Part D plans, including price concessions in excess of the maximum fair price (MFP) for selected drugs.** CMS should thus

¹ CMS. "Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments." March 15, 2023. Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

implement the program in a way that does not disrupt or weaken the ability of Part D plans to negotiate price concessions with manufacturers, both for selected drugs and drugs that are not subject to the MFP. CMS should, in its final guidance, clarify this point, and incorporate this broader theme in its implementation of specific aspects of the program, including in its consideration of manufacturer-specific data for purposes of negotiating with a manufacturer of a selected drug and in determining whether a selected drug will be subject to re-negotiation, as well as in the Part D formulary inclusion of selected drugs requirement.

- **PBMs will play a vital role in administering CMS’s Negotiation Program, such as in providing manufacturers with the necessary verification of whether or not a particular claim is for an MFP-eligible individual.** To most efficiently stand up this new program, CMS should consider whether existing frameworks involving PBMs and pharmacies can best facilitate access to MFP for eligible individuals at dispensing entities. For example, the Coverage Gap Discount Program (CGDP) provides a useful model in which PBMs already facilitate access to price concessions at the point-of-sale to make other supply chain actors whole. Its successor—the Manufacturer Discount Program (MDP)—could be built in such a way that the Negotiation Program’s prices are also operationalized through it.

I. Section 30 – Identification of Selected Drugs for Initial Price Applicability Year 2026.

Background: CMS will take an expansive approach to the Negotiation Program by using a broad definition of a “qualifying single source drug” (“QSSD”) to include all dosage forms and strengths of the drug with the same active moiety (or, for biologics, active ingredient) and the same holder of a New Drug Application (NDA) (or, for biologics, a Biologics License Application (BLA)) —inclusive of products that are marketed pursuant to different NDAs/BLAs. In addition, for purposes of counting the seven or 11 years that must elapse to qualify, CMS will use the earliest date of approval of the *initial* application number assigned to the NDA/BLA holder for the active moiety/active ingredient. Furthermore, in the initial guidance, CMS states that to be considered for the IRA’s orphan drug exclusion, a drug or biological product must (1) be designated as a drug for only one rare disease or condition under section 526 of the Federal Food, Drug, and Cosmetic (FD&C) Act; and (2) be approved by the FDA only for one or more indications within such designated rare disease or condition. Notably, to qualify for the orphan drug exclusion, all dosage forms and strengths and different formulations of the QSSD must meet the criteria for exclusion.

Comment: CMS’s approach effectively eliminates the ability of drug manufacturers to “game the system” and keep some products out of the definition of QSSD. As explained in more detail in our comment on Section 110 below, CMS’s broad approach has the potential to capture potentially dozens of different dosage forms, strengths, and routes of administration for a

selected drug, thereby significantly increasing the number of unique marketed products subject to a MFP in a given year. While we endorse and appreciate the intent of this choice, defining QSSD so broadly may have unintended consequences, particularly with respect to the ability of Part D plans and PBMs to effectively manage their formularies and thus preserve access to lower-cost medication options for beneficiaries.

Our primary concern relates to how CMS's broad definition of QSSD will interact with the IRA's Part D formulary requirement to cover "each covered Part D drug that is a selected drug." CMS's broad definition of QSSD could lead to an (incorrect) reading of this provision as requiring Part D plan sponsors to include in their formularies *every dosage form, strength, or formulation* of the selected drug. As explained in more detail below, such an approach would be inconsistent with the current framework of the Part D program, which does not require formularies to include every dosage form, strength or formulation of a drug, even for "protected class drugs." It is also inconsistent with the framework of the IRA, which preserves and promotes the ability of PBMs to negotiate additional price concessions on drugs subject to the MFP. This reading also does not align with the reality of the pharmacy supply chain: today pharmacies do not generally stock each dosage form, strength, and formulation of a product and doing so would require a significant overhaul to inventory management and supply chain agreements. Given the above, PCMA urges CMS to clarify in its final guidance that it will not take such an approach with regard to the IRA's Part D formulary requirement, and that it will instead proceed with an approach consistent with our request outlined in Section 110 below.

Lastly, as currently worded, the proposed QSSD definition could potentially capture differing routes of administration of a selected drug. We are concerned that this approach may inadvertently encompass drugs with significant variation in cost due to the different routes of administration. Moreover, we are concerned about the potential implications for drugs of a selected drug that are covered under Medicare Part B – i.e., injectable or intravenous drugs furnished "incident to" a physician's service – even though Medicare Part B drugs will not be selected for negotiation until 2028. PCMA urges the agency to clarify in final guidance how access to MFP for these situations will be resolved, and that these drugs are outside the scope of the IRA's Part D formulary requirements.

II. Section 40 – Requirements for Manufacturers of Selected Drugs for Initial Price Applicability Year 2026.

Background: CMS intends to enter into an Agreement (a "Medicare Drug Price Negotiation Program Agreement") only with the Primary Manufacturer of each selected drug. To the extent that more than one entity meets the statutory definition of a manufacturer for a selected drug for purposes of IPAY 2026, CMS intends to designate the entity that holds the NDA/BLA for the selected drug to be the Primary Manufacturer subject to an Agreement. Pursuant to section 1193(a)(4), CMS intends to include in the Agreement with the Primary Manufacturer several requirements pertaining to Secondary Manufacturers of the selected drug, including reporting a

list of relevant Secondary Manufacturers and collecting and reporting necessary negotiation data elements and information applicable to any Secondary Manufacturer. CMS also intends to hold the Primary Manufacturer responsible for other aspects of the program, such as ensuring that any Secondary Manufacturer makes the MFP available to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers.

Comment: PCMA supports imposing requirements for all various forms of the selected drug on a single Primary Manufacturer, including requirements pertaining to Secondary Manufacturers. This approach centralizes responsibility for compliance with the Negotiation Program’s requirements outlined in the initial guidance and allows CMS to most efficiently operationalize the requirements of the statute, including the statutory requirement to negotiate a single MFP with “the manufacturer” of a selected drug and the requirement that the Primary Manufacturer provide access to the MFP to MFP-eligible individuals.

As we remarked in our comments on the Small Biotech Drug exception, the various ownership and market licensing structures in place in the pharmaceutical market are more complicated than what Congress laid out in the IRA, and what CMS has laid out in guidance thus far. As such, we recommend CMS work through several iterations of assigning Primary Manufacturer status before settling on the NDA/BLA holder as the default.

III. Section 40.4 – Providing Access to the MFP.

Background: CMS proposes to define “providing access to the MFP” as ensuring that the amount paid by the dispensing entity for the selected drug is no greater than the MFP. To accomplish this, CMS proposes to require that Primary Manufacturers provide access to the MFP to dispensers (e.g., pharmacies) in one of two ways: (1) by ensuring the price paid by the dispensing entity is no greater than MFP; or (2) by providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP. Thus, CMS intends to allow access to MFP by dispensers either at the point-of-sale or through the provision of retrospective reimbursement for the difference. Primary Manufacturers would be required to ensure that dispensers (as well as entities such as wholesalers) are reimbursed the difference between their acquisition cost and the MFP within 14 days.

Comment: PCMA does not believe either option proposed by the agency represents an effective approach at providing access to MFP to dispensers. There is currently no existing mechanism in the supply chain that would allow manufacturers to ensure the price paid by the dispensing entity for a drug dispensed to an MFP-eligible individual is no greater than MFP. Furthermore, dispensing entities purchase most drugs from wholesalers or specialty distributors, who themselves are currently under no obligation to comply with the requirement to offer MFP. On the issue of retrospective reimbursement, existing wholesaler and supplier frameworks do

not facilitate payments from manufacturer to the dispensing entity based upon claims payment.² In practice, it is PBMs that play the primary role in processing retrospective reimbursements on behalf of their members.

Given the above, PCMA instead urges CMS to consider as an alternative the Coverage Gap Discount Program (CGDP) in place today. Under the CGDP, Part D plan sponsors and PBMs facilitate manufacturer price concessions at the point-of-sale, while CMS utilizes a third party administrator (TPA) to aggregate Part D data, distribute invoices to manufacturers, reconcile disputes, and reimburse Part D plans for “advancing” access to the manufacturer discount at the point-of-sale. This existing framework for the CGDP, which CMS has indicated will be largely carried over with the transition to the new Manufacturer Discount Program (MDP) in January 2025, is the most effective approach to facilitate access to the MFP at the point-of-sale, and would fulfill the policy goal of ensuring that stakeholders receive the full benefit of the MFP *at the time of dispensing* an MFP-eligible drug, rather than relying on other lengthier and less efficient processes. CMS should leverage the existing system to best operationalize this critical component of providing access to MFP to dispensing entities. Taking this tack, however, does raise a number of operational questions for additional consideration, namely:

- It may require new reporting and documentation requirements for actual pharmacy acquisition costs for selected drugs via an updated National Council for Prescription Drug Programs (NCPDP) telecommunications standard or acceptance of the use of a standard benchmark payment rate for this purpose alone.
- Given the magnitude of the expected price differences, and high volume of applicable claims, plans may need further assurances about repayment by manufacturers, or for CMS to establish a secured fund for this purpose.³

Furthermore, as mentioned above, pursuant to the IRA, CMS will in January of 2025 transition from the CGDP to the new MDP. On this transition, CMS has stated that

in more detail in our comments on the agency’s information collection request related

² The 340B program, for example, is operationalized through wholesaler chargebacks. It is agnostic to ultimate claims payment. All duplicate Medicaid discount and other reconciliation occurs *after the fact* between manufacturers and covered entities. The reconciliation is not made in real-time, and 340B prices are not generally made available to patients at the point-of-sale.

³ See our comments on the MDP agreement, filed April 10, 2023, in which we identified a manufacturer that had declared bankruptcy and was unable to pay its CGDP obligations.

⁴ CMS-10846, Supporting Statement-Part A.

to the IRA's Part D benefit redesign provisions, PCMA also recommends that CMS align the new MDP agreement with its MFP agreement. PCMA believes this approach would allow CMS and Part D plans to administer the Part D program most efficiently on behalf of beneficiaries.

For IPAY 2026, and the second price applicability year of 2027, only Part D drugs will be selected for negotiation. However, some Part D covered drugs can be administered by physicians and covered under Part B instead. We believe CMS needs to account for access to MFP across both benefits, for a drug that is selected on the basis of its spending in one benefit. Providing access to retail and specialty pharmacy drugs under Part B is not common. The need to provide access outside of a drug's normal benefit will generally work in the other direction: Part B drugs administered incident to a physician service can from time-to-time be prescribed and dispensed in a manner that turns them into Part D covered drugs. The process we propose here would be able to handle these situations, too, since they would simply run through the PBM's claims processing system. Similarly, in a Medicare Advantage Prescription Drug (MA-PD) plan that more holistically manages prescription drug benefits across Parts B and D, the claims adjudication system would be able to offer MFP to the appropriate individuals.

The law continues to allow for the payment of dispensing fees for selected drugs, along with the MFP, and dispensing fees will continue to count toward beneficiary cost-sharing calculations. For non-selected drugs, the negotiated price paid to pharmacies today is not mathematically linked to an actual acquisition cost. Instead, these rates are determined by negotiations between pharmacies and Part D plan sponsors, and account for price concessions paid by or owed to pharmacies for contract performance, among other contract terms. Dispensing fees in the Part D program are not a significant source of revenue to pharmacies as they are in other programs, like Medicaid, where reimbursement is set by law to track with acquisition costs more closely. We believe some Part D plans may negotiate higher dispensing fees for selected drugs than for non-selected drugs in their contracts with pharmacies, to reflect pharmacy revenue needs more appropriately. CMS should understand and acknowledge this market dynamic well in advance of plan year 2026 bids and plan benefit package reviews.

IV. Section 50.1 – Manufacturer-Specific Data.

Background: The IRA directs CMS, for purposes of negotiating the MFP of a selected drug, to consider certain "manufacturer-specific data," as the basis for determining its initial offers. These data are required to be reported by the Primary Manufacturer and include: research and development costs; current unit costs of production and distribution; prior federal financial support for novel therapeutic discovery and development; data on pending and approved patent applications; exclusivities recognized by the FDA and FDA applications and approvals; and market data and revenue and sales volume data in the United States. In the initial guidance, CMS states that it intends for the Primary Manufacturer to aggregate data from both the Primary Manufacturer and any Secondary Manufacturer(s).

Comment: As mentioned above, PCMA appreciates CMS’s language regarding placing the onus on the Primary Manufacturer to collect all required data and information. PCMA urges CMS to further clarify in the final guidance that manufacturer-specific data should originate exclusively from manufacturers, and that the agency will not impose any additional reporting requirements on third parties, such as PBMs, as part of the reporting and collection of manufacturer-specific data.

As for the Negotiation Program itself, PCMA is concerned that the agency’s consideration of “market data and revenue,” which CMS proposes to define to include “manufacturer average net unit price to Part D Plan sponsors,” may serve to deter manufacturers of selected drugs from negotiating additional price concessions with Part D plans, thus disrupting the successful, market-based approach that has made the Part D program so successful over the last two decades. As such, PCMA urges CMS to clarify in final guidance that it will administer the Negotiation Program in a way that does not disrupt or create disincentives for manufacturers to negotiate additional rebates or discounts on selected drugs. Furthermore, and as explained in more detail below, CMS should clarify that consideration of this type of manufacturer-specific data will not by itself trigger a future re-negotiation of MFP.

V. Section 50.2 – Evidence About Therapeutic Alternatives for the Selected Drug.

Background: Under the IRA, CMS is required to consider “evidence about therapeutic alternatives” for purposes of negotiating an MFP for the selected drug. The factors on therapeutic alternatives CMS must consider include: the extent to which the selected drug represents a therapeutic advance and the extent to which the selected drug and the therapeutic alternatives address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy. CMS must also consider the FDA-approved prescribing information for the selected drug and therapeutic alternatives, and evidence on the comparative effectiveness of the selected drug and its therapeutic alternatives. In the initial guidance, CMS states that it intends to consider evidence about therapeutic alternatives submitted by members of the public, including manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties. CMS also notes that because the IRA prohibits the agency from using comparative clinical effectiveness research in a manner that treats extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill, the agency will not consider information submitted that treats extending the life of individuals in these populations as of lower value, such as the use of quality-adjusted life-years (QALYs).

Comment: PCMA generally supports the consideration of therapeutic alternatives as part of this process. Increasing availability of therapeutic alternatives provides benefits to a range of stakeholders, including providing patients with a wider selection of potentially lower-cost treatment options. PBMs are at the forefront of considering therapeutic alternatives through the use of Pharmacy & Therapeutic (P&T) committees to design patient-centric, value-based

formularies. P&T committees are comprised of independent clinical experts that serve an essential function in evaluating clinical evidence on drugs and recommending placement of drugs on formularies. Consistent with the sources CMS states it will use to evaluate therapeutic alternatives in the context of the Negotiation Program, P&T committees also consider relevant information and evidence from across multiple platforms, including current medical literature, HHS-approved compendia, and widely recognized national, evidence-based guidelines when making formulary recommendations. Given the value of therapeutic alternatives in increasing options to lower cost and clinically effective options, PCMA believes it is appropriate for CMS to also consider this factor for purposes of negotiating an MFP for the selected drug. Furthermore, the IRA prohibits the use of information that treats extending the life of individuals who are elderly, disabled, or terminally ill as of lower value. However, PCMA urges CMS to clarify in final guidance that this general prohibition will not apply to, and is not intended to discourage, the ongoing use of non-QALY measures of cost- or clinical effectiveness.

VI. Section 60.3 – Methodology for Developing an Initial Offer.

Background: For the purposes of determining an initial offer, CMS intends to (1) identify therapeutic alternative(s), if any, for the selected drug; (2) use the Part D net price for the therapeutic alternative(s) that is a Part D drug to determine a starting point for developing an initial offer; (3) evaluate the clinical benefit of the selected drug (including compared to its therapeutic alternative(s)) for the purposes of adjusting the starting point using the negotiation factors, resulting in the “preliminary price”; and (4) further adjust the preliminary price by the negotiation factors outlined in the guidance to determine the initial offer price.

Comment: PCMA supports CMS’s approach of using the Part D net price for the therapeutic alternative(s) as the starting point for negotiation for the selected drug. PCMA agrees with CMS that this approach best enables the agency to start developing the initial offer within the context of the cost and clinical benefit of a group of drugs that treat the same disease or condition, and that the “cost of therapeutic alternatives ... is an important factor when considering the overall benefit that a treatment brings to Medicare beneficiaries.”⁵ In cases where there is no identified therapeutic alternative, PCMA supports CMS’s approach of determining the starting point for the initial offer based on the Federal Supply Schedule or “Big Four Agency” pricing.

CMS will identify the price of each therapeutic alternative that is a covered Part D drug by using Part D Prescription Drug Event (PDE) data and detailed Direct and Indirect Remuneration (DIR) report data. PCMA understands the benefit of this approach to collecting information regarding the price of therapeutic alternatives but urges the agency to implement necessary safeguards to ensure it does not publicly share any proprietary information in a way that could harm or undermine competition. We urge caution in relying upon the detailed DIR reports, as well, since

⁵ CMS Initial Guidance, p. 49.

often Part D plans are allocating price concessions across different strengths and package sizes indirectly. PCMA also urges CMS to clarify that this process will not impose any additional reporting burdens or require additional data submissions from plan sponsors or PBMs.

Last, PCMA urges the agency to clarify that once the MFP is set for a selected drug, a manufacturer's decision to negotiate a price lower than MFP with a particular Part D plan sponsor will not prompt a renegotiation in later years. Pursuant to the statute, once an MFP is established for a selected drug, the MFP is only updated by an annual CPI-U adjustment for the relevant 12-month period.⁶ This is the case unless the selected drug is subject to renegotiation,⁷ which is further limited to select circumstances including *material changes* to the manufacturer-specific and comparative-effectiveness negotiation factors.⁸

Even if CMS considers Part D price concessions as part of its review of “market data and revenue” criterion of manufacturer-specific data for purposes of negotiating the MFP, PCMA urges CMS to clarify that a manufacturer's decision to negotiate a price lower than MFP with a particular Part D plan sponsor alone will not suffice to qualify as a “material change” to the manufacturer-specific negotiation factor that would require a selected drug to undergo renegotiation. This clarification is truly critical. Ambiguity regarding the breadth of the potential impact of the “market data and revenue” criterion on renegotiation may deter manufacturers from negotiating with PBMs. PBMs would be less able to negotiate price concessions that are lower than the MFP, ultimately contravening the IRA's mission of lowering prescription drug costs for patients. In the final guidance, we strongly urge CMS to clearly communicate that the decision of a manufacturer of a Selected Drug to negotiate a discount or other price concession in excess of MFP with a payer is not a “material change” to the manufacturer-specific negotiation factor that would require a selected drug to undergo renegotiation.

VII. Section 70 – Removal from the Selected Drug List Before or During Negotiation, or After an MFP is in Effect.

Background: Pursuant to the IRA, a selected drug will cease to be a selected drug and will no longer be subject to the Negotiation Program if CMS determines: (1) the FDA has approved a generic drug under Section 505(j) of the FD&C Act that identifies as its reference listed drug a product that is included in the selected drug, or the FDA has licensed a biosimilar biological product under section 351(k) of the Public Health Service (PHS) Act that identifies as its reference product a product that is included in the selected drug; and (2) the generic drug or biosimilar biological product, as applicable, is marketed pursuant to such approval or licensure. CMS states that the effect and timing of losing selected drug status will depend on when CMS

⁶ See Section 1195(b)(1)(A) of the Social Security Act.

⁷ See Section 1195(b)(1)(B) of the Social Security Act.

⁸ See Section 1194(f)(2) of the Social Security Act.

makes these determinations. CMS will consider an approved generic drug or licensed biosimilar biological product to be marketed when these data reveal that the manufacturer of the generic drug or biosimilar biological product has engaged in “bona fide” marketing of it.

Pursuant to Section 90.4 of the initial guidance, if CMS makes such a determination that a generic drug or biosimilar biological product has been marketed as evidenced by the PDE data, CMS intends to monitor whether robust and meaningful competition exists in the market once it makes such a determination. Examples of monitoring CMS may conduct include whether the generic drug or biosimilar biological product is regularly and consistently available for purchase through the pharmaceutical supply chain, and whether it is available for purchase by community retail pharmacies in sufficient quantities from their wholesale suppliers.

In accordance with section 1192(c)(1) of the Act, a selected drug that is included on the list of selected drugs for an initial price applicability year will remain a selected drug for that year and each subsequent year beginning before the first year that begins at least nine months after the date on which CMS determines the statutory criteria for removal are met.

Comment: PCMA is supportive of a process for removal from the selected drug list that expeditiously removes a drug from negotiation after generic or biosimilar entry. Expedient removal of a selected drug when removal criteria are met is essential to allow Part D plan sponsors and PBMs to fulfill their role of promoting substitution of generics and biosimilars as lowest net cost products, where applicable. Furthermore, to provide greater certainty surrounding when a drug will be removed from the list of selected drugs, PCMA urges CMS to develop a clear and administrable standard for “robust and meaningful” competition from generic or biosimilar entrants, such that only a product that is truly marketed will trigger the removal from the selected drug list. We generally believe that if a new generic or biosimilar product is available to wholesalers and dispensers through common distribution channels, this should qualify as “bona fide” marketing of that drug or product.

VIII. Section 80 – MFP Eligible Individuals.

Background: The IRA defines “maximum fair price eligible individual” to mean, with respect to a selected drug, the following: in the case such drug is dispensed to the individual at a pharmacy, by a mail-order service, or by another dispenser, an individual who is enrolled in a prescription drug plan under Medicare Part D or an MA–PD plan under Medicare Part C (including enrollees in Employer Group Waiver Plans (EGWPs)) if coverage is provided under such plan for such selected drug; and/or in the case such drug is furnished or administered to the individual by a hospital, physician, or other provider of services or supplier, an individual who is enrolled under Medicare Part B, including an individual who is enrolled in an MA plan under Medicare Part C, if payment may be made under Part B for such selected drug.

Comment: PCMA supports this definition of an MFP-eligible individual. Part D plan sponsors and PBMs will play a critical role in providing manufacturers with the necessary verification of whether or not a particular claim is for an MFP-eligible individual. PBMs already perform this important role in other federal programs, particularly in the 340B program for identified 340B claims, where PBMs help prevent diversion by utilizing necessary verification procedures to ensure that drugs purchased with 340B discounts are provided only to eligible patients.

This is just part of the larger role PBMs will play in the Negotiation Program generally. As mentioned above, PCMA urges CMS to adopt an approach in final guidance that explicitly leverages the existing mechanisms PBMs utilize to facilitate access to price concessions (and thus MFP) at the point-of-sale to both MFP-eligible individuals (in the form of cost-sharing reflected the MFP price) and to dispensers, and to administer the existing rebating system to make other supply chain actors whole.

Furthermore, as we identified in Section 40.4 above, CMS also needs to consider how to effectuate access to negotiated Part D covered drugs to MFP-eligible individuals seeking to obtain through their Part B or Part C benefits. Our suggestion to leverage the MDP in the pharmacy transaction space may not work well for medical benefit applications of the MFP for selected drugs. By 2028, CMS will have had to solve this for the Part B provider community in a more formalized manner. In the meantime, we recommend CMS allow flexibility to plans, keeping in mind the 14 days turnaround included in the draft guidance.

IX. Section 110 – Part D Formulary Inclusion of Selected Drugs.

Background: Pursuant to the IRA, CMS intends to require Medicare Part D plans to include in their Part D formularies “each covered Part D drug that is a selected drug” during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period.⁹

Notably, however, as mentioned above, CMS is proposing to take an expansive approach with the program by broadly defining a QSSD that can qualify as a selected drug subject to negotiation to include all dosage forms and strengths of the drug with the same active moiety (or, for biologics, active ingredient) and the same holder of an NDA (or, for biologics, a BLA) — inclusive of products that are marketed pursuant to different NDAs/BLAs. In addition, for purposes of counting the seven or 11 years that must elapse to qualify, CMS will use the earliest date of approval of the *initial* FDA application number assigned to the NDA/BLA holder for the active moiety/active ingredient.

⁹ Section 1860D-4(b)(3)(I) of the Social Security Act.

Comment: CMS’s broad approach to defining QSSDs that can be subject to negotiation, paired with the narrow scope of the orphan drug exclusion, may lead to an increased number of unique marketed products subject to MFP in a given year (e.g., more than 10 unique, marketed products may account for the ten selected QSSDs.) Therefore, PCMA urges CMS to clarify in final guidance that it **will not interpret** the Part D formulary requirement to cover “each covered Part D drug that is a selected drug” as requiring Part D plan sponsors to include in their formularies *every dosage form, strength, or formulation* of the selected drug. The practical impact of taking such an approach cannot be overstated, as it could potentially require a plan to include in its formularies dozens of different dosage forms, strengths, and routes of administration for a selected drug. This would severely undermine a plan’s ability to administer and determine the scope of its formulary to ensure low-cost options for its beneficiaries. It would also be inconsistent with the framework of the IRA, which preserves and promotes the ability of PBMs to negotiate additional price concessions on drugs subject to the MFP.

Moreover, this approach is inconsistent with the current framework of the Part D program. Today, Part D formularies must include drug categories and classes that cover disease states, consistent with Part D program requirements, and within each category or class, must include at least two drugs, regardless of the classification system that is utilized by the plan.¹⁰ While CMS guidance requires that plan sponsors include multiple strengths and dosage forms for each covered drug,¹¹ CMS **does not** require formularies to include **every** dosage form, strength, or formulation of the drug (potentially across multiple NDAs/BLAs). Such a policy would fundamentally undermine the market-based negotiation that underlies the Part D program.

Even in the case of “protected class” drugs, which remain subject to a higher standard than selected drugs (to the extent they fall outside of these classes), Part D plans are only required to cover “substantially all” drugs in the named classes. CMS instituted the protected class policy for plan year 2006 “because it was necessary to ensure that Medicare beneficiaries reliant upon these drugs would not be substantially discouraged from enrolling in certain Part D plans, as well as to mitigate the risks and complications associated with an interruption of therapy for these vulnerable populations.”¹² These are not risks beneficiaries will face, for high-spending blockbuster drugs, in 2026. Formulary inclusion policies for selected drugs should not mimic those for protected class drugs (except if a selected drug is in a protected class, of course). CMS has defined “substantially all” to include several notable exceptions, including: multi-source brands of the identical molecular structure; extended release products when the immediate-release product is included; products that have the same active ingredient or moiety;

¹⁰ Section 1860D-4(b)(3)(C) of the Social Security Act.

¹¹ Medicare Prescription Drug Benefit Manual Chapter 6 – Part D Drugs and Formulary Requirements, Sec. 30.2.1.

¹² Medicare Prescription Drug Benefit Manual Chapter 6 – Part D Drugs and Formulary Requirements, Sec. 30.2.5.

and dosage forms that do not provide a unique route of administration (e.g., tablets and capsules versus tablets and transdermals).¹³ Thus, even for the protected class requirements—a policy implemented to ensure vulnerable populations have continuous access to needed medications—Part D plan sponsors are not required to cover *every dosage form, strength, or formulation* of a particular drug, thus preserving, to an extent, the ability of PBMs to negotiate over formulary placement for drugs that fall under a protected class. It follows that the IRA’s formulary requirement for drugs subject to negotiation should not be interpreted to be on par with or even *more expansive* than CMS’s protected drug class policy intended to maintain access to medications for certain vulnerable patient populations.

Furthermore, requiring Part D plans to include in their formularies every dosage form, strength, or formulation of the selected drug also does not align with the practical realities of the pharmacy supply chain. Pharmacies today do not purchase and maintain significant inventory of all dosage forms and strengths of relevant drugs. Pharmacies instead purchase in large quantities the most common configurations prescribed for the patients they serve, and subsequently order other forms as needed. Requiring every dosage form, strength, or formulation of a selected drug to be on formulary would thus require pharmacies to completely overhaul existing purchasing and inventory practices. It is unlikely Congress intended for the IRA’s Part D formulary requirement to have such a far-reaching effect on other stakeholders in the drug supply chain.

Finally, the underlying statutory language of the IRA indicates that it was not Congress’s intent to require Part D plans to cover on their formularies every dosage form, strength, or formulation of a selected drug. The relevant statutory language simply states that Part D plan sponsors must “include each covered Part D drug that is a selected drug” that is subject to an MFP for the relevant year.¹⁴ There is no language regarding formulary placement of every dosage form, strength, or formulation of the selected drug subject to MFP in the statute. Had Congress intended for such an expansive reading of the Part D formulary requirement, it would have included clarifying language. Given the above, PCMA urges CMS to clarify in final guidance that a plan can be in compliance with the IRA’s formulary requirement so long as one formulation or dosage of a selected drug subject to an MFP is included in the formulary. Furthermore, consistent with CMS’s existing protected class policy, for drugs subject to an MFP that also fall under one of the six protected classes, CMS can clarify that the agency will continue to enforce its “substantially all” formulary requirements as set forth in Chapter 6 of the Medicare Prescription Drug Benefit Manual. This approach best allows PBMs to fulfil their essential role in negotiating price concessions in addition to the established MFP, while maintaining the agency’s expanded protections for protected class drugs.

¹³ *Id.*

¹⁴ Section 1860D-4(b)(3)(1) of the Social Security Act.

PCMA also notes that, notwithstanding the above, there is no language in the IRA indicating that drugs subject to MFP that are included in a plan's Part D formulary must be exempt from utilization management of any kind. As such, in order to provide certainty regarding this important tool used by PBMs to effectively negotiate price concessions and ensure lower-cost drugs for patients, we urge CMS to clarify in final guidance that it will not impose any restrictions on the ability of PBMs to utilize different utilization management tools on drugs subject to MFP that do not fall under one of the six protected classes.

Conclusion

We appreciate the opportunity to comment on the initial guidance for IPAY 2026 regarding implementation of section 11001 and 11002 of the IRA, which established the Medicare Drug Price Negotiation Program to negotiate prices for certain single source drugs and biological products. We hope our suggestions help CMS to implement the Negotiation Program in a way that utilizes, and does not undermine, the existing market-based approach to the Part D program that has allowed Part D plan sponsors and PBMs to successfully negotiate discounts that benefit patients and the program since the inception of the program. We would welcome the opportunity to meet with the agency to discuss these or any other issues relevant to the initial implementation of the Negotiation Program for IPAY 2026. If you have any questions on these suggestions and recommendations, please do not hesitate to contact me directly at tdube@pcmanet.org.

Sincerely,

Tim Dube

April 13, 2023

Dear Administrator Brooks-LaSure,

I am writing in response to your March 15 Memorandum on Medicare's Drug Price Negotiation Program, which provides initial guidance on the implementation of sections 11001 and 11002 of the Inflation Reduction Act.

The Pharmaceutical Industry Labor-Management Association (PILMA) is a coalition of trade unions and companies in the biopharmaceutical industry that advances unified policy positions on which our trade union and industry members agree. We wish to highlight serious flaws in the Medicare Drug Price Negotiation Program's initial guidance.

PILMA seeks a strong biopharmaceutical industry in order to support abundant, well-paying union jobs across the full range of trades, from highly skilled to unskilled, from lab technicians to construction workers.

The potential impact on union jobs is the reason PILMA is concerned about CMS's initial guidance. The guidance doubles down on shortcomings present within the Inflation Reduction Act itself, laying out policies that will inevitably hamper the growth of the biopharmaceutical industry and its associated jobs. Indeed, PILMA forecasts a contraction in industry jobs as a result of the IRA. Your initial guidance does not address the issue of industry jobs at all, let alone how to lessen the negative impact of the IRA in this regard.

For example, the guidance makes clear the intention of CMS to penalize companies that seek to safeguard additional discoveries they make about a medication after the Food and Drug Administration approves its initial use. As you are aware, industry often explores successful medications for application to different diseases or at treatment stages different from (typically earlier than) those specified in the initial approval. Additional research can also lead to better safety, dosage refinements, and alternative delivery mechanisms that improve convenience for patients. This is a vital part of industry activity and ensures that our healthcare system gets the most out of new medications. It also supports industry jobs.

Unfortunately, the CMS guidance takes no note of this problem within the IRA, nor does it offer a strategy for mitigation. This absence from the guidance will limit research and development investment and the jobs it supports.

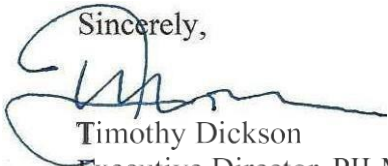

We are also concerned about the disparate jobs impact related to the different exemption periods for price negotiations for small-molecule drugs versus biologics. Your guidance does not address how to assess this differential impact on the workforce.

The guidance, though vague, also makes clear that CMS intends to use a "reference pricing" standard to determine a drug's maximum fair price. At minimum, the reference pricing standard will make it hard to predict what price a developer can expect if its drug works. Given that investments in these drugs need to be made long before they are sure to succeed, the risk of a lower-than-expected determination from CMS affects developers' calculus and investment decisions -- and accordingly, hiring plans and jobs.

Further, your draft guidance appears to impose a kind of "gag order" on biopharmaceutical companies regarding their discussions with and submissions to CMS on participation in price negotiation. We are concerned that the proposed restrictions will lessen the ability of industry executives to be candid with their workers, to the detriment of a close and productive working relationship.

Thank you for considering this comment on the flaws in the Price Negotiation Program's initial guidance. By fixing these shortfalls, CMS can send a message to Americans that it values the workers that make our biopharmaceutical industry the most innovative and productive in the world.

Sincerely,

A handwritten signature in blue ink, appearing to read 'Timothy Dickson', is written over the printed name.

Timothy Dickson

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Deputy Administrator Seshamani:

The Pharmaceutical Research and Manufacturers of America (PhRMA) appreciates the opportunity to respond to the Centers for Medicare & Medicaid Services' (CMS, the Agency) *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for the Initial Price Applicability Year 2026, and Solicitation of Comments* (Guidance or the Guidance) which was released by CMS on March 15th, 2023.¹ PhRMA represents the country's leading innovative biopharmaceutical research companies, which are devoted to discovering and developing medicines that enable patients to live longer, healthier, and more productive lives. Since 2000, PhRMA member companies have invested more than \$1.1 trillion in the search for new treatments and cures, including \$102.3 billion in 2021 alone.

While PhRMA is pleased to comment on portions of the Guidance, we also have significant concerns about the content of the Guidance, as well as the policies the Guidance implements. The drug pricing provisions of the Inflation Reduction Act (IRA) establish an unprecedented new price-setting authority for medicines in Medicare. This represents a seismic shift from the current market-based systems that underpin both Medicare Part D, which relies on competing plans to control costs, and Medicare Part B, which pays for physician-administered medicines based on discounts available in the market. PhRMA is deeply concerned that this shift will erode patient access and undermine continued biopharmaceutical innovation, particularly progress that occurs after a medicine's initial approval by the U.S. Food and Drug Administration (FDA).

Unfortunately, the Guidance only serves to reinforce and increase our concerns. What the drug pricing provisions of the IRA require is not "negotiation." Unlike negotiations manufacturers enter into with health plans, the Secretary will set prices for selected drugs and enforce them with the threat of legal penalties so severe that no manufacturer could afford to incur them. Given these dynamics, it is imperative that the Guidance establish clear

¹ Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

standards and processes to assure stakeholders that CMS' decision making will not be arbitrary and can be influenced by data presented by manufacturers. Unfortunately, the Guidance fails this test. Instead, the Guidance would allow CMS to consider virtually any evidence, and assert that its review of the evidence supports any virtually any decision without any recourse to hold CMS accountable for not following a "consistent methodology", as required by statute.

Indeed, the Guidance describes an approach that fails to give manufacturers and public stakeholders sufficient predictability and transparency. In particular, PhRMA is concerned that the Guidance:

- Provides inadequate (in some cases non-existent) opportunities for meaningful input on the Guidance, as well as the manufacturer "Agreement";
- Establishes requirements as part of the manufacturer Agreement that would undermine the effective implementation of the "Medicare Drug Price Negotiation Program" (the Program), including onerous prohibitions against manufacturers disclosing any information about their experiences under the Program;
- Fails to define a methodology and process for setting "Maximum Fair Prices" (MFP) that are consistent, objective, and predictable; and
- Appears to suggest an approach to determining MFPs that explicitly penalizes innovation.

Specifically, the Guidance implies that CMS is planning to use its discretion to set MFPs using a "cost plus" approach. Suggestions of this approach in the Guidance include statements that CMS "may" use factors such as research and development costs, production and distribution costs, and remaining patents and exclusivities to reduce the price the Secretary would otherwise set for a drug based on the clinical benefits it offers to patients. This approach is wholly incompatible with the economics of the research-based biopharmaceutical sector, in which returns on a small share of commercially successful medicines set investment incentives.^{2,3} Such an approach also devalues therapeutic performance, would be exceptionally destructive to the development of new medicines and indications, and is unnecessary to achieving savings under the law. CMS cites its latitude to determine how or to what degree each factor should be considered. Rather, it should use that latitude to fairly assess the clinical benefit of selected drugs offered to patients and decisively reject a "cost plus" approach.

Compounding problems, the Guidance also falls short of legal requirements, as well as what is widely acknowledged to be a sound policy development process, allowing only 30 days of comment for a program CMS acknowledges is "novel" and "complex."⁴ CMS is incorrect that the Guidance is exempt from procedural requirements of the Medicare statute or the Administrative Procedure Act (APA) and that the Agency need only "voluntarily" accept comments. Under the APA, the Guidance is a legislative rule; under section 1871 of the Social Security Act (SSA), program guidance or program instructions that establish a "substantive legal standard" must be issued with notice and 60 days of comment in the *Federal Register*.⁵ CMS also is wrong to rely on the statutory deadline of September 1st, 2023 as "good cause" to waive notice and comment. CMS waited until

⁴ 87 Fed. Reg. 62433 (Oct. 14, 2022).

⁵ *Azar v. Allina Health Services*, 139 S. Ct. 1804 (2019). See also HHS Office of the General Counsel, Advisory Opinion 20-05 on Implementing *Allina* (Dec. 3, 2020), https://www.hhs.gov/guidance/sites/default/files/hhs-guidance-documents/2101111604-mh-advisory-opinion-20-05-on-implementing-allina_12.03.2020_signed.pdf. CMS cites to Congress' direction to implement through program instruction or other forms of guidance, but such direction does not explicitly supersede section 1871 or APA requirements. The provision requiring program guidance is not prefaced with a "notwithstanding" clause, a phrasing that would have clarified the IRA's preemptive intent. "Repeals by implication are not favored, and are a rarity." *Maine Cmty. Health Options v. United States*, 140 S. Ct. 1308, 1323 (2020) (cleaned up).

March (approximately seven months after IRA enactment) to publish the Guidance; the fact that the Agency waited longer than it should have to publish guidance does not exempt it from providing required opportunities for stakeholder comment.

We are particularly troubled that the Agency chose to publish a critically important aspect of the Program – “Identification of Selected Drugs for Initial Price Applicability Year 2026” (section 30) – as final, without opportunity for any public input or comment.⁶ The issues addressed in section 30 are extremely important to patients including which drugs and forms would be subject to price setting, the statute’s orphan drug exclusion, and the biosimilars pause. It is a grave error for CMS to adopt the approach outlined in that section without giving stakeholders an opportunity to comment. Manufacturers and PhRMA have expertise in these area and are uniquely positioned to provide CMS with the type of feedback needed on foundational decisions such as the definition of a “qualifying single source drug” (QSSD) and the biosimilar pause. Providers, pharmacies, patients, and their caregivers also provide perspectives CMS should consider in a novel and complex program that sets prices and new reimbursement rates for medicines in Medicare. Finalizing section 30 without notice and comment denies the Agency the expertise of all stakeholders and raises serious legal questions under section 1871 of the SSA and the Due Process Clause of the U.S. Constitution. The approach outlined in section 30 will have far-reaching consequences for PhRMA members and for patients. Most critically, it will shape how innovative biopharmaceutical companies allocate scarce resources as they develop the next generation of treatments and cures, which will be used by patients both inside and outside of the Medicare program. PhRMA notes CMS’ statement that it “may make changes to any policies, including policies on which CMS has not expressly solicited comment, based on the Agency’s further consideration of the relevant issues.” We urge the Agency to reconsider this position and engage on these important matters in the future.

Despite these significant concerns with the Guidance, PhRMA recognizes that CMS has a statutory obligation to implement the Program. Our comments outline recommendations the Guidance can mitigate the harm to patient access and innovation over time. Below we summarize those recommendations for CMS.

REQUIREMENTS FOR MANUFACTURERS OF SELECTED DRUGS (Section 40)

- Abandon the Primary/Secondary manufacturer definition and instead enter into separate Agreements with each manufacturer, as anticipated by the statute.
- Allow manufacturers enough time to comment on the Agreement language before the Agreement deadline; avoid use of open-ended language in the Agreement.
- Open the “confidentiality policy” for public comment and ensure the policy and protocols offer robust protection and security of proprietary information, as outlined in comments below. Abandon the proposed data use limitation as it violates the First Amendment, conflicts with government transparency principles, and cannot be finalized.
- Establish a process to effectuate the MFP for eligible patients that provides manufacturers with access to needed data from the Part D Prescription Drug Event (PDE) records in order to verify that the patient is an MFP-eligible individual.
- Work in coordination with the Health Resources and Services Administration (HRSA) to revise the Guidance to prevent duplicated MFP and 340B discounts as required under the IRA.

⁶ There is an extremely narrow exception for the Small Biotech Exception Information Collection Request (ICR).

NEGOTIATION FACTORS (Section 50)

- Use – and allow manufacturers to submit data from – the FDA’s Orange and Purple Book listings and Drugs@FDA for relevant patent information.
- Allow manufacturers to voluntarily provide additional data, as manufacturers need discretion due to the varied ways in which they record and maintain data on these factors.
- Amend the Information Collection Request (ICR) guidance to allow manufacturers to note where they have provided requested data and ensure that there is sufficient space for companies to provide rationale and references for approximate data calculations.
- Place minimal weight on recoupment of research and development (R&D) costs, and specify that this factor will not be used to reduce an MFP; count only a fraction of global net revenue toward “recoupment” of R&D costs.
- Amend the Guidance to limit required submission of R&D costs to data available to the manufacturer that can be directly attributable to the selected drug, while allowing companies to voluntarily provide supplemental data and a supportive narrative.
- Allow manufacturers to rely on benchmark or industry-wide data in cases where a company may not maintain the data.
- Remove the tax credits from the definition of “prior federal financial support” and limit consideration to funding that resulted in a patent application containing a Government Interest Statement and/or research where a patent assignee was a U.S. government agency for an invention directly related to the development of the selected drug (e.g., excluding basic science, research tools, or similar general concepts).
- Reverse the proposal that penalizes manufacturers for having patents and exclusivities by instead increasing the preliminary price to reflect the innovation in the product.
- Explicitly acknowledge statutory prohibitions against the use of quality-adjusted life years (QALYs) and similar metrics, in any context based on both the language in the IRA and the SSA.
- Require that entities attest to removing all QALY-based research from their data submissions to CMS, including research where the findings were intrinsically influenced by the use of QALYs.
- Develop robust literature review and research standards for the Agency and all external organizations CMS works with on evidence synthesis and technology assessment, both formally and informally, to ensure that the evidence it relies upon or develops is methodologically rigorous and patient-centered.

NEGOTIATION PROCESS (Section 60)

- Set MFPs for selected drugs at or near the ceiling price for all Medicare Part B and Part D medicines beginning with the first several “initial price applicability years” (IPAY) in view of the short timeline for implementation and novelty of the Program.
- In subsequent years, consider setting the MFP for “selected drugs” at the ceiling price in the following circumstances:
 - Selected drugs for which the IPAY is less than 13 years since the medicine’s initial FDA approval, to mitigate consequences of the Program for small molecule medicines;

- Selected drugs for which the statutory ceiling price is the net price, reflecting significant discounts through brand-to-brand competition;
 - Selected drugs that meet or have met the FDA’s definition of unmet need, evaluated across a product’s lifecycle;
 - Selected drugs that meet or have met the New Technology Add-On Payment’s (NTAP) definition of “substantial clinical improvement”, and therefore represent a significant therapeutic advance; and
 - Any selected oncology drug that receives a Category 1 or 2A rating in the National Comprehensive Cancer Network’s Drugs and Biologics Compendium, and therefore represents a significant therapeutic advance.
- Prior to making its initial offer to the manufacturer, CMS should publish and solicit public comment on key elements of its MFP analysis including, but not limited to: 1) therapeutic alternative(s) CMS has identified for any selected drug it is considering (for each indication); 2) data and analysis CMS developed and considered supporting each factor, including evidence provided by third parties engaged formally or informally by CMS; 3) benefits and impacts of a selected drug CMS intends to consider; and 4) stakeholders, and other government agencies and organizations CMS intends to engage, formally or informally.
 - Place a greater weight on the factors related to the benefits that medicines actually offer to patients, caregivers, and society as specified in section 1194(e)(2).
 - Engage relevant experts – including manufacturers and clinicians – as the primary resources for determining therapeutic alternative(s) and provide an opportunity for feedback on therapeutic alternative(s) before the initial offer is made.
 - Use “clinically appropriate” as the standard for decision-making as to a selected drug’s therapeutic alternative or comparator; do not rely on cost to select “therapeutic alternative(s)” and comparators.
 - Consider a comprehensive range of clinical and non-clinical benefits and impacts of a selected drug, including those that are important to patients, caregivers, and society, based on feedback from those stakeholders. Include in the explanation a detailed account of how CMS identified relevant benefits and impacts of a selected drug, data and analysis on each benefit and impact for the selected drug, and how each contributed to the selected drug’s MFP.
 - Provide manufacturers of selected drugs the opportunity to meet with Agency staff at least three times in-person prior to the manufacturer’s counteroffer: 1) after drug selection but prior to initiation of the price-setting process; 2) prior to CMS presenting the initial offer; and 3) after CMS presents the initial offer.
 - Use the annual non-Federal average manufacturer price (non-FAMP) already in use by the U.S. Department of Veterans Affairs (VA), as defined in 38 U.S.C. § 8126(h)(5), in MFP calculations.
 - Describe the template that will be used for the initial, concise justification and ensure it includes: 1) how therapeutic alternative(s) for each indication were selected; 2) how each factor was weighed; 3) data and analysis CMS developed and considered supporting each factor, including evidence provided by third parties engaged formally or informally by CMS; 4) benefits and impacts considered; and 5) stakeholders, and other government agencies and organizations CMS engaged, formally or informally, in the process and how their input factored into the Agency’s offer.
 - Publish the required IPAY 2026 explanation for the MFP before the IPAY 2027 price setting process begins and ensure that all explanations include, at a minimum: 1) therapeutic alternative(s) for each indication and how they were selected; 2) how each factor was weighed; 3) data and analysis CMS developed and

considered supporting each factor, including evidence provided by third parties engaged formally or informally by CMS; 4) benefits and impacts considered; and 5) stakeholders, and other government agencies and organizations CMS engaged, formally or informally, in the process and how their input factored into the Agency's decision-making.

CIVIL MONETARY PENALTIES (CMPs) (Section 100)

- Complete notice-and-comment rulemaking on Program-related CMPs before seeking to impose any such CMPs on manufacturers.
- Implement procedures governing IRA drug pricing-related CMPs through a single rulemaking and model such procedures after well-established precedents.
- Do not impose CMPs on drug manufacturers for acts and omissions of third parties (e.g., secondary manufacturers, dispensers, providers, supply chain intermediaries) over which manufacturers have little, if any, control.
- Clearly explain, through notice-and-comment rulemaking, the factors CMS will consider in assessing whether to seek a Program-related CMP and the amount of any such CMP, and, during the early years of the Program, construe these factors liberally in favor of manufacturers in a manner that would not trigger a CMP.

PART D FORMULARY INCLUSION OF SELECTED DRUGS (Section 110)

- Minimize effects within therapeutic classes that would result in narrower formularies and fewer choices for patients.
- Review and update Part D formulary standards. Monitor plan coverage and tiering decisions, cost-sharing levels, and patient out-of-pocket exposure.
- Redefine Part D "negotiated price" to consider all manufacturer price concessions. Conduct strong oversight of formulary requirements and guard against non-discrimination violations.
- Re-examine and update rules around Part D coverage determinations, appeals, and tiering exceptions.

Our detailed comments follow below.

Introduction

The Pharmaceutical Research and Manufacturers of America (PhRMA) believes that the “Medicare Drug Price Negotiation Program” (the Program), as codified in statute, will have significant consequences that will harm patients and continued biopharmaceutical innovation. In this regard, we are exceedingly disappointed that the Centers for Medicare & Medicaid Services’ (CMS, the Agency) did not take steps in the *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for the Initial Price Applicability Year 2026, and Solicitation of Comments* (Guidance or the Guidance)⁷ to mitigate against the law’s negative consequences. We urge the Agency to make changes to address this in revised Guidance.

As CMS revises the Guidance document, and implements the Program broadly, we urge the Agency to consider our recommendations to mitigate against harmful consequences for patients. We also strongly encourage CMS to continuously monitor and evaluate the impact of its policies on patient access to all medicines, including but not limited to selected drugs, and biopharmaceutical innovation, including innovation across a medicine’s lifecycle. Below we describe concerns with government price setting in general before addressing the specific provisions of the Guidance.

The Impact of Price Setting on Patient Access and Biopharmaceutical Innovation

PhRMA is deeply concerned that setting prices for medicines will erode patient access and undermine continued biopharmaceutical innovation. Although national government price setting for medicines is novel for the U.S., it is not for other countries. Experience in these countries illustrates the degree to which government price setting erodes biopharmaceutical innovation and curtails patient access to treatments. Indeed, access delays and barriers are defining characteristics of such foreign systems, which prioritize cost-cutting over access, quality, and innovation. As a result, in countries that set prices for medicines, many patients – including those with cancer, diabetes, autoimmune, and rare diseases – face significant restrictions on access to treatments. Although the Inflation Reduction Act (IRA) differs from the price setting systems in these countries in several fundamental ways, the potential harm to patient access remains in any system in which the government is making a policy judgment related to a health intervention’s benefits and costs at a national level.

Data on the availability of medicines in foreign countries underscores the challenges patients face as a result of price setting. For example, 85 percent of all new medicines launched between 2012 and 2021 are reimbursed in Medicare/Medicaid programs, compared to other countries’ public health care programs where only 61 percent of new medicines are reimbursed in Germany, 48 percent in the United Kingdom, 48 percent in Japan, 43 percent in France, 24 percent in Australia, and 21 percent in Canada.⁸ In these countries, it takes an average of 27 months longer than in the U.S. for new medicines to become reimbursed by a public plan.⁹ The statistics underscore the importance of CMS implementing the Program in ways that help mitigate these potentially devastating effects.

In addition to potential harms to patient access for currently available treatments, government price-setting programs will invariably undermine incentives for biopharmaceutical innovation in the U.S. As a result of a health care system that relies on the strengths of market competition to balance cost control, patient access, and continued innovation, the U.S. leads the world in both research and development (R&D) for lifesaving treatments and cures. However, this was not always the case. In 1990, biopharmaceutical R&D investment in Europe was

⁷ Available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

⁸ PhRMA analysis of IQVIA MIDAS and country regulatory data, October 2022. Note: New active substances approved by FDA, EMA and/or PMDA and first launched in any country between January 1, 2012, and December 31, 2021. A medicine is considered publicly reimbursed in Canada if 50 percent or more of the population lives in a province where it is reimbursed by the public plan. A medicine is considered publicly reimbursed in the United Kingdom if recommended by England’s National Institute for Health and Care Excellence (NICE) for funding by England’s National Health Services (NHS).

⁹ PhRMA analysis of IQVIA Analytics (2023).

more than 45 percent higher than similar investment in the U.S. However, decades of implementation of price controls and other anti-innovation policies across Europe pushed the locus of industry to the U.S., and as a result, reversed that dynamic.¹⁰ In 2004, the U.S. Department of Commerce found that price controls in certain Organisation for Economic Co-operation and Development (OECD) countries suppress investment in worldwide R&D by 11 to 16 percent annually, which leads to fewer new medications being launched each year.¹¹ These effects likely have grown worse in the two decades since this research was published.

The IRA's drug price-setting provisions are already having an impact on biopharmaceutical R&D decisions. In the months following IRA passage, several biopharmaceutical manufacturers have announced cancellations of pipeline projects as a direct result of the law. A 2022 survey of PhRMA member company leaders shows that a majority have concerns – three-quarters of leaders responding to the survey said the IRA creates significant uncertainties for R&D planning and that they already are reconsidering R&D investment strategies, and 78 percent reported that early-stage pipeline projects are likely to be cancelled due to IRA provisions.¹² Fewer products in early-stage development will lead to fewer new cures and treatments for patients in the long run. Small molecule medicines, such as medicines for cancer that come in pill or tablet form, are particularly vulnerable to losing out on R&D investments, due to the short timeframe under which they can become eligible for price setting.¹³ In the recent survey, 63 percent of respondents said they expect to shift R&D investment away from small molecule medicines.

While the price-setting framework in the IRA poses a threat to all biopharmaceutical innovation, it is particularly harmful to the R&D that occurs after a medicine's initial U.S. Food and Drug Administration (FDA) approval in the years leading up to and after a drug becomes eligible for price setting. In the aforementioned 2022 survey, 95 percent of respondents stated that they expect to develop fewer new uses for medicines due to the limited time available before a drug is subject to government price setting. The methodology for price setting should, to the extent possible, consider and preserve the intent of the intellectual property protections provided for companies to invest in biopharmaceutical R&D as well as the incentives for R&D that takes place after the initial FDA approval, including ongoing research that identifies important new uses of existing drugs.

There are numerous examples of medicines that have conferred benefit after their initial FDA approval. For example, an infused cancer drug originally approved via the accelerated approval pathway in 2014 to treat advanced or unresectable metastatic melanoma has since been approved for more than 35 different indications across 16 tumor types. This includes a recent FDA approval on January 26th, 2023 for adjuvant treatment following resection and platinum-based chemotherapy for stage IB, II, or IIIA non-small cell lung cancer (NSCLC).¹⁴ This is the type of research and innovation CMS' implementation puts at risk.

Recent research further underscores the frequency at which post-approval innovation occurs. The Partnership for Health Analytic Research studied the development of improvements to medicines that received initial FDA approval between 2010 and 2012. Of these 88 medicines, more than half were later approved by the FDA for at least one additional indication. For cancer, the share was even higher; 62 percent of oncology medicines were

¹⁴ Keytruda [package insert]. Whitehouse Station, NJ: Merck & Co., Inc; 2023. https://www.accessdata.fda.gov/drugsatfda_docs/label/2023/125514s1281bl.pdf.

later approved for one or more additional indications, a majority of which were approved seven or more years after approval.¹⁵ Since the IRA creates disincentives for investment in indications post-original FDA approval, we suggest CMS give appropriate weight to post-approval innovations that deliver significant clinical benefit to patients, caregivers and society when determining Maximum Fair Prices (MFP) for selected drugs. In some instances, products with a number of indications that offer such significant benefit should be priced at or near the statutory ceiling.

PhRMA is also concerned about the potential impact of the IRA on orphan drug development, which often includes R&D on medicines for a rare disease that also might provide promise for non-orphan diseases with a related causal pathway. PhRMA notes that CMS has issued section 30.1.1 and its approach to determining eligibility for orphan drug exclusion in that subsection as final without accepting comments. Accordingly, as with the remainder of section 30, PhRMA is not commenting on the approach outlined in that subsection. PhRMA nevertheless notes CMS' statement that it "is considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development." PhRMA looks forward to engaging with CMS on this issue outside of the context of this Guidance process and encourages the Agency to issue guidance as expeditiously as possible, with appropriate opportunity for and consideration of public comment, on this important subject.

The aforementioned dangers to patient access to current and future treatments reinforce that CMS should design its methodology to mitigate negative effects on patients and continued innovation. CMS' MFP methodology should also reflect the reality that Part D sponsors already receive significant rebates on many drugs likely to be selected, and that the ceiling price set in statute can represent an additional deep discount to the Medicare program for these medicines.¹⁶ Given the previously discussed consequences of price setting, CMS should be cautious when setting MFPs below the statutorily defined ceiling price. Setting prices for medicines is a highly complicated and technical undertaking that CMS must complete on an exceedingly short timeline and with limited existing expertise to build upon.¹⁷ Challenges facing the Agency in this regard have also been acknowledged by CMS officials themselves, who have noted that the timelines are "tremendously tight for us."¹⁸

While we appreciate CMS taking the important step of issuing a Guidance, we note that it was published only five and a half months before the Agency is required to publish its list of ten selected drugs on September 1st, and only six and a half months before signed "Agreements" and complex, voluminous data submissions will be due from manufacturers. As a result, given these delays, we believe it is important for CMS to recognize the reality that neither the Agency nor manufacturers have a realistic period of time to prepare for implementation. In light of this, as described in more detail below, we believe CMS should commit to setting final MFPs at or near the deep, statutorily mandated "ceiling price" discounts in the first several years of the Program.

PhRMA also recommends that, consistent with longstanding principles of administrative law and good guidance, CMS respond in writing to comments on the Guidance, and that CMS maintain a public docket of comments received. Further, consistent with the timetable announced by CMS, we support completion and publication of

Available at: <https://www.cbo.gov/system/files/2023-02/58850-IRA-Drug-Provs.pdf>.

¹⁷ As just one example, the Guidance states CMS will use a "qualitative" approach to consider on an indication-by-indication basis "nuanced differences between different drugs" on numerous dimensions of clinical performance, for a range of specific subpopulations. (Sections 50.2, 60.3.1, 60.3.3.1) CMS does not have a significant experience in performing and has not demonstrated its capability to perform such assessments. Moreover, this is only one of many novel areas for CMS that are part of price setting.

Guidance with at least two months' lead time before the first list of selected drugs is announced on September 1st, 2023. We appreciate the Agency's reaffirmation in an April 7th communication that it plans to publish revised Guidance this summer, as well as its commitment to publicly posting the comments it receives.¹⁹ In addition, we request to see the Agreement in advance of CMS' selection of drugs for price setting to give manufacturers opportunity to comment and time to review the Agreement in order to enter the price setting process.

Some of the flaws in the initial guidance appear to reflect a misperception that the Program represents a "negotiation" akin to manufacturer negotiations with health insurance companies. In fact, it is very different. Regardless of the term being used in statute, the Program is a federal policy decision-making exercise that involves both a non-public component (manufacturer submission of proprietary data and CMS communication directly with the company) and a public component (e.g., public solicitation of input to inform the Agency's decision and public explanation of the decision).

PhRMA's comments on specific provisions in the Guidance are set forth below. The recommendations are driven by our expertise on many of the issues on which CMS seeks comment and are offered to help mitigate against unintended and negative consequences to patients and innovation. We urge CMS to revise its Guidance in response to the below recommendations.

* * * *

I. Requirements for Manufacturers of Selected Drugs (Section 40)

Section 40 of the Guidance focuses on the "Agreement" that manufacturers must enter with CMS under the Program and other issues related to the Agreement. PhRMA is concerned that several provisions in this section exceed CMS' statutory authority, are unworkable, and contribute to a decision-making framework that is subjective and unpredictable. We describe these concerns, and recommend modifications, in more detail below.

a. Primary/Secondary Manufacturer Definition

CMS' proposal to establish separate categories of "Primary" and "Secondary" manufacturers, and to hold Primary Manufacturers responsible for other distinct corporate entities ("Secondary" manufacturers), is unworkable and not supported by statute. In section 40, CMS notes that the IRA adopts the definition of "manufacturer" in section 1847A(c)(6)(A) of the Social Security Act (SSA) (which derives from the Medicaid rebate statute).²⁰ CMS then explains that the IRA directs it to negotiate an MFP with "the manufacturer" of a selected drug.²¹ If "more than one entity meets the statutory definition of manufacturer for a selected drug for purposes of [initial price applicability year (IPAY)] 2026," CMS states, it "intends to designate the entity that holds the [New Drug Application(s) (NDA(s)) / Biologic License Application(s) (BLA(s))] for the selected drug to be 'the manufacturer' of the selected drug (hereinafter 'Primary Manufacturer')." Any other entity that meets the statutory definition of manufacturer for a drug product included in the selected drug and "either (1) is listed as a manufacturer in an NDA or BLA for the selected drug or (2) markets the selected drug pursuant to an Agreement with the Primary Manufacturer" would be deemed a "Secondary Manufacturer." Secondary Manufacturers would include any manufacturer of any authorized generics and any repackager or relabeler of the selected drug that "meet these criteria."

CMS proposes to sign an Agreement only with the Primary Manufacturer, under which CMS states that the Primary Manufacturer would be required to agree, among other things, to:

¹⁹ Centers for Medicare & Medicaid Services. (Email announcement, received April 7, 2023). Medicare Drug Price Negotiation Initial Guidance: Comments due by April 14.

²⁰ SSA § 1191(c)(1), incorporating 1847A(c)(6)(A), incorporating § 1927(k)(5).

²¹ SSA § 1193(a)(1).

- Report manufacturer-specific information applicable to any Secondary Manufacturer (and in some cases to blend pricing data of the Secondary Manufacturer with its own pricing data);²²
- Ensure that any Secondary Manufacturer(s) make the MFP available to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers;
- Respond to CMS requests within “specified timeframes” with documentation demonstrating compliance and remedial actions, as applicable, pursuant to reports of noncompliance or other CMS compliance and oversight activities; and
- Pay any CMPs for violations (including those stemming from noncompliance by any Secondary Manufacturer).

Other than citing to use of the word “the,” CMS cites to no other statutory authority for imposing vicarious liability on Primary Manufacturers. And the provision immediately preceding the paragraph referencing “the manufacturer” mentions multiple Agreements with multiple manufacturers, stating that the “Secretary shall enter into Agreements with manufacturers of selected drugs.”²³ The reference to “the” manufacturer, thus, merely refers back to each Agreement CMS maintains with each of the various manufacturers signing these Agreements. If more than one legally distinct entity meets the definition of “manufacturer,” then CMS may enter into separate Agreements with each of such manufacturers, and there would be one “manufacturer” or “the manufacturer” under each Agreement. As a result, Congress’ use of “the” hardly merits the significance CMS reads into it, and certainly does not warrant adopting a policy that conflicts with ordinary corporate responsibilities.²⁴

Nothing in the IRA authorizes CMS to impose requirements, liability, or certainly not excise taxes, on a legal actor who maintains a distinct corporate identity. While CMS may argue that the IRA permits adding requirements “determined by the Secretary to be necessary for purposes of administering the program and monitoring compliance with the program,”²⁵ CMS’ proposal goes beyond anything “necessary” to administer the MFP program. In fact, CMS arguably could monitor a manufacturer’s compliance more easily if it maintains an Agreement with each distinct corporate entity – such that it is directly, rather than indirectly, holding each entity accountable.

Any other reading of the language would amount to Congress delegating to CMS major corporate law questions of holding one entity responsible for the activities of an unrelated corporate actor, even though there is no indication in the IRA that Congress intended to grant the Secretary powers so extensive as to alter ordinary laws of corporate liability, or to require amendments to the contracts Primary Manufacturers currently maintain with Secondary Manufacturers. Even if Congress had delegated such broad authority, gap-filling rules that alter contracts and corporate legal assumptions would require more than mere guidance.²⁶

CMS’ proposal also conflicts with past practice. Historically, CMS has not required manufacturers to report Secondary Manufacturers’ data. CMS decided not to finalize such a proposal in a 2007 rule, after receiving comments that doing so would be “unduly burdensome on manufacturers, call into question the veracity of manufacturer pricing information reported to CMS, and potentially violate anti-trust statutes because [the CMS proposal] would require manufacturers to share pricing information and engage in anti-competitive practices.”²⁷

²² Guidance at Appendix C; ; Negotiation Data Elements under sections 11001 and 11002 of the Inflation Reduction Act ICR. Available at: <https://www.cms.gov/regulations-and-guidance/legislation/paperworkreductionactof1995/pa-listing/cms-10847>.

²³ SSA § 1193(a) (emphasis added).

²⁴ See also 1 U.S.C. 1, which provides that, “[i]n determining the meaning of any Act of Congress, unless the context indicates otherwise— words importing the singular include and apply to several persons, parties, or things; [and] words importing the plural include the singular. . . .”

²⁵ SSA § 1193(a)(5).

²⁶ *Perez v. Mortg. Bankers Ass’n*, 575 U.S. 92 (2015) (Guidance cannot have the force and effect of law).

²⁷ 72 Fed. Reg. 39199 (Jul. 17, 2007).

CMS concluded that requiring a primary manufacturer to include sales of a secondary manufacturer within its Average Manufacturer Price (AMP) calculation “would be problematic from an administrative accounting and anti-trust perspective.”²⁸

As was the case in 2007, it would be legally problematic, as well as infeasible, for innovator manufacturers to gather the vast amounts of data CMS is anticipating gathering – all prior to CMS’ October 1st, 2023 deadline for signing an Agreement under section 1193 with the Primary Manufacturer and October 2nd, 2023 deadline to submit extensive data and research to CMS. To report information to CMS, innovator manufacturers would likely have to access proprietary books and records of the Secondary Manufacturers, which may be competitors, raising a variety of business and legal issues. For example, section 50.1, explains that the Primary Manufacturer is required to submit “[c]urrent unit costs of production and distribution of the selected drug, averaged across the Primary Manufacturer and any Secondary Manufacturer(s).” Section 50.1 also anticipates that the Primary Manufacturer will collect “[m]arket data and revenue and sales volume data” from Secondary Manufacturers and blend the data with its own data. Section 50.1.1 states that the Primary Manufacturer “must submit data on [non-Federal average manufacturer price (non-FAMP)] for the selected drug for the Primary Manufacturer and any Secondary Manufacturer.” The Guidance, if adopted as final, raises the specter of anti-trust concerns to the extent it requires a Primary Manufacturer to collect and aggregate non-public, competitively sensitive Secondary Manufacturer information otherwise not accessible by the Primary Manufacturer.

Further, even if Primary Manufacturers could modify existing contractual agreements to ensure indemnification clauses, create firewalls to access proprietary information, and ensure information is available, there is simply insufficient time to do so prior to the deadlines for the 2026 IPAY (which require execution of CMS-manufacturer Agreements under section 1193 by October 1st, 2023, and certain information to be submitted by October 2nd, 2023). Indeed, it is not clear what unintended consequences CMS’ policy would have on the supply chain and/or collaboration among manufacturers to spur innovation, and CMS includes no discussion of how its requirements would affect current repackaging, relabeling, or authorized generic manufacturing activities.

For the reasons stated above, ***CMS must not adopt the Primary/Secondary Manufacturer policy.*** If more than one entity meets the definition of manufacturer, CMS may enter into separate Agreements with each manufacturer, as the statute already anticipates multiple Agreements with multiple manufacturers.

b. Entrance into Agreement with CMS and Compliance with Administrative Actions (Sections 40.1 and 40.5)

CMS states that it would use the Health Plan Management System to identify relevant points of contact, effectuate the Agreement, and store the Agreement, and that within “5 days following publication by CMS of the list of selected drugs for an initial price applicability year [September 1st, 2023, for the first year of the Program], if the Primary Manufacturer of a selected drug elects to enter into an Agreement with CMS...the Primary Manufacturer must submit to CMS all names, titles, and contact information for representatives authorized to execute the Agreement and conduct the negotiation.” CMS also notes that it “intends for the Agreement to contain the requirements discussed in sections 40.1 through 40.7 of this memorandum.” While CMS states it “will make reasonable efforts to make the final text of the Agreement available to the public before the selected drug list for initial price applicability year 2026 is published,” it has publicly indicated it will not likely seek comments on the Agreement itself. As the deadline for publication of the selected drug list is September 1st, 2023, CMS’ proposal for “final text” appears to mean that manufacturers will be required to sign, within a month (by October 1st, 2023), an Agreement they have never seen before and which they have only 30 days to review.

First, ***PhRMA recommends that CMS should not adopt its “5 days for review and decision” proposal.*** The statute (which gives as little as 30 days post-selection to decide whether to sign) is itself highly problematic, but

²⁸ Ibid at 39200.

does not authorize CMS to cut the 30-day decision period down to five days.²⁹ While PhRMA appreciates CMS attempting to identify authorized representatives early, requiring manufacturers to decide whether to “elect to sign” within five days would conflict with the statute’s later deadline of October 1st. Moreover, as long as an Agreement may be signed by the statutory deadline, CMS should view statutory obligations as fulfilled.

Second, ***PhRMA reminds CMS that it may not impose manufacturer requirements that go beyond the plain language of section 1193 of the SSA.*** Although in several places, CMS characterizes the Agreement as “voluntary” it is important to note that the IRA price-setting provisions are distinct from an ordinary contract or grant relationship, where an entity submits a bid or proposal in response to a solicitation. The 1193 Agreement cannot be described as voluntary. Instead, the Agreement is properly understood as a contract of adhesion, signed under duress. Manufacturers of selected drugs have little recourse other than to sign the Agreements. If the manufacturer does not enter into the Agreement by the required date (October 1st, 2023, for the first year of the Program), the manufacturer is subject to per-day excise taxes starting at almost twice the sales of the selected drug and increasing to 1,900 percent of a drug’s total revenues.³⁰ While this up-to 1,900 percent assessment is framed as a “tax,” Congress understood that it would function as a penalty forcing manufacturers to subject themselves to the government’s so-called “agreement.” For example, the Joint Committee on Taxation estimated that the “tax” would raise zero revenue, because no manufacturer could possibly afford to pay such an astronomical assessment.³¹ Further, to suspend imposition of the possibility of crippling excise taxes under the IRA, a manufacturer must terminate “all” applicable agreements under Medicaid and Medicare Part D,³² resulting in the termination of coverage in Medicaid and Medicare Parts B and D for all of the manufacturer’s products – not just the selected product – when almost half of annual nationwide spending on prescription medicines is through Medicare and Medicaid.³³

Because the IRA sidesteps a true negotiation in any sense of the term, CMS cannot use the Agreement to bind manufacturers to requirements that go beyond the plain language of section 1193 and claim manufacturers “agreed” to the terms. CMS has also previously noted that statutory agreements that function similar to the 1193 agreement are not “contracts” or true “agreements” but merely a notification of the statutory provisions governing the Program. With respect to the Medicaid National Drug Rebate Agreement (NDRA), CMS noted:

The NDRA is not a contract. Rather, it should be viewed as an opt-in Agreement that memorializes the statute and regulations. Therefore, we noted our intention to use the updated NDRA as a standard agreement that will not be subject to further revisions based on negotiations with individual manufacturers.³⁴

Third, ***PhRMA recommends CMS share the Agreement text itself for a meaningful period of comment.*** Without seeing the Agreement text and being afforded a period of comment, it is unreasonable for CMS to conclude that innovator manufacturers will simply review and sign, all in a one-month period. In past situations,

²⁹ SSA §§ 1191(b)(4)(A); 1191(d)(2). In other cases, those entering into agreements have more time to review. The Coverage Gap Discount Program agreement allowed a 30-day review period. The VA offers a rolling submission process. The Medicaid rebate program has another approach that implements the agreement 60 days after the end of the quarter. *See e.g.*, 42 CFR § 423.2315(c); <https://www.medicaid.gov/medicaid/prescription-drugs/medicaid-drug-rebate-program/medicaid-national-drug-rebate-agreement-ndra/index.html>; <https://www.va.gov/opal/nac/fss/pharmaceuticals.asp>; <https://www.va.gov/opal/docs/nac/fss/vaSolicitationM5Q50A03R8.zip>.

³¹ Joint Commission on Taxation, *Estimated Budget Effects of the Revenue Provisions of Title XIII - Committee On Ways And Means, of H.R. 5376, The “Build Back Better Act,” As Passed by the House of Representatives, Fiscal Years 2022–2031*, at 8 (Nov. 19, 2021), <https://bit.ly/3plC4cd> (“no revenue effect”); *accord* Letter from P.L. Swagel, Director, CBO, to Hon. F. Pallone Jr., Chairman, Committee on Energy and Commerce (Oct. 11, 2019), at 14. Available at: <https://bit.ly/3osZPzX> (noting JCT had concluded, of identical predecessor provision, that “manufacturers would either participate in the negotiation process or pull a particular drug out of the U.S. market entirely”).

³² 26 U.S.C. 5000D(c).

³³ CBO, *Prescription Drugs: Spending, Use, and Prices* at 8 (2022).

³⁴ 83 Fed. Reg. 12770, 12771 (March 23, 2018).

CMS has provided the text of the draft agreement and requested comments before finalizing the agreement.³⁵ Without knowing exactly how the Agreement will read for this Program, it is not possible to anticipate every potential comment on the contours of the Agreement.

Fourth, and finally, ***PhRMA recommends CMS not include in the Agreement open-ended language that seeks to bind manufacturers to unknown requirements or ambiguous terms.*** CMS states in section 40.5 that “after entering in an Agreement with CMS...the Primary Manufacturer must comply with requirements determined by CMS to be necessary for purposes of administering the Negotiation Program and monitoring compliance with the Negotiation Program.” CMS does not offer additional information as to what exactly it intends to include as a result of this statement. However, even if the Agreement were a true contract – which, as discussed above, it is not – parties to a contract cannot be “bound to unknown terms which are beyond the range of reasonable expectation.”³⁶

c. Submission of Data to Inform Negotiation (Section 40.2)

Under the timetable described in the Guidance, manufacturers of selected drugs will only have 30 days after the list of selected drugs is published to prepare and submit information to CMS. Thirty days is a woefully inadequate period of time for manufacturers to gather and submit the data that will be used in price setting. CMS has authority to allow flexibility on submission of data beyond October 2nd, 2023, and should use that authority to provide additional time for manufacturers to submit robust data and research to support MFP determinations. CMS or manufacturers may also find that there must be an opportunity to submit additional information to resolve issues, answer specific questions, or address misunderstandings in how CMS is interpreting data or data submission requirements. The deadline of October 2nd, 2023 arguably applies only to the data specifically mentioned in section 1193(a)(4) (that is, non-FAMP data). This analysis would harmonize the following statutory provisions:

- Section 1194(b)(2)(A), which, as amended by 1191(d)(5), states “Not later than October 2, 2023, the manufacturer of the drug shall submit to the Secretary, in accordance with section 1193(a)(4), the information *described in such section*” (emphasis added);
- Section 1193(a)(4), which “describes” non-FAMP information as well as “information that the Secretary requires to carry out the negotiation (or renegotiation process) under this part”; and
- Section 1194(e), which requires certain information for price setting, but is not cross-referenced in section 1193(a)(4).

The IRA also states that the Secretary may specify the “manner” in which data are submitted. The fact that the statute fails to “describe” an October 2nd, 2023 deadline for submitting data to support consideration of the section 1194(e) factors, along with the discretion the Secretary maintains to dictate the manner of submission, allows CMS some flexibility on timelines. This flexibility provides the Agency an important opportunity to facilitate a more effective implementation of the Program by permitting submission of additional or updated data and research after October 2nd. ***PhRMA recommends that CMS read the statute in a manner that ensures adequate time to gather information and submit data on the 1194(e) factors, and not to adhere to an arbitrary and rigid deadline of October 2nd if there are other, more reasonable ways to interpret the language.*** Further, we urge the Agency to specify opportunities for manufacturers to submit additional data after October 2nd, including manufacturer-specific data under section 1194(e)(2).

d. Confidentiality of Proprietary Information (Section 40.2.1)

³⁵ 81 Fed. Reg. 78816 (Nov. 9, 2016).

³⁶ Restatement (Second) of Contracts § 211 (1981).

PhRMA appreciates CMS' recognition that a large amount of the data to be submitted by manufacturers, including non-FAMP data³⁷, is highly sensitive and proprietary. In Appendix C, CMS includes ten pages of definitions relating to "manufacturer-specific" information to be submitted by October 2nd, 2023. Separately, CMS recently released a 45-page form for collecting information.³⁸ Despite these robust submission requirements, the Guidance fails to describe, and therefore does not provide opportunity for comment on, the details of the robust confidentiality policy that must accompany companies' submission of manufacturer-specific data. We discuss this concern in more detail below and provide suggested minimum requirements for a confidentiality policy.

PhRMA is unaware of any other program that would compile such a large volume of biopharmaceutical innovator information in one repository – on R&D, patent, cost, pricing, and other highly sensitive data. Congress seemingly was aware of the sensitivity of data to be submitted, as it included in the IRA an unusually restrictive limitation, applying not just to disclosure of manufacturer-submitted data but also their "use." Only the Secretary (or Comptroller General in certain situations) may use the data, and then, only to carry out the price-setting Program.³⁹

While CMS acknowledges it will adopt a confidentiality policy, it does not propose such a policy for comment, and states only that such policy would be "consistent with existing requirements for protecting proprietary information, such as Exemption 4 of the Freedom of Information Act (FOIA)." However, Exemption 4 of FOIA addresses disclosure, not use, and nothing in the IRA directs CMS to use FOIA as the basis for its confidentiality and security protocols. Further, Exemption 4 would not by itself adequately protect the proprietary information the IRA requires. While PhRMA urges CMS to adopt the procedures of FOIA regulations allowing innovators to designate part or all of the information submitted as proprietary,⁴⁰ CMS must also develop a robust confidentiality policy, shared with manufacturers for feedback.

CMS' cursory, one-line explanation of a "confidentiality policy" provides little assurance to manufacturers that their highly valued information will be protected. At a minimum, any confidentiality policy must require:

- Access to any information received is limited to the smallest number of employees and other personnel possible, as well as the minimum data necessary, and such personnel are inventoried and recorded on a regular basis (including an explanation of such individual's legitimate need to use the information and purpose);
- Execution of non-disclosure agreements by any individuals with access to the data (including contractors and staff) as a pre-condition to access, under which they are restricted from improperly using or disclosing any proprietary information received, during their employment/engagement and in perpetuity post-employment;
- Destruction of data by any individuals with access to the data when any Agreement terminates. CMS, the Comptroller General, or any part of the U.S. Department of Health and Human Services (HHS) that accesses information maintains policies as to how and when it will destroy proprietary information of the manufacturer, informs the manufacturer of such destruction, and documents compliance with destruction policies;

³⁷ Non-FAMP is the average price paid by wholesalers for drugs distributed to non-federal purchasers. Manufacturers calculate this on a quarterly basis and report it to the U.S. Department of Veterans Affairs (VA); this calculated price includes any rebates, cash discounts or other price reductions but excludes any discounts given to federal purchasers. Manufacturer rebates, discounts, and other price reductions are confidential and proprietary and non-FAMP, as used today with the VA, is not a publicly available metric.

³⁸ 88 Fed. Reg. 16983 (March 21, 2023); <https://www.cms.gov/regulations-and-guidance/legislation/paperworkreductionactof1995/pralisting/cms-10847>.

³⁹ SSA § 1193(c).

⁴⁰ 45 C.F.R. § 5.41.

- Notification to any submitters of any erroneous use or disclosure of proprietary information, even if inadvertent, and how it intends to remedy such use or disclosure;
- Notification to manufacturers any time data are shared outside of CMS (for example with a contractor) or CMS intends to use such data for purposes unrelated to price setting (for example, because CMS determines the data are not proprietary), the rationale for such sharing/use, and providing manufacturers with a robust prior opportunity to object to such sharing/use, along with an adjudication process. If CMS determines that otherwise proprietary information is nevertheless “publicly available,” CMS should explain such reasoning prior to allowing such information to be used (and provide for a period of adjudication before the data could be shared or released). Again, such notification must extend not just to public disclosure, but also any “use” or disclosure outside CMS, including to Congress or other agencies; and
- Referrals made to the Department of Justice regarding violations of criminal laws prohibiting the publication, divulging, disclosure, or making known in any manner or to any extent not authorized by law, trade secret or confidential commercial information.⁴¹

The government has a history of requiring non-disclosure agreements from contractors and others under agreement, and PhRMA is happy to share templates. Exhibit B, attached to this comment letter, is one such template. Clauses CMS should add to any contracts or other Agreements include HHS Acquisition Regulations (HHSAR) 352.224-71, and clauses similar to H.6, or the “Disclosure of Information” provision, respectively, at the sites below:

- <https://www.hhs.gov/sites/default/files/gram-contract.pdf>; and
- <https://www.hhs.gov/sites/default/files/vaccine-agreement-with-glaxo-smith-kline-modifications-1-and-2.pdf>.

CMS should put forward a security policy as well, explaining how it will ensure the cybersecurity of systems holding manufacturer-specific data. The security protocol must include limited access to only certain personnel via secure portal; procedures on secure encrypted transmission mechanisms (as approved by HHS’ Chief Information Officer and Office of the General Counsel); secure storage; inability to download confidential information to removable media or any other portable storage; policies on and tracking of any printing or screenshotting of confidential information (including watermarking of electronic and paper copies with a “confidential” label, safeguards that only a minimum amount may be printed, and standards that printouts remain within a particular physical location from which they cannot be removed, along with locked offices and file cabinets).

CMS should periodically audit and report on its use of confidential commercial information, as well as compliance with its confidentiality and security protocols.

For the reasons stated above, ***PhRMA recommends that CMS protect confidential information beyond the protections of FOIA Exemption 4, share its confidentiality policy for comment, and ensure contractors and others with access to manufacturer data have agreements with CMS that adequately protect the high volumes of proprietary information CMS will collect.***

PhRMA also asks that CMS clarify that the existence of and status of a pending NDA or BLA, in addition to information contained in a pending NDA or BLA, will be treated as proprietary information under SSA section

⁴¹ 18 U.S.C. 1905.

1193(c) and as trade secret and/or confidential commercial information that is protected from disclosure under Exemption 4 of the FOIA, 5 U.S.C. § 552(b)(4).

This clarification is needed because section 40.2.1 of the Guidance states that “CMS intends to treat the data on prior Federal funding and approved patent applications, exclusivities, and *applications and approvals* under section 505(c) of the Federal Food, Drug, and Cosmetic (FD&C) Act or section 351(a) of the Public Health Services Act as non-proprietary because CMS believes these data are available publicly.” The use of the term “applications and approvals” suggests that both pending and approved applications might be treated as non-proprietary. The “applications and approvals” language also appears in Appendix C (Definitions), which states that “[a]ctive *and pending* FDA applications and approvals includes...all applications for approval under section 505(c) of the Federal Food, Drug, and Cosmetic Act or sections (sic) 351(a) of the Public Health Service Act, *including those not yet decided...*” (emphasis added).

PhRMA disagrees that “these data are available publicly.” On the contrary, information in pending marketing applications is typically proprietary and highly sensitive and is protected from disclosure by federal law. This sensitivity remains after approval, with much data and information in approved applications remaining protected confidential commercial information and trade secrets exempt from disclosure. Under FDA’s regulations, the existence and status of a pending application, in addition to information contained in a pending NDA or BLA, generally are protected from public disclosure.⁴² FDA adopted this regulation to implement the Federal Trade Secrets Act, FOIA, and section 301(j) of the FD&C Act, which all protect such information from public disclosure, and has long regarded this information as competitively sensitive for which disclosure would cause competitive harm.⁴³ Only once a decision on an application is final will certain information regarding the application be subject to potential disclosure, and even then, other information within the application remains protected.⁴⁴ Consistent with the fact that FDA protects information about and in pending marketing applications from disclosure, CMS’ Guidance should be revised to provide that CMS will treat such information as proprietary under SSA section 1193(c) and as trade secret and/or confidential commercial information under FOIA. Indeed, the fact that CMS has misidentified these data as publicly available further underscores the need to rely upon a manufacturer’s indication that data are proprietary and not in the public domain.

Finally, CMS notes that it will publish an explanation for the MFP by March 1st, 2025, and may make “high-level comments about the data submitted to CMS, without sharing any proprietary information,” such as saying that the “manufacturer has recouped its R&D costs.” In making any such high-level statement, the Agency should be specific about its limitations.⁴⁵ CMS is defining R&D in ways that differ from the ways that the biopharmaceutical industry does. The industry definition as a matter of course includes costs for all failures and

⁴² See 21 C.F.R. §§ 314.430(b) (“FDA will not publicly disclose the existence of an application...before an approval letter...or tentative approval letter is sent to the applicant..., unless the existence of the application...has been previously publicly disclosed or acknowledged.”); id. § 314.430(c) (“If the existence of an unapproved application or abbreviated application [for a small molecule drug] has not been publicly disclosed or acknowledged, no data or information in the application or abbreviated application is available for public disclosure.”); id. § 601.51(b) (“The existence of a biological product file will not be disclosed by [FDA] before a biologics license application has been approved unless it has previously been publicly disclosed or acknowledged.”), id. § 601.51(c) (“If the existence of a biological product file has not been publicly disclosed or acknowledged, no data or information in the biological product file is available for public disclosure.”); see also 39 Fed. Reg. 44,602, 44,634 (Dec. 24, 1974) (“The existence of a pending NDA constitutes confidential commercial information where the existence of clinical testing has not previously been publicly disclosed or acknowledged.”)

⁴³ 39 Fed. Reg. at 44,634

⁴⁴ 21 C.F.R §§ 314.430(f), (g), 601.51(e), (f)

⁴⁵ CMS should also remain mindful of international commitments to protect undisclosed information from being disclosed or unfairly used, particularly under Article 39 of the WTO TRIPS Agreement. Failure to protect confidential information, including in any “high-level” statements, would be contrary to international commitments of the United States.

successes and doesn't distinguish between them.⁴⁶ Thus, "high-level" statements should not provide misleading information that extends beyond CMS' unique definitions and its price-setting scheme.

e. Data Use Provisions and Limitations (Section 40.2.2)

PhRMA strongly opposes provisions of the Guidance that would prohibit manufacturers from disclosing information exchanged verbally or in writing that relates to basic elements of CMS' MFP decision-making process. These provisions lack legal authority, hinder government accountability, and prevent ongoing, year-to-year learning that will be important to the effective implementation of and manufacturer compliance with the Program. We urge CMS to delete these provisions and adopt an approach that promotes transparency and accountability in government decision-making while protecting proprietary and confidential information.

Specifically, in section 40.2.2 of the Guidance, CMS cites to general authority for "administering the program and monitoring compliance," to propose a sweeping policy that would restrain manufacturer speech by placing limits on what a manufacturer can use or disclose from CMS' offers, including the ceiling price, the information contained in any concise justification provided with an offer, and any information exchanged verbally during the "negotiation" period. CMS would prohibit audio or video recording of any oral conversations between CMS and a manufacturer, and even limit use – stating that manufacturers could use government information only for purposes of the Program, and as required by applicable state or federal law.

The Agency also proposes a "Certificate of Data Destruction," to be submitted within 30 days of a drug or biologic no longer qualifying as a selected drug. Under such certificate, a manufacturer would certify that all information received from CMS during the "negotiation" period and potential "renegotiation" period(s), including the initial offer and any subsequent offers, and the concise justification(s), and any of the manufacturer's written notes or emails pertaining to negotiation (or renegotiations) with CMS, have been destroyed.

PhRMA is unaware of CMS or HHS ever having proposed such an over-broad and patently unconstitutional information policy. Prior governmental restraints on speech "are the most serious and the least tolerable infringement on First Amendment rights,"⁴⁷ and they are subject to a "heavy presumption against [their] constitutional validity."⁴⁸ Indeed, restraints on the disclosure of "truthful information about a matter of public significance" – like the data subject to use restrictions in section 40.2.2 – are almost never permissible under the First Amendment.⁴⁹ The Supreme Court has recognized a limited exception to that rule for information that cannot be disclosed without doing substantial, concrete, and immediate harm, such as when necessary to protect "the secrecy of information important to our national security."⁵⁰ However, the information at issue here is plainly not of that type.⁵¹

⁴⁶ PhRMA's definition of R&D expenditures reported in its Annual R&D Survey (<https://phrma.org/resource-center/Topics/Research-and-Development/2022-PhRMA-Annual-Membership-Survey>) includes basic and applied research, as well as developmental activities carried on or supported in the pharmaceutical, biological, chemical, medical, and related sciences, including psychology and psychiatry, if the purpose of such activities is concerned ultimately with the utilization of scientific principles in understanding diseases or in improving health. When reporting industry R&D expenditures, members include the total cost incurred for all pharmaceutical R&D activities including salaries, materials, supplies used, a fair share of overhead (administration, depreciation, space charges, rent, etc.), as well as the cost of developing quality control. Also included are expenditures within the company's U.S. (inside)/foreign (outside) research laboratories plus R&D funds contracted or granted to commercial laboratories, private practitioners, consultants, educational and nonprofit research institutions, manufacturing and other companies, or other research-performing organizations located inside/outside of the United States. These **do not** include the cost of routine quality control activities, capital expenditures, or any costs incurred for drug or medical R&D conducted under a grant or contract for other companies.

⁴⁹ *Bartnicki v. Vopper*, 532 U.S. 514, 527 (2001) (citation omitted).

⁵⁰ *Snepp v. United States*, 444 U.S. 507, 509 n.3 (1980).

⁵¹ See *McGehee v. Casey*, 718 F.2d 1137, 1141 (D.C. Cir. 1983) ("The government has no legitimate interest in censoring unclassified materials.").

Indeed, section 40.2.2 does not claim that its data use restrictions would satisfy strict scrutiny – i.e., that they serve a compelling state interest and are narrowly tailored to achieve that interest. Much less does CMS offer actual “empirical evidence” to substantiate the need for such restrictions,⁵² nor can CMS defend the data use restrictions in section 40.2.2 on the ground that manufacturers enter the price setting process voluntarily. In fact, as noted above, participation by manufacturers is not truly voluntary, as the manufacturer’s ability to opt out of the program is highly limited, both as a practical and legal matter. But even if participation were voluntary, “[t]he government may not censor [truthful, non-classified information], ‘contractually or otherwise.’”⁵³ Simply put, the government may not impose a “direct regulation of speech...as a condition on the receipt of federal funds” where, as here, the condition goes “beyond ensuring that federal funds [are] not...used to subsidize” unwanted speech.⁵⁴

Section 40.2.2’s document-destruction requirements similarly constitute impermissible restrictions on the freedom of speech. Indeed, the requirement to destroy information “receive[d] during the negotiation period from CMS” goes a significant step further even than a prior restraint on publication. It is hard to imagine almost any scenario (outside the national security context) in which the government can justify forcing a private individual to destroy the individual’s own property – even the individual’s own notes – in order to prevent truthful information from getting out. Taken literally, the Guidance would require manufacturers to destroy emails, notes, and other records of their own internal company deliberations, so long as those deliberations “pertain[] to negotiations,” regardless of whether the records reflect information from CMS itself. As noted below, the policy would also prevent manufacturers from reporting inappropriate or unlawful behavior by CMS or its employees and officials, since such disclosures are usually not “required by applicable state or federal law.” The government has no legitimate interest – much less a compelling interest – in commanding such a result.

Section 40.2.2 violates the First Amendment in other ways as well. The prohibition on using price setting data “for any purpose other than the Medicare Drug Negotiation Program” is impermissibly vague. Vague laws inherently invite subjective enforcement, a concern that is heightened when speech is at issue.⁵⁵ For that reason, “a more stringent vagueness test” applies where, as here, the government attempts to restrict private speech.⁵⁶ If taken at face value, CMS’ prohibition would apply to a manufacturer’s internal deliberations, akin to an individual’s internal thought process; such a prohibition would be substantially overbroad and would fail strict scrutiny. But even if CMS would read the prohibition more narrowly – something it is not possible to discern from the Guidance itself – the Guidance’s failure to specify its scope with reasonable precision threatens to chill legitimate speech and invites arbitrary enforcement.⁵⁷

For information that is not proprietary to the manufacturer, the proposal also is at odds with government records retention and freedom of information principles. For example, for non-proprietary information held in government custody, the government ordinarily is required to disclose such data if requested under FOIA.⁵⁸ Thus, while information *held by the government* might be subject to records requests under FOIA, CMS would simultaneously require a *manufacturer* to hide or destroy the same information. Presumably, when the information is in government custody, it would be subject to Federal Records Act⁵⁹ requirements, under which the Agency would be required to maintain the records, document its activities, file records for safe storage and efficient retrieval, and dispose of records only according to an Agency schedule.

⁵⁸ 5 U.S.C. 552.

⁵⁹ 44 U.S.C. 31.

Far from allowing CMS to “administer the program” and “monitor compliance,” the provisions would have the effect of undermining sound program administration and consistent compliance by foreclosing vital opportunities for program transparency. Manufacturers that undergo the MFP decision-making process would effectively be muzzled from pointing out flaws, oversights, or methodological problems in CMS’ administration of the Program or its compliance monitoring. Further, CMS’ proposal would impede the year-to-year learning by stakeholders that would serve an important role in effective program administration and compliance.

It is unclear if the policy would apply to sharing or retaining information with respect to attorneys, accountants, or others performing due diligence on a company’s activities or providing the company with legal advice. Even within the same corporation, a manufacturer would not have the data to inform activities on a second set of selected drugs. The degree of secrecy imposed by these provisions creates the impression of an Agency unwilling to subject its decisions to open, evidence-based scrutiny, creating a significant risk of undermining public trust in CMS decision-making. With the public explanation of the MFP occurring many months after the end of the price setting period (on March 1st, 2025) and a full 17 months after the sole, limited opportunity for the public to provide input, the public and those relying on medicines or certain forms of medicines that could be affected by CMS price setting may question why CMS felt the need to shield its decision-making process from scrutiny in this way. ***For the reasons stated above, CMS should abandon the proposed data use restrictions on disclosing and/or using government-provided data as the policy violates the First Amendment, conflicts with government transparency principles, and cannot be finalized.***

In a recent blog-post CMS stated: “CMS continues to believe that transparency promotes accountability.”⁶⁰ We agree, and believe such transparency must start with the Agency itself.

f. Effectuation of the MFP (Section 40.4)

Under section 1193(a) of the SSA, manufacturers entering into an Agreement with CMS must provide access to the MFP for selected drugs that are covered under Part D to (1) MFP-eligible individuals and (2) pharmacies, mail order services, and other dispensers with respect to such MFP-eligible individuals who are dispensed such drugs. CMS notes in the guidance that the IRA requirement that the negotiated price for a selected drug be less than or equal to the MFP plus a dispensing fee for MFP-eligible individuals⁶¹ “ensures that Part D MFP-eligible individuals will have access to the MFP at the point-of-sale.”⁶² In addition, CMS would define “providing access to the MFP” in the context of dispensing entities as ensuring the amount paid by the dispensing entity is not greater than the MFP. Furthermore, CMS intends to require Primary Manufacturers to provide access to the MFP in one of two ways: (1) by ensuring that the price paid by the dispensing entity is no greater than the MFP; or (2) by providing retrospective reimbursement for the difference between the dispensing entity’s actual acquisition cost and the MFP.⁶³

It is critical that the Agreement reflect such options and ensure that manufacturers are only required to provide access to the MFP after receiving data to verify eligibility.

While we appreciate CMS’ clarity on options for providing access to the MFP, PhRMA has significant concerns that the resulting process will add burden to all stakeholders in the pharmaceutical supply chain, significantly increase risks to program integrity, and ultimately impact the Agency’s ability to implement the IRA in a successful and orderly manner unless CMS: (1) ensures manufacturers receive data needed to verify MFP eligibility and 340B drug status; (2) removes the requirement for manufacturers to reimburse intermediate entities

⁶¹ SSA § 1860D-2(d)(1)(D) (as amended by IRA 11001(b)) (Part D negotiated price for a selected drug must be less than or equal to the MFP plus a dispensing fee).

⁶² Guidance, p. 31.

⁶³ Guidance, p. 32.

within 14 days; and (3) uses a more widely available pricing benchmark to define the MFP discount amount. PhRMA strongly urges the Agency to work towards a solution (clarified in guidance), that would:

- ***Provide manufacturers with access to certain data fields from the Part D Prescription Drug Event (PDE) records that will enable manufacturers to verify that a patient is an MFP-eligible individual.*** The statute does not require a manufacturer to provide access to the MFP for an individual who is not an “MFP-eligible individual”⁶⁴ and therefore, data need to be available to a manufacturer to verify an individual’s eligibility for the MFP prior to payment. Similarly, a manufacturer will need appropriate data to provide 340B covered entities (CEs) with the lesser of the MFP and 340B ceiling price, as well as to prevent payment of both an MFP statutory discount and a 340B discount on the same unit as is expressly prohibited under the MFP/340B nonduplication clause.⁶⁵ Without access to data for verification, we believe there could be significant disruptions to the Agency’s implementation of the IRA, and a significant risk of non-MFP eligible individuals receiving access to the MFP in contradiction to the statute. CMS should expressly acknowledge that manufacturers will establish, receive, review, and as necessary, audit MFP validation data to ensure manufacturers have provided MFP access in accordance with the statute. A list of the minimum needed data fields is included as Exhibit A to this comment letter.
- ***Remove the requirement for manufacturers to reimburse applicable intermediate entities within 14 days for manufacturers choosing a retrospective approach to providing access to the MFP.*** To meet the required payment deadline to pharmacies and other dispensers (hereafter referred to jointly as pharmacies), manufacturers could contract with intermediate entities to facilitate payments to pharmacies in a timely manner, provided those intermediate entities are given access to claims-level transaction data. However, manufacturers need more time than the 14 days proposed by CMS to review claims and verify patient eligibility for the MFP. PhRMA strongly recommends that CMS eliminate the requirement to reimburse intermediate entities within 14 days and instead provide flexibility for intermediate entities and manufacturers to develop processes and set contractual terms related to timing of payment.
- ***Utilize a widely available pricing benchmark such as Wholesale Acquisition Cost (WAC) to define the amount of MFP discounts.*** Acquisition cost is an inappropriate metric to use for defining the amount of MFP discounts. It is currently known solely at the prescription level by the dispensing pharmacy and requiring pharmacies to report the acquisition cost to other stakeholders in the supply chain – who could be playing key coordinating roles in facilitating payment of MFP discounts – could harm competitive incentives in the pharmaceutical supply chain.

PhRMA urges the Agency to improve effectuation of the MFP and minimize stakeholder burden by designating a third-party administrator (TPA) to facilitate this process for manufacturers choosing a retrospective approach. This will best ensure consistent patient access to the MFP at the point-of-sale, enable full reimbursement to pharmacies through a standardized process within the 14-day time frame proposed by CMS, protect program integrity, promote efficiency and accuracy, and minimize stakeholder burden.

If CMS believes it is unable to modify the Guidance to address the three issues noted above, PhRMA strongly urges CMS to withdraw section 40.4 from the revised Guidance. The Agency should instead continue to work with stakeholders to address these issues to meet the needs of all entities within the pharmaceutical supply chain.

PhRMA’s additional feedback on this section of the Guidance follows below.

⁶⁴ SSA § 1191(c)(2) and section 80 of the Guidance.

⁶⁵ SSA § 1193(d)

CMS Needs to Provide Manufacturers with Access to Claims Data for Verification

With or without designating a TPA, CMS must, at a minimum, articulate a process by which manufacturers will receive access to detailed claims data necessary to verify claims, regardless of whether the manufacturer chooses to make the MFP discount available upfront or on a retrospective basis. Manufacturer access to these data is imperative for protecting program integrity. A list of minimum data fields is included as Exhibit A to this letter, and we recommend that CMS seek stakeholder feedback before finalizing this list of data fields.

PhRMA believes it is important for CMS to make these data available to manufacturers, and to do so in an easily accessible format. Manufacturers cannot rely on entering into private contracts with other supply chain stakeholders to secure the data necessary for verification, as these stakeholders may not have access to all required claims-level data elements. For example, if a manufacturer were to contract with a wholesaler to provide pharmacies with access to the MFP, the wholesaler may not have access to the claims-level detail needed for manufacturer verification without significant changes to the existing chargeback system or intervention from CMS.

The Agency's Example of Effectuating the MFP in Section 90.2 of the Guidance is Missing Critical Information Flows Needed to Verify Claims

In section 90.2 of the Guidance (“Monitoring Access to the MFP”), CMS provides an example of how private sector stakeholders could leverage existing systems for manufacturers to provide access to the MFP. Specifically, CMS details a chargeback from a wholesaler to a manufacturer for a retrospective MFP discount to a pharmacy.

Several elements of this example – in which wholesalers would invoice manufacturers for retrospective MFP discount chargebacks – are incompatible with the existing pharmaceutical supply chain infrastructure. First, the MFP must be made available on individual claims, but wholesalers do not currently engage in claims-level data transactions with pharmacies. Either pharmacies would need to begin reporting claims-level data to wholesalers, a burdensome reporting requirement that pharmacies may have significant reservations about undertaking, or wholesalers would need to be given access to portions of PDE data to obtain claims-level data necessary to correctly bill manufacturers for chargebacks.

Second, the Agency’s description in section 90.2 describes two “existing mechanisms” to ensure dispensing entities have access to the MFP and to verify that the MFP is only received by MFP-eligible individuals. However, the two mechanisms described by CMS – the RxBIN and Part D processor control number (RxPCN) – are not sufficient pieces of information for a manufacturer to fully verify eligibility for the MFP. For example, it would not be possible from just the RxPCN and RxBIN to identify which medicine is being dispensed, or to confirm that a transaction was not a duplicate or was not later reversed or revised. As noted above, Exhibit A to this comment letter includes a list of minimum fields that are needed for manufacturers to accurately verify eligibility of claims for MFP discounts, and to accurately identify claims subject to 340B discounts.⁶⁶ Most of these fields already appear on the Part D PDE record (and many are already provided to manufacturers under the Coverage Gap Discount Program), thus minimizing the reporting burden. PhRMA recommends that the Agency periodically reevaluate data elements necessary to verify MFP eligibility, with industry input, to help minimize operational shortcomings.

The Agency's Proposed Requirement for Manufacturers to Ensure Full Reimbursement to Dispensers and Intermediate Entities, as Applicable, is Not Possible as Drafted within 14 Days

⁶⁶ Accurate identification of claims subject to 340B agreements is necessary to ensure manufacturers provide 340B CEs access to the lesser of the MFP or 340B ceiling price.

PhRMA has significant concerns with the Agency's proposed requirement for manufacturers to reimburse any intermediate entities involved in effectuating the MFP within 14 days.

Under the Coverage Gap Discount Program (CGDP), Part D plans (or pharmacy benefit managers (PBMs) acting on their behalf) pay coverage gap discounts on behalf of manufacturers at the time of pharmacy adjudication (which, under prompt pay requirements, occurs within 14 days). But a key reason this system is possible is that manufacturer verification of coverage gap discount claims is permitted on a quarterly basis, some time after the 14-day timeframe for payment to the pharmacy.

PhRMA appreciates the need for timely reimbursement to pharmacies, but we strongly urge CMS to strike the language that would require reimbursement to intermediate entities within the same 14-day window as the pharmacy.⁶⁷ This would enable manufacturers to contract with intermediate entities for more time to perform claims verification after pharmacies have been fully reimbursed, as PhRMA does not believe that proper claims verification is possible within the 14-day window. Under the CGDP, for example, manufacturers have 38 days from receipt of an invoice from the CGDP TPA, Palmetto, to pay coverage gap discount obligations. The same 38-day payment window from receipt of invoice also applies to manufacturer rebate obligations under the Medicaid Drug Rebate Program. Indeed, under the Part D program today, plans submit PDE entries to CMS on a two-week cycle. So, CMS itself would barely receive data necessary for verification within the 14-day reimbursement window, let alone have time to make those data accessible to manufacturers for verification.

Acquisition Cost is an Inappropriate Metric to Define the Amount of an MFP Discount

In section 40.4 of the Guidance, CMS proposes that Primary Manufacturers choosing to provide access to the MFP through retrospective reimbursement will need to provide the pharmacy with a discount equal to the difference between the pharmacy's acquisition cost and the MFP.

PhRMA has significant concerns with the Agency's proposal. Acquisition cost is an inappropriate metric for several reasons, including: (1) the dispensing pharmacy's true acquisition cost for an individual prescription is currently unknown to entities outside of the pharmacy; and (2) reporting of the acquisition cost could harm competitive incentives in the pharmaceutical supply chain. Instead, PhRMA urges CMS to exercise its authority under section 1196 of the SSA and define a retrospective MFP discount based on a widely available pricing benchmark like WAC. Specifically, section 1191(a)(4) directs the Secretary to "carry out the...administrative duties...in accordance with section...1196," which, in turn, provides for "[t]he establishment of procedures to carry out the provisions of [the Medicare Drug Price Negotiation Program], as applicable, with respect to [MFP-eligible individuals]."

Pharmacies may purchase medicines from multiple wholesalers at different prices, and the quantity purchased can vary significantly. Individual prescriptions are often comprised of a quantity of medicine pulled from larger bottles received from wholesalers and can even be comprised of a quantity taken from bottles purchased from different wholesalers at different prices depending on the available inventory at the pharmacy. Because of this, only the dispensing pharmacy would be in a position to know the true acquisition cost for a prescription dispensed to an MFP-eligible beneficiary. Wholesalers or other supply chain stakeholders do not currently have insight into the acquisition cost at the prescription level, nor do manufacturers since they typically do not sell medicines directly to pharmacies.

Furthermore, requiring pharmacies to report the acquisition cost for each prescription to intermediate entities for purposes of MFP effectuation has the potential to harm competitive incentives in the pharmaceutical supply chain. For example, if pharmacies are required to include acquisition cost data as part of the claim transaction, this could create incentives for Part D plans and PBMs to limit reimbursement to no more than the reported acquisition cost

⁶⁷ The IRA is silent on providing access to the MFP to intermediate entities.

or to limit participation in preferred networks to pharmacies willing to accept cost-based reimbursement. PBMs could also use information about a pharmacy's acquisition cost to cut reimbursement for the pharmacy's non-Medicare patients. Such actions would significantly disadvantage community pharmacies. Additionally, because pharmacies may purchase the same medicine from multiple wholesalers, requiring pharmacies to report acquisition costs to wholesalers could also undermine competitive incentives between wholesaler competitors.

Given the issues with acquisition cost detailed above, PhRMA strongly urges CMS to instead define the retrospective MFP discount based on WAC. Using WAC as the pricing benchmark would reduce the risk of creating misaligned incentives for pharmacies and other stakeholders, and any intermediate entity assisting manufacturers in providing access to the MFP would be able to readily determine WAC on the date of dispense, allowing for a seamless, easy calculation of a retrospective MFP discount amount. On average, WAC tends to be a little higher than pharmacy acquisition costs for brand drugs today,⁶⁸ and as such, would best ensure that pharmacies do not incur a shortfall after receiving retrospective reimbursement of an MFP discount and would still allow pharmacies to earn a margin on prescriptions for selected drugs. In contrast, use of acquisition cost, including the National Average Drug Acquisition Cost (NADAC), as a pricing benchmark could significantly reduce or eliminate margins for pharmacies on prescriptions for selected drugs, which could put community pharmacies in particular at risk of closure.

g. Nonduplication with 340B Ceiling Prices (Section 40.4.1)

In section 40.4.1 of the Guidance, CMS states that a Primary Manufacturer is required to provide access to the MFP to 340B CEs if the MFP is below the 340B ceiling price for a selected drug when the CE (or a pharmacy on its behalf, in appropriate cases) dispenses a selected drug to a 340B patient of the CE who is also a Medicare beneficiary. CMS further states that if the 340B ceiling price is "subsequently determined" to be below the MFP, then the manufacturer is responsible for providing the 340B CE the difference between the MFP and 340B ceiling price.

PhRMA has significant concerns that these proposed requirements do not describe the statutory nonduplication clause correctly and conflict with the Agency's proposal in section 40.4 of the Guidance for manufacturers to provide access to the MFP under a retrospective approach by reimbursing pharmacies the difference between the acquisition cost and MFP within 14 days. Specifically, we believe that the Agency's proposed requirements in each section will result in manufacturers providing duplicate MFP and 340B discounts instead of preventing them.

Currently, we understand many CEs manage their 340B inventory virtually using a replenishment model. Under this model, a 340B CE will track, typically with a computerized system, units of medicines dispensed to 340B-eligible patients. When a certain threshold of units is reached, the CE places an order to replenish that stock at the 340B discounted price.⁶⁹ Thus, the medicine is received upfront at the 340B price. This model introduces complexity and is not statutorily mandated.

In such replenishment models, drugs subject to an agreement under section 340B of the Public Health Service Act (340B agreement) are identified after the drug is dispensed. This lag in identification of claims potentially eligible for 340B pricing would make it more difficult to clearly identify whether a 340B discount or MFP discount is owed on a given claim. In addition, it also appears to create an incompatibility with the Agency's proposed requirement for manufacturers to provide pharmacies access to the MFP through a retrospective

⁶⁸ Average pharmacy acquisition costs tend to be 4 percent below WAC based on NADAC data. *See* Myers and Stauffer. (2022). NADAC Equivalency Metrics. Available at: <https://www.medicaid.gov/medicaid/prescription-drugs/downloads/retail-price-survey/nadac-equiv-metrics.pdf>.

⁶⁹ For an overview of the physical inventory model and the replenishment model, as utilized by contract pharmacies in the 340B program, please see: OIG. Memorandum Report: Contract Pharmacy Arrangements in the 340B Program. February 4, 2014. Available at: <https://oig.hhs.gov/oei/reports/oei-05-13-00431.pdf>.

discount equal to the difference between the acquisition cost and the MFP within 14 days, since under the replenishment model, the acquisition cost will vary based on the 340B status of the claim and is not known at the time of dispensing. In other words, a 340B pharmacy using a replenishment model would not know the appropriate acquisition cost in time for manufacturers to meet the proposed 14-day reimbursement requirement. If the pharmacy uses an acquisition cost that is not the 340B price to invoice a manufacturer for a prescription that is later determined to be subject to a 340B agreement, this could result in the manufacturer paying duplicate discounts. And, as noted above, under the IRA's nonduplication clause,⁷⁰ a manufacturer owes nothing further to a CE if the CE already acquired the drug at a 340B ceiling price *lower than* the MFP; it only owes the differential between the 340B ceiling price and the MFP if the CE already acquired the drug at a 340B ceiling price that *exceeds* the MFP.

PhRMA urges CMS, in coordination with the Health Resources and Services Administration (HRSA) to issue clear rules for relevant stakeholders to address this conflict and to prevent duplicate MFP and 340B discounts as required under the IRA. PhRMA recommends the Agency consider several potential solutions:

- *Require identification of 340B units at the point-of-sale.* CMS should require identification of 340B units at the point-of-sale through the use of a claims indicator. This would designate the appropriate acquisition cost, as the 340B status of each prescription would immediately be known and allow manufacturers to be able to pay the retrospective discount to the pharmacy upon appropriate verification from the CE within 14 days.⁷¹ The use of a claims indicator would also align with the requirement for CMS to identify and exclude 340B units from the Part D inflation rebate beginning in 2026.
- *Clarify that manufacturers can choose to make the MFP the “default payment.”* In coordination with HRSA, CMS could require CEs to follow a new retrospective discount mechanism (i.e., a “rebate”) to obtain 340B pricing for selected drugs. CMS should revise the Guidance to state that manufacturers could initially provide the MFP to CEs (or pharmacies dispensing medicines on their behalf) for verified MFP-eligible individuals and then later reimburse CEs for any difference owed between the MFP and the 340B ceiling price (if lower) as a rebate. Under this approach, when invoicing manufacturers, pharmacies or a coordinating intermediate entity would then always use a non-340B acquisition cost for an MFP drug to determine the retrospective MFP discount amount. If it was determined later that a drug was subject to a 340B agreement, and the 340B ceiling price was below the MFP, a manufacturer would reimburse the CE for the difference between the MFP and 340B ceiling price after receiving an invoice from the CE.⁷²

If CMS is not able to address the inconsistency between the proposed Guidance in sections 40.4 and 40.4.1 using one of the solutions outlined above, or another approach, PhRMA urges CMS to withdraw sections 40.4 and 40.4.1 from the revised Guidance to avoid confusion. This would give the Agency additional time to develop a replacement solution to the complicated intersection between 340B and the MFP that works for stakeholders and adheres to the statute's nonduplication clause.

Identifying Units Subject to 340B Agreements

Regardless of the approach CMS chooses to adopt to reconcile the inconsistency between sections 40.4 and 40.4.1 of the Guidance, the accurate identification of units of selected drugs subject to 340B agreements is critical to allowing manufacturers to meet their obligation to provide CEs with the lesser of the MFP or 340B ceiling price

⁷⁰ SSA § 1193(d).

⁷¹ Ibid.

⁷² This proposal should be read consistent with PhRMA's position on the 14-day requirement for providing access to the MFP, as set forth in the preceding section of this comment letter.

when the CE (or a pharmacy on its behalf, in appropriate cases) dispenses a selected drug to a 340B patient of the CE who is also a Medicare beneficiary. Without an accurate way to identify 340B units, manufacturers could be at risk of paying multiple discounts that are meant to be prevented by law.

PhRMA continues to support the Agency’s proposal in the Part D inflation rebate Guidance to require a 340B indicator be included on the PDE record and on all pharmacy claims.⁷³ PhRMA also urges CMS to add a second, “non-340B” indicator value such that the PDE is never silent on the 340B status of each claim. PDE submissions without either of the two indicator values should be rejected as incomplete. This approach would give CMS needed certainty that a 340B determination has been made for each claim. In addition, this would align with the approach taken by the Agency for the discarded drug refund modifier, where providers and suppliers submitting claims for single-dose container or single-use package drugs under Part B must use the “JW” modifier to indicate the amount of a medicine that was discarded, or, effective July 1st, 2023, use the “JZ” modifier to attest that no amount of a medicine was discarded.⁷⁴

Even with a set of mandatory claims indicators, however, PhRMA has significant concerns that all prescriptions subject to a 340B agreement may not be appropriately captured, which could undermine the ability of manufacturers to meet their obligation to provide CEs with the lesser of the MFP or 340B ceiling price when the CE (or a pharmacy on its behalf) dispenses a selected drug to a 340B patient of the CE who is also a Medicare beneficiary. A recent report by IQVIA found that only 61 percent of treatments for Part B separately payable drugs originating at rural referral centers and sole community hospitals used a relevant 340B modifier,⁷⁵ a highly concerning result given that CMS requires these entities to use the “JG” and “TB” modifiers on claims seeking Medicare payment for a 340B-acquired drug. By comparison, IQVIA found that 89 percent of treatments for Part B separately payable drugs originating at disproportionate share hospitals (DSHs) used a relevant modifier.⁷⁶ Since the requirement to use either the “JG” or “TB” modifiers applies equally to DSHs, rural referral centers, and sole community hospitals, the reasons for the significantly different rates of modifier use are unclear.

PhRMA believes that the addition of a “non-340B” indicator value and the rejection of PDE records that lack one of the two relevant values discussed above will help to improve appropriate reporting of units subject to 340B agreements. PhRMA further encourages CMS to establish a robust process to audit 340B CEs to confirm the appropriate identification of units subject to 340B agreements, with penalties for CEs found to be out of compliance. Alternatively, CMS could establish a clearinghouse-type organization to identify 340B units dispensed or administered to Medicare enrollees. The 340B clearinghouse would act as a claims verifier, reviewing Part D PDE data as well as data submitted by 340B CEs (or entities acting on their behalf) to confirm whether a claim is subject to a 340B agreement, similar to the role played by 340B TPAs and split-billing vendors today.⁷⁷ Part D claims identified as being subject to a 340B agreement by either claims indicators or the clearinghouse would then be shared with manufacturers.

Without either a mandate to use a 340B indicator on the PDE or a data clearinghouse that can share identified 340B claims with manufacturers, it is unclear which mechanism manufacturers could use to provide CEs with the lesser of the MFP or 340B ceiling price when a selected drug is dispensed to a 340B patient of the CE who is also

⁷⁶ Ibid.

⁷⁷ 340B TPAs and split-billing vendors assist 340B CEs in managing prescription 340B eligibility, ordering, and payment. These entities track electronic data feeds (such as inpatient or outpatient status, prescriber eligibility, clinic location, Medicaid payor status, drug identifier, and quantity dispensed) to assess 340B patient eligibility.

a Medicare beneficiary. Thus, it is imperative for CMS to adopt an approach to accurately identify all Part D prescriptions subject to 340B agreements.

II. Negotiation Factors (Section 50)

Sections 50 and 60 of the Guidance describe numerous, closely related elements of the MFP price-setting process (statutory factors, price setting methodology and process, respectively). Overall, CMS' approach to defining the statutory factors in section 50 and Appendix C, as well as the process and methodology described in section 60, falls short of establishing a "consistent process and methodology" for MFP price setting as required in section 1194 of the SSA. To be truly consistent, a methodology must provide a reasonable degree of predictability for stakeholders – particularly manufacturers – on how the factors, and data that underpins them, affect the outcome of the Agency's decision.

Unfortunately, the initial guidance falls short of these standards. The lack of specificity in how individual factors are defined and weighted, combined with an opaque process, results in a subjective and arbitrary price setting framework. We urge CMS to make changes in a revised Guidance to provide needed clarity and specificity in the MFP methodology and factor definition, without resorting to a formulaic approach that does not allow the needed flexibility to account for important clinical differences between medicines and therapeutic areas.

Despite the lack of specificity in the proposed methodology and factor definition, the few details that CMS does articulate almost uniformly point to an approach that will significantly exacerbate the underlying flaws in the statute itself and worsen the impact on patients. Because the IRA directs CMS to "consider" a host of factors, the Agency could balance the factors in a manner that rewards innovation, preserves patient care and advancement, and ensures manufacturers – at a minimum – recoup R&D and costs of production and distribution. Instead, the Agency proposes to:

- Define factors in ways that seem explicitly designed to drive the MFP to excessively low "cost-plus" pricing levels;
- Propose an approach to calculating R&D cost "recoupment" that doubles down on the inherent flaws in the statute's unprecedented inclusion of the concept; and
- Penalize rather than reward manufacturer investments in continued R&D following a drug's approval.

Together, these choices strongly suggest a predisposition to devalue the factors related to the clinical benefits and value of medicines to patients which could help mitigate the law's adverse impact on medical progress. We elaborate on our concerns with CMS' proposed definitions of the statutory factors below. In section III, we discuss concerns with CMS' methodology and process for setting MFPs.

a. Requirements for Submission of Manufacturer Submitted Data Generally (Section 50.1)

In section 50.1 of the Guidance, implementing the "manufacturer-specific data" provisions of IRA (SSA 1194(e)(1)), CMS states that it intends to require that a Primary Manufacturer submit data related to the selected drug to CMS regarding R&D costs of the Primary Manufacturer and whether the Primary Manufacturer has recouped those costs; current unit costs of production and distribution; prior federal financial support for the drug's discovery and development; data on pending and approved patent applications, patent exclusivities, and NDA/BLA approvals; and market data and revenue and sales volume data in the U.S. for the Primary and Secondary Manufacturer. Appendix C of the Guidance includes a list of definitions that describe the data to be collected for the Program.

CMS intends for the Primary Manufacturer to aggregate data from both the Primary Manufacturer and Secondary Manufacturer on the non-FAMP, current unit costs of production and distribution, market data, and revenue and sales volume. It is not workable for Primary Manufacturers to report these data on behalf of Secondary

Manufacturers since Primary Manufacturers likely lack access to such data from Secondary Manufacturers, either legally or practically. See section I, subsection (a) of our comments for our detailed concerns with this part of the Guidance. In addition, as discussed above, there is insufficient time to modify contracts between the parties prior to October 1st, 2023. Further, even if these data were only being collected and submitted by the Primary Manufacturers, we are concerned that the proposed data will be virtually impossible for manufacturers to collect and submit within the 30-day timetable envisioned by the Agency. ***CMS has discretion under the law to permit additional data submission after the October 2nd, 2023 deadline, and we strongly recommend the Agency exercise this discretion.***

Because much of the data required by the IRA are already provided by biopharmaceutical companies under other statutory requirements, CMS should obtain relevant data from publicly available sources wherever possible. For example, ***PhRMA recommends that CMS obtain information about approved patent applications from the FDA's Orange and Purple Book listings and information about approved applications from Drugs@FDA, rather than impose additional burden on manufacturers to submit these data, and companies should be explicitly permitted to reference such sources in their submissions to CMS. Conversely, manufacturers should be permitted to voluntarily provide additional data about manufacturer-specific factors, which could provide necessary context or be helpful to CMS, at their discretion, due to the varied ways in which manufacturers record and maintain information about these factors.*** We note that several areas of the Information Collection Request (ICR) form lack sufficient text limits to allow companies to provide adequate supporting information when companies deem it would be helpful to inform CMS decision-making and should not be constrained in their ability to provide such information. ***PhRMA recommends that CMS amend the Guidance to allow sufficient space for manufacturers to provide a rationale for calculations that approximate spending on manufacturer-specific data elements or have referenced other publicly available information where necessary.***

b. Research and Development (R&D) Costs (Appendix C)

While the statute directs CMS to “consider” R&D costs and the extent to which the manufacturer has recouped such costs, nowhere does the IRA require penalizing biopharmaceutical innovators for recouping R&D, as CMS appears to propose. Indeed, as noted above, the factor could just as easily be read to require a floor, ensuring that, at a minimum, a manufacturer be permitted to recoup R&D. Unfortunately, CMS has chosen to establish standards for the R&D factor that are untethered from the realities of how biopharmaceutical progress occurs, failing to reflect or account for the high-risk nature of research and drug discovery and the complex ecosystem underpinning the U.S. biopharmaceutical research and development enterprise.

CMS also defines the factor in an overly narrow manner, stating that it will review a combination of costs incurred by the Primary Manufacturer for all FDA-approved indications of a drug, such as basic pre-clinical research costs, post-Investigational New Drug (IND) application costs, FDA Phase IV clinical trials, post-marketing trials, abandoned and failed drug costs, and all other R&D costs. CMS proposes to calculate “recoupment” of R&D costs by comparing them to global, total lifetime net revenue for the selected drug. CMS would then increase or decrease the preliminary MFP it calculates depending on whether costs have been “recouped.”

CMS’ proposal to deem that a manufacturer has “recouped” investment based on the global net revenue for the product is fundamentally at odds with maintaining strong incentives for continued R&D. Currently, the biopharmaceutical industry is acknowledged by the Congressional Budget Office (CBO) to be one of the most R&D-intensive in the U.S.⁸⁰ In 2020, U.S. biopharmaceutical R&D investment totaled \$122 billion.⁸¹ Companies invest on average over 20 percent of revenue in R&D,⁸² and in total account for approximately 18 percent of all business-funded R&D in the country, according to data from the National Science Foundation.⁸³ The Brookings Institution reported in 2015 that in 2009 the pharmaceuticals and medicines sector had the highest R&D spending per worker among 50 R&D- and STEM knowledge-intensive industries, at \$143,110. The sector coming in

second on this measure, communications equipment, was more than \$50,000 lower per worker. Even a cutting-edge, high investment sector like semiconductors and other electrical components had R&D spending of only \$49,612.⁷⁸ In sum, the biopharmaceutical industry is the United States' most R&D-intensive sector.

The Agency's flawed approach to assessing "recoupment" of costs reflects a misunderstanding of the economics of the global biopharmaceutical marketplace. Only one of thousands of potential candidates will ultimately result in an FDA-approved medicine, and less than 12 percent of the candidate medicines that make it into Phase I clinical trials are ultimately approved by the FDA.⁷⁶ Following approval, many medicines face significant competition or are not a commercial success.^{77 78} Companies account for these odds when they plan their R&D programs. The revenues from a few successful medicines support continued investment in the high-risk effort to discover new medicines and help to recoup costs of the many failures across their entire portfolio of medicines, not simply, as CMS proposes, those in the same therapeutic class or with the same intended mechanism of action. In sum, because selected drugs are among the subset of medicines with the highest spending in Medicare, they are *by definition* successful and thus likely to have "recouped" their R&D costs by CMS' definition, especially when defined as narrowly as CMS has proposed.

Based on section 60.3.4, CMS appears to be planning to compare global net revenue to R&D costs as defined by CMS to determine whether a manufacturer has recouped its R&D costs. Nowhere does CMS acknowledge that manufacturers necessarily incur a wide range of expenditures, beyond R&D. For instance, manufacturers also must manufacture a drug, incur expenditures to sell a drug in order to earn revenue on it, pay taxes, operate compliance programs, and engage in a variety of other costly operations. Without performing these core functions, a manufacturer would not be in a position to perform R&D. Therefore, CMS' narrow definition greatly overstates revenue that, even in its flawed construct, can reasonably be counted as "recouping" R&D costs.

CMS' definition also ignores ex-U.S. costs necessary to generate global sales. Over the last 20 years the use of multi-regional clinical trials (MRCTs) has become a preferred strategy for rapid new drug development.⁷⁹ MRCTs are conducted in more than one region under a single protocol and allow data generated in one country or region to be leveraged to help gain approval in another country or region. These studies, in addition to clinical trials that may be conducted solely outside the U.S. at the request of regulators, are required for achieving sales in countries around the world and are not necessarily costs related to the U.S. regulatory requirements for INDs or NDA/BLAs. Despite requiring manufacturers to provide the global, total lifetime net revenue from global product sales, CMS' methodology does not explicitly account for these ex-U.S. costs – further increasing the likelihood that manufacturers will be penalized for having "recouped" their costs under CMS' skewed methodology.

All of these concerns reflect the fallacy of CMS' unnecessary interpretation of the IRA, as well as its definitions of costs and "recoupment," both of which will arbitrarily and unnecessarily shift the price down. Given the discretion of the statute (to consider R&D recoupment as a floor, not a downward adjustment), the fact that such downward adjustments could never result in a "fair price," and the economic model that fuels medical advances, CMS should, in specifying "how or to what degree" this factor is applied, state that it will not be used to lower a price determined on the basis of a drug's therapeutic and clinical attributes.

PhRMA recommends that to the extent CMS maintains the flawed proposal on "recoupment," it should place minimal weight on this factor and specify that it will not be used to reduce an MFP determined on the basis of a drug's therapeutic and clinical attributes. Furthermore, the Agency should count only a fraction of global net revenue toward "recoupment" of R&D costs.

⁷⁸ Muro, M., Rothwell J., Andes S., Fikri K., Kulkarni S. (2015). America's Advanced Industries. Brookings Institute. Available at: https://www.brookings.edu/wp-content/uploads/2015/02/AdvancedIndustry_FinalFeb2lores-1.pdf.

Finally, CMS' approach to implementing this aspect of the statute is not only at odds with the way that manufacturers operate and invest in R&D, but also creates significant burden and complexity. In most cases it will be extremely challenging for manufacturers to quantify costs as required by CMS – and will be virtually impossible to comply within the 30-day timeframe. CMS has requested that manufacturers provide the costs of direct and indirect basic pre-clinical research costs on drugs with the same active moiety/active ingredient or mechanism of action as the selected drug that did not make it to clinical trials. This will require companies to produce a record of costs incurred for pre-clinical data that may be 20 or more years old, a herculean task. For companies with ex-U.S. headquarters, global data may not be easily accessible, or accessible at all, in the normal course of business to U.S. affiliates. In addition, pre-clinical costs may include, for example, investments in platform technologies that are used across multiple drug development programs, as well as development tools such as model-informed drug development or AI programs. As a result, calculation of product-specific R&D will require allocation of costs across drug development programs and products at the level of granularity which is prescribed in the guidance. Similarly, costs for “abandoned and failed” products may be difficult if not impossible to attribute to a drug development program in the ways CMS has specified. These difficulties are compounded when drug products are developed through the efforts of multiple companies, through early-stage R&D licensing arrangements, or other partnerships.

We urge CMS to recognize total investments across the entire portfolio. Rather than creating requirements that are virtually impossible for companies to accurately comply with, CMS should provide manufacturers with flexibility to provide information on broader R&D costs, including information about pre-clinical costs, failed and abandoned drug costs as well as “other R&D costs.” Other costs may include costs of global development and regulatory submission activities. Companies should also be permitted to rely on benchmark/industry-wide data in cases where a company may not maintain the data itself.

CMS should amend the Guidance to limit required submission of R&D costs to data available to the manufacturer that can be directly attributable to the selected drug, while allowing companies to voluntarily provide supplemental data. In addition, manufacturers should be given the opportunity to provide a supporting narrative.

c. Current Unit Costs of Production and Distribution (Appendix C)

Regarding current unit costs of production and distribution, CMS would define costs of production to include all direct and indirect costs related to purchasing raw ingredients, including intermediates, active pharmaceutical ingredients, excipients, and other bulk chemicals; formulating and preparing the finished drug product; performing quality control and testing of the drug; and operating costs for personnel, facilities, transportation, any importation, and other expenses related to preparing the finished drug product. Distribution costs would include all direct and indirect costs related to packaging and materials; labeling; shipping to any entity that acquires the drug from the Primary or Secondary Manufacturer; and operating costs for any of the above. Current unit costs would include only costs incurred by the Primary and Secondary Manufacturer and only units produced and distributed for sale in the U.S. R&D costs and marketing costs would not be included.

CMS' proposed definition for the unit costs of production and distribution in the Guidance is concerning. CMS has expanded the language on this factor beyond the statute to a level of additional detail and specificity that companies may not have access to, particularly in situations where companies may be working with additional suppliers and manufacturers in the supply chain. ***PhRMA strongly recommends that rather than specifying the definition, CMS allow discretion for manufacturers to describe production and distribution costs which they are able to report and to provide a narrative explanation describing how these costs were calculated.***

d. Prior Federal Financial Support (Appendix C)

CMS would define prior federal financial support to include tax credits, direct financial support, grants or contracts, and any other funds provided by the federal government to support discovery, research, and/or development of the selected drug – all during the time period from when initial research began or when the drug was acquired by the Primary Manufacturer, through the date the most recent NDA/BLA was approved. CMS states that it may consider decreasing the preliminary price if funding for the drug’s discovery and development was received with federal financial support.

PhRMA is disappointed with CMS’ decision to broadly define federal financial support and strongly disagrees with the notion that tax credits, including orphan drug tax credits, are appropriate for inclusion as “prior federal financial support,” which would serve to undermine the incentive that the credits are intended to provide by decreasing a selected drug’s MFP. Tax credits serve to incentivize R&D spending on life-saving medicines and, for orphan drugs, that spending is for medicines for rare diseases. These tax credits are critical to incentivize innovation and are not akin to the government providing direct support to a company’s research efforts and CMS’ policy undermines longstanding intent by Congress to incentivize R&D into these difficult to treat diseases.

PhRMA urges CMS to remove tax credits from the definition of “prior federal financial support.”

America’s biopharmaceutical industry is at the heart of a robust R&D ecosystem that develops more innovative drugs than any other country in the world. The industry’s unique role in that ecosystem is to utilize its scientific and industrial expertise to take the necessary risks to build upon and further advance basic science research into safe and effective treatments that can be made available to patients. Private sector companies regularly fund academic researchers and collaborate with government-funded scientists to advance a variety of promising scientific concepts to better understand various disease states and drug targets. However, many of those explorations are not ultimately included in developing the actual products for patient use. Rather, this knowledge must be shared and further expanded upon to contribute to potential new drugs and drug targets. ***Therefore, PhRMA recommends that CMS limit its consideration of prior federal financial support for discovery and development solely to funding that resulted in a patent application containing a Government Interest Statement and/or research where a patent assignee was a U.S. government agency for an invention directly related to the development of the selected drug (e.g., excluding basic science, research tools, or similar general concepts). PhRMA also requests that CMS clarify that prior federal financial support needs to be reported only for the time period starting when the Primary Manufacturer acquired the drug, even where this approach may result in the reporting of no prior federal financial support during the relevant period for products associated with patent applications that included a government interest statement.***

e. Patents, Exclusivities, and Approvals (Appendix C)

Regarding patents, exclusivities, and approvals, CMS considers relevant patents to be those that are pending or approved and linked to the selected drug as of September 1st, 2023, as well as pending and approved applications for which a claim of patent infringement could reasonably be asserted against a person engaged in the unlicensed manufacture, use, or sale of the selected drug. CMS notes that FDA exclusivity periods include Orphan Drug Exclusivity and Pediatric Exclusivity. CMS states that it will consider the length of the available patents and exclusivities before the selected drug may no longer be single source and may consider decreasing the preliminary price if the selected drug has patents and exclusivities that will last for a number of years.

PhRMA strongly disagrees with CMS’ proposal to decrease the MFP for selected drugs that have remaining patents and exclusivities. Instead, we recommend CMS take the opposite approach and recognize the benefit provided by these investments and consider adjusting the preliminary price upward based on these protections. Patent rights are a form of intellectual property (IP) protection enunciated in the U.S. Constitution and are critical to the continued investment in R&D, including for new medicines and improvements for existing medicines. Patents require the description of inventions to be disclosed to the public, allowing society to understand and learn from the invention, and this disclosure lays the groundwork for competition from nonidentical drugs that treat the

same conditions as well from generics and biosimilars. Annualized savings from biosimilars reached \$6.5 billion in 2020, and competition from generics and biosimilars is expected to reduce U.S. brand sales by \$128 billion through 2025.⁷⁹

CMS' proposal to penalize manufacturers for the lengthy, costly, and risky R&D that has resulted in new innovations protected by patents and exclusivities will undermine U.S. leadership in biopharmaceutical innovation and weaken the intent of the IP system. As a matter of course, drugs selected for price setting at 7 or 11 years will have remaining patents and exclusivities, which may include, for example, unexpired 7-year orphan-drug exclusivity for an orphan indication approved after the drug's initial approval or a 3-year new clinical exclusivity earned through new clinical trials of a drug product. Indeed, as a matter of law, innovative biologics receive 12 years of exclusivity following first licensure, and pediatric exclusivity would extend this period another six months. Thus, CMS' policy choice of penalizing patents and exclusivities would broadly undercut incentives for progress.

In addition, manufacturers should not be penalized in cases where they have obtained patents and exclusivities for innovation, including for important advances and improvements made after an initial FDA approval. Patents and exclusivities covering post-approval innovations may not affect the timing of approval and launch of generic or biosimilar products that omit a new indication, do not seek approval of an improved formulation, or are not made using a more efficient manufacturing process. It would be unjust to penalize manufacturers for obtaining patents and exclusivities that do not extend the single-source status of a product. Additionally, by choosing to adopt a policy of reducing the MFP from the ceiling price due to the existence of remaining patents and exclusivities, CMS would eviscerate these incentives that Congress created to promote innovation, knowledge-sharing, and benefits to patients and society. For example, existing incentives in the Best Pharmaceuticals for Children Act to conduct pediatric development beyond any required pediatric studies would be weakened. Actions related to patents should be left to legislation and where appropriate, the proper administrative body, i.e., USPTO. There is no indication that Congress intended for the IRA to hollow out these incentives in the manner that CMS proposes. Indeed, by imposing a financial penalty on manufacturers for obtaining patents and exclusivities, CMS would exacerbate the serious concerns that the Program raises under the Takings Clause of the Fifth Amendment to the U.S. Constitution, including by effectively depriving manufacturers of part of the value of a patent or exclusivity.⁸⁰

Post-approval R&D often results in innovations that can improve patients' lives. In fact, more than 60 percent of oncology medicines approved a decade ago received approvals for additional indications in later years, and most of those occurred seven or more years after initial FDA approval. Such post approval research often requires lengthy and costly clinical trials, taking a total of three to six years. Penalizing manufacturers for both patents and/or exclusivities on the original product as well as post-approval innovations would fundamentally change incentives for improving patient and doctor choice as well as continued investment in research following a drug's initial approval. Perversely, CMS' proposed policy would penalize the development of the very attributes of medicines and knowledge about medicines' performance that CMS states it will evaluate under the elements of this Guidance related to assessing a drug on its clinical dimensions. Indeed, the statutory classification of a selected drug as a short-monopoly drug, extended-monopoly drug, or long-monopoly drug already provides a mechanism for reducing the ceiling price and renegotiating the MFP as additional years elapse since approval. CMS should not further penalize manufacturers in the manner described in the guidance. ***PhRMA urges CMS to amend the Guidance and clarify that if a drug has existing unexpired patents or exclusivities, rather than penalizing the manufacturer with a lower price, it should result in an upward shift of the preliminary price to reflect the innovation in the product.***

⁷⁹ IQVIA Institute Report (2020). Biosimilars in the United States 2020 – 2024.

⁸⁰ U.S. Const., Amend. V.

Regarding submission of information on pending or approved patent applications, ***PhRMA suggests that CMS consult the FDA’s Orange and Purple Book listings, as well as provide flexibility for manufacturers to supplement these listings to provide information about pending patent applications and other relevant facts.*** CMS should not use information about pending patent applications to adjust its preliminary price downward. Claims for infringement cannot be based on a pending application, and it would be premature to decide about the exclusionary effect of a patent application before issuance of a patent because the claims can change significantly during prosecution and a patent ultimately might not be granted. Also, CMS should explicitly confirm that “pending applications” for submissions purposes do not include abandoned applications, which would not be relevant for CMS’ price-setting process and are considered neither pending nor approved patent applications. CMS should further clarify that manufacturers are not required to submit non-public patent information, including information about pending applications that have not been published, given the highly confidential nature of this information. Manufacturers should also be permitted to refer CMS to the Orange and Purple Book for exclusivity data and Drugs@FDA for information about approved applications. Manufacturers could then supplement those sources with information about pending applications.

In addition, the definition of relevant patent information to include pending and approved patent applications “relating to the selected drug” and patents “linked to the selected drug” is vague and could encompass patents and patent applications that have no bearing on the continued single-source status of a selected drug.⁸¹ For example, it could entail the submission of information about foreign patents and patent applications, as well as patents that are neither owned nor licensed by the Primary Manufacturer. The reference to “patents linked to the selected drug where the Primary Manufacturer is not listed as the assignee/applicant,” in particular, is inconsistent with the statutory requirement that the manufacturer submit “[d]ata on pending and approved patent applications . . . for the drug.”⁸² Moreover, it is unclear how the scope of relevant patent information defined in the Guidance aligns with the statutory standard for the listing of patent information in the Orange Book.⁸³ ***CMS should only consider patents and patent applications that are directly related to the selected drug, as opposed to those directed to basic science, research tools, and similar general concepts, manufacturing processes, unapproved uses, unapproved formulations and dosage forms, metabolites, intermediates, and third-party patents and applications for which the manufacturer has no rights of enforcement.*** CMS should only require information about patents and patent applications that is relevant to whether a selected drug will remain single source. CMS should provide a standard for relevance that is consistent with the scope of the requirement to submit patent information for listing in the Orange Book and Purple Book.

f. Market Data and Revenue and Sales Volume Data (Appendix C)

CMS proposes to require that manufacturers report more than 20 metrics relating to drug prices and sales under “Market Data and Revenue and Sales Volume Data” (see Appendix C): WAC unit price; National Council for Prescription Drug Programs (NCPDP) billing unit standards; 340B ceiling price; Medicaid Best Price; AMP; 340B prime vendor program price; Federal supply schedule (FSS) price; Big Four price; U.S. commercial average net unit price, with and without patient assistance and “best”; manufacturer average net unit price to Part D Plan sponsors with and without patient assistance and “best”; total U.S. gross revenue; total U.S. net revenue with and without patient assistance; and quarterly total U.S. unit volume. In most cases CMS would require the Primary Manufacturer to aggregate its own data on the selected drug from both the Primary Manufacturer and data from

⁸¹ Guidance at 88.

⁸² SSA § 1194(e)(1)(D).

⁸³ See Federal Food, Drug, and Cosmetic Act § 505(b)(1) (requiring the submission of patent information for “any patent which claims the drug for which the applicant submitted the application or which claims a method of using such drug and with respect to which a claim of patent infringement could reasonably be asserted if a person not licensed by the owner engaged in the manufacture, use, or sale of the drug.”).

any Secondary Manufacturer. The Guidance specifies that all of these data with explanations must be submitted to CMS within 30 days of selection – by October 2nd, 2023.

PhRMA has major concerns with these reporting requirements specified as “Market Data and Revenue and Sales Volume Data.” These requirements are extremely broad and would impose substantial burdens on manufacturers, especially given the short time period to collect the data and the need to gather data from all Secondary Manufacturers. As discussed in response to section 40, it would be legally problematic and extremely challenging for Primary Manufacturers to gather the vast amounts of data CMS is asking them to collect from Secondary Manufacturers. CMS fails to provide any justification or rationale for the breadth of this proposed data requirement. The Guidance also introduces two new pricing metrics (each with three variations) with little explanation as to which sales and discounts should be included in and excluded from these calculations. Manufacturers are required to report a new “U.S. commercial average net unit price” in three ways (with patient assistance programs, without patient assistance programs, and “best” price) and a “manufacturer average net unit price to Part D Plan sponsors” similarly (with patient assistance programs, without patient assistance programs, and “best” price).

CMS unjustifiably fails to define these new metrics with specificity or any reference to existing terms or rules, which is a marked departure from how Congress and agencies have defined pricing metrics and calculations in other federal drug pricing programs such as the Medicaid Drug Rebate Program, the 340B Drug Pricing Program, the Federal Ceiling Price statute and related U.S. Department of Veterans Affairs (VA) guidance, and the FSS. In doing so, CMS fails to grasp the potential for the lack of clear definitions to cause inconsistency in the way these metrics are reported and calculated, and thus what meaning they may have. Without additional CMS guidance, these metrics would pose considerable risk to manufacturers, who will be required to report in a compressed timeframe under the serious threat of CMPs. Moreover, the new reporting requirements, if finalized, would place unnecessary burdens on manufacturers given that a significant portion of this information is already reported to and available to CMS such as net prices to Part D and Medicaid Best Price.

To help address such gaps in reporting instructions, manufacturers would have to develop a set of reasonable assumptions to calculate these various new metrics and then rely on these assumptions to report these metrics. Yet the Guidance increases the risk of nonuniform and perhaps unintentionally inaccurate reporting in multiple ways, including the following:

- The Guidance makes flawed assumptions about manufacturer patient assistance, requiring that manufacturers calculate and report new metrics with and without patient assistance (“U.S. commercial average net unit price,” with and without patient assistance; “manufacturer average net unit price to Part D Plan sponsors” with and without patient assistance; and “total U.S. net revenue” with and without patient assistance). Patient assistance is financial assistance intended to reduce patients’ out of pocket costs and is not considered a price concession offered to customers.⁸⁴ In other words, patient assistance does not constitute “market” data under SSA § 1194(e)(1). But this is the rubric under which CMS would require manufacturers of selected drugs to report their patient assistance amounts.
- Moreover, the Guidance would require manufacturers to calculate and report a Part D price (“manufacturer average net unit price to Part D Plan sponsors”) “with patient assistance” when the

⁸⁴ See, e.g., 42 CFR § 447.505(c)(8)-(12)(CFR as of December 31, 2020) (excluding from Medicaid Best Price specified types of patient assistance, to the extent the benefits were not provided to other parties, regulations that were revised by a December 31, 2020 “accumulator adjustment rule” that was itself overturned in court); *PhRMA v. Becerra*, 2022 WL 1551924, *5 (D.D.C. 2022)(overturning the “accumulator adjustment rule” that would have generally resulted in manufacturers having to include patient assistance in their Best Price determinations, and emphasizing that “A manufacturer’s financial assistance to a patient does not qualify as a price made available from a manufacturer to a best-price-eligible purchaser. Rather, a manufacturer’s financial assistance is available from the manufacturer to the patient”).

federal anti-kickback statute would generally prohibit them from offering cost-sharing assistance to Part D patients, and when patient assistance is not given to or intended for any type of “plan sponsors” – all of which raises further questions and confusion about what CMS even means by “patient assistance” and thus how manufacturers could reasonably interpret and carry out these new reporting mandates.

- A closely related source of confusion and uncertainty – and risk--- is that the Guidance is silent on whether a “patient assistance program” is meant to include a manufacturer’s charitable free drug programs (which it should not). The fact that CMS refers to “patient assistance” in a Part D context where manufacturers do not provide cost-sharing assistance to patients causes further questions about what CMS means by “patient assistance.” Yet there is language in the data elements ICR that seems to consider only “coupons and copay assistance” as the patient assistance that CMS is asking manufacturers to report.⁸⁵

To correct these problems, CMS should withdraw all of the new metrics. Failing that, CMS should delete all items asking for manufacturers to report “patient assistance” from the Guidance (and the related data elements ICR). If any references to patient assistance are retained, we ask that CMS define what constitutes a “patient assistance program” and explicitly clarify that a “patient assistance program” does not include manufacturer charitable free drug programs.

It might appear initially that manufacturers of selected drugs could resolve all of these problems by adopting appropriate reasonable assumptions and specifying these assumptions in their data reports to CMS. But manufacturers are being required to develop their reasonable assumptions, perform and test their calculations, and report this information to CMS – in some cases all while collecting and seemingly blending in data from one or more Secondary Manufacturers, plus with caps on the amount of text they can provide in their narratives explaining their reported data to CMS – in a time frame that is impracticable, and at risk of severe penalties for submitting data that CMS ultimately deems insufficient or inaccurate.⁸⁶ These burdensome procedures are in no way necessary for CMS to make MFP determinations and accordingly we urge CMS to rectify these problems when revising its Guidance.

Finally, PhRMA takes issue with how CMS plans to use the market and sales data during the price setting process. For example, according to section 60.3.4 of the Guidance, if one of the new metrics reported – e.g., “average commercial net price – is lower than the “preliminary price,” CMS may adjust the preliminary price downward. Yet CMS provides no explanation for the relationship between these prices, or for why a lower commercial net price (or any of these pricing metrics) should drive the preliminary price down, and likely result in a lower MFP.⁸⁷

CMS should at a minimum withdraw these new metrics (i.e., all three variations of “U.S. commercial average net unit price” and “manufacturer average net unit price to Part D plan sponsors, respectively) in the revised Guidance. In the revised Guidance CMS should only require reporting of existing price reporting metrics (e.g., WAC, AMP). It is also critical that CMS permit manufacturers to submit all of the market and sales data under a reasonable timeframe (and in particular beyond October 2nd, 2023, which we believe the statute permits), and without limits on the number of lines or words manufacturers can use to explain their assumptions or other aspects of their metrics.

⁸⁵ ICR for Negotiation Data Elements under sections 11001 and 11002 of the Inflation Reduction Act (IRA) (CMS-10847, OMB 0938-NEW) Questions 31-36, p. 33-37.

⁸⁶ Id. The ICR limits manufacturer responses explaining their reported pricing data and reasonable assumptions to a free text box that has a “1,000 word limit.” P. 35-36.

⁸⁷ Guidance, p. 53.

g. Quality-Adjusted Life Years (QALY) and Cost Effectiveness Analysis (Section 50.2)

PhRMA appreciates CMS' acknowledgement that it will not use quality-adjusted life years, or QALYs, in its determination of MFPs for selected drugs in a "life-extension context," given their discriminatory nature and failure to accurately capture the benefits treatments offer to patients. (CMS does not define "life extension context" in the Guidance document.) While we agree with CMS' statement that the language set forth in the IRA prohibits CMS' reliance on QALYs or similar metrics, we are concerned that CMS overlooks a separate, but equally relevant prohibition on reliance on QALYs that is more broadly applicable across Medicare that was enacted as part of the Affordable Care Act.

Specifically, CMS fails to reference the existing prohibition on Medicare reliance on QALYs or similar metrics found in the SSA.⁸⁸ This prohibition would prevent CMS from using QALYs as part of its determination of MFPs, including in a "life extension context", including in CMS' determinations of MFPs. ***PhRMA recommends CMS explicitly acknowledge this additional statutory prohibition in its revised Guidance, and refrain from using QALYs or any similar metric, in any context.*** Given the concerns of numerous stakeholders regarding use of QALYs and similar metrics, clarity and transparency in this matter is absolutely critical as CMS implements the Program. By clearly and unequivocally precluding these standards from MFP decision-making, CMS will build trust with stakeholders and the public at large.

It is widely acknowledged that QALYs, which are the basis for many cost effectiveness analyses (CEA), discriminate against seniors, the disabled, communities of color, and the chronically ill. As noted by the National Council on Disability, "QALYs place a lower value on treatments which extend the lives of people with chronic illnesses and disabilities."⁸⁹ These concerns have been echoed repeatedly by numerous stakeholders – in 2021, more than 80 stakeholder groups signed a letter led by the American Association of Persons with Disabilities, "strongly urging policymakers to reject potentially catastrophic legislation and policies that reference QALYs and similar metrics."⁹⁰ Even leading academics who have long relied upon QALYs for their work, have acknowledged that "the problem of whether [QALYs] unjustly discriminate[s] against the disabled remains a deep and unresolved difficulty."⁹¹

PhRMA also strongly recommends that CMS commit to avoiding reliance on CEAs, regardless of the metric it is rooted in, when determining a selected drug's MFP as part of this process. Reliance on CEA, whether it is rooted in QALYs or another similar metric, as the basis for policy decisions risks further discriminating against underserved and underrepresented people of color who are already at higher risk of not receiving the care they need. Given CMS' priority to improve health equity, this should be of particular concern. According to Tufts Medical Center, fewer than five percent of CEAs stratify results by race or ethnicity.⁹² And because CEA ignores important patient differences in communities of color – such as differences in treatment, disease risk, health status, or life expectancy – it ignores (and potentially worsens) systemic inequities that harm people in those communities. For example, as Black seniors are more likely to die of colon cancer,⁹³ some treatments have been

estimated to be more effective in improving survival among Black patients relative to other races.⁹⁴ CEA, which determines what works for an average patient population, would obfuscate the value of treatments to Black patients.

QALY-based CEA also often assigns a lower value to Black lives. Researchers found that the life of a Black patient with diabetes and visual impairment is valued as having 15 percent fewer QALYs remaining compared to White patients with the same diseases.⁹⁵ Additionally, QALY-based research systematically undervalues communities of color because they have lower life expectancy relative to the average population⁹⁶ due to factors including worse access to care,⁹⁷ lower quality of care,⁹⁸ and higher risk of disease.⁹⁹ As a result of shorter life expectancies, Black patients' lives would be automatically valued ten percent less than White patients.¹⁰⁰

CEA based on any metric can present significant concerns beyond those issues related to discrimination, as it often fails to capture benefits and impacts that matter to patients or patient subgroups. For example, generic measures, such as the EQ-5D, are often used for capturing patients' health-related quality of life to assess QALYs.¹⁰¹ While these types of measures are useful for simplifying the comparison of different interventions, they do not always capture all the dimensions of quality of life that are important to patients. For example, researchers have noted that the EQ-5D may fail to reflect the entirety of quality of life for patients with sickle cell disease by not including domains such as fatigue, stigma, fluctuations in pain (particularly from recurrent painful vaso-occlusive events or pain crises), or the impact of racial disparities all of which are relevant for people with sickle cell disease.^{102,103}

We caution against use of metrics that seek to address the discriminatory nature of QALYs, but have their own flaws. In addition to documented equity and technical issues, these measures have been shown to inaccurately and incompletely capture the full impact of treatments on patients. For example, in response to the controversy surrounding QALYs, the Institute for Clinical and Economic Review (ICER) developed a new metric for quantifying value, the equal-value life year gained (evLYG).¹⁰⁴ However, the evLYG introduces new problems. For example, the evLYG devalues drugs for conditions that do not extend life expectancy, like eczema or blindness, so therapies for these conditions would be seen as having no value.¹⁰⁵ Thus, the evLYG would value

two drugs, one that reduces side effects and one that does not, as of equal value, even though side effects have a significant impact to patients. Neither the QALY nor the evLYG properly captures the value of a drug to patients and people with disabilities, and CMS should avoid reliance on either.

Furthermore, PhRMA has significant concerns about how CMS intends to implement the statutory prohibition on use of QALYs and similar metrics, critical to protecting patients and persons with disabilities, many of whom strongly oppose these standards. In the Guidance, CMS states that in situations where a study uses QALYs but also has “clearly separated” this use from other evidence in the study that is relevant to the price-setting factors, CMS will consider this “separate evidence.” CMS also notes that it will “ask” entities to state whether or not the research submitted contains QALYs, thus placing the responsibility entirely on CMS to ensure that QALY-based research is not considered in determining MFPs for selected drug. Beyond those statements there is a worrisome lack of specifics offered as to how CMS intends to operationalize and enforce the QALY prohibition. When combined with the overall lack of transparency in CMS’ decision making, this proposal is likely to erode public trust in the program.

As it stands, CMS does not have the time and expertise to review large quantities of data and separate out the information in the study that is relevant to the price-setting factors but does not implicate the use of QALYs. Further, CMS fails to define “clearly separated” sufficiently to allow stakeholders to understand what information is prohibited and what is not. It is unclear to what degree any influence QALY-based research has on other parts of research that are not QALY-based automatically disqualifies the non-QALY based research from consideration. Instead of allowing CMS to judge the separation, CMS should require that entities submitting information have removed QALY-based information. Often, non-QALY driven comparative effectiveness research is not easily cleaved from its QALY-based parts. ***PhRMA recommends that CMS require that any entity submitting information attest to having removed QALY (or similar metric)-based research from its submission.***

h. Standards for Review of Literature and Research (Section 50.2)

In describing the approach it will take to determining MFPs for selected drugs, CMS states that it intends to review existing literature and real-world evidence (RWE). In a single sentence, CMS also describes criteria it may consider in determining the literature it intends to review as part of setting MFPs. While PhRMA appreciates CMS offering these criteria, we believe that this falls far short of what is necessary to ensure that the evidence CMS relies upon is fit for purpose. For example, CMS states that it will consider “rigor of the study methodology” but does not describe what qualifies as methodologically rigorous or cite examples of third-party standards that evidence must meet to be considered.

Failure to provide clarity around the quality and characteristics of evidence CMS intends to consider will undoubtedly undermine CMS’ methodology for setting prices in the eyes of manufacturers and other stakeholders, and deprive manufacturers of necessary predictability in terms of how CMS will arrive at MFPs. Therefore, ***PhRMA recommends that CMS go several steps further, and develop robust standards it will adhere to ensure that the evidence it both relies upon and develops is methodologically rigorous and patient-centered.*** The development of such standards is critical to giving manufacturers, as well as other stakeholders, confidence in the research CMS develops and relies upon in determining MFPs.

Standards for quality and patient-centeredness are not only critical for third-party evidence reviewed by CMS, but for CMS’ internal analysis as well. CMS notes in section 50.2 that in addition to reviewing existing literature, it will also “conduct internal analytics”, though it does not provide further detail on what those analytics might entail. It also does not appear from the Guidance that CMS intends to apply the aforementioned criteria to its own analysis, which is concerning. It is not only critical that external evidence CMS considers be methodologically rigorous and patient-centered, but that CMS’ own analyses achieve these goals. Therefore, ***PhRMA recommends that CMS clarify that its own internal analytics will be required to meet well-defined quality standards as well.***

There is a significant body of work that CMS may choose to borrow from in developing standards for rigor and patient-centeredness. Several organizations have done work to create best practices, guiding principles and guidelines in establishing principles and standards for evidence and data. CMS should pay particular attention to the standards set forth by patient advocacy organizations such as the National Health Council, which have also developed their own guidance in evaluating the quality and patient-centeredness of value assessment frameworks.¹⁰⁶ The National Health Council has developed a rubric for Patient Centered Value Assessment,¹⁰⁷ which outlines six key domains¹⁰⁸ that PhRMA agrees are critical to ensuring the evidence and organizations CMS relies upon in determining a selected drug's MFP are of high-quality and are patient-centered. The rubric also contains additional details on specific domains that CMS should reference when developing its own standards.

CMS should look to academically driven organizations as well. For example, the International Society for Pharmacoepidemiology (ISPE) created “Guidelines for Good Pharmacoepidemiology Practices (GPP),” which propose essential practices and procedures that should be considered to help ensure the quality and integrity of pharmacoepidemiologic research, and to provide adequate documentation of research methods and results.¹⁰⁹ While adherence to these guidelines does not ensure valid or robust research, they provide a starting point in achieving a methodologically sound framework for the research and data CMS plans to both conduct and review as part of MFP setting.

PhRMA has public, well-established principles¹¹⁰ on evidence-based medicine and value assessment that reflect the consensus and knowledge of experts in the biopharmaceutical industry. While these best practices focus on value assessment in the context of private sector decision-making, there is still significant relevance in their content. The National Pharmaceutical Council also has detailed guiding practices for value assessment.¹¹¹

Academics and researchers such as the International Society for Pharmacoeconomics and Outcomes Research (ISPOR) Special Task Force on U.S. Value Assessment Frameworks have established best practices for health technology assessments (HTA). While the Task Force recommendations extend beyond the scope of review established in the IRA (e.g., by making recommendations related to cost-effectiveness analysis), they do illustrate the importance of CMS considering a broad range of value elements (e.g., fear of contagion, scientific spillover).

i. Standards for Third Parties Conducting Technology Assessments (Section 50.2)

CMS also notes that it will “consult subject matter experts as part of its process to set MFPs for selected drugs, in addition to considering evidence from “the Primary Manufacturer and members of the public, including other manufacturers, Medicare beneficiaries, academic experts, clinicians, and other interested parties.” However, CMS has thus far failed to provide any information to the public about what third-party evidence it will rely upon in making MFP determinations. Building on our recommendation above that CMS create robust standards for the evidence it will consider in determining MFPs (as discussed above), *PhRMA recommends CMS set standards in*

guidance that external organizations for organizations conducting evidence synthesis or technology assessment must meet.

Such standards should ensure methodological rigor and necessarily exclude organizations with a payor-focused mission or funding, as well as organizations that historically focus on CEA. This is important because of statutory prohibitions against CEA as well as the need to avoid analysis driven by a payor focus on cutting costs over patient needs by discounting clinical and non-clinical benefits that matter to patients, caregivers and society.

Adherence to appropriate standards for patient-centeredness and methodological rigor will result in avoidance of certain organizations that fail to meet those standards. In this regard, PhRMA urges CMS not to rely on evidence generated by the ICER or similar cost effectiveness analysis-driven organizations. ICER's grounding in threshold-based decision making, payor-centered mission, and methodological shortcomings make it and similar organizations ill-suited to the standards set in the IRA, as well as the goals of patient-centeredness and public trust. While many stakeholders have voiced particular concern over ICER's methods and governance, CMS should generally avoid relying on any technology assessment organizations that cannot demonstrate clear independence and patient-centeredness. This should also preclude reliance on other technology assessment organizations that primarily serve or are governed by payors, such as the Blue Cross Blue Shield Technology Evaluation Center or the Drug Effectiveness Review Project.

To date, ICER has fallen short of the types of standards that CMS should develop for setting the MFP. ICER's bias toward payor needs and cost-cutting has been seen in its drug-specific assessments, which often deviate from its own commitments to stakeholders to obtain predetermined, payor-driven objectives. Several months before ICER's assessment of remdesivir, a treatment for COVID-19, ICER committed to include the societal perspective as a co-base case alongside the health system perspective in its assessments, when disease areas met certain criteria.¹¹² However, in spite of its prior commitment – and COVID-19 clearly meeting the established criteria – ICER declined to develop a co-base case based on the societal perspective, resulting in a skewed assessment of remdesivir's value. This ignored important societal benefits of an effective treatment for COVID-19, such as reducing the risk associated with reopening business and schools. ICER was criticized for this decision, not only by the biopharmaceutical industry, but by former employees and academic thought-leaders.¹¹³

ICER's assessments have also fallen short of standards for patient-centeredness in evidence assessment. Although ICER includes outcomes that matter to patients and caregivers in the “other benefits and disadvantages” or “contextual consideration” portion of its report, it fails to include the outcomes in its recommendations on its health-benefit price benchmark of a drug. For example, in ICER's review of treatments for myasthenia gravis, ICER omitted multiple outcomes from its quantitative assessment of the treatment's value, including impact on caregivers, chronic fatigue, and impact on mental health, that were cited by patient and caregiver advocates as important.¹¹⁴

Importantly, ICER's assessments heavily rely on the QALY metric, which as discussed above has a history of devaluing the lives of vulnerable populations. While it is now recognized by many stakeholders and researchers that traditional methods of QALY-based value assessment are controversial and outmoded (and ICER itself has acknowledged these concerns¹¹⁵), ICER persists in generating health-benefit price benchmarks based on QALYs and similarly flawed metrics for every assessment it conducts. ICER's failure to acknowledge the concerns of

stakeholders with regard to the QALY and other issues is why CMS should avoid reliance on ICER and other similar organizations when determining MFPs.

j. Consideration of Real-World Evidence (Section 50.2)

We appreciate CMS' statement that it will consider RWE as part of its process for setting MFPs. PhRMA hopes that in determining MFPs for selected drugs, CMS will review and incorporate a broad range of rigorous scientific evidence, including data resulting from real-world experience with the drug's use, including the RWE that has become available in the years since a treatment's FDA approval.

However, we are concerned by 1) the lack of specifics in the Guidance as to the standards for quality CMS will use to determine whether individual pieces of RWE should be relied upon to determine MFPs, and 2) the lack of specifics as to how RWE will be weighed against other forms of evidence. These are important details that manufacturers, as well as other stakeholders, require in order to understand how CMS intends to arrive at MFPs for selected drugs.

RWE can come from a variety of sources, including electronic health records, payor administrative claims, implementation studies and patient registries and represents a valuable source of information about the real-world benefits and risks of a medicine. CMS should consider evidence from all these sources, and incorporate a broad range of rigorous scientific evidence, including data resulting from real-world experience with the drug's use, including the RWE that has become available in the years since a treatment's FDA approval.

Particularly for a drug that has been on the market seven or more years, RWE can provide valuable insights into how the drug works in a real-world clinical setting, including for different subpopulations and in different contexts. For example, an ongoing study of 133 people with HIV demonstrated the benefits of a long-acting antiretroviral treatment (LA-ART) to individuals with HIV. The study showed that the LA-ART given every four to eight weeks, and delivered with comprehensive support services, suppressed HIV in people who were previously not virologically suppressed. The study focused on reaching people who have historically had decreased access to antiretroviral therapy (ART), including people experiencing housing insecurity, mental illnesses, and substance use disorders, and who may have been included in clinical trials.¹¹⁶

However, use of RWE and the consideration and weight it is given varies amongst organizations and decision-makers. This makes it important for CMS to include more explicit discussion of its approach to considering RWE as part of its MFP methodology than what was included in the Guidance. ***PhRMA recommends that CMS appropriately consider rigorous RWE generated after initial FDA approval related to the benefits and impact of a selected drug.*** Consideration of RWE will be particularly important to ensure CMS can properly assess and value the full range of benefits and elements of unmet need discussed below, such as improved adherence, patient convenience, and broad health care cost offsets.

k. Consideration of Specific Patient Populations (Section 50.2)

CMS states that it will consider research on and RWE relating to Medicare populations – including individuals with disabilities, end-stage renal disease (ESRD) and aged populations – as particularly important. In addition, CMS will prioritize research specifically focused on these populations over studies that include outcomes for these populations, but in which these populations were not the primary focus. CMS states that it will consider the effects of the selected drug and its therapeutic alternative(s) on specific populations, including individuals with disabilities, the elderly, the terminally ill, and children.

¹¹⁶ Long-acting antiretroviral therapy suppresses HIV among people with unstable housing, mental illnesses, substance use disorders. (Feb 21, 2023). Available at: <https://www.nih.gov/news-events/news-releases/long-acting-antiretroviral-therapy-suppresses-hiv-among-people-unstable-housing-mental-illnesses-substance-use-disorders>.

Because patient sub-populations can differ in their response to or preference for a therapy, a variety of treatment options may be required to optimize treatment and provide the most clinical benefit to a patient. CMS recognition of patient heterogeneity is particularly important to ensure alignment with the emergence of personalized medicine. While the sub-populations listed above are important, PhRMA recommends CMS consider additional subgroups as well, including those based on factors such as genomics, preferences, co-morbidities, and marginalized populations experiencing avoidable disparities in health outcomes.

This consideration is critical because the value individual patients and patient subgroups place on benefits and impacts, or their unmet needs, can vary. Studies have long shown that not only do patients place significant emphasis on benefits other than prolonged survival or cost, but that these preferences vary considerably depending on factors such as type and severity of disease and individual life circumstances. For example, research has shown that when asked to weigh different treatment impacts (e.g., effect on disease progression, effect on relapse rate, effect on multiple sclerosis (MS) symptoms), preferences among patients with MS were highly diverse. In most categories, patient opinions were more varied than those of other stakeholders, including clinicians or payors.¹¹⁷ In order to capture this diversity, CMS needs to consider all relevant sub-populations for the selected drug.

III. Negotiation Process (Section 60)

Section 1194 of the SSA, requires a “consistent methodology and process” for setting MFPs, and that these prices be “fair.” CMS has a critical opportunity to design this consistent methodology to ensure fair prices that account for reduced access to medicines in Medicare and loss of future treatments and cures.

Unfortunately, CMS’ Guidance provides no assurance that the Agency will meet this standard. Rather than describing a “consistent methodology and process,” CMS proposes an unworkable and subjective framework for setting MFPs. Furthermore, the process for price setting signals that CMS intends to provide only the most limited opportunities for stakeholders, such as patients and clinicians, to have input into the Program.

While CMS recognizes the importance of ensuring the rigor of the research and evidence synthesis it relies on in MFP decision-making, the Guidance fails to describe a process or standards for ensuring that its MFP determinations are rooted in patient-centeredness and methodological rigor. To help address this, ***PhRMA strongly recommends that prior to making its initial offer to the manufacturer, CMS make available to the public key elements of its MFP analysis. and provide an opportunity for the public to comment on them. This should include, but not be limited to:***

- ***Therapeutic alternative(s) CMS has identified for any selected drug it is considering (for each indication);***
- ***Data and analysis CMS developed and considered supporting each factor, including evidence provided by third parties engaged formally or informally by CMS;***
- ***Benefits and impacts of a selected drug CMS intends to consider; and***
- ***Stakeholders, and other government agencies and organizations CMS intends to engage, formally or informally.***

Below we outline specific concerns with the proposals in the Guidance, as well as concrete recommendations for how CMS can address these concerns, mitigate harm to patients, and recognize innovation in implementing the Program.

¹¹⁷ Nash, B. Mowry, S. McQueen, R. B., Longman, R. (2017). People with MS value therapies differently than do physicians or payers. Available at: <https://realendpoints.com/wp-content/uploads/2017/12/PhRMA-white-paper-final.pdf>.

a. Price Setting Methodology

CMS proposes as potential starting points for the initial offer: 1) Part D net price or Part B average sales price (ASP) of the selected drug; 2) Part D net price(s) and/or Part B ASP of therapeutic alternative(s); or 3) FSS or “Big Four” Agencies price either for selected drugs with no therapeutic alternative(s) or for selected drugs that have therapeutic alternative(s) with net prices or ASPs greater than the statutory ceiling. This approach is misguided and will result in egregiously low prices previously criticized and rejected by stakeholders. Furthermore, the approach proposed by CMS is arguably in tension with the statute. While the statute requires CMS to achieve the lowest “fair” price “for each selected drug,”¹¹⁸ CMS’ approach looks primarily at therapeutic alternative(s) to the selected drug, rather than the selected drug itself.

The approach relies upon therapeutic reference pricing, which resembles the “least costly alternative (LCA)” policies previously attempted by CMS and struck down by a federal court more than a decade ago.¹¹⁹ This approach would give CMS broad authority to make judgments about clinical “similarity” for a broad range of medicines. It would also overlook significant differences in the needs of patients, many of whom do not fit value judgments based on broad, average results. Individual patient differences occur due to several factors, such as genetic variation, differences in clinical characteristics, co-morbidities, and quality-of-life preferences. For example, the five different larifuno-oncology agents recommended for treatment of metastatic non-small cell lung cancer (mNSCLC) can appear similar when looking at treatment effects based on averages,¹²⁰ however, different treatments are recommended based on patient subgroup¹²¹ – defined by PD-L1 expression – because overall survival can increase by as much as 164 percent¹²² based on the patient characteristics. Furthermore, patients can value quality-of-life factors differently with treatments that require less frequent visits to a provider or that can be delivered by mail often being of higher value to Hispanic and Black patients who are more likely to live in a neighborhood impacted by pharmacy deserts. As a result, imposing policies like LCA that rely on broad judgments of comparative effectiveness of treatments will overlook important differences in the way individual patients respond to treatment, and downstream, can create barriers to access to important treatments. When proposed in other contexts, patient advocates have reiterated these concerns, “We cannot achieve a healthier society simply by making investments based on what is the cheapest.”¹²³

Furthermore, PhRMA does not support CMS’ proposed reliance on the FSS price or the “Big Four” price. Domestic reference pricing at these prices has also been soundly rejected by policymakers, including very recently by Congress – during Senate floor consideration of the IRA, Senator Bernie Sanders offered an amendment to tie drug prices in Medicare to those used in the VA. This amendment failed overwhelmingly by a vote of 99 to one.¹²⁴

FSS contracts are not designed or intended to establish a pricing benchmark for medicines, and instead are procurement contracts that direct federal purchasers use to purchase items and services from vendors and suppliers. Specifically, FSS purchasers acquire medicines on the FSS directly from wholesalers or biopharmaceutical manufacturers at the contracted price and then furnish such medicines to certain patients within “closed” health care delivery systems. Further, FSS and “Big Four” prices do not reflect the full “cost” of the

medicine. As noted in a recent report by the CBO, comparing prescription drug prices among government programs is difficult, and average prices are not directly comparable because the price of medicines in federal programs like Medicare, which uses a retail distribution network, must consider pharmacy storage and dispensing costs and profits. In contrast, average FSS and “Big Four” prices (which are two distinct prices authorized by law for different purchasers) do not consider wholesaler profits, storage, distribution, or pharmacy/physician dispensing.¹²⁵ They are, therefore, not reasonable starting points for CMS’ price setting process.

In addition, reliance on FSS and “Big Four” prices could result in manufacturers effectively being assessed an inflation rebate twice. Per statutory requirements of the Veterans Health Care Act, some medicines on the FSS have an additional inflationary rebate component factored into the Federal Ceiling Price, while medicines in Medicare will have a separate inflation rebate if pricing metrics increase faster than inflation.¹²⁶

Recommended Approaches to Determining MFPs for Selected Drugs

PhRMA believes that instead of haphazardly piecing together an approach to price setting based on previously rejected policy ideas, CMS should adopt a methodology in the initial years of the program that acknowledges both the exceptionally challenging task at hand, as well as the substantial potential harm to patients and innovation if CMS undervalues selected medicines. It is broadly understood that CMS is establishing a price setting program for the first time, without necessary experience in this area. There is also extraordinary burden on manufacturers to submit data and engage in this complicated process with little information or advance notice. Given this confluence of factors, ***PhRMA recommends that CMS ensure all MFPs are set at the statutory ceiling price beginning with IPAY 2026, and for several subsequent price applicability years.***

Beyond the first several years of the Program, CMS should consider the fundamental problems posed by the IRA’s price setting framework and work to adopt policies that mitigate those problems. One example is the reduced incentives for continued R&D for small molecule medicines created by the IRA’s criteria for selecting drugs, which could result in CMS selecting small molecule drugs a mere seven years after their initial FDA approval. The IRA effectively reduces the period of exclusivity from the current effective average of 13 to 14 years to nine years for small molecule drugs selected for price setting (and CMS’ decision to finalize a “qualifying single source drug” (QSSD) definition based on active moiety heightens this effect).¹²⁷ Nine years will simply not be enough time for many drugs in development to earn a return that warrants the large and uncertain investment a company must make to bring a drug to market. Recent empirical research shows that, on average, about half of a product’s revenues are earned during years 10 through 13 after approval, and very few drugs have earned a return justifying investment within nine years after approval.¹²⁸ And as previously noted, recoupment of investment itself isn’t sufficient—a “cost-plus” approach to setting MFPs will also undoubtedly devastate biopharmaceutical innovation.

For these reasons, ***PhRMA recommends setting the MFP for selected drugs that have been on the market for less than 13 years at or near the ceiling price set forth in statute.*** This would be in keeping with the overall intent of the IRA, which sets ceiling prices at different levels according to the time since FDA approval.

CMS should also recognize in setting MFPs that the stated intent of the price setting provisions was to address the lack of competition for older drugs from generics or biosimilars. This objective takes a narrow view of

¹²⁵ CBO. (2021). A Comparison of Brand-Name Drug Prices Among Selected Federal Programs.

Available at: <https://www.cbo.gov/publication/57007>. CBO notes that FSS and “Big Four” prices are not retail prices. Specifically, “Pharmacy dispensing fees are incorporated into the prices in Medicare Part D, Medicaid, and the TRICARE retail pharmacy network. However, the prices for VA and DoD...do not include the agencies’ costs of dispensing drugs.”

¹²⁶ See SSA §§ 1847A(i) and 1860D-14B.

¹²⁸ Tewari, A. et al. (2022) The Drug Pricing Handbook - Everything you Need to Know. Jefferies Research. September 15, 2022. p.4.

competition: for some products, brand-to-brand competition occurs prior to generic or biosimilar entry, which has resulted in payors negotiating steep rebates and a net price that falls below the statutorily mandated discount. CMS has an opportunity to acknowledge this competition by setting MFPs for such drugs at the ceiling price.

The statutory ceiling price for selected drugs is the lower of two options – either the net price (or ASP) of a selected drug, or a significant percentage off of the selected drug’s non-FAMP. ***PhRMA recommends that if a selected drug’s statutory ceiling price is the net price, then the MFP should be set at the ceiling price (the net price) for the selected drug.*** This would acknowledge drugs for which brand-to-brand competition has resulted in meaningful savings, and therefore, were not the target of the policy. Furthermore, it is operationally feasible for CMS, as CMS has access to the necessary price data and must calculate a net price to determine the ceiling price.

There are two other instances in which PhRMA specifically recommends CMS set the MFPs at the ceiling price beyond the first several years of the Program: drugs that represent a substantial unmet need and drugs that represent a significant therapeutic advance against therapeutic alternative(s). Identifying these types of discrete factors or circumstances that will result in MFPs at or close to the ceiling price would provide at least some predictability in CMS’ decision-making process. Those recommendations are discussed below in subsections (f) (Unmet Medical Need) and (g) (Therapeutic Advance).

b. Weighting of Factors

As noted by CMS in the Guidance, the statute establishes two sets of factors that CMS must consider when determining the offers and counteroffers to reach a drug’s MFP: “manufacturer-specific data” and evidence regarding alternative treatments. As CMS has acknowledged, the statute does not specify “how CMS should determine an initial offer nor how or to what degree each factor should be considered.”¹²⁹ PhRMA is concerned by CMS’ failure to clarify how it will use its discretion in considering and weighting the factors. ***PhRMA strongly recommends that CMS generally place greater emphasis on the factors related to the benefits medicines offer to patients included in section 1194(e)(2).*** These benefits include not just the benefit to patients, but also to caregivers and society. An emphasis on these benefits and factors may somewhat mitigate against the disincentives inherent in government price setting for continued innovation resulting from price setting by reducing the penalty on drugs with significant demonstrated benefits that accumulate over the course of a product’s life cycle. We note, however, that the mitigation is limited by the fact that the statutory ceiling price applies even when a higher price would be set based on the factors related to the therapeutic benefits medicines offer to patients.

As a corollary, CMS should place less weight on factors that would diminish drugs’ benefits and could stagnate innovation if overweighted. This includes most of the factors listed in section 1194(e)(1), such as cost of production, costs of R&D, and federal funding toward the development of a selected drug. If CMS places too much importance on these factors, the result could be a “cost recovery” pricing model for selected drugs, in which the price is set to allow the manufacturer to recoup only the cost of producing the drug, including the cost of R&D. Basing prices for drugs on costs incurred by the manufacturer, instead of the value and benefits conferred by the innovation, sends perverse, unintended signals to manufacturers that devalue and disincentivize R&D and pose a significant threat to innovation and progress for future medicines. Placing greater weight on the factors in section 1194(e)(2) will help incentivize continued medicine advances and innovation. In addition, to avoid a chilling effect on post-approval research, factors used to determine the MFP should include consideration of both existing and pending patent protections, existing regulatory data exclusivities, and labeled as well as pending indications in addition to other factors, such as ongoing clinical development programs.

¹²⁹ Guidance, section 60.3.

c. Therapeutic Alternative(s)

For IPAY 2026, CMS will identify the selected drug's FDA-approved indications that are neither excluded from coverage nor otherwise restricted. CMS will then identify pharmaceutical therapeutic alternative(s) for each indication of the selected drug, using data submitted by the Primary Manufacturer and the public, along with widely accepted clinical guidelines and peer-reviewed studies. CMS also will consider clinical evidence via literature searches.

Although PhRMA strongly disagrees with CMS' proposal to use therapeutic reference pricing as the starting point for MFP determinations, PhRMA agrees that therapeutic alternative(s) should generally be limited to pharmaceutical therapeutic alternative(s). We believe that some of the resources CMS cites in the Guidance, such as clinical guidelines, will be very helpful in identifying therapeutic alternative(s) for certain classes of drugs.

However, ***PhRMA believes that experts, including manufacturers and clinicians, should be the primary resources for determining therapeutic alternative(s), and CMS should go beyond what the Agency laid out in the Guidance to engage key stakeholders in the selection of therapeutic alternative(s).*** PhRMA notes that manufacturers are in a strong and unique position to inform CMS' determination of appropriate therapeutic alternative(s) for a selected drug, based on their extensive expertise and research on the benefits and impacts of their medicines throughout the product lifecycle. Manufacturer-sponsored research frequently includes comparative effectiveness research, which requires selection of a clinically appropriate comparator. Additionally, clinicians with disease-specific expertise and disease-specific clinical guidelines generated by clinicians should also play a meaningful role in CMS' determination of a selected drug's therapeutic alternative(s). Simply asking stakeholders to provide information through an ICR is an insufficient means of engaging stakeholders on this key issue. Clinician and patient engagement will be discussed in further detail in section III.t. of this letter.

Procedurally, it is unclear when CMS will identify the therapeutic alternative(s) for a selected drug and communicate that information to the manufacturer. PhRMA notes that if CMS fails to communicate the therapeutic alternative(s) for the selected drug early enough in the process, the manufacturer and stakeholders will be unable to include the required information in their data submissions to the Agency. ***PhRMA strongly recommends that CMS publicly identify the therapeutic alternative(s) selected, including if based on information and feedback received through the ICR, and allow the manufacturer and stakeholders to provide feedback on CMS' proposal.***

When determining the therapeutic alternative for a selected drug, ***PhRMA recommends that CMS use "clinical appropriateness" as the standard for decision-making.*** In order to determine the clinical appropriateness of a therapeutic alternative, CMS should do the following:

- Engage meaningfully with the manufacturer on potential therapeutic alternative(s) and comparator(s);
- Look to clinician guidance, including physician-driven evidence-based clinical guidelines, as a resource; and
- Reference other widely recognized, scientifically rigorous, evidence-driven resources to identify therapeutic alternative(s).

Selection of the appropriate therapeutic alternative(s) in assessments of the comparative effectiveness of treatments is complex and can involve subjective judgments. Both the significant complexity of this issue, as well as the consequences of CMS choosing an inappropriate therapeutic alternative for its decision-making, is illustrated in price setting systems outside the U.S. Germany provides perhaps the starkest case study for the magnitude of the impact that inappropriate comparator selection can have in a large market. Problems with comparator selection, combined with rigidity in accepting indirect comparisons, is one of the main failings of the German system. In Germany, 70 percent of assessments by the German Federal Joint Committee (G-BA) are

negative for non-orphan innovative medicines, and most rejections (72 percent) are for not presenting data against the G-BA chosen comparator.¹³⁰ Yet, research shows that in 43 percent of cases, medical societies opposed the comparator selected by the G-BA.¹³¹

Beyond ensuring that the chosen therapeutic alternative is clinically appropriate, ***PhRMA strongly cautions that cost cannot play a role in determination of a selected drug's therapeutic alternative or clinical comparator.***¹³²

Experience in other countries illustrates how cost factors have the potential to skew choice of comparators to achieve a desired cost-containment outcome. The Agency should establish standards and procedures for comparator selection that protect against this. In Germany, for example, because the price of a drug is based on its comparative clinical effectiveness relative to a comparator, Germany's choice for a comparator has a considerable impact on the reimbursement price.¹³³ Germany uses the least costly available comparator as the price benchmark when the G-BA determines there is no benefit, even if the treatments have differences that are significant from a patient or caregiver perspective, such as reduced side effects or mode of administration.¹³⁴ PhRMA strongly cautions against adopting this approach.

d. Benefits and Impacts

In assessing comparative effectiveness between a selected drug and therapeutic alternative(s), CMS plans to identify outcomes to evaluate for each of the selected drug's indications and consider the safety profiles. When evaluating clinical benefits of the selected drug and its therapeutic alternative(s), CMS intends to consider health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience.

PhRMA is deeply concerned with CMS' description of the outcomes that it will consider in determining how a selected drug compares to a therapeutic alternative, particularly the narrow and vague description of the outcomes that CMS will consider, as well as its failure to center the decision-making on patients. In order to preserve patient access and biopharmaceutical innovation, ***PhRMA recommends that CMS consider the broad range of benefits and impacts of a selected drug, with particular focus on those that are important to patients, caregivers, and society.*** CMS' statement that it intends to consider health outcomes such as changes in symptoms or other factors that are of importance to a person and patient-reported outcomes is insufficient reassurance that patients will play a meaningful role in determining what benefits and impacts are prioritized as part of CMS' decision-making process. As noted by the Patient-Centered Outcomes Research Institute (PCORI) in its 2022 review of 200 publications from a range of different health organizations related to the discussion of value, "When it comes to defining patient-centered value, most stakeholders agree that it includes health and non-health outcomes and monetary and non-monetary impacts that are defined based on patient goals, expectations, and experiences."¹³⁵

It is widely recognized that patients value a range of benefits of medicines beyond clinical endpoints evaluated in research.¹³⁶ For example, benefits that may be valued by patients, but typically are not captured in research, include the range of potential side effects, impact on patients' ability to carry out basic functions, and quality of

life. Other non-clinical-related benefits also can be very important, such as the utility of reduced frequency of dosing through a long-acting formulation and reduced caregiver burden. CMS should ensure that its evaluations of therapeutic advances capture the value of and give significant weight to these benefits and impacts in selected drugs' MFPs to maintain incentives for manufacturers to continue meeting these needs.

In addition to capturing this full range of outcomes, CMS' methodology should ensure that when patient, caregiver, or clinician perspectives differ from those of payors, the former are prioritized. A survey focused on MS that included patients, neurologists who treat MS, and payors found significant variability in the value of different impacts among the different stakeholder groups. For example, MS patients placed the most value on treatment of mobility and upper limb function, whereas neurologists placed the least value on this combination of symptoms.¹³⁷ CMS must not evaluate therapeutic advances in a vacuum.

As noted above, ***PhRMA believes that benefits and impacts of a selected drug compared to its therapeutic alternative(s) must incorporate consideration of a drug's impact on society, including benefits to patient caregivers and their families.*** CMS does not mention society or caregivers at all in the discussion of outcomes in the Guidance even though approximately one out of every five Americans is a caregiver.¹³⁸ Failing to account for the benefits and impacts of a medicine to society could inappropriately reduce CMS' determination of a selected drug's MFP. For example, a recent study found that inclusion of caregiver impacts can have a significant effect on an assessment of an intervention's value.¹³⁹ Important disease-related societal impacts, such as a reduction in costs associated with incarceration rates (such as with treatments for alcohol use or mental illness), environmental impacts, and the cost of social services, should also be included in the MFP determination.

When a drug provides a significant benefit to society, CMS should consider increasing the MFP accordingly, including setting the price at or near the statutory ceiling. This should include any selected drug that is a vaccine, due to the unique circumstances of vaccines and substantial patient and public health benefits that they confer. Vaccines represent some of the most impactful advances in public health, helping to prevent the spread of many infectious diseases and, in many parts of the world, eliminating some of the most devastating conditions. There is no better case study for the importance of vaccines than the biopharmaceutical industry's response to the recent COVID-19 pandemic. The importance of vaccination goes beyond global pandemics, however – in the U.S. today, 16 diseases are now preventable as a result of childhood vaccines,¹⁴⁰ and routine immunization of U.S. children born between 1994 and 2018 has prevented more than 419 million illnesses.¹⁴¹ The IRA itself recognizes the unique importance of vaccines, eliminating patient cost sharing for adult vaccines under Medicare Part D. CMS should recognize this in setting final MFPs as well by accounting for vaccines' remarkable benefits to public health.

PhRMA also has concerns about CMS' approach to identifying benefits and impacts; CMS should meaningfully engage with manufacturers and patients to identify the relevant benefits and impacts, rather than predominantly relying on literature reviews or ICRs. Specific recommendations for how CMS should engage with patients and physicians are discussed in section III.t. of this comment letter.

¹⁴¹ CDC. (2022). VFC Infographic: Protecting America's Children Every Day. Updated 2021 analysis using methods from "Benefits from Immunization during the Vaccines for Children Program Era – United States, 1994 – 2021. *MMWR*. 25 April 2014. Available at: <https://www.cdc.gov/vaccines/programs/vfc/protecting-children.html>.

PhRMA notes that accounting for a broad range of benefits and impacts aligns with input from experts in the fields of comparative effectiveness research and HTA.¹⁴² Best practices for HTA include capturing a range of potential “value elements,” including treatment adherence, fear of contagion, the value of hope, and scientific spillover effects.¹⁴³ Although they may be difficult to quantify, individuals and organizations, such as the Innovation and Value Initiative,¹⁴⁴ are developing methods to incorporate some of these value elements, such as insurance value and real option value into research. CMS can contribute to progress in this field by identifying these outcomes as important in its MFP-setting deliberations.

Input from clinicians, patients and caregivers with disease-specific experience will be particularly important in order to accurately identify the benefits and impacts of a treatment that matters to patients, caregivers, and society. As such, CMS will need to establish a process to engage with stakeholders, beyond soliciting feedback through an ICR. ***PhRMA recommends that following the ICR and prior to CMS’ initial offer, CMS engage the manufacturer and other stakeholders in direct conversations, in which the Agency shares the benefits and impacts it identified as meaningful through the ICR, as well as its own research, and allows the manufacturer and stakeholders to provide feedback on the Agency’s findings.***

Second, CMS should be transparent with both manufacturers and stakeholders as to the benefits and impacts that CMS considered, and how the benefits and impacts influenced the MFP. PhRMA recommends CMS provide this detail in both the justification for CMS’ initial MFP offer (section 1194(b)(2)(B)), as well as the explanation for a drug’s MFP (1195(a)(2)). Specifically, ***PhRMA recommends that CMS include in its explanation of a selected drug’s MFP a table listing the following elements:***

- ***The benefits and impacts across all indications, clinical and non-clinical, that CMS considered in its determination of a selected drug’s MFP;***
- ***CMS’ process for determining benefits and impacts to include in its determination of the MFP, including a list of each stakeholder consulted;***
- ***Information about the relative weight given to each benefit and impact considered during the determination of the MFP;***
- ***Source(s) of evidence for each benefit and impact; and***
- ***How each benefit and impact influenced the final MFP.***

CMS’ assessment of how a drug performs on these benefits and impacts (derived from stakeholder feedback) should form the foundation of how it arrives at a selected drug’s MFP. Furthermore, this level of transparency – balanced with important data protections – is imperative so that manufacturers and stakeholders can have confidence in CMS’ conclusions, and so that manufacturers can plan for evidence generation in anticipation of their drug’s selection for the Program.

e. Cost of Selected Drug and Therapeutic Alternative(s)

As previously stated, PhRMA has significant concerns with CMS’ proposal to use therapeutic reference pricing as the foundation of its approach to setting prices for selected drugs. However, we recognize that the statute includes as a factor “the extent to which such [MFP] drug represents a therapeutic advance as compared to

¹⁴² Neumann, P. J., Willke, R. J., Garrison, L. P. (2018). A Health Economics Approach to US Value Assessment Frameworks—Summary and Recommendations of the ISPOR Special Task Force Report. *Value in Health*, 21(2), 119–123. Available at: <https://doi.org/10.1016/j.jval.2017.12.012>.

¹⁴⁴ The Innovation and Value Initiative. <https://thevalueinitiative.org/>.

existing therapeutic alternatives and the costs of such existing therapeutic alternatives,” to the extent such information is available.

Should such information be available, PhRMA recommends that CMS interpret such language broadly, to include a consideration of a range of direct and indirect costs (such as the costs to caregivers, transportation costs, lost work time¹⁴⁵), and cost savings associated with appropriate use of a selected drug. Medicines not only improve and save lives, but also frequently help avoid other, often costly, health care services, such as emergency room visits, hospital stays, surgeries, and long-term care.¹⁴⁶ Health cost savings due to improved use of medicines are well-documented in public programs, including Medicare. For example, as a result of seniors and people with disabilities gaining Medicare Part D prescription drug coverage, Medicare saved \$27 billion due to improved adherence to congestive heart failure medications from 2010 to 2016.¹⁴⁷ Other federal agencies recognize these savings; the CBO explicitly accounts for Medicare savings from policies that increase the use of medicines due to reduced spending on other Medicare services.¹⁴⁸ By recognizing these savings in determining a selected drug’s MFP, CMS can provide an important signal to innovators that it recognizes the importance of medicines’ ability to save money for the health care system.

Additionally, PhRMA recommends that any data CMS relies upon to understand the cost of a drug reflect true net cost after rebates to Medicare. Manufacturers often pay substantial rebates to Medicare Part D plan sponsors and pharmacy benefit managers, but these price concessions are not reflected in Part D negotiated prices. According to government data, rebates can reduce average net costs for Part D plan sponsors by 40 percent or more for commonly used classes of medicines.¹⁴⁹ Government data also show that manufacturer rebates lowered total gross Part D expenditures by 22 percent in 2020¹⁵⁰ and that total Part D rebates paid by manufacturers increased by more than 400 percent between 2010 and 2020.¹⁵¹ These findings underscore the importance of CMS ensuring the data it uses to set the MFPs for selected drugs account for manufacturer rebates. PhRMA understands that CMS plans to identify the price¹⁵² of each therapeutic alternative covered by Part D, net of all price concessions, when developing a starting point for its initial MFP offer.

CMS should also account for the significant discounts on medicines provided under the 340B Drug Pricing Program. Ignoring these statutory discounts could lead to CMS setting an MFP that negatively impacts incentives for innovation. While the IRA forbids a duplicate 340B and MFP discount on a selected drug, without needed data for verification, manufacturers could be forced to pay steep discounts under both programs in addition to any commercial rebates owed to Part D plans and PBMs. Overall, 340B purchases are 17 percent of outpatient

¹⁴⁵ As of 2018, more than one in six Medicare beneficiaries – or 10.1 million people – were employed according to: Feder, J. M., Radley, D. C. (2020). COVID-19’s Impact on Older Workers: Employment, Income, and Medicare Spending. The Commonwealth Fund. ¹⁵² However, release of these data has significant competitive implications well beyond the Medicare program. Thus, specific pricing information by competitive products should never be shared.

branded drug sales.¹⁵³ Thus, if CMS were to ignore 340B discounts it would be missing a key factor that economists have stated can impact drug pricing.¹⁵⁴

f. Unmet Medical Need

PhRMA has significant concerns with CMS' unnecessarily narrow definition of "unmet medical need." CMS states that it will consider a selected drug as filling an unmet medical need if it treats a disease or condition where there are very limited or no other treatment options. In defining unmet medical need narrowly, CMS will exacerbate the harm to innovation that will result from Medicare price setting. If CMS fails to fully acknowledge innovation that addresses unmet patient needs, it will send signals that disincentivize ongoing innovation in areas where patients desperately need options.

CMS' definition is far narrower than the definition relied upon by the FDA, which facilitates several expedited programs (e.g., accelerated approval, breakthrough designation). In order to determine if a product meets the threshold for these programs, FDA defines unmet medical need as "a condition whose treatment or diagnosis is not addressed adequately by available therapy" that includes either "an immediate need for a defined population" or "a longer-term need for society."¹⁵⁵ FDA further clarifies that such a drug will treat a condition:

- Where there is no available therapy;
- Where there is available therapy, but the drug presents additional benefits; and
- Where the only available therapy was approved under the accelerated approval program and clinical benefit against the primary endpoint has not yet been verified.

Research has shown that the FDA definition of unmet need has significantly benefited patients by allowing the FDA to prioritize drugs that offer the largest health gains.¹⁵⁶ Therefore, given the significant risks to patients from CMS' inexplicably narrow definition, ***PhRMA recommends that at a minimum, CMS set the MFP for any selected drug that meets the FDA's definition of unmet need at the ceiling price, including those that met that definition at the time of approval.***

Furthermore, CMS should recognize other types of unmet need, including, but not limited to:

- Personalized medicines for certain subpopulations;
- Progress against rare and hard-to-treat illnesses;
- Treatments that improve patient adherence and quality of life;
- Need for additional treatments in a therapeutic area, such as a curative treatment;
- Treatments that improve the health of underserved and vulnerable communities who face health disparities;
- Treatments that benefit multiple common comorbidities at once; and

¹⁵⁶ Chambers, J.D., Thorat, T., Wilkinson, C. L., Neumann, P. J. (2017). Drugs Cleared Through The FDA's Expedited Review Offer Greater Gains Than Drugs Approved By Conventional Process. Health Affairs;36(8):1408-1415. DOI: 10.1377/hlthaff.2016.1541.

- The stepwise nature of progress in which significant gains for patients are achieved via advances that build on one another.

Additionally, *PhRMA recommends that CMS consider unmet need across the product lifecycle*. The drugs selected by CMS will not be new to the market – although they may have met an unmet need at some point in their lifecycle, it is possible and even likely that treatment options will have changed by the time they are selected for the Program. This includes selected drugs that received expedited review by the FDA, which as noted above has an established definition of unmet need. Moreover, CMS’ consideration of whether a drug meets an unmet need after its initial FDA approval is important to preserve incentives for post-approval research, as previously discussed.

g. Therapeutic Advance

Section 1194(e)(2)(A) requires CMS to consider “[t]he extent to which such drug represents a therapeutic advance as compared to existing therapeutic alternatives and the costs of such existing therapeutic alternatives.” Similar to our above comments on unmet need, it is critical that CMS acknowledge, in setting MFPs, medicines that represent an advance over existing treatments to maintain incentives for ongoing biopharmaceutical innovation. For drugs that represent a significant therapeutic advance, CMS should strongly consider setting MFPs at the statutory ceiling price.

Fortunately, CMS has both references within existing reimbursement policy, as well as resources, that can assist in defining and assessing selected drugs against this criterion. Furthermore, relying on existing Medicare policy would grant manufacturers of selected drugs critical predictability in understanding the criteria they must meet in order to obtain the statutory ceiling price for selected drugs.

One of these references is the New Technology Add-On Payment (NTAP) designation, which exists to ensure adequate reimbursement for certain new products that demonstrate, among other things, enhanced clinical improvement over existing technologies. In order to receive an NTAP, a product must demonstrate a substantial clinical improvement over existing services or technologies (in addition to two other distinct criteria), which is defined as “an advance that substantially improves, relative to...technologies previously available, the diagnosis or treatment of Medicare beneficiaries.” A product meets the substantial clinical improvement criterion for an NTAP if it satisfies one of the following factors:

- “The new...technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments.
- The new...technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods and there must also be evidence that the use of the new...technology to make a diagnosis affects the management of the patient.
- The use of the new...technology significantly improves clinical outcomes relative to services or technologies previously available...
- The totality of the information otherwise demonstrates that the new...technology substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.”¹⁵⁷

¹⁵⁷ 42 CFR § 412.87(b)(1)(ii) “Additional payment for new medical services and technologies: General provisions.”

The NTAP definition for substantial clinical improvement represents an established measurement that has been used for evaluating the value of certain products. By relying on an existing definition already in use in the Medicare program, CMS would be able to build on internal processes, experience and expertise used by the Agency to assess products that have applied for an NTAP. ***PhRMA recommends that CMS deem any drug that meets or has met the NTAP definition of “substantial clinical improvement” as representing a significant therapeutic advance and set the MFP at the ceiling price.*** This would not only apply to drugs that received official NTAP status previously, but any drug that currently meets the definition of “substantial clinical improvement” should be deemed as representing a therapeutic advance and should receive the ceiling price.

Additionally, PhRMA believes that highly credible, physician-driven oncology compendia, which CMS already relies on in other contexts, are important reference points for determining whether a treatment represents a therapeutic advance. Since 2008, the National Comprehensive Cancer Network (NCCN)’s Drug and Biologics Compendium has been one of these trusted resources. The NCCN Compendium’s aim is to provide stakeholders, including policymakers with information to “improve the effectiveness and quality of care for patients by developing and disseminating up-to-date, authoritative information.”¹⁵⁸ The recommendations in the Compendium are driven by stakeholders who should be central to the process for determining MFPs – multidisciplinary expert panels representing different specialties, including clinicians and patient advocates. Importantly, the Compendium is also updated on a regular basis to reflect currently available evidence.

Within the NCCN Compendium, indicated uses are categorized in a systematic approach that describes the type of evidence available for and the degree of consensus underlying each recommendation. NCCN considers evidence of both efficacy, safety of interventions, as well as an intervention’s toxicity. The two highest potential recommendation categories (of four) and their definitions are:

- Category 1: Based upon high-level evidence, there is uniform NCCN consensus that the intervention is appropriate; and
- Category 2A: Based upon lower-level evidence, there is uniform NCCN consensus that the intervention is appropriate.¹⁵⁹

These two levels of recommendations reflect that a treatment is supported by strong evidence, as well as near uniform consensus (a majority vote of at least 85 percent of the expert panel) among experts that the intervention is appropriate for the listed indication. Given the consensus this designation reflects, and its credibility, ***PhRMA recommends that CMS deem any oncology drug receiving a Category 1 or 2A rating as a significant therapeutic advance and set MFPs for drugs that receive these designations in the Compendium at the ceiling price.***

h. Manufacturer Engagement

In the Guidance, CMS states that if the Primary Manufacturer does not accept CMS’ written initial offer and proposes a written counteroffer, which is subsequently not accepted by CMS, the Agency will invite the Primary Manufacturer to an in-person or virtual meeting that would take place within 30 days of CMS’ receipt of the Primary Manufacturer’s written counteroffer. After this initial meeting, each party would have the opportunity to request one additional meeting, for a maximum of three meetings between CMS and the Primary Manufacturer. In addition, all meetings must occur during a narrow time period – approximately four months’ time between the Primary Manufacturer’s written counteroffer to CMS and the end of the price setting period.

¹⁵⁸ National Comprehensive Cancer Network. (2008). “Submission Request to CMS.” Available at: <https://www.cms.gov/Medicare/Coverage/CoverageGenInfo/downloads/covdoc14.pdf>.

¹⁵⁹ National Comprehensive Cancer Network. “Definitions for NCCN Categories.” Available at: <https://www.nccn.org/guidelines/guidelines-process/development-and-update-of-guidelines>.

While PhRMA appreciates CMS' willingness to provide some opportunities for manufacturer engagement, we believe that, in addition to the described meetings during the offer and counteroffer process, manufacturers should be permitted to engage with CMS much earlier in the process and should not have to wait until after an offer and counteroffer are rejected to meet with the Agency. PhRMA believes that CMS should meet with manufacturers at key decision points in the MFP process, similar to the opportunities for engagement that FDA provides manufacturers during the drug review and approval process. The purpose of the meetings would include providing an opportunity for a dialogue where CMS and manufacturers could ask questions of one another, including questions about the data CMS evaluates to determine a selected drug's MFP and allowing manufacturers to provide context and correct errors regarding the data that CMS relies on to set the MFP, including data given to CMS by third parties.

Specifically, *PhRMA recommends that CMS offer manufacturers the opportunity to meet¹⁶⁰ with relevant Agency staff at least three times prior to a counteroffer, including:*

- After drug selection but prior to initiation of the price setting process, to permit the manufacturer to provide critical input on issues such as potential evidence sources and comparator choice;
- Prior to CMS presenting the initial offer, so that CMS can provide information on its decision-making, analysis it conducted, and evidence sources, and permit the manufacturers to correct errors and provide important context; and
- After CMS presents the initial offer, so that manufacturers have the ability to discuss the data and assumptions that informed the initial offer.

The process that CMS proposes – whereby manufacturers would meet with CMS only after an initial offer and counteroffer are rejected, with all meetings forced into a four-month period – is insufficient and does not provide an opportunity for meaningful dialogue. While PhRMA reiterates that the Program cannot be thought of as a true negotiation, if CMS genuinely wants both a dialogue with manufacturers and a scientifically robust analysis of the clinical benefits of the selected drug, it should establish a process with sufficient time to meet and exchange information.

i. Patient and Clinician Engagement

CMS fails to outline a clear and meaningful process to engage with key stakeholders. Throughout the 91-page Guidance, there is barely any mention of the role of clinicians and patients as critically important stakeholders. The only formal opportunity for outside parties' input is through a generic ICR with a very short (30-day) deadline for input that begins after the list of selected drugs is published. PhRMA believes that providing clinicians and patients with only this limited role is a damaging misstep and lost opportunity that will significantly undermine the strength and reliability of the Program.

PhRMA strongly recommends that CMS develop a comprehensive and deliberative process to solicit input and advice from stakeholders, particularly patients, clinicians, and caregivers, at the start of the price setting process so they may provide relevant information to CMS in a timely manner. Patients¹⁶¹ and clinicians bring unique and essential expertise and perspectives on the value of medicines. Their firsthand experience with selected drugs in a real-world setting will likely lead them to develop perspectives that differ significantly from the perspectives of

¹⁶⁰ The definition of a "meeting" should be established by CMS. The FDA meeting criteria and tiering approach might be applicable for CMS. Please See: US Department of Health and Human Services, Food and Drug Administration, Center for Drug Evaluation and Research (CDER), Center for Biologics Evaluation and Research (CBER). Formal Meetings Between the FDA and Sponsors or Applicants of PDUFA Products: Guidance for Industry. (DRAFT GUIDANCE). December 2017, Procedural.

¹⁶¹ CMS should define "patients" broadly in this process and seek input from patients and family caregivers with lived experience with a specific disease state or therapeutic area, but also stakeholders who may not have that experience but who serve as patient advocates or are experts in issues such as health equity.

researchers assessing a treatment's value. The importance of including patient and clinician input in evidence-based processes has been underscored by a wide range of academics, thought-leaders, and research organizations. For example, in publishing its Rubric for patient-engagement, PCORI stated: "Engaging patients, caregivers, and other health care stakeholders as partners in planning, conducting, and disseminating research is a promising way to improve clinical decision-making and outcomes."¹⁶²

CMS recently published an ICR that includes "optional" submissions of data from Primary Manufacturers and the public regarding evidence about alternative treatments described in section 1194(e)(2).¹⁶³ Such information would need to be submitted no later than 30 days after publication of the selected drug publication list, would follow the questionnaire format of CMS' ICR, and would be in written format only. PhRMA is concerned that this regimented process will not be well-publicized or accessible to patient or clinician groups, when such input is essential to the MFP process. It is imperative that CMS gain relevant input early in the process and meaningfully consider it in determining specific MFPs. As previously noted, PhRMA also recommends that prior to making its initial offer to the manufacturer, CMS make available to the public key elements of its MFP analysis and provide an opportunity for the public to comment on them.

Clinician input will be particularly important for CMS to ensure that decision-making is rooted in the clinical reality of how selected drugs are used in a real-world clinical practice, and the drugs' impact on patients. CMS should specifically solicit advice from clinicians with experience specific to the relevant therapeutic area or disease state (e.g., if a treatment for Parkinson's disease is evaluated, a neurologist who specializes in Parkinson's disease or movement disorders should be consulted). Recent research found that estimates of value corresponding to assumptions identified by clinician-researcher experts and ICER often differed by substantial margins when examining the value of poly (ADP-ribose) polymerase (PARP) inhibitors in ovarian cancer. The differences found had a significant impact on results – utility estimates and treatment duration estimates yielded notable differences in the estimated value of the treatments.¹⁶⁴

These differences extend to assessments of a treatment's benefit compared to therapeutic alternative(s). A recently released study found that physicians in the U.S. disagreed with the German health agency's determination of the clinical benefit of innovative diabetes medicines 89 percent of the time. Of the U.S. physicians that disagreed, 97 percent said that the drugs in question provided additional clinical benefit for patients.¹⁶⁵ By including input from patients and relevant clinicians, CMS can help avoid discrepancies between how insurers or other price-setting agencies evaluate medicines versus how patients and clinicians value such medicines.

PhRMA recommends CMS consult with clinical leaders of the appropriate medical specialty societies, as well as leading clinical experts, during implementation of the Program and throughout the MFP determination process. This would include, at a minimum, key milestones, such as the scoping process for CMS' analysis, before the Agency makes an initial offer, and, if needed, in responding to a potential manufacturer counteroffer.

CMS has several options to facilitate input from clinicians in informal and formal manners. For example, CMS could convene ad hoc groups of clinicians and patients. In addition, CMS could establish a standing committee that provides input/recommendations, similar to the existing relationship between CMS and the American Medical Association (AMA), RVS Update Committee (RUC) or the Physician-Focused Payment Model

Technical Advisory Committee (PTAC).¹⁶⁶ Alternatively, particularly given the short timeframe before the first drugs are selected for price setting, CMS could also consider engaging an existing advisory committee, such as the Medicare Evidence Development and Coverage Advisory Committee (MEDCAC), as a resource in the MFP process.¹⁶⁷

Finally, following the statutorily required publication of the MFP explanation, PhRMA recommends CMS solicit feedback from all stakeholders regarding whether CMS has appropriately evaluated available evidence and arrived at an appropriate conclusion. This process will require CMS to ensure that the explanation provided after finalization of the MFP provides sufficient insight into CMS' decision-making process so that stakeholders are able to provide constructive and meaningful feedback.

j. Initial Justification

The written initial offer from CMS, which must be made no later than February 1st, 2024, must include a "concise" justification for the offer based on the negotiation factors and the methodology CMS lays out for developing an initial offer. The initial offer's justification is a critical part in the price setting process, particularly given the lack of communication between the manufacturer of the selected drug and the Agency that exists under CMS' proposed process. CMS must ensure that the initial justification enables the Primary Manufacturer to better understand the context for CMS' MFP offer, to inform the counteroffer and data provided as part of the counteroffer. As such, CMS needs to disclose all inputs and methodologies that it uses to arrive at an initial offer and must share this information prior to making the initial offer to ensure the manufacturer can properly respond to CMS.

PhRMA recommends that CMS describe, in final guidance, the template it will use for the concise justification and that it include information similar to the final published explanation and identify key pieces of information including:

- ***Therapeutic alternative(s) for a selected drug (for each indication);***
- ***How each of the factors listed in section 1194(e) were weighed relative to one another in CMS' decision-making;***
- ***Data and analysis CMS developed and considered supporting each factor, including evidence provided by third parties CMS engaged formally or informally;***
- ***Benefits and impacts of a selected drug CMS considered; and***
- ***Stakeholders, and other government agencies and organizations CMS engaged, formally or informally, including how stakeholder input explicitly informed CMS' determination of the MFP.***

k. Explanation for the MFP

CMS states that it will publish an explanation for the MFP no later than March 1st of the year prior to the IPAY year. For example, CMS will provide an explanation for the MFP for IPAY 2026 on March 1st, 2025. The intent of the published explanation is to summarize how the relevant factors were considered during the price setting process and would focus on the factors that had the greatest influence in determining the MFP. The published

¹⁶⁶ The RUC is a volunteer group of 32 physicians and other health care professionals who advise CMS regarding the valuation of a physician's "work" under the Medicare physician fee schedule. The PTAC is an 11-member group that provides comments and recommendations to the HHS Secretary on physician payment models.

¹⁶⁷ This advisory committee provides independent guidance and expert advice to CMS on specific clinical topics. MEDCAC is used to supplement CMS' internal expertise and has experience reviewing medical literature and technology assessments. The MEDCAC includes clinicians and patient advocates and could be a useful forum for CMS to convene in establishing the Program. CMS notes that it may recruit non-MEDCAC members who have relevant expertise to provide additional input to Committee members.

explanation will include high-level comments on the submitted data, without any proprietary information. The published explanation will list the selected drug, discuss contributing price setting factors, and note any factors or circumstances that may be unique to the selected drug. If the MFP is not agreed upon, CMS will indicate that no Agreement was reached.

PhRMA notes that for IPAY 2027, “Primary Manufacturers” will be required to submit manufacturer-specific data to CMS by March 1st, 2025, on the very same date such manufacturers have access to the explanation for how CMS arrived at the MFP for the prior year. This is an unworkable timeline. ***PhRMA strongly recommends that the MFP explanation be released simultaneously with the MFP and before the process to set prices for IPAY 2027 begins*** in order to give manufacturers essential predictability in CMS’ decision-making process. Manufacturers can better understand the process if they have access to the MFP explanation prior to being required to submit data to CMS for the following year. The statute requires CMS to publish the explanation *no later than* March 1st of the year prior to the IPAY, which indicates that CMS has discretion to publish the explanation at an earlier date. The published explanation of the MFP should be an important chance for CMS to solicit stakeholder feedback to improve the price setting process and is a critical piece in helping stakeholders understand how CMS arrives at an MFP for a selected drug. As this explanation could help build trust between CMS and other key stakeholders, ***PhRMA recommends the explanation provide information on many of the issues previously addressed, including but not limited to:***

- ***Therapeutic alternative(s) for a selected drug (for each indication);***
- ***How each of the factors listed in section 1194(e) were weighed relative to one another in CMS’ decision-making;***
- ***Data and analysis CMS developed and considered supporting each factor, including evidence provided by third parties engaged formally or informally by CMS;***
- ***Benefits and impacts of a selected drug CMS considered; and***
- ***Stakeholders and other government agencies and organizations CMS engaged, formally or informally, including how stakeholder input explicitly informed CMS’ determination of the MFP.***

As noted above, PhRMA also recommends that CMS offer manufacturers an opportunity to comment on a draft MFP explanation and that CMS respond to such comments.

I. Average Non-FAMP (Section 60.2.3)

Calculation of 2021 Annual non-FAMP

In section 60.2.3 of the Guidance,¹⁶⁸ CMS states that, in calculating the average 2021 non-FAMP for a selected drug, CMS intends to use the non-FAMP of each NDC-11 for the selected drug for each quarter of calendar year 2021. ***For the reasons discussed below, PhRMA instead recommends CMS to use the annual non-FAMP already reported by manufacturers to the VA as defined in 38 U.S.C. § 8126(h)(5).*** Specifically, for 2021, this would be the annual non-FAMP value reported by manufacturers to the VA by November 15, 2021.

In defining the average non-FAMP, the IRA does not specify which four quarters are “the 4 calendar quarters of the year involved” but notably cross-references 38 U.S.C. § 8126(h)(5). As noted above, 38 U.S.C. § 8126(h)(5) already defines an annual non-FAMP as a weighted average across the four quarters of the federal fiscal year, which runs from October through September of the following year. In defining the average non-FAMP for purposes of the IRA as based on a calendar year, CMS is introducing confusion, inefficiency, and added burden

¹⁶⁸ This approach is also proposed in section 60.2.1 with reference in section 50.1.

on both manufacturers and the Agency itself. Given the statutory reference to 38 U.S.C. § 8126(h)(5), CMS should instead utilize the existing annual non-FAMP as reported to the VA.

If CMS finalizes this portion of the guidance with the continued use of calendar year quarters, PhRMA supports the Agency's proposal for a weighted average.

Clarifying Weighting in Calculating a Single Average non-FAMP

In section 60.2.3 of the Guidance, CMS addresses its intended approach for calculating a single average non-FAMP across dosage forms and strengths of a selected drug for comparison against the calculated sum of the plan specific enrollment weighted amounts for the selected drug.

As written, the language included in the Guidance for steps 1 through 11 of section 60.2.3 could be read as utilizing units of NDC-11s used in the calculation of non-FAMP or units sold across all markets as opposed to units dispensed within the Part D program, which would result in an inconsistency with sections 60.2.2. and 60.5.

PhRMA urges CMS to clarify that the calculation of a single non-FAMP across dosage forms and strengths will be weighted by the 30-day equivalent supply dispensed under the Part D program as reported on the PDE. This would align the weighting methodology for the non-FAMP calculations with the weighting by 30-day equivalent supply utilized by CMS for the calculation of plan-specific enrollment weighted amounts in section 60.2.2 and the application of the single MFP across dosage forms and strengths in section 60.5.

Cross-Walking non-FAMP and PDE Unit Types

In step one of the calculation laid out in section 60.2.3 of the Guidance, CMS notes that the non-FAMP unit type may differ from unit types used on the Part D PDE record, which uses NCPDP-defined values. In such cases, CMS proposes to convert the non-FAMP unit type to the PDE unit type such that the average non-FAMP and the sum of plan specific enrollment weighted amounts represent the same quantity of the selected drug.

PhRMA agrees with the Agency on the need to convert non-FAMP units to PDE units in cases where the unit types differ for the same medicine. We would also encourage CMS to add a field to the PDE file layout to collect how the amount reported in the "Quantity Dispensed" field is measured using the NCPDP-defined values, as the Agency proposed in the Part D inflation rebate Guidance issued earlier this year.¹⁶⁹ Having this field added to the PDE would help CMS ensure accurate conversion of non-FAMP to PDE units, just as the Agency noted the potential of this field in helping to ensure accurate conversion of PDE to AMP units in the Part D inflation rebate Guidance.

m. Application of the MFP Across Dosage Forms and Strengths (Section 60.5)

In section 60.5 of the Guidance, CMS provides its intended approach to applying a single MFP across each dosage form and strength of a selected drug in accordance with section 1196(a)(2) of the Act. A key piece of this proposed approach (and indeed, a key piece of the methodologies CMS lays out in sections 60.2.2, 60.2.3, and 60.3 as well) rests on defining 30-day equivalent supplies for each dosage form and strength of a selected drug and therapeutic alternative(s).

PhRMA urges CMS to provide greater clarity regarding how the Agency intends to calculate 30-day equivalent supplies and identify alternative(s) when a 30-day supply cannot provide a reasonable comparison between therapeutic alternative(s). This calculation may not be as straightforward as it appears, particularly for certain types of medicines. Take the following two examples where CMS should give additional consideration to how to

¹⁶⁹ CMS. (February 9, 2023). Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of section 1860D-14B of SSA, and Solicitation of Comments. Available at: <https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf>

appropriately calculate 30-day equivalent supplies: (1) medicines used on an as-needed basis, such as rescue inhalers; or (2) when comparing two products where the treatment duration varies significantly (e.g., an oncology medicine that is administered on an ongoing basis until disease progression vs. a fixed-dose therapy) comparing the cost of a 30-day equivalent supply would not accurately capture the total cost of comparable outcomes. Medications where 30-day supplies can vary significantly across patients also need to be accounted for. For example, among patients using insulin, a typical 30-day supply can be very different from one patient to the next, both because different patients need different amounts of insulin, but also because insulin dosing varies by indication (e.g., for treatment for Type I vs. Type II diabetes). CMS should also give careful thought to how best account for starting dosages of medicines, where a patient's dosage increases over a period of time upon first starting a medication before reaching a steady, long-term dosage amount (e.g., titration).

PhRMA notes that manufacturers have experience with calculating 30-day equivalent supplies under certain state drug price transparency reporting requirements, and there are certain vendors that assist manufacturers with these calculations.¹⁷⁰ We suggest that CMS speak with manufacturers and these vendors to better understand how 30-day equivalent supplies are calculated for medicines, particularly medicines falling into one of the more complicated situations described in the paragraph above.

In addition to providing clarity on how the Agency intends to calculate 30-day equivalent supplies, PhRMA urges CMS to provide insight and data to manufacturers such that manufacturers can fully understand the Agency's application of a single MFP across dosage forms and strengths. Specifically, PhRMA requests that CMS make available to manufacturers of selected drugs:

- The Agency's calculated 30-day equivalent supply for each NDC-9;
- The total number of units dispensed for each NDC-9 in the 2022 Part D PDE data; and
- An Excel template with the Agency's 10-step calculation approach for applying the MFP across different dosage forms and strengths.

In providing this information to manufacturers of selected drugs, CMS will help to ensure that manufacturers have full transparency into the Agency's calculations.

n. Dispute Resolution

We are disappointed that CMS does not discuss mechanisms for dispute resolution, particularly after the Agency had indicated in its January 11, 2023 memo that "dispute resolution process for specific issues that are not exempt from administrative or judicial review under section 1198" would be one of seven major issues discussed in the Guidance.¹⁷¹ While the Agency references this in the introduction to the Guidance, it does not then describe any policy for resolving disputes or affording opportunities for manufacturers to engage with CMS to correct errors. Despite appeals mechanisms being widely recognized as a "best practice" for HTA-informed policy decision-making, CMS appears to be taking the position that provisions in SSA section 1198 preclude administrative and judicial review for many of the basic elements of the MFP program. PhRMA disagrees with any such interpretation of section 1198. Specifically, section 1198 does not prohibit CMS from establishing informal procedures to resolve disputes and affording manufacturers the opportunity to engage with the Agency to correct errors that will inevitably arise during the MFP decision-making process. Indeed, CMS interpreted similar statutory provisions on administrative and judicial review in connection with the Part B and Part D inflation

¹⁷⁰ For example, Global Pricing Innovations (<https://globalpricing.com/>).

¹⁷¹ CMS. (Jan. 11, 2023). Medicare Drug Price Negotiation Program: Next Steps on Implementation for Initial Price Applicability Year 2026. Available at: <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-next-steps-implementation-2026.pdf>.

rebates to accommodate an error correction process.¹⁷² We were disappointed CMS chose not to put this discretion to use in the service of good public policy, as these opportunities to engage in meaningful dialogue to resolve disputes and correct errors would benefit both manufacturers and CMS and, importantly, could help avoid implementation missteps.¹⁷³ We encourage CMS to incorporate these processes into its final guidance for IPAY 2026.

Because the MFP program will involve CMS gathering and evaluating extensive and disparate types of cost and clinical data and research, and applying them to national MFP pricing decisions, it will create numerous potential areas where errors can occur or disputes arise over valid, but differing, assumptions (for example, interpretations on the appropriate approach to synthesizing data from different studies, or assumptions or extrapolations of treatment benefit based on study results). The risk of errors and disputes occurring will be further enhanced because the Agency will be required to conduct extensive evidence reviews in a much shorter time period than is typically required for traditional systematic reviews.¹⁷⁴

IV. Removal from the Selected Drug List Before or During Negotiation, or After an MFP is in Effect (Section 70)

For purposes of a selected drug's exit from the Program, "CMS will consider an approved generic drug or licensed biosimilar biological product to be marketed when [PDE] data reveal that the manufacturer of the generic drug or biosimilar biological product has engaged in bona fide marketing of that drug or product." As discussed in greater detail in our comments on section 90 below, there is no statutory basis for CMS' proposed "bona fide marketing" standard. Nevertheless, however CMS defines "marketing," CMS' timeline in section 70 for removing a selected drug is overly restrictive.

Specifically, CMS could read the law to allow a reference product to exit the Program if a generic or biosimilar product is marketed after the "negotiation period" but before the IPAY begins. Such reading aligns with the statutory definition of a (QSSD)—a threshold requirement for a drug to be subject to price setting. The statute defines a QSSD "with respect to an initial price applicability year,"¹⁷⁵ indicating that a product's status as a QSSD must exist as of the first day of the IPAY, not just at the selected drug publication date, as the Guidance suggests. Had Congress intended QSSD status to be assessed only as of the selected drug publication date, it would have said so. Thus, a product that has become multisource before the IPAY should not be subjected to price setting. This view also comports with the definition of "price applicability period," which means, "*with respect to a qualifying single source drug*, the period beginning with the first initial price applicability year with respect to which such drug is a selected drug and ending with the last year during which the drug is a selected drug."¹⁷⁶ This reference to QSSD status signals that a product that has gone multisource and hence no longer meets the QSSD definition should not be subject to a price applicability period. Moreover, as the statute and CMS' Figure 1 in the

¹⁷⁵ SSA § 1192(e)(1).

¹⁷⁶ SSA § 1191(b)(2) (emphasis added).

Guidance show, only products that are QSSDs may be eligible drugs. Where a product is no longer a QSSD, it cannot, by definition, be considered an eligible drug or a selected drug.¹⁷⁷

Our position aligns with subsection (c)(1) in section 1192 and its use of the phrases, “with respect to the [IPAY]” and “with respect to such year” in paragraph (1).¹⁷⁸ This phrasing supports the conclusion that eligibility status (and hence, QSSD status) must remain in place as of January 1 of the IPAY for subsection (c)(1) to apply to the drug. Thus, this provision speaks to the exit process for drugs that remain a QSSD and selected drug on the first day of the IPAY and then experience generic or biosimilar competition. Paragraph (2) “clarif[es] the application of paragraph (1) to a specific time period when various tasks otherwise would need to be performed by both CMS and the manufacturer, i.e., during the negotiation period. The provision does not address what happens if the generic or biosimilar is marketed after the negotiation period, as there is no “negotiation process” to which the manufacturer is subject, and thus no need for a clarification that the process must stop. Paragraph (2)’s styling as a “clarification” shows that the underlying defined statutory terms referenced in subsection (c) must be given full effect in subsection (c)(1). In other words, it does not change the fact that the statute defines QSSD “with respect to an [IPAY].”

This position is grounded in sound policy. Congress crafted the IRA to provide for price setting for *single source* products. CMS’ current position undermines this intent by applying MFPs to products that are already multisource. This position thereby directly undermines generic and biosimilar competition and incentives for pursuing approval of these products. For generic and biosimilar companies, developing and marketing generic and biosimilar products within the timeframes under the law is already challenging. The processes necessary to market a generic or biosimilar product can be complex, and there are many steps that are not solely in control of the generic or biosimilar sponsor, including FDA review timelines. The MFP may go into effect before they are ever able to market their products and may set a price below the level of economic viability. CMS’ position compounds this problem by essentially providing that generic or biosimilar marketing in the last thirteen months before the IPAY does not trigger Program exit. In other words, a generic or biosimilar company that bring their products to the market during these thirteen months will nevertheless be forced to compete with an MFP.

We therefore urge CMS to revise the Guidance to provide that a reference product or listed drug exits the Program if generic or biosimilar marketing occurs after the negotiation period but before the IPAY. CMS also should amend the table on page 63 of the Guidance as follows.

¹⁷⁷ SSA § 1192(c) (defining “selected drug”), 1192(d) (defining “negotiation-eligible drug”).

¹⁷⁸ The section provides as follows:

(c) SELECTED DRUG.—

(1) IN GENERAL.—For purposes of this part, in accordance with subsection (e)(2) and subject to paragraph (2), each negotiation-eligible drug included on the list published under subsection (a) with respect to an initial price applicability year shall be referred to as a ‘selected drug’ with respect to such year and each subsequent year beginning before the first year that begins at least 9 months after the date on which the Secretary determines at least one drug or biological product—

(A) is approved or licensed (as applicable)—

(i) under section 505(j) of the Federal Food, Drug, and Cosmetic Act using such drug as the listed drug; or

(ii) under section 351(k) of the Public Health Service Act using such drug as the reference product; and

(B) is marketed pursuant to such approval or licensure.

(2) CLARIFICATION.—A negotiation-eligible drug—

(A) that is included on the list published under subsection (a) with respect to an initial price applicability year; and

(B) for which the Secretary makes a determination described in paragraph (1) before or during the negotiation period with respect to such initial price applicability year;

shall not be subject to the negotiation process under section 1194 with respect to such negotiation period and shall continue to be considered a selected drug under this part with respect to the number of negotiation-eligible drugs published on the list under subsection (a) with respect to such initial price applicability year.

Date on which CMS determines that a generic drug or biosimilar biological product is approved and marketed	Result with respect to selected drug for the Program
September 1, 2023 through August 1, 2024 <u>December 31, 2025</u> (which includes Negotiation Period for initial price applicability year 2026)	Selected drug remains a selected drug for initial price applicability year 2026, though MFP does not apply; selected drug ceases to be a selected drug on January 1, 2027
August 2, 2024 <u>January 1, 2026</u> through March 31, 2026	Selected drug remains a selected drug and MFP applies for initial price applicability year 2026; selected drug ceases to be a selected drug on January 1, 2027.
April 1, 2026 through March 31, 2027	Selected drug remains a selected drug and MFP applies for initial price applicability year 2026 and calendar year 2027; selected drug ceases to be a selected drug on January 1, 2028.

V. Manufacturer Compliance and Oversight (Section 90)

a. Monitoring of Access to the MFP (Section 90.2)

Please refer to our comments on section 40.4 for a discussion of CMS’ proposals in section 90.2 of the Guidance.

b. Monitoring for Bona Fide Marketing of Generic or Biosimilar Product (Section 90.4)

“Bona Fide Marketing”

With respect to section 90.4, even accepting for the sole purpose of commenting on this Guidance that CMS’ adoption of a “bona fide marketing” standard is final, there is nevertheless no statutory basis for CMS’ proposal “to monitor whether robust and meaningful competition exists in the market once it makes such a determination [that a generic drug or biosimilar biological product has been marketed].”¹⁷⁹ The statute contemplates that a selected drug will exit the program based on such a determination and nothing more, and does not provide CMS a role in monitoring generic and biosimilar competition. As set out below, CMS’ concept of “bona fide marketing” is contrary to the statute. This approach also fails to provide clarity or certainty regarding when a medicine becomes ineligible for price setting.

The statute defines a QSSD in relevant part as a drug for which a generic or biosimilar product is not “marketed.”¹⁸⁰ The guidance instead refers to a new term “bona fide marketing,” providing that, “[i]n accordance with 1192(c) and (e) of the Act for the purpose of identifying [QSSDs] for [IPAY] 2026, CMS will review PDE data for a given generic drug or biosimilar . . . and will consider a generic drug or biosimilar biological product to be marketed when that data reveal that the manufacturer of that drug or product has engaged in bona fide

¹⁷⁹ Guidance, p. 67.

¹⁸⁰ SSA § 1192(e)(1)(A)(iii) & (B)(iii); *see also id.* § 1192(c)(1)(B) (addressing the termination of “selected drug” status following the Secretary’s determination that a generic or biosimilar product “is marketed.”).

marketing of that drug or product.”¹⁸¹ The addition of the term “bona fide” adds an extra-statutory limitation and is at odds with the ordinary meaning of “marketed.”

Indeed, in the guidance’s “Appendix C: Definitions for Purposes of Collecting Manufacturer-Specific Data,” CMS defines “marketing” as “the introduction or delivery for introduction into interstate commerce of a drug product.”¹⁸² PhRMA agrees with this definition, which is consistent with FDA’s interpretation of provisions of the FDCA for which a product’s marketing status is relevant. For example, in the context of 180-day exclusivity for first generic applicants, the FDCA provides that FDA shall not make effective a subsequent generic application until “180 days after the date of the first commercial marketing of the drug...by any first applicant.”¹⁸³ In regulations, FDA defines the term “commercial marketing” in relevant part as “the introduction or delivery for introduction into interstate commerce of a drug product described in an ANDA, outside the control of the ANDA applicant.”¹⁸⁴ This definition is particularly relevant given that the IRA specifically refers to the generic product being “marketed under section 505(j) of the [FDCA],” which has long been understood to mean introduction into interstate commerce.¹⁸⁵ Had Congress intended to change the criteria for a generic to be considered “marketed,” it would have done so. Similarly, for purposes of implementing section 506I of the FDCA concerning marketing status reports, FDA considers a product’s marketing status to depend on whether a product is distributed by the application holder, i.e., whether the product is available for sale.¹⁸⁶ Notably, since the IRA’s enactment, Congress extended the section 506I marketing provisions to apply to biologics licensed under the PHSA and in so doing made no changes that would suggest Congress meant to do anything other than endorse FDA’s approach to defining marketing status.¹⁸⁷ FDA’s definitions reflect the generally accepted ordinary meaning of the “marketing” of a pharmaceutical product, and, consequently, the meaning of “marketed” that Congress intended in the context of the IRA. Moreover, in a Supreme Court case involving a law that used the term “marketing,” but left the term “undefined,” the Court used “ordinary meaning” of “marketing.”¹⁸⁸ Significantly, the Court held that “[m]arketing ordinarily refers to the act of holding property for sale with the activities preparatory thereto . . . and does not require that the promotional or merchandising activities connected with the selling be extensive.”¹⁸⁹ In contrast, the guidance imposes an extra-statutory limitation on qualifying marketing that goes beyond its ordinary meaning. *We urge CMS to abandon the new term “bona fide marketing” and rely instead on the definition of “marketing” in Appendix C.*

CMS’ position also conflicts with another part of the Program statute at section 1192(f)(2)(D)(iv) which expressly prohibits manufacturers from receiving the biosimilars-based selection “pause” based on volume-limited arrangements. Specifically, section 1192(f)(2)(D)(iv) states that “[i]n no case shall the Secretary delay the inclusion of a biological product as a selected drug on the list published under subsection (a) if the Secretary determined that the manufacturer of the biosimilar...entered into any Agreement described in such paragraph with the manufacturer of the reference product...that...*restricts the quantity (either directly or indirectly) of the biosimilar biological product that may be sold in the United States over a specified period of time.*”¹⁹⁰ Clearly, then, Congress knew how to impose volume-based requirements or limitations and did so in the very same section of the statute. Again, when “Congress includes particular language in one section of a statute but omits it in another section of the same Act,” it is “generally presumed that Congress acts intentionally and purposely in the

¹⁸⁹ *Id.* (emphasis added).

¹⁹⁰ SSA § 1192(f)(2)(D)(iv) (emphasis added).

disparate inclusion or exclusion.”¹⁹¹ Congress’s decision not to qualify the term “marketed” demonstrates that CMS’ additional “bona fide” limitation conflicts with the statute.

The use of specific PDE data and the time frame for such data, as described in the Guidance, are also at odds with the statutory language. The guidance states that “CMS will review PDE data for a given generic drug or biosimilar biological product during the 12-month period beginning August 16, 2022 and ending August 15, 2023, using PDE data available on August 16, 2023, and will consider a generic drug or biosimilar biological product when that data reveal that the manufacturer of that drug or product has engaged in bona fide marketing of that drug or product.”¹⁹² The statute does not instruct CMS to consider PDE data – either exclusively, or at all – in assessing marketing status and to ignore all other sources of marketing information. Thus, in accordance with the statute, the determination of whether a product is marketed, as that term is commonly understood, should not be based on PDE data.

PDE data are inappropriate as a benchmark to assess whether a generic or biosimilar is marketed. PDE data only reflect Part D claims: Part D plans are a subset of payors, which themselves are a subset of the biopharmaceutical marketplace, and a subset that would be expected to pay for a newly approved drug later than other segments of the marketplace. And in fact, Medicare Part D plans are “notably slower than commercial plans in coverage of first generics... For the 2021 Medicare Part D plan year, on average, only 21 percent of first generics that launched in 2020 were covered by plan formularies.” An analysis by the Association for Accessible Medicines found that “it takes nearly three years before first generics are covered on more than half of Medicare Part D formularies,” and even when covered, these drugs are less likely to be placed on generic tiers (meaning that the generic may be infrequently used and thus may not appear in any particular sample of PDE data even if it is covered by the Part D plan).¹⁹³ This delayed utilization pattern – even for first generics – is consistent with the fact that CMS allows Part D plans’ Pharmacy and Therapeutics Committees a lengthy period to review new drugs and decide whether to place them on formulary.¹⁹⁴ In short, hinging a decision about when a new generic or biosimilar is “marketed” solely on records of Part D utilization is an arbitrary and irrational approach that inevitably will miss most of the evidence of marketing and determine an incorrect date for when marketing of the drug began.

Finally, any monitoring by CMS of the competitive landscape for pharmaceuticals would duplicate the existing efforts of the Federal Trade Commission (FTC), which has the statutory authority and expertise to perform this function. It is also unnecessary in light of FDA initiatives, including the Drug Competition Action Plan¹⁹⁵ and Biosimilars Action Plan,¹⁹⁶ which have focused on improving access to generic and biosimilar products in the U.S. Moreover, the FTC and FDA have also been working together on these issues, issuing joint statements and holding joint workshops, most recently focusing on competition for biologics and biosimilars.¹⁹⁷ CMS also lacks the expertise and resources to police marketplace competition issues. CMS’ proposed monitoring of the status of competition in the marketplace therefore is unauthorized and unnecessary.

VI. Civil Monetary Penalties (Section 100)

In section 100 of the Guidance, CMS addresses the civil monetary penalty (CMP) provisions set forth in section 1197 of the SSA (the Program-related CMPs) and briefly describes the “procedures” CMS intends to follow to impose these CMPs on manufacturers. Our comments reflect how we believe CMS can implement these CMPs in a manner that conforms to the statute, while affording reasonable and appropriate protections to manufacturers.

a. Notice-and-Comment Rulemaking on Program-Related CMPs

The extraordinary nature of Program-related CMPs demands notice-and-comment rulemaking. Section 1197 authorizes extraordinarily high CMP amounts. To our knowledge, the maximum CMP amount set forth in section 1197(d), which provides for a penalty equal to \$100 million for each item of false information, is *by far* the highest CMP amount related to any federal health care enforcement regime. Moreover, the maximum CMP amount set forth in section 1197(a) is equal to 10 times the difference between the price the manufacturer charges and the MFP¹⁹⁸ – a strikingly large amount in comparison to the most common punitive fine recognized in American law (*i.e.*, treble damages). Further, the maximum CMP amount set forth in section 1197(c) of \$1 million per day greatly exceeds other “per-day” CMP amounts in the SSA (such as the maximum \$10,000 per day penalty in section 1927(b)(3)(C)(i) for the similar failure of a manufacturer to provide timely information relevant to Medicaid drug rebates).

These extraordinarily high penalties, by themselves, warrant notice-and-comment rulemaking prior to Agency implementation. When coupled with the complexity and novelty of the Program and the implementation challenges that will persist for at least the first few years, basic notions of fairness and due process require notice-and-comment rulemaking. PhRMA strongly urges CMS to complete this notice-and-comment process before seeking to impose any Program-related CMPs on a manufacturer. Such rulemaking should address the following issues, at a minimum:

- Clear and detailed procedures CMS intends to use to impose Program-related CMPs against selected drug manufacturers;
- The scope of a selected drug manufacturer’s Program-related CMP liability with respect to acts and omissions of third parties, including independent actors in the pharmaceutical supply chain over which the manufacturer exercises little, if any, control; and
- Factors CMS will consider in assessing whether to seek a Program-related CMP and the amount of any such CMP.

We address each of these issues, in turn, below.

b. Combined Rulemaking on CMP Procedures

PhRMA urges CMS to implement IRA drug pricing-related CMP procedures through a single rulemaking and model such procedures after well-established precedents. Given the significant overlap between the CMP provisions in sections 1197 (governing the Program), 1847A(i)(7) (governing Part B rebatable drugs), and 1860D-14B(e) (governing Part D rebatable drugs) of the SSA, PhRMA urges CMS to undertake notice-and-comment rulemaking to implement a common set of procedures to govern these CMPs.¹⁹⁹ We note that proceeding through notice-and-comment rulemaking to implement procedures for these CMPs would be consistent with CMS’

¹⁹⁸ A similar penalty amount applies with respect to a manufacturer’s failure to pay a rebate due in connection with the biosimilar delay provisions. *See* SSA § 1197(b).

¹⁹⁹ To clarify, CMS should codify separate regulatory provisions to address the circumstances under which a manufacturer could be subject to a CMP under: (1) the Program; (2) the Part B inflation rebate program, and (3) the Part D inflation rebate program. These separate regulatory provisions should cross-reference a single CMP appeals procedure that applies to all IRA drug pricing-related CMPs.

obligation under section 1871(a) of the SSA to issue regulations before establishing a substantive legal standard.²⁰⁰

In developing procedures to govern the imposition of CMPs, CMS should use well-established agency procedures as a model. Examples include the CMP procedures for Medicare Advantage organizations (MAOs) and Part D prescription drug plan sponsors (PDPs),²⁰¹ and the CMP procedures issued by the HHS OIG.²⁰² Each of these examples establishes clear and detailed procedures for the Agency to provide detailed notice of the basis of the CMP and for the regulated parties to, among other things, respond to CMP notices, request hearings before an administrative law judge (ALJ), and appeal ALJ decisions to the HHS Departmental Appeals Board before seeking review in the U.S. Court of Appeals.²⁰³

In addition, the CMP procedures should provide an opportunity for manufacturers to confer with the Agency prior to the imposition of CMPs. Even when regulations do not require it, it is customary for government agencies to issue pre-enforcement notification letters or pursue other informal means to give regulated parties an opportunity to respond before the Agency initiates formal proceedings, such as by issuing a CMP notice.²⁰⁴ Engaging in pre-enforcement discussions with manufacturers would be beneficial to both manufacturers and CMS. This is particularly true because of the extraordinarily high CMP amounts at issue and the novelty and complexity of the Program, which is still being implemented. Both manufacturers and CMS will likely be working through implementation challenges, often fact-specific, for at least the first few years of the Program. Therefore, it is critical that CMS implement a process to informally engage with manufacturers through pre-enforcement communications before initiating formal CMP proceedings.

c. CMPs Due to Acts and Omissions of Third Parties

PhRMA urges CMS to not impose CMPs on drug manufacturers for acts and omissions of third parties over which manufacturers have little, if any, control. As reflected earlier in our comments, PhRMA strongly opposes CMS' intention to hold a Primary Manufacturer responsible for certain acts and omissions of a Secondary Manufacturer. PhRMA is deeply concerned that, under this framework, CMS could attempt to impose \$1 million-per-day CMPs on a Primary Manufacturer for acts or omissions of a Secondary Manufacturer over which the Primary Manufacturer has little, if any, control.²⁰⁵

Similarly, CMS intends to hold Primary Manufacturers "ultimately" "responsib[le]" for ensuring access to the MFP, despite acknowledging that "[e]ach component of the pharmaceutical supply chain may have a role in making the MFP available to MFP-eligible individuals."²⁰⁶ Here, too, manufacturers have very limited, if any, ability to influence the conduct of independent actors in the pharmaceutical supply chain. Notwithstanding these

²⁰⁰ In any event, under section 1847A(i)(7) of the SSA, CMS is expressly required to issue regulations establishing procedures governing CMPs under the Medicare Part B inflation rebate program.

²⁰¹ 42 C.F.R. Part 422, Subparts O and T (CMP procedures for MAOs); 42 C.F.R. Part 423, Subparts O and T (parallel procedures for PDPs).

²⁰² 42 C.F.R. Parts 1003 and 1005.

²⁰³ We note that the limitations on administrative and judicial review set forth in section 1198 of the SSA do not limit a manufacturer's right under section 1128A(e) of the SSA to seek judicial review of a determination by the Secretary to impose a CMP pursuant to section 1197.

²⁰⁴ See, e.g., OIG, Revisions to the OIG's Exclusion Authorities, 82 Fed. Reg. 4100, 4109 (Jan. 12, 2017) ("In practice, OIG also contacts potential subjects of section 1128(b)(7) exclusions, often through 'pre-demand letters' or other means to give defendants the opportunity to respond to OIG before formal proceedings are initiated."); 42 C.F.R. §§ 422.756, 423.756 (setting forth CMS' procedure for imposing intermediate sanctions on MAOs and PDPs, respectively, which provides for a written notice to the plan of CMS' proposed intermediate sanction and an opportunity for the plan to provide a written rebuttal within 10 days of receipt of CMS' notice).

²⁰⁵ For example, it appears from the guidance that CMS believes it could impose \$1 million-per-day CMPs on a Primary Manufacturer in the following instances: (1) a Secondary Manufacturer fails to make the MFP available to MFP-eligible individuals or specified dispensers, see, e.g., Guidance at 26, 68-69; and (2) a Secondary Manufacturer fails to provide a Primary Manufacturer with required non-FAMP information for a selected drug that the Primary Manufacturer would be required to submit to CMS for purposes of the "negotiation," see, e.g., Guidance, pp. 27-28, 69.

²⁰⁶ Guidance, p. 65.

limitations, the Guidance suggests manufacturers could face CMPs equal to 10 times the difference between the net acquisition price and the MFP *for each unit* of a selected drug acquired at a price exceeding the MFP.²⁰⁷

PhRMA strongly opposes any interpretation of the statute that would seek to impose CMP liability on manufacturers of selected drugs due to the acts or omissions of any independent third party. Doing so would dramatically expand the scope of manufacturers' legal liability and disrupt the allocation of risk under numerous contractual arrangements between and among manufacturers and other entities spanning the pharmaceutical supply chain. Amending these contracts to account for CMS' policy change would require significant time and resources that CMS does not address in setting forth these new compliance expectations for manufacturers.

While PhRMA strongly opposes CMS' intention to shift legal risk to manufacturers in this manner, if CMS retains these policies in the final IPAY 2026 guidance, the Agency should *at a minimum* articulate a non-enforcement policy pursuant to which it will refrain from imposing CMPs on Primary Manufacturers under sections 1197(a) and 1197(c) for a reasonable time following issuance of the final guidance for IPAY 2026.²⁰⁸ In addition, as discussed below, if CMS pursues CMPs against any Primary Manufacturer based on a third party's conduct, CMS should weigh the Primary Manufacturer's level of culpability to seek a low penalty.

d. CMS Explanation of Factors Used in Assessing CMPs

CMS should publicly explain the factors it will consider in assessing CMPs against manufacturers. As a threshold matter, the extraordinary maximum penalty amounts for the Program-related CMPs present serious concerns under the Excessive Fines Clause of the Eighth Amendment to the U.S. Constitution. While these amounts are set by statute, in seeking to impose a CMP on a manufacturer, CMS should consider whether a compromise penalty amount below the statutory amount is required to avoid this constitutional issue.²⁰⁹

Moreover, given the extraordinary range of potential penalty amounts under the statutory maximums, PhRMA strongly urges CMS to clearly explain, through notice-and-comment rulemaking, the factors it will consider and weigh in assessing whether to seek a Program-related CMP and the amount of any such CMP. CMS has clear statutory authority to exercise such discretion. Specifically, each Program-related CMP cross-references section 1128A of the SSA, which requires that, in determining the amount of any CMP, agencies must consider "the nature of claims and the circumstances under which they were presented, "...the degree of culpability, ...[and] such other matters as justice may require."²¹⁰

Factors CMS should consider as part of this rulemaking include, for example:

- the nature and circumstances of the manufacturer's conduct;
- the degree of the manufacturer's culpability, including, for example, whether the manufacturer took timely and appropriate corrective action;
- whether the manufacturer had knowledge of a violation of an applicable Program requirement;
- the clarity of existing guidance available to the manufacturer;

²⁰⁷ Guidance, pp.64-65, 68.

²⁰⁸ We note that there is precedent for this approach. For example, OIG proposed adopting a similar policy of enforcement discretion in its 2020 proposed rule on CMPs related to information blocking. *See* 85 Fed. Reg. 22979, 22985 (Apr. 24, 2020) ("We appreciate that information blocking is newly regulated conduct...The goal in exercising our enforcement discretion is to provide individuals and entities that are taking necessary steps to comply with the ONC Final Rule with time to do so while putting the industry on notice that penalties will apply to information blocking conduct within a reasonable time.").

²⁰⁹ SSA § 1128A(f) authorizes agencies to "compromise" CMPs imposed on regulated parties.

²¹⁰ SSA § 1128A(d).

- efforts by the manufacturer to obtain clear guidance from CMS and/or another government Agency on a specific issue impacting the manufacturer’s compliance with an applicable Program requirement;
- good faith efforts by the manufacturer to comply with applicable Program submission deadlines (*e.g.*, submission of information pursuant to section 1193(a)(4)), considering reasonable requests by the manufacturer that CMS extend such deadlines in appropriate circumstances; and
- the degree to which a manufacturer could exercise control over, or sought to address the conduct of, a third party on which a manufacturer relied in satisfying an applicable Program requirement.

CMS’ discussion of how it will consider and weigh these factors should provide clear, detailed, and meaningful distinctions in penalty amounts to help manufacturers focus compliance efforts consistent with CMS priorities. In light of ongoing implementation of the Program, which will continue for at least a few years, CMS should construe the foregoing factors liberally in favor of manufacturers and in a manner that would not trigger a CMP. Such an approach is particularly appropriate where a manufacturer has engaged with CMS in good faith and can demonstrate that it has taken reasonable steps to comply with applicable Program requirements.

e. Threshold for Manufacturer CMP Liability

Program CMPs that require a manufacturer to act “knowingly” should apply only if the manufacturer had actual knowledge. Section 1197(c) of the SSA is the only CMP provision that requires a manufacturer to act “knowingly” for liability to attach. Specifically, a manufacturer must knowingly provide false information under certain procedures that apply in connection with the small biotech exception or the biosimilar delay provisions. A manufacturer that knowingly submits such information is subject to a CMP equal to \$100 million for each item of false information.

Separately, in section 100.2 of the Guidance, CMS states that a manufacturer would be out of compliance with the requirement to submit information under section 1193(a)(4) of the SSA and subject to a CMP equal to \$1 million per day of a violation under section 1197(c) if it knowingly submits false information required under the Agreement between the manufacturer and CMS.

CMS should not attempt to impose a CMP on a manufacturer under either of these provisions unless CMS can first demonstrate that the manufacturer had actual knowledge of a violation. Importantly, the term “knowingly” is not defined in Part E of Title XI of the SSA. Nor is the term defined in section 1128A of the SSA, which is incorporated by reference into the Program-related CMPs.²¹¹ In the absence of a legally binding definition of “knowingly,” CMS should interpret this term based on its plain meaning, which requires one to act “[w]ith knowledge; consciously; intelligently.”²¹² The extraordinary amounts of these CMPs further support interpreting “knowingly” in its most natural way to reserve such penalties for only truly knowing conduct. Accordingly, CMS should not seek to impose a CMP under either of these provisions unless CMS can first demonstrate that the manufacturer had actual knowledge of a violation.

VII. Part D Formulary Inclusion of Selected Drugs (Section 110)

In section 110 of the Guidance, CMS notes that “Medicare Part D plans shall include each covered Part D drug that is a selected drug on Part D formularies during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period.” PhRMA agrees with CMS that, per the statute, any drug that is a selected drug, for which the MFP is in effect, must be on all Part D formularies and widely available to beneficiaries in Medicare.

²¹¹ The Program-related CMPs incorporate the definitions and all other procedural aspects of section 1128A. Only the substantive violations described in subsections (a) and (b) are not incorporated.

²¹² Black’s Law Dictionary, Knowingly, <https://thelawdictionary.org/knowingly/> (accessed Mar. 26, 2023).

PhRMA also would like to note our concerns that price setting, layered on top of the significant changes in stakeholder liability from Part D redesign, will have significant impacts on the structure of Part D and could negatively impact patient access to medicines. Indeed, we believe that price setting will put the very nature of Part D's competitive system at risk. Negotiations between plans and manufacturers around formulary and benefit designs are foundational elements of Part D's current market-based system, which has delivered broad access for beneficiaries to a range of plans and treatment options since the program's inception. The Agency must tread carefully in implementing the IRA and setting prices for selected drugs so that these foundational program elements are not completely undermined and beneficiary access to medicines is not lost or hindered.

As described in more detail below, the price setting in the IRA will have impacts far beyond the drugs selected for IPAY 2026, extending to other therapeutic competitors in the class. To that end, ***PhRMA recommends that CMS' process for arriving at a final MFP for selected medicines should seek to minimize effects within therapeutic classes that would result in narrower formularies and fewer choices for patients. CMS should also be mindful and seek to limit the risk of perverse incentives that are more likely to result from MFPs set at levels well below the ceiling price.*** CMS should create sufficient safeguards to ensure that there is diversity across plan formularies to offer beneficiaries plan options that continue to meet their individual therapeutic needs. In practice, this calls for plan formularies that include both selected drugs and medicines that aren't subject to government price controls.

To illustrate these concerns, recent analysis by the Hayden Consulting Group of the impact of the IRA's government price setting provisions on the Part D program show that the market-based competitive conditions that have led to historical access for a broad array of treatments in Part D could be stifled.²¹³ Specifically, Hayden examines illustrative therapeutic classes where there is significant brand-to-brand competition today and evaluates changes in plan liability before and after implementation of the IRA, assuming that at least one competitor in the class is subject to price setting. To limit an increase in liability and mitigate risk, Hayden concludes that plans are likely to impose aggressive utilization management to limit market share for medicines that are not subject to price setting, and/or demand higher rebates for formulary access.²¹⁴ Hayden's analysis assumes that these formulary dynamics occur when the MFP is set at the ceiling price and notes the "magnitude of the MFP discount will be the greatest determinant of competitive dynamics in the market."²¹⁵ To the extent that CMS sets MFPs for selected drugs well below the ceiling these potential formulary dynamics could intensify further.

As the IRA is implemented, Part D's broad choice of medicines must be maintained. CMS' MFP process should have as a key goal expanded access to medicines for Medicare beneficiaries – including coverage, access, and affordability that is as good as or better than what is in place today – rather than more restrictions in coverage. To that end, ***PhRMA recommends that CMS review and update its formulary review standards*** to reflect the significant shift from the competitive environment that has been in place since the Part D program's inception to today, recognizing the IRA's major changes to the Part D benefit as a result of redesign and government price setting for a steadily growing number of medicines over time. ***PhRMA specifically recommends that CMS pay close attention to plans' tiering decisions, cost-sharing levels, patient out-of-pocket exposure, and utilization management protocols for both brand and generic medicines to ensure that plans do not over-emphasize low premiums at the expense of enrollees having high quality benefits that provide affordable access to medicines.***

Given major changes in the Part D program occurring in the coming years, Part D plans are also likely to expand upon current trends towards more formulary tiers and increase the number of medicines subject to maximum

²¹⁴ Hayden Consulting Group. (Nov 10, 2022). Government Price Negotiation & its Anticipated Impact on Contracting Dynamics in Medicare Part D. Available at: <https://www.haydencg.com/post/hcg-white-paper-series-the-inflation-reduction-act-3>.

²¹⁵ Hayden Consulting Group. (Dec 20, 2022). Inflation Reduction Act: Impact of the DNP & Future Dynamics, including Medicare Part B. Available at: <https://www.haydencg.com/post/hcg-white-paper-series-the-inflation-reduction-act-4>.

coinsurance requirements, continuing to stratify their formularies and increasing the number of medicines placed on non-preferred and specialty tiers. According to MedPAC's most recent report to Congress, in 2019 most Part D beneficiaries were enrolled in plans that utilized a five-tier formulary, including a specialty tier for medicines exceeding a certain cost threshold, and the use of coinsurance was widespread.²¹⁶ Additional formulary tiers can result in access burdens for patients, as Part D plan sponsors typically impose up to 33 percent coinsurance for medicines on the specialty tier, and coinsurance for non-preferred tier medicines can be as high as 40 to 50 percent.²¹⁷

Patient out-of-pocket burdens are exacerbated by current practices of Part D plan sponsors to retain the substantial discounts and rebates negotiated with manufacturers, typically using rebate dollars to reduce premiums overall instead of lowering patient cost sharing on rebated medicines. Even if a Part D sponsor or its PBM has negotiated a rebate for a medicine, beneficiary coinsurance is typically based on a medicine's undiscounted list price. A recent analysis found that 92 percent of Part D beneficiaries' out-of-pocket spending is based on the list price rather than the discounted price their insurer gets.²¹⁸ For beneficiaries with coinsurance, failure to pass through rebates at the point-of-sale could manifest in disproportionately high out-of-pocket costs for non-selected drugs. This is because while selected drugs will have their coinsurance calculated as a percentage of the MFP price, coinsurance for competing non-selected drugs will continue to be based on the undiscounted price of the drug, even in cases when the manufacturer provides a substantial rebate. To address the out-of-pocket challenges caused by plans' and PBMs' failure to pass rebates directly to patients at the point-of-sale, ***PhRMA recommends that CMS redefine Part D negotiated price to take into account all manufacturer price concessions.***

PhRMA also recommends that CMS update its plan evaluation and oversight procedures and rigorously exercise its responsibility to enforce statutory non-discrimination requirements in Part D. Specifically, PhRMA urges CMS to conduct diligent formulary oversight to guard against increasingly aggressive utilization management restrictions or the narrowing of patient treatment options, including exclusion of medicines. In particular, CMS should increase transparency of the Agency's formulary review processes, reporting on CMS' oversight and outcomes of the formulary reviews outlined in the Part D Benefits Manual.²¹⁹ Since Part D's origination, plans have increasingly restricted access to medicines in Part D through tighter formularies, limiting the number of medicines covered for beneficiaries. Additionally, insurers use utilization management as a strategy to reduce their spending on covered medicines, which can have a negative impact on patient access. These insurance tactics, including prior authorization and fail first (also known as step therapy), may prevent or delay patients from accessing the medicines prescribed by their physicians. A recent report from GoodRx found that the average number of medicines covered by Part D that are subject to utilization management

²¹⁸ PhRMA. (March 2021) "Trends in Out-of-Pocket Spending for Brand Medicines in Medicare Part D." Available at: https://www.phrma.org/-/media/Project/PhRMA/PhRMA-Org/PhRMA-Org/PDF/S-U/Trends-in-Out-of-Pocket-Spending-for-Brand-Medicines-in-Medicare-Part-D_FINAL-Update-May-21.pdf.

²¹⁹ Section 30.2.7 (Formulary Performance and Content Review) of the Part D benefits manual, outlines CMS' key formulary review concepts which include: review of tier placement to ensure the formulary doesn't discourage enrollment of certain beneficiaries, determining whether appropriate access is afforded to drugs or drug classes addressed in widely accepted treatment guidelines, availability of the most commonly prescribed drug classes for the Medicare population, and review of UM restrictions to ensure that use of these tools are consistent with industry best practices and identification of outliers. CMS should more clearly define these standards such as what it means for a formulary to provide "appropriate access" and for UM restrictions to be "consistent with industry best practices" or "outliers." Additionally, CMS should issue an annual report providing aggregate data on the analyses it conducted, the results of those analyses, and changes to formularies and UM required by its analyses. Reporting should be sufficiently specific to allow stakeholders and researchers to assess the impact of CMS' formulary review on formulary design and patient access to medicines. Transparency into the findings of these formulary reviews are critical to understanding patient safeguards to access. Available at: <https://www.cms.gov/medicare/prescription-drug-coverage/prescriptiondrugcovcontra/downloads/part-d-benefits-manual-chapter-6.pdf>.

restrictions increased from 27 percent in 2010 to 47 percent in 2021.²²⁰ This confirms previous research published by MedPAC that found Medicare beneficiaries now face access barriers for nearly half of all medicines covered in Part D.²²¹

Further, changing incentives from the IRA could result in plans choosing to cover medicines very differently; they may impose tighter formularies or stricter utilization management than they have historically, jeopardizing beneficiary access, particularly for conditions where broad formulary access is critical. We note that therapeutically alternative medicines in a given class may not be appropriate for some patients who may need a particular medicine. For example, rheumatoid arthritis patients are more likely to fail on multiple medicines before having a positive clinical response to a given product. If plans narrow access to certain medicines due to dynamics introduced by government price setting, patients who are stable on a given medication may lose access and be forced to switch to an alternative medicines that is not optimal for their unique circumstances, which could result in adverse health outcomes.^{222,223} With changing formulary dynamics caused by government price setting, PhRMA is concerned that formulary restrictions are likely to increase, resulting in significant risk to patients needing innovative medicines to treat difficult to treat conditions such as cancer and autoimmune conditions. Numerous studies have found that switching stable patients to a new medicine for non-clinical reasons leads to poor side effects and increased nonadherence and is often associated with negative health outcomes.²²⁴ Given the potential for significant disruption as a result of the government price setting layered on top of Part D redesign, ***PhRMA recommends that CMS, through rulemaking, create safeguards that limit plan actions to disrupt patients who are stable on therapeutic regimens, including both selected drugs and their competitors.***

PhRMA urges CMS to maintain and protect the current Part D coverage standards for medicines. Part D requires plan formularies to include at least two drugs per class and all or substantially all of the drugs within the six protected classes of concern. We note that at least two drugs per class is a minimum standard which Part D plans can choose to exceed. Part D also requires plans to cover all or substantially all drugs in the six protected classes: immunosuppressants, antidepressants, antipsychotics, anticonvulsants, antiretrovirals, and antineoplastics. PhRMA has long maintained that these formulary protection standards are important to protect Medicare beneficiaries, many of whom have multiple chronic conditions with several medications that could contraindicate each other and who need access to a wider variety of medication options. According to a 2022 analysis by the CBO, per enrollee use of prescription medicines increased in Medicare Part D from an average of 48 prescriptions per year in 2009 to 54 in 2018,²²⁵ a trend that will likely continue. Even without the substantial changes to the Part D program that are going to occur, in many cases, the vulnerable populations covered in Medicare and their health care providers need to have access to a broad range of medications, beyond just two drugs per class.

PhRMA recommends that CMS continue to enforce existing formulary requirements and important non-discrimination controls that ensure patient access to medicines. In the rapidly changing post-IRA environment, it is critical that CMS maintain and strengthen existing Part D beneficiary protections to ensure robust access to medicines. To protect patient access to affordable prescription medicines in Medicare Part D, CMS will need to

aggressively oversee Part D plan behavior when it comes to bidding, most notably around benefit designs that attempt to manipulate the Part D patient protections to hide discriminatory practices.

Further, CMS must not lose sight of the importance of strong beneficiary protections and appeals in the midst of so many fundamental changes to Part D. To that end ***PhRMA encourages CMS to re-examine and update rules around coverage determinations, appeals, and tiering exceptions*** to allow beneficiaries to appeal for lower cost sharing or exceptions for clinical reasons, to require clear language in Part D plan materials/websites that explains the exceptions process, and to allow medicines on the specialty tier to be subject to the tiering exceptions process. We also call on the Agency to enhance transparency and public reporting of these beneficiary protections and appeals outcomes.

Finally, in addition to rigorously maintaining and overseeing the existing Part D beneficiary protections, CMS should take additional steps to ensure meaningful choice of plans for beneficiaries. PhRMA is concerned that as the government drug “negotiation” program continues its annual process of selecting and setting prices for an increasing number of drugs, these dynamics could result in the rapid standardization of Part D plan formulary designs. Plans will be required to include all selected drugs on formularies and, in time, could also respond with severe access limitations on all competing non-selected drugs. This could lead to fewer meaningfully different options for beneficiaries to choose from when evaluating and selecting a Part D plan that will provide affordable access to their medications. It is imperative that CMS guard against these potential unintended consequences.

VIII. Conclusion

PhRMA appreciates your consideration of these comments. Please feel free to contact Jenny Bryant at jbryant@phrma.org or James Stansel at jstansel@phrma.org if there is any further information we can provide or if you have any questions about our comments.

Exhibit A – Minimum Part D Data Fields Required for Verification of MFP-eligible Patients

In order to verify patient eligibility for the MFP and the calculation of MFP discount amounts owed by the manufacturer, at a minimum, CMS should ensure that manufacturers have access to the following minimum data fields on a detailed claims-level basis. Furthermore, CMS should also ensure manufacturers choosing to sell to pharmacies at a net price no higher than the MFP also have access to these data fields to improve program integrity. The majority of these data fields are already available through the PDE record, reducing the burden of sharing these fields with manufacturers.

Data Item	PDE Field Name (if Applicable)
Date of Service (i.e. date filled)*	Date of Service
Prescription ID Number*	Prescription Service Reference Number
Part D Contract ID and Part D Plan Benefit Package ID	Plan Contract ID and Plan Benefit Package ID
De-identified Part D Beneficiary ID	Medicare Beneficiary Identifier
Prescriber National Provider Identifier (NPI)	Prescriber ID
Pharmacy NPI*	Service Provider ID
National Drug Code (NDC)*	Product Service ID
Days Supply*	Days Supply
Quantity Dispensed*	Quantity Dispensed
Fill Number*	Fill Number
Paid Date (date the Part D plan paid the pharmacy)	Paid Date
Claim Status (whether the claim was paid or reversed)	
340B and non-340B Indicators (if adopted by CMS)	
340B Clearinghouse Determination (if adopted by CMS)	
340B Ceiling Price (received from Clearinghouse)	
Maximum Fair Price (MFP)	
Pharmacy Acquisition Cost**	
MFP Discount (Acquisition Cost less the MFP)**	

* These fields are already provided to manufacturers as part of the detailed data reports under the CGDP.

** This should be read consistent with PhRMA’s position outlined in section I(f) of this comment letter that CMS should use an alternative metric such as WAC instead of acquisition cost.

Exhibit B – Example of Non-Disclosure Agreement

Attachment 5 Non-Disclosure Agreement

CONTRACTOR EMPLOYEE COMMITMENT TO PROTECT NON-PUBLIC INFORMATION NON-DISCLOSURE AGREEMENT FOR HEALTH AND HUMAN SERVICES/ASPR

I, _____ hereby consent to the terms in this Agreement in consideration of my being granted confidential access to certain United States Government documents or materials containing sensitive but unclassified information.

Access to non-public information may be required in the performance of my official duties, while working under the following contract or sub-contract with the Department of Health and Human Services (HHS), Assistant Secretary for Preparedness and Response (ASPR):

Contract Number _____ between _____ and my employer _____.

To carry out the duties and functions of the United States (U.S), certain information may be disclosed to Contractors that are authorized representatives of the U.S. for the purposes of the disclosure and this Contractor Non-Disclosure Agreement. Such disclosure shall be considered authorized and not a disclosure to the public or outside the Government.

Should I have access to non-public information, I agree that I shall not release, divulge, publish, or disclose such information to unauthorized persons. I shall protect such information and will employ all reasonable efforts to maintain the confidentiality of such information. These efforts shall be no less than the degree of care employed by HHS to preserve and safeguard sensitive information. I will not disclose proprietary information designated "For Official Government Use Only" which has been received in connection with the Health and Human Services Professional Scientific Services contract, except on a need-to-know basis as instructed by the client. Prior to any disclosure to any other Government personnel or any other support contractor personnel, I will verify with the Contracting Officer/Contracting Officer Representative that the individual has signed a non-disclosure agreement with the Contracting Officer/Contracting Officer Representative substantially the same as this agreement. I understand that my obligation not to disclose information applies to information, which I have already received and to information I will receive in the future.

I acknowledge that the unauthorized disclosure of non-public information would violate this agreement; may additionally violate federal law, regulations or policy; and could form the basis for legal action against me or against my employer. I further acknowledge that unauthorized disclosure of said information may compromise the security of the HHS and violate the terms of the aforementioned contract with the United States Government.

I further certify that there are laws and regulations which provide for criminal and/or civil penalties for improper disclosure, including but not limited to:

Re: Medicare Drug Price Negotiation Program Initial Guidance

Dear Dr. Seshamani:

The Plasma Protein Therapeutics Association (PPTA) is pleased to have this opportunity to comment on the initial guidance on the Medicare Drug Price Negotiation Program (Initial Guidance) issued by the Centers for Medicare & Medicaid Services (CMS).¹ PPTA is the standard setting and global advocacy organization that represents plasma donation centers and manufacturers of plasma protein therapies. Our U.S. membership includes ADMA, Grifols, Kedrion SpA, and Takeda. PPTA strives to ensure that Medicare beneficiaries continue to have appropriate access to life-saving plasma protein therapies. We are pleased to see CMS continues to recognize the unique nature of plasma and is implementing the IRA statutes in a manner consistent with historical recognition of the fragile plasma-based therapy ecosystem. We believe this minimizes and limits disruption to this ecosystem which is critical to ensuring patients retain access to necessary therapies.

BACKGROUND

Plasma protein therapies are made from human plasma² donated by healthy individuals or by using recombinant technology.³ It is essential that plasma protein therapies have adequate reimbursement due to their unique nature. Manufacturers of plasma-derived therapies depend upon donated plasma from healthy, committed

¹ The initial guidance is available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

² Human plasma is the clear liquid portion of blood that remains after the red blood cells, leukocytes, and platelets are removed. Due to its human origin, complexity, and richness in therapeutically useful proteins, human plasma is a unique biological material. See Thierry Burnouf, *Plasma Proteins: Unique Biopharmaceuticals – Unique Economics*, in 7 PHARMACEUTICALS POLICY AND LAW, BLOOD, PLASMA AND PLASMA PROTEINS: A UNIQUE CONTRIBUTION TO MODERN HEALTHCARE 209 (2005, 2006).

³ Recombinant therapies are only available for clotting factors and C1 esterase inhibitors; plasma-derived therapies are the only life-saving treatment for most plasma protein deficiencies.

individuals as the raw material for therapeutic production. The process for collecting donated plasma is highly regulated, resource-intensive, and time-consuming, with a production process spanning seven to ten months. Individual proteins within plasma are isolated for therapeutic use through distinct fractionation processes. The result is plasma protein therapies that are sole source biologicals that produce different therapeutic outcomes depending on the patient.

Many patients struggle to access providers who have sufficient expertise to treat their conditions, and patients may experience challenges in accessing treatment both geographically and at the appropriate site of care. An analysis of access issues by the Department of Health and Human Services (HHS) Office of the Assistant Secretary for Planning & Evaluation⁴ found that previous changes in Medicare reimbursement policy resulted in access challenges, treatment delays, and shifts in site of service for individuals who use plasma protein therapies. Another study⁵ and a data analysis reached a similar conclusion.⁶ The risks to patient health outcomes underscore the need for a reimbursement framework that ensures access to all therapies.

DISCUSSION

Under the Initial Guidance, CMS will exclude plasma-derived products when identifying qualifying single source drugs as described in section 30.1.3 of this memorandum. Under the Initial Guidance, a plasma-derived product is a licensed biological product that is derived from human whole blood or plasma, as indicated on the approved product labeling, with CMS referring to certain FDA websites to determine if a product is subject to the exclusion. Consistent with section 30.1.3, all plasma protein therapies are rightfully subject to the exclusion. This result is an essential one to ensure continued patient access to these critical therapies, for reasons detailed below, and thus we commend CMS for the exclusion of plasma protein therapies from the Medicare Drug Price Negotiation Program.

Plasma protein therapies, as a class, have a longstanding history of special recognition by federal policymakers in acknowledgement of the non-interchangeability, complex sourcing and production process for plasma medicines. These biological products treat patients who predominantly have rare diseases, and most are orphan drugs. The starting material for plasma derived medicines is human plasma collected from

donors. The amount of source plasma needed to manufacture enough product to treat only one patient annually can exceed 1,300 donations for certain therapies. Furthermore, these products take 7 to 12 months from the time of plasma donation to the delivery of treatment to a patient.

Since 2019, CMS and FDA have had continuing concerns over availability and access to these life-saving therapies and maintaining sufficient collections of plasma. Plasma protein therapies are often subject to various external influences that can affect plasma donation and collection. Plasma protein therapies are, by nature, intrinsically fragile and difficult to fractionate into medicine. The starting material collection process for all plasma protein therapies is influenced greatly by donor concerns like pandemics and man-made problems such as an international border crossing ban. Due to this unique starting material and production process, the cost structure for plasma therapies is significantly different than small molecule pharmaceuticals. For plasma products, the raw materials and manufacturing costs make up 57% of overall costs, compared to 14% for small molecule drugs. During the pandemic and border crossing issues the ingredient costs for plasma derived medicines increased significantly. This variable and very divergent cost structure means that drug price negotiation models are not well suited to this class of products.

Federal policymakers have previously recognized this by exempting this class of therapies from certain Medicare policy proposals, including:

- In 2020, In the Most Favored Nation interim final rule, CMS exempted IVIG from the model based on potential supply impacts⁷;
- In 2005, CMS attempted to implement a third-party vendor model for Medicare Part B drugs, but exempted plasma products because of the importance of maintaining patient access to all products⁸; and
- In 2006, in response to concerns about access to IVIG after implementation of the Medicare Modernization Act, CMS established a temporary pre-administration service payment to compensate providers for services required to locate and acquire adequate product.⁹

The Initial Guidance properly continues the recognition of the importance of plasma protein therapies for hundreds of thousands of patients and the unique nature of the plasma protein therapy industry by excluding these products from the Medicare Drug Price Negotiation Program.

CONCLUSION

We are grateful for this opportunity to offer comments to CMS on the Initial Guidance, focusing specifically on the exclusion of plasma-derived products when identifying qualifying single source drugs. CMS has correctly included plasma protein therapies within this exclusion and that should continue to be the case throughout CMS's

RE: Comments on CMS' Medicare Drug Price Negotiation Program Initial Guidance

We are members of the Program On Regulation, Therapeutics, And Law (PORTAL) at Brigham and Women's Hospital and Harvard Medical School. PORTAL is one of the largest, non-pharmaceutical industry-funded academic research centers in the US devoted to investigating drug prescribing, outcomes, and policy. We applaud CMS' initial guidance on the implementation of Medicare price negotiation under the Inflation Reduction Act of 2022. Effective implementation of this policy is vital to ensure that Medicare beneficiaries and taxpayers benefit from fair drug prices. We recently published a study simulating the impact of price negotiation from 2018-2020 and found that, in just the first 3 years of drug price negotiation, Medicare could lower prescription drug spending by 5% by accepting the statutory ceiling price in the law, and even more if negotiations lead to lower prices.¹

In this submission, we provide some specific comments aimed at sharpening and clarifying key pieces of the framework for drug price negotiation. Overall, we are supportive of the approach outlined by CMS. The issues raised here are meant to provide constructive feedback to help strengthen the guidance, minimize the likelihood that brand-name manufacturers avoid fair negotiations, and anticipate effects on the pharmaceutical supply chain.

30.1 Identification of Qualifying Single Source Part D Drugs for Initial Price Applicability Year 2026

CMS plans to treat fixed-dose combinations separately from drugs that contain the same active ingredients / active moieties. While this may be sensible in some cases, it creates an opportunity for drugmakers to avoid negotiation by splitting the market between drugs with a fixed-dose combination alternative. For example, antiretrovirals to treat human immunodeficiency virus (HIV) are frequently marketed as fixed-dose combinations; if drugmakers could co-formulate new molecular entities with a variety of older ones, they could maintain lower Medicare spending on each product to delay being selected for negotiation or, in some cases, prohibit selection by keeping products below the \$200 million Medicare spending threshold necessary to be selected. CMS should instead consider aggregating sales for fixed-dose combinations with other dosage forms containing the newest active ingredient if the products are made by the same company.

By contrast, under the current guidelines, CMS plans to aggregate the sales of active ingredients with different indications and/or routes of delivery, which may be problematic. For example, fluticasone propionate is approved as a nasal spray to treat nonallergic rhinitis (Flonase, NDA 020121) and as an orally inhaled powder to treat asthma (Flovent, NDA 020833). Both products are made by GlaxoSmithKline. Flonase has marketed generic versions that would preclude it from being selected for negotiation, but Flovent does not yet have generic competition. As a result, aggregating sales for these two different products would preclude CMS from negotiating prices for Flovent, which had gross Medicare spending of nearly half a billion dollars in 2021. One potential solution is for CMS to manually review products with different routes of administration before they are aggregated, and to only aggregate such products if the labeled indication(s) are similar.

The guidance also states that bona fide generic or biosimilar competition for “*any strength or dosage form of a potential qualifying single source drug*” would disqualify a drug from being considered for negotiation. This poses a problem, because drug companies frequently engage in product hopping from one formulation to another, actively moving patients to the newer version that often has longer patent protection. If generic or biosimilar competition for the drug’s earliest version precludes negotiation, the newer version of the product should still be eligible for negotiation. We recommend that CMS determine if a given drug would be eligible for negotiation if the strength or dosage forms with generic competition were excluded. For example, if a brand-name drug comes in 2 different formulations and has generic competition for only 1 of these formulations, then the other formulation should still be eligible for price negotiation if its annual gross Medicare spending is above the \$200 million threshold and if the drug has no other reasons for exclusion.

30.1.1 Orphan Drug Exclusion from Qualifying Single Source Drugs

We have concerns about this exclusion. First, we do not see a good reason why drugs treating rare diseases that earn more than \$200 million in Medicare sales should be excluded from negotiation. The fact that drugs qualify based on Medicare sales is a marker that they are commercially successful. It costs less for drug companies to develop orphan-designated drugs than drugs that treat common conditions.²

Second, this exclusion, as implemented, could have unintended consequences for the repurposing of rare disease drugs to treat other rare diseases. For example, pomalidomide (Pomalyst) was initially approved by the FDA in 2013 to treat multiple myeloma, a condition for which the drug was granted an orphan designation in 2003. In 2018, the drug was granted a second orphan designation for the treatment of Kaposi sarcoma, and the

² Wouters OJ, McKee M, Luyten J. Estimated Research and Development Investment Needed to Bring a New Medicine to Market, 2009-2018. *JAMA*. 2020; 323(9):844-853. doi:[10.1001/jama.2020.1166](https://doi.org/10.1001/jama.2020.1166).

drug's label was expanded to include the treatment of AIDS-related Kaposi sarcoma in 2020. Had this second indication not been added to the drug's label, the drug might have qualified for the orphan drug exclusion. This creates a perverse incentive, in which a maker of a commercially successful rare disease drug may choose not to study the drug's effectiveness and safety for other indications.

While CMS cannot remove the sole-orphan exemption from the IRA, there is an important issue that CMS should address in guidance. To be eligible for this exclusion, the guidance specifies that drugs must *“be designated as a drug for only one rare disease or condition under section 526 of the FD&C Act.”* Drug companies frequently seek orphan designations several years before these conditions may be added to the drug's labeling. In cases where a drug is currently approved for a single orphan-designated disease but has one or more additional orphan designations that are not yet FDA-approved, drugmakers may seek to withdraw the designated indication if doing so would allow them to qualify for the orphan drug exclusion. We would suggest that CMS clarify how such withdrawn designations will be handled regarding this exclusion. We recommend that such withdrawals should not exempt manufacturers from drug price negotiation.

30.1.3 Plasma-Derived Product Exclusion from Qualifying Single Source Drugs

We also have concerns about the exclusion of plasma-derived products. First, we do not see a good reason why otherwise eligible plasma-derived products should be excluded from negotiation: there were at least 5 such products with Medicare spending over \$200 million in 2021, all of which are immunoglobulins. Rather, the fact that prices remain high despite the availability of multiple therapeutically similar immunoglobulin products suggests that this is a product class that could benefit from Medicare price negotiation. Further, highly expensive plasma-derived products such as factor replacement therapy pose major affordability and access problems for many patients.

We recognize that CMS cannot amend the IRA to include plasma-derived products. However, we believe that CMS could better clarify which products will be considered plasma-derived. The statute defines a plasma-derived product as “a biological product that is derived from human whole blood or plasma.” CMS should clarify whether, for example, cellular and gene therapies that may be derived using apheresis from a patient's blood would therefore be entirely excluded from negotiation. We do not believe that such products should be excluded and would recommend that CMS explicitly identify such products in its final guidance as eligible for drug price negotiation.

The initial CMS guidance states that CMS will identify plasma-derived products from the following FDA website: <https://www.fda.gov/vaccines-blood-biologics/blood-blood-products/approved-blood-products>. This page includes a list of fractionated plasma products but also includes a list of all biologic products regulated by the FDA Center for Biologics Evaluation and Research, which includes a wide range of products, not all of which are likely to meet the definition of plasma-derived products. We recommend that CMS clarify the definition so that only fractionated plasma products (and not those listed on the “Licensed Biological Products with Supporting Documents” page) will be excluded from negotiation. These products are listed here: <https://www.fda.gov/vaccines-blood-biologics/approved-blood-products/fractionated-plasma-products>.

40.2.1 Confidentiality of Proprietary Information

“CMS is seeking comment about the proper balance between the public's interests in transparency and the protection of business information in this context.”

We urge CMS to be very selective about which data elements it treats as confidential proprietary information. The status quo is that prescription drug prices are shrouded in secrecy; there have been several efforts in recent years to make prices more transparent for consumers, including via state transparency laws.^{3,4} Drug manufacturers, insurers, and pharmacy benefit managers have all fought to maintain the secrecy of discounts and prices through the supply chain. However, the resulting information asymmetry harms patients who are partially or fully exposed to the full pre-discount price based on their health insurance status or benefit design. It also impedes manufacturer competition and limits accountability on whether rebates are being translated into savings for insurers and patients. Transparency is a core element of competitive markets.

While CMS may have reasons to treat some data elements as proprietary during this first round of negotiation, we recommend that the guidance clarify that CMS reserves the right to re-classify elements as non-proprietary in subsequent years. For example, while individual net prices negotiated between the manufacturer and each Part D plan may be confidential, the weighted average net price across all Part D plans may not be subject to the same restraints. Average net prices for selected drugs have been published in staff reports released as part of an investigation by the US House Committee on Oversight and Accountability.⁵ Similar arguments could be used to improve transparency of Medicaid best prices, 340B discounts, and federal supply schedule and Big 4 prices.

In addition, given substantial public interest, we would recommend that CMS include as many details as possible about the negotiation process that helps patients understand how CMS arrived at the maximum fair price, including data used to derive the initial offer, the amount of the initial offer, amount of the manufacturer's counteroffer, and any new information that informed a change between the initial offer and the final MFP.

50.2 Evidence about Therapeutic Alternatives for the Selected Drug

“CMS is soliciting comment on other metrics, in addition to QALYs, that may treat extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill and that CMS should also exclude from consideration when developing offers and reviewing counteroffers.”

We believe that CMS should consider both life extension and improved quality of life when measuring the comparative effectiveness of a selected drug and therapeutic alternatives. In many cases, drugs do not extend life, such as symptomatic treatments for arthritis. In these cases, the use of QALYs or other measures that assess quality of life is non-discriminatory. In cases where drugs do extend life, CMS should consider alternative measures that incorporate quality of life but treat extended life equally for all individuals. One example of such a measure is the equal value life year gained (evLYG). The use of such measures would be helpful for CMS in determining a maximum fair price, and we believe they align with the statutory requirements.

60.1 Establishment of a Single Proposed MFP for Negotiation Purposes

The choice by CMS to negotiate prices for a 30-day equivalent supply rather than per unit is sensible for many drugs used to treat chronic conditions. However, in some cases, 30 days may not be the optimal time frame by which to evaluate drugs. For example, some drugs are administered once (e.g., a 1-time gene therapy) or used for a short, fixed period to treat an acute condition (e.g., an antibiotic or antiviral). For this reason, CMS may wish to allow for flexibility in selecting an alternative supply of the drug if it is not used chronically.

This same concern applies when comparing the price of the selected drug to the prices of therapeutic alternatives. If the therapeutic alternatives have a different dosing schedule than the selected drug, comparing prices per 30-day supply may not be sensible. For example, denosumab is an injection given every 6 months for treating osteoporosis; therapeutic alternatives may include oral bisphosphonates (often dosed once a week) and injected bisphosphonates (dosed once a year). Comparing prices per 30-day supply, in this case, may not adequately capture variations in the price of treatment, and CMS should consider using the annual cost of treatment instead.

60.3.2 Developing a Starting Point for the Initial Offer

“If there are multiple therapeutic alternatives, CMS intends to consider the range of net prices and/or ASPs as well as the utilization of each therapeutic alternative to determine the starting point within that range.”

For selected drugs with multiple therapeutic alternatives, we would recommend that the lowest net price for a therapeutic alternative serve as the starting point for the initial offer. Such an approach would ensure that any amount that CMS pays in excess of the lowest-cost alternative is justified by the drug’s comparative safety and effectiveness.

“If the selected drug has no therapeutic alternative, if the price of the therapeutic alternatives identified is above the statutory ceiling for the MFP (described in section 60.2 of this memorandum), or if there is a single therapeutic alternative with a price above the statutory ceiling, then CMS intends to determine the starting point for the initial offer based on the Federal Supply Schedule (FSS) or “Big Four Agency” price (“Big Four price”).”

In case when a selected drug has no pharmacologic therapeutic alternatives, we would recommend CMS consider using prices negotiated by other countries as a starting point for the initial offer, especially if foreign prices are lower than the FSS or Big Four price. Nearly every other large, industrialized country has a process for evaluating evidence and negotiating prices when drugs are first approved. CMS should leverage these existing assessments to determine a maximum fair price.

60.6.1 Explanation for the MFP

“Section 1195(a)(2) of the Act requires CMS to publish an explanation for the MFP no later than March 1 of the year prior to the initial price applicability year, which will be March 1, 2025 for initial price applicability year 2026.”

We would encourage CMS to publish the explanations for the published MFPs before the statutory deadline, ideally alongside the published MFPs, which must be published by September 1, 2024, for the first 10 negotiated drugs. Transparency around these explanations will provide essential information for a variety of

stakeholders, including state governments and private payers that may wish to use this information as part of their own drug price negotiation processes.

90.4 Monitoring for Bona Fide Marketing of Generic or Biosimilar Products

“CMS is seeking comment on the most effective ways to monitor whether robust and meaningful competition exists in the market after a selected drug ceases to be a selected drug.”

The CMS guidance states that drugs will be excluded from negotiation once they have bona fide generic or biosimilar competition. CMS has identified several tools that it may use to monitor for bona fide competition, including assessing whether the generic drug or biosimilar is consistently available for purchase by wholesalers and whether patients can access generic and biosimilar versions in pharmacies and clinics. CMS also plans to analyze the share of generic or biosimilar uptake based on Medicare claims data. We think that each of these approaches is important, though determining the minimum thresholds required for bona fide generic competition will be challenging.

One type of generic or biosimilar competition that, in our opinion, should not count as bona fide competition, regardless of market share, is entry based on “limited-supply agreements.” These agreements occur when a brand-name manufacturer agrees to allow for generic or biosimilar competition (usually in exchange for dropping litigation) and the generic or biosimilar firms agree to release their products in a limited fashion according to agreed-upon terms. Brand-name manufacturers may have a strong financial incentive to avoid Medicare negotiation, and a possible strategy to do so may be via limited-supply agreements with generic or biosimilar firms. For example, a brand-name company may allow a generic firm to obtain 20% market share in the US (leaving 80% for the brand-name firm) for a period so that its drug is excluded from Medicare negotiation during that time.

While the nature of legal settlements between brand-name and generic firms is often shrouded in secrecy, we know that limited-supply agreements already occur in the pharmaceutical industry. In our review of Hatch-Waxman patent challenges from 2003 to 2022 (also known as “paragraph IV certifications”), for example, we uncovered limited-supply agreements for at least 4 high-cost brand-name products: Lamictal⁶ (lamotrigine), Solodyn⁷ (minocycline), ProAir HFA^{8,9} (albuterol), and Revlimid^{10,11} (lenalidomide). In the case of ProAir HFA, the brand-name firm Teva agreed to settle litigation with Perrigo in June 2014 and allow the limited release of generic albuterol inhalers from December 2016 to June 2018, at which point limits would no longer apply. In this case, Perrigo’s generic product did not end up receiving FDA approval until 2020. Bristol Myers Squibb entered into agreements with at least two generic firms (Dr. Reddy and Sun Pharma) to allow limited-

supply sales for generic lenalidomide beginning in 2026. Such agreements may be more pervasive than is publicly known. Generic entry according to limited-supply agreements should not, in our view, count as bona fide generic competition. Rather, IRA negotiation should include brand-name drugs and biologics with limited-supply agreements so long as these drugs and biologics would otherwise qualify.

Baltimore, Maryland 21244-1850

Re: Medicare Drug Price Negotiation Program Initial Guidance

Submitted electronically via IRAREbateandNegotiation@cms.hhs.gov

Dear Deputy Administrator Seshamani,

Pursuant to the Centers March 15, 2023, memo addressed to interested parties on the subject of Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments, the LGBTQIA+ Primary Care Alliance (Primary Care Alliance or PCA) submits these comments. The Primary Care Alliance supports the balance of the Centers for Medicare and Medicaid Services (CMS) implementation plan, however, as interested party with a complex relationship to the price of pharmaceutical products, the PCA submits the following comments and recommendations to safeguard the nation's safety net clinics and primary care providers to underserved populations.

Interest and Expertise of the Primary Care Alliance

The Primary Care Alliance includes FQHCs, State Primary Care Associations, community health centers, and other health care organizations and providers throughout the nation, who promote best practices for providing culturally responsive and compassionate health care and related services for persons identifying as lesbian, gay, bisexual, transgender, and gender diverse, queer, intersex, and/or asexual or on the ace spectrum (LGBTQIA+). The Alliance members joining in these comments collectively serve several hundred thousand individuals and families every year, in the Northeast, Mid-Atlantic, Midwest, South, and West. Our members also advocate for federal, state, and local laws and public policies that advance the health and well-being of sexual and gender diverse people, with particular emphasis on persons of color, immigrants, people

with disabilities and chronic illnesses, low-income individuals and families, transgender and gender diverse persons, sex workers, drug users, and other particularly marginalized communities.

Comments of the LGBTQIA+ Primary Care Alliance

CMS SHOULD ENSURE THAT DRUG PRICE NEGOTIATIONS DO NOT UNDERMINE RESOURCES FOR SAFETY NET CLINICS TO PERFORM OUR ESSENTIAL FUNCTIONS

It is our primary concern that we communicate to CMS that actions taken to address the high cost of drugs do not inadvertently decimate the safety net providers that are the cornerstone of the cross-government approach to address health equities for underserved communities of people, including LGBTQ+ people, people living with or at risk for HIV, and Black, Latine, and Asian American and Native American people. As community health centers dedicated to addressing the health and wellbeing of underserved populations, many members of the PCA are participants in the 340B program. The 340B program creates a complex relationship between our health centers and the high price of drugs by funding many of the wrap around services that our most vulnerable patients rely on to access life-saving care. Patient navigation, adherence, retention, and outreach services are all routinely paid for using 340B program revenue. While we support drug price negotiations, CMS should take due care that drug price negotiations do not weaken the health care safety net.

CMS can do so through a number of mechanisms to strengthen the drug price negotiation plan:

1. The Secretary should have the authority to adjust the drug price negotiation plan to ensure the continued vitality of the safety net of community health care centers, federally qualified health centers and look-alikes, and Ryan White program clinics.
2. As Congress has decided that CMS is not allowed to negotiate on drugs for a single rare disease, CMS should encourage more research into medications to treat rare diseases, so that the list of drugs that Medicare can negotiate on can expand.
3. CMS should ensure that randomized controlled trials are not the only types of evidence that are considered in establishing effectiveness of medications and deciding which medications to prioritize for lower prices and therefore greater access (beyond the legally mandated requirements about cost thresholds). Where clinical equipoise does not exist,

evidence from a variety of research designs, including pragmatic trials and non-RCT designs, should be given appropriate weight.

4. While the 6 protected classes of drugs (antidepressants, antipsychotics, anticonvulsants, immunosuppressants, antiretrovirals, and antineoplastics) that Part D has to cover will depress CMS's bargaining power with the manufacturers, weakening the protected classes—as CMMI proposed to do in early 2021—is unacceptable. The protected classes of drugs are essential to protect the health and wellbeing of our patients.
5. CMS should institute robust enforcement mechanisms for manufacturers that attempt to evade or violate the negotiated prices. Spot checks are insufficient and routine. systematic enforcement mechanisms are essential.

Conclusion

The LGBTQIA+ Primary Care Alliance appreciates this opportunity to furnish information to CMS regarding the implementation of the drug price negotiation initial guidance. We continue to appreciate CMS' partnership with our members in advancing the health and wellbeing of the American people. For more information about any subjects mentioned here, please contact Benjamin Brooks, (bbrooks@whitman-walker.org).

Joint Comments Regarding Medicare Drug Price Negotiation Guidance

Dear Dr. Seshamani,

Thank you for the opportunity to provide stakeholder feedback as CMS works to enact the new drug price negotiation and inflationary rebate systems established through the Inflation Reduction Act.

Our groups, representing patients, consumers, health care providers and public health experts are committed to ensuring access to affordable medicines and eager to support successful implementation of the law. Many of us have invested years working towards passing laws including these policies, and appreciate that CMS is committed to implementing the objectives of lowering prescription drug prices and reducing costs for millions of older adults and people with disabilities.

We are filing these comments today to register our serious concerns with CMS' proposed approach for developing its negotiated price offer starting point. We strongly urge CMS not to move forward with this approach and to consider other proposed options.¹

Section 60.3 outlines the proposed methodology from CMS for developing an initial price offer in drug price negotiations. CMS proposes in section 60.3.2 to take as a starting point for developing its initial negotiated price offer the average prices available for therapeutic alternatives for the selected drug.

Below, we articulate two major concerns with this approach.

1. Starting with the prices of therapeutic alternatives will lead to ongoing inappropriately high prices.

Evidence shows that drug prices paid under Medicare Part D are significantly higher than those paid under other health programs in the United States, including Medicaid and the Department of Veterans Affairs, as well as those paid in other wealthy countries.^{2,3,4}

¹ Some of the undersigned groups have proposed to use health technology assessments to arrive at a starting point for determining initial price offers in negotiations, while others propose to take a holistic approach to the factors provided in Section 1194(e) of the Act to determine a price based on the cost of innovation and promoting therapeutic advancements. These proposals are clarified further in individual comments provided to CMS from Families USA, Public Citizen, and others.

⁴ Government Accountability Office, *Prescription Drugs: U.S. Prices for Selected Brand Drugs Were Higher on Average than Prices in Australia, Canada, and France*, GAO-21-282, April 28, 2021.

Current inappropriately high prices, which burden Medicare beneficiaries and taxpayers, are the underlying reason that Congress passed and President Biden signed a law to empower Medicare to negotiate in the first place.

These prices are set by drug corporations under monopoly conditions to maximize profits, while plans face broad coverage obligations under Medicare Part D. Taking prices of therapeutic alternatives set under these conditions as the starting point for developing negotiated price offers would in turn bias the system towards inappropriate high, unfair prices.

2. Starting with the prices of therapeutic alternatives would be a missed opportunity for the law to provide virtuous systemic impact.

In support of its negotiated price offer starting point proposal, CMS argues that “[the prices of therapeutic alternatives] is an important factor when considering the overall benefit that the treatment brings to Medicare beneficiaries.” We agree that pricing of a medicine and its therapeutic alternatives impact Medicare beneficiaries, but we do not believe it follows that prices of therapeutic alternatives should dictate the starting point of prices CMS negotiates.

Rather than provide virtuous systemic impact, the current process CMS is considering would reduce incentives for manufacturers of therapeutic alternatives to lower their prices. Using existing drug prices that have not been negotiated by CMS as the basis for negotiations risks building inertia for higher prices into the system. By instead negotiating a maximum fair price through alternate methods, articulated by some of our organizations in individual comments, CMS’ negotiation process could help reduce the prices of the alternative therapies, since the manufacturers of the alternatives may try to compete on price with that of the negotiated product.

Thank you again for your time and attention. The decisions CMS faces now have the potential to impact pricing and access to medicines for millions of people for years to come. Please reconsider your approach to developing a starting point in negotiations to help ensure Medicare beneficiaries and taxpayers do not continue to pay inappropriately high drug prices.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

RA Capital Management, LP and Orbimed Advisors appreciate the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

RA Capital is a multi-stage investment manager dedicated to evidence-based investing in public and private healthcare and life science companies. The flexibility of its strategy allows RA Capital to provide seed funding to startups and to lead private, IPO, and follow-on financings for its portfolio companies, both facilitating the crossover process and allowing management teams to drive value creation from inception through commercialization.

OrbiMed is a leading healthcare investment firm, with over \$17 billion in assets under management. OrbiMed invests globally across the healthcare industry, from start-ups to large multinational corporations, through a range of private equity funds, public equity funds, and royalty/credit funds. OrbiMed seeks to be a capital provider of choice, providing tailored financing solutions and extensive global team resources to help build world-class healthcare companies.

The IRA puts CMS in a leadership position to define the societal value of medicines, which will shape biomedical investing for decades to come. While only 9 years of market-based pricing for NDA-path drugs is already shifting investment towards BLA drugs, we believe that the proposals below would help investors ascribe some value to NDA-path medicines beyond 9 years (albeit less than in a pre-IRA world). Anything CMS can do to blunt the degree of revenue reduction for drugs it recognizes as “worthy” (taking all relevant parameters of value into account) would hopefully lead to better health outcomes and continued innovation by preserving the investability of NDA-path drugs for people on Medicare that investors believe would meet the value criteria you lay out (which is why it’s also important that those value criteria be clearly defined and

transparently and predictably applied). Our proposals are consistent with CMS's goals of improving health outcomes and promoting value-based, person-centered care.

1) Defining therapeutic alternatives - consider a broad value framework when considering your initial offer

When considering therapeutic alternatives to and clinical benefits of a selected drug, we would encourage you to consider all aspects of a drug's profile that may lead to an improved experience for the person being treated, alleviate caregiver burden, and otherwise contribute to societal value. The societal value of a drug can be better described and quantified using a [Generalized Cost Effectiveness Analysis](#) (GCEA)¹. Given the limitations on using the QALY, we would expect that any cost-effectiveness analysis would likely end up accounting for benefit using equal value life years gained (evLYG). **We would propose that you base your initial offer for each selected drug on a GCEA, not a conventional CEA that ignores many of the demonstrably real elements of value.** If the GCEA estimate for the drug is below the maximum fair price ceiling, you can use the GCEA estimate as the basis for your initial offer. If a drug is above the maximum fair price ceiling, you can simply use the ceiling.

A GCEA analysis accounts for key aspects of a drug's profile valued by the people who need it, their caregivers, and even healthy non-caregivers who derive peace-of-mind from knowing that medicines are there for them in case they might need them. ***This last value, to healthy people, is especially important*** yet entirely overlooked by conventional math, but we know it's real.

Consider, for example, how society spends money on smallpox countermeasures even though no one has smallpox, or how society wants new antibiotics and urges policy like the PASTEUR Act even though there are very few cases of pan-drug resistant infections. Some cancers are now less scary for all of us because we know there is screening technology and medicines that can manage or cure them. HIV is less scary for the whole population because we have effective antivirals. Vaccines restore peace of mind and, in the case of COVID-19, trillions of dollars of economic activity. Although models would have suggested that most people would not have died of COVID-19, what mattered was that billions of people were worried that it might happen to them or their loved ones, so they paid a high price (isolation) to avoid that outcome. Parents of a child with food allergies (and the child themselves) derive peace-of-mind (a measurable

¹ Economists refer to a [value flower](#), whose petals represent the many ways drugs have societal value beyond just the obvious benefit to the people who take them, [and repeatedly have urged that CEAs assessing the societal value of medicines take them into account](#). Economists have [devised a more generalized CEA methodology called GRACE](#) that accounts for [disease severity](#) (most simply, the value to averting death is worth a lot more than 10x the value of improving one's quality of life by 10%) and [insurance value](#) (the value healthy people derive from knowing that a drug is there in case they need it, as with a fire extinguisher). Economists also point out that guidelines urge that CEAs should account for a drug going generic, but the [vast majority of published CEAs ignore this](#) and therefore [undervalue medicines](#). The combination of GRACE and genericization leads to a more generalized framework for appreciating a drug's societal value, which is the basis for many ongoing GCEAs. Economists have given the example of how [drugs for multiple sclerosis](#) and [vaccines](#) have broader societal value than captured by conventional CEA and urge a more comprehensive approach. It's possible for a company to commission a GCEA study that incorporates some of the petals of the flower, such as this [assessment of the checkpoint inhibitor Opdivo for the treatment of 2nd line NSCLC](#). More such studies are on the way.

benefit, whether one uses the QALY or evLYG) from knowing their child carries an epinephrine product even if their child might never actually experience an anaphylactic event. Conventional CEA would require that child to experience anaphylaxis for the epinephrine to have value (akin to requiring a house to catch on fire for a fire extinguisher to have value) whereas GCEA would account for the risk reduction that medicines (and fire extinguishers) offer to everyone, every day, just by existing.

GCEA goes beyond safety and efficacy to include other aspects such as ease-of-use, accessibility for vulnerable populations, and safety and efficacy in specific populations that may be contra-indicated to other drugs. For example, Eliquis and Warfarin are both anticoagulants, but Eliquis has been shown to have a reduced risk of major bleeds, does not require complex monitoring, and has fewer interactions with food and other drugs. As such, people can more easily adhere to therapy with Eliquis and it is accessible even to people in rural areas who cannot easily get to clinics for monitoring. A GCEA would take all this into account and credit Eliquis with its superiority to Warfarin.

The superiority of one medicine compared to others should also be considered in the context of the *future* value of that medicine. Conventional CEA only looks at people that start treatment when the medicine is first approved and assumes that the medicine's price will never change. That ignores that a novel medicine leaves us with forever-improved healthcare. Because we have statins, we never have to worry that cardiovascular disease will ever be as poorly managed as it was before those products came to market. Even now that statins are generic, there are millions of people who are able to access statins at lower prices, reducing their risk of heart attacks and strokes. Conventional CEA ignores all the QALYs or evLYGs generated in future years. It would be as if we considered the merits of investing in clean energy only in terms of what it could do for us today instead of looking out to the future. And yet, the disease burden looming ahead is no less real than the burden of climate change.

There will be those who say that a GCEA is imprecise. And that's true. All CEAs are imprecise. Our concern is that a CEA magnifies that imprecision by assigning demonstrably incorrect values (i.e., zero) to caregiver benefits, risk reduction for currently healthy people, and the magnitude by which a drug's price will drop in the future (worth noting that if there were any doubt before how low its price would go after loss of exclusivity, after the IRA CMS should have no doubts and therefore it would be illogical to model the value of a medicine as if it will never become inexpensive). A GCEA by contrast seeks to ground its valuation in more rather than fewer indices and thereby increases the precision and reliability of the resulting assessment.

2) Transparency - make all documents related to the offer and counter-offer process public

We believe the public, industry, and investors would benefit from having **all offer and counter-offer documents made public**. Consider how the FDA's publication of correspondence for all approved drugs helps maintain public trust in the approval process as well guide drug

developers and investors towards clinical trial designs and drug profiles more likely to result in approvable products.

Drug developers and investors will now be looking to CMS to understand what NDA-path products remain investable, as well as what data they should generate to show value. Ultimately, CMS is accountable to the American people for setting a value framework that will determine which types of drugs for elderly populations get developed over the coming decades. An understanding of this framework will require much more than the high-level explanation provided for the MFP. Industry participants will need to analyze the specific context in which the factors were considered and how CMS responded to company arguments.

We understand your concerns about confidential information. Of the information that companies are submitting to CMS, we view the only sensitive information as R&D costs, unit costs of production, and certain net pricing information. Such information could easily be redacted from the publicly available documents, just as confidential information is currently redacted from FOIA requests and FDA review documents.

We would also like to point out what others have, which is that biomedical R&D relies on a portfolio of investments of which only a few projects turn into commercial products. So a drug's price is not linked to the cost of its own development. The relationship between drug prices and R&D investment goes in the other direction. The higher the rewards investors see today's new medicines earning, the more willing they are to invest more in trying to develop more such medicines that could also justify comparable rewards. The lower the rewards today's drugs generate, whether because their launch prices are lower or their period of profitability has been truncated by the IRA, the less they are willing to invest in more such projects. Ideally, CMS would not place emphasis on or even use whatever information companies provide about a drug's R&D costs.

3) Define a Qualified Single Source Drug by its NDA or BLA to encourage development of new and meaningfully better formulations

Consider a small biotech developing a pill for a chronic condition that affects mainly people on Medicare. The first version of their pill must be taken twice a day with food. The company is also developing a second-generation version of their pill, using the same active moiety as the first version, that only needs to be taken once a day and can be taken without food. This second-gen version is several years behind the first. Before the IRA, investors would encourage the company to develop both versions, expecting that they would be rewarded for the second-gen version since people who take the drug, their caregivers, and their doctors would value its benefits. Today, investors have a quandary. If the negotiation clock starts at 9 years and will be applied to both versions of the pill, will investors be rewarded for investing in the second version? Conversely, should they pause development of the first-gen version, expected to get to market sooner, to save their 9 years for the second-gen version?

We would propose each NDA triggers a new clock to encourage innovation in next-gen versions (and avoid incentives to slow the development of first-gen versions), even if the active moiety is the same. If a new formulation of an active moiety is not valued by the market, doctors can simply not prescribe it and plans can use prior authorization to require that people try the less expensive, price-negotiated version first. But to the extent that the new formulation really is better than the first, then it should be allowed to have its own 9-year period in which to realize the incentive for such superiority (and if a GCEA confirmed that this superiority is cost-effective it might then prompt CMS to impose only the minimum required discount after 9 years).

Another benefit to defining a qualified single source drug by its NDA or BLA is that it would encourage the development of improved versions of existing drugs for orphan indications. RA Capital Management is an investor in Aerovate Therapeutics, which is developing an inhaled version of imatinib for people with pulmonary arterial hypertension (PAH). Oral imatinib showed efficacy in PAH but was not well-tolerated. In fact, those side effects were so severe at effective doses that oral generic imatinib, though inexpensive, is not used for the treatment of PAH. That's why there's an unmet need for a better way of delivering imatinib; Aerovate's inhaled version of imatinib is intended to focus the drug on the lung, thus limiting the side effects related to the drug reaching other parts of the body. Since PAH is an orphan disease, Aerovate's drug should be exempt from negotiations, if approved. However, imatinib itself received multiple orphan drug designations. Does that mean Aerovate will be ineligible for the orphan drug exemption because an irrelevant oral formulation was developed for other diseases? Oral imatinib's orphan drug designations (granted many years ago, to another company, in oncology indications) should have no bearing on Aerovate's eligibility for the orphan drug exemption.

For the purpose of determining eligibility for the orphan drug exemption, CMS should look at only the number of orphan drug designations for the NDA in question vs. looking through across all active moieties.

Certainly, if another version of that moiety could not be used and is not used in place of the formulation in question, then CMS should not lump those formulations together when considering whether the orphan exemption applies.

4) The orphan drug exemption should only count active orphan drug designations for approved indications

Companies often pursue multiple orphan drug designations (ODD) while their drugs are in development. For example, several drugs targeting KRAS G12C-mutated cancers have orphan drug designation in both G12C-mutant non-small-cell lung cancer and colorectal cancer. However, such drugs are only approved in non-small-cell lung cancer. Should such drugs be considered "multi-orphan" since they have ODDs in colorectal cancer, despite not being approved for that indication (yet)? We would recommend clarifying that, for the purposes of counting the number of orphan drug designations to determine single orphan eligibility, CMS will only look to the number of ODDs for approved indications. At a minimum, CMS should not

consider withdrawn ODD applications for the purpose of determining eligibility for the single orphan exemption.

We encourage CMS also to consider only those ODDs for which indications have been approved. Those ODDs for indications that the drug ultimately wasn't approved for only serve to provide R&D tax credits that helped defray the cost of exploring those indications. If vestigial ODDs ended up invalidating ODD-based orphan exemption for the one orphan indication a drug ultimately got approved for, then companies would not file for an ODD until they knew which one indication they would launch their drug for. That would disqualify them from the R&D tax credits for that drug and therefore drive up the cost of orphan drug development. CMS could readily address this concern by adopting a policy of evaluating a drug's eligibility for the orphan drug exclusion based only on those designations with approved indications.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact Chris Morrison by e-mail at cmorrison@racap.com if you have any questions regarding our comments.

Sincerely,

Tess Cameron

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure:

The Rare Access Action Project, (RAAP) appreciates this opportunity to comment on the initial guidance regarding the Drug Price Negotiation Program (Negotiation Program) under the Inflation Reduction Act of 2022 (IRA) issued by the Centers for Medicare & Medicaid Services (CMS or Agency) on March 15, 2023 (Initial Guidance).¹

RAAP is a registered 501(c)(4) non-profit organization that is a coalition of life sciences and patient stakeholders that explore creative policy solutions to address structural issues in access and coverage. Our priorities are twofold. First, we advocate for policies that stimulate the development of therapies that treat rare diseases. Second, we advance initiatives that ensure rare disease patients have access to the care and treatments they need.

As detailed further, RAAP is extremely concerned about the impact that CMS' final definition of qualified single source drug (QSSD) will have on patients.² With history as a guide, RAAP believes that CMS' final definition of QSSD will have a significant chilling effect on investment in clinical development of orphan drugs.

I. Background: Rare Diseases and Orphan Products

¹ CMS, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (Mar. 15, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

² *Id.* at page 7.

Over 7,000 rare diseases affect more than 30 million Americans.³ The Orphan Drug Act (ODA), enacted in 1983, provides financial incentives to encourage the development of drugs to treat, diagnose, or prevent rare diseases or conditions that affect fewer than 200,000 people in the US. The ODA has resulted in manufacturers developing orphan drugs that have provided benefit to previously overlooked populations, including new drugs offering breakthrough therapies and existing drugs providing medical benefits for new populations. Since 1983, 6,371 drugs and biologics have received the Orphan Drug designation, and the FDA has approved 1,110 drugs and biologics for orphan indications, as shown in the figure below⁴:

Whereas, from 1973-1983, manufacturers marketed only 34 orphan products, 10 of which were developed by the pharmaceutical industry and 24 were developed from research and funding by the federal government.⁵ This is a stark and distinguishing difference from today that further reinforces the tremendous positive impact of the ODA. Further, from 1983 to 2014, 843 new molecular entities

³ <https://www.fda.gov/patients/rare-diseases-fda>

⁴ FDA. Search Orphan Drug Designations and Approvals. Accessed March 28, 2023.

<https://www.accessdata.fda.gov/scripts/opdlisting/ood/>

⁵ <https://www2.law.umaryland.edu/marshall/crsreports/crsdocuments/RS20971.pdf>

were approved by the FDA, 25% of those were orphan drugs. A study in *Health Affairs* found that the average number of orphan New Molecular Entities (NMEs) approved per year was 7, but from 2010-2014, the average increased to 12.5 further showing the power of the ODA.⁶

Specifically, the ODA has transformed treatments for rare cancers. Between 1983 and 2015, 177 drugs were approved to treat rare cancers. The 177 approvals originated from 1,391 orphan drug designations.⁷ By almost any measure the ODA has successfully achieved its policy objectives—to stimulate the development of orphan therapies.

Rare diseases include more familiar conditions, such as cystic fibrosis, Lou Gehrig's disease, and Tourette's syndrome, as well as less familiar conditions, such as aromatic L-amino acid decarboxylase (AADC) deficiency, Duncan's Syndrome, Madelung's disease, and acromegaly/gigantism. These conditions are complex and often not well understood, which causes great challenges to the diagnosis and treatment as well as research efforts. Rare disease treatments range from curing the disease, modifying how the disease functions, or treating the symptoms. Truly curative treatments are rare. Disease-modifying therapies target the underlying pathology of a disease to prevent it from worsening. Symptomatic treatments seek to temper symptoms or to maintain physical, emotional, and mental functioning. Only 5% of rare diseases have a treatment approved by the Food and Drug Administration (FDA) and for one-third of individuals with a rare disease, it can take between one and five years to receive a proper diagnosis.

The successes mentioned above resulted from significant clinical investment within the backdrop of the financial incentives of the ODA and a healthcare system that could provide equal access to these life altering therapies. Manufacturers invested knowing that there was a potential of seven years of market exclusivity to recoup the billions of dollars of investment.⁸ Companies relied on the ODA to partner with patients to develop the next generation of orphan therapies and now, however, due to CMS' nearsighted definition of QSSD the future of orphan drug discovery is bleak.

II. CMS' Final Definition of Qualified Single Source Drugs Could Irreparably Stunt the Development of Therapies that Treat Rare Disease

In Section 30.1.1 of the Initial Guidance, entitled, "Orphan Drug Exclusion from Qualifying Single Source Drugs" CMS states that it "is considering whether there are additional actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development."⁹ RAAP appreciates this statement and hopes that the Agency reevaluates its final decisions to identify

⁶ <https://www.healthaffairs.org/doi/10.1377/hlthaff.2015.0921>

⁷ <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4828121/>

⁸ <https://www.fda.gov/patients/rare-diseases-fda>

⁹ *Id.* at page 11.

“qualifying single source drugs” at the active moiety/active ingredient level and to set the seven or eleven-year clock for purposes of the qualifying single source drug definition on the date of initial FDA approval. RAAP interprets this definition for orphan drugs as not on the date on which a drug loses its status as an excluded orphan drug. RAAP urges CMS to clarify its intent as if true together, these decisions will stunt manufacturer development of orphan drugs because it will force manufactures to choose between developing an orphan indication or a non-orphan indication.

A. CMS’ Overreach Of Defining QSSD based on Active Moiety/Active Ingredient will Disincentivize Orphan Drug Development

In its Initial Guidance, CMS states that “[i]n accordance with the statutory language (section 1192(e)(1) of the Inflation Reduction Act (IRA)) cited above for purposes of the Negotiation Program, CMS will identify a potential qualifying single source drug using: For drug products, all dosage forms and strengths of the drug **with the same active moiety** (emphasis added) and the same holder of a New Drug Application (NDA) inclusive of products that are marketed pursuant to different NDAs. For biological products, all dosage forms and strengths of the biological product **with the same active ingredient** (emphasis added) and the same holder of a Biologics License Application (BLA) inclusive of products that are marketed pursuant to different BLAs.”¹⁰ In other words, the potential qualifying single source drug will also include all dosage forms and strengths of the biological product with the same active ingredient and marketed pursuant to the same BLA(s).¹¹ RAAP believes that Agency’s final policy of combining drugs by active moiety and biologicals by active ingredient is inconsistent with the plain reading of the statute that in turn will harm orphan drug development.

Specifically, the plain text of section 1192(e)(1) references FDA action in the singular, not the plural by using word approval or licensure, not approvals or licensures. The law states that “qualifying single source drug” is defined for products approved under an NDA by reference to whether seven years has elapsed since “such approval.” Similarly, the term is defined for products licensed under a BLA by reference to whether eleven years has elapsed since “such licensure.” These clauses are written in the singular, it therefore requires products to be treated as the same qualifying single source drugs only where they share the same NDA or BLA. The use of “such license” and “such approval” is intentional and unambiguous. Congress used this language to denote that a qualifying single source drug is distinguished by a distinct approval or licensure—i.e., a distinct NDA or BLA. CMS must give effect to the plain language of the statute by distinguishing among qualifying single source drugs based on their FDA application and reverse this final decision.

Biopharmaceutical innovation is incremental, relying on sustained and continuous improvements to molecules, pathways, and modes of administration to achieve

¹⁰ <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf> at page 8.

¹¹ *Id.*

maximum clinical benefit for patients. For patients living with a rare disease or disorder this development process is particularly necessary because of the rarity of their condition. Science cannot take significant leaps and develop new active moieties with each generation of treatment. By combining drugs at the active moiety or active ingredient level, CMS is likely cutting off hundreds of investments into new orphan disease indications.

B. CMS' Decision of Starting the Negotiation Clock at FDA Approval will Prevent Clinical Development for Rare Therapies

CMS states that to determine the date of approval or licensure for a potential qualifying single source drug with more than one FDA application number, CMS intends to use the earliest date of approval or licensure of the initial FDA application number assigned to the NDA/BLA holder for the active moiety / active ingredient. Consistent with CMS' request on actions it could take to best support orphan drug development, RAAP strongly urges CMS to reverse this decision and or clarify that for orphan drugs, where a drug loses eligibility for the orphan drug exclusion, the clock starts on the date the drug loses such eligibility, not the date of FDA approval for purposes of the qualifying single source drug definition.

Manufacturers typically seek indications and orphan designations sequentially as new clinical evidence is developed, and thus starting the clock at FDA approval regardless of clinical sequencing will hurt orphan drug discovery. For example, the U.S. Department of Health and Human Services Office of Inspector General, published a report in 2021 that demonstrates the potential impact that this policy could have on orphan drug discovery. Specifically, based on the graph¹² below the orphan indications for the top drugs on the list would likely not have been developed. It is reasonable to believe that the manufacturer of these blockbuster drugs may have chosen only the larger indications.

¹² Id.

Exhibit 6: Drugs with both orphan and nonorphan approvals were much less likely to be used for their orphan indications.

Source: OIG analysis of 2018 Medicare Part B claims and Part D PDE records.

*Note: Opdivo and Keytruda both have FDA approval for orphan indications to treat small cell lung cancer (SCLC), as well as nonorphan indications to treat non-small cell lung cancers (NSCLC). Because ICD-10 diagnosis codes do not distinguish between SCLC and NSCLC, we removed units related to any form of lung cancer from our analysis.

Additionally, RAPP's did a quick review of the FDA database and identified the following ten examples of products that obtained orphan drug designations (ODDs) and received subsequent non-ODD FDA-approvals. Based on CMS' current approach, RAAP believes that none of these orphan indications would have been pursued.

1. Venetoclax originally received approval based on ODD in 2016 for CLL or SLL, and in 2018, received accelerated approval in ND AML under BTD without an ODD.

2. Pembrolizumab originally received approval based on ODD in 2014 for melanoma, and in 2015, received accelerated approval in NSCLC without an ODD

3. Cabozantinib received approval based on ODD in 2017 for HCC, and in 2021, received approval in 1L RCC in combination with nivolumab under FTD and ROTR without an ODD.

4. Atezolizumab received approval based on ODD in 2016 for UC, and in 2018, received approval in 1L NSCLC in combination with bevacizumab and chemo without an ODD.

5. Zanubrutinib received approval based on ODD in 2019 in MCL, and in 2023, received approval in CLL and SLL without an ODD.

6. Olaparib was first approved in 2014 for a subset of ovarian cancer patients. Then it received approval based on ODD in 2019 in pancreatic cancer, and

in 2020, received approval in ovarian cancer in combination with bevacizumab without an ODD.

7. Durvalumab received approval based on ODD in BTC, and in 2022, received approval in NSCLC in combination with tremelimumab without an ODD

8. Pemigatinib received approval based on ODD in 2020 in cholangiocarcinoma, and in 2022, received approval in MLNs without an ODD.

9. Tocilizumab received approval based on ODD in 2021 in systemic sclerosis, and in 2022, received approval for COVID-19 under EUA without an ODD.

10. Ivosidenib received approval based on ODD in 2021 in cholangiocarcinoma, and in 2022, received approval in ND AML in combination with azacitidine under priority review and ROTR without an ODD.

RAAP believes that it is imperative that CMS continue the work of the Congress and the ODA and continue to help stimulate the development of orphan drugs. Through the ODA, Congress devised a regulatory infrastructure that carefully balances incentives in favor of the development of orphan drugs. This history is repeated by Congress in the IRA as evidenced by the orphan drug exclusion. Congress again recognized the special nature of orphan drug discovery. RAAP is disappointed that CMS does not recognize this continued Congressional theme of protecting orphan drug discovery in its final definitions.

As such, RAAP urges CMS to promote orphan drug development by clarifying that the seven- or eleven-year clock for purposes of the qualifying single source drug definition starts on the date on which a drug loses its status as an excluded orphan drug.

III. Other Issues Related to Implementing the Orphan Drug Exclusion

In the spirit of implementing policies that continue to stimulate orphan drug development, RAAP urges the Agency to implement, at a minimum, the following recommendations that will better support ongoing development of and access to drugs targeting patients living with rare diseases.

First, CMS should establish a process that enables manufacturers to submit evidence that an indication falls within an orphan drug designation to account for situations where CMS is unable to determine eligibility for the orphan drug exclusion based on a review of FDA's orphan drug databases. Second, CMS should confirm that it will determine eligibility for the orphan drug exclusion based on orphan drug designation at the time of selection. Under FDA regulations, a manufacturer may voluntarily withdraw a requested or granted orphan drug designation at any time. Where a manufacturer does so, the withdrawal is publicized, and any benefits associated with the designation cease. Accordingly, when determining eligibility for the orphan drug exclusion, CMS should confirm that it will look only to orphan designation at the time of selection and will not look to any prior designation that has been withdrawn. Doing so would help avoid improperly narrowing the universe of protected orphan drugs. Finally, CMS proposes that if a selected drug "has patents and exclusivities that will last a number of years," CMS may adjust the "preliminary price" downward. RAAP is very

concerned by this implication for orphan drug development. Specifically, this could mean that drugs that have orphan exclusivity could have a lower MFP than would otherwise apply further disincentivizing the pursuit of orphan indications.

IV. Conclusion

Based on the policies stated in the Initial Guidance, RAAP anticipates that some if not many of the current drug discovery programs for orphan diseases will unfortunately be discontinued. Therefore, we urge CMS to implement the above changes in order to mitigate the risk that the Initial Guidance will deter the development of these orphan drugs and many more in the future.

Thank you for the opportunity to submit these recommendations on which actions CMS can take in its implementation of the Negotiation Program to best support orphan drug development. RAAP is significantly concerned that without changing the definition of QSSD and starting the clock from when a nonorphan indication is approved that orphan drug discovery will significantly diminish. RAAP believes that CMS owes it to future patients to preserve the intentions and benefits of the ODA and reverse these final decisions regarding the definition of QSSD.

We look forward to working with CMS to further develop policies that maximize access to therapies treating rare diseases. Please feel free to contact me at 202-631-5752 or by email at mike@rareaccessactionproject.org .

Sincerely,

A handwritten signature in black ink, appearing to read "Michael Eging", with a large, stylized circular flourish at the end.

RE: Inflation Reduction Act (IRA) Initial Program Guidance; Comment Request (Docket No. CMS-1800-NC2)

Dear Administrator Brooks-LaSure:

The Rare Disease Company Coalition ([RDCC](#)) appreciates the opportunity to provide comments to the Centers for Medicare & Medicaid Services (CMS) initial guidance for the Medicare Drug Price Negotiation Program for the implementation of the *Inflation Reduction Act* (IRA). The RDCC appreciates that the Centers for Medicare & Medicaid Services is considering whether there “are additional actions the agency can take” in implementing the IRA Negotiation Program to “best support orphan drug development.” We recommend that CMS take all possible steps to better support the development of important new orphan drugs, including clarifying key aspects of the Orphan Drug Exclusion.

The RDCC is a coalition of 20 life science companies committed to changing the paradigm in rare disease treatment by discovering, developing, and delivering life-changing therapies for rare disease patients around the globe. To date, RDCC members have brought 45 treatments to market – the majority of which are the first FDA-approved treatments available for a given disease – and have over 200 rare disease treatments in development.

State of Rare Disease Therapy Development and Challenges

In the United States, a rare disease is a condition affecting fewer than 200,000 people. There is an estimated baseline of more than 7,000 individual rare diseases that cumulatively affect about 30 million people in the US, however; this number may be closer to 10,000 individual conditions.¹ These diseases are devastating and often life-threatening: 80 percent of rare diseases are genetic in origin, 50 percent

¹ Haendel, Melissa et al. How many rare diseases are there? NIH National Library of Medicine. <https://pubmed.ncbi.nlm.nih.gov/32020066/>. February 2020.

impact children,² with many rare diseases resulting in premature deaths of infants and young children.³ Despite significant advancements in the detection and sequencing of rare diseases, as well as advances in the development of rare disease therapies, there remains a high unmet need for rare disease patients with at least 95% of rare diseases left without an FDA-approved treatment.

The latter point is a stark reminder of the challenges facing sponsors of rare disease therapies. The investment required to bring an innovative therapy to patients is substantial and requires the application of significant resources toward new technologies, platforms, and treatments. It is estimated that each newly approved drug takes over 10–15 years to develop, and over \$1–2 billion in average costs.⁴ These estimates are in part due to the high degree of resources attributed to the over 90% of drug candidates that fail prior to entering clinical studies, during phase I, II, or III trials, or final approval.⁵ Many of these interventions never make it to market but nonetheless support learning and development to be applied to successful future pursuits. RDCC's 20 members alone invest, on average, over \$15 billion in research and development (R&D) annually.

Legacy of the Orphan Drug Act

Signed into law in 1983 to recognize the need for investment and discovery in the rare disease space, the *Orphan Drug Act* (ODA)⁶ recognized the paucity of rare disease drug development and the need for a series of economic incentives to encourage the development of orphan drugs (a reference to the unwillingness of drug companies to adopt these drugs and take them through the long FDA process). These incentives included tax credits for qualifying clinical trial expenses, exemption from standard user fees attached to new drug and biologic product applications, and eligibility for seven years of market exclusivity post-approval. These incentives have succeeded in increasing the number of approved drugs and biologics to prevent, diagnose, or treat rare diseases and conditions where the total affected patient population is low and where the chance of market failures is due to a reduced ability to recoup research and development costs.

The ODA has demonstrated overwhelming evidence of its success. Before 1983, only 38 drugs were approved to treat rare diseases. Since the passage of the Orphan Drug Act, more than 7,000 rare diseases have been identified, and over 1,100 orphan indications for treatments have obtained FDA approval.⁷ Accordingly, Congress and agencies should continue to explore ways to protect the ODA incentives and further encourage development through guidance and incentives based on changes in the evolving market to ensure that innovation continues for rare disease patients.

Inflation Reduction Act Impact on Rare Disease Drug Development

The recently-signed *Inflation Reduction Act* (IRA) exempts some orphan drugs from Medicare price negotiation. Specifically, the IRA includes a provision that must exclude from price negotiation "a drug that is designated as a drug for only one rare disease or condition under section 526 of the *Federal Food, Drug and Cosmetic Act* and "for which the only approved indication (or indications) is for such disease or condition."⁸ The congressional intent of the Orphan Drug Exclusion was to continue to incentivize drug development for rare diseases by *not* having products that treat rare diseases subject to price controls. On its face, the Orphan Drug Exclusion is an important step in ensuring consistency in the regulation of orphan products in the future, given the lengthy timeline required for advanced therapeutic development. However, while the IRA clarifies that an orphan drug with one designation is excluded from price negotiation, it would disincentivize drug companies from doing further research to develop a rare disease drug for additional rare diseases by making that product eligible for negotiation once they have obtained a second designation. Notably, orphan drugs are often later approved for additional therapeutic areas, and if that happens, the IRA will no longer exempt them from price negotiations.

This approach also fails to account for important advances in drug development, stifling innovation through isolating single indications. For instance, Section 504 of the *Food and Drug Administration Reauthorization Act of 2017* (FDARA) required pediatric assessments to be made on adult drugs based on the claimed indication of the drug and the relevant molecular target for pediatric cancer drugs.⁹ This legislative change has resulted in FDA's creation of lists of molecular target candidates in multiple categories. Such a change, long discussed by stakeholders as a means of generating new drug studies in the pediatric population, indicates a significant change in how drugs are developed and expands the possibility of repurposing drugs with existing rare disease indications to others. According to an IQVIA/NORD report from December 2020 that examines trends in rare disease innovation, "there are 447 drugs with orphan-only indications, with 104 drugs approved for two or more orphan indications. Compared with the development of novel orphan drugs, repurposing drugs for new indications is a time-saving and cost-efficient method resulting in higher success rates, which can, therefore, drastically improve drug development for rare diseases.

The existing exemption is confined to a narrow set of orphan medicines. It raises the question of the extent to which innovation in rare disease development for indications for other rare diseases will be affected by Medicare drug price negotiations. This framework would achieve the opposite of the intended purpose of the aforementioned ODA, which is to encourage the development of drugs for rare diseases by providing incentives in the form of regulatory exclusivity.

As a result of this policy, companies will be forced to make hard choices regarding R&D investment. Remaining uncertainty about if, when, and how rare disease drugs will become negotiation eligible creates business risks that disincentivize the development of drugs for the limited populations impacted by rare diseases. Since the passage of the IRA, companies have already announced plans to suspend their additional orphan indication programs in light of the narrowness of the orphan drug exemption, highlighting the real-world impact that this legislation is already having on orphan drug R&D and investment.¹⁰ Even before a drug reaches the negotiation list, due to the complexity and long timeline

⁸ Section 1192(e)(3)(A); [Public Law 117-169](#).

⁹ [Public Law 115 - 52](#).

¹⁰ Kelly, Cathy. IRA Effect: Alnylam Acting 'Rationally' In Halting Second Orphan Indication For Amvuttra – Analysts. Pink Sheet. <https://tinyurl.com/bdh8cbrf>. November 7, 2022.

from initial drug discovery and early R&D to full FDA approval, these suspension decisions are being made now as investors and companies look to minimize their risk. These decisions will impact the drug development pipeline for decades to come.

Given the current construct of the law, timing issues are crucial for sponsors to understand the horizon for drug development and how the IRA provisions may impact their market viability in the future. As CMS considers whether there are additional actions the agency can take in its implementation of the Negotiation Program to best support orphan drug development, CMS should clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by the FDA for seven or 11 years to treat the second disease or condition (i.e., the date the exemption ends rather than the date of FDA approval for the original orphan indication) and in doing so, would provide meaningful incentives for continued rare disease drug development. Further, CMS must clarify that the timeline for negotiation eligibility would begin for a product that no longer qualifies for the Orphan Drug Exclusion upon approval for another condition.

Recommendations

In summary, as CMS considers whether there are additional actions it can take in implementing the Negotiation Program to best support orphan drug development, RDCC urges CMS to:

- Ensure rare disease drug development is not stifled; we request that CMS clarify that obtaining additional orphan designations for a small molecule or biologic will not make a drug negotiation eligible until the drug has been approved by FDA for 7 or 11 years to treat the second disease or condition.
- Clarify that where an orphan drug loses eligibility for the orphan drug exclusion, the 7- or 11-year “qualified single source drug” clock runs from the date on which the drug lost eligibility for the exclusion.

We appreciate the Agency’s attention to these important issues and urge immediate action to strengthen protections and certainty for those developing rare disease therapies. Should you have any questions, please feel free to contact me at amanda@rarecoalition.com.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Seshamani:

RWC-340B appreciates the opportunity to submit comments to the Centers for Medicare & Medicaid Services ("CMS") on the guidance Memorandum entitled "Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments" ("Memorandum"). Our comments concern Section 90.2 of the Memorandum: "Monitoring of Access to the MFP."

As background, RWC-340B is a national association of HIV/AIDS health care clinics and service providers receiving support under the Ryan White Comprehensive AIDS Resources Emergency ("CARE") Act. Ryan White clinics are dedicated to caring for low-income and vulnerable patients living with HIV/AIDS and are serving on the frontlines of both the AIDS epidemic and the COVID pandemic, supporting high risk clients and communities. RWC-340B members provide primary care, case management, and other support services for persons living with HIV/AIDS. For many of these services, Ryan White clinics receive little to no compensation and, for that reason, are highly dependent on the 340B drug pricing program ("340B Program") to underwrite the cost of providing comprehensive care to their patients.

RWC-340B supports CMS's objective to implement the requirement of the Inflation Reduction Act of 2022 ("IRA"), including a manufacturer's obligation to provide 340B safety net providers the difference between the maximum fair price ("MFP") and the 340B ceiling price when the MFP is lower than the 340B ceiling price. RWC-340B has two comments.

First, CMS states that it will make available on a publicly available website: the selected drugs, initial price applicability years, the MFP files, and the explanations of factors having the greatest influence on

determining the MFPs.¹ RWC-340B supports CMS's decision to make publicly available all MFP prices and relevant supporting information. Providing the MFP price publicly ensures that the important process of comparing the MFP and 340B ceiling price is fair and transparent. We request that CMS ensure that the MFP pricing information is presented in a format that is consistent with and easily comparable to the ceiling price information on the Office of Pharmacy Affairs Information System (OPAIS).

Second, with respect to access to the MFP for 340B covered entities, the IRA states that a manufacturer "shall be required to provide access to the maximum fair price to such covered entity with respect to maximum fair price eligible individuals who are eligible to be furnished, administered, or dispensed such selected drug at such entity at such ceiling price in a nonduplicated amount to the ceiling price if such maximum fair price is below the ceiling price for such selected drug." 42 U.S.C. § 1320f-2(d)(2). In two instances in the memorandum, however, CMS states that a manufacturer must give a 340B covered entity the difference between the 340B price and the MFP "[i]f the 340B ceiling price is subsequently determined to be lower than the MFP."² These statements appear to be an error and RWC-340B requests that CMS correct this mistake.

* * *

RWC-340B appreciates the opportunity to provide input on this important issue. Thank you for your consideration of our comments. If you have any questions, please feel free to reach out to me at ceo@cempa.org.

Sincerely,

Shannon Stephenson
President

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Sana Biotechnology, Inc. (Sana) appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

About Sana Biotechnology, Inc.

Sana is focused on creating and delivering engineered cells as medicines for patients. We share a vision of repairing and controlling genes, replacing missing or damaged cells, and making our therapies broadly available to patients. We are a passionate group of people working together to create an enduring company that changes how the world treats disease. Sana is a U.S. company with operations in Seattle, WA, Cambridge, MA, South San Francisco, CA and Rochester, NY.

Sana has developed a hypoimmune platform designed to create cells *ex vivo* that can “hide” from the patient’s immune system to enable the effective transplant of allogeneic cells. We are applying hypoimmune technology to donor-derived allogeneic T cells, with the goal of making potent and persistent CAR T cells at scale. Autologous CAR T cells have shown tremendous potential, but are difficult to make, challenging to deliver, and variable in product quality. Allogeneic CAR T cells have generally disappointed to date, as the challenge of immune rejection of foreign cells has limited the durability of patient responses. Our goal is simple – clinical benefit at least as good as that achieved with autologous CAR T cells on the most meaningful outcome for patients, durable complete responses (no evidence of cancer), with a scale, product consistency, and deliverability comparable to a regular drug. Our most advanced program using hypoimmune technology is SC291, our hypoimmune CD19-targeted allogeneic CAR T therapy, targeting cancers such as acute lymphoblastic leukemia (ALL), chronic lymphocytic leukemia (CLL), and non-Hodgkin’s lymphoma (NHL). Our preclinical data highlight that these hypoimmune CAR T cells can evade immune detection, persist, and clear tumor cells both acutely and over time. If these results translate to our clinical studies, SC291 has transformative potential for patients, and we look forward to presenting initial clinical data later this year. SC291 is the first drug to enter the clinic from Sana’s HIP CAR T platform; this platform has the potential to create a regenerative pipeline for allogeneic

CAR T therapies. After SC291, our next programs using hypoimmune technology include our allogeneic CD22-targeted CAR T program targeting ALL, CLL, NHL cancers and our allogeneic BCMA-targeted CAR T program targeting multiple myeloma.

Currently, allogeneic T cells derived from human whole blood are used to manufacture our allogeneic CAR T cell therapies. If ultimately approved as biological products under section 351(a) of the Public Health Service Act, Sana's allogeneic CAR T cell therapies will be biological products derived from human whole blood.

Summary of Comments

We are requesting that CMS revise to the Drug Price Negotiation Program Guidance to make clear that any biological product licensed under section 351(a) of the Public Health Service Act and derived from human whole blood or plasma will be excluded when identifying drugs to be included in the Medicare Drug Price Negotiation Program, consistent with the statute. The statutory exclusion for plasma-derived products in the Inflation Reduction Act (IRA) is both clear and broad in the exclusion. We believe that the Drug Price Negotiation Program Guidance, if not revised, creates an ambiguity in which drugs are subject to this exclusion, which could be construed as limiting the statutory exclusion. This discrepancy between the statute and guidance creates uncertainty for innovator companies like Sana, magnified by the pipeline nature of our development, which can ultimately decrease the development of innovative medicines for patients. In addition, the deviation from the clear language of the statute is arbitrary and capricious and will inevitably lead to litigation. This will divert resources of both innovators and the agency from the development and delivery of medicines to patients.

Section 30.1.3 Comments

Specifically, the IRA defines Plasma-Derived Products as "A biological product that is derived from human whole blood or plasma" and the IRA provides that a biological product is (in relevant part) one "licensed under the section 351(a) of the Public Health Service Act". In other words, to the extent a biological product is licensed under a BLA and is derived from human whole blood or plasma, it falls into the plain language of the Plasma-Derived product exclusion in the statute.

In contrast, the Drug Price Negotiation Program Guidance adds additional criteria to this exclusion that narrows which products would qualify for the exclusion. The guidance states that CMS "will refer to product information available on the FDA Approved Blood Products website to identify approved blood products regulated as biological products and the FDA Online Label Repository to verify if the product is derived from human whole blood or plasma." This guidance creates an ambiguity suggesting that the sole place to look for biological products meeting the Plasma-Derived product exclusion is the FDA Approved Blood Products website. This impermissibly narrows the statutory exclusion, which simply requires the biological product to be approved via a BLA and be derived from human whole blood or plasma.

Therefore, we request that CMS revises its guidance to reflect the clarity and breadth of the Plasma-Derived Products statutory exclusion of the IRA. Failure to do so would be inconsistent with the statute and would be arbitrary and capricious. Specifically, we ask that revisions be made to the Drug Price Negotiation Program Guidance as follows:

- (i) make clear that any biological product licensed under section 351(a) of the Public Health Service Act and derived from human whole blood or plasma will be excluded by CMS when identifying drugs to be included in the Medicare Drug Price Negotiation Program;
- (ii) make clear that the FDA Approved Blood Products website is only one way, and not the only way, to identify approved blood products regulated as biological products;
- (iii) make clear that the approved biological product's labeling is the means to verify if the product is derived from human whole blood or plasma, including through consultation with FDA as needed.

* * * * *

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to patients from fewer innovative medicines is minimized. Please contact Jennifer Tousignant by telephone at (206)701-7914 or by e-mail at jennifer.tousignant@sana.com, if you have any questions regarding our comments.

Sincerely,

DocuSigned by:

RE: Medicare Drug Price Negotiation Program Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026: Response to Solicitation of Comments

Dear Administrator Brooks-LaSure:

Seagen Inc. appreciates the opportunity to comment on the Medicare Drug Price Negotiation Program: Initial Memorandum (initial guidance) issued by the Center for Medicare & Medicaid Services (CMS or Agency) on March 15, 2023.¹

Seagen is a global biotechnology company that develops and commercializes transformative cancer therapies. Seagen's singular mission is to make a difference for people impacted by cancer. As an industry leader in antibody drug conjugate (ADC) technology, we pioneered the science of harnessing antibodies designed to deliver cell-killing agents to cancer cells. Three of four of our approved medicines are built on this technology. Seagen has a deep and diverse pipeline of next-generation ADC technologies, small molecule, and other targeted therapies aimed at addressing unmet needs of people living with cancer.

¹ Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year (IPAY) 2026, and Solicitation of Comments.

Targeted cancer therapies, like the ADCs manufactured by Seagen, are designed for very specific patient populations, expensive to develop, and difficult to manufacture. Uncertainty in future returns creates significant risk to future patient access by reducing our ability to reinvest in our pipeline. In 2022, Seagen invested \$1.3 billion into research and development and \$1.2 billion in 2021. There are other smaller manufacturers making deep investments in transformative cancer therapies. However, due to government price setting, companies like Seagen will be forced to walk away from gaining initial approvals in smaller patient populations, often in later lines of therapy where disease has progressed and prognosis is grim. Studies have demonstrated that government price setting is associated with dramatic declines in early research and patient access, which, of course, is the fundamental precursor to a robust and growing pipeline of new therapies targeting areas of unmet medical need, including cancer therapies.²

The initial guidance only relates to the Program for IPAY 2026, and it is critical CMS provides additional guidance following the complete rulemaking with comment period for IPAY 2028, which will apply to Part B products in addition to Part D products. Due to the limited scope of this initial guidance, CMS is missing critical stakeholder feedback on complex issues impacting Part B drugs, like utilization of J-codes as a more appropriate way to identify potentially qualifying single source physician-administered products and other nuances not addressed within the current guidance. With additional time ahead of implementation for Part B, Seagen urges CMS to follow the standard rulemaking process.

As a threshold matter, Seagen is concerned that CMS did not solicit comment on Section 30 of the initial guidance, which includes important guidance regarding the definitions of qualifying single source drugs and negotiation-eligible drugs, which form the basis of the Program. We believe CMS's failure to request comment on these provisions removes an important opportunity for public input on the foundations of CMS' implementation of the program. In addition, Seagen requests the Agency not only solicit comments on the entirety of initial guidance, but also review and consider all comments provided by stakeholders regarding such guidance.

It is important to clarify the process Congress describes as a "negotiation" under the Program is not a true negotiation. The Program lacks clear communication between impacted parties, reasonable opportunity for manufacturer input, and most importantly lacks ability for impacted stakeholders to identify and correct errors which prohibits mutual assent. Instead, Congress describes price setting under the veil of negotiation,

² See T. Abbott & J. Vernon, *The Cost of US Pharmaceutical Price Reductions: A Financial Simulation Model of R&D Decisions*, 28 Managerial & Decision Econ. 293 (2007); see also Vital Transformation, *The Historical Impact of Price Controls on the Biopharma Industry* (2021), <https://vitaltransformation.com/2021/11/the-historical-impact-of-price-controls-on-the-biopharma-industry/>.

and Seagen urges CMS to use its implementation authority to make the Program a more equitable and transparent process for all stakeholders.

I. Qualifying Single Source Drugs and Negotiation-Eligible Drugs

A. Seagen strongly encourages CMS to define a Qualifying Single Source Drug as encompassing a single New Drug Application (NDA) or single Biologics License Application (BLA) in alignment with statute.

Section 1192(e) of the Social Security Act (SSA) generally defines “qualifying single source drug” to mean:

- A drug product “that is approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act [FDCA] and is marketed pursuant to such approval” where “at least seven years have elapsed since the date of such approval” and “that is not the listed drug for any [generic] drug that is approved and marketed”;³ and
- A biological product “that is approved under section 351(a) of the Public Health Services Act [PHSA] and is marketed under section 351(a) of such Act where at least eleven years has elapsed since the date of such licensure” and “that is not the reference product for any [biosimilar] biological product that is licensed and marketed.”⁴ The statute provides for limited exclusions from this definition for certain orphan drugs, plasma-derived products, low Medicare-spend drugs, as well as an exclusion for small biotech drugs under the definition of negotiation-eligible drugs.

Under the initial guidance for biologics, CMS proposes to identify a qualifying single source drug as all dosage forms and strengths with the same active ingredient and the same BLA holder, “inclusive of products that are marketed pursuant to different BLAs. CMS intends to apply a similar approach to drug products. We urge CMS to identify a qualifying single source drug by reference to a single NDA or BLA. Under statute, “qualifying single source drug” is defined for products approved under an NDA or BLA by reference to whether enough years has elapsed since “such approval”⁵ or “such licensure,”⁶ respectively.

By using these terms which refer to an “approval” and a “licensure” in the singular, the statute clearly defines qualifying single source products by a single distinct NDA or BLA. There is no alternative definition

³ SSA § 1192(e)(1)(A) (the seven years are counted to the selected drug publication date with respect to the applicable initial price applicability year (IPAY)).

⁴ *Id.* § 1192(e)(1)(B) (the eleven years are counted to the selected drug publication date with respect to the applicable IPAY).

⁵ SSA § 1192(e)(1)(A).

⁶ *Id.* § 1192(e)(1)(B).

supported by the language or intended by Congress. Therefore, CMS must adopt the same definition when identifying single source drugs under the Medicare Drug Price Negotiation Program.

Additionally, by following the plain language of the statute identifying a single source drug by reference to the individual NDA or BLA, the associated dosage forms and strengths, across which Medicare expenditures are aggregated and the MFP applied, must also be referenced to the assigned NDA or BLA of said product. In a letter to the Agency, certain members of Congress call this “an apparent effort to subject as many medications as possible to the IRA’s price-setting program” by using “an unusual definition of ‘qualifying single-source drugs’ that aggregates entirely different medications according to their active ingredient or moiety, thereby discouraging research into future drug indications.”⁷ As the Agency’s initial guidance constitutes overreach, CMS must correct its approach to align to the statute by specifying that for purposes of aggregation of Medicare expenditures and application of the MFP, dosage forms and strengths are also identified by reference to the NDA or BLA of the qualifying single source.⁸

II. Orphan Drugs

A. Seagen encourages CMS to exclude products with multiple orphan indications, where all indications for a given product are orphan.

The Inflation Reduction Act categorically excludes a drug from negotiation eligibility if the drug is “designated as [an orphan drug] for only one rare disease or condition . . . and . . . the only approved indication (or indications) is for such disease or condition.”⁹ In an attempt to reach the most patients who could benefit from a therapy, it is not uncommon for a single product to be tested and approved for use in multiple orphan diseases. Due to the inherent complexities in developing drugs for orphan diseases, where a single product provides benefit to more than one orphan disease, under the current statute that drug or biologic receives no protection from Medicare price negotiation. This harms all patients – whether orphan disease or otherwise – who are waiting for breakthroughs while simultaneously disincentivizing manufacturers from pursuing additional trials for products that already serve a separate orphan disease.

⁷ Republican letter to the Agency on April 12, 2023, available at https://www.finance.senate.gov/imo/media/doc/sfc_ira_price-setting_program_implementation_guidance.pdf

⁸ Regardless of the “qualifying single source drug” definition adopted by the Agency, CMS must **consistently** apply such definition. As such, if CMS were to maintain that products that share the same active moiety (drugs) or the same active ingredient (biologics) are the same qualifying single source drug, BIO agrees that the market entry of a generic or biosimilar to **any** such product would disqualify **all** such products from treatment of a qualifying single source drug. See Initial Guidance at 10. Any other approach would be irreconcilable with CMS’s stated “qualifying single source drug” definition. See, e.g., *Nat’l Credit Union Admin. v. First Nat. Bank & Tr. Co.*, 522 U.S. 479, 501–02 (1998) (a basic canon of interpretation is that similar or identical language “be accorded a consistent meaning”).

⁹ SSA § 1192(e)(3)(A) (such drugs are categorically ineligible for selection for negotiation because they are excluded from the definition of “qualifying single source drug”).

B. CMS should clarify that, where an orphan drug loses eligibility for the orphan drug exclusion, the seven- or eleven-year “qualified single source drug” clock runs from *the date on which the drug lost eligibility for the exclusion*.

Doing so would help maximize protection for orphan drugs. Absent such clarification, an orphan drug that loses eligibility for the orphan drug exclusion could be virtually immediately subject to selection for negotiation, simply because it was designated as an orphan drug for a second rare disease, or an indication was approved for a second disease. CMS should act to avoid such a result, as it would further disincentivize developers of orphan drugs from investing in treatments for orphan diseases.

Implementing the above recommendations is necessary to mitigate the risk that the Program will deter the development of orphan drugs to treat those suffering from rare diseases. It is also fully consistent with long-standing Congressional policy favoring protection of orphan drugs. The orphan drug exclusion is merely the latest of a long line of Congressional policies protecting orphan drugs. Such policies date back to the early 1980s, when Congress enacted the Orphan Drug Act of 1983 to create various incentives to encourage and facilitate the development of new orphan drugs.¹⁰ In keeping with Congress’s long-held policy of protecting orphan drugs, CMS should make every effort to ensure that it does not hamper orphan drug innovation as it implements the Program and its orphan drug exclusion.

III. Selection Process for Negotiation

A. CMS must adopt a clear appeal process for stakeholders to request additional consideration or review of CMS selection decisions.

For each IPAY, the statute directs CMS to publish a list of the drugs that have been selected for negotiation (under statutorily specified parameters) by February 1 of the year that is two years before such IPAY (with a modified timeline for IPAY 2026).¹¹

Although the Inflation Reduction Act contains limits on administrative and judicial review of certain determinations, CMS still has significant discretion in establishing procedures to resolve disputes and correct errors that arise during the MFP decision-making process. Seagen strongly urges CMS to exercise its discretion and adopt an early-notice and dispute resolution process at least 12 months prior to intended selection of a drug or biologic for negotiation, consisting of both notice of selection intent and anticipated non-FAMP ceiling, to afford due process and ensure the integrity of the Program for future IPAYs. Eligibility

¹⁰ See Orphan Drug Act, Pub. L. No. 97-414, §§ 1, 2, 96 Stat. 2049, 2049–51 (1983), as amended by Pub. L. 98-551, 98 Stat. 2815, 2817 (1984).

¹¹ SSA §§ 1191(b)(3), 1192(a); see also *id.* § 1191(d)(1) (September 1, 2023, for IPAY 2026).

for selection is based on multiple factors, including whether a sufficient number of years have elapsed since approval or licensure;¹² whether a generic or biosimilar has come to market;¹³ whether the drug is eligible for the orphan drug exclusion;¹⁴ whether the drug is a plasma-derived product;¹⁵ whether the drug is a small biotech drug;¹⁶ whether Medicare expenditures are sufficiently low to disqualify the drug from selection;¹⁷ and whether Medicare expenditures are sufficiently high to qualify the drug for selection.¹⁸

Additionally, CMS intends to require manufacturers to submit newly approved NDC-11s, as well as delisting existing NDC-11s within 30 days of marketing discontinuation for the calculation of total expenditures. This is yet another area where manufacturers must be able to identify and correct errors in this list to avoid under- and misattribution by CMS.

Implementation of the Inflation Reduction Act is complex, and without the inclusion of a robust process for manufacturers to provide input and suggested corrections it will be easy for errors to be made. In fact, mistakes already have been made by the Agency during Inflation Reduction Act implementation. Specifically, the Medicare Part B Inflation Rebate beneficiary coinsurance reduction amounts were calculated and published in error (we believe due to use of the incorrect reference quarter)¹⁹. This mistake underscores the critical need for stakeholders to be able to identify and request correction of future errors, particularly since errors within the negotiation program could easily lead to significantly reduced patient access.

IV. Negotiation Process

A. Seagen recommends specific steps to improve the proposed negotiation process.

The statute requires CMS to “develop and use a consistent methodology and process...for negotiations” of the MFP.²⁰ Congress intended for the negotiation process to be transparent and predictable for all participants, and although no two negotiations will be alike, every negotiation should be subject to a clear and reasonable assessment framework. The framework should be published with public comment solicited

²⁰ SSA § 1194(b)(1). The renegotiation process must be consistent with the negotiation process to the extent practicable. *Id.* § 1194(f)(1), (4).

and incorporated by the Agency, and should be applicable to all negotiations, both initial and all renegotiations.

Additionally, because each negotiation will necessarily be unique, assessments for oncology products should be completed for each indication, considering each patient population, disease state, and line of therapy, in alignment with the label prescribing information. Cancer is different and cannot be equated to diabetes, asthma, autoimmune diseases, or other chronic diseases. Assessment and review of individual oncology products must consider the targeted nature of the therapy, including the disease state, patient population, line of therapy, and any biomarker considerations. Due to these complexities, targeted cancer therapies, like the ones manufactured by Seagen, must receive individual review at the individual NDA, BLA or NDC-11/J-code level. This review should include the input of a therapeutic-assessment advisory committee inclusive of medical professionals with representation across specialties to ensure appropriate consideration of all factors throughout the negotiation process. An informed panel must include physician representation with deep experience treating in the specialty (such as oncologists for oncology selected drugs), health economists, and patient representation from the specialty. Such an approach will ensure differences between disease states, patient populations, and medical need are assessed appropriately and further Congress and CMS's shared goal of protecting patient access.

B. Seagen asks CMS to consider research and development costs appropriately.

Regarding the negotiation factors submitted by manufacturers in accordance with section 1194(e)(1) of the Act, Research and Development Costs should include drug development platform costs associated with the development of the selected drug. Additionally, to protect and encourage innovative drug development, Research and Development Costs should include the cost of development of drugs in which development was discontinued at a ratio of the manufacturers reinvestment rate of revenue to drug development costs in the therapeutic area of the selected drug.

C. Seagen requests the Agency allow flexibility in the submission of manufacturer information and allow additional engagement between negotiating parties.

Since individual circumstances of a selected product will vary and may not be identified in advance for every possible future negotiation, the Agency must afford flexibility to manufacturers by allowing submission and due consideration of all forms of clinical, health economic and outcomes research (HEOR), real world evidence (RWE), patient reported outcomes (PROs), and other additional evidence deemed relevant and meaningful by the manufacturer. Related, as all evolving market dynamics may not be anticipated, a manufacturer should also be permitted to supplement its timely submission where a post-submission development arises or there otherwise is good cause. It is vital that CMS allow such submissions after the

submission deadline. In addition to allowing for such submissions, the Agency must include supplemental information in its assessment of the product.

Furthermore, at any point in the offer and counter-offer process, either the manufacturer or CMS should be allowed to request confidential live or virtual engagements to ensure transparency in the assessment of products assessed for negotiation.²¹ Following an assessment process which includes these critical steps is not only statutorily required but also helps to ensure that CMS complies with its legal obligation to treat similarly situated entities similarly, absent a reasoned basis for distinction.²²

D. To support clarity in the Medicare Drug Price Negotiation Program, CMS should provide *meaningful justification* of its initial offer or any counteroffer. CMS must also provide the manufacturer with enough time for response during the negotiation process.

Open dialogue will be vital to the transparency of the Program. To this end, Seagen asks CMS to specify that its initial offers and its responses to any counteroffers include *meaningful* explanations of how the Agency arrived at the offer or response. *Meaningful explanations* should include the citing of any sources CMS used in its review.

In addition, as part of a negotiation process, both CMS and manufacturers should be afforded the same amount of time for review and submission of initial and/or subsequent offers. Seagen respectfully requests CMS commit to responding to any counteroffer within 30 days. We further ask CMS to commit to affording at least 30 days for manufacturers to comment on the response and for CMS to consider any such comment before the MFP is set. Such protections are essential to ensuring the integrity of a sustainable negotiation process.

E. Seagen requests CMS protect the confidentiality of any proprietary information submitted in the course of negotiation.

The statute imposes a clear confidentiality requirement: “Information submitted to . . . [CMS] . . . by a manufacturer of a selected drug that is proprietary information of such manufacturer (as determined by . . . [CMS]) shall be used only by . . . [CMS] or disclosed to and used by the Comptroller General of the United States for purposes of carrying out [the Program].”²³ Seagen understands the importance of protecting confidentiality and asks CMS to honor similar protections of proprietary information submitted by manufacturers to the Agency during the course of negotiation. This is consistent with the approach taken

²¹ Initial Guidance at 55.

²² See *Bracco Diagnostics*, 963 F. Supp. at 27–28.

²³ *Id.* § 1193(c).

in other areas of federal law and policy, which have long given special consideration to such highly sensitive information.

We appreciate CMS's confirmation that the protections under FOIA, including the prohibition on disclosure of information designated as confidential without providing a pre-disclosure notification and an opportunity to raise objections to disclosure,²⁴ will apply to information submitted under the program.²⁵ We seek confirmation that the protections under government price reporting law and policy will also apply. Related, the 340B Drug Pricing Program (340B Program) generally prohibits disclosures of information submitted by manufacturers under the program.²⁶ Where confidential commercial information is protected against disclosure under this or other federal programs, CMS should follow existing precedent by protecting such information against disclosure.

V. MFP-Setting for Critically Important Products, Like Those that Treat Cancer

A. Seagen encourages CMS to set MFPs responsibly and should recognize the importance of differentiated evaluations in critical disease states, like cancer.

CMS proposes to identify a single price for use during the negotiation process based on a 30-day equivalent supply. This is unreasonable in complex disease states, like cancer. Cancer patient populations are unique and because of the nuances of disease progression, CMS must not lump therapies into buckets based solely on site of the tumor. A treatment that works well for a breast cancer patient with a HER2 mutation, for example, may be completely ineffective for a patient without such mutation. Therefore, CMS must consider only appropriate treatments for a given indication together, without bucketing treatments into oversimplified groups. This is one of the complexities leading Seagen to request different treatment for oncology therapies.

B. CMS must acknowledge that medications treating cancer, including cancer therapies treating multiple indications cannot have therapeutic alternatives in most cases, and therefore, must always be assigned the MFP ceiling.

Cancer therapies often have more than one indication, allowing them to serve multiple distinct patient populations. Because cancer patient populations can be small and heterogeneous, ongoing clinical trials of proven medications are the most efficient and expedient way to bring appropriate care to patients battling diverse cancer diagnoses. In fact, it is often the case that innovative cancer medications do not have a true

²⁴ See 45 C.F.R. §§ 5.41, 5.42.

²⁵ Initial Guidance at 29.

²⁶ Health Res. & Servs. Admin., General Instructions for Completing the Pharmaceutical Pricing Agreement 7 (2019), available at www.hrsa.gov/sites/default/files/hrsa/opa/pharmaceutical-pricing-agreement-example.pdf.

therapeutic alternative due to the specific patient population or biomarker targeted. Cancer patients require these hyper-targeted approaches to fight aggressive diseases. Therefore, Seagen does not believe CMS should start at an ASP of therapeutic alternatives unless said alternative is for the exact same indications and patient sub-populations. Within the statutory limitations, Seagen strongly encourages CMS to assign the MFP for all cancer medications with multiple indications at the statutory ceiling at initial and all renegotiations. Application of the MFP ceiling may still risk decline in investment into multiple indications.

As stated initially, while this proposed guidance is intended for the negotiation of Part D drugs for 2026 only, for the reasons outlined above there needs to be a separate opportunity to comment on the Program for Part B drugs beginning 2028.

VI. Conclusion

As a global biotechnology company, Seagen recognizes the responsibility to improve and expand access to our medicines to patients in need. Seagen appreciates the complexity of implementing a program this size and we reiterate our request that the Agency engage in thorough review and consideration of these comments. We look forward to ongoing discussions and additional opportunity to provide feedback on future IPAYs, particularly when physician administered drugs are included.

Sincerely,

Re: Sections 40.4 and 90.2: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani:

The Senior Care Pharmacy Coalition (“SCPC”) appreciates the opportunity to provide comments on the March 15, 2023 memorandum issued by the Centers for Medicare & Medicaid Services (“CMS”), entitled *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments* (the “Draft Guidance”), and particularly Sections 40.4 (“Providing Access to the MFP”) and 90.2 (“Monitoring of Access to the MFP”) addressing how drug manufacturers may provide pharmacies with access to drugs at “maximum fair price” (MFP). Respectfully, we believe that the Draft Guidance does not properly account either for how pharmacies purchase drugs from wholesalers, or how pharmacies are reimbursed for the sale of those drugs by Part D Plans (PDPs), even in situations where the drug manufacturer provides a discount to the drug price such as in the Part D Manufacturer Coverage Gap Discount program in operation today. For that reason, **we urge CMS to significantly revise Sections 40.4 and 90.2 to simply require that manufacturers and Part D Plans afford pharmacies access to MFP prices using the same methodologies used by manufacturers, PDPs, and pharmacies today.** There is no need to build new systems – much less systems that likely will prove unworkable or unduly disruptive in the marketplace. In Appendix A, we offer specific amendments to the respective provisions in the Guidance which we believe will meet the agency’s operational goals while avoiding undue burden for pharmacies and other affected stakeholders.

SCPC is the only Washington-based organization exclusively representing the interests of long-term care (LTC) pharmacies. SCPC's membership includes 80% of all independent LTC pharmacies. Our members serve one million residents daily in skilled nursing facilities and assisted living communities across the country.¹ Given the distinct characteristics of the LTC patient population and the enhanced clinical responsibilities of LTC pharmacies, we offer unique perspectives on CMS' initiatives and proposals, particularly how Medicare Prescription Drug Benefit ("Part D") policies and requirements impact Part D enrollees with institutional level of care needs and the LTC pharmacies that serve them.

CMS correctly notes that § 1193(a)(1)(A) of the Inflation Reduction Act (IRA) requires manufacturers to afford pharmacies and other dispensers to access MFP prices. Unfortunately, the statute provides no guidance regarding implementation. It appears that CMS has imported a concept from a different section of the IRA into the provision in the Guidance pertaining to § 1193(a)(1)(A). The unrelated provision, section 1860D-14C(c)(1)(B), concerns the Part D Manufacturer Discount which requires manufacturers to ensure that a pharmacy is paid for the difference between the "negotiated price" and the "discounted price" of a Part D drug within 14 days for electronic claims and 30 days for non-electronic claims, select provisions from another section of the IRA into the Guidance related to CMS seems to have imported the 14 day requirement – but not the 30-day requirement – into § 1193(a)(1)(A) of the Guidance. We respectfully suggest that, since Congress explicitly included a retroactive reconciliation provision in § 1860D-14C(c)(1)(B) but not in § 1193(a)(1)(A), Congress did not delegate authority to the agency to mandate how manufacturers or wholesalers may reconcile the difference between a "negotiated price" and pharmacy acquisition costs retroactively. Although the existing coverage gap discount program process operated by Palmetto² may be a useful model for reconciliation between manufacturers and Part D Plans ("PDPs" or "Plans"), Section 1193(a)(1)(A) should be implemented differently than proposed in the Draft Guidance.

The Draft Guidance misapprehends how pharmacies acquire and dispense medications. Section 40.4 suggests that manufacturers should ensure that either: (1) the pharmacy acquisition cost for a drug subject to price negotiation is at the MFP price; or (2) retrospectively, through wholesalers, as suggested in Section 90.2, reconcile the price with the pharmacy. Neither option is viable for pharmacies.

The first option for pharmacies to acquire at the MFP price is not possible to implement as pharmacies do not and cannot acquire drugs at the MFP price. Virtually all pharmacy purchases from wholesalers are at Wholesale Acquisition Cost (WAC). At the time that pharmacies purchase drugs from wholesalers, they do not know the patients to whom the drugs will be dispensed. Pharmacies in general, and LTC pharmacies in particular, do not maintain separate inventories for each of various payers that may reimburse them for dispensing a drug. Pharmacies simply do not

¹ This figure is based on pre-pandemic facility occupancy rates. Our members also serve an increasing number of individuals with LTC needs, including Medicare beneficiaries, living in community settings and at home.

² <https://tpadministrator.com/internet/tpaw3.nsf/T/CGDP%20Reconciliation>

maintain separate inventories for Part D, Medicaid, VA, DoD, Commercial, and other payers, and there are not different acquisition costs from wholesalers depending on the patient that the pharmacy anticipates will in the future be dispensed the product. Thus, there is no way for either manufacturers or pharmacies to create a special pharmacy acquisition cost at the MFP price exclusively for eligible Part D beneficiaries. The first option in the Draft Guidance – requiring the manufacturer to ensure that the pharmacy acquires the drug at the MFP price – would be impossible to implement.

Similarly, the second option - reconciliation between manufacturers and pharmacies directly or through wholesalers – is not viable. Pharmacies acquire drugs from wholesalers at WAC, and then are reimbursed by the relevant plan or payer based upon a contractual formula [often calculated based upon a published “Average Wholesale Price” (AWP)] which is intended in part to cover the acquisition cost amount. It is common that the relevant plan or payer (including Medicare Part D Plans) will dictate the price the pharmacy must charge the insured (including the Part D beneficiary). The payer-determined price pharmacies must charge typically is lower than the WAC or the contractual AWP price. To the extent that this occurs (and it is very common that the price at the point of sale is lower than the pharmacy acquisition cost), the plan or payer pays the pharmacy the AWP contractual formulary rate, and then reconciles that payment with the manufacturer, directly or through a third-party administrator, through a rebate, discount, or other mechanism. This is how the Part D program operates today, and how it should continue to operate, even for drugs with MFP prices.

Importantly, in both the Part D program (including the existing Coverage Gap Discount Program which faces similar issues) and all other programs today *the manufacturer does not reconcile the price with the pharmacy, either directly or through wholesalers*. In fact, wholesalers are not part of this information flow at all, given that wholesalers never have claims-level data about which patients received a given drug or what the applicable price should be for any given plan or payer. Instead, **any “reconciliation” of the pharmacy purchase price and the “negotiated price” takes place between the Plan and the manufacturer without pharmacy involvement**. The Draft Guidance would necessitate creation of a new mechanism relying in significant part on wholesalers, companies which lack the information necessary to undertake the intended reconciliation, and on pharmacies, which lack the time and resources necessary to engage directly with manufacturers as contemplated in the Draft Guidance. This approach, moreover, would be duplicative of a process already in place between manufacturers and PDPs that is working effectively in the Part D program today. For these reasons, we urge CMS to eliminate any suggestion or requirement that manufacturers reconcile prices directly with pharmacies or use wholesalers to do so.

We urge that CMS revise the Draft Guidance to permit manufacturers, PDPs, and pharmacies to adapt existing mechanisms to ensure pharmacy access to MFP prices. Section 90.2 of the Draft Guidance recognizes that “there is widespread use of chargeback payments and rebate mechanisms among the pharmaceutical stakeholders in the private sector, which allows for entities to receive rebates or discounts on their purchases after those purchases are made, based on the specific

population to whom the drug or biological is dispensed. As appropriate, the private sector may make modifications to these existing mechanisms to effectuate access to the MFP. SCPC urges that CMS need say nothing else in either Section 40.4 or in Section 90.2 regarding the manner in which manufacturers must comply with the statutory requirement to provide the MFP price to pharmacies or beneficiaries. This approach would allow manufacturers and PDPs to rely on existing processes without creating a duplicative process solely for MFP prices, asking wholesalers to undertake tasks for which they lack adequate information, and unduly burden pharmacies which can ill-afford the added costs and administrative burdens the provisions of the Draft Guidance would require. If the Guidance says more, we urge CMS to adopt the existing Coverage Gap Discount Program methodology, operated by Palmetto today, which allows Plans to pay pharmacies for drug acquisition cost and then has manufacturers reconcile payments to account for drug pricing discounts without the involvement of the pharmacy.

To simplify the Guidance and consistent with the comments above, we have attached a “redline” of the Draft Guidance translating our comments into specific revisions to the Draft Guidance, which we believe will result in a more streamlined and workable method for assuring that pharmacies have access to MFP pricing without undue burden.

We raise two other issues: first, the shift in drug pricing risks significant economic ripple effects across wholesalers, Plans and PBMs, Pharmacy Services Administrative Organizations (PSAOs) and others in the distribution chain. We urge CMS to clarify in the Guidance that Plans need to maintain pharmacy reimbursement to ensure that it is sufficient to cover the pharmacy’s acquisition costs and the costs of dispensing the medication, including the additional costs associated with long-term care pharmacy dispensing. Without such clarification, CMS risks damaging the existing national network of LTC pharmacies and putting patient access at risk.

Second, SCPC notes that the draft Guidance proposes to calculate the MFP price based upon the lowest unit of drug or biological, aggregating numerous drugs or biologicals with different active ingredients, different dosage forms, different strengths, and other differences. We note that this approach seems inconsistent with Congressional intent because it mixes and matches different products and different manufacturers when determining MFP. We caution that whatever pricing metric CMS chooses must be translated back to a price per NDC-11 (the specific National Drug Code the FDA assigns to each drug, specific to dosage form and strength), which is a legal prerequisite for pharmacies to process claims. The entire pharmacy electronic transaction system is based upon tracking products based upon their NDC-11, and the only way in which pharmacies will be able to offer MFP prices to beneficiaries at the point of sale is if there is price per NDC, at the NDC-11 level. We urge CMS to take this into account in updating and revising its Draft Guidance.

APPENDIX A – PROPOSED AMENDMENTS TO DRAFT GUIDANCE

Section 40.4

40.4 Providing Access to the MFP

After entering in an Agreement with CMS and in accordance with section 1193(a) of the Act, the manufacturer of a selected drug that is a covered Part D drug (as defined in section 1860D-2(e) of the Act) must provide access to the MFP to MFP-eligible individuals (defined in section 1191(c)(2)(A) of the Act and section 80 of this memorandum) and to pharmacies, mail order services, and other dispensers with respect to such MFP-eligible individuals who are dispensed that drug during a price applicability period.

Under section 1860D-2(d)(1)(D) of the Act, as amended by section 11001(b) of the IRA, the negotiated prices used in payment by each Part D plan sponsor for each selected Part D drug must not exceed the applicable MFP plus any dispensing fees for such drug. In Part D, the negotiated price of a Part D drug is the basis for determining beneficiary cost-sharing and for benefit administration at the point of sale. Therefore, the requirement that the price used for beneficiary cost-sharing and benefit administration cannot exceed the MFP (plus dispensing fees) ensures that Part D MFP-eligible individuals will have access to the MFP at the point of sale. Therefore, while section 1193(a)(1)(A) of the Act specifies that manufacturers must provide access to the MFP to MFP-eligible individuals, as a practical matter that will be accomplished by Part D plan sponsors without additional steps required of the manufacturer.

However, section 1193(a)(1)(A) of the Act also requires that manufacturers provide access to the MFP for selected drugs to pharmacies, mail order services, and other dispensers with respect to MFP-eligible individuals who are dispensed such drugs. CMS intends to require that the Primary Manufacturer ensure that entities that dispense drugs to MFP-eligible individuals, including pharmacies, mail order services, and other dispensers, have access to the MFP for the selected drug in accordance with section 1193(a) of the Act and as further discussed in section 90.2 of this memorandum. ~~CMS intends to define “providing access to the MFP” as ensuring that the amount paid by the dispensing entity for the selected drug is no greater than the MFP.~~

~~CMS intends to require that Primary Manufacturers provide access to the MFP in one of two ways: (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP; or (2) providing retrospective reimbursement for the difference between the dispensing entity’s acquisition cost and the MFP. As part of this obligation, the Primary Manufacturer must ensure the MFP is made available to pharmacies, mail order services, and other dispensers for units of the selected drug for which there is a Secondary Manufacturer.~~

~~Further, CMS intends to require that a Primary Manufacturer achieve certain outcomes to comply with the requirement under section 1193(a)(1)(A) of the Act to provide access to the MFP:~~

~~1. A Primary Manufacturer would be required to submit its process for making the MFP available for the selected drug in writing to CMS at least 30 days before the start of the initial price applicability year for the selected drug. CMS intends to publish these processes on the CMS IRA website. For initial price applicability year 2026, a Primary Manufacturer of a selected drug must send its process for ensuring MFP availability to CMS in writing by December 2, 2025. A Primary~~

~~Manufacturer would also be required to notify CMS of any changes to its process for making the MFP available at least 30 days before the change goes into effect.~~

~~2. CMS intends to monitor for compliance and audit, as needed, to ensure that the MFP is being made available for the selected drug. A Primary Manufacturer would be required to retain for at least ten years from the date of sale any records relating to sales of the selected drug to entities that dispense the selected drug to MFP-eligible individuals, including pharmacies, mail order services, and other dispensers for units of selected drug. See section 90.2 of this memorandum for additional details.~~

~~3. CMS intends to require that a Primary Manufacturer ensure that pharmacies, mail order services, and other dispensers as well as intermediate entities, such as wholesalers, as applicable, are reimbursed timely for the full amount of the difference between their acquisition cost for the selected drug and the MFP within 14 days. Manufacturers or their contracted entities shall not charge any transaction fee for this process. CMS intends that the Agreement would not restrict the Primary Manufacturer or Secondary Manufacturer(s) from offering a price lower than the MFP. CMS reiterates that Primary Manufacturers would be responsible for ensuring that the MFP is made available to pharmacies, mail order services, and other dispensers that dispense the selected drug to MFP-eligible individuals, including ensuring that MFP is available for units of the selected drug for which there is a Secondary Manufacturer.~~

Section 90.2

90.2 Monitoring of Access to the MFP

In accordance with section 1193(a)(3)(A) of the Act, under the Agreement with CMS with respect to a price applicability period, access to the MFP with respect to such a selected drug shall be provided by the Primary Manufacturer to MFP-eligible individuals at the pharmacy, mail order service, or other dispenser at the point of sale, and to the pharmacy, mail order service, or other dispenser with respect to such MFP-eligible individuals who are dispensed the selected drug. Existing systems under the Coverage Gap Discount Program exist for manufacturers and Plans to address these issues and these systems should be used in the future to ensure pharmacies are appropriately reimbursed by Plans so that MFP-eligible beneficiaries maintain access to MFP prices without harming the pharmacy.

~~Further, in accordance with section 1193(a)(5) of the Act, which requires that the manufacturer comply with requirements determined by the Secretary to be necessary for purposes of administering the program and monitoring compliance with the program, and section 40.4 of this memorandum, CMS intends to require that the Primary Manufacturer establish safeguards to ensure the MFP is available to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers on units of the selected drug for which there are Secondary Manufacturers, as described in section 40.4 of this memorandum. CMS reiterates that the requirement to provide~~

~~access to the MFP applies to all sales of the selected drug to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers that are providing a selected drug to an MFP-eligible individual, as discussed in section 80 of this memorandum.~~

~~Moreover, in accordance with section 1196(a)(3)(A) of the Act, CMS intends to establish procedures for reporting violations related to access to the MFP with respect to MFP-eligible individuals who are enrolled in a PDP under Part D of title XVIII or MA-PD plan under Part C, as described later in this section.~~

Each component of the pharmaceutical supply chain may have a role in making the MFP available to MFP-eligible individuals, but it is ultimately the Primary Manufacturer's responsibility to ensure access to the MFP. There are various methods by which dispensing entities and MFP-eligible individuals can determine whether they are accessing the MFP for a selected drug.

For example, under section 1195(a) of the Act, the MFPs for selected drugs will be published by CMS, giving the public and other interested parties an opportunity to know the MFP for each selected drug, as well as the explanation for each MFP (see section 60.6 of memorandum for additional details). Under section 1191(d)(1), the MFPs for selected drugs for initial price applicability year 2026 must be published by September 1, 2024. In addition, CMS anticipates that pharmaceutical database companies will publish the MFPs such that they would become more readily accessible to pharmaceutical purchasers. CMS believes such transparency of the MFPs for selected drugs will help dispensing entities and MFP-eligible individuals to know the MFP for a selected drug and determine whether they are able to access the MFP. CMS is seeking comments on additional ways that CMS could help dispensing entities and MFP-eligible individuals know the MFP for a selected drug and determine whether they are able to access it.

Moreover, with respect to operationalizing access to the MFP, CMS intends to leverage existing mechanisms to ensure that dispensing entities have access to the MFP, and that the MFP for a selected drug is provided only to MFP-eligible individuals. ~~For example, each Medicare Part D plan is required to use a unique Part D processor identification number (RxBIN) and Part D processor control number (RxPCN) combination to identify a Medicare Part D payer. This existing mechanism will ensure that the pharmacy is able to identify at the point of sale whether the individual is an MFP-eligible individual.~~

In addition, there is widespread use of chargeback payments and rebate mechanisms among the pharmaceutical stakeholders in the private sector, which allows for entities to receive rebates or discounts on their purchases after those purchases are made, based on the specific population to whom the drug or biological is dispensed. As appropriate, the private sector may make modifications to these existing mechanisms to effectuate access to the MFP.

~~For example, a pharmacy may purchase a medication for \$100 per bottle and the MFP as applied to this selected package is \$80. The Medicare beneficiary is enrolled in a Part D plan under which coverage of the selected drug is available, thus the beneficiary is an MFP-eligible individual. For this example, the plan has not negotiated a lower price for the medication. The pharmacy provides the negotiated price (i.e., MFP plus a dispensing fee) at the point of sale to the Medicare beneficiary. As a result of this transaction, the pharmacy is owed \$20 by the manufacturer. The~~

pharmacy would submit the information regarding the \$20 chargeback amount to its wholesaler and receive a credit from the wholesaler for that amount. The wholesaler would be compensated by the manufacturer after billing the manufacturer for the chargeback amount.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Sionna Therapeutics appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Sionna Therapeutics is a life sciences company dedicated to developing highly effective and differentiated treatments for cystic fibrosis (CF) by normalizing the function of CFTR, the key protein associated with disease progression in CF. Building on over a decade of extensive research on the genetic mutations associated with CF and founded in 2019, Sionna is advancing a pipeline of small molecules engineered to correct the protein defects caused by $\Delta F508$, the most common mutation that affects the CFTR protein. The company has a first-in-class portfolio of programs targeting correction of NBD1, the key and unique mechanism to enable full restoration of $\Delta F508$ -CFTR function, and complementary programs targeting ICL4 and TMD1. Sionna's pipeline has the potential to deliver best-in-class efficacy and reach previously unachievable levels of long-term benefit for people with CF.

In addition to being a company focused on improving the standard of care for people living with cystic fibrosis, we are a group of individuals who collectively have contributed hundreds of years supporting the research and development of biopharmaceuticals. Our passion and dedication to drug development drives a priority to ensure that no modality of treatment, for example small molecules, or group of patients, for example those of Medicare eligibility, are at a disadvantage to the continued investment and development of therapeutic advancements. We have serious concerns about the Inflation Reduction Act and the broad implications it will have on future investment, drug development and ultimately improved standards of care for Americans.

For example, the nine years of pre-negotiation exclusivity afforded to small molecule therapeutics may in many cases be insufficient to attract investment necessary to undertake highly risky R&D in CF and other indications. This will skew investor interest toward large molecule modalities that are difficult to genericize and thus generate less long-term societal value. It will reduce investment in drugs that can reach intracellular targets. And it will dissuade companies from tackling the important challenges of treating diseases that affect America's seniors and other Medicare populations.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact Mike Cloonan, President & CEO by telephone at 617-819-2020 or by e-mail at mike.cloonan@sionnatx.com if you have any questions regarding our comments.

Sincerely,

Mike Cloonan
President & CEO

Re: Comments on “Initial Guidance” for Implementation of the Medicare Drug Negotiation Program Established by IRA

Dear Deputy Administrator Dr. Meena Seshamni,

On behalf of the Small Business & Entrepreneurship Council (SBE Council), I write to express concern about the initial implementation guidance for the Medicare Drug Price Negotiation Program established by the Inflation Reduction Act (IRA). This guidance proposed by the Centers for Medicare & Medicaid Services (CMS) would pose new impediments to the research and development of life-saving drugs, imperiling patients and small biotechs.

SBE Council is an advocacy, research and education organization dedicated to protecting small business and promoting entrepreneurship throughout the United States. Small businesses dominate every sector of the U.S. economy, which means their viability and growth is vital to quality job creation, innovation and competition within each industry. This includes the life-sciences industry, where small- and medium-sized companies employ over 70% of the nearly 1.9 million-member workforce.

These start-ups and small firms play a critical role in developing life-saving medicines, from novel cancer drugs to Covid-19 vaccines. In fact, small biotech companies developed more than half of FDA-approved drugs between 2011 and 2020.

To continue serving the needs of patients, these innovators rely on a transparent regulatory environment that actively seeks out and values their input. However, the new implementation guidance largely shuts them out of the government's decision-making process for the Price Negotiation Program.

While CMS has allowed stakeholders to submit their comments on the new guidance, they limited the comment period to just 30 days -- around half of the time normally allotted for public input on initial rules. For a large biotech company, marshaling the resources to submit comments within this narrow timeframe may not be as serious a challenge. But the same cannot be said for start-ups, who often do not have the administrative capacity to do so.

By severely constraining the ability of smaller innovators to engage with CMS on this guidance, the agency is sending a strong signal that it will not grant their input the attention it deserves.

The price-setting process, as reflected within the guidance, also severely lacks transparency. There's no guarantee that CMS will take stakeholder comments into account at all -- and respondents will have to wait 17 months before that crucial information is made available to them. That's six months *after* the maximum fair prices for relevant drugs have already been determined.

Soliciting insight from those directly involved in creating new treatments should give CMS an opportunity to hone its rules before making a final determination. Instead, the agency has opted to disengage with the life-sciences community -- particularly its smaller stakeholders.

This follows the problematic trend that began with the IRA itself. By imposing stringent price controls on a range of life-saving drugs, Congress failed to account for the devastating impact the law would have on the small- and medium-sized companies responsible for research and development.

CMS' initial guidance compounds the arbitrary nature of these policies, chilling innovation and jeopardizing patient access to new medicines. The provisions regarding "therapeutic reference pricing" and "unmet medical needs" encapsulate this problem.

The former would make price-setting decisions by referencing alternative treatment options available. Such reference pricing quickly breaks down in practice because of ill-defined standards. Even ostensibly minor differences between two "similar" medicines can have major clinical implications for patients. Because no two people living with a disease are exactly alike, some may respond well to one therapeutic but not another. By relying on therapeutic reference pricing, CMS would overlook patients' needs and inappropriately value new treatments that may be their best option for staying healthy.

Similar concerns apply to the agency's rule regarding drugs that address unmet needs. CMS has stipulated that it may adjust the price-setting starting point for treatments geared towards unmet medical need, which the agency defined as "treating a disease or condition in cases where very limited or no other treatment options exist." But this definition is so narrow in focus that it could exclude *any* medicine that provides patients with a measurable clinical benefit from the exemption criteria, provided it is not the only one that does so. Cutting-edge drugs that treat life-threatening diseases will be systematically devalued, and patients will bear the brunt.

In the long-term, provisions like these undermine the research and development ecosystem that enables new drugs to reach patients in the first place. If CMS aggressively imposes price controls in an arbitrary fashion, start-ups and investors in small biotechs will lose confidence that they can make a sufficient return on investment.

This is already happening in response to the IRA. Last October, the small biotech firm Alnylam Pharmaceuticals announced that they were suspending development on a treatment for a rare genetic eye disease, citing the law as their impetus for doing so.

These harmful consequences are only exacerbated by the guidance rules concerning intellectual property - which undergirds all innovation - and the emerging biosimilars market.

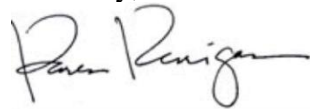

The guidance notes that CMS "intends to consider the length of...available patents and exclusivities" in deciding whether to force down the price of a drug. But this is a non-starter for small biotech companies. It commonly costs \$2 billion to bring a new treatment to market, a process that can span a decade. Acquiring exclusive rights to the drug is the *only* way to guarantee a return on investment.

The impact will be particularly damaging for research and development that happens after a drug receives FDA approval. Manufacturers often seek additional patents so they can fine-tune their drugs and bolster efficacy. Post-approval research is especially crucial for cancer drugs. As one example, Merck's cutting-edge melanoma immunotherapy drug Keytruda is only halfway through its full development program.

Small biotechs producing biosimilars will face similar obstacles that hinder development. While the IRA enables biosimilar developers to request a delay on price controls for specific drugs, CMS will not make this option available to those currently involved in litigation against reference manufacturers. But these legal disputes often precede the given biosimilar gaining approval and coming to market within the necessary time period.

Small- and medium-sized companies are already buckling under existing IRA provisions that encumber research and development. For the sake of those who develop life-saving treatments, we strongly urge CMS to correct the provisions of their implementation guidance that will intensify this crisis.

Sincerely,

Karen Kerrigan

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure,

Sparrow Pharmaceuticals appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program Guidance Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comment posted on the CMS website on 15 March 2023 (Drug Price Negotiation Program Guidance).

Sparrow is a private, clinical-stage pharmaceutical company that aims to spare patients the ravages of steroids. We have two small molecule drugs in ongoing Phase 2 clinical trials.

- SPI-47 is a glucocorticoid. Millions of US patients rely on glucocorticoid medications (e.g., prednisone, dexamethasone) to control autoimmune diseases, prevent transplanted organ rejection, and treat various cancers, severe COVID disease, and other conditions. But they do so at tremendous costs: glucocorticoids are associated with ~10% of all drug adverse events reported to FDA and ~10% of all drug-related hospitalizations in the US. SPI-47 will be a combination of prednisolone (a glucocorticoid) with a novel small molecule drug (SPI-62) that modulates glucocorticoid metabolism in a manner that has potential to prevent or reverse many glucocorticoid adverse events whilst maintaining glucocorticoid efficacy.
- SPI-62 as monotherapy has potential to prevent or reverse the morbidity associated with cortisol (our natural glucocorticoid) excess caused by benign tumors: Cushing's syndrome (an orphan disease) and autonomous cortisol secretion (a common but mostly undiagnosed disease).

Although Sparrow, even if successful, will not have products on the market until after 2026, the proposed guidance will be harmful to Sparrow's ability to provide innovative therapies to millions of US patients with unmet medical needs.

Recognizing that CMS is not seeking comments on Section 30, its negative impact on our business is so severe that this letter would be incomplete without elaborating our concerns.

That innovative small molecule drugs are subject to CMS price negotiation only 9 years after launch is harmful to several key Biden Administration goals. That needs to be changed to 13 years to put small molecules on equal footing with biologics, lest the industry continue a shift to fewer small molecules and more biologics, which has started already.

- The shift will increase drug and other medical costs in the long-term, exactly the opposite of IRA's intent.
 - During exclusivity, biologics are on average more expensive than small molecules.
 - Biologics are often administered by infusion, which brings additional Part B costs on top of higher Part D costs.
 - It is more complex to genericize a biologic to a biosimilar than an innovative small molecule to a generic.
 - Biosimilars are much more expensive than generics. More high-priced biosimilars will become a perpetual feature of US healthcare.
- The shift will reduce our industry's productivity to answer President Biden's "cancer moonshot".
 - Many drug targets that could be the basis for future cancer cures are inside cells, and so not accessible by biologics.
 - As companies reduce resource commitment to small molecules, some of those targets will be passed over for drug development.
 - This will impact other areas of medicine besides cancer.
- The shift will negatively impact high-quality US jobs in small molecule drug manufacturing, just as the Administration aims to expand the capacity to ensure US supply of essential medicines. Without a strong supply of innovative small molecules, that sector of US industry will be forced to contract rather than expand.

For Sparrow specifically, the small molecule penalty makes it more challenging to attract the financing essential to continue development of our innovations. Because our target is found only inside cells, it is not amenable to a biologic approach. We have a chance to deliver novel therapies that are effective, safe, convenient, and cost-effective for millions of US patients only if we can continue to attract capital to fund small molecule drug development.

Regarding Section 50.2, Sparrow respectfully requests that CMS processes for determining the Maximum Fair Price for individual medicines should account broadly for all associated value

inputs. Rather than the narrow cost-effectiveness analyses used historically by HTA bodies such as ICER, we suggest that CMS utilize generalized cost-effectiveness analyses that account for value to patients, caregivers, health care providers, and society at large.

Sparrow's SPI-47 might be exemplary of a drug with value inputs that traditional models would not capture adequately. For treatment of autoimmune diseases, SPI-47 aims to supplant two classes of current therapies.

- Glucocorticoids, as mentioned above, are associated with considerable adverse event burden which leads not only to patient morbidity, but also to additional burden on caregivers and health care providers as well as substantial healthcare costs to society. If SPI-47 works as hoped, much of that morbidity, burden, and cost will disappear.
- Immune-suppressing biologics (e.g., adalimumab) which are the highest cost drug class for both CMS and private insurers. SPI-47, if successful, will offer efficacy and safety comparable to the best biologics for multiple autoimmune and inflammatory diseases with superior convenience (once-daily pill). The more immune-suppressing biologics can be replaced with a lower-price alternative (i.e., SPI-47) the greater the savings to CMS and the US healthcare system overall.

It's important for Sparrow that CMS adopts processes that allow for less traditional value inputs such as the morbidity, burden, and cost of drug adverse effects that no longer occur and the cost of high-priced drugs that can be utilized substantially less than in the past.

Sparrow appreciates your consideration of these comments as you develop the Drug Price Negotiation Program. We look forward to continued interaction with CMS toward successful implementation of this program in a manner that minimizes the potential harm to US patients (i.e., all of us) from fewer innovative medicines such as (hopefully) SPI-47 and SPI-62. Please contact me by e-mail david@sparrowpharma.com if you have any questions regarding this letter.

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Dr. Seshamani:

We are writing to you in our capacity as academic researchers and scientists who have studied and published extensively on the subject of patient-centered comparative effectiveness research and population health measurement. Specifically, we want to comment on Section 50.2 and 60.3.3 of your March 15, 2023 memo referenced above.

Language in the initial guidance for Medicare Price Negotiation includes restrictions on the use of the QALY to assess comparative benefit and safety of therapeutic alternatives. Your office seeks comments on “other metrics, in addition to QALYs, that may treat extending the life of an individual who is elderly, disabled, or terminally ill as of lower value than extending the life of an individual who is younger, nondisabled, or not terminally ill and that CMS should also exclude from consideration when developing offers and reviewing counteroffers.” With this letter, we provide our input on this topic.

The concern expressed by some is that the QALY systematically discriminates against elderly, disabled or terminally ill Americans when used to inform resource allocation decisions or price determinations. **While the QALY remains controversial, placing value on both life extension and quality of life should not be.** Not all medical interventions financed through federal or state resources extend life. Interventions that improve patient quality of life without extending life are essential for countless patients and their families. For example, many of the FDA-approved treatments for patients with chronic obstructive pulmonary disease (COPD) and emphysema improve symptoms and lung function and also reduce burdensome and expensive disease exacerbations. The impact these interventions have on well-being and quality of life is substantial and important to patients and their families. Yet, there is no direct evidence that these treatments improve life expectancy. There also are treatments that improve survival but at a quality of life that is lower for patients. Failing to value improvements in quality of life might penalize such treatments in coverage and payment determinations and may limit access for patients suffering from poor quality of life.

In 2015, Professor Richard Cookson enumerated and discussed the ethical concerns and issues regarding discrimination with the QALY.¹ The U.S. National Academy of Sciences took up this issue, too.² In both reports, the authors find valid reasons for measuring both quality of life and longevity improvements but acknowledge some limitations of the QALY as a vehicle for doing so. Since these reports were completed, scientists (including five of us) have created alternatives to the QALY that retain the ability to assess and value well-being and quality of life to inform policy and resource allocation decisions without discriminating against any members of society.^{3,4,5} The equal value of Life Years Gained (evLYG), Healthy Years in Total (HYT) and the Generalized Risk Adjusted QALY (GRA-QALY) method are important advances in the field of population health measurement and comparative effectiveness research. These tools were designed specifically to mitigate the concerns about the QALY and provide a means by which population health measures can be explicitly considered as part of policy evaluations.

Importantly, in the National Disability Council's report on *"Alternatives to QALY-Based Cost-Effectiveness Analysis for Determining the Value of Prescription Drugs and Other Health Interventions,"* the Council concludes that the evLYG, "eliminates the risk of undervaluing life-extension for people with disabilities," and that the "HYT is a better approach.....because it removes the devaluation of life extension of people with disabilities."⁶ **In other words, these new metrics have overcome the concerns of disability advocates, while preserving the ability to assess quality of life alongside survival gains.**

Health care authorities in other countries (Australia, Canada, France, Germany, Japan, Netherlands, Sweden, and the UK to name a few) use the outcomes of comparative effectiveness research, including improvements in both life expectancy and quality of life, to inform their population health care funding decisions. They do so because they understand that resource allocation decisions can have positive and negative effects on population health. By using the full range of comparative effectiveness evidence on treatments, these jurisdictions consider all evidence seen as useful and equitable as well as necessary for the efficient use of scarce health sector resources. But in the U.S., we do not routinely – nor as a matter of federal policy - use comparative effectiveness research based on the QALY to inform pricing, coverage and reimbursement decisions. While we understand the QALY has certain limitations and is politically charged (H.R. 485, for example) for federal health care policy, **we suggest that CMS not restrict use of valid and non-discriminatory alternatives in their assessment of comparative clinical benefit of therapeutic alternatives.**

Dr. Seshamani, we applaud the work that has begun at CMS to implement the health care provisions of the IRA. This is very important work that will benefit Medicare beneficiaries, of which some of us now count ourselves amongst. We now have useful and valid alternatives to the QALY that allow for the assessment and valuation of treatments that improve population health without discriminating against vulnerable patient populations. Indeed, these new measurement approaches can even promote health equity by recognizing the additional value of improving health outcomes for vulnerable populations. Many Americans, including Medicare beneficiaries, continue to suffer the burden of poor quality of life. CMS should ensure that its processes and methods that incorporate comparative effectiveness research into decision

making can explicitly recognize the value of reducing this burden to improve patient outcomes by acknowledging that there are available measures that incorporate life extension and quality of life without discrimination.

We respectfully ask that CMS not exclude the evLYG, HYT and GRA-QALY metrics from the list of acceptable evidence the agency might collect and use concerning the comparative effectiveness and safety of therapeutic alternatives as part of Medicare Price Negotiation.

***Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191 – 1198 of the Social Security Act for
Initial Price Applicability Year 2026, and Solicitation of Comments***

Dear Dr. Seshamani:

Sunovion Pharmaceuticals Inc. (“Sunovion”) appreciates the opportunity to provide comments on the March 15, 2023, memorandum issued by the Centers for Medicare & Medicaid Services (“CMS”), entitled *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments* (the “Guidance”). We incorporate by reference the comments submitted by PhRMA and add to those comments by describing the need for CMS to carefully consider the unique attributes of medications for mental illness and other conditions affecting the central nervous system as the negotiation framework is established for 2026 and beyond, especially with respect to consideration of “Unmet Medical Need” and “Therapeutic Alternatives.”

Sunovion is a global biopharmaceutical company focused on the innovative application of science and medicine to help people with serious medical conditions. With patients at the center of everything we do, Sunovion has charted new paths to life-transforming treatments that reflect ongoing investments in research and development and unwavering commitment to support people with psychiatric and neurologic conditions.

Of particular relevance to these comments, Sunovion has researched and brought to market innovative treatments for conditions impacting the central nervous system including: (1) Latuda®, an atypical antipsychotic medication indicated for the treatment of adults and adolescents (13 to 17 years) with schizophrenia, for adults, children and teens (10 to 17 years) with depressive episodes that happen with bipolar I disorder (bipolar depression), or for use with lithium or valproate to treat adults with depressive episodes that happen with bipolar depression; and (2) Aptiom®, an anti-epilepsy medicine indicated for the treatment of partial-onset seizures in patients 4 years of age and older. We are also developing a new medication for schizophrenia, ulotaront, a TAAR-1 agonist¹. As such, we have particular insight into the medical needs of patients living with schizophrenia, bipolar disorder, and epilepsy.

Guided by our commitment to patients and our ongoing focus on developing treatments in neurology and psychiatry, Sunovion focuses these comments on the following recommendations:

- 1) CMS should consider the unique nature of mental illness as the agency works to finalize the negotiation guidance and its application to potentially selected mental health medications. CMS should conduct additional direct outreach to individuals living with mental illness and their caregivers, as well as clinical experts and industry, to appropriately shape the negotiation parameters that may be used for mental health medications.
- 2) CMS should rethink its approach to establishing therapeutic alternatives, given that mental health drugs with the same label indication and in the same therapeutic class may not be therapeutically interchangeable.
- 3) CMS should clarify and expand upon its definition of unmet need to better recognize the significant outstanding unmet needs of people living with mental illness.
- 4) CMS should ensure continued broad formulary access to mental health medications.

CMS Should Consider the Unique Nature of Mental Illness and the Challenges of Developing Treatments

Sunovion is among only a few companies focused on developing treatments for serious mental illness (SMI), thus we are particularly concerned that the final Guidance must appropriately account for the unique nature of mental health medications, and

¹ [Heffernan, et al., Ulotaront: A TAAR1 Agonist for the Treatment of Schizophrenia;](https://pubmed.ncbi.nlm.nih.gov/35047111/)
<https://pubmed.ncbi.nlm.nih.gov/35047111/>

acknowledge that drugs within these unique therapeutic classes are not interchangeable. The draft Guidance, without considering the importance of mental health medications and their lack of interchangeability or substitution, risks inappropriate evaluation of these important treatments.

Almost 30% of Medicare beneficiaries live with mental health conditions. As recently reported by the Commonwealth Fund:²

[a]bout one in four Medicare beneficiaries live with mental illness — conditions such as depression, anxiety, schizophrenia, and bipolar disorder — but only 40 percent to 50 percent receive treatment. The prevalence of mental illness is about equal among beneficiaries enrolled in traditional Medicare (31%) and those in Medicare Advantage plans (28%), although variation in data sources and measurement make comparisons difficult.

Mental illness is experienced most by those beneficiaries under age 65 who qualify for Medicare via disability, as well as by low-income beneficiaries dually eligible for Medicare and Medicaid. It is also more pervasive in beneficiaries from American Indian/Alaska Native and Hispanic communities relative to other racial and ethnic groups.

An estimated 14.2 million adults in the United States live with one or more serious mental illnesses such as schizophrenia or bipolar disorder.³

Schizophrenia and related psychotic disorders affect up to 2.1 million Americans and an estimated 43% of insured people with schizophrenia are covered by Medicare.^{4,5} “annual healthcare costs exceed \$155 billion. People living with schizophrenia often experience a reduced quality of life (QOL) and are more likely to be homeless, unemployed, or living in poverty compared with the general population. Life expectancy for patients with schizophrenia is 15 to 20 years below the average and is complicated by numerous comorbidities, such as weight gain, increased cardiovascular risk, and

³ Geils, Incentivizing Drug Development in Serious Mental Illness, *Clin Ther.* 2022 Sep;44(9):1258-1267. doi: 10.1016/j.clinthera.2022.08.002.

⁴ <https://www.nimh.nih.gov/health/statistics/schizophrenia>

⁵ <https://www.umass.edu/public-health-sciences/news/more-adults-schizophrenia-have-insurance>

changes in mood and cognition. Treatment nonadherence can increase the risk of relapse, rehospitalization, and self-harm, leading to a reduced QOL and increased economic burden.”⁶

Bipolar disorder is also prevalent within the Medicare community. The disease is estimated to affect 2.8% of the population, although that is widely understood to be underestimated due to diagnosis delays. Those with the disease experience greater hospitalization, increased direct healthcare costs, and significantly increased economic and humanistic costs. Direct increased healthcare costs are estimated at \$20,846 per patient per year.⁷

While the needs for better access to mental health services and novel treatments continue to grow, challenges to develop new medicines that better meet the needs of patients are significant. Consider these key findings from a recent review by the Tufts Center for Evaluation of Value and Research on drug development in SMI:

Clinical development timelines for drugs used to treat severe mental illness are some of the longest. The FDA approval process is 38% longer for central nervous system (CNS) versus non-CNS drugs. When CNS drugs fail, they tend to do so in late-stage trials and after significant financial investment.

Clinical trial success rates are low; 6.2% of drugs for the CNS that enter into clinical trials, including drugs for serious mental illness, achieve market approval (versus 13.3% for non-CNS drugs).

Serious mental illness is a particularly difficult area to conduct clinical research in, especially in regards to recruitment and retention in trials. Individuals may have difficulty accepting their diagnosis and initiating treatment and be less willing to seek participation in clinical trials.⁸

Given the scale of the mental health crisis, the Administration has repeatedly called out the importance of access to treatment. For example, in his May 1, 2022 Presidential Proclamation for National Mental Health Awareness Month, President Biden emphasized that “less than half of Americans struggling with mental illness receive the

⁸ Geils, *supra*.

treatment they need — even fewer within Black and Brown communities.”⁹ Secretary Becerra and several other leaders in the Administration echoed these sentiments.¹⁰ It is paramount that newly established Administration policies, including the drug price negotiation framework, do not serve to undermine broader goals related to treatment access and the importance of developing new treatments that may improve health and functional outcomes for individuals living with mental illness.

CMS Should Rethink its Approach to Therapeutic Alternatives for Mental Health Medications Due to Lack of Interchangeability

Section 1194(e)(2) of the IRA requires CMS to consider evidence of alternative treatments to a select drug in evaluating the drug’s value for purposes of price negotiation. The draft Guidance, in section 50.2., repeats the four elements in the statute that the Agency must consider in evaluating “evidence about therapeutic alternatives”:

1. The extent to which the selected drug represents a therapeutic advance compared to existing therapeutic alternatives for the selected drug and the costs of such existing therapeutic alternatives;
2. FDA-approved prescribing information for the selected drug and its therapeutic alternatives;
3. Comparative effectiveness of the selected drug and its therapeutic alternatives, including the effects of the selected drug and its therapeutic alternatives on specific populations (including individuals with disabilities, the elderly, the terminally ill, children, and other patient populations, herein referred to as “specific populations”); and
4. The extent to which the selected drug and the therapeutic alternatives to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy.

Mental health drugs are not therapeutically equivalent, even when indicated for the same disease or within the same therapeutic class. CMS’ proposed use of therapeutic

⁹ <https://www.whitehouse.gov/briefing-room/presidential-actions/2022/04/29/a-proclamation-on-national-mental-health-awareness-month-2022/>

¹⁰ <https://www.hhs.gov/about/news/2022/05/03/secretary-becerra-and-hhs-leaders-recognize-mental-health-awareness-month-2022.html>

alternatives is of particular concern for mental health medications, where it may be difficult or impossible to identify a true therapeutic alternative due to the lack of interchangeability within these classes. Clinicians and researchers continue earnest efforts to understand the complexities of mental health and brain function, but physicians remain limited in their ability to know how different patients will react to available treatments.¹¹ As explained by a prominent mental health physician and researcher:

[T]he treatment of mental illness is almost always ‘trial and error,’ and in many instances requires long-term treatment. In fact, the available published evidence suggests that only 25 percent to 33 percent of people who have a mental disorder experience a complete clinical response to the first two to three medications, even when prescribed in the presence of ongoing psychotherapy.¹²

The Tufts CEVR Report on drug development in SMI also found that “[f]inding an effective and tolerable treatment regimen for serious mental illness is complicated by its heterogeneity and complex biology. In any year, approximately 40% of individuals with schizophrenia, 50% of individuals with bipolar disorder, and 35% of individuals with major depression remain untreated.”¹³ Another study estimating Part D’s impact on medication access among Medicare/Medicaid dual eligible beneficiaries “found that 30.2% of antidepressant users, 23.7% of antipsychotic users, and 12.3% of mood stabilizer users had used more than one drug in the class in 2002.”¹⁴ Numerous other studies have documented the same issues.¹⁵

In clarifying the statutory criteria, the draft Guidance suggests that CMS will examine peer reviewed clinical trial and other studies, both to evaluate whether the select drug constitutes a “therapeutic advance” over “therapeutic alternatives” and serves an “unmet medical need.” We respectfully submit that the draft Guidance is insufficient and inadequate, as there are several classes of drugs, including mental health drug

¹¹ See Geils, *supra* (noting that research and development of serious mental illness medications is limited by the lack of information regarding “the inherent complexity of the brain” and the “limited knowledge of neuropathways.”)

¹² Joseph R. Calabrese, M.D., “Why I’m Speaking Out Against the Proposed Medicare Part D Change—And Why You Should, Too” (Feb. 4, 2014) (emphasis in original), available at <http://careforyourmind.org/why-im-speaking-out-against-the-proposed-medicare-part-d-change-and-why-you-should-too/>.

¹⁵ Geils, *supra*.

classes, for which the literature is unlikely to accurately depict the extent to which a select drug in a therapeutic class is not substitutable or an alternative to other drugs with an indication for the same disease.

One of the criteria that CMS in the draft Guidance proposes to adopt is the consideration of “health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience.” However, at least in the mental health space, some of these measures do not exist. For example, there are few relevant “intermediate outcomes” and challenging “surrogate endpoints” by which to measure mental health drugs.¹⁶ Thus, many of the proposed criteria suggested by CMS will not be helpful in its evaluation of alternatives. We call on CMS to recognize that a “one-size fits all” approach to the assessment of drugs in different therapeutic classes is not appropriate and will significantly disadvantage certain classes of medications, and discourage development of novel medications in areas of significant unmet need.

CMS does state that “[h]ealth outcomes such as changes in symptoms or other factors that are of importance to a person, and patient-reported outcomes would also be considered. CMS intends to focus the review of clinical benefit on outcomes of particular importance to the condition or disease being treated by the selected drug and will determine such outcomes from the CMS-led literature review and information submitted by manufacturers and the public through the Negotiation Data Elements ICR, described in section 50 of this memorandum.” Draft Guidance 62.3.3.1. Unfortunately, however, many of the factors that are of importance to a person, such as side effects that are notoriously difficult to manage, are not fully addressed in the literature, and will never be captured in a “literature review.” We urge the Agency to be more refined in its analysis and to consider a broader set of relevant materials beyond what is in the literature.

Finally, the proposed CMS analysis will likely conflict with the Food, Drug and Cosmetic Act and the Public Health Services Act. For example, the guidance states that CMS intends to consider whether the product “represents a therapeutic advance compared to existing therapeutic alternatives” and whether it fills an “unmet medical need”—but these determinations are highly detailed scientific inquiries undertaken by teams of scientists at the FDA—CMS has neither the staff nor resources to be able to conduct these reviews, and reading the published scientific literature will not inform the Agency as to whether actual therapeutic advances exist. (For example, a review of published

¹⁶ Geils, *supra* (noting that accelerated approval is valuable to manufacturers generally, but that “it is useless in disease areas without established surrogate or intermediate end points, such as SMI [serious mental illness]”).

studies regarding any particular mental health medication likely would turn up few, if any, of the peer-reviewed studies and reports identified above.)

While we acknowledge that the draft Guidance includes a glancing reference to the patient and caregiver perspective, it does not appear that CMS will adequately consider these important voices, much less take the time to appreciate the unique ways in which mental health medications serve these communities. For that reason, we urge CMS to meet with potentially affected stakeholders including patients, caregivers, and physician experts to provide additional future comment opportunities regarding the most appropriate way to identify comparators for mental health medications selected for negotiation. We also urge CMS to develop a more comprehensive process for consideration of “therapeutic alternatives” that permits drug sponsors, who often have the most comprehensive information about their products and potential alternatives, to identify proposed therapeutic alternatives or the lack thereof.

CMS Must Clarify and Expand Upon the Definition of “Unmet Medical Need” to Recognize the Significant and Ongoing Unmet Needs of Individuals with Mental Illness

Another of the four criteria identified in Section 1194(e)(2)(C) of the Act, and carried over into the draft Guidance, is “the extent to which the selected drug and the therapeutic alternatives to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy.” The draft Guidance interprets the phrase “unmet medical need” to mean “treating a disease or condition in cases where very limited or no other treatment options exist.” Draft Guidance 60.3.3.1; *see also* 60.3.3.2 (“For selected drugs with no therapeutic alternatives, CMS intends to adjust the starting point for the initial offer based on the extent to which the selected drug fills an unmet medical need.”). We respectfully submit that this definition is too broad and too simplistic, and therefore inappropriate for mental health medications.

Read literally, the draft Guidance would never consider any mental health drug subject to negotiation as addressing an “unmet medical need” as there are dozens of drugs that treat mental health today. There are “first-generation” antipsychotics like lithium and haloperidol, each of which is an “available therapy” but would rarely be a first line treatment today. A second generation of “atypical antipsychotics” consisting of numerous branded and generic medications are also available. Yet, with all these treatments, many Medicare beneficiaries *still* are unable to find a treatment that works for them. The current construct of “therapeutic alternatives” and “unmet medical need” in the draft Guidance could inappropriately lead to the comparison of innovative

second or third generation mental health treatments to older generics which may have markedly different side effect profiles and efficacy.

Instead, for the 25% of Medicare beneficiaries living with schizophrenia, bipolar disease, or other mental health conditions¹⁷, none of the available drugs may actually meet the patient's need. Understanding unmet need from the patient and caregiver perspective is critical. A recent report from an Externally-Led Patient-Focused Drug Development Meeting on Schizophrenia included findings from a patient and caregiver survey regarding reasons for stopping treatment. The reasons were many and varied, including that the medication did not treat the individual's symptoms, that the treatment led to weight gain, or that it caused movement effects such as tremor, stiffness, or agitation.¹⁸ Treatments that may ultimately address one or more of these barriers to patient adherence, and ultimately barriers to improved patient outcomes, compared to current medications should be assessed as meeting an unmet need.

As evidenced by the numerous references above, the very nature of mental health medications, and their well-defined lack of interchangeability and substitution on a patient-by-patient basis, means that nearly every mental health medication selected for negotiation will likely fill an unmet medical need for a significant cohort of the Medicare population. We call on CMS to clarify and broaden the definition of unmet need in consultation with patients, caregivers, and other affected stakeholders.

CMS Should Ensure that Mental Health Drugs Remain Broadly Accessible on Part D Formularies

The Guidance is also lacking clarity on whether and how Part D Plans must maintain access to both selected drugs and non-selected drugs following implementation of a negotiated price. Section 110 of the draft Guidance simply states: "In accordance with section 1860D-4(b)(3)(I) of the Act, Medicare Part D plans shall include each covered Part D drug that is a selected drug on Part D formularies during Contract Year (CY) 2026 and all subsequent years for which the MFP of the selected drug is in effect during the price applicability period." The draft Guidance does not state *how* Part D Plans are to "include" selected drugs, and is silent on the impacts on non-selected drugs in the same class. We are concerned that changing health plan incentives for drugs in a class where one or more drugs are negotiated could lead to negative formulary access consequences

¹⁷ <https://www.commonwealthfund.org/publications/explainer/2023/mar/medicare-mental-health-coverage-included-changed-gaps-remain>

¹⁸ <https://sczaction.org/wp-content/uploads/2023/02/Reimagine-Schizophrenia-VOP-report-FINAL.pdf>

(in the form of higher cost sharing, additional utilization management controls, and/or tiering). As CMS implements the negotiation program, the agency should ensure guardrails that prevent the erosion of important patient protections and policies that prevent discrimination in formulary design for certain patients, including those living with mental illness.

Such erosion would be devastating to those Medicare beneficiaries with SMI needing access to medications in these classes. We urge CMS to add guardrails into Section 110 to clarify that current beneficiary access, and the quality of that access, should not worsen as a consequence of MFP pricing in a particular class. CMS must take steps to ensure that beneficiaries retain access to the most clinically appropriate medication as determined by the provider and the patient. Adverse side effects that may result from taking the wrong medication frequently cause patients to discontinue their medication; this in turn leads to costly hospitalizations, relapses, and other harms to beneficiaries and to society.¹⁹

In 2018, the Pew Charitable Trusts found that, while restricting beneficiary access to select branded mental health drugs might generate some insurer savings from drug spend, “given the current high rates of generic use within the” therapeutic class, “there may be limited potential for savings from changes to this policy.”²⁰ The Pew findings echoed CMS’s own conclusions from 2014 when it estimated that repealing protections for two classes of drugs -- depression and immunosuppressants -- would save less than 0.4 percent of projected Medicare Part D spending in 2019. (Following opposition from many parties, Medicare withdrew this proposed change.)

State Medicaid programs have previously made attempts to limit patient access for mental health medications and have had to deal with the negative effects. For example, when Maine attempted to limit the antipsychotics included on its Medicaid formulary, tolerability issues contributed to unfavorable clinical outcomes and undermined the achievement of any savings. Noting a sharp rise in treatment discontinuities following the introduction of prior authorization (“PA”) for atypical antipsychotics (often called “AAs”), researchers stated that “[r]esponses to specific AAs and risks of adverse events

¹⁹ See, e.g., Kathleen Lang, et al., Medication Adherence and Hospitalization Among Patients with Schizophrenia Treated with Antipsychotics, *Psychiatric Serv.* 61.12 (2010): 1239-1247; Estimate of the Net Cost of a Prior Authorization Requirement for Certain Mental Health Medications, Driscoll & Fleeter (Aug. 2008), available at <http://www.namiohio.org/images/publications/Publications/EstimatedCostofPriorAuthorizationAugust20Final1.pdf>; see also Geils, *supra*, Incentivizing Drug Development in Serious Mental Illness.

²⁰ The Pew Charitable Trusts, “Policy Proposal: Revising Medicare’s Protected Classes Policy” (March 2018).

... vary. Thus, if certain patients are sensitive to adverse events associated with preferred agents, the PA policy could increase the incidence of unfavorable outcomes and contribute to medication discontinuation.”²¹ Maine suspended the restrictive access program nine months later because of “numerous case reports of adverse effects associated with the policy.”²²

A retrospective analysis of medical and pharmacy claims across 24 state Medicaid programs reported that patients with formulary restrictions had increased risks of hospitalization, lower adherence, and higher medical and prison costs.²³ A literature review of 15 studies of assessing the impact of formulary restrictions also concluded that drug cost containment policies may result in cost shifting rather than cost savings.²⁴ This volume of evidence further reinforces the need for CMS to maintain current access protections and prevent any potential narrowing of patient treatment options.

CONCLUSION

Drug development in SMI is associated with higher costs and higher risks than drug development for other chronic conditions. Regimes similar to the select drug Guidance, such as ex-US Health Technology Assessments, have significant delayed access to treatments and caused a reduction in available mental health medications.²⁵ In order to avoid potential serious adverse consequences for patients, CMS must take these concerns into consideration in evaluating its negotiation for any selected drugs for SMI by revising the draft guidance in close and continued consultation with all affected stakeholders. The availability of SMI drugs, and particularly newer next generation medications, to patients in need is already too low. The challenges to developing drugs in this therapeutic area are already high and will only be exacerbated with implementation of the negotiation program. Thus, we urge CMS to consider the comments above and to amend the Guidance to recognize the unique nature of these treatments.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Centers for Medicare & Medicaid Services,

I write to you on behalf of my organization, Survivors for Solutions, to encourage you not to move forward with the agency's initial guidance for the Inflation Reduction Act's (IRA) Medicare Drug Price Negotiation Program. This guidance puts the health of millions of Americans in jeopardy, demeans our democracy by opening only the narrowest windows for these patients to offer their lived experiences, and belittles the voice of the patient – the most important stakeholder to this process – who will be most harmed by the IRA.

A 30-year survivor of multiple sclerosis, I founded Survivors for Solutions out of concerns for how little deliberation was given to such an impactful and extreme shift in policy such as the IRA. Made more grievous by the fast-tracked, party-line passage under the cloak of Covid lockdowns with little to no input from patients such as myself. Lawmakers enshrined price control schemes in a risky show attempt to address the high cost of a few drugs, choosing to ignore the real causes of high out of pocket costs that heavy price patients like me would have to ultimately and continue to pay. These mandates will significantly stunt the discovery of treatments and cures and slam the heavy hand of government interference onto the delicate ecosystem of the pharmaceutical research and development process. Some deep-pocketed special interests may not like the idea of paying for breakthrough treatments, but this is a critical aspect of what makes this country a leading force in delivering cutting-edge medicine to the world. Patients with health concerns ranging from cancers, chronic illnesses, and rare conditions need America's innovative ecosystem to thrive so that they may receive treatments that otherwise would not have been discovered. There are countless individuals that will be negatively impacted by fewer discoveries and less research, and it is up to our leaders to protect that hope.

The most affordable drug is the one that is never discovered. Our top biopharmaceutical research scientists put in time and effort to end suffering, dedicating years to the “trial and error” that comes with discovering new medicines to keep the pipeline of treatments flowing. Many patients, such as myself, must undergo multiple different treatments before we can find the one that works. The downstream effect of this price control gamble is that it will act as a disincentive to the company researchers that are critical for making future progress and creating multiple treatments for patients fighting to survive and desperate for the hope that additional options can deliver.

There are better ways to reduce drug costs for patients in this country, but the answer should never be to kill innovation and take away hope. Health care is about caring for people’s health, not CBO bean counters. The much-maligned research scientists have brought us the elimination of illnesses that were once deemed incurable; those are results that are simply too important to abandon.

Lastly, I cannot reiterate how arrogant, offensive, and un-democratic it is that this formal comment window is only open for thirty days – an atypical and extremely short timeframe. Patients, advocates, and those holding reservations about this guidance deserve more time to review the information and comment on this monumental alteration of our nation’s health system. Frankly, if you allowed a free and open public comment where people understood how much suffering, death, and despair this rule will bring about, there are not enough shelves in the Library of Congress to contain the outcry that would be unleashed.

Sincerely,

John Czwartacki

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure:

Sutro Biopharma appreciates the opportunity to submit comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Sutro Biopharma is a clinical stage company pioneering a unique way of discovering, developing, and manufacturing therapeutics. Our focus is aimed primarily on next-generation cancer therapeutics – antibody drug conjugates, bispecific antibodies, and cytokine derivatives. *While our company is working on biologics for the treatment of difficult to treat diseases, we can empathize with our peers at other companies who are working on small molecules that the IRA just made far less attractive to investors. It would have been our hope that our own drug, should it ever reach the market, could be used in combination or sequenced with those other medicines to meaningfully benefit and maybe even cure these diseases. We note that there are programs in development that may have to choose between an oral or biologic formulation, and the IRA would incentivize biologics over oral medicines.*

While we recognize that CMS is not formally accepting comments, we felt it was important to provide feedback into this new process.

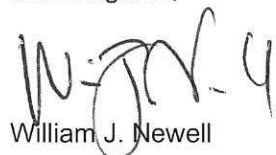

- I. Section 30.1: Medicare negotiation for NDA-path drugs at nine-years post launch severely restricts the financial opportunity to recoup the significant costs invested in research, development, and manufacturing to bring an approved product to market. And unfortunately, many products fail in clinical trials and associated costs are lost. Also, erosion of the investment case for small molecules may influence companies to develop biologics over small molecules, which may not be favorable for patient convenience and experience. We recommend extending exclusivity to 13 instead of 9 years.
- II. Section 30.1.1 Unfairly penalizes drugs that can benefit multiple orphan or rare diseases and would limit patient benefit and dis-incentivize development in novel ways. Alternatively, CMS should look to consider only active orphan drug designations for the purposes of determining

eligibility for the orphan drug exclusion and not including withdrawn orphan drug designations.

- III. Section 50. Cost-effectiveness evaluations like ICER tend to underestimate value of new medicines. Many countries that rely on these evaluations also experience significant delays in access to innovative medicines. Alternatively, CMS should consider broader evaluations of cost effectiveness, highlighting key product attributes like efficacy, safety and ease of use in determining relevant "therapeutic alternatives."
- IV. Section 90.4 Drives prices down inadvertently threatens the competition and viability of biosimilars and generic medications, which would negatively impact the overall costs across the market.
- V. Section 40.2.2 Lack of transparency on CMS criteria on MFP leads to great uncertainty and ambiguity on what is needed to justify price negotiations and access to innovative medicines. This will negatively impact investor confidence and increase risks to products even after they are approved.

We appreciate your consideration of our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to seniors from fewer innovative medicines is minimized. Please contact me by telephone or e-mail below if you have any questions regarding our comments.

Best Regards,

Re: Medicare Drug Price Negotiation Program Guidance

T1International is grateful for the opportunity to provide comments to CMS regarding Medicare Drug Price Negotiation Program Guidance.

T1International is a global diabetes advocacy organization led by and for people with diabetes. We believe in a world where everyone with diabetes, no matter where they live, has everything they need to survive and achieve their dreams. We do not accept funding from the pharmaceutical companies and we provide advocacy training and support to advocates across the U.S. and around the world. In 2014, T1International launched the #insulin4all campaign which has grown into a global movement. In the U.S., T1International supports advocates via 41 #insulin4all Chapters, our Federal Working Group, and through our Global Advocacy Network.

At T1International, our global advocacy goal is that the average combined monthly out-of-pocket cost of insulin and blood glucose testing supplies for people with diabetes will represent no more than 5% of median income in any given country by 2025. Our campaign priorities include a federal price cap on insulin, patent reform, tax reform, emergency access to insulin laws (Alec's laws), expanding pharmacist scope of practice (Kevin's Laws), expanding public production and public procurement of insulin and other drugs, and reforming insurance formularies to eliminate non-medical mid-year plan switching.

As patients working on insulin access and affordability, we are frustrated with the lack of explicit insulin price negotiations included in this bill. Recent insulin manufacturers announcements of lowering the list prices of several insulin products does not go far enough; to meet patients' full needs, these price decreases must apply to all insulin products, must be codified, and must be negotiated in a fair and transparent manner. We appreciate CMS developing guidance that minimizes opportunities for manufacturers to undermine the intention of the Inflation Reduction Act by closing loopholes regarding many predatory business strategies, anti-competitive tactics, abusive pricing and general market manipulation. We hope the identification of selected drugs for initial price applicability sets a strong standard for future drug negotiations, including for insulins.

Product hopping prevention measures are critical for patients using insulin and other drugs. We support defining single source drugs by aggregating across all dosage forms and strengths. Doing so will prevent some potential gaming that we have seen run rampant in the insulin market. For example, vials and pens have different prices due to different patent evergreening practices, and patients have been changed to newer, more expensive insulin prescriptions without their prior notification. We urge CMS to

ensure that competing products are defined so as to require a meaningful market penetration and easy accessibility by patients, to prevent potential gaming by product hopping.

Scrutiny around biosimilar delay requests is an important first step. Insulin manufacturers have wielded the existence of captive generics and modest biosimilar competition by competing manufacturers to avoid some scrutiny. This cartel-like behavior has resulted in a lack of meaningful competition and lower prices, since captive generics have historically not been available in pharmacies and biosimilars of many important biologic drugs have made only modest headway against their entrenched competitors. Biosimilars must be available and accessible to patients at pharmacy counters to actually bring down drug prices.

Drug prices are already too high. We cannot look at net price or average sale price as a key factor to set maximum fair price as they are already inflated. In the insulin market, the lack of industry competition means that net prices are too high. Consequently, using the prices of therapeutic alternatives as a starting point will lead to inappropriately high prices. Therefore, we should instead look at the cost of manufacturing with adjustments for clinical benefits, which will continue to incentivize innovation.

Patients need access to maximum fair prices in a clear and cohesive way. To effectively price affordable drugs and to amplify the impact of the IRA, industry pricing data needs to be collected with detail and openly published so that it is accessible. Collection and publication of disaggregated figures on R&D costs, for example, can allow explanation and public discussion of the maximum fair price. This level of transparency will set an important precedent for patients. For example, Colorado's prescription drug price transparency bill (HB19-1131), which has manufacturers provide WAC prices, is interpreted differently by every manufacturer, making accessing and interpreting the information challenging for patients. If CMS regulated cost transparency, reporting would be consolidated, streamlined, and consistent, and patients and advocates would be better able to navigate the prices.

Real, meaningful, and diverse penalties are needed for effective enforcement. Civil monetary penalties of \$1mil/day for violating terms of the negotiated agreement and \$100mil for submission of false information will increase the likelihood of the negotiation process yielding the intended outcome: fair prices at the pharmacy counter.

The process needs to center patient involvement and experience. Expanding opportunities for independent patient advocates, patient advocacy groups, and consumer groups will improve processes and practices. This is especially true for those of underrepresented demographics and communities, including those in different age groups, races, and the LGBTQIA+ community. We want to ensure that [ethical patient engagement principles](#) are followed in the process.

The Honorable Xavier Becerra
Secretary
Department of Health and Human Services
200 Independence Avenue, SW
Washington, D.C. 20201

The Honorable Chiquita Brooks-LaSure
Administrator
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244

Dear Secretary Becerra and Administrator Brooks-LaSure:

The Taxpayers Protection Alliance (TPA) writes today on behalf of taxpayers and consumers to voice our concern regarding the Centers for Medicare & Medicaid Services' (CMS) initial guidance on the drug pricing provisions in the Inflation Reduction Act (IRA). We urge you to reconsider advancing these provisions that would pose irreparable harm to the future of American healthcare and patients.

TPA has been critical of how the highly partisan IRA's price-setting policies threaten the development of potential lifesaving cures to the detriment of all American consumers. CMS' initial guidance doubles down on this damage by creating a process with minimal transparency that prioritizes the government's interests over those of patients. This represents a further encroachment of the federal government into the successful U.S. pharmaceutical system that provides American patients with the greatest access to critical cures of any country in the world.

CMS' initial guidance endangers the types of intellectual property (IP) protections that are the very lifeblood of pharmaceutical innovation. IP protections are critical to incentivizing pharmaceutical companies to invest the time and resources needed to explore potential cures because they give companies assurance that they will be rewarded for their risks if a drug is proven effective.

Targeting drugs for the length of their exclusivities and patents takes away incentives to innovate, meaning fewer companies will invest in exploring potential lifesaving cures for American patients. The Biden administration has championed its commitment to finding a cure to cancer. That won't be possible if there's no incentive to innovate, particularly when it comes to post-approval research.

We urge you to do what's in the best interest of American consumers and reconsider this rule.

Sincerely,

David Williams
President

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, Solicitation of Comments

Dear Deputy Administrator and Director Seshamani:

The ALS Association is pleased to provide comments on the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026.

As the world's leading ALS organization, our goal is to make ALS livable for everyone, everywhere, until we cure it. Established in 1985, The ALS Association is the only national nonprofit organization fighting ALS on every front. By leading the way in global research, coordinating multidisciplinary care through certified clinical care centers, and fostering policy solutions, we strive to make ALS a livable disease while aggressively searching for new treatments and a cure. We are committed to ensuring all people with ALS have access to medical products and services that enhance their health and wellbeing and improve their quality of life.

In the drug pricing debate, our primary goal is to ensure equitable access to treatments. We are constantly taking into consideration ways to support efforts to reduce drug prices with the need to safeguard the pace of innovation and protect access to new therapies. This is particularly important for treatments that impact people with rare diseases, as barriers to developing new treatments are already high. Additionally, we are particularly concerned with any cost-cutting efforts that may disincentivize drug development and devalue treatments options for people living with Amyotrophic Lateral Sclerosis (ALS), those with disabilities, or the terminally ill.

The ALS Association remains concerned about timely access to innovative treatments. Solutions must be balanced to ensure individuals do not have to face even more barriers to treatments. Congress has recognized the unique nature of rare diseases and we are hopeful CMS will also work persistently to protect access to drugs for rare disease populations as Inflation Reduction Act (IRA) implementation takes shape.

Thus, we support the Centers for Medicare and Medicaid Services (CMS)'s program to reduce drug prices via the Medicare Drug Price Negotiation Program as required by IRA but offer comments herein on ways to ensure cost benefits and equitable access to therapies are secured for people living with ALS, the acutely ill, and people with disabilities.

OUR VISION: Create a world without ALS.

OUR MISSION: To discover treatments and a cure for ALS, and to serve, advocate for, and empower people affected by ALS to live their lives to the fullest.

HOME OFFICE • 1300 Wilson Boulevard, Suite 600, Arlington, VA 22209 • PHONE 202.407.8580 FAX 202.464.8869 • [als.org](https://www.als.org)

Ensure people living with ALS benefit from lower drug prices:

We are supportive of the provisions that require negotiated products within the Medicare Part D program to be included on Part D plan formularies. It is important that CMS ensures rare disease patients benefit from all drug price negotiation efforts to reduce out of pocket costs, establish premium caps, and maintain timely access to drugs. Often, therapies that treat rare diseases are placed on the specialty tier of plan formularies, resulting in significant out-of-pocket costs and access delays for Medicare beneficiaries. Once a drug is negotiated and appropriately priced it should be placed on a lower formulary tier to reduce patient out-of-pocket costs and pass on savings to patients.

Discontinue the use of unreliable and discriminatory methodologies in drug price negotiations:

An unfortunate source of treatment delays or denials for the ALS community are the inequitable use of comparative clinical effectiveness research and utilization management tools used by payers to support economic, scientific, legal, and or public policy rationales. We appreciate the intent of Congress to protect vulnerable populations through IRA by including key provisions, such as, “the Secretary shall not use evidence from comparative clinical effectiveness research in a manner that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, non-disabled, or not terminally ill.”^{iv} While it is not an explicit component of the IRA, we also want to express our strong objections to the quality-adjusted life year (QALY) methodology used by some organizations to assess the “cost-effectiveness” of therapies. We believe this approach devalues the life of a person living with ALS and is therefore fundamentally flawed and not equitable.

As previously stated in our February 13, 2023, public comments on *Contract Year 2024 Policy and Technical Changes* [CMS-4201-P], we strongly support CMS’s proposals to clarify and revise the regulations governing when and how Medicare Advantage plans develop and use coverage criteria and utilization management policies to improve health equity for people with disabilities. The use of prior authorization for people with rare diseases too often causes unnecessary delays and denials even though requested therapies meet Medicare coverage guidelines. We agree with CMS proposed policies to improve prior authorization policies and we implore the agency to universally apply protections to Medicare Advantage enrollees and ensure equivalency with Traditional Medicare coverage policies.

We urge CMS to require Medicare Part D plans to reduce or eliminate the use of utilization management tools which unnecessarily delay essential care, including prior authorization, to ensure people with rare diseases – especially people living with ALS – have timely and broad access to negotiated drug therapies and associated cost savings.

Avoid disrupting research and innovation of therapies for rare diseases:

As mentioned, barriers to drug development for rare conditions are extremely high. Small disease populations have difficulty recruiting patients for clinical trials and managing disincentives for investment. We appreciate CMS’ recognition of this phenomenon by excluding orphan drugs from drug price negotiations. However, additional clarity could be provided about how that exclusion functions and these protections are applied. Additionally, we recommend that CMS maintain the exclusion for orphan drugs that have more than one indication. If not, drugmakers will be disincentivized from pursuing additional indications that could be beneficial.

Avoid the use of tools that do not adequately capture value:

The ALS Association joins the National Council on Disability and other patient advocacy organizations representing patients and people with rare diseases and disabilities on the position that clinical

comparative effectiveness research tools, such as incremental quality adjusted life years (QALYs) and equal value of life years gained (evLYG) metrics, do not fully capture patient preferences and societal value of therapies for people living with ALS and can be inherently discriminatory. Fortunately, the IRA explicitly prohibits the use of comparative clinical effectiveness research in such a way that treats extending the life of an elderly, disabled, or terminally ill individual as of lower value than extending the life of an individual who is younger, non-disabled, or not terminally ill and specifically clarifies that CMS cannot rely on discriminatory metrics like QALY.

We are concerned that section 50.2 of this draft guidance indicates that CMS will consider studies that use QALYs. CMS should reiterate in its guidance that it will not rely on QALYs or similarly discriminatory metrics in the evaluation of drug therapies. Instead, CMS should define comparative clinical effectiveness research in a manner consistent with the existing definition in the Affordable Care Act (ACA), which clearly defines the research as comparing clinical benefit and not cost or cost-effectiveness. In determining what comparative effectiveness research to rely on, CMS should look to a robust body of ongoing research that includes patient-centered input, measures therapeutic benefit to patients, and engages patients and people with disabilities to understand their perspectives on quality of life and preferred outcomes and experiences.

Continue robust engagement of rare disease patients and people with disabilities:

We appreciate the opportunity to comment on this draft guidance and to continue to engage with CMS on these and other efforts to reduce drug prices and out of pocket costs for people living with ALS. We strongly encourage CMS to maintain continual engagement with the patients and with organizations that represent their interests. Ensuring these voices are a part of the process will ensure policies are patient-centered and value-based.

Recommendations:

In summary, we urge CMS to i) simplify and streamline the data submission process for patients and caregivers; ii) clarify what information the agency is seeking from patients and in what format to allow for data standardization and aggregation, iii) organize patient listening sessions specific to selected drugs to collect representative data while CMS is preparing the initial offer for a negotiated price; and iv) include consistent and granular summaries of the data and assumptions on which each negotiation was based on, including patient experience data.

We look forward to continual opportunities to engage with CMS on these and other topics and provide valuable insights on issues of importance to people living with ALS and their family members. Should you have any questions, please contact Rich Brennan, Vice President of Federal Affairs at rich.brennan@als.org.

Sincerely,

Melanie Lendnal, Esq.

RE: Medicare Drug Price Negotiation Program Guidance

Attention: IRRebateandNegotiation@cms.hhs.gov

Deputy Administrator Seshamani:

As Senior Vice President of Industry Relations for Sentry Data Systems, now The Craneware Group, I am pleased to have the opportunity to comment on the above referenced memorandums specific to the 340B Discount Drug Program administered by Health Resources and Services Administration (HRSA). We have previously commented on other matters and our emphasis is on Providing Access to the Maximum Fair Price (MFP) (40.4) and nonduplication with 340B Ceiling Price (40.4.1).

Sentry Data Systems, a pioneer in automated pharmacy procurement, utilization management and 340B compliance, is leading the industry in helping healthcare organizations address their three biggest challenges: reducing costs, managing compliance and improving outcomes. More than 10,000 hospitals, clinics, integrated delivery networks (IDNs) and pharmacies across the country rely on our integrated platform for their procurement, drug utilization and compliance solutions.

In July 2021, Craneware announced the acquisition of Sentry Data Systems and Agilum Healthcare, optimizing an already-robust catalog of solutions. Now, after more than 20 years as the leading provider of revenue integrity solutions improving financial performance in U.S. hospital and health systems, together, we are The Craneware Group¹ and we deliver software applications across the value cycle.

The Craneware Group (AIM:CRW.L), the market leader in automated value cycle solutions, including 340B management, collaborates with U.S. healthcare providers to plan, execute, and monitor operational and financial performance so they can continue to deliver quality care to their communities. Customers choose The Craneware Group's Trisus data and applications platform as their key to navigating the journey to financially sustainable value-based care. Trisus combines revenue integrity, cost management, 340B performance, and decision enablement into a single, SaaS-based platform. Trisus Chargemaster secured top ranking in the Chargemaster Management category of the "2023 Best in KLAS Awards: Software & Services" and is part of an extensive value cycle management suite. The Craneware Group – transforming the business of healthcare.

Maximum Fair Price Access

Maximum Fair Price

Restating previous comments provided to CMS in March 2023, 340B covered entities may not utilize 340B purchased drugs if the maximum fair price is less than the 340B purchase price. In these instances, covered entities will not be required to utilize the JG or TB modifier for Part B Claims, and similarly for Part D Claims; those claims will need to be subject to inflation reduction rebates.

Maximum Fair Price and Contract Pharmacies

340B covered entities may choose to contract with pharmacies on their behalf to dispense 340B to eligible patients, that may also be considered MFP-eligible individuals (patients) for the purposes of Medicare Part D. It is important that MFP pricing be available through bill to-ship to mechanisms. This entails that billing is sent to the 340B covered entity, and drug product is shipped to the contract pharmacy when eligible patients receive prescription benefits on behalf of the covered entity. Any differences between acquisition cost for the selected drug and the MFP would need to be reimbursed timely through the appropriate contract pharmacy wholesaler or manufacturer direct purchase accounts or third-party logistics (3PL) companies within 14 days without any transaction fee. It is important to note that manufacturers have implemented practices related to contract pharmacy that do not align with the law as noted by recent HRSA communications to certain manufacturers². Additionally, 3PL companies have placed barriers to receiving 340B price and should also make available MFP pricing on selected drugs. Making the MFP available to covered entities and their contract pharmacies is essential to carrying out the Inflation Reduction Act.

Nonduplication with 340B Ceiling Price

While manufacturers have been required by the 340B statute to provide 340B Ceiling Price, it should be noted that not all manufacturers with a focus on high-cost specialty drugs make 340B pricing consistently available to covered entities. We encourage CMS to make available the MFP to 340B covered entities to allow them the opportunity to purchase at the best price available to them.

HRSA Office of Pharmacy Affairs Information System (OPAIS)

While the spirit of the IRA is to avoid nonduplication of 340B Ceiling Price, it is imperative to recognize that MFA will need to be added to the HRSA Office of Pharmacy Affairs Information System (OPAIS) an indicator for both 340B and MFP pricing. As a software company responsible for processing 340B eligible claims based on 340B price, and now MFP pricing, it would greatly assist us to have limited access to the price file on behalf of the covered entity to validate price file data received from wholesalers to data in OPAIS. The limitations of the OPAIS system today, do not allow for third-party access to support covered entities determine accurate pricing, outside of the wholesaler or the covered entity making inquiries without the assistance of software.

Price File Updates

MPF should be provided by the wholesaler on the 340B price file to covered entities with an indicator that it is an MFP. Wholesalers can include indicators on the type of pricing provided (340B Prime Vendor Program sub-ceiling price, 340B, WAC). If MFP is available at 340B price, both prices should be supplied on the price file. The wholesaler acquisition price (WAC) file should always include the MFP. Unique to the 340B program is the group purchasing organization (GPO) prohibition for certain types of hospitals, often requiring them to purchase on WAC versus 340B. Additionally, GPOs often repackage drugs and sale at a GPO price, which certain 340B covered

² Health Resources and Services Administration Office of Pharmacy Affairs HRSA Correspondence to Stakeholders accessed 4/12/2023 <https://www.hrsa.gov/opa/program-integrity>

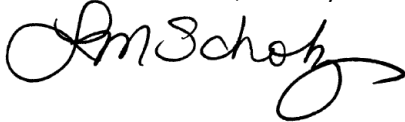

entities with GPO prohibition criteria, are not allowed to utilize. It will be important that GPO repackaged drugs, also have MFP available when appropriate. These price file changes assist covered entities determine whether a 340B price or MFP price is the lower price using technology versus manual look-ups of the OPAIS. Software solutions then have “best price” functionality that can assist determine which price should be used and subsequently place appropriate modifiers based on price and assist with the true-up process for drugs indicated as an MFP at the time of dispensation, including retrospective changes. The current process supported by HRSA is available for both covered entities and manufacturers to dispute price discrepancies. We would encourage a standard format for submitting to manufacturers for price variations between MPF and 340B with HRSA and CMS.

Thank you for the opportunity to provide comments on behalf of The Craneware Group and for your time to consider our recommendations. We welcome providing our insights into the IRA process to support covered entities manage the complexity of 340B in the current environment with a look to the future to make it accessible and fair for the safety net- the ultimate beneficiary of the 340B program. The 340B program allows the covered entities to serve their communities offering more comprehensive care—therefore having a comprehensive and efficient revenue integrity process allows them to continue to focus on what they do best- care for patients.

We would be happy to provide more real-world operational information or answer any questions.

Regards,

Lisa Scholz, PharmD, MBA, FACHE
Senior Vice President, Industry Relations

April 14, 2023

Dear Administrator Brooks-LaSure,

The Foundation for Research on Equal Opportunity (FREOPP) writes in response to proposed guidance published on March 15, 2023, implementing the Medicare drug price negotiation program as enacted in the Inflation Reduction Act (IRA). FREOPP is a non-profit, non-partisan think tank that seeks to expand economic opportunity to those who least have it, using the tools of individual liberty, economic freedom, technological innovation, and pluralism. All of our research and policy recommendations considers the impact on those below median income and wealth.

The IRA's drug price negotiation program represents a welcome change to the status quo for Medicare drug spending. Our research recognizes that one of the biggest drivers of rising drug spending comes from pharmaceutical companies increasing prices on branded drugs that have been on the market for several years. The IRA appropriately selects drugs for price negotiation that are nearing the end of their patent and FDA exclusivity timelines while driving significant savings for Medicare and the beneficiaries it serves.

We also applaud CMS' regulatory change to the meaning of "gross covered prescription costs," as outlined in CMS' proposed rule dated December 27, 2022. The change ensures that drugs will be selected for negotiation based on total gross expenditures in Medicare, rather than net expenditures. In turn, the change potentially disincentivizes drug companies from using large rebates to get better formulary placement, leading to lower out-of-pocket costs for seniors.

However, we recognize certain aspects of implementation could be clarified or improved. There are two aspects of CMS guidance on Medicare Drug Price Negotiation Program implementation that demand special attention.

1. *Impacts to generic development.* Though the IRA will reduce Medicare drug spending by \$102 billion over the next 10 years, the most effective mechanism for drug cost savings is competition. The Drug Price Competition and Patent Term Restoration Act, aka Hatch-Waxman Act, is proof that competition from generics can drive immense savings for Americans.

Therefore, CMS must walk a careful line between maximizing Medicare drug savings through the IRA and fostering a healthy generics market that allows generics and biosimilars to quickly grow market share.

Unfortunately, CMS guidance falls short in this area in a key way.

The IRA provides two conditions by which a selected drug is removed from the drug price negotiation program: the generic or biosimilar that references the selected drug must first be approved by the FDA, and then it must be "marketed" pursuant to such approval.

According to guidance, CMS will review the previous 12 months of Medicare prescription drug data to determine if a company has engaged in "bona fide marketing" of the generic or biosimilar only after CMS has determined such drug has been approved by the FDA. This implies

that, should a generic be recently approved, CMS would wait to receive 12 months of sales data before determining if the drug has reached a satisfactory level of marketing to remove the branded reference product from negotiation. In addition, CMS is silent on the sales thresholds during the 12 months that it believes reaches the level of bona fide marketing.

CMS risks unnecessarily delaying the removal of an MFP from a selected drug if it requires 12 months of sales data to determine if the drug is marketed or if CMS sets a high sales threshold to achieve bona fide marketing. We believe that the longer an MFP remains in effect, the more difficult it will be for generic or biosimilar drugs to gain market share.

Therefore, we recommend CMS clarify its timeline for considering whether a generic or biosimilar exists for a selected drug, and to make such determinations as soon as practical to minimize disruption of generic drug launches.

2. *Information disclosed for explanation of MFP.* Following negotiations and determination of the MFP, CMS will publish the MFP for each drug along with an explanation of how it arrived at the MFP according to factors outlined in Sec. 1194(e) of the IRA. According to the March 15 guidance, “CMS intends to make high-level comments on the data submitted to CMS, without sharing any proprietary information.”

The IRA empowers the Secretary to determine what information provided by drug companies is proprietary for the purposes of carrying out price negotiation. Pursuant to such authority, CMS intends to define proprietary information as “commercial or financial information of the Primary Manufacturer or a Secondary Manufacturer that cannot be found publicly.”

Thus, CMS intends to treat the following company-provided data as proprietary information:

- a. Research and development costs and recoupment,
- b. Unit costs of production and distribution,
- c. Pending patent applications,
- d. Market data, and
- e. Revenue and sales volume data.

By treating such information as proprietary, we believe CMS has missed an extraordinary opportunity to shed light on how pharmaceutical prices are set throughout the pharmaceutical market. We also believe there is a substantial public interest in releasing such information. We could answer vital questions, such as root causes of rising drug prices in the U.S., whether high prices are justified on the basis of high R&D costs, and how companies use the patent system to stymie competition.

Guidance indicates CMS seeks to protect proprietary information so that companies will be more likely to cooperate with CMS and engage in the negotiation process. In this regard, we believe CMS is proceeding with too much caution. In particular, market data and revenue and sales data may be considered proprietary by pharmaceutical companies, but this data is in fact available to many stakeholders through subscription services such as SSR Health and IQVIA.

While it is understandable that CMS prefers full cooperation from drug makers, we believe that the possibility of civil monetary penalties, as outlined in Section 1197 of the IRA, will motivate

drug companies to comply with program requirements, including the submission of data to inform CMS' negotiation efforts.

We recommend CMS clarify when it considers company data is available to the public and thus non-proprietary. We also recommend CMS use its regulatory authority to release as much data as is legally possible when publishing the MFP and explanations of the factors influencing the MFP.

We appreciate the opportunity to provide comment on these important matters as CMS implements the Medicare Drug Price Negotiation Program. We welcome further dialogue to ensure the program reduces drug spending in Medicare while enhancing drug price competition in the wider pharmaceutical market.

Meena Seshamani, MD, PhD
Deputy Administrator and Director of the Center for Medicare
Centers for Medicare & Medicaid Services
Department of Health and Human Services
200 Independence Avenue SW
Washington, DC 20201

**Re: Medicare Drug Price Negotiation Program: Initial Memorandum,
Implementation of Sections 1191-1198 of the Social Security Act for Initial Price
Applicability Year 2026, and Solicitation of Comments**

Dear Deputy Administrator Seshamani:

The Leukemia & Lymphoma Society (LLS) appreciates the opportunity to provide comment on this initial guidance implementing the Inflation Reduction Act (IRA)'s drug price negotiation program. LLS's mission is to cure leukemia, lymphoma, Hodgkin's disease, and myeloma, and to improve the quality of life of patients and their families. We advance that mission by advocating that blood cancer patients have sustainable access to quality, affordable, coordinated health care, regardless of the source of their coverage.

Input Regarding Clinical Benefit and Patient Engagement

Patient engagement is an important step to better understanding how patients view the burden of their disease, their desired treatment outcomes, and their views on benefits and risks associated with the range of treatments available to them. Driven by the work of the Food and Drug Administration (FDA) on patient-focused drug development (PFDD), many drugmakers have worked with FDA and patient organizations to develop quantitative and qualitative data that allows regulators and other stakeholders to better understand the needs of particular patient populations and the extent to which a drug meets those needs. We encourage CMS to consider the positive impact of appropriately incorporating PFDD data and similar data that may help CMS better understand the extent to which a given product represents a therapeutic advancement over other products and/or meets a patient need that is otherwise unmet by other products.

We ask CMS to provide more clarity on how the agency intends to leverage negotiation data, to ensure that the agency is evaluating these elements with the patients' experiences, preferred outcomes, and needs in mind. For instance, we ask that CMS transparently outline a consistent methodology for how data related to therapeutic alternatives will result in changes to an initial or final offer. As part of this methodology, we ask that CMS ensure data explicitly related to patient value is prioritized. CMS should appropriately prioritize patient experience

data among the many factors CMS identifies in the guidance as sources that will inform an initial/final offer. Following negotiation for a particular product, we encourage CMS to articulate how patient experience data influenced initial and final offers.

In addition to the opportunity to submit data, LLS urges CMS to develop further initiatives to solicit feedback from the patient community. These processes could be comparable to the FDA's work in PFDD. CMS should develop a patient engagement infrastructure that creates an ongoing dialogue with patient communities whose patients may be prescribed drugs that have been selected for negotiation.

Maintaining and Improving Beneficiary Protections

We appreciate the IRA's provision requiring all Part D plans to cover each drug with negotiated prices for all years for which the price is in effect during the price-applicability period. This provision helps ensure that beneficiaries will benefit from the negotiation process and have access to the lowest-price drugs.

LLS encourages CMS to monitor Part D plans to ensure beneficiaries have access to all negotiated drugs and provide opportunities to comment on beneficiary protections in the future. Additionally, we urge CMS to require Part D plans to reduce or eliminate burdensome utilization management (UM) tools and prohibit plans from placing negotiated drugs on a formulary tier requiring cost-sharing calculated by co-insurance rather than a flat copay.

The initial guidance did not address UM tools (e.g., step therapy, prior authorization, etc.) or cost-sharing requirements employed by Part D plans with respect to negotiated drugs. UM techniques and cost-sharing requirements can create significant barriers and increase costs for patients by delaying the start or continuation of necessary treatment and negatively affecting patient health outcomes. Thus, it is critical that CMS create guardrails to ensure plans facilitate appropriate access to medicines by limiting these burdensome barriers, especially when the drug in question has an established maximum fair price. LLS believes this step would reduce the risk of plans delaying or denying access to products vital to a patient's care plan.

CMS must closely monitor plans as they adjust formularies due to these new incentives, as CMS will likely need to create new, more patient-friendly consumer protections to facilitate patient access to clinically-necessary off-formulary drugs.

Maintaining Incentives for Additional Indications

The IRA made significant changes to the incentives for drugmakers to invest in new indications for drugs they are bringing or have brought to market. The previous financial incentives for this investment were far from perfect, but it's clear they encouraged investments in supplemental indications. The IRA ushers in a new era with different incentives, and stakeholders are closely monitoring the effect of these new incentives.

As we monitor the effects of these new incentives, it is prudent to consider opportunities to reinforce the kind of investments that have led to new indications with proven value for patients. In that spirit, we encourage CMS to consider opportunities to promote a drugmaker's investment in research and development – opportunities aimed specifically at identifying supplemental indications, particularly indications for small populations, pediatric populations, and for populations with unmet needs. For example, CMS could use such investment as a factor in considering which products are selected for negotiation or in determining an initial or final offer during the negotiation process.

Utilization of Quality-Adjusted Life-Years (QALYs) in the Negotiation Process

LLS supports CMS's interpretation of the IRA as requiring the agency to separate out and exclude QALY metrics from the analysis of evidence in value-based decisions.

LLS believes that any evidence that values extending the life of some individuals less than extending the life of other individuals based on disability status, age, or membership in other special populations (e.g., children or those of marginalized status, including the patient community of color) is completely inappropriate. All patients deserve to be treated equally.

LLS agrees with CMS that negotiation would benefit from access to additional types of measures as a base for evaluation. While we cannot provide specific recommendations at this time, it is important that CMS does not rely on a single metric and instead looks widely at sources to take a holistic approach.

Orphan Drug Exemption

We appreciate that the IRA includes a limited exemption from drug price negotiation for orphan drugs that only treat one rare disease. However, we are concerned about CMS's current interpretation of this exemption. That interpretation would make products eligible for negotiation once they have been designated for two or more orphan diseases, even if a product is not yet FDA-approved to treat the second orphan disease. Our concern is that this might disincentivize drug companies from conducting even the basic research necessary to develop a drug for additional rare diseases, as designating a drug for a rare disease is done very early on in the drug development process, far in advance of when a company would be permitted even to market a drug for that specific condition. We urge CMS to clarify that obtaining additional designations for a small molecule or biologic will not make a drug negotiation-eligible until the drug has been approved by FDA to treat a second disease or condition.

Conclusion

LLS thanks CMS again for its leadership in this critical area and for this opportunity to provide comment on this important guidance. If you have any questions or would like to discuss our

LEUKEMIA &
LYMPHOMA
SOCIETY®

Center for Medicare and Medicaid Services
Attn: IRAREbateandNegotiation@cms.hhs.gov

RE: Medicare Drug Price Negotiation Program Guidance

To Whom it May Concern:

I am writing to you today to express my support for the use of cost-effectiveness analysis (CEA) as a critical input into data collection and analysis for drug price negotiation to support the Medicare program. I recognize that CMS is excluding consideration of the quality-adjusted life year (QALY) as a measure of health gain in such analyses, due to concerns that the measure may somehow value extending the life of an elderly, disabled, or terminally ill individual at a lower level than that of a younger or healthier individual. I disagree with this approach because, in practice, QALYs are used to compare the effects of treatments, not to value the life of an individual in the absolute.

Nevertheless, there are alternatives to the QALY that take different approaches to measuring and valuing life extension. For example, the equal-value life year ([evLY](#)) and health years in total ([HYT](#)) are two approaches to valuing life extension from treatment on an equal footing across diseases and patient populations. The *disability*-adjusted life year ([DALY](#)), used widely in the developing world, actively measures the level of disability and premature loss of life caused by disease, with the intent of rewarding innovations that reduce these effects. Finally, a new approach, known as Generalized Risk-Adjusted Cost-Effectiveness ([GRACE](#)) Analysis, allows for improvements in quality of life to be weighted more heavily for disabling and severe conditions. All of these measures, applied with care and consideration, meet the intent of the statute that excludes QALYs, because they all treat life extension on an equal footing.

The alternative measures specified above do not exist in isolation; rather, they are used like the QALY is as a key component of CEA. If CMS also restricts or eliminates the use of these alternatives, there is little left upon which to base CEA. Using a simpler measure like "[life years](#)", for example, would only reward treatments that extend life, not those that act primarily to improve quality of life. This would severely underestimate benefits that might be gained from new treatments for multiple sclerosis, psoriasis, arthritis, and many other conditions that greatly diminish function and quality of life.

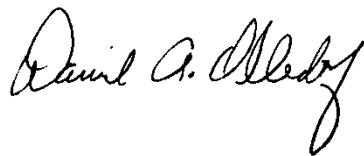

In sum, these concerns do not come from a standpoint of technical jargon and academic preferences; rather, it is that I strongly believe that elimination of CEA and other economic analysis to inform health decisions will harm the very populations the QALY-eliminating language seeks to protect. Without such analyses, insurers (including plan sponsors participating in Part D) can resort to placing severe restrictions on access to medications and creating multiple hoops for patients to

jump through as a way of saving money, without paying any attention to the potentially significant value that new (albeit expensive) treatments might bring. I have witnessed, and strongly support, great levels of innovation over the last decade, innovation that has changed the lives of patients and families. Analyses such as CEA can help ensure the health system is investing in those types of innovations and paying fairly for them; this will serve to send the right signals to industry about the type of innovation we as a society want.

Please do not hesitate to contact me should have any questions or require clarification.

Sincerely,

A handwritten signature in black ink, reading "Daniel A. Ollendorf". The signature is written in a cursive, flowing style.

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure,

While we don't believe that legislators who approved the Inflation Reduction Act (IRA) intended to stop or dissuade the development of life-saving drugs, that is one of the unfortunate consequences of the IRA.

We are Tyra Biosciences, a San Diego based company, and one of many emerging biotechnology companies that face shareholder pressure to reconsider the clinical development pathway for our drug candidates in certain indications as a direct result of the IRA. In our case, the IRA provides a disincentive to continue the development of an oral cancer treatment that we believe has the promise to be more effective than current therapies, including providing for an easier and more convenient oral administration over daily injections or hours-long infusion administration.

Our company designs and develops precision small molecules that we believe could substantially extend the lives of cancer patients who would otherwise run out of treatment options or have to cease treatment due to intolerable drug toxicity. Our lead drug candidate, which has not been approved by the US Food and Drug Administration, is TYRA-300: the first oral drug of its kind to enter the clinic. As an FGFR3-selective agent, TYRA-300 has the potential to extend the lives of patients and mitigate the common side-effects of currently marketed non-selective FGFR inhibitors, including liver damage, diarrhea, painful mouth sores, eye toxicity, skin rashes and sensitivity, hair loss, and debilitating fingernail pain and disfigurement. There are over 100,000 cancer patients in the U.S. today that could potentially benefit from TYRA-300, including approximately half of the 80,000 new bladder cancer diagnoses every year in the U.S.

This same drug candidate, TYRA-300, also shows promise in treating genetic skeletal dysplasias such as achondroplasia (dwarfism) based on pre-clinical data. Over 40,000 kids in the U.S. could potentially benefit every year from TYRA-300. Based on positive pre-clinical results,

we may decide to seek orphan designation for achondroplasia since the IRA provides an exclusion from forced negotiation/capped pricing for a drug that is orphan designated for only one rare disease or condition and that is approved for only an indication (or indications) for such disease or condition.

Whereas large molecules are typically administered intravenously by injections, most small molecules, like TYRA-300, can be administered orally as a pill. We believe TYRA-300 holds the promise of children avoiding daily injections for skeletal dysplasia and for cancer patients to be able to take a pill rather than travelling to an outpatient clinic for infusions (which can be expensive, inconvenient, and time consuming).

By establishing different periods following approval when negotiation eligibility may begin for large molecules (11 years after BLA approval) and small molecules (7 years after NDA approval), the Inflation Reduction Act disadvantages small molecules like TYRA-300.

Our largest investors are raising questions and have asked us to take into account the impact of the IRA on our clinical development timeline for TYRA-300 in certain indications. Why? Because if we were to seek and obtain approval initially for bladder cancer, this approval would trigger the 7-year price negotiation application for TYRA-300, potentially adversely impacting aggregate drug sales for skeletal dysplasias in children if an approval for this indication came after a bladder cancer indication approval, because upon approval of the second indication, less than 7 years would remain until the drug could potentially become subject to the IRA forced negotiation/capped price provision.

Conversely, if we were to seek and obtain approval initially for skeletal dysplasias, instead of bladder cancer, this approval would not trigger the 7-year rule if we receive orphan designation for this disease and come under the IRA's orphan drug exclusion, avoiding the potentially adverse impact of the 7-year timeline on aggregate drug sales for skeletal dysplasias. The 7-year clock would then start to run when we subsequently receive approval for a bladder cancer indication. In other words, because of fiduciary obligations owed to their respective investors (which include pension and retirement funds), our investors and we are being forced to consider choosing between advancing treatment for cancer patients versus progressing treatment for children with genetic disorders like skeletal dysplasias.

Here's how you could help these children *and* cancer patients. While we understand that the Centers for Medicare & Medicaid Services (CMS) is not seeking comment on Section 30.1, we respectfully urge you to please support applying to NDA-approved drugs the same 11-year period applicable to BLA-approved drugs before eligibility for the IRA's forced negotiation/capped price provision begins. Creating small- and large-molecule parity for negotiation eligibility at 11 years also would reduce the importance of the orphan drug exemption in determining whether the drug merits investment today, thereby benefitting patients through earlier access to multiple indications.

* * * * *

We appreciate you considering our comments as you develop Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented appropriately and that the potential harm to patients from fewer innovative medicines is minimized. Please contact me by telephone at (212) 574-8225 or by e-mail at afawaz@tyra.bio if you have any questions regarding our comments.

Sincerely,

A handwritten signature in black ink that reads "Ali Fawaz". The script is fluid and cursive, with the first letters of the first and last names being capitalized and prominent.

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure and Director Seshamani:

The U.S. Chamber of Commerce (“the Chamber”) in conjunction with the Chamber’s Global Innovation Policy Center (“GIPC”) urges the Centers for Medicare and Medicaid Services (“CMS”) to re-evaluate the approach taken in CMS’s Initial Memorandum, implementing certain provisions of the *Inflation Reduction Act* (“IRA”). The Chamber supports appropriate efforts to ensure that every American has equitable access to life-saving medicines at fair market prices, from COVID-19 vaccines to new diagnostics and therapeutics combating some of the world’s most debilitating diseases. However, we firmly believe that both the IRA itself, and the implementation contemplated by the guidance document, will harm life-science innovation and limit choices of life-saving medications for Americans.

The Chamber’s primary, although by no means exclusive or exhaustive, concerns can be summarized in three points:

1. Analysis and experience in other countries proves that market-restrictive policies like the IRA’s price controls deter future innovation, inhibit patient access, and limit patient choice;
2. The actions contemplated by the guidance document are inconsistent with the statute and would even more severely penalize life-science innovation and devalue the role of the living innovation ecosystem; and
3. Under applicable legal provisions and regulatory procedures, the Administration must solicit and then consider stakeholder feedback through a formal request for comment under the appropriate rulemaking mechanism. In addition, the guidance’s thirty-day deadline and restricted comment solicitation for only some elements of the implementation fail to give stakeholders adequate time to fully and fairly participate in the regulatory process.

The Chamber’s additional concerns are outlined in more detail below.

- I. Market-restrictive policies like the IRA’s harmful, ill-conceived price controls have a negative impact on innovation that results in restricted access to new, innovative, and life-saving medications by American patients.

In March, the Chamber released its *2023 Patient Access Report (Phase One)* (“The Report”). As GIPC recently explained in a letter to HHS Secretary Xavier Becerra, the Report confirms what proponents of the free market system already know: marketplace competition and effective intellectual property protections give patients greater access to the latest life-saving medicines.¹ In contrast, the Chamber’s research shows that market-restrictive policies like artificial price controls deter future innovation, inhibit patient access, and ultimately limit patient choice.

Reducing barriers to access has long been a health policy priority and focus for Congress and the business community. The Chamber supports appropriate, effective efforts to help mitigate and overcome obstacles to life-saving medicines. But, government price setting will create additional access challenges for Americans.

Unfortunately, many have accepted the failed premise that government intervention and price setting is the most effective way to provide patients with access to life-saving innovations. This approach is embodied within the drug pricing provisions of the IRA. While the IRA claims to promote access by controlling prices through so-called “negotiation,” the reality is that innovators are forced to comply with the government’s arbitrary and coercive price control scheme or face crippling penalties. At the same time, incentives to develop generic and biosimilar medications, one of the key components in the innovative ecosystem in today’s biopharmaceutical market, are virtually destroyed – embedding price controls in the U.S. market in a way that would be virtually irreversible for future generations of medicines.

The Chamber’s Report cautions that the IRA’s drug pricing penalties will harm patients by causing them to forfeit early and extensive access to the best life-saving medications. The Report’s methodology shows that in other OECD countries which have implemented price controls, patients see fewer overall biopharmaceutical product launches, including biologics and oncology products, and have delayed access to medicines.² For example, prior to the enactment of the IRA’s price controls, out of 104 new oncology products released globally, 80% were launched in the U.S., while only 58% were launched in Europe. Similarly, in several benchmark countries, patients can often wait up to several hundred days to receive access to life-saving treatments, waiting an average of 133 days in Germany and up to 500 days in Spain.

The IRA’s anticipated harms have already been revealed through the numerous life-science innovators who have officially ended product research and development programs, citing the new price controls. Anecdotally, for example, Eli Lilly CEO Dave Ricks said the company had already dropped a blood cancer drug from its R&D pipeline because they “couldn’t make the math work . . .

¹ Ltr from David Hirschmann, President and CEO, Global Innovation Policy Center, to Secretary Xavier Becerra, March 22, 2023.

² The report found that fewer biopharmaceutical products overall launched in Canada, Japan, South Korea, Australia, and European Union member states than in the United States over the past 20 years.

[i]n light of the Inflation Reduction Act, this program no longer met our threshold for continued investment.”³ Similarly, Novartis warned that the new law could discourage research in its most promising areas of research: RNA and radioligands.⁴ Finally, Alnylam has stopped the development of a treatment for a rare eye disease due to the need “to evaluate impact of the Inflation Reduction Act.”⁵

In addition, research by The Pharmaceutical Research and Manufacturers of America (“PhRMA”) shows the IRA’s pricing provisions may put the development of more than 400 new medicines at risk.⁶ This research indicates these potential medicines under development target some of the most common, yet serious, chronic diseases affecting America’s seniors, including Alzheimer’s, diabetes, and congestive heart failure.⁷ Unfortunately, this report, too, demonstrates the IRA’s ill-conceived price controls are already having a “chilling effect” on research and development. According to the report, life science innovators believe the IRA’s current framework will undermine advances critical to patient well-being.⁸ In fact, when asked, some 82% “or more of companies with pipeline projects in cardiovascular, mental health, neurology and cancers expect substantial impacts on R&D decisions....”⁹

These are but a few of the most prominent examples of the type of innovative, life-saving products whose realization, availability and ultimately access are ironically threatened by the IRA’s price controls to purportedly improve access. As more information comes to light, it is likely to become clear that the most vulnerable patients – including older Americans, those diagnosed with rare diseases, and underserved populations– will pay the price for innovation lost to the IRA. To describe these policies as disastrous for American innovation would be an understatement. Government intervention in the market establishment of prices undermines the innovation ecosystem that enabled the U.S. to become one of the most inventive countries in the world. Decisionmakers must consider the implications of price controls for patients before proceeding with the implementation of the IRA’s framework, which would jeopardize U.S. leadership on biopharmaceutical innovation and access to treatments. The ability of American patients to access life-saving innovations in a timely manner depends on it. Surely this outcome—less innovative medicines and longer wait times—isn’t what any policymaker or advocate wants.

- II. Actions contemplated by the guidance are not supported by the statute and further undermine life-science innovation, devalues the living innovation ecosystem, and limits patient access to new, life-saving medications.

As if the IRA’s price controls are not harmful enough to America’s life-science ecosystem, it appears that interpretations and actions contemplated by the Administration in this guidance go beyond the statutory text and further exacerbate the law’s negative effects. For example, the

⁹ *Id.*

proposed guidance anticipates establishing rules that would penalize life-science innovators for investing in extensive research and development to acquire patents for selected medications. Under the proposed guidance, the agency would “consider the length of the available patents...and may consider adjusting the preliminary price downward” if the patents last “for a number of years.” Given the timelines set forth in the IRA, this could include both patents on medications originally approved and patents secured for subsequent innovations.

This policy could penalize America’s life-science innovators for engaging in both initial product innovation and in the additional research and development into both new treatments and new applications of existing treatments, in a way that is inconsistent with the United States Government’s deliberate, longstanding policy decisions, on which companies and investors have relied for many years, to bolster innovation with patent protection in the U.S. Both theory and reality suggest that more patents in a therapeutic class expand innovation and economic growth, expand patient choice, and advance the public good with better health. Innovation is not a one-time, compartmentalized process. When a life sciences innovator files an initial patent claim it often does so in the early stages of research and development, years before an intended product reaches the market and all aspects of its applications and treatments have been clinically tested. Extensive clinical trials and continuing investments in research and development are required to uncover subsequent health conditions that may be treated by the initial product. The result is living innovation, a tree that continues to bear fruit. From delivery efficacy and patient compliance to dosages, mitigation of side effects, extended-release formulations, and entirely new treatments, so-called “follow-on innovations” deliver invaluable benefits to patients and consumers.¹⁰

More than 60 percent of oncology medicines approved a decade ago went on to receive additional approvals, and more than 70 percent of these additional approvals occurred seven or more years after initial approval, and as such required significant investment in research and development on the part of the innovator. These new uses provide treatment options for different diseases, including rare diseases, or additional patient populations such as children. However, with the policies laid out in the IRA guidance, instead of these critical advances, companies will have to reconsider whether post-approval research is sustainable, given the commitment of time and resources.

One product that demonstrates the value of living innovation is Botox. When Botox was initially approved, it was to treat two rare eye muscle disorders. Today, there are more than 12 approved indications, including for overactive bladder.¹¹ Similarly, AZT was originally developed as a failed attempt at cancer treatment.¹² It was only years after its failed application as a cancer treatment—and untold investments in clinical trials and research—that its potential in the fight

¹⁰ Professor Kristen Osenga, *Are “patent thickets” to blame for high drug prices*, Richmond-Times Dispatch, Nov. 30, 2022 (“It’s no secret that drug manufacturers regularly continue to innovate drugs long after they’re originally proven safe and effective. There are countless legitimate reasons to do so. Sometimes, post-market research suggests that a particular dosage or delivery method could be superior to the original.”).

¹² Christopher M. Holman, *Why Follow-On Pharmaceutical Innovations Should Be Eligible For Patent Protection*, IP-Watch, Sep. 21, 2018, available at <https://www.ip-watch.org/2018/09/21/follow-pharmaceutical-innovations-eligible-patent-protection/>.

against HIV/AIDS was discovered.¹³ Without the ability to engage in follow-on innovation and secure patent protections, it is questionable whether the new treatments for either of these life-science innovations would be available in the future.

Each stage of innovation requires new investment and risk, which is made possible by incentives like the potential for patent protection. According to one study, the median cost of getting a new life science innovation to market was \$985 million, with an average overall cost of \$1.3 billion.¹⁴ Other studies estimate the cost, based on the amount of research and clinical trials required, could be as high as \$2.8 billion.¹⁵ The reality is that cutting-edge medical treatment is costly, and the hope it gives to patients with previously incurable diseases and illnesses is immense. To justify these substantial costs and investments, many of which never materialize or become profitable, innovators must have access to potential patent protection, and the ability to recoup significant investments to enable future innovations and follow-on uses that arise later in the product's development lifecycle.

Simply put, given the significant costs associated with bringing any iteration of a product to market, without the ability to secure full scope of protection and additional protections for follow-on innovations, life science companies will not invest in new or improved versions of their medicines. Actions contemplated by the guidance, and especially its penalization of companies that secure additional legal rights, would undermine the living life-science innovation ecosystem and prevent new medicines and treatments for existing medicines from entering the market. This would ultimately harm the very people CMS wishes to protect: American patients suffering from debilitating diseases.

To be clear, the Chamber believes that the IRA's price-control provisions are unconstitutional. But the underlying defects in the statute are no justification for CMS to go even farther in guidance and undermine innovation and patient access even more than the IRA itself requires.

- III. The thirty-day window for comments contemplated by the guidance is insufficient and provides inadequate notice, which is exacerbated by regulatory overreach in the guidance; stakeholder feedback should be solicited through formal, robust notice and comment mechanisms.

CMS's approach in implementing the negotiation provisions of the IRA exceeds CMS's statutory authority and encroaches on the authority of other parts of the Executive Branch. Specifically, in assessing whether a biosimilar or generic competitor has come to market, CMS proposes to evaluate its own prescription drug event data to determine if competition is taking place, an authority that cannot be found in the IRA. Similarly, CMS intends to conduct its own assessment of clinical value and product safety in the negotiation process, in a manner that exceeds the limited authority to consider evidence regarding alternative treatments that is set forth in the

¹³ *Id.*

¹⁵ Robert Zirkelbach, *The Cost of Innovation*, PHRMA, November 19, 2014.

statute. Evaluation of competition and clinical value assessment in a comprehensive fashion are roles delegated to the FTC and FDA, respectively – not to CMS. By going beyond the statute in these areas, CMS is exceeding its authority and expertise and setting up a slippery slope with even more significant government interference in our health care system and free markets.

CMS has also been touting transparency and stakeholder engagement as CMS moves forward to implement the IRA. Unfortunately, it's not the number of meetings that matters so much as the substance of those meetings. Despite months and months of CMS effort, too many unanswered questions remain that will have significant bearing on the state of the U.S. economy and patients who rely on the Medicare program for access to needed medicines.

As a threshold matter, the Chamber notes that CMS requires stakeholders to submit their comments on the guidance within thirty days, which is half the time typically provided for public comment on initial rules for a new program. Thirty days is far too little time for stakeholders to develop meaningful input on a major new program that CMS itself has described as “novel” and “complex”, particularly given the regulatory overreach reflected in the guidance. This limited window hardly allows patients and other stakeholders to provide meaningful input and suggests that CMS is not interested in hearing from relevant parties in a manner that would shape its decisions. These issues are vitally important and deserve an opportunity for meaningful and effective comment by all interested parties.

This critical public policy matter requires a formal, robust notice and comment period. Moreover, CMS should solicit comment on all topics discussed in the Memorandum, not merely on a subset of those topics. Indeed, we recommend that CMS utilize notice and comment rulemaking to obtain public input here, given due process constraints, the Medicare statute's notice and comment requirements, and core public participation values.¹⁶ This is particularly important in light of the obvious legal and practical concerns raised by core aspects of the guidance, as well as serious legal questions about the nature and validity of the statutory provisions being implemented.

IV. Conclusion.

With the passage and implementation of the Affordable Care Act, Congress and the Obama Administration believed that access to health care services and treatments would be achieved by expanding comprehensive health coverage to all Americans. While the Chamber supports increasing the number of Americans with health coverage, we are mindful that barriers persist in a different way as higher deductibles, and out of pocket costs mitigate premium increases but also pose challenges to access. Now with the passage and implementation of the Inflation Reduction Act, it appears that Congress and the Biden Administration are focused on a new false panacea, a mistaken belief that artificially holding down prices will ensure access to therapies. However, with this new form of expanded government intrusion in our health system, our country will see that the IRA imposes new barriers to access as therapeutic pathways and research are quashed.

¹⁶ See, e.g., 42 U.S.C. § 1395hh(a)(2); *Azar v. Allina Health Servs.*, 139 S. Ct. 1804, 1808, 1815-16 (2019); *Ralls Corp. v. Comm. on Foreign Inv. in U.S.*, 758 F.3d 296, 318-19 (D.C. Cir. 2014).

The Chamber appreciates the opportunity to submit these comments for the record regarding CMS's IRA implementation guidance. We stand ready and willing to work with this Administration to find lawful and appropriate ways to ensure that life-saving medications are both available and accessible to all Americans. However, the Chamber cannot and will not support misguided, market-restrictive, and legally defective efforts that limit patient access and choice and undermine the living life-science innovation ecosystem. The Chamber strongly urges CMS to withdraw this guidance and instead engage in a formal, robust comment process that is consistent with the statute to ensure that all stakeholder voices are heard and that no adverse action is taken which will undermine American innovation.

Sincerely,

David Hirschmann

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Brooks-LaSure:

UCB is a global biopharmaceutical company with U.S. headquarters located in Atlanta, Georgia. With more than 8,700 employees globally, we are inspired by patients and driven by science. Our focus is on innovating new medicines to treat severe, chronic neurological, immunological, and rare conditions. UCB is committed to ensuring that all patients have affordable access to the right medicine at the right time, regardless of age, ethnicity, geography, or economic circumstance. Patients are at the heart of everything we do at UCB, from where we invest our research dollars to how we engage with other stakeholders to bring new therapies to market. Every day, we work to ensure that patients have the best individual experience while promoting access to high-quality, coordinated, affordable care and equitable access to medicines for *all* patients.

UCB appreciates the opportunity to provide comments to the Center for Medicare & Medicaid Services' (CMS's) Medicare Negotiation Program: Initial Memorandum (hereinafter "the Memorandum"). As a patient-centered company, UCB shares CMS's commitment to ensuring patients have affordable access to the best treatment for their individual circumstances. We offer the following comments to the Memorandum for CMS's consideration:

I. (Section 60.1) Establishment of Single Proposed Maximum Fair Price (MFP) for Negotiation Process

In the Memorandum, CMS states that it intends to base the single MFP on the cost of the selected drug per 30-day equivalent supply, weighted across dosage forms and strengths – as opposed to a per unit (e.g., tablet, capsule, injection) or a per volume or weight-based metric. UCB appreciates that CMS intends to use this approach to allow for a more direct comparison with therapeutic alternatives, which might have different dosage forms, strengths, and frequency of use than the selected drug. However, we have concerns about the use of this methodology and how it will be applied to certain treatments.

The calculation CMS outlines in the Memorandum is complicated and may not be appropriate as applied to certain treatments or types of treatments. Unclear or inconsistently applied methodology can unfairly disadvantage some therapies. While the methodology may be relatively straightforward as applied to medications for chronic conditions that are taken at regular intervals, it may prove problematic when applied

to certain products or types of products. For example, medications used at irregular dosages or intervals, such as rescue medications; medications used for multiple indications may have unclear or misleading 30-day averages; and dosing averages across formulations could have unclear or misleading 30-day averages due to different uses and sites of care.

For example, midazolam used as a rescue medication used to treat acute repetitive or cluster seizures. Rescue medication is not intended to be used daily and should not be used more than five times per month. A patient may have several cluster seizures per month necessitating use of the medication; alternatively, a patient may go for several months without experiencing a cluster seizure, therefore without the need for a dose. No two patients are affected the same way and, as such, will not have the same treatment schedule. In fact, a single patient's use of such a rescue medication may vary over the course of a lifetime. In the case of a rescue medicine intended for acute symptoms, it would be confusing and misleading to apply a single MFP across a 30-day supply as a standard 30-day supply does not exist.

Treating patients with generalized myasthenia gravis (gMG), a rare disease, who are AChR or MuSK antibody positive is complicated.¹ The recommended dose of many treatments is based on body weight tier/band associated with a fixed dose and the treatment cycle may be based on a provider observation period, or after gMG symptoms begin to worsen – which varies patient-by-patient and will vary for the same patient within a lifetime. gMG is a highly heterogeneous disease which presents differently patient-to-patient and, often, differently hour-by-hour in the same patient. Because gMG is such a diverse disease, treatment is necessarily diverse and tailored to the unique disease journey of each patient during each stage of their disease. Attempting to construct a standardized 30-day supply for such a treatment would not only be confusing but misleading.

UCB encourages CMS to work with stakeholders – including manufacturers, patient groups, and provider groups – to better understand how 30-day equivalent supplies are calculated for those medicines that have irregular or varied dosing schedules.

II. (Section 60.3.1) Identifying Therapeutic Alternatives for the Selected Drug

In the Memorandum, CMS states that, for each indication of a selected drug, it will identify a pharmaceutical therapeutic alternative(s) (covered Medicare Part D or Part B drugs or biologics only). CMS states that, in identifying therapeutic alternative(s), it will rely on data submitted by the manufacturer and the public, Food & Drug Administration (FDA) approved indications, indications included in CMS-approved Part D compendia, widely accepted clinical guidelines, and peer-reviewed studies. CMS goes on to specify that it will start with therapeutic alternatives within the same chemical or therapeutic class, or mechanisms of action, before considering other drug classes, and that, in the case of therapeutic alternatives not yet in compendia or evidence-based guidelines, it will rely on clinical evidence through literature searches. UCB requests additional clarity with respect to how CMS will identify *clinically appropriate* comparator therapeutic alternatives, particularly in the case of chronic and rare diseases.

When identifying therapeutic alternatives for selected drugs, UCB encourages CMS to incorporate the patient point of view. The value of a treatment is more than a mathematical calculation of efficacy and cost, and the value of a treatment differs according to *each specific patient* being treated. Patient perspectives provide critical insights into what is most important to patients, such as improved productivity, out-of-pocket (OOP)

¹ ClinicalTrials.gov. Accessed January 2023.

spending, ability to participate in activities of daily living, impact on caregiver burden, improvement over alternative treatments, impact on public health, and the promise of hope (among other priorities). Incorporation of patient perspectives will help to account for the nuances of different treatment's impact on the holistic patient experience and reflect individual patient viewpoints and disease journeys.

Newer, more targeted therapies bring disease control faster and more consistently without the risk of adverse effects. It is important to consider these clinical attributes when identifying a therapeutic alternative. UCB encourages CMS to select therapeutic alternatives carefully to ensure that patients are not inadvertently driven to inferior treatments – e.g., treatments that are clinically inferior or have a greater side effect profile but have a lower cost because they have been on the market for a longer time. When selecting a therapeutic alternative, CMS should rely on a variety of credible data sources that account for the diversity of patient populations, particularly data from real-world settings, and reported by patients directly. For example, real-world evidence (RWE) can provide insight into the benefit of a treatment and its usage in a real-world scenario, beyond data collected in randomized clinical trials (RCT).

When selecting a treatment alternative, UCB encourages CMS to consider unmet need and improvement over existing treatments from the patient perspective. Below, please find disease-specific examples to illustrate the importance of considering the nuance among a patient population and the heterogeneity of disease when selecting a treatment alternative. Additionally, when considering the improvement of a treatment over existing therapies, UCB encourages CMS to also consider the additional burden that certain older formulations – e.g., requiring multiple infusions – may place on patients and families further highlighting the need for additional treatment options and formulations.

A. Treatment of Seizure Clusters

Seizure clusters, also known as acute repetitive seizures, describe a pattern of increased seizure frequency or severity which is recognizable to the patient and/or caregiver, and which is not the patient's usual seizure pattern. Patients experiencing seizure clusters have been shown to have higher death rates, and the occurrence of frequent seizures in short periods of time is associated with an increased incidence of post-ictal psychosis.² Patients with clusters are more frequently transported to emergency departments (ED) and have more hospital admissions. Use of a rescue medication that may stop or prevent the evolution of seizure clusters at home, school, or work may prevent transport to the ED or hospital admission and lessen stress for the patient, family, and caregivers.³

NAYZILAM® (midazolam), is a prescription nasal spray used for the short-term treatment of seizure clusters in patients 12 years of age and older. While, prior to approval of NAYZILAM®, other rescue treatments were available, NAYZILAM® addressed an unmet need for this population and represents a significant improvement over previously available treatment. The previously approved rescue treatment for seizure clusters was a rectal gel; the nasal spray route of administration represents a significant improvement for this patient population.

² Post-ictal psychosis (PIP) is a severe mental condition associated with epilepsy, characterized by a disconnection from reality.

³ See Patricia Penovich, MD, EFMN. Acute Repetitive Seizures (ARS) or Cluster Seizures. Jan. 2020. [Acute Repetitive Seizures \(ARS\) or Cluster Seizures - \(epilepsyfoundationmn.org\)](https://www.epilepsyfoundationmn.org/ARS-or-Cluster-Seizures).

B. *Myasthenia Gravis is a “Snowflake” Rare Disease*

Generalized myasthenia gravis (gMG) is an extremely heterogeneous disease, varying not just patient-to-patient but hour-to-hour within a single patient. The nature of the disease further complicates the already complex world of rare disease and the subjective nature of the treatment approaches from physician-to-physician and patient-to-patient. Newer, more targeted therapies and solutions meet the unique needs of gMG patients and providers, while older, less innovative therapies may fall short in treating the disease and slowing its progression. Because gMG is a rare disease with limited treatment options available, it is imperative that CMS fully and carefully consider patient perspectives and utilize RWE to account for the true lived patient experience, which includes the social, psychological, and emotional effects of living with the unpredictability of a disease which is often not visible to others – including healthcare providers.

In the case of gMG treatments, conventional therapies are associated with side effects, treatment-related comorbidities, and long-term toxicities that can prevent those treatments from being suitable maintenance therapies. Additionally, conventional therapies may expose patients to disease exacerbations and poor quality of life – e.g., osteoporosis-related fractures, psychiatric disorders, renal failure, thrombotic events, aseptic necrosis, infection and gastrointestinal bleeding. Additionally, clinical effectiveness of “standard of care” or “best practice” therapy is limited and there is wide variability with respect to onset of action, patient response, and health outcomes.

UCB urges CMS to take into account the nuances of treatment and avoid generalizing that all patients will have the same response to “standard of care” treatment. Any consideration of alternative treatments for gMG must recognize the heterogeneity of the disease and focus on a treatment’s impact in the subset of patients with inadequate disease control despite being on standard of care therapy. Considering that many patient populations are very heterogeneous, and the effectiveness of a treatment is not equivalent across a population, UCB encourages CMS to engage with disease-specific organizations and providers, utilizing treatment guidelines, when evaluating a clinically appropriate “treatment alternative”.

Access to *the most clinically appropriate* treatment is highly important for gMG patients as uncontrolled gMG leads to crisis, exacerbations, and decreased patient quality of life. For example, over a one-year period, refractory patients had a significantly greater chance of:

- a. Having at least one myasthenic crisis (21.3%), compared with non-refractory patients (6.1%, $p<0.001$);
- b. Having at least one exacerbation (71.2%), compared with non-refractory patients (32.4%, $p<0.001$); and
- c. Hospitalization and/or have an emergency department visit compared with non-refractory patients and non-MG control patients ($p<0.001$ for all).

C. *Newer Rheumatoid Arthritis Treatments Demonstrate Superior Clinical Benefit*

Rheumatoid arthritis (RA) is a chronic inflammatory disorder that can damage a wide variety of body systems, including the skin, eyes, lungs, heart, and blood vessels. Unlike the wear-and-tear damage of osteoarthritis, RA affects the lining of the patient’s joints, causing painful swelling that can eventually result in bone erosion and joint deformity. The inflammation associated with RA can damage other parts of the body as well. New

types of medications have dramatically improved treatment options. However, RA can still cause physical disability.⁴

Without appropriate treatment, RA inevitably causes irreversible damage to the structural joints and is often accompanied by multiple organ damage. Joint damage progresses in the early stages after onset, and the deformed joints cause irreversible physical dysfunction. Prompt diagnosis along with appropriate treatment is essential for the clinical management of RA. Treatment options for RA have improved significantly in the 21st Century and now include medications that slow the progression of joint damage. These drugs are called disease-modifying antirheumatic drugs (DMARDs). These drugs act on the immune system to slow the progression of RA. The aim of treatment is to lower disease activity or achieve remission.

When a patient is initially diagnosed with RA, they are usually prescribed *methotrexate* (MTX). MTX is a synthetic DMARD (csDMARD) that reduces inflammation via multiple mechanisms. It is usually combined with a glucocorticoid (GC) drug such as *prednisone* (*Deltasone*). MTX is used as an anchor DMARD in treating RA and many patients benefit from MTX; however, a large number of RA patients suffer from side effects. A variety of side effects can be associated with MTX when treating RA patients, from mild to severe or discontinuation of the treatment.⁵

Biological DMARDs (bDMARDs), which are made from living organisms or contain components of living organisms, target TNF, IL-6 receptors and others; and targeted synthetic DMARDs (tsDMARDs), such as Janus kinase (JAK) inhibitors, have been introduced in addition to conventional synthetic DMARDs (csDMARDs), such as MTX. Since the introduction of these treatments, clinical remission has become a realistic therapeutic goal for the majority of RA patients. Sustained remission facilitates prevention of structural joint damage over a long period of time, in addition to preventing progression of physical dysfunction.^{6,7}

RA does not present or progress the same for every patient; different treatments are more effective for different patients, and it may be difficult to figure out which medication (or combination of medications) will work best to help a patient regain control of their RA. It is very important that these patients have access to the best and most medically appropriate treatment for their specific circumstances.

III. (Section 110) Part D Formulary Inclusion of Selected Drugs

In the initial Memorandum, CMS reiterates that Medicare Part D plans must include each covered Part D drug that is a selected drug on Part D formularies. However, like the IRA statutory language, the Memorandum does not contain any additional parameters Part D plans must follow with respect to selected drugs. Under the redesigned benefit, plans will have a significant increase in financial liability. Considering this dynamic, plans may apply burdensome utilization management, making it difficult for patients to access certain therapies. Additionally, because plans are required to cover negotiated products, it is unlikely that plans will obtain high rebates on those products, incentivizing plans to prefer non-negotiated drugs from which they can obtain high

rebates. UCB is concerned with potential unintended consequences that may result from the IRA's drug pricing provisions – namely, that gains in affordability may come at the expense of access.

Unnecessarily Restrictive Utilization Management Harms Patients. Utilization management (UM) is now an integral part of most public and private health plans. The great majority of Americans are now enrolled in privately or publicly funded health plans that use UM programs as a primary cost-containment strategy. This includes 90 percent of privately insured employees and all Medicare and Medicaid participants.⁸ Utilization management for the sole purpose of reducing cost can interfere with early intervention and result in more costly procedures down the road due to a delay in care.⁹

Also known as “fail first,” step therapy is a tool used by health plans to control costs. Under its rules, patients are required to try one or more alternative prescription drugs, chosen by their health plans, before coverage is granted for the drug originally prescribed by a patient's health care provider. Step therapy is applied to medications treating a range of diseases and conditions including epilepsy, autoimmune diseases, psoriatic and rheumatoid arthritis, cancer, diabetes, multiple sclerosis, mental health, and many, many others. Its negative effects can include far worse than delays in treatment; it can give a serious disorder more time to progress, often causing significant anguish for the patient, as well as increasing the burdens on health care providers and, thus, increasing costs – both to the patient and, ironically, the insurance company. In the case of epilepsy, the practice can even precipitate Sudden Unexplained Death in Epilepsy (SUDEP), due to higher instances of SUDEP in patients with uncontrolled seizures.¹⁰

While the medications beneficiaries are forced to “step through” may lead to near-term savings for plans, such forced substitutions can also yield adverse clinical effects and/or suboptimal clinical outcomes for patients. As a result, such policies often lead to increased costs in the long run. Step therapy policies prioritize the short-term cost considerations of health plans above care-based decisions made within the patient-provider relationship.¹¹ UCB would like to offer disease-specific examples of how unnecessarily restrictive step therapy protocols can harm patients.

a. *Epilepsy*

Insurance companies are increasingly forcing epilepsy patients to try other treatments before covering the cost of originally prescribed treatments. This jeopardizes those patients' ability to drive and can even put their employment at risk. The majority of patients with epilepsy can control their seizures and other symptoms through proper drug treatment.¹² However, when patients are restricted from accessing the treatment(s) prescribed by their physician, they have a high risk of experiencing sudden seizures and other complications. Patients treating epilepsy can be particularly susceptible to adverse reactions from medications that differ from the treatments their doctors prescribe. Forcing epilepsy patients to step through other

medications before accessing the originally prescribed treatment puts many patients at risk of severe reactions.¹³

Delaying epilepsy patients access to prescribed treatments can have significant consequences, beyond simply putting those patients at risk of adverse reaction and exacerbating the severity of their symptoms. Individuals with uncontrolled epilepsy are at increased risk of losing their driver's license, their professional certifications, or potentially even their jobs. Any cost-savings gained imposing step therapy may well be mitigated by the additional costs incurred by patients who fail on the insurer's preferred medication.

b. *Rheumatoid Arthritis*

Rheumatoid arthritis (RA) is a chronic, debilitating disease that significantly impacts patients' quality of life and socioeconomic productivity. On a personal level, RA has a significant socioeconomic impact on patients' lives, and is ranked among the highest of all chronic diseases for its effects on health-related quality of life (HRQoL); limitations in physical function, as well as increased pain and fatigue affect patients' attendance at paid work, their work performance within and outside the home, and their participation in family, social, and leisure activities. Newer, more effective treatments, such as tumor necrosis factor (TNF) inhibitors, improve the signs and symptoms of disease, inhibit progression of joint damage, and improve physical function and HRQoL.¹⁴ Treatment is often able to limit or reduce joint damage and improve patients' quality of life; adhering to a treatment plan can make a big difference in patients' disease progression.

It is imperative that RA patients work with their physician to find an appropriate treatment regimen as soon as possible after diagnosis and adhere to that treatment regimen. Early diagnosis and proper treatment strongly affect patients' quality of life. In the early phase of the disease, effective treatment and strict monitoring can help to achieve remission within the shortest period. Delay in appropriate treatment can result in loss of the golden time when effective treatment must start.¹⁵

Forcing patients to step through other medications before they are able to access the treatment originally prescribed by their physician – particularly where the physician has no mechanism by which to override step therapy protocols – is inappropriate and can disproportionately negatively impact the health, well-being, and disease progression of RA patients. RA is a serious, debilitating disease and every day that RA patients do not get relief is a day spent suffering through long-term harm to their body. Delays in symptom and disease relief can result in serious complications and the need for more invasive and costly interventions like surgery and hospitalization.

What works for patient A might not necessarily be right for patient B, which is why it is important to work closely with a rheumatologist to determine the most effective treatment regimen. It can take time – sometimes a few months – to determine whether a treatment is working which can cause a long delay in patients accessing the most appropriate treatment when forced to step through other medicines. Importantly, once an RA patient switches treatments, there is no guarantee the original treatment will work as well as it once did when the patient switches back.

IRA Part D Redesign Incentivizes Increased Use of Utilization Management. Beginning in 2024, Medicare beneficiaries will have \$0 cost-sharing in the catastrophic phase and the income threshold for full eligibility under the low-income subsidy (LIS) program will be expanded. Beginning in 2025, the IRA makes additional changes to the Part D program. The coverage gap will be eliminated, and beneficiaries' annual out-of-pocket (OOP) costs will be capped at \$2,000 (adjusted annually for inflation) and beneficiaries will be allowed to "smooth" cost-sharing over a certain threshold across the coverage year. The government's responsibility in the catastrophic phase will be reduced from 80% to 20% and health insurance plans' liability significantly increases from 15% in the initial coverage phase to 60% in the catastrophic phase – in both LIS and non-LIS. Lastly, a new drug manufacturer discount program will require discounted prices for patients in the initial coverage phase (10%) and the catastrophic phase (20%) – in both LIS and non-LIS, with negotiated drugs excluded.

Changes to the Part D benefit do make improvements for patient affordability; however, that affordability may come at the expense of patient access to a wide range of prescription drugs. The increase in liability for health insurance plans, particularly in the catastrophic phase, may incentivize plans to increase the use of utilization management, restricting access to new, innovative treatments which often achieve better health outcomes and lead to lower overall costs to the system. Health plans are incentivized to forgo optimal patient outcomes in order to increase their bottom line. Increase in use of UM will only exacerbate the existing negative impacts of step therapy to patients. Without restrictions on plans' use of UM, patients may experience access barriers to needed therapies. As such, UCB encourages CMS to issue additional guidance, putting parameters around plans' ability to use UM tools to ensure that Medicare patients continue to have access to the most appropriate treatment for their unique circumstances.

c. Psoriasis

Psoriasis is an autoimmune disease characterized by raised areas of abnormal skin. These areas are red, pink, or purple, dry, itchy, and scaly. Psoriasis is associated with an increased risk of psoriatic arthritis, lymphomas, cardiovascular disease, Crohn's disease, and depression. There is no known cure for psoriasis, but various treatments can help control the symptoms. These treatments include steroid creams, vitamin D₃ cream, immunosuppressive drugs – such as methotrexate (MTX) – and biologic therapies targeting specific immunologic pathways. Psoriasis treatments are not all equal; different treatments are appropriate for different patients based on the degree of psoriasis and psoriatic disease severity.¹⁶ For example, systemic treatments, such as MTX, are used in patients that are not responsive to or unable to tolerate topical treatments. Biologics targeting Th1/Th17 cytokines have revolutionized psoriasis treatment.¹⁷ Studies show that the biologics approved to treat psoriasis and psoriatic arthritis can be very effective. For many people with moderate-to-severe psoriasis or psoriatic arthritis, a biologic may offer the most effective treatment available.¹⁸ Additionally, the use of a single drug or single therapy method may not work for every psoriasis patient; many patients are prescribed and find success with a combination approach to treatment. A combination approach has three main benefits: it decreases the possibility of reaching toxic levels with a single drug; the individual drugs can be prescribed at a lower dose; and a combination approach can be more

successful than a single treatment option.¹⁹ Psoriasis is associated with an increased risk of psoriatic arthritis, lymphomas, cardiovascular disease, Crohn's disease, and depression. As such, it is imperative that psoriasis patients have access to the most appropriate treatment for their specific disease state, without delay.

IV. Conclusion

UCB appreciates the opportunity to comment on CMS's Medicare Negotiation Program: Initial Memorandum. We welcome further discussion and look forward to working with CMS to continue improving quality of care and affordable access for all patients. Please direct any questions to Amanda Ledford, Director of U.S. Public Policy, via email at Amanda.Ledford@ucb.com or by phone at (202) 893-6194.

Sincerely,

A handwritten signature in black ink, appearing to read "Patricia A. Fritz". The signature is stylized with a large initial "P" and a long, sweeping underline.

Patricia A. Fritz

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Seshamani:

United Therapeutics Corporation (“United Therapeutics”) is a biotechnology company focused on the development of unique therapies and manufactured organs to address the unmet medical needs of patients with rare chronic and life-threatening conditions. United Therapeutics offers several medicines to treat pulmonary arterial hypertension (“PAH”), a life-threatening orphan disease, and also offers an oncology therapy approved for the treatment of high-risk pediatric neuroblastoma. It has also developed and commercializes the only FDA approved therapy for treatment of a rare condition known as pulmonary hypertension associated with interstitial lung disease. Longer-term, the company is actively developing technologies to solve the acute shortage of transplantable organs, through ex vivo lung perfusion, xenotransplantation, regenerative medicine, and 3D organ bioprinting.

We appreciate the opportunity to submit comments on the Centers for Medicare & Medicaid Service (“CMS”) Medicare Drug Price Negotiation Program Initial Memorandum¹ (“Initial Memorandum”) for initial price applicability year 2026 regarding the implementation of Sections 1191 through 1198 of the Social Security Act, as added by Sections 11001 and 1102 of the Inflation Reduction Act² (“IRA”). Also, we respectfully request that CMS promptly publish all submitted comments.

The U.S. pharmaceutical industry has long been a motor of innovation that provides life-saving therapies. Indeed, our company is a prime example of how entrepreneurship can thrive in a free-market economy, resulting in treatments that otherwise would never have become available.

¹ CMS, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (Mar. 15, 2023), available at <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>.

² P.L. 117-169.

United Therapeutics CEO Martine Rothblatt founded the company in 1996, after her daughter was diagnosed with PAH. Since its founding, United Therapeutics has commercialized multiple PAH therapies based on the active ingredient treprostinil that would not exist today, without Dr. Rothblatt's leadership. The company also developed and launched tadalafil, the active ingredient in Cialis, for the orphan PAH indication, allowing this molecule to benefit PAH patients alongside its more widespread indication.

Today, United Therapeutics is a public benefit corporation with approximately 1,000 employees primarily located in the United States, and continues its commitment to patients in the areas of lung disease and organ manufacturing. The United Therapeutics success story was only possible in an environment that rewards investment, innovation, and initiative. Without such rewards, innovators and leaders will not be able to assume the risks associated with pioneering new therapies, particularly in the orphan disease space.

And yet, these foundations of U.S. pharmaceutical innovation are under threat. The IRA's capped price and forced negotiation provisions mark the most significant change to the federal healthcare programs since their enactment more than 30 years ago, signaling a shift away from the free market approach to government price controls. But in creating the drug price negotiation program, Congress set carefully defined boundaries—the IRA's goal is clear: to subject only a specified number of single source drugs to price caps, not drugs for which there are generics or biosimilars. Unfortunately, the Initial Memorandum would impermissibly expand the IRA's scope, hurting innovation by eliminating the economic incentives that are essential to the functioning of the free market pharmaceutical economy. Some of the approaches CMS has adopted could produce procedurally deficient, arbitrary, and capricious decisions in particular factual scenarios where the agency is acting beyond its limited grant of authority, lacks sufficient information to act in a non-arbitrary fashion, or has failed to fully understand or appreciate the underlying record.

As we describe in further detail below, two particularly bald examples of ways in which CMS is proposing to impermissibly expand the scope of the IRA's statutory negotiation program would be (1) expanding the number of drugs subject to forced negotiations and price caps in 2026 beyond the number clearly intended by congress and outlined in the IRA itself (ten Part D drugs) by defining the operative term, Qualifying Single Source Drug ("QSSD") so broadly as to encompass a potentially large number of different therapies, and (2) imposing an impermissibly high bar before recognizing that a generic or biosimilar is being marketed.

The Initial Memorandum is also troubling procedurally. CMS may believe that the IRA did not require formal notice and comment rulemaking in the initial years following its enactment, which is why CMS is issuing one of the most significant portions of the Initial Memorandum in final form, namely the QSSD definition and related provisions (Section 30). However, CMS should still solicit and respond to comments on this topic. Indeed, such comments may identify significant shortfalls in CMS's plans that, if implemented as described, would deprive the regulated community of constitutionally required process.

The risk of damaging the U.S. biopharmaceutical industry through poorly-considered policy choices that go beyond what Congress intended is very real. Soliciting comments is an important first step, but CMS must do more—it must carefully consider manufacturer input: CMS is

becoming an industry participant and should avail itself of the knowledge and experience that only stakeholders can provide as the agency assumes the novel role of negotiating the price for pharmaceuticals on which many patients rely.

For example, CMS overlooked an important consequence of adopting an overly broad QSSD definition (and one that is clearly inconsistent with Congressional intent). By drawing in both Medicare Part D and Part B drugs if they share the same active moiety/active ingredient and are approved for the same manufacturer, any Maximum Fair Price (“MFP”) that applies to such a QSSD in 2026 will be used to set the Part B reimbursement rate pursuant to an IRA statutory requirement³—thus subjecting Part B drugs to an MFP in 2026, which the IRA contemplates for 2028, not for prior years. The QSSD definition, as proposed, thus directly violates the letter of the IRA. CMS can and should address these and other shortcomings of the Initial Memorandum and should abandon its assertion that its solicitation of comments is voluntary and that the agency will not entertain comments to Section 30 of the Initial Memorandum.

Our comments are addressed in further detail below. In addition, United Therapeutics subscribes to the comments regarding this Initial Memorandum that are submitted by the Biotechnology Innovation Organization (BIO).

I. THE PROPOSED QSSD DEFINITION VIOLATES THE LETTER AND INTENT OF THE IRA.

In the Initial Memorandum, CMS proposes to define QSSD as follows:⁴

- For drug products, CMS proposes to treat as a single QSSD all dosage forms and strengths of the drug that have the same active moiety and are approved under New Drug Applications (“NDAs”) held by the same manufacturer.
- For biological products, CMS proposes to treat as a single QSSD all dosage forms and strengths of the biological product that have the same active ingredient and are approved under Biologics License Applications (“BLAs”) held by the same manufacturer.

This definition ignores different approvals by the U.S. Food and Drug Administration (“FDA”) and is impermissibly broad in other ways. In keeping with the IRA, CMS should define a QSSD as corresponding to a particular FDA approval.

A. The proposed QSSD definition subjects Part B drugs to the MFP in 2026, in direct violation of the IRA.

The proposed QSSD definition would sweep in both Part D and Part B drugs, which would result in the MFP setting the Part B reimbursement rate for Initial Price Applicability Year (“IPAY”) 2026, a clear violation of the IRA, which expressly limits the forced negotiation and capped

³ IRA § 1198(b)(1)(A).

⁴ IRA § 1192(e)(1); Initial Memorandum Section 30.1.

price provision to Part D drugs for 2026 and 2027, and includes Part B drugs only beginning with IPAY 2028.

As proposed, the QSSD definition would sweep in different drugs with the same active moiety or different biologics with the same active ingredient, regardless whether these drugs or products are payable under Part D or Part B. For example, a manufacturer holds two NDAs for two drugs with the same active moiety, with one drug being self-administered and therefore reimbursed under Medicare Part D, and the other being physician-administered and therefore reimbursed under Part B. If this single QSSD is subject to an MFP in IPAY 2026, the Part B drug's Part B reimbursement rate would be set at 106% of MFP, not of Average Sales Price ("ASP").⁵ Congress specifically delayed negotiation for Part B drug prices until IPAY 2028, yet CMS' overly broad QSSD definition, focusing on active moiety or active ingredient, would subject Part B drugs to an MFP in IPAY 2026.

CMS appears not to have appreciated the interplay between its overly broad QSSD definition and IRA § 1198(b)(1)(A), a prime example for why CMS must solicit and consider comments to all sections of the Initial Memorandum. As it stands, the Initial Memorandum's discussion of the negotiation factors in Section 60 or of the negotiation process addresses only Part D-related considerations. The agency also does not address the dislocations that would occur if the Part B payment rate of a drug⁶ is severely depressed by reference to an MFP negotiated solely in consideration of the Part D market.

If CMS adopted its proposed QSSD definition, it would do so in violation of the IRA and to the detriment of Part B patients. CMS must revise its QSSD definition to align with the IRA statutory scheme, which clearly contemplates a QSSD definition that focuses on the FDA approval or licensure. Such an appropriately delineated QSSD definition would avoid the unintended consequence of subjecting Part B drugs to forced negotiations and price caps prior to IPAY 2028.

B. The proposed QSSD definition would subject newly-approved drugs to negotiation, contrary to Congressional intent.

One important safeguard that Congress included in the IRA is the protection from forced negotiation and government price controls for drugs that are recently approved. The earliest an NDA-approved drug becomes eligible for negotiation is 7 years after approval, and for biologics, 11 years after BLA approval. But the overly-broad QSSD definition would include drugs with different FDA approvals and approval dates, and the Initial Memorandum would start the 7 or 11-year clock on the approval date of the first approval associated with the QSSD. For example, if a manufacturer has an NDA approved for an active moiety in 2005 and a second NDA for the same active moiety approved in 2022, CMS would treat both products as the same QSSD, and

⁵ IRA § 1198(b)(1)(A) requires amending § 1847A(b)(1)(B) of the Social Security Act (42 U.S.C. 1395w-3a(b)(1)(B)) to include that where a drug is selected and thus subject to an MFP, that drug's Part B payment is based on MFP + 6% rather than the typical ASP + 6%.

⁶ For brevity, we refer to both drugs and biologics as drugs.

would start the 7 year clock in 2005. Although approved less than 7 years ago, the 2022 NDA would be subject to negotiation.

But CMS goes further. Section 60.5.1 of the Initial Memorandum contemplates a situation where a manufacturer of a selected drug receives a new NDA or BLA, and CMS proposes to subject that newly approved product, with its own new FDA approval, to the existing MFP. Both the proposed QSSD definition and Section 60.5.1 eliminate the manufacturer's opportunity to receive a return on the investment necessary to obtain the new FDA approval. Without such compensation, manufacturers will not have the ability to innovate their existing drugs, and to generate patient benefit from existing active moieties or active ingredients. This result is particularly insidious in the context of small molecules, as the active moiety definition cuts across different active ingredients, and thus potentially across very different drugs. As noted in the introduction, United Therapeutics obtained approval for tadalafil in the PAH orphan indication. The Initial Memorandum threatens these successes and thus patient access to therapeutic innovations.

CMS's approach overrides the FDA approval scheme, which is predicated on providing patent protection and exclusivity as an incentive for pursuing a costly and burdensome FDA approval. The unintended consequence of CMS's overreach would be to stifle pharmaceutical innovation, as manufacturers will not be able to justify shouldering the significant economic burdens and assuming the risk of failure inherent in seeking a new FDA approval if the economic incentives, in the form of patent protection and exclusivity, have been severely curtailed, if not obliterated.

We urge CMS to adopt a QSSD definition that focuses on FDA approval. That would eliminate the injustice of attributing the approval date of one FDA approval to a completely distinct, different FDA approval. But if CMS retains the proposed QSSD definition, then at a minimum, CMS should commence the 7- or 11-year clock not on the date of the first FDA approval associated with the QSSD, but on the date of the most recent FDA approval. Similarly, if an MFP is in place, related products approved after the price becomes effective should not be subject to the MFP. While this approach would not address the other problems caused by the overly broad QSSD definition, it at least would preserve the incentive for manufacturers to maximize the uses and therapeutic potential of already-approved active moieties and active ingredients and to continue to innovate exiting drugs.

C. The proposed QSSD definition renders meaningless the IRA's limitation of 10 selected drugs for IPAY 2026.

A key boundary that Congress included in the IRA is the limited number of drugs subject to negotiation in the first IPAYs. For 2026, the IRA provides that only 10 drugs are to be selected, followed by 15 drugs in each of the next two years, and continuing with 20 drugs each year thereafter. Congress intentionally chose these numbers and the gradual increase after considerable debate, as evidenced by the legislative history of the IRA, going back to H.R. 3.⁷

⁷ H.R.3 - 116th Congress (2019-2020): Elijah E. Cummings Lower Drug Costs Now Act, H.R.3, 116th Cong. (2020), <https://www.congress.gov/bill/116th-congress/house-bill/3>.

CMS's broad QSSD definition referencing active moiety (for drugs) or active ingredient (for biologics) vitiates Congress's carefully constructed scheme by pressing a potentially large number of very different products into each of the 10 selected drug slots. CMS should adhere to Congressional intent and abandon its overly expansive definition of QSSD in favor of a definition that focuses on FDA approval.

D. The proposed QSSD definition is inconsistent with the long-standing federal regulatory scheme governing drug and biologic approvals.

The IRA contemplates that CMS will negotiate the prices of drugs or biologics. A plain reading of the words of the IRA makes clear that active moieties and active ingredients are simply not drugs. The IRA focuses on the price available to Medicare beneficiaries, and there are no market prices for active moieties or active ingredients for patients. Further, the IRA QSSD definition refers to drugs as approved under section 505(c) of the Federal Food, Drug, and Cosmetic Act and marketed pursuant to such approval, and to biological products as licensed under section 351(a) of the Public Health Service Act and marketed pursuant to such licensure.⁸ The reference to the specific FDA approval is instructive; nothing in the IRA contemplates an active moiety or active ingredient as being considered the “drug.”

Yet the proposed QSSD definition would ignore the IRA's explicit references to FDA approvals. Detailed legal standards govern when different FDA approvals are required, and these are relevant to the scope of the QSSD definition. The IRA refers to “such approvals” when describing drugs subject to negotiation—and CMS should ensure consistency throughout the federal regulatory scheme by adopting FDA approval/licensure as the basis for defining a QSSD.

The IRA QSSD definition further refers to covered Part D drugs and drugs or biological products for which payment may be made under Part B. Neither the Medicare Part D nor Part B benefit provides payment for active moieties or active ingredients; rather these programs cover drugs. Among other things, this is evidenced by how CMS itself reimburses under Part B—on the basis of billing codes established for each different FDA approval. Similarly, in the Medicaid context, CMS has stated that baseline price reporting data follow the FDA approval. CMS's proposed QSSD definition is a power grab in contravention of the plain meaning of the law. The statute empowers CMS to negotiate the prices of a limited number of drugs, and CMS should abide by this mandate.

CMS is also seemingly misapplying the IRA's data aggregation provision. For purposes of determining negotiation eligible drugs, the IRA permits CMS to aggregate expense data “across dosage forms and strengths *of the drug*” in order to calculate expenditures for QSSDs to determine if a QSSD is negotiation-eligible.⁹ But this IRA provision is limited to establishing the ranking of QSSDs. And while the statutory language allows aggregation across dosage forms and strengths, and even new formulations, nothing suggests that Congress contemplated broad aggregation on the basis of active moiety or active ingredient and across FDA approvals. Further, the aggregation provision is limited to particular circumstances. Reading it as

⁸ IRA § 1192(e)(1).

⁹ IRA § 1192(d)(3)(B) (emphasis added).

supporting a QSSD definition that ignores different FDA approvals is not borne out by the statutory language.

CMS should give effect to the plain meaning of the IRA, which calls for defining a QSSD by reference to its FDA approval—not on active moiety or active ingredient.

E. The proposed QSSD definition impermissibly limits the IRA’s orphan drug exclusion, in contravention of the IRA.

CMS uses the overly broad scope of its own QSSD definition to narrow the IRA’s orphan drug exclusion. The IRA excludes from the QSSD definition a drug if it “is designated as a drug for only one rare disease or condition under section 526 of the Federal Food, Drug, and Cosmetic Act and for which the only approved indication (or indications) is for such disease or condition.”¹⁰ Yet the Initial Memorandum states that “[i]n order to qualify for the orphan drug exclusion, all dosage forms and strengths and different formulations of the qualifying single source drug ...must meet the criteria for exclusion.”¹¹ In other words, a QSSD under CMS’s reading—which includes an assembly of different products and FDA approvals—only satisfies the orphan drug exclusion if all the various products are designated for “only one” rare disease or condition, and if all the various products are only approved for indications for that one rare disease or condition.

This is not what the IRA statutory scheme contemplates and will be a disincentive to the development of orphan drugs. The following example illustrates CMS’s impermissible narrowing of the IRA’s orphan drug exclusion. The manufacturer has three NDAs, each for a different active ingredient, but all three different active ingredients share the same active moiety. Under CMS’s QSSD definition, all of these distinct products would constitute a single QSSD. The active ingredient associated with the first NDA is orphan designated for a rare disease, and the FDA approval is for an indication for such rare disease. The other two active ingredients do not have orphan designation. Under the Initial Memorandum, the QSSD would not qualify for the orphan drug exclusion. But under the plain reading of the IRA, each of the three NDAs would constitute a separate QSSD—and the first of these three QSSDs would qualify for the orphan drug exclusion, by virtue of being designated for a rare disease and FDA approved for an indication for such rare disease. This is the outcome Congress intended.

The overly-broad QSSD definition espoused by CMS contravenes the language of the IRA and the intent of Congress to incentivize orphan drug development by excepting orphan drugs from the forced negotiation and capped price provisions. This agency overreach is threatening patient access to the very therapies that Congress sought to protect from the impact of the IRA’s policies, an absurd result that CMS can avoid by adopting a QSSD definition appropriately limited to FDA approval.

¹⁰ IRA § 1192(e)(3)(A).

¹¹ Initial Memorandum Section 30.1.1.

II. CMS IS IMPOSING AN ARBITRARY AND IMPROPER STANDARD WHEN DETERMINING WHETHER A GENERIC OR BIOSIMILAR IS MARKETED.

The IRA's statutory scheme focuses on drugs that have been on the market without generic or biosimilar competition. Congress intended that only those drugs that are truly "single source" may be selected for negotiation. The IRA accomplishes this by excluding from the QSSD definition a drug that is the listed drug for a generic that is marketed or a biologic that is the reference product for a biosimilar that is marketed.¹² Similarly, a selected drug exits that status if the Secretary determines that the selected drug has a generic or biosimilar that is marketed.¹³

CMS is frustrating Congressional intent by adopting an onerous, arbitrary, and ultimately unworkable definition of what it means for a generic or biosimilar to be "marketed." Further, CMS is basing its marketing determination solely on Part D prescription drug event ("PDE") data, which is not reflective of market reality and is therefore not a reliable indicator of when a drug is marketed.

A. CMS proposes an improperly narrow "marketing" determination that is subjective and arbitrary, opening the door to undisciplined and inconsistent agency determinations.

In the Initial Memorandum, CMS states that when determining whether a generic or biosimilar is being "marketed," it intends to analyze whether "robust and meaningful competition exists in the market," but does not define that standard further.¹⁴ Requiring "robust and meaningful competition" is vague and cannot be consistently applied across different products. Without consistent and transparent standards, it will be impossible for pharmaceutical manufacturers to accurately assess how the forced negotiation and capped price provision may apply to their products. A vague standard also will result in CMS making arbitrary determinations, creating an uneven playing field and unfairly favoring some drugs to the detriment of others.

CMS also states that it will consider a generic or biosimilar to be marketed when the PDE data reveal that the generic/biosimilar manufacturer has engaged in "bona fide marketing."¹⁵ The Initial Memorandum again does not clarify what "bona fide marketing" means. In the absence of a clear standard, the agency appears to be in a position where it will unilaterally determine when it deems a generic or biosimilar to be marketed.

CMS should clearly define the standard it will apply when making the "marketed" definition. The starting point for that definition should be the plain English meaning of the word "to market." Merriam Webster defines this as "to expose for sale in a market; sell," and defines "on the market" as "available for purchase."¹⁶ Fanciful terms like "robust and meaningful competition" and "bona fide marketing" have no basis in the IRA and serve only to arrogate to

¹² IRA § 1192(e)(1).

¹³ IRA 1192(c)(1).

¹⁴ Initial Memorandum Section 90.4.

¹⁵ Initial Memorandum Section 70.

¹⁶ *Marketed*, Merriam-Webster Dictionary (11th ed. 2003).

CMS the power to force drugs into the negotiation process by ignoring the existence of a generic or biosimilar—a power Congress never delegated to CMS or intended CMS to have.

B. The Initial Memorandum adopts inconsistent and contradictory definitions of “marketed.”

The Initial Memorandum proposes multiple, contradictory definitions of “marketed.” Appendix C of the Initial Memorandum sets forth information that CMS plans to collect from manufacturers during the negotiation process, and states that the term marketing “is defined as the introduction or delivery for introduction into interstate commerce of a drug product.” CMS should apply this definition, which is in line with the plain English meaning of “marketing,” throughout the Initial Memorandum, including when applying the exclusion from the QSSD definition. It is puzzling that the agency would define the same term in contradictory ways *in the same guidance document*—particularly when the IRA itself provides no basis for conflicting or even differing interpretations.

A marketing definition focused on “bona fide marketing” and “robust and meaningful competition” is also at odds with how CMS has defined marketing in other contexts. For example, in the Part D inflation rebate guidance¹⁷—which also implements the IRA—CMS proposes identifying the “first marketed” date of a drug as the “market date that the manufacturer is required to report” pursuant to the Medicaid Drug Rebate Program. For purposes of that program, CMS has defined “marketed” to mean “that a covered outpatient drug is available for sale by a manufacturer in the states.”¹⁸ Finally, for Medicare Part B purposes, CMS requires manufacturers to report a data field titled “Date of first sale.”¹⁹ Not surprisingly, that field is not further defined.

CMS has been able over the years to develop cogent “marketed” definitions and has even done so in Appendix C to the Initial Memorandum. In keeping with a plain English approach to statutory interpretation, CMS should adopt a clear standard for purposes of the QSSD exclusion, consistent with Appendix C. The agency should be even-handed in its application of the law and not adopt divergent definitions for the same concept in what can easily be perceived as an effort to expand its power under the IRA.

¹⁹ CMS, Medicare Part B Drug Average Sales Price (ASP) User Manual (Version 2.0, 2019) available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Part-B-Drugs/McrPartBDrugAvgSalesPrice/Downloads/Medicare-Part-B-ASP-Data-Collection-User-Guide.pdf>.

C. CMS construes the meaning of “marketed” too narrowly by relying on PDE data to make its determination that a generic or biosimilar has been marketed.

CMS proposes to rely on PDE data for its determination that a generic or biosimilar is marketed and for subsequently monitoring whether the generic or biosimilar “is regularly and consistently available for purchase through the pharmaceutical supply chain, and whether it is available for purchase by community retail pharmacies in sufficient quantities from their wholesale suppliers.”²⁰ Exclusive reliance on PDE is inappropriate, and has no basis in the statute, as the IRA is concerned with whether the QSSD is “single source,” which is not the case when a generic or biosimilar is being marketed generally—regardless whether the generic or biosimilar enjoys widespread adoption by Part D.

Further, PDE data is unlikely to provide answers to the very inquiries that CMS proposes to undertake. A generic or biosimilar may well be “regularly and consistently available for purchase,” including by “community retail pharmacies,” but nevertheless such a drug may have little Part D utilization, such as because the generic manufacturer elected not to contract with Part D plans or had logistical issues achieving the necessary formulary positions. CMS’s proposed reliance on PDE data is also concerning because it is unclear which data fields CMS will elect to focus on. The term PDE data is broad and the data can be filtered to create summary extracts that would obscure whether a generic or biosimilar is present. There are other data sources CMS has access to that would allow the agency to understand the level of distribution of a drug, such as the National Average Drug Acquisition Cost (“NADAC”) data. Basing the “marketed” determination solely on Part D data is not reflective of market reality and therefore not a reliable indicator of when a drug is marketed.

A generic or biosimilar could also be available for sale, i.e., marketed, with little sales data because consumers or providers prefer the brand version for a variety of reasons. It would be inconsistent with the letter and spirit of the IRA to treat a drug as single source and refrain from excluding it from the QSSD definition or removing it from the selected drug list simply because sales data of a generic or biosimilar do not rise to a certain level in a certain market segment, both arbitrarily chosen and determined by CMS. In keeping with the plain English meaning of “to market,” CMS should determine whether a generic or biosimilar is “marketed” on the basis of whether a sale of the generic or biosimilar has occurred.

D. CMS appears to require 12 months of generic or biosimilar data prior to making a determination that it has been marketed.

The IRA provides that a selected drug will remain selected until “the first year that begins at least 9 months after the date on which the Secretary determines at least one” generic or biosimilar is approved and marketed.²¹ Therefore the timing of the determination is significant – a determination after March 31 of a given year will see the selected drug remain in that status for

²⁰ Initial Memorandum Section 90.4.

²¹ IRA § 1192(c)(1).

the entire following year, while a determination on or before March 31 would see the selected drug exit that status the following January.

In the Initial Memorandum, CMS proposes to determine whether a generic or biosimilar has been marketed each month, starting with October 2023.²² United Therapeutics agrees with a monthly determination, as this approach avoids the unfair impact inherent in the IRA’s 9-month holding period. However, CMS also proposes to base its marketed determination on PDE data from “the most recent 12-month period available to determine if the manufacturer of the generic drug or biosimilar biological product has engaged in bona fide marketing.”²³ According to the Initial Memorandum, for IPAY 2026, CMS intends to review PDE data for a given generic drug or biosimilar during the 12-month period beginning August 15, 2023 and ending August 15, 2023.²⁴

It is unclear if CMS intends to review data from within a 12-month period for its determination, or if CMS will require a complete 12 months’ worth of data before making the determination. Importantly, the IRA does not contemplate any period of review—likely because Congress expected CMS to ascribe a plain English meaning to “marketed,” where marketing occurs when the generic or biosimilar experiences a sale, not requiring a specific lookback period. CMS should clarify that it will not wait with making a marketed determination until 12 months of data is available. The alternative would impermissibly limit under what circumstances a generic or biosimilar is deemed to be marketed.

CMS also should institute a formal pathway for manufacturers to supply information about the marketing of a generic or biosimilar. Given the importance of the timing of the “marketed” determination, stakeholders should have the opportunity to supply essential information to CMS, and CMS should make assurances in any final guidance that the agency will review and consider the submission.

E. CMS proposes to engage in “monitoring” of whether a generic or biosimilar is “marketed,” with uncertain implications.

CMS indicates that even after making a determination that a generic or biosimilar is marketed, the agency will “monitor the manufacturers of generics or biosimilar biological products to ensure they are engaging in bona fide marketing of the generic or biosimilar biological product.”²⁵ The IRA contemplates no such monitoring. Furthermore, CMS does not indicate what the agency proposes to do on the basis of the results of such monitoring. The lack of clarity opens the door to troubling possibilities, such as whether CMS would revise a marketed determination as a result of such monitoring. The lack of clarity is itself an indication that CMS may be embarking on a pathway of arbitrary determinations. Given the significance of the marketing determination to a drug’s QSSD or selected drug status, CMS should make its intentions glaringly obvious rather than keeping stakeholders guessing as to the agency’s

²² Initial Memorandum Section 70.

²³ Initial Memorandum Section 70.

²⁴ Initial Memorandum Section 30.1.

²⁵ Initial Memorandum Section 30.1.

policy—and in keeping with the framework established by the IRA, CMS should abandon its poorly defined notion of monitoring the status of generics and biosimilars following a “marketed” determination.

III. CMS CORRECTLY PROPOSES THAT THE PRESENCE OF A SINGLE GENERIC OR BIOSIMILAR REMOVES THE DRUG FROM NEGOTIATION.

As noted above, the IRA focuses on single source drugs, which means that the reference or listed drug should not be considered to be single source if a generic or biosimilar is marketed. CMS proposes that the presence of a single generic or biosimilar removes the entire drug from QSSD status, and forms the basis for the entire QSSD exiting selected drug status. That is the correct interpretation, in keeping with the IRA statutory text, as well as Congressional intent. Further, CMS is appropriately applying the same legal standards in both instances—with respect to the exclusion from the QSSD definition, as well as with respect to a drug existing selected drug status.

United Therapeutics welcomes CMS’s proposal. However, given the significance of the QSSD definition and the related exclusion, it will be essential for the pharmaceutical industry to be able to rely on the applicable legal standards. For that reason, any final guidance should make clear that CMS commits to retaining this approach beyond 2026 and for subsequent IPAYs, including 2028 and beyond.

IV. CMS SHOULD NOTIFY THE MANUFACTURERS OF THE 50 NEGOTIATION-ELIGIBLE DRUGS.

United Therapeutics agrees with CMS’s approach to identify the 50 negotiation-eligible drugs solely based on a ranking of expenditures. We urge CMS to commit in any final guidance to retaining this approach beyond 2026 and for subsequent IPAYs, including with respect to Part B drugs, beginning in 2028.

In the interest of transparency, CMS should notify the manufacturers of negotiation-eligible drugs as soon as CMS has identified these drugs, so that the affected manufacturers can prepare in advance for possible selection of their drugs for negotiation. The disclosure should indicate where a particular drug is ranked among the 50 negotiation eligible drugs, thereby providing additional insight to manufacturers as to the likelihood of being selected for negotiation in subsequent IPAYs. This advance notice would also allow the manufacturer more time to prepare the necessary information for CMS and would give manufacturers the opportunity to notify CMS if a drug is included among the negotiation eligible drugs in error. Transparency would thus benefit not only the manufacturer, but also CMS, as the agency would be able to evaluate the manufacturer concerns ahead of making the selection and could avoid costly mistakes.

In the case of biologics, this type of notification would also enable the manufacturer of the QSSD to inform the manufacturer of a potential biosimilar of the likelihood that the biologic would be selected for negotiation, which would enable the biosimilar manufacturer to consider whether to avail itself of the biosimilar delay process. Without this level of transparency, it is unclear how biosimilar manufacturers would determine whether and when to do so.

V. CMS SHOULD REMOVE UNNECESSARY OBSTACLES WHEN ESTABLISHING “HIGH LIKELIHOOD” OF IMMINENT LICENSURE OF A BIOSIMILAR.

The IRA provides that the sponsor of a biosimilar can apply to CMS to delay inclusion of the reference product as a selected drug for up to two years if there is a “high likelihood” that the biosimilar will be licensed and marketed within the specified period. The Initial Memorandum establishes certain unnecessary obstacles that the manufacturer of a biosimilar must satisfy to avail itself of this process.

A. CMS should not dismiss applications where there is active patent litigation between the reference product manufacturer and the biosimilar manufacturer.

CMS proposes to reject an application from the biosimilar manufacturer if there is active litigation between the biosimilar and reference product manufacturers regarding the reference product’s patents.²⁶ Such an exclusion is overly broad, particular as patent-related litigation is exceedingly common in instances where release of a biosimilar is imminent. It is accurate, as CMS states, that patent litigation is “highly unpredictable,” but outright rejection of applications on that basis is not consistent with the IRA and would be tantamount to invalidating the entire mechanism. CMS instead should consider the application on its merits and should evaluate the existence of patent litigation as just one factor in its evaluation.

B. CMS should focus its determination of high likelihood on the status of the biosimilar’s BLA application.

CMS proposes that the application must clearly demonstrate that the biosimilar manufacturer “will be operationally ready” to timely market the biosimilar. CMS suggests it will consider the manufacturer’s progress “against the actions, activities, and milestones that are typical of the normal course of business leading up to the marketing of a drug.” Unfortunately, it is unlikely that CMS possesses sufficient expertise to understand what is “typical” in the lead-up to launching a drug, creating the potential for flawed determinations and arbitrary actions by the agency. Further, launch preparation and timing will vary significantly from product to product, based on unique aspects of each therapy and each manufacturer’s distribution model. For that reason, CMS should focus its high likelihood determination on objectively ascertainable facts, such as the status of the BLA application for the biosimilar. When evaluating subjective factors, such as operational readiness, CMS should give deference to the assertions made by the biosimilar manufacturer in its application.

C. CMS is too prescriptive as to the types of documents that may be submitted to support a finding of “high likelihood.”

The Initial Memorandum proposes factors CMS will apply to determine whether a “high likelihood” exists that a biosimilar will be licensed and marketed. CMS specifically requires disclosures about capital investments (or comparable documents for privately held companies),

²⁶ Initial Memorandum Section 30.3.1.2.

revenue expectations and manufacturing schedules. While these are examples of documents that can be expected to be available to biosimilar manufacturers in the normal course of business, CMS is too restrictive when it limits applicants to these particular types of documents. Circumstances are likely to vary significantly by manufacturer. CMS should instead be less prescriptive with respect to the types of information that the biosimilar manufacturer may provide, and CMS should make this process as flexible and principle-based as possible.

D. CMS should notify reference manufacturers of both successful and unsuccessful applications.

CMS proposes to notify the manufacturer of the reference biologic of a successful application for delay from a biosimilar manufacturer.²⁷ United Therapeutics urges CMS to also provide notification in the case of unsuccessful applications to provide additional transparency to all stakeholders. In particular, manufacturers that are public companies and therefore subject to periodic reporting obligations may need to consider this information for their disclosures.

VI. THE PROPOSED DEFINITION OF “MANUFACTURER” IS OVERLY BROAD AND IMPRECISE.

In the Initial Memorandum, CMS broadens the definition of manufacturer to include so-called “secondary manufacturers,” which CMS defines as an entity that “markets the selected drug pursuant to an agreement with the Primary Manufacturer as a ‘Secondary Manufacturer.’”²⁸

The IRA defines manufacturer by reference to section 1847A(c)(6)(A) of the Social Security Act, which in turn, cross-references section 1927(k)(5). CMS does not clearly explain in the Initial Memorandum how it seeks to implement these very broad statutory definitions, which generally focus on entities engaged in the production or packaging of drugs (as quoted below). The agency uses phrases such as “of the selected drug” when referring to the manufacturer, which is imprecise and not helpful when applying the broad statutory definition in a particular context. In Medicaid regulations, CMS has clarified the 1927(k)(5) manufacturer definition to refer to “any entity that holds the NDC for a covered outpatient drug or biological.”²⁹ CMS should provide similar clarity here using the same approach.

The secondary manufacturer definition is troubling because of its similar lack of precision. The Social Security Act definition of manufacturer at section 1927(k)(5) refers to “any entity which is engaged in—(A) the production, preparation, propagation, compounding, conversion, or processing of prescription drug products, either directly or indirectly by extraction from substances of natural origin, or independently by means of chemical synthesis, or by a combination of extraction and chemical synthesis, or (B) in the packaging, repackaging, labeling, relabeling, or distribution of prescription drug products.”³⁰ An entity could meet this definition by virtue of manufacturing a drug, but not the primary manufacturer’s drug, and could then

²⁷ Initial Memorandum Section 30.3.1.4.

²⁸ Initial Memorandum Section 40.

²⁹ 42 CFR 447.502 “Manufacturer.”

³⁰ Social Security Act § 1927(k)(5).

contract with the “primary” manufacturer to market the primary manufacturer’s drug. In this scenario, this entity, although not involved in the manufacture of the primary manufacturer’s drug at all, could be deemed a secondary manufacturer under the definition proposed by CMS. The Initial Memorandum must clarify the scope of the secondary manufacturer definition to make it appropriately precise.

CMS acknowledges this issue in Section 90.2 of the Initial Memorandum, stating that “it is possible for an entity that meets the statutory definition of a manufacturer, but that is not the Primary Manufacturer or a Secondary Manufacturer, to market one or more drug or biological products pursuant to one or more NDA(s) or BLA(s) included in the selected drug.”³¹ The primary manufacturer should have no obligations regarding the conduct of such entities, including with respect to whether such entities are making the MFP available to MFP-eligible individuals.

VII. MANUFACTURER CONFIDENTIAL INFORMATION MUST BE AFFORDED GREATER PROTECTION, AND MANUFACTURERS MUST BE ALLOWED TO DISCLOSE INFORMATION REGARDING THE NEGOTIATION PROCESS.

The Initial Memorandum indicates that for IPAY 2026, CMS intends to treat as proprietary only certain data elements submitted by a primary manufacturer.³² The scope of information that is by definition treated as confidential should be expanded. CMS also seeks to restrict the information about the negotiation process that the manufacturer may disclose or even retain. Such restrictions are not appropriate and must not be included in any final guidance.

A. CMS must afford greater protections to manufacturer confidential information.

The IRA requires that manufacturers make extraordinary disclosures to CMS, including information necessary for CMS to negotiate with the manufacturer. CMS should defer to the manufacturer’s designation of these disclosures as proprietary and confidential, rather than, as proposed, treating only limited categories of information as confidential. This approach should apply to information initially provided by the manufacturer, as well as any information provided by the manufacturer during the negotiation process. CMS is a government agency and as such should rely on market participants that possess the necessary sophisticated understanding of commercial reality and are in a better position to assess whether information is proprietary and confidential or not. Therefore it is appropriate for CMS to defer to manufacturers regarding these determinations. United Therapeutics agrees with the Initial Memorandum that, in accordance with the IRA, any proprietary information may be used only for “purposes of carrying out the Negotiation Program.”³³

³¹ Initial Memorandum Section 90.2.

³² Initial Memorandum Section 40.2.1. For IPAY 2026, CMS proposes to treat as proprietary the following: All non-FAMP information, commercial or financial information that cannot be found publicly, research & development costs and recoupment, unit costs of production and distribution, pending patent applications, market data and revenue and sales volume data.

³³ *Id.*

CMS should limit its disclosure when publishing the MFP explanation to information already available in the manufacturer's public company or similar filings—that is, already public information. The Initial Memorandum indicates that CMS intends to make “high-level comments about the data submitted to CMS, without sharing any proprietary information reported to CMS,” such as “the manufacturer has recouped its research and development costs.”³⁴ To avoid any inadvertent disclosure, prior to publication of this public explanation, CMS should give the affected manufacturer an opportunity to review the publication and to designate any information therein that is confidential and proprietary.

B. CMS should allow manufacturers to retain and disclose information regarding their negotiation with CMS.

The Initial Memorandum proposes to require that manufacturers may “not ...disclose to the public any information in the initial offer or any subsequent offer by CMS, the ceiling price contained in any offer, or any information contained in any concise justification provided with an offer.”³⁵ This is wholly inappropriate. Manufacturers should be allowed in their discretion to disclose to the public information about their negotiation with CMS to provide transparency, particularly if a manufacturer disagrees with CMS's characterization of the negotiation in its public explanation for determining the MFP. Such an unreasonable restriction may also contradict other legal disclosure obligations the manufacturer may be subject to.

Further, manufacturers should not be required to agree “that all information the Primary Manufacturer receives during the negotiation period from CMS shall be destroyed within 30 days of a determination by CMS that the drug or biologic no longer qualifies as a selected drug, except as may be required by applicable state or federal law.”³⁶ Manufacturers should be allowed to retain records of the negotiation process. It is troubling that CMS would seek to impose such an unreasonable obligation, which would deprive the manufacturer of recourse if the manufacturer were to subsequently become subject to challenge regarding how it conducted the negotiation.

CMS lacks statutory authority to require that all manufacturer agreements incorporate these non-disclosure and information destruction provisions. While the IRA directs the Secretary to enter into manufacturer agreements under which “the manufacturer complies with requirements determined by the Secretary to be necessary for purposes of administering the program and monitoring compliance with the program,”³⁷ CMS's wholly inappropriate mandatory non-disclosure and information destruction provisions are not necessary to administer or monitor compliance with the negotiation program.

³⁴ Initial Memorandum Section 40.2.1.

³⁵ Initial Memorandum Section 40.2.2.

³⁶ *Id.*

³⁷ IRA § 1193(a)(5).

VIII. THE STATUTORY CEILING PRICE, NOT THE PRICE OF ALTERNATIVE TREATMENTS, SHOULD BE THE STARTING POINT FOR CMS'S INITIAL OFFER DURING NEGOTIATION.

The IRA sets out that the MFP developed during the negotiation process may not exceed the statutory ceiling price, the only specific price defined in the IRA. The statute also provides certain negotiation factors that CMS must consider when conducting the negotiation process.³⁸ The negotiation begins with an initial offer proposed by CMS to the manufacturer. In the Initial Memorandum, CMS proposes to develop that initial offer by primarily relying on just one of these factors, namely the price for alternative treatments in the therapeutic space. Taking a page from the real estate playbook, CMS appears to be searching for “comparables” to the selected drug, intending to then base the initial offer on the price for such comparable therapies. CMS proposes to then use the other negotiation factors merely to adjust that initial offer. While appearing as a convenient shortcut for the agency, this approach is fundamentally flawed. Instead, the statutory ceiling price should be the starting point for CMS's initial offer, which CMS can then adjust, if appropriate, by reference to the negotiation factors—not just by reference to a single negotiation factor.

By definition, the drugs subject to negotiation have been marketed for longer periods without a generic or biosimilar and represent the highest amounts of Medicare spending. By their very nature, such drugs are unlikely to have therapeutic alternatives that can provide similar patient benefits; otherwise, the market (without government intervention) would already have shifted toward such alternatives.

This weakness is highlighted by CMS's overreach: In order to make this approach feasible, CMS is going so far as proposing to include off-label uses of the selected drug. CMS proposes to consider “off-label use when identifying indications [of the selected drug] if such use is included in nationally recognized, evidence-based guidelines and recognized by CMS-approved Part D compendia.”³⁹ In other words, CMS might prepare an initial offer on the basis of the prices for therapeutic alternatives to an *off-label use* of the selected drug. This is an unsound approach that fails to assign any value to the selected drug's FDA approval, disregarding the costs and risks that obtaining such approval entailed. Off-label indications should not be taken into account for purposes of obtaining therapeutic alternative prices, and frankly should have no place at all in the federal regulatory scheme.

CMS also indicates that it will rely on ASP figures when identifying the prices for therapeutic alternatives. Only a Part B drug (generally, a physician-administered drug) would have an ASP figure available, but only Part D drugs (generally, self-administered) are subject to negotiation in IPAY 2026. These different methods of administration indicate that Part D and B drugs, even if in the same therapeutic space, are not at all comparable. For example, Part B drugs are often infused, and manufacturers of infusion drugs have, where possible, invested considerable resources to create and gain approval for presentations that can be administered subcutaneously and are thus self-administered. CMS's proposal to include Part B drugs when identifying prices

³⁸ IRA Section 1194(3).

³⁹ Initial Memorandum Section 60.3.1.

of therapeutic alternatives for IPAY 2026 is therefore misguided and fails to account for the greater patient benefits often associated with self-administered (i.e., Part D) drugs.

Where genuine (i.e., not off-label) alternative therapies with prices below the statutory cap are not available, CMS proposes to rely on Federal Supply Schedule or “Big Four” pricing to prepare its initial offer.⁴⁰ These prices are based on the Non-Federal Average Manufacturer Price (“Non-FAMP”) metric, resulting in a circular logic: The MFP is capped by reference to Non-FAMP, and CMS is proposing to commence the negotiation with an offer that is also based on Non-FAMP. The appropriate approach in this scenario is readily at hand: Where no therapeutic alternatives are available, or the therapeutic alternatives are priced higher than the IRA capped price, CMS should offer the IRA capped price as its initial offer, which would likely conclude the negotiation.

Thus any final guidance should provide that the starting point for CMS to prepare the initial offer should be the statutorily capped price, rather than an arbitrary reference price for purported therapeutic alternatives. CMS should operate under the presumption that the MFP should be lower than the statutory cap only where application of the IRA’s negotiation factors supports such a further reduced price. This is appropriate, because the basis for the statutory cap—Part D expenditure or Non-FAMP, which generally reflects prices to wholesalers net of discounts—reflects the patient benefits provided by the selected drug. The statutory ceiling price is the only price that is specifically defined in the IRA. CMS should assign it the same significance that Congress has.

IX. IN REVIEWING THERAPEUTIC ALTERNATIVES, CMS SHOULD NOT RELY ONLY OR PRIMARILY ON LITERATURE ADDRESSING THE MEDICARE POPULATION.

As noted, one of the IRA’s negotiation factors considers therapeutic alternatives to the selected drug.⁴¹ The statute makes clear that when reviewing therapeutic alternatives, CMS may not rely on literature that treats as less valuable extending the life of an elderly, disabled, or terminally ill person. United Therapeutics wholeheartedly agrees with this policy. However, the Initial Memorandum oddly misconstrues this requirement. It provides that CMS intends to consider “research and real-world evidence relating to Medicare populations, including individuals with qualifying disabilities, patients with end-stage renal disease (ESRD), and Medicare-aged populations, *as particularly important*.”⁴²

CMS should not rely only or primarily on data that addresses the Medicare population or which treats extending the life of an elderly person as more valuable than that of younger, non-disabled, or non-terminally ill persons, as neither the statute nor prudent policy support such an interpretation. The ultimate MFP will only apply to the Medicare program, but the MFP (and its justification) will be publicly available, and private payors and other stakeholders outside of

⁴⁰ Initial Memorandum Section 60.3.2.

⁴¹ Initial Memorandum Section 50.2.

⁴² *Id.* (emphasis added).

Medicare will rely on and utilize the MFP to conduct their own negotiations with the manufacturer.

This puts CMS in a unique position to impact the availability of drugs and therapeutic alternatives to patients outside of Medicare. CMS must give careful consideration to the ramifications of its negotiation position. One way it can exercise care is by giving substantial weight to literature that addresses the drug and its therapeutic alternatives in populations other than the elderly, disabled, or terminally ill. The QSSD determination focuses on general attributes of the drug, such as years since approval. There is no basis in the statute to deviate from this general approach in this instance by focusing the negotiation on particular patient populations.

X. WHEN APPLYING THE NEGOTIATION FACTORS, CMS SHOULD CONSIDER INDIRECT RESEARCH AND DEVELOPMENT COSTS, AND SHOULD DISREGARD THE LENGTH OF PATENT PROTECTION AND EXCLUSIVITY.

One of the IRA’s negotiation factors refers to research and development costs for the selected drug, and whether the manufacturer has recouped these costs. CMS appears to treat recoupment of research and development costs as specific to the particular selected drug, but the agency has not considered that for every product that a manufacturer brings to market, a large number of products end in failure during the clinical and pre-clinical trial phases. CMS should allow manufacturers to report, and CMS should consider, the research and development costs of the many failed drug candidates when assessing the research and development costs for the selected drug, and the degree to which these costs have been recouped.

Furthermore, costs associated with an approved drug may actually relate to the clinical and other data generated for an earlier drug; that is, the costs associated with a given drug are not neatly delineated. This means that manufacturers may need to provide CMS with costs associated with the earlier drug because these costs are indirect costs that affect the price of the successfully-marketed drug. All the while, the sales associated with the earlier drug should not be counted toward the “recoupment” of costs of the subsequent drug. In light of these complexities, CMS must be cognizant of the difficulties inherent in allocating costs to specific products, especially if a manufacturer has a large product portfolio. Any final guidance therefore must specifically allow manufacturers to report these additional, indirect costs that are associated with the selected drug.

The Initial Memorandum indicates that CMS “intends to consider the length of the available patents and exclusivities before the selected drug may no longer be single source.”⁴³ For example, “if the selected drug has patents and exclusivities that will last for a number of years, CMS may consider adjusting the preliminary price downward.”⁴⁴ There are a number of grave issues with this approach, first and foremost that CMS is arbitrarily creating a negotiation factor not contemplated by the IRA. The statute is very clear when describing the negotiation factors, making clear that Congress intended to establish the parameters for negotiation. Nothing in the

⁴³ Initial Memorandum Section 60.3.4.

⁴⁴ *Id.*

IRA supports considering patent protection and exclusivity during the negotiation in the manner proposed by CMS.

Further, CMS's proposal runs counter to basic tenets of FDA legal standards and the U.S. patent system. Manufacturers should be rewarded, not penalized with a downward adjustment of the preliminary price, for innovating and investing in the collection of clinical data justifying an extension of regulatory exclusivity. CMS's interpretation limits manufacturers' ability to recoup expenses for their investments that benefit patients, such as conducting a pediatric clinical trial that may result in obtaining pediatric exclusivity. The patent system is based on the notion that the reward for innovation is patent protection and exclusivity, and CMS is turning this long-standing framework on its head.

XI. CMS SHOULD MORE CLOSELY ALIGN THE NEGOTIATION PROCESS WITH COMMERCIAL NEGOTIATIONS.

In some respects, the Initial Memorandum seeks to characterize the IRA negotiation process as akin to a commercial negotiation between equal market participants. In fact the negotiation is a forced process with a forgone conclusion, namely that the price is capped—but CMS nevertheless has leeway under the IRA to align the process with commercial negotiations, and to forego some of the authoritarian elements present in the Initial Memorandum.

A. CMS should not limit the number of negotiation meetings.

CMS proposes that there will be up to a total of three negotiation meetings between CMS and the manufacturer. United Therapeutics agrees that the negotiation process should not be limited to written exchanges, but disagrees with limiting the meetings to a total of three. Given the significance of the outcome of this process, there should be flexibility to allow for more than three meetings. It is also unclear whether a phone call to clarify specific points or some other interaction qualifies as a "meeting" and would occupy one of the three slots. As in any other negotiation, a party can reject an invitation to a meeting. Therefore the guidance should provide for a minimum number of meetings, but should not impose a limitation as to the total number of meetings. CMS leadership has indicated the agency's intention to simulate a genuine negotiation, as would occur in the commercial market. Any final guidance should not limit the number of meetings.

B. If both CMS and the manufacturer engage in a bona fide negotiation that yields no agreement, the resulting MFP should be the statutory ceiling price.

The IRA provides a timeframe for the negotiation process, including when that process ends. But the IRA does not indicate how to proceed if the negotiation period ends without an agreement as to the MFP. The Initial Memorandum similarly does not address this circumstance, other than to state that the manufacturer is required to respond in writing to the final CMS offer, and that "CMS will notify the Primary Manufacturer of any failure to meet the deadline and the possible consequences thereof if no MFP agreement by July 31, 2024."⁴⁵ The Initial Memorandum also provides that if no MFP is agreed to, CMS will not publish an MFP or an

⁴⁵ Initial Memorandum Section 60.4.4.

explanation, and will indicate on its website only the absence of agreement. Finally, the Initial Memorandum contemplates that the manufacturer might agree to an MFP after the negotiation period ends.

If the manufacturer has satisfied its obligation to participate in the negotiation process as outlined in the IRA and in the manufacturer agreement, and no MFP is agreed to at the end of the negotiation period, the statutory ceiling price should be the MFP. This result is in keeping with the IRA statutory intent of achieving a capped price and coupling the price cap with a negotiation process. If both parties genuinely followed the statutory requirements related to the process, the default result should be the statutorily capped price, and the manufacturer should not be exposed to civil monetary penalties or other enforcement mechanisms. Any other result would reveal that CMS has overstepped its authority by mandating, rather than negotiating, a price—by essentially treating its final offer as one the manufacturer is required to agree to. Congress mandated a price, as it has done via the price cap, but CMS can merely negotiate a price. If a genuine negotiation process that complies with the IRA fails to yield agreement, the default MFP should be the capped price mandated by Congress which, as noted, is the only price specifically defined in the IRA.

XII. THE OVERLY BROAD QSSD DEFINITION MAKES COMPLEX MFP AND CEILING PRICE CALCULATIONS NECESSARY, WHICH CANNOT ACCURATELY REFLECT DRUG USE REALITIES.

The Initial Memorandum describes how CMS will establish a single proposed MFP for negotiation purposes, and how CMS will determine the statutory ceiling price for the selected drug. This process would be comparatively straightforward if the QSSD definition were limited to a specific FDA approval. However, given the expansive QSSD definition that CMS is proposing—encompassing all of a manufacturer’s FDA approvals, dosage forms, and strengths that share the same active moiety or active ingredient—the need to arrive at a single MFP and a single statutory ceiling price makes it necessary to perform complex calculations. The calculations CMS proposes have no basis in the statute and were not contemplated by Congress. But more detrimentally, they do not properly reflect the nature of many drugs or how they are administered over time. Furthermore, CMS has not provided detail on how it will perform important steps in the calculations, as well as necessary unit conversions. CMS should abandon its overly broad QSSD definition and instead define QSSD to correspond to a specific FDA approval, which would make these complex calculations unnecessary. Indeed, operationalizing the statutory MFP language in conformity to the IRA is only possible if CMS revises its QSSD definition to refer to FDA approval.

A. The single MFP that CMS proposes to calculate across FDA approvals, dosage forms, and strengths (including different unit types) does not reflect the nature or administration of drugs.

At each step of the negotiation process, CMS proposes to offer a single MFP which it will then apply to the drug’s multiple dosage forms, strengths, and unit types.⁴⁶ CMS will base the single price on the average cost of the selected drug per 30-day equivalent supply—rather than per

⁴⁶ Initial Memorandum Section 60.1.

unit—averaged across dosage forms and strengths. CMS believes this approach is justified because it will allow for a more direct comparison with therapeutic alternatives.

The Initial Memorandum accurately states that the IRA requires that a single price be negotiated for each selected drug. But the overly broad QSSD definition, which cuts across dosage forms, strengths, unit types, and FDA approvals, forces CMS to now also stretch the notion of what a “price” can be. The proposed approach of focusing on a cost per 30-day “equivalent” supply, weighted across dosage forms and strengths, is a statistical ploy that will fail to accurately reflect the costs associated with the various presentations encompassed by the QSSD definition.

For instance, the 30-day supply is a proper understanding of drug usage for traditional drugs—take one tablet per day. This understanding of drug therapies would have been adequate when the Medicaid Drug Rebate Program was enacted in 1991, but it is no longer sufficient in 2023. Pharmaceutical innovation has resulted in complex therapies, with dosage requirements varying widely across specific patients, and varying over time, not to mention single-use curative therapies.

For example, Orenitram® requires a flexible titration schedule, and may have continued titration and varying dosage throughout a specific patient’s therapy. Ultimately, the cost of therapy for one patient may be multiples of the cost for another patient during the same period of time. It is simply not feasible to derive a 30-day “equivalent” cost for these types of complex therapies.

B. CMS has not provided important details of how it proposes to calculate the IRA ceiling price, including unit conversions.

The IRA establishes a price cap on the basis of the greater of historic Medicare spend or average Non-FAMP. Contrary to what the IRA provides or what Congress intended, the overly broad QSSD definition makes it necessary to calculate the price cap across different dosage forms, strengths, and unit types. When determining the historic spend or average Non-FAMP figures for purposes of determining the ceiling price, CMS proposes to again utilize a per 30-day “equivalent” supply.

For historic spend, CMS also is engaging in various conversion calculations to move from data at the NDC-11 level to a single amount for the entire QSSD, across NDC-11s, dosage forms, and strengths. CMS fails to provide important details as to how this calculation will be performed. Similarly, for Non-FAMP, CMS proposes to convert Non-FAMP units to historic spend (PDE) units so as to allow the historic spend and Non-FAMP numbers to be comparable. CMS does not provide any details as to how this unit conversion would be performed.

Any final guidance should align Non-FAMP determinations with long-standing Department of Veterans Affairs (“VA”) legal standards. Non-FAMP is a metric that the VA has collected from manufacturers since 1992, and the VA already has addressed various circumstances related to Non-FAMP reporting. For example, the VA permits restatements of Non-FAMP in various circumstances. CMS should provide an equivalent mechanism for Non-FAMP restatements. As is the case with price metrics reported to CMS, like Average Manufacturer Price, there can be anomalies in the Non-FAMP calculation. CMS should adopt the same override rules that the VA has provided in order to address such circumstances.

We are furthermore concerned about the accuracy of these calculations and transparency throughout the negotiation process. Given that CMS will only include a “concise justification”⁴⁷ for its offer and that CMS may not make an offer that exceeds the drug’s IRA ceiling price, manufacturers may not have the ability to review CMS’ calculations for arriving at the ceiling price as an initial matter. CMS should include in its concise justification a copy of its calculations to show precisely how it arrived at the purported ceiling price so that the manufacturer can take this information into account when formulating a counteroffer.

This Initial Memorandum and its complex MFP and ceiling price calculations are focused solely on Part D drugs, because only Part D drugs are subject to negotiation for IPAY 2026. However, Part B drugs will enter the process in IPAY 2028. CMS should have developed a pricing methodology for 2026 that can easily be adapted for Part B drugs as well, but CMS has not done so. As a result of the too broad QSSD definition, CMS is proposing an overly complex approach that, when applied to Part B drugs, will result in yet more complicated unit conversions, as there is even greater variety in Part B billing units.

XIII. THE OVERLY BROAD QSSD DEFINITION MAKES A COMPLEX CALCULATION NECESSARY TO DERIVE AN MFP AT THE PER UNIT LEVEL.

As described above, the overly broad QSSD definition makes complex calculations necessary to derive a single MFP that applies across dosage forms, strengths, and unit types. This then means that the final MFP resulting from the negotiation has to be converted yet again, this time to a per-unit price, so that it can be effectuated in the marketplace. Once again, CMS can eliminate these difficulties and complexities by adopting a QSSD definition in any final guidance that aligns with the IRA and statutory intent and defines a QSSD by reference to a single FDA approval.

The process CMS proposes for breaking the MFP down to a per-unit level, undoing the prior aggregation across dosage forms and strengths (i.e., across NDC-9s), refers to how the Wholesale Acquisition Cost (“WAC”) price for the QSSD differs between NDC-9s (and units). In other words, CMS proposes to use the QSSD’s WAC distribution across NDC-9s (and units) as the reference to then distribute the MFP across NDC-9s (and units) in the same proportion.

WAC is defined in the Medicare statute as “the manufacturer's list price for the drug or biological to wholesalers or direct purchasers in the United States, not including prompt pay or other discounts, rebates or reductions in price, for the most recent month for which the information is available, as reported in wholesale price guides or other publications of drug or biological pricing data.”⁴⁸ Because it does not reflect discounts, WAC is an imperfect measure of the actual price in the market. CMS should consider other price metrics it has available, such as NADAC data, in order to achieve an MFP price per unit that is more aligned with market reality.

⁴⁷ Initial Memorandum Section 60.4.1.

⁴⁸ Social Security Act § 1847A(c)(6)(B) (emphasis added).

Additionally, it is worth noting that WAC changes over time as manufacturers modify their prices. The Initial Memorandum proposes to use WAC for calendar year 2022,⁴⁹ but does not appear to account for WAC changes during that year. Any final guidance that utilizes WAC as the basis for the MFP price distribution across NDC-9s must consider WAC changes in the period.

XIV. CMS SHOULD CLARIFY THAT FOR IPAY 2026, THE MFP IS APPLICABLE ONLY TO PART D UTILIZATION.

Consistent with the IRA, the Initial Memorandum defines MFP-eligible individuals as Part D and Part B beneficiaries.⁵⁰ But the guidance fails to make clear that for 2026, the MFP is applicable only to Part D utilization, not Part B utilization. Any final guidance must make clear that the MFP for 2026 applies to Part B beneficiaries only when receiving a drug under Part D, and that the MFP does not apply when the beneficiary is administered a drug under Part B. This distinction is particularly important because CMS's overly broad QSSD definition results in Part D and B drugs being included as the same QSSD, a circumstance the IRA does not address, and Congress did not contemplate.⁵¹

XV. CMS SHOULD NOT REGULATE THE MECHANISM WHEREBY MANUFACTURERS MAKE THE MFP AVAILABLE TO ELIGIBLE INDIVIDUALS.

The IRA provides that the manufacturer “shall” provide the MFP to eligible individuals at the point of sale.⁵² Yet the Initial Memorandum proposes to require the manufacturer to “ensure” dispensing entities have access to the MFP, and to require submission to CMS of the manufacturer’s process for making the MFP available.⁵³ CMS then proposes to publish the process on its website. Further, in the Initial Memorandum, CMS requires that manufacturer may make the MFP available to pharmacies, by (1) ensuring that the price paid by the dispensing entity when acquiring the drug is no greater than the MFP or (2) providing “retrospective reimbursement” for the difference between the dispensing entity’s acquisition cost and MFP.⁵⁴

Manufacturer obligations are sufficiently clear in the IRA, and it is patently unnecessary for CMS to attempt to regulate in detail how the MFP is to be effectuated. CMS may be becoming a market participant by virtue of the forced negotiation process, but the agency should not overstep its boundaries by seeking to regulate commercial arrangements between manufacturers and other participants in the supply chain, even if the manufacturer has become subject to drug price

⁴⁹ Initial Memorandum Section 60.5.

⁵⁰ Initial Memorandum Section 80.

⁵¹ Importantly, CMS cannot cure the problem we discuss above caused by the overly broad QSSD definition, namely that the Part B reimbursement rate for a Part B drug that is swept into the QSSD (and therefore selected drug) definition is equal to MFP plus 6 percent, not ASP plus 6 percent. This is a statutory requirement. IRA § 1198(b)(1)(A).

⁵² IRA § 1193(a)(3)(A).

⁵³ Initial Memorandum Sections 40.4 and 90.2.

⁵⁴ Initial Memorandum Section 40.4.

negotiations. As with other federal programs that require ceiling prices—such as the VA federal supply schedule pricing program—commercial actors are best equipped to develop the mechanics for making these prices appropriately available.

Finally, there is no reason why commercial arrangements that the manufacturer enters into to effectuate the MFP should be disclosed to CMS, let alone be published by CMS on its website. The IRA contemplates no such measures, and such requirements would again raise confidentiality concerns. In the absence of a mandate by Congress, CMS should allow free market participants to develop their own commercially viable approaches and not interfere in the pharmaceutical marketplace.

XVI. AFTER AN NDA OR BLA TRANSFER, CMS SHOULD NOT HOLD THE PRIOR NDA/BLA HOLDER RESPONSIBLE FOR MAKING THE MFP AVAILABLE.

The Initial Memorandum provides that the agreement to negotiate that manufacturers have to enter into “shall be effective, with respect to a selected drug, until such drug is no longer considered a selected drug.”⁵⁵ Like the overly broad QSSD definition, this scope exceeds the IRA and Congressional intent. CMS is proposing to disregard NDA/BLA transfers, with the original manufacturer remaining responsible for making the MFP available, unless the original manufacturer transfers that obligation to the new NDA/BLA holder.

Not only is this further CMS overreach, it is also internally inconsistent. CMS proposes to define QSSD in part by reference to the manufacturer holding the NDA or BLA. Nevertheless, in the context of transfers, CMS is proposing to disregard that ownership. Transfer of an NDA/BLA to a manufacturer that does not have a negotiation agreement with CMS in place must remove that NDA/BLA from the QSSD definition and selected drug status.

XVII. CMS SHOULD SPECIFY THAT WHERE THE MFP IS LOWER THAN THE 340B CEILING PRICE, ONLY 340B OR MFP ELIGIBLE INDIVIDUALS MAY RECEIVE THE MFP.

The IRA provides that the manufacturer is “required to provide access to the maximum fair price to [a 340B] covered entity with respect to maximum fair price eligible individuals who are eligible to be furnished, administered, or dispensed such selected drug at such entity at such [340B] ceiling price in a non-duplicated amount to the [340B] ceiling price if such maximum fair price is below the [340B] ceiling price for such selected drug.”⁵⁶ The Initial Memorandum fails to make clear that the manufacturer must provide the MFP to 340B covered entities only with respect to “maximum fair price eligible individuals” who are otherwise eligible to be dispensed 340B-priced drugs.

It is essential that CMS correctly implement the boundaries of MFP eligibility in any final guidance. This is fundamental to the proper realization of the IRA’s statutory scheme: The manufacturer is required to provide to a 340B covered entity the lower of either (1) the 340B ceiling price or (2) the MFP, but only “with respect to maximum fair price eligible individuals”

⁵⁵ IRA § 1193(b).

⁵⁶ IRA § 1193(d)(2).

who are eligible to receive the drug “at such entity at such [340B] ceiling price.” If the MFP is lower than the 340B ceiling price, the covered entity is entitled to the MFP only as to individuals eligible to receive 340B-priced drugs, i.e., patients of the covered entity. Any final guidance should provide a requirement that the 340B covered entity verify 340B patient eligibility to the manufacturer before requesting to purchase the selected drug at the MFP—that is what the IRA requires, and CMS must implement this requirement in any final guidance.

Further, while the statute is clear that the manufacturer is required to provide either the 340B ceiling price or the MFP, but not both, the Initial Memorandum obfuscates this requirement through the use of imprecise language. CMS should clearly reflect in any final guidance what the IRA provides, namely that duplicate discounts are illegal: A unit can either be subject to the 340B price or the MFP.

Given the long-standing duplicate discount issues involving the 340B program, CMS should provide a mechanism to guard against MFP/340B duplicate discounts. If the MFP is effectuated through a rebate, it is likely that duplicate discounts could arise, with the covered entity claiming the 340B price at time of purchase and later submitting for a rebate to also receive the MFP, much like covered entities do in the Medicaid context, in violation of statutory requirements. CMS can guard against such duplicate discounts right from the outset by requiring the use of claims modifiers to reliably identify 340B utilization.

In the same way that the MFP can be effectuated through a rebate, so too can the 340B ceiling price, an approach the Health Resources and Services Administration (“HRSA”) has adopted for AIDS Drug Assistance Program grantees. The implementation of the MFP through a rebate mechanism provides an opportunity to implement the 340B discount for all types of covered entities through a rebate as well. This would finally address long-standing problems with the 340B program, while also simplifying the implementation of the MFP. We encourage CMS to collaborate with HRSA in the coming months and issue joint guidance addressing implementation of the MFP and 340B price through a rebate.

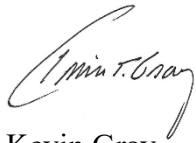

XVIII. CONCLUSION

The IRA imposes a European, government-controlled pricing model onto the U.S. free market-based system. Whether that is a prudent policy, and whether pharmaceutical manufacturers—or third-party middlemen—are ultimately responsible for U.S. prescription drug prices, is beyond the scope of this comment letter. But regardless of the wisdom of the underlying policy, and the potential impact on the U.S. economy, Congress clearly and expressly provided important boundaries in the IRA, and CMS in its Initial Memorandum has egregiously exceeded what Congress intended. We are particularly concerned with the overly broad QSSD definition which, as we have explained, subjects Part B drugs to an MFP-based reimbursement rate in IPAY 2026, jeopardizing patient access to these Part B therapies—a result CMS did not foresee as it sought to advance overly zealous policy goals.

CMS must reconsider and revise key operative portions of the Initial Memorandum, including Section 30. United Therapeutics hopes that CMS understands the magnitude of the responsibility given to it by Congress under the IRA: The mere publication of a drug on the selected drug list is likely to immediately cause dislocations in the pharmaceutical market, long

before an MFP is even published. CMS must understand that the U.S. pharmaceutical industry and marketplace are not separate from, or adverse to, patients and Medicare beneficiaries—they are one and the same. Damage to the U.S. pharmaceutical industry and its ability to provide medical innovation directly translates into patients losing access to existing therapies or never having the chance to receive new therapies, because the avenue for bringing them to market has been foreclosed.

Sincerely,

Baltimore, MD

SUBJECT: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of
Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026

RE: Solicitation of Comments

Dear Dr. Seshamani,

On March 15, 2023, the Centers for Medicare & Medicaid Services (CMS) released draft guidance on how the agency will implement the drug price negotiation provisions of the Inflation Reduction Act. The following comments and recommendations are specific to section 60.3, “Methodology for Developing an Initial Offer.” As CMS moves forward with the first round of negotiations, the team reviewing each drug will need to aggregate a wide range of comparative effectiveness evidence and manufacturer-submitted data to arrive at a preliminary price offer. Importantly, evidence on comparative effectiveness will encompass typical surrogate or primary endpoints from clinical trials, patient experience and preferences, and broader contextual factors (e.g., whether the drug targets severe conditions) that may be important to our values as a society. Some evidence may be quantifiable (e.g., incremental change in a primary endpoint versus therapeutic alternative) whereas other evidence may be more difficult to quantify (e.g., patient experience factors). Some evidence that cannot be quantified may hold more importance for patients, families, providers, payers, and policy-makers than typical primary endpoints from clinical trials.¹

Our team has studied decision-making processes where multiple sources of evidence – both quantitative and qualitative – can be combined in to one framework to facilitate the evaluation of a therapy and inform decision-making around pharmaceutical coverage or pricing. We believe this type of framework could be used by CMS to guide the development of the preliminary price as described in sections 60.3.3 and 60.3.4. In this comment, we provide two main recommendations related to using a structured framework for evaluating multiple, often conflicting factors, on a drug’s risks, benefits, and costs. But first we provide a brief discussion of terminology.

CMS states in section 60.3.3 that it considered both a quantitative and qualitative approach for adjusting the starting point for an initial offer and ultimately proposed a qualitative approach. In the recommendations below, we do not rely on the quantitative versus qualitative distinction and instead refer to our proposed approach as ‘structured deliberation’. We prefer this terminology for two reasons. First, describing approaches to evidence aggregation as quantitative versus

¹ Trenaman L, Pearson SD, Hoch JS. How Are Incremental Cost-Effectiveness, Contextual Considerations, and Other Benefits Viewed in Health Technology Assessment Recommendations in the United States? Value Health. 2020 May;23(5):576-584.

qualitative may introduce confusion when also discussing quantitative versus qualitative evidence. Second, we believe the best approaches to evidence aggregation are likely to integrate both quantitative (e.g. numerical weights and scores) and qualitative elements (e.g. deliberation between stakeholders and flexible, non-algorithmic decision-making).² Finally, we use the term aggregation to refer to identification, grouping, prioritization, and scoring of both quantitative and qualitative evidence on a selected drug for a particular indication. Given the identification process has largely been implemented in the CMS guidance, our recommendations below refer to subsequent steps of aggregation.

Recommendation 1: To account for both quantitative and qualitative evidence, we recommend that CMS use an existing framework to group and prioritize all the evidence sources and factors that may inform the negotiation process.

The framework we developed groups and prioritizes information in a way that can generalize across all negotiable drugs but also provide flexibility in allowing situation-specific factors to be included in the decision-making process. In particular, and as noted in the guidance, CMS will consider a variety of factors and evidence sources to determine a preliminary price for negotiations yet have not stated the level of importance they may place on different evidence types, including quantitative versus qualitative evidence. We recommend CMS facilitate a structured deliberative process each calendar year to group and prioritize evidence on these factors to inform the initial offer and subsequent negotiations. Our team developed the first of its kind structured deliberation format that includes generation of a priority list of factors important to decision-making in multiple contexts including important aspects of treatments to patients and their families, providers, payers, and other stakeholders. The method we developed facilitates voting panel members to prioritize factors at a group level, where each person's opinion is counted. This method also supports a structured form of group-level deliberation allowing for the inclusion of factors that are less quantifiable but represent concepts important to patients and their families, providers, payers, and other stakeholders. The method is pragmatic and flexible, supporting efficient updates when preferences change or new factors are included in the process.

We tested our framework with the Colorado Prescription Drug Affordability Board in addition to multiple stakeholders - e.g., patients with a particular disease to identify the importance of patient experience factors and multi-stakeholder groups to identify the importance of societal contextual factors.³ Our findings suggest: 1) using a structured framework facilitates deliberations on both qualitative and quantitative evidence in a transparent and efficient manner; 2) consistency, predictability, and prioritization will influence activity on evidence generation either by value assessors or by stakeholders informing value assessment (industry, clinical guidelines, patient advocates, etc.); and 3) the method of prioritization we created is reproducible, efficient in hybrid, online, or in-person approaches (e.g., completed within 2-3 hours), and can be applied to prioritize any valued factors, not just the factors required through legislation.

² DiStefano MJ, Krubiner CB. Beyond the numbers: a critique of quantitative multi-criteria decision analysis. *Int J Technol Assess Health Care*. 2020;36(4):292-296.

³ [Prescription Drug Affordability Review Board | DORA Division of Insurance \(colorado.gov\)](https://www.colorado.gov/prescription-drug-affordability-review-board); March 31, 2023 meeting and prioritization exercise; McQueen RB, Mendola ND, Jakab I, Bennett J, Nair KV, Németh B, Inotai A, Kaló Z. Framework for Patient Experience Value Elements in Rare Disease: A Case Study Demonstrating the Applicability of Combined Qualitative and Quantitative Methods. *Pharmacoecoon Open*. 2023 Mar;7(2):217-228.

Recommendation 2: Within the framework, group factors into “domains” that can be weighed by order of importance to patients and their families, providers, payers, and other stakeholders.

After reviewing the CMS guidance, we propose grouping factors in to three separate domains that represent large categories of evidence: 1) therapeutic advancement (e.g., clinically significant change in primary endpoint versus comparator); 2) patient and caregiver experience factors (e.g., drug reduces caregiver burden); and 3) societal and system-level factors (e.g., drug will result in system-level cost savings). Within each domain, there may be multiple factors that are important to the determination of the preliminary price. But regardless of how the factors are grouped into domains, CMS can weigh the factors in a way that incentivizes evidence generation and submissions with the opportunity for therapies to be “scored” on each factor. The process of weighing each domain and factor within each domain is a standalone process that helps facilitate a transparent discussion among stakeholders about important aspects of evaluating therapies. A further step including “performance scores” may allow for therapies to be scored for their benefits on both quantitative and qualitative evidence submissions. If the weights are combined with performance scores for each therapy, these results may be used as a modifier on negotiated price options. For example, if the drug is highly beneficial not only in terms of its primary endpoint, but also on patient experience factors (e.g., oral route of administration vs infusion) and issues impacting broader society (e.g., addressing an unmet medical need), this framework would help account for those additional factors in the maximum fair price negotiation. The framework is also very flexible with no scoring algorithm used as a modifier. Simply weighing the domains and factors improves transparency and incentivizes evidence generation and submissions from external stakeholders along with internal CMS-led evidence reviews. This allows rapid updates, for example, if the manufacturer brings additional evidence of therapeutic benefit or an additional factor for consideration to a negotiation meeting.

We applaud CMS for undertaking the difficult process of aggregating multiple factors to inform a preliminary negotiation price. As a team, we understand the nuances of mixed methods approaches and our framework will be helpful for CMS in multiple areas of the negotiation process. Please do not hesitate to reach out to our team for any advice or guidance on implementing our proposed process. Thank you for your time reading our comments.

RE: Response to “Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments” - Developing Continuous Patient Engagement to Support the Medicare Drug Price Negotiation Program

Dear Dr. Seshamani:

We are writing to comment on the March 15 draft guidance released by the Centers for Medicare & Medicaid Services (CMS) on implementing the Medicare Drug Price Negotiation Program (DPNP). We appreciate CMS providing this important mechanism for input and urge the agency to establish and apply a patient-centered approach to its negotiation process and factors. A patient-centered approach would ensure that the development of the DPNP “formally includes a range of outcomes and data sources—including those related to patient and caregiver experiences—that are foundational to patient-centeredness, so that the implementation of Medicare drug benefits better aligns with the goals of patients they were designed to serve.”¹ The inclusion and representation of patients and stakeholder are critical to improving health care outcomes, quality, safety, and access in the United States.

Failure to engage patient communities meaningfully would represent an avoidable misstep by CMS as these stakeholders bring unique and essential expertise and perspectives on the value of medicines. Their firsthand experience with the selected drugs, therapeutic alternatives, and the medical system in a real-world setting is essential to consider while conducting healthcare research. Academics, thought leaders, and research organizations have underscored the importance of including patient and caregiver input in evidence-based processes.

The initial guidance document left us with questions regarding how patients or caregivers’ perspectives will be meaningfully considered in the implementation of the DPNP and how their input will be sought throughout the process as described in the guidance. For example, CMS notes that the public will have an opportunity to submit data through an Information Collection Request beginning after the announcement of the selected drugs. The 30-day window afforded stakeholders to offer input after the list of selected drugs is published on September 1st may not be enough time for patients, providers, or caregivers to gather and submit data. We hope that

¹ Mattingly, TJ and Mullins CD. [Achieving Patient-Centeredness In Medicare’s New Drug Price Negotiation Program](#). *Health Affairs Forefront*. 2023.

CMS will revise the guidance and explicitly create formal methods to engage key stakeholders throughout the process.

This comment letter also serves to notify you of an upcoming research project designed to incorporate the expertise of The PATIENTS Professors Academy graduates to provide suggestions to improve how CMS engages stakeholders in the DPNP using the 10-Step Framework for continuous patient and stakeholder engagement.² (*Shown in Appendix Figure A1*). We hope this project can offer insights to CMS on optimal opportunities to work with the patient communities to improve the negotiation process. We eagerly welcome CMS's partnership on this project to ensure it can appropriately inform its goals. We intend to provide insight directly from patients trained in applying this Framework who each bring their own lived experiences and perspectives to the engagement process.

As researchers in patient engagement and patient-centered decision-making, the PATIENTS Program and Applied Patient Experience, LLC are organizations devoted to ensuring continuous and authentic engagement with patient populations throughout the research life cycle. CMS needs to ensure that disease-specific patient-community perspectives are accounted for when evaluating the clinical benefits of selected medicines. However, patient perspectives can only be meaningfully considered if engagement occurs early and throughout the process to identify and assess data and determine how the data are weighted and used in CMS decision making. As such, we call on CMS to adopt a proactive, formalized approach to engaging patients.

The PATIENTS Program is an interdisciplinary research team of community partners and researchers based out of the University of Maryland Baltimore's School of Pharmacy. The PATIENTS Program provides a proven approach to continuous engagement in patient-centered research, known as the 10-Step Framework for Continuous Patient Engagement. Since 2013, the PATIENTS Program has served as a bridge between West Baltimore communities and researchers at the University of Maryland Baltimore. The shared vision is that "patients and stakeholders are heard, inspired, and empowered to codevelop research." The benefits of the approach include (1) an authentic commitment to—and from—the community, (2) faster recruitment and greater retention in studies; (3) enhanced diversity for representative results; and (4) better patient self-management because of the inclusivity in research. The PATIENTS Program is housed within the Department of Practice, Sciences, and Health Outcomes Research (P-SHOR) at the University of Maryland, Baltimore, which improves health care through innovation, collaboration, and advocacy to achieve excellence in pharmacy education, practice, and research. There are more than 50 faculty members whose training and expertise encompass pharmacy, public health, pharmacoepidemiology, pharmacoconomics, health services research, law, and health policy. The health services and outcomes research initiatives promote health services and outcomes research and advance information on public policy and health outcomes related to prescription drug use and delivery. It advocates advanced education and research training in behavioral, economic, and epidemiological/pharmacoepidemiologic health services and policy analysis as applied to drug use and distribution problems. P-SHOR addresses these goals by:

- Conducting new and innovative research related to the delivery, use, costs, and safety of pharmaceuticals and other healthcare products

² Mullins CD, Abdulhalim AM, Lavallee DC. [Continuous Patient Engagement in Comparative Effectiveness Research](#). JAMA. 2012. and Edwards HA, Huang J, Jansky L, Mullins CD. [What Works When: Mapping Patient and Stakeholder Engagement Methods Along the Ten-Step Continuum Framework](#). Journal of Comparative Effectiveness Research. 2021.

- Providing expertise, support, and leadership to professional, governmental, community, and health-related organizations and agencies
- Training graduate students, post and pre-doctoral fellows for future academic, industry, and public policy positions through a variety of academic, training, and mentoring programs

The PATIENTS Program provides a proven approach to continuous engagement in patient-centered research across multiple medical specialties. In 2022, the PATIENTS Program launched its **PATIENTS Professors Academy**. This free 5-week virtual program teaches the PATIENTS Program 10-Step Framework for continuous patient and stakeholder engagement with interactive components led by patient advisors and subject matter experts. Research is conceptualized and driven by communities of patients and their care providers. In 2022, the Academy graduated 90 “Professors”. Graduates of The PATIENTS Professors Academy are able to advise companies, government agencies, community-academic partnerships, and other entities on ways to make clinical and translational research more relevant, appealing, and diverse.

Applied Patient Experience, LLC is a patient engagement and patient-centered research consulting firm. Our expertise is engaging individuals and their caregivers about their experiences living with a disease or disability and applying those insights to guide decisions across drug development, value/health technology assessment, and real-world studies. We provide advisory services and conduct high-quality patient-centered research in partnership with non-profits, government, life science, and technology companies.

We would be happy to engage you to determine where our research could be most impactful or to describe our process in greater detail. After our research concludes, we will share our final report and be accessible to the team at CMS should there be an opportunity to provide clarifications or additional details.

We appreciate the opportunity to provide comments on the draft guidance. Please get in touch with any of the project leadership below if you have questions. We hope to continue to engage with CMS on the issue of patient engagement in the application of the IRA.

Sincerely,

C. Daniel Mullins, PhD

Re: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Seshamani:

Thank you for the opportunity to submit comments on the Center for Medicare & Medicaid Services' (CMS) initial guidance, *Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments* ("initial guidance").¹ I am a Professor of Internal Medicine in the School of Medicine and a Professor of Health Management and Policy in the School of Public Health at the University of Michigan and where I direct the Center for Value-Based Insurance Design ("VBID Center"). My three-decade research and policy agenda focuses on increasing access to, and enhancing equity in the delivery of essential clinical services.

The Inflation Reduction Act's provisions on prescription medicines are of seminal importance to American health care. The law establishes, for the first time, a cap on patient's out-of-pocket costs in Medicare Part D and allows Part D enrollees the option to make cost-sharing up to the out-of-pocket maximum more affordable by electing a maximum monthly cap that spreads cost-sharing across the year. These provisions address significant problems in patient affordability of medicines. As a colleague and I have written, "There is immediate urgency to provide patients with relief from out-of-pocket costs for their medications.... A robust evidence base confirms that medication adherence declines as patients are required to pay more to fill their prescriptions."²

Another part of the law, establishing CMS negotiation of certain Medicare Part B and Part D drug prices, is also profoundly important to U.S. health care. Medicare's large share of the U.S. market means that the program's determination of selected drugs' program-wide "Maximum Fair Price" (MFP) will play a large role in establishing incentives for manufacturers of brand medicines. These

¹ <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

² http://vbidcenter.org/wp-content/uploads/2019/01/AJMC_02_2019_Fendrick-1-22-19.pdf

² http://vbidcenter.org/wp-content/uploads/2019/01/AJMC_02_2019_Fendrick-1-22-19.pdf

decisions by the Secretary of Health and Human Services (HHS) invariably will affect which medicines and which indications for medicines brand manufacturers pursue and which they sideline, the timing of development and even the timing of availability on the U.S. market. Further, physicians, patients and caregivers represent important stakeholders in this program,³ and the process and standards the agency establishes will set an important benchmark for consideration of clinical factors and physician input in its decision-making.

One facet of the VBID Center's work has centered on the concept of "clinical nuance" recognizing that 1) medical services differ in the amount of health produced, and 2) the clinical benefit derived from a specific service depends on the consumer using it, as well as when, where, and by whom the service is provided."⁴ Another facet of the work done at VBID Center has recognized that the emergence of precision medicines means, in certain circumstances defined by clinical criteria, what has been conventionally treated as "the first-line therapy is no longer high-value, and a clinically indicated, 'precision' alternative becomes a higher value choice."⁵ Both areas underscore the need for multi-faceted, nuanced assessments of clinical factors and circumstances when making policy choices, especially those pertaining to affordability of medications

No medical service or medication is always high or low value, but depends on factors such as the patient and the specific clinical scenario. The MFP statute appears to recognize this point, directing the agency to consider the effects of treatments on various patient populations. The initial guidance further reinforces that similar multi-faceted, granular assessments of clinical factors and circumstances are demanded in Part D price negotiation. This approach requires well-structured input from expert clinicians to define the analyses that will be conducted and to evaluate and draw conclusions from the evidence they generate.

Following the statute, the initial guidance identifies multiple parts of setting the MFP that turn on clinical determinations, with each specific to a particular indication of a given drug. These include, for instance, selecting the therapeutic alternative, outcomes considered, determining the comparative effectiveness of the drug and whether the drug represents a therapeutic advance or addresses an unmet need.

CMS's reviews of drug- and indication-specific assessments inevitably will involve analysts with a variety of backgrounds and skills synthesizing and reaching judgments based on a large volume of complex information. However, the specific, nuanced clinical determinations that the initial guidance designates as central to determining the MFP *make it particularly important that appropriate clinical expertise be engaged on each clinical question.*

In this context, appropriate clinical expertise requires well-structured input throughout the process from clinicians who regularly treat patients with the conditions for which the

³ <https://www.healthaffairs.org/content/forefront/implementing-drug-negotiation-provisions-ira-considerations-cms>

⁴ <https://vbidcenter.org/wp-content/uploads/2017/03/Precision-Medicine-1-pager-1-15-20.pdf>

⁵ Ibid.

drug/indication is prescribed.⁶ Data, studies and other evidence cannot be properly used to address the clinical questions CMS has specified without a system for obtaining expert clinicians' advice in defining the questions and evaluation of the evidence. This is needed to draw upon specific knowledge about illnesses and treatments that may not be embedded in studies, yet must play an important role in the agency's decisions. It also is needed to bring real world experience to interpreting and making judgments about data, including clinical nuance that will not necessarily be evident to non-clinicians or to clinicians who are not expert in currently treating patients for the disease/indication at issue. Experienced clinicians do not have the only relevant skills for the assessments and decisions CMS has described but these determinations about "nuanced differences between drugs" cannot be properly made without their skills.

The single, 30-day "information collection request" proposed by CMS at the start of the drug-specific MFP process may not be sufficient for obtaining the expert clinical input needed by the agency. CMS should make targeted revisions to its initial guidance to ensure that the agency is obtaining the expert engagement needed on clinically relevant determinations as called for in the initial guidance and listed above.

Essential points for CMS to obtain clinician input will occur at the start of the process, during the process when initial draft MFP decisions are proposed, and at the end of the process when CMS must publish MFP explanations. These key points for engagement are described in more detail below:

- 1) **Early in the MFP decision-making process**, CMS must establish procedures for earlier, more robust engagement with clinical experts. A single, broad solicitation for input, while a good initial step, may not be sufficient to serve this purpose.
- 2) **During the MFP process**, CMS should seek physician and expert clinical input on the research and evidence synthesis it is relying on in its review, how it is weighting evidence and outcomes, and how it proposes to consider patient differences and clinical nuance across indications and patient subgroups,
- 3) **After publication of CMS' explanation of each selected drug's final MFP**. The law requires CMS to publish a summary explanation of how it came to the final MFP several months after the MFP decision itself is made and published. CMS should ensure that these explanations provide enough detail for clinical experts to be able to see how their input was or was not considered in the agency's final decision. The publication of the explanation should occur in a timely enough manner so that clinical experts can see and learn from how their input was considered before the process begins for the next year of selected products. In addition, CMS should solicit public comment, including from clinical advisors and/or practicing physicians, in order to foster agency learning and continuous improvement of the MFP program.

⁶ Because it is the clinical experts who have the relevant expertise, it is important that assessments and conclusions be prepared and structured by them rather than by staff or contractors without such expertise.

There are a number of methods by which CMS can obtain clinician input. For example, CMS could establish therapeutic area-specific Clinician Advisory Panels that are focused on guiding clinically relevant decision making for each selected product. The Panels should include multiple physicians who regularly treat patients for the conditions/indications for which the selected drug is prescribed. Panel members could be selected following consultation with the relevant medical specialty societies and organizations representing patients and, to assure neutrality, be mutually acceptable to CMS and the manufacturer. They should also reflect the range of practice settings and types of patients with the condition.

In its initial guidance, CMS has recognized the important principles of evaluating drugs based on their clinical performance and that such an evaluation must be conducted with attention to nuanced differences between drugs. Operationalizing these principles in a single determination that applies across 50 million seniors and disabled persons is especially challenging. Establishing a system that provides for neutral clinical experts to fully inform the clinical questions, data and conclusions specified in the initial guidance is one element of meeting the challenge.

Finally, while I am hopeful that the provisions of the law to redesign Part D will positively impact beneficiary access to needed medicines, as stated above, I am concerned that *unintended formulary effects of introducing a drug whose price is restricted to the MFP may alter incentives for how well plans cover other agents in the same therapeutic class*. Over time, plans have increasingly imposed formulary controls such as utilization management and formulary exclusions. When an MFP is identified, I have concern that these existing formulary management tools will intensify. *As such, CMS should regularly monitor plan formularies to ensure access is not increasingly restricted.*

Lastly, while the law requires that beneficiary cost sharing be based on the MFP for selected drugs, this cost sharing based on net price does not extend to all medicines in Part D. CMS should move to redefine negotiated price in Part D to factor in discounts and rebates, to provide parity in cost sharing rules for beneficiaries using non-MFP medicines. Patient access to therapeutic options in recognition of clinical nuance should be the top priority for CMS as these provisions are implemented.

Thank you for the opportunity to comment on this important policy. I applaud your many efforts aimed to enhance access and affordability to essential medications for Medicare beneficiaries. Please feel free to call on me if I can assist you in any way.

Sincerely,

A. Mark Fendrick, M.D.

RE: Response to Solicitation for Comments, Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191-1198 of the Social Security Act for Initial Price Applicability Year 2026

Dear Dr. Seshamani,

Thank you for the opportunity to comment* on the Medicare Drug Price Negotiation Program. As researchers with expertise in pharmacoeconomics, health economics and policy, we have been studying trends in drug pricing and payment models in order to improve patient access to effective treatments, while creating incentives for U.S. manufacturers of health technologies to continue innovating. Our comments draw on our experiences and per developed in that research. We share a mission to measurably improve the value for money accruing from pharmaceuticals and other health technologies, through evidence-based policy solutions, research excellence, and public-private partnerships.

As CMS begins building a new program that relies in part on health economic principles to implement the Medicare Drug Price Negotiation Program, we recommend incorporating several key elements to promote the program's success. Our recommendations have the goal of building public confidence and stakeholder buy-in through rigor and reliable application to CMS decision-making. As described in greater detail below, we recommend that CMS:

- Establish explicit methodological standards to ensure the rigor of research, evidence reviews, and assessments;
- Describe a methodology for applying evidence to pricing decisions that places the greatest weight on added clinical benefit and contextual factors, such as unmet medical need;
- Create a transparent process to:
 - a. solicit input from patients, physicians, and academic researchers with expertise on issues such as choice of comparators and outcomes;
 - b. describe to stakeholders how they are their input will be considered in proposed decisions.

Therefore, we provide the following comments and that we believe would be helpful to consider as your office continues to advance efforts for Drug Price Negotiation through the Medicare Program:

1. **Current CMS Position:** *Apply adjustments by the manufacturer-specific factors outlined in the law to determine the initial offer price.*

Our Recommendation: Place greater emphasis on the clinical benefit factors (e.g. survival, rate of cure), as prioritized with input from the patient community affected, rather than manufacturer-specific factors. Manufacturer-specific factors would lean more towards a cost-plus pricing model, which rewards less efficient firms rather than those providing the most benefit to patients. This is particularly important given vertical integration of PBMs, insurers and pharmacies, which already have an incentive to share data with their rebate-conferring drug company partners. These will be the only entities controlling this essential information, which is necessary for evaluating the drug company's value claims. Such information and data analytic asymmetries will only expand and grow more problematic, making it nearly impossible for payors and government entities to engage in independent auditing.

In contrast, a clinical benefit factor-based negotiation process provides CMS with the ability to reward efficiency and clinical benefit, which ultimately reduces costs and benefit patients. Transparent incorporation of benefits will lead to pricing models that align better with the value of the technology to Medicare beneficiaries and American taxpayers.

2. **Current CMS Position:** *Engage members of the public (including people with Medicare, consumer advocates, prescription drug companies, Medicare Advantage and Part D plans, health care providers and pharmacies, and other interested parties) on key policies, make requests for information, and inform the public on other implementation timelines and milestones.*

Our Recommendation: A stakeholder engagement process should provide input on the priorities and activities of the drug price negotiation methodology and decision-making.¹ Adopt a deliberative, continuous, and transparent process to engage the stakeholders (i.e., those mentioned above in your current position) *as well as* patients affected by the treatments under review, experts in pharmacoeconomics, health economics, and outcomes research and policy. These experts have diverse perspectives to identify and evaluate evidence that can provide insight into the negotiation process that the other listed stakeholders may lack.

¹ Lakdawalla DN, Neumann PJ, Wilensky GR. Health Technology Assessment in the U.S. – A Vision for the Future. Los Angeles: USC Schaeffer Center, 2021. Accessed at: <https://healthpolicy.usc.edu/research/health-technology-assessment-in-the-u-s-a-vision-for-the-future/>.

3. **Current CMS Position:** *CMS intends to consider health outcomes, intermediate outcomes, surrogate endpoints, patient-reported outcomes, and patient experience when reviewing the clinical benefit of the selected drugs and its therapeutic alternative(s).*

Our Recommendation: Ensure evidence on clinical benefit and unmet need reflects perspectives and experiences important to patients, as well as their caregivers, clinicians, and society, including selection of therapeutic alternatives, outcomes, and unmet needs. Given variation in evidence sources, weight should be applied to those factors most important to patients, caregivers, clinicians, and society. CMS can leverage real-world data (e.g., payer claims, patient registries, and electronic health records) and patient-centered outcomes research (e.g., mixed-methods) approaches to capture this information. There are multiple frameworks available to incorporate multi-stakeholder perspectives.²

In addition, we encourage CMS to evaluate the potential role for measurements of value beyond clinical benefit and unmet need. We recognize that the Inflation Reduction Act creates some limitation to this by focusing on comparative effectiveness research and mandatory ceiling price discounts unconnected to value measurement, but we also believe that any price negotiation should be conducted transparently and linked to a drug's value for money to the extent possible.³ While the Affordable Care Act, and Inflation Reduction Act, have prohibited the use of traditional economic measures of value, such as the quality-adjusted life year (QALY), because they assign less value to life extensions for patients with disability and severe disease, recent advances in value assessment may provide alternative pathways forward. For example, the Generalized Risk-adjusted Cost-Effectiveness (GRACE) framework offers an empirical pathway to evaluating price relative to value for all patients without bias for inequities.⁴ CMS should launch a dialogue with relevant stakeholders to discuss potential approaches to broader consideration of value measures, consistent with past recommendations of several expert panels.^{1,3,5}

⁴ Lakdawalla DN, Phelps CE. Health Technology Assessment With Diminishing Returns to Health: The Generalized Risk-Adjusted Cost-Effectiveness (GRACE) Approach. *Value Health*. 2021 Feb;24(2):244-249. doi: 1.116/j.jval.22.13. Epub 221 Jan 12. PMID: 3351831.

⁵ Rimber BK, Harper H, Witte ON. Promoting Value, Affordability and Innovation in Cancer Drug Treatment. A Report from the President of the United States from the President's Cancer Panel. Bethesda, MD: President's Cancer Panel; 218 March.

4. **Current CMS Position:** *CMS intends to consider the source, rigor of the study methodology, current relevance to the selected drug and its therapeutic alternative(s), whether the study has been through peer-review, study limitations and degree of uncertainty of conclusions, to ensure integrity of the contributing data within the negotiation process (page 37).*

Our Recommendation: Establish rigorous and more detailed standards for evidence relied upon in both the literature review and all third-party submitted data, as well as CMS's own "internal analytics." While CMS indicates that it intends to employ rigorous standards, CMS does not indicate what these standards will be, what methods will be used to establish them, or if they will apply to internal analyses conducted by CMS. Other organizations, including the International Society for Pharmacoeconomics & Outcomes Research (ISPOR), the International Society for Pharmacoepidemiology (ISPE), and a recent Health Technology Assessment Panel Report co-published by the Aspen Institute and USC Schaeffer Center provide specific guidance on methods that are rigorous and could apply to drug price negotiation analytics.

5. **Current CMS Position:** *CMS intends for the published explanation of Maximum Fair Price (MFP) to summarize how relevant negotiation factors were considered during the negotiation process.*

Our Recommendation: The explanation of Maximum Fair Price (MFP) should be thorough and released as early as possible to enhance the predictability and transparency of the process. Such thoroughness should specify that CMS will include in its public announcement of the MFP:

- How it selected the therapeutic alternatives;
- How the various factors were weighed;
- How stakeholders were engaged;
- How evidence was considered;
- How types of outcomes were considered;
- How unmet need was defined;
- And, which priority populations were considered.

Thank you for your time and consideration of these issues as we as a nation continue to explore the programmatic structure of Medical Drug Price Negotiation.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance

Dear Administrator Brooks-LaSure,

Ventus Therapeutics ("Ventus") appreciates the opportunity to submit comments in response to the Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191–1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments posted on the Centers for Medicare & Medicaid Services (CMS) website on March 15, 2023 (Drug Price Negotiation Program Guidance).

Ventus is a U.S.-based biopharmaceutical company founded in 2019 with the mission to create exceptional small molecule medicines for seriously ill patients. Our proprietary drug discovery platform, ReSOLVE™, gives us unique insights into the molecular structure of disease-causing protein targets to guide the development of differentiated therapies at a fast pace. Ventus is specifically focused on accessing important disease targets with small molecules. Our lead drug candidates include a potential first-in-class and a potential best-in-class medication for the treatment of diseases of systemic inflammation and neuroinflammation, respectively. Systemic inflammation drives the burden of patients suffering from a wide range of severe diseases, such as lupus, systemic sclerosis, dermatomyositis, and osteoarthritis, among many others. Neuroinflammation is the hallmark of many diseases related to aging, such as Alzheimer's disease and Parkinson's disease. Strong preclinical data demonstrate the potential efficacy of our programs in several of these diseases. In addition, many of these diseases continue to have significant unmet need where millions of patients have no good treatment options available today. Investment in the development of innovative and novel therapies, such as those in Ventus' pipeline, is required to improve the lives of patients suffering from these diseases.

Ventus recognizes that the CMS has a tremendous task ahead to implement the Inflation Reduction Act (IRA). We also understand that CMS considers its guidance on Section 30 to be final. However, given the fact that Ventus recognizes the importance of developing affordable medications, we highlight the importance of small molecules as a therapeutic modality that should be part of the solution and not penalized. Section 30, as written, would have a significantly negative impact on the funding of important research and development efforts for diseases of the elderly, such as Alzheimer's disease, cancer, and blindness, by disproportionately penalizing small molecule drugs. For these reasons, we are including our comments below, which we would have made had comments been permitted.

Section 30.1:

Medicare price negotiation of NDA-path drugs at seven-years from the date of approval significantly degrades the availability of funding for the development of small molecule drugs for age-related diseases, such as Alzheimer's disease.

Small molecules represent the most tried, tested, and proven modality among all drug modalities in development today. Other modalities, such as antibodies, gene therapies, and cell therapies, have many disadvantages compared to small molecules: they are significantly more expensive to manufacture, add more cost to the overall health system (i.e., infusion costs, need for special equipment to deliver the drugs, etc.), and, for certain modalities, are much less proven with more safety liabilities. In addition, patients of all ages, especially elderly patients, prefer the convenience of an oral small molecule. Small molecules are trusted by the public, who often mistrust different therapeutic modalities, as recently seen during the COVID epidemic.

What is not so different between NDA-path drugs and BLA-path drugs is the research and development of both types of drugs. There is no meaningful cost difference between developing a small molecule or a biologic. In addition, because small molecules are generally easy to genericize, prices for these drugs typically drop by approximately 80-90% or more when patent exclusivity ends and one or more generics enter the market, which is much more significant than seen with biosimilars or other modalities. Furthermore, the probability of success (or failure) is the same, regardless of modality.

Significantly disincentivizing the development of small molecules for diseases of the elderly, despite small molecules being no different than biologics from a development cost, risk, or timeline perspective, runs counter to the overarching goals of the IRA in terms of driving affordability in the long-term for Medicare patients. And the long-term impact of this disincentive will be substantially fewer small molecules developed and approved for chronic and highly prevalent diseases affecting the elderly population. This would then lead to reduced treatment options, increased number of injections, and higher cost of care for patients, payers, and society.

Our recommendation: Revise the eligibility period for price negotiations for small molecules to match the 11 years set for large molecule drugs. This increase of four years will preserve most incentives to develop novel small molecule drugs and ensure that all drugs essentially “go generic” without undue delay, putting an end to wasted spending.

* * * * *

We appreciate your consideration of our comments as you develop the Drug Price Negotiation Program policy. We look forward to continuing to work with CMS to ensure that this program is implemented in a manner that minimizes the potential harm to seniors from fewer innovative medicines. Please contact our V.P., Intellectual Property & Legal, Dr. Robin Weatherhead, at RWeatherhead@ventustx.com for questions and comments relating to this letter. We would welcome the opportunity to meet with you or answer any questions CMS may have about our comments, at your request.

Sincerely,

Marcelo E. Bigal

Marcelo Bigal, M.D., Ph.D.
President & Chief Executive Officer

RE: Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments

Dear Administrator Seshamani:

ViiV Healthcare Company (ViiV) appreciates the opportunity to comment on the initial guidance¹ for the Medicare Drug Price Negotiation Program as part of the Inflation Reduction Act (IRA).

ViiV, a global specialist HIV company established in 2009, is the only company solely dedicated to combating, preventing, and hopefully curing HIV and AIDS. ViiV specializes in the development of HIV medicines and is devoted exclusively to advancing science into HIV treatment, prevention, and care. From its inception, ViiV has had a singular focus to improve the health and quality of life of people impacted by this disease and has worked to address significant gaps and unmet needs in HIV care. ViiV is proud to be part of the scientific advances in the treatment and prevention of this disease, transforming HIV from a terminal illness to a manageable chronic condition.

An estimated 1.2 million people in the United States are living with HIV and there are approximately 38,000 new HIV diagnoses each year.² At least 13 percent are unaware they have the virus.³ Only 65 percent of diagnosed individuals had achieved viral suppression as of 2020, according to the CDC.⁴ Access to all modalities and new innovations for HIV treatment, and PrEP is an important consideration for the Medicare program and the populations it serves. Therefore, as the Centers for Medicare & Medicaid Services (CMS) implements the Medicare Drug Price Negotiation Program, we are concerned that CMS's policies will adversely impact meaningful innovation, create operational challenges, and limit

patient access to transformative therapies. ViiV respectfully submits the comments below to highlight issues of interest to the patients we serve.

We make the following recommendations to CMS:

- I. HIV medications should be excluded from Medicare negotiation to ensure innovation continues for HIV treatment and prevention in order to:**
 - a. Support Ongoing Efforts to End the HIV Epidemic**
 - b. Align to CMS's Health Equity Goals**
- II. If HIV remains in scope for Medicare negotiation, we ask CMS to:**
 - a. Set the maximum fair price (MFP) at or near the manufacturer Wholesale Acquisition Cost (WAC) or list price.**
 - b. Expand Definition of Unmet Need to Include Public Health Considerations Like Adherence and Clinical Issues such as HIV Resistance**
 - c. Engage HIV Experts and Proactively Seek Broad Stakeholder Input**

Below are our recommendations with supporting rationales:

- I. HIV medications should be excluded from Medicare negotiation to ensure innovation continues for HIV treatment and prevention in order to:**
 - a. Support ongoing Efforts to End the HIV Epidemic**

As a public health issue, HIV is unique and advancements in treatment and prevention have the potential to eradicate the disease, but only if new options continue to be made available. CMS already treats HIV medications differently than other drug products in Medicare Part D. HIV is recognized as a one of only six “classes of clinical concern” or “protected classes” by Medicare due to the difficulty in managing the disease. Because of this HIV should be excluded from IRA’s MFP negotiation.

The Medicare Part D protected classes rule requires all (or substantially all) prescription drugs to be covered in six protected therapeutic classes including HIV.⁵ CMS adopted the Part D policy to “mitigate the risks and complications associated with an interruption of therapy for these vulnerable populations.”⁶ This protected class policy aligns with the recommendations of health experts, policymakers and HIV-specialized providers, who recommend unrestricted formularies in HIV treatment. The U.S. Department of Health and Human Services’ “Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents Living with HIV” emphasize the need for individualized treatment regimens to enhance adherence and ensure long-term treatment success.⁷ The same policy rationale should extend to ensure HIV treatments and preventions are protected in terms of setting MFP within this guidance.

⁵ CMS.gov. Medicare Advantage and Part D Drug Pricing Final Rule (CMS-4180-F). Jun 3, 2019. <https://www.cms.gov/newsroom/fact-sheets/medicare-advantage-and-part-d-drug-pricing-final-rule-cms-4180-f#:~:text=Current%20Part%20D%20policy%20requires%20sponsors%20to%20include,antiretrovirals%3B%20and%206%29%20ant,ineoplastics%3B%20except%20in%20limited%20circumstances>. ⁷ Panel on Antiretroviral Guidelines for Adults and Adolescents. Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents with HIV. Department of Health and Human Services. <https://clinicalinfo.hiv.gov/en/guidelines/hiv-clinical-guidelines-adult-and-adolescent-arv/whats-new>. Accessed January 11, 2023.

HIV treatment and prevention options are public health tools that deserve unique considerations not similarly contemplated for other classes of biologics or drugs. Specifically, HIV treatment is beneficial to the patient, suppressing the virus, reducing complications and promoting the wellness of persons with HIV. In addition, once a person with HIV achieves viral suppression, HIV treatment also reduces the risk of sexual transmission of HIV to others.⁸ This “treatment as prevention” benefits population health. However, as mentioned previously, only 65 percent of diagnosed individuals had achieved viral suppression as of 2020, according to the CDC.⁹

The federal government has recognized public health benefits of treating HIV in its creation of the “Ending the HIV Epidemic Initiative: A Plan for America” (EHE),¹⁰ a bold national effort that aims to leverage scientific advances in HIV to end the HIV epidemic in the United States. The EHE focuses efforts across many federal health agencies, offices, and programs, including the US Department of Health and Human Services (DHHS) Office of the Assistant Secretary for Health, the Centers for Disease Control and Prevention (CDC), the Ryan White HIV/AIDS Program (RWHAP), the Health Resources and Services Administration (HRSA) Health Center Program, the National Institutes of Health (NIH), the Indian Health Service, and the Substance Abuse and Mental Health Services Administration (SAMHSA).¹¹ These federal agencies are working with state and local governments, health departments, and communities to develop jurisdictional plans to expand the use of the highest-impact HIV prevention strategies, including PrEP utilization.¹²

Additionally, in 2021, the White House and DHHS released the updated National HIV/AIDS Strategy (NHAS),¹³ which further outlines the federal commitment to ending HIV. The NHAS Federal Implementation Plan was released last year and outlines how the federal government will execute the national plan.¹⁴

This level of federal commitment to end a single disease is notable. ViiV urges CMS to consider how best to align the nation’s efforts to eradicate HIV with the goals of the IRA and its implementation, and respectfully ask that HIV products are excluded from negotiations.

b. Align to CMS’s Health Equity Goals

ViiV applauds the work of DHHS and CMS to promote health equity and to reduce racial and ethnic health disparities.^{15,16} The first pillar of the 2022 CMS Strategic Plan is advancing health equity, and the CMS Framework for Health Equity 2022-2032 prioritizes addressing the causes of health disparities

within CMS programs.^{17,18} Assuring equitable access to effective treatment for people with HIV and to optimal HIV prevention options for individuals who would benefit requires scientific innovation in HIV and drug options available to this vulnerable population.

Health disparities by race and ethnicity are particularly sobering for people with HIV. While 2019 HIV prevalence rates and new diagnoses among White and Hispanic/Latinx appear comparable at first glance,¹⁹ the burden of the disease comparatively across populations of color is much higher than White populations. The HIV epidemic continues to have a disproportionate impact on these communities, raising the risk of new infections with each sexual or injection drug use encounter.²⁰ In particular, Black/African American, and Hispanic/Latino communities are disproportionately affected by HIV compared to other racial/ethnic groups. For example, in 2019, the rate of new HIV diagnoses per 100,000 for Black people (45.0) was about 8 times that of white people (5.3); Latino people (21.5) had a rate 4 times that of white people.²¹ Similarly, Black women are disproportionately affected by HIV compared to women of other races and ethnicities. From 2014 to 2018, the rate of new HIV infections among Black women is 13 times that of white women and 4 times that of Latina women.²²

Black women are also disproportionately affected by HIV compared to women of other races and ethnicities. From 2015 to 2019, the rate of new HIV infections among Black women is eleven times that of white women and four times that of Latina women.²³ The clear racial disparities in HIV rates in the U.S. indicate a need for renewed focus on HIV prevention among people of color. Inequities in access to HIV prevention and treatment across populations most vulnerable have led to increasing racial disparities in HIV incidence, transmission, and viral suppression.²⁴

ViiV encourages CMS to align its efforts on IRA implementation to the agency's goals on advancing health equity and eliminating health disparities.

//. If HIV remains in scope for Medicare negotiation, we ask CMS to:

a) Set the maximum fair price (MFP) at or near the manufacturer Wholesale Acquisition Cost (WAC) or list price.

ViiV recommends CMS clarify that Wholesale Acquisition Costs (WAC) will be used as the basis to determine MFP discounts/rebates. CMS provides Primary Manufacturers the option to provide rebates “for the difference between the dispensing entity’s acquisition cost and the MFP.”²⁵ Manufacturers do not

normally sell direct to pharmacy locations. Instead, manufacturers sell products at WAC to wholesalers/distributors who then resell the product to pharmacy locations. A pharmacy's Actual Acquisition Cost (AAC) will likely not equal the cost for which the manufacturer sold the product. Use of AAC as the basis to determine MFP rebates may result in higher base prices than the list prices the manufacturer used for the sale of the drug. Manufacturers are not able to validate the AAC and varied cost bases will result in inconsistent MFP rebates paid for the same product to different pharmacies. AAC may include any third-party markups from entities in the supply chain that will inflate the price and result in higher rebates than required to effectuate the MFP. The use of WAC as the basis will ensure accurate effectuation of the MFP. WAC is a published list price set in advance and available to all entities in the supply chain.

b) Expand Definition of Unmet Need to Include Public Health Considerations Like Adherence and Clinical Issues such as HIV Resistance

CMS's proposed definition of unmet need in the guidance as "treating a disease or condition where very limited treatment options exist" is too limited when considering HIV.²⁶ We urge CMS to consider the public health ramifications of non-adherence in infectious diseases like HIV in defining unmet need. Within HIV there is a significant unmet need in terms of populations who have not been able to achieve adherence to their drug regimens (for either treatment or prevention). New scientific innovations that can address this need for adherence are, therefore, attempting to address this unmet need in a population. These non-adherent populations may be vulnerable, hard-to-reach, underserved populations with challenging social determinants of health, and necessitate different treatment options. The DHHS "Guidelines for the Use of Antiretroviral Agents in Adults and Adolescents Living with HIV"²⁷ emphasize the need for individualized treatment regimens to enhance adherence and ensure long-term treatment success. Similarly, CDC's PrEP clinical guidelines also indicate that patient success in prevention benefits from availability of prevention options.²⁸

In addition, there is another unmet need in HIV treatment. Due to the fact that HIV virus constantly evolves and gain resistance to current treatments, the resistance landscape is constantly changing in HIV, and necessitates ongoing scientific research and innovation of new treatment options. In clinical settings, health care providers work closely with patients to select HIV treatment options with great specificity for each patient. Effective treatment of HIV is highly individualized and takes into account a patient's size, gender, treatment history, viral resistance, coexisting illnesses, drug interactions, immune status, side effects, and stigma. Specifically, viral resistance is a major factor that can limit drug efficacy, limit therapeutic options, and lead to cross-resistance to another drug.²⁹

c) Engage HIV Experts and Proactively Seek Broad Stakeholder Input

ViiV believes that experts, including scientists, manufacturers, advocates, patients, and clinicians, should be consulted when considering MFP. The voice and perspective of patients with lived experience in HIV have been a fundamental voice in the transformation of HIV from deadly virus to manageable chronic condition, to an epidemic that could be ended in our lifetime. Clinicians with disease-specific expertise

and disease-specific clinical guidelines generated by clinicians should also play a meaningful role in CMS's determination of a selected drug's price.

Additionally, manufacturers are in a strong and unique position to inform CMS's value of a selected drug, based on extensive expertise and research on the benefits and impacts of their medicines throughout the product lifecycle. Thus, manufacturers should be able to share our expertise as a part of this process.

ViiV Healthcare appreciates the CMS's consideration of these comments on IRA and applauds the agency for its commitment to ensuring patients have equitable access to continued innovation. Please feel free to contact me at (770) 710-9620 or carie.a.harter@viiivhealthcare.com should you have any questions.

Sincerely,

Re: Medicare Drug Price Negotiation Program Guidance

Dear Dr. Seshamani:

Vizient, Inc. appreciates the opportunity to respond to the Centers for Medicare and Medicaid Services (CMS) Medicare Drug Price Negotiation Program: Initial Memorandum, Implementation of Sections 1191 – 1198 of the Social Security Act for Initial Price Applicability Year 2026, and Solicitation of Comments (hereinafter the “Guidance”).¹ Also, Vizient thanks CMS for releasing additional resources to help stakeholders better understand the agency’s Inflation Reduction Act (IRA) implementation efforts and plans. The Guidance is for implementation of the Negotiation Program for initial price applicability year 2026. While Vizient is not commenting on all questions posed in the guidance, Vizient emphasizes the importance of considering healthcare providers’ perspectives as certain policies contemplated in the guidance may impact patient care.

Background

Vizient, Inc. provides solutions and services that improve the delivery of high-value care by aligning cost, quality, and market performance for more than 60% of the nation’s acute care providers, which includes 97% of the nation’s academic medical centers, and more than 20% of ambulatory providers. Vizient provides expertise, analytics, and advisory services, as well as a contract portfolio that represents more than \$130 billion in annual purchasing volume, to improve patient outcomes and lower costs. Headquartered in Irving, Texas, Vizient has offices throughout the United States.

Recommendations

Vizient appreciates the willingness of CMS to consider stakeholder feedback regarding Medicare drug price negotiation guidance issued on March 15, 2023. As noted in the Guidance, the IRA established the Medicare Drug Negotiation Program (hereinafter the

¹ <https://www.cms.gov/files/document/medicare-drug-price-negotiation-program-initial-guidance.pdf>

“Negotiation Program”) to negotiate Maximum Fair Prices² (MFPs) for certain high expenditure, single source drugs and biological products. Vizient’s comments encourage CMS to clarify aspects of the Guidance and offers recommendations to improve transparency of the negotiation process.

Identification of Selected Drugs for Initial Price Applicability Year 2026

Identifying Potential Qualifying Single Source Drugs

In the Guidance, CMS indicates that the agency will identify single source drugs by using a process that applies to drug products and a separate process that applies to biological products. For biological products, CMS provides that “all dosage forms and strengths of the biological products with the same active ingredient and the same holder of the Biologics License Application (BLA), inclusive of products that are marketing pursuant to different BLAs.” As CMS is likely aware, biological products may have presentations in which there may be the same active ingredient/moiety but variation in administration, inactive ingredients or additional active ingredient/moiety (e.g., such as when a “biobetter” is developed³). Vizient encourages CMS to work with stakeholders to identify an evaluation process to determine when it would be appropriate group certain biological products together.

Delay in the Selection and Negotiation of Certain Biologics with High Likelihood of Biosimilar Market Entry

As noted in the Guidance, the Secretary may delay a biological from being selected for negotiation if certain circumstances are met, including if the Secretary determines there is a high likelihood that a biosimilar will be both FDA approved and marketed before September 1, 2025. Such a delay could occur if a Biosimilar Manufacturer’s Initial Delay Request⁴ is granted.

In the Guidance, CMS details that an Initial Delay Request must clearly demonstrate that patents related to the reference drug are unlikely to prevent the biosimilar from being marketed before September 1, 2025. CMS provides that it will consider this requirement met if “one or more court decisions establish the invalidity, unenforceability, or non-infringement of any potentially applicable non-expired patent relating to the Reference Drug that the patent holder asserted was applicable to the Biosimilar.”⁵ Vizient notes that there are often remaining, active patents for the reference product related to indications and that biosimilars will frequently enter the market with fewer indications than the reference product. As a result, market entry tends to

² As provided in the Guidance, “In accordance with section 1191(c)(3) of the Social Security Act, (“the Act”), maximum fair price means, with respect to a year during a price applicability period and with respect to a selected drug (as defined in section 1192(c) of the Act) with respect to such period, the price negotiated pursuant to section 1194 of the Act, and updated pursuant to section 1195(b) of the Act, as applicable, for such drug and year.”

³ See Sharma A, Kumar N, Kuppermann BD, Bandello F, Loewenstein A. Biologics, biosimilars, and biobetters: different terms or different drugs? *Eye (Lond)*. 2019 Jul;33(7):1032-1034. doi: 10.1038/s41433-019-0391-5. Epub 2019 Mar 7. PMID: 30846867; PMCID: PMC6707288, referring the term “biobetter” but noting that it has been widely used but is still not a defined term.

⁴ CMS will remove from the ranked list of 50 negotiation-eligible drugs as described in the Guidance any negotiation-eligible drug for which the inclusion on the selected drug list is delayed in accordance with the IRA. The IRA contemplates two potential requests under the Biosimilar Delay: (1) a request to delay the inclusion of a Reference Drug by one initial price applicability year (“Initial Delay Request”), as stated in the IRA; and (2) a request to delay the inclusion of a Reference Drug for which an Initial Delay Request has been granted for a second initial price applicability year (“Additional Delay Request”) as stated in the IRA.

⁵ Guidance, pg. 19

depend on whether there are substantive, non-expired patents. Vizient encourages CMS to clarify the Initial Delay Request policy in circumstances where a biosimilar may be marketed with fewer than all of the indications from the reference product.

Another circumstance that could be demonstrated in the Initial Delay Request related to whether the patent-related issues may prevent the biosimilar from being marketed is “the Biosimilar Manufacturer has a signed legal agreement with the Reference Manufacturer that permits the Biosimilar Manufacturer to market the Biosimilar in one or more dosage form(s), strength(s), and indication(s) before September 1, 2025, without imposing improper constraints on the Biosimilar Manufacturer.” Vizient appreciates the agency’s inclusion of this policy as it may encourage Reference Product manufacturers to make agreements with biosimilar manufacturers to support competition before the product would be potentially eligible for negotiation. Vizient encourages CMS to clarify “without imposing improper constraints on the Biosimilar Manufacturer”, as it is unclear how CMS will interpret this provision as different agreements develop, such as those that include licensing agreements.

Similarly, CMS indicates that it will consider active litigation to be determinative that there is not clear and convincing evidence that the biosimilar will be marketed before September 1, 2025. Vizient asks that CMS clarify whether the scope of the litigation will be considered, particularly where the biosimilar could be approved and marketed with a limited set of indications, even if there is ongoing active litigation.

Another requirement for the Initial Delay Request is that it must clearly demonstrate that the Biosimilar Manufacturer will be operationally ready to market the biosimilar before September 1, 2025. To assess this requirement, in part, CMS will consider “a manufacturing schedule consistent with the public-facing statements and any revenue expectations.” In addition, CMS includes in the process to submit an Initial Delay Request, that the biosimilar manufacturer include the manufacturing schedule for the biosimilar as submitted to the FDA during its review of the licensure application, to the extent available. Vizient encourages CMS to also consider collaborating with the Food and Drug Administration (FDA), to identify key milestones that would indicate the likelihood of approval and marketing and whether information could be more readily shared between FDA and CMS, especially if CMS would like to confirm aspects of the submission or if the agency has additional questions for FDA. Also, as FDA policy may evolve, we recommend CMS evaluate such policies for their impact on the negotiation process, including Initial Delay Requests.

Negotiation Factors

In the Guidance, CMS provides additional details regarding the sources CMS intends to use regarding therapeutic alternatives to a selected drug which would be relevant during the negotiation process.⁶ As provided in the Guidance, academic experts, clinicians and interested

⁶ As noted in the Guidance, “section 1194(e)(2) of the Act directs CMS to consider evidence about alternative treatments to the selected drug, as available, including:

parties may submit information on selected drugs and their therapeutic alternatives. While CMS notes that all such information related to drugs selected for initial price applicability year must be submitted to CMS by October 2, 2023, it is unclear how such information should be submitted, in what format and whether CMS will proactively identify data needs for interested parties' input. In addition, it is unclear whether CMS envisions a similar process for future price applicability years and whether such processes will be similar for Part B and Part D drugs.

Also, CMS indicates that it may consult outside subject matter and clinical experts on topics related to alternative treatments to the selected drug. Vizient actively provides data-driven insights to help healthcare providers achieve cost efficiencies, performance gains, and clinical improvements. For example, Vizient's [list](#) of essential medications for high-quality patient care is developed by Vizient pharmacy experts to identify medications where, if not available, would prove the greatest threat to a hospital's ability to provide immediate and high-quality patient care. The list also connects pharmacy leaders to mitigation strategies, which are ready-to-use documents with pertinent clinical and operational strategies to address shortages at the institutional level. Given Vizient's role in supporting members and pharmaceutical expertise, we would welcome any request from CMS to consult with our subject matter and clinical experts.

Lastly, as detailed in Appendix C of the Guidance, CMS indicates that 340B pricing data would be collected for use in the Negotiation Program. Vizient discourages CMS from using 340B pricing data for purposes of the Negotiation Program as doing so may have unintended consequences for the 340B Program. For example, Vizient is concerned that using 340B pricing to help set the MFP, which would be published, could result in commercial payers using this information to set discriminatory reimbursement for 340B covered entities based on that pricing. As a result, safety net providers would be limited in their ability to serve their communities. Also, Vizient notes that 340B prices are excluded from a manufacturer's non-federal average manufacturer price (non-FAMP) calculations. We encourage the agency to consider this information as it decides the appropriateness of collecting this information for negotiation purposes. While Vizient appreciates that CMS has provided some language in the Guidance to help ensure ongoing access to 340B pricing, we recommend CMS remove 340B pricing from the negotiation factors to help minimize disruption to safety net providers.

Establishment of a Single Proposed MFP for Negotiation Purposes

CMS indicates that, for the purposes of determining a single price included in an initial offer, the agency intends to base the single price on the cost of the selected drug per 30-day

1. The extent to which the selected drug represents a therapeutic advance compared to existing therapeutic alternatives for the selected drug and the costs of such existing therapeutic alternatives;
2. FDA-approved prescribing information for the selected drug and its therapeutic alternatives;
3. Comparative effectiveness of the selected drug and its therapeutic alternatives, including the effects of the selected drug and its therapeutic alternatives on specific populations (including individuals with disabilities, the elderly, the terminally ill, children, and other patient populations, herein referred to as "specific populations"); and
4. The extent to which the selected drug and the therapeutic alternatives to the drug address unmet medical needs for a condition for which treatment or diagnosis is not addressed adequately by available therapy."

equivalent supply⁷, weighted across dosage forms and strengths, as applicable. Vizient suggests CMS consider price per 30-day treatment for oral medications and price per-dose for injectable medications. For injectable medications, this option may enable better comparisons between products that are listed as therapeutic alternatives.

In addition, Vizient encourages CMS to share information publicly regarding its application of this methodology, including its approach to identify a single price for use at each step in the negotiation process. While CMS notes that the Guidance is applicable to Part D drugs, such information may help inform stakeholder comments on future iterations of the Guidance and for Part B drugs. For example, additional information regarding circumstances where the single price was more challenging to calculate due to more complex dosing intervals would be helpful to share with stakeholders.

Also, as related to the methodology for developing an initial offer, CMS indicates that to evaluate the clinical benefit conferred by the selected drug compared to its therapeutic alternative(s), CMS aims to broadly evaluate the body of clinical evidence, including data received from the public and through consults with clinical and academic experts. As noted above, Vizient possesses a unique perspective, including data and analytics capabilities that would likely be relevant to the agency as it adjusts the starting point for the negotiation based on the clinical benefit. Vizient reiterates our willingness to serve as resource to CMS.

Per the IRA, CMS is to consider a range of factors when developing an initial offer, including manufacturer-specific data and evidence about therapeutic alternatives. In the Guidance, CMS also notes that in determining the initial offer, it will consider various aspects of a selected drug's clinical benefit drug compared to therapeutic alternatives. While not exhaustive, the agency indicates it will consider factors related to clinical benefit, safety and patient experience. Vizient encourages CMS to also consider resiliency and supply assurance when evaluating such products. While a more frequent concern with multisource medications, the market has had to withstand interruptions of sole source, branded pharmaceuticals, including biologic products.

Monitoring Access to the MFP

As provided in the IRA, the Primary Manufacturer⁸ is to provide access to the MFP to MFP-

⁷ CMS clarifies the cost of the selected drug would be per 30-day equivalent supply rather than per unit (e.g., tablet, capsule, injection)

⁸ As provided in the Guidance, "In section 1191(c)(1) of the Act, the Negotiation Program statute adopts the definition of "manufacturer" established in section 1847A(c)(6)(A) of the Act. Section 1193(a)(1) of the Act establishes that CMS will negotiate an MFP with "the manufacturer" of the selected drug. To the extent that more than one entity meets the statutory definition of manufacturer for a selected drug for purposes of initial price applicability year 2026, CMS intends to designate the entity that holds the NDA(s)/BLA(s) for the selected drug to be "the manufacturer" of the selected drug (hereinafter "Primary Manufacturer"). Likewise, for initial price applicability year 2026, CMS intends to refer to any other entity that meets the statutory definition of manufacturer for a drug product included in the selected drug and that either (1) is listed as a manufacturer in an NDA or BLA for the selected drug or (2) markets the selected drug pursuant to an agreement with the Primary Manufacturer as a "Secondary Manufacturer." Secondary Manufacturers would include any manufacturer of any authorized generics and any repacker or relabeler of the selected drug that meet these criteria."

eligible individuals⁹ at the pharmacy, mail order service or other dispenser at the point of sale, and to the pharmacy, mail order service, or other dispenser with respect to such MFP-eligible individuals who are dispensed the selected drug. Also, CMS “reiterates that the requirement to provide access to the MFP applies to all sales of the selected drug to MFP-eligible individuals and to pharmacies, mail order services, and other dispensers that are providing a selected drug to an MFP-eligible individual”.¹⁰ Vizient appreciates the agency’s clarification as it may help prevent access challenges for providers. We encourage CMS to gain additional input from providers to determine whether other aspects of the Guidance should be clarified.

In the Guidance, regarding operationalizing access to the MFP, CMS also notes “there is widespread use of chargeback payments and rebate mechanisms among the pharmaceutical stakeholders in the private sector, which allows for entities to receive rebates or discounts on their purchases after those purchases are made, based on the specific population to whom the drug or biological is dispensed.”¹¹ Vizient is concerned that circumstances where the dispenser would have to submit for a rebate would add administrative burden, especially as additional review may be needed to identify when a rebate request would need to be submitted. Also, Vizient emphasizes the financial challenges that dispensers would endure due to higher inventory costs upfront and, adding to this, creating cash flow issues while waiting for both reimbursement and the manufacturer to make them whole. These financial challenges would be exacerbated as MFP reimbursement would also be lower. We encourage CMS to work with dispensers to identify options that would be less burdensome from both an administrative and financial perspective. Our comments would also apply should the agency consider a similar approach for Part B. We urge the agency to work closely with healthcare providers in refining this policy.

Similarly, we request the agency to work with providers in identifying their implementation needs and a process to report circumstances in which MFP pricing is not made accessible, including delays or burdensome processes to obtain such pricing. As noted, barriers to obtain such pricing could result in pharmacies and other dispensers taking financial losses that would likely be untenable and potentially jeopardize patient access to care. We urge CMS to carefully consider these concerns and regularly work with providers on solutions before and after implementation for both Part B and Part D. Further, we encourage CMS to develop policies to help ensure manufacturers provide prompt payment to providers and do not unnecessarily delay payments, including by imposing additional demands on providers.

⁹ As provided in the Guidance, “In accordance with section 1191(c)(2) of the Act, the term “maximum fair price eligible individual” means, with respect to a selected drug, the following: in the case such drug is dispensed to the individual at a pharmacy, by a mail order service, or by another dispenser, an individual who is enrolled in a prescription drug plan under Medicare Part D or an MA–PD plan under Medicare Part C (including enrollees in Employer Group Waiver Plans (EGWPs)) if coverage is provided under such plan for such selected drug; and/or in the case such drug is furnished or administered to the individual by a hospital, physician, or other provider of services or supplier, an individual who is enrolled under Medicare Part B, including an individual who is enrolled in an MA plan under Medicare Part C, if payment may be made under Part B for such selected drug.”

Monitoring for Bona Fide Marketing of Generic or Biosimilar Product

As provided in the IRA, a selected drug will no longer be subject to the negotiation process if certain circumstances are met, including a determination that a generic or biosimilar has been marketed as evidenced by prescription drug event (PDE) data.¹² CMS intends to monitor whether “robust and meaningful” competition exists in the market once a selected drug is no longer a selected drug. While CMS seeks comment on the most effective ways to monitor whether robust and meaningful competition exists in the market, Vizient encourages the agency to first clarify what is meant by “robust and meaningful” competition.

Also, CMS provides examples of monitoring including whether the generic drug or biosimilar biological product is regularly and consistently available for purchase through the pharmaceutical supply chain, and whether it is available for purchase by community retail pharmacies in sufficient quantities from their wholesale suppliers. Vizient believes other data, such as national market share, presence at distributors, on group purchasing organization (GPO) contracts, and included in payer formularies could be among the several factors CMS considers to help inform whether “robust and meaningful” competition exists, depending on the context (e.g., Part B or D drugs) and product. Vizient also encourages CMS to gain insights from stakeholders as it evaluates whether “robust and meaningful” competition exists.

Research and Development Costs

In the Guidance, CMS outlines its interpretation of the primacy manufacturer’s research and development costs which are to be collected and used in the Negotiation Program. Vizient believes publicly sharing research and development costs, including recoupment of such costs, could help improve transparency. To the extent possible we encourage CMS to make this information publicly available. Should such availability not be possible, we suggest the agency consider making this information available in an aggregated view as this would also help improve transparency and understanding of true research and development expenditures.

Provider Input

Vizient understands that the IRA included several ambitious deadlines to which CMS has worked to adhere. We appreciate the agency’s efforts at promptly sharing information with stakeholders and seeking comment. As the agency continues to release guidance and resources regarding IRA implementation, we suggest the agency consider summarizing resources to better clarify the potential impact to providers and consistently seek their input. In addition, while the Guidance focuses on Part D drugs, we encourage the agency to clarify aspects of the Guidance that may also be applicable to Part B so that stakeholders may

¹² The two circumstances are, “(1) the FDA has approved a generic drug under section 505(j) of the FD&C Act that identifies as its reference listed drug a product that is included in the selected drug, or the FDA has licensed a biosimilar biological product under section 351(k) of the PHS Act that identifies as its reference product a product that is included in the selected drug; and, (2) the generic drug or biosimilar biological product, as applicable, is marketed pursuant to such approval or licensure.”

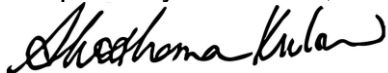

respond before the Part D policies are implemented and would potentially be more challenging to modify for Part B.

Conclusion

Vizient thanks CMS for the opportunity to share feedback in response to the Guidance. Vizient emphasizes the importance of minimizing provider burden and proactively engaging providers regarding IRA implementation plans to gain their feedback and perspectives.

Vizient membership includes a wide variety of hospitals ranging from independent, community-based hospitals to large, integrated health care systems that serve acute and non-acute care needs. Additionally, many are specialized, including academic medical centers and pediatric facilities. Individually, our members are integral partners in their local communities, and many are ranked among the nation's top health care providers. In closing, on behalf of Vizient, I would like to thank the CMS for providing us the opportunity to comment on the Guidance. Please feel free to contact me or Jenna Stern at jenna.stern@vizientinc.com, if you have any questions or if Vizient may provide any assistance as you consider these issues.

Respectfully submitted,
