**Sources of Information**

190.16 - Partial Thromboplastin Time (PTT)

Other Names/Abbreviations

PTT

Description

Basic plasma coagulation function is readily assessed with a few simple laboratory tests: The Partial Thromboplastin Time (PTT), Prothrombin Time (PT), Thrombin Time (TT), or a quantitative fibrinogen determination. The PTT test is an in vitro laboratory test used to assess the intrinsic coagulation pathway and monitor heparin therapy.

HCPCS Codes (Alphanumeric, CPT® AMA)

### Code | Description
--- | ---
*Z05.42 | *Observation and evaluation of newborn for suspected metabolic condition ruled out
*Z05.43 | *Observation and evaluation of newborn for suspected immunologic condition ruled out
*Z05.5 | *Observation and evaluation of newborn for suspected gastrointestinal condition ruled out
*Z05.6 | *Observation and evaluation of newborn for suspected genitourinary condition ruled out
*Z05.71 | *Observation and evaluation of newborn for suspected skin and subcutaneous tissue condition ruled out
*Z05.72 | *Observation and evaluation of newborn for suspected musculoskeletal condition ruled out
*Z05.73 | *Observation and evaluation of newborn for suspected connective tissue condition ruled out
*Z05.8 | *Observation and evaluation of newborn for other specified suspected condition ruled out
*Z05.9 | *Observation and evaluation of newborn for unspecified suspected condition ruled out
*Z19.1 | *Hormone sensitive malignancy status
*Z19.2 | *Hormone resistant malignancy status
Z51.81 | Encounter for therapeutic drug level monitoring
Z51.89 | Encounter for other specified aftercare
*Z53.31 | *Laparoscopic surgical procedure converted to open procedure
*Z53.32 | *Thoracoscopic surgical procedure converted to open procedure
*Z53.33 | *Arthroscopic surgical procedure converted to open procedure
*Z53.39 | *Other specified procedure converted to open procedure
Z79.01 | Long term (current) use of anticoagulants
*Z84.82 | *Family history of sudden infant death syndrome
Z86.2 | Personal history of diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism

### Indications
1. The PTT is most commonly used to quantitate the effect of therapeutic unfractionated heparin and to regulate its dosing. Except during transitions between heparin and
warfarin therapy, in general both the PTT and PT are not necessary together to assess the effect of anticoagulation therapy. PT and PTT must be justified separately.

2. A PTT may be used to assess patients with signs or symptoms of hemorrhage or thrombosis. For example:
   - Abnormal bleeding, hemorrhage or hematoma petechiae or other signs of thrombocytopenia that could be due to Disseminated Intravascular Coagulation
   - Swollen extremity with or without prior trauma

3. A PTT may be useful in evaluating patients who have a history of a condition known to be associated with the risk of hemorrhage or thrombosis that is related to the intrinsic coagulation pathway. Such abnormalities may be genetic or acquired. For example:
   - Dysfibrinogenemia
   - Afibrinogenemia (complete)
   - Acute or chronic liver dysfunction or failure, including Wilson’s disease
   - Hemophilia
   - Liver disease and failure
   - Infectious processes
   - Bleeding disorders
   - Disseminated intravascular coagulation
   - Lupus erythematosus or other conditions associated with circulating inhibitors, e.g., factor VIII Inhibitor, lupus-like anticoagulant
   - Sepsis
   - Von Willebrand’s disease
   - Arterial and venous thrombosis, including the evaluation of hypercoagulable states
   - Clinical conditions associated with nephrosis or renal failure
   - Other acquired and congenital coagulopathies as well as thrombotic states

4. A PTT may be used to assess the risk of thrombosis or hemorrhage in patients who are going to have a medical intervention known to be associated with increased risk of bleeding or thrombosis. An example is as follows: evaluation prior to invasive procedures or operations of patients with personal or family history of bleeding or who are on heparin therapy

**Limitations**

1. The PTT is not useful in monitoring the effects of warfarin on a patient’s coagulation routinely. However, a PTT may be ordered on a patient being treated with warfarin as heparin therapy is being discontinued. A PTT may also be indicated when the PT is markedly prolonged due to warfarin toxicity.

2. The need to repeat this test is determined by changes in the underlying medical condition and/or the dosing of heparin.
3. Testing prior to any medical intervention associated with a risk of bleeding and thrombosis (other than thrombolytic therapy) will generally be considered medically necessary only where there are signs or symptoms of a bleeding or thrombotic abnormality or a personal history of bleeding, thrombosis or a condition associated with a coagulopathy. Hospital/clinic-specific policies, protocols, etc., in and of themselves, cannot alone justify coverage.

**ICD-10-CM Codes That Do Not Support Medical Necessity**

Any ICD-10-CM code not listed in either of the ICD-10-CM sections above.

Disorders of Hemostasis, Ratnoff, Oscar D. & Forbes, Charles D., W.B. Saunders Co., 1996

190.17 - Prothrombin Time (PT)

Other Names/Abbreviations
PT

Description
Basic plasma coagulation function is readily assessed with a few simple laboratory tests: the Partial Thromboplastin Time (PTT), Prothrombin Time (PT), Thrombin Time (TT), or a quantitative fibrinogen determination. The PT test is one in-vitro laboratory test used to assess coagulation. While the PTT assesses the intrinsic limb of the coagulation system, the PT assesses the extrinsic or tissue factor dependent pathway. Both tests also evaluate the common coagulation pathway involving all the reactions that occur after the activation of factor X. Extrinsic pathway factors are produced in the liver and their production is dependent on adequate vitamin K activity. Deficiencies of factors may be related to decreased production or increased consumption of coagulation factors. The PT/INR is most commonly used to measure the effect of warfarin and regulate its dosing. Warfarin blocks the effect of vitamin K on hepatic production of extrinsic pathway factors.

A PT is expressed in seconds and/or as an international normalized ratio (INR). The INR is the PT ratio that would result if the WHO reference thromboplastin was used in performing the test.

Current medical information does not clarify the role of laboratory PT testing in patients who are self monitoring. Therefore, the indications for testing apply regardless of whether or not the patient is also PT self-testing.
