A-1 IRF-PAI Quality Measures Requiring National Average Observed Scores and Covariate Values for Risk-Adjustment .................................................................................................................. 89
A-2  Risk-Adjustment Covariates for the Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) ................................................................. 90
A-3  Risk-Adjustment Covariates for the Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury ......................................................................................................................... 91
A-4  Etiologic Diagnosis or Comorbid Conditions – ICD-10-CM Codes ................................................. 92
A-5  Risk-Adjustment Covariates for the Change in Self-Care, Change in Mobility, Discharge Self-Care, and Discharge Mobility Measures (NQF #2633, NQF #2634, NQF #2635, and NQF #2636) ........................................................................................................ 93
A-6  Exceptions to Risk-Adjuster Comorbidities for the Change in Self-Care, Change in Mobility, Discharge Self-Care, and Discharge Mobility Measures (NQF #2633, NQF #2634, NQF #2635, and NQF #2636) ..................................................................................... 118
Chapter 1
Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual Organization and Definitions

The purpose of this manual is to present the methods used to calculate quality measures that are included in the Centers for Medicare & Medicaid Services (CMS) Inpatient Rehabilitation Facility (IRF) Quality Reporting Program (QRP). Quality measures are tools that help measure or quantify healthcare processes, outcomes, patient or resident perceptions and organizational structure/systems that are associated with the ability to provide high-quality services related to one or more quality goals.1 This manual provides detailed information for each quality measure, including quality measure definitions, inclusion and exclusion criteria and measure calculation specifications. An overview of the IRF QRP and additional information pertaining to public reporting is publicly available and can be accessed through the IRF QRP website.2 The next section outlines the organization of the manual and provides an overview of the information found in each section.

Section 1.1: Organization

This manual is organized by chapter and each chapter contains sections that provide additional details. Chapter 1 presents the purpose of the manual, explaining how the manual is organized and defining key terms that are used throughout subsequent chapters. The remaining chapters are organized by quality measure and provide detailed information about measure specifications and reporting components. Chapters 2 and 3 identify the Centers for Disease Control and Prevention’s (CDC) National Healthcare Safety Network Measures (NHSN) quality measures and the claims-based measures, respectively. The quality measures that rely on IRF-Patient Assessment Instrument (PAI) are presented in Chapter 4 and record selection criteria is explained for each measure. Chapter 5 describes the two Internet Quality Improvement and Evaluation System (iQIES) data reports for the IRF-PAI quality measures, consisting of the iQIES Review and Correct Reports and the iQIES Quality Measure (QM) Reports. The iQIES Review and Correct Reports is a single report that contains facility-level quarterly and cumulative rates and its associated patient-level data. The iQIES QM Reports are comprised of two report types, one containing facility-level measure information and a second that includes patient-level data for a selected reporting period. Following the discussion of quality measure specifications for each report, information is presented in table format to illustrate the report

2 The IRF QRP website can be found at the following link: https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/IRF-Quality-Reporting/index.html
calculation month, reporting quarters and the months of data that are included in each monthly report. The chapter concludes with the transition from IRF-PAI v2.0 to IRF-PAI v3.0. Data collection for IRF-PAI v3.0 begins on October 1, 2019 and will impact certain quality measure specifications. Chapter 6 presents the measure calculation methodology specific to the IRF-PAI quality measures and Chapter 7 provides the measure logical specifications for each of the quality measures within the IRF-PAI, in table format. Lastly, Appendix A and the associated Risk Adjustment Appendix File includes the intercept and covariate coefficients values that are used to calculate the assessment-based (IRF-PAI) risk-adjusted measures.

Section 1.2: IRF Stay Definitions

**Patient stay-level record:** A patient stay-level record is an IRF-PAI record, which includes both admission and discharge data and reflects an IRF stay.

**Stay:** The period of time between a patient’s admission date into an IRF and date of discharge from the IRF.

**Target date:** The target date for an assessment is the discharge date (Item 40).

**Target period:** The span of time that defines the measure reporting period (e.g., a calendar year for the quality measure IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients [NQF#2633]).

**Sort order:** The patients’ assessment records included in the target period must be sorted by the following variables in the following order:

- Provider Internal ID
- Patient Internal ID
- Discharge Date (descending): This will result in assessment records appearing in reverse chronological order so that the most recent assessment records appear first.

Section 1.3: Measure-Specific Definitions

- **Incomplete stay:** Incomplete patient stays are defined for the function measures. We refer readers to Chapter 6 to review the measure specifications to determine what is considered an incomplete stay for each measure, as applicable.

- **Complete stay:** Complete patient stays are identified as patient stays that are not incomplete for the function measures. All patients not meeting the criteria for incomplete stays will be considered complete stays.

*Table 1-1* below provides a list of the assessment-based measures included in the IRF QRP and the corresponding reference name for each measure.

\[a\] This measure is NQF-endorsed for use in the IRF setting (http://www.qualityforum.org/QPS/0678) and an application of this quality measure is finalized for reporting by IRFs under the IRF QRP (Federal Register 78 (6 August 2013): 47903-47919). Web. [http://www.gpo.gov/fdsys/pkg/FR-2013-08-06/pdf/2013-18770.pdf](http://www.gpo.gov/fdsys/pkg/FR-2013-08-06/pdf/2013-18770.pdf) and Federal Register 79 (6 August 2014): 45908-45918. Web. [http://www.gpo.gov/fdsys/pkg/FR-2014-08-06/pdf/2014-18447.pdf](http://www.gpo.gov/fdsys/pkg/FR-2014-08-06/pdf/2014-18447.pdf). The use of the words “resident” and “short stay” in the title of this measure refers to the use of this measure in the SNF/NH setting. CMS’s use of these words does not imply that the IRF patient is a “resident” or that a stay in an IRF is a “short stay.”

\[b\] This measure is NQF-endorsed for long-stay residents in nursing homes (http://www.qualityforum.org/QPS/0674) and an application of this quality measure is finalized for reporting by IRFs under the IRF QRP (Federal Register 80 (6 August 2015): 47096-47100). Web. [https://www.gpo.gov/fdsys/pkg/FR-2015-08-06/pdf/2015-18973.pdf](https://www.gpo.gov/fdsys/pkg/FR-2015-08-06/pdf/2015-18973.pdf)

\[c\] This measure is NQF-endorsed for use in the LTCH setting (http://www.qualityforum.org/QPS/2631) and an application of this quality measure is finalized for reporting by IRFs under the IRF QRP (Federal Register 80 (6 August 2015): 47100-47111). Web. [https://www.gpo.gov/fdsys/pkg/FR-2015-08-06/pdf/2015-18973.pdf](https://www.gpo.gov/fdsys/pkg/FR-2015-08-06/pdf/2015-18973.pdf)
Chapter 2
National Healthcare Safety Network Measures

An overview of the NHSN measures and annual reports containing quality measure information can be accessed on the [CDC NHSN website](http://www.cdc.gov/nhsn/index.html). Additionally, quality measure information and quality reporting program details can be found in the [FY 2017 IRF PPS final rule](https://www.gpo.gov/fdsys/pkg/FR-2016-08-05/pdf/2016-18196.pdf). Below are the CDC NHSN quality measures included in the IRF QRP as of October 1, 2019 and hyperlinks that provide detailed information about each measure on the CDC website, including measure descriptions and definitions, data collection methods, specifications (e.g. numerator, denominator, Standardized Infection Ratio (SIR) calculations), and reporting requirements:

**National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138) (CMS ID: I006.01)**
- This measure calculates the total number of healthcare-associated CAUTI among patients in bedded inpatient care locations, from the total number of indwelling urinary catheter days for each location under surveillance for CAUTI during the associated data period. This measure is risk-adjusted.
- [CDC NHSN: CAUTI](#)

**National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717) (CMS ID: I015.01)**
- This measure calculates the total number of observed hospital-onset CDI LabID events among all inpatients in the facility, excluding well baby-nurseries and NICUs, from the total number of expected hospital-onset CDI LabID events, determined through the facility’s number of inpatient days, bed size, affiliation with a medical school, microbiological test used to identify C. difficile, and community onset CDI admission prevalence rate.
- [CDC NHSN: CDI](#)

**Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) (CMS ID: I016.01)**
- This measure identifies the percentage of healthcare personnel who receive the influenza vaccination among the total number of healthcare personnel in the facility for at least one working day between October 1 and March 31 of the following year, regardless of clinical responsibility or patient contact.
- [CDC NHSN: Healthcare Personnel Vaccination Coverage](#)

4 The FY 2017 IRF PPS final rule can be found at the following link: [https://www.gpo.gov/fdsys/pkg/FR-2016-08-05/pdf/2016-18196.pdf](https://www.gpo.gov/fdsys/pkg/FR-2016-08-05/pdf/2016-18196.pdf)
[This page intentionally left blank.]
CMS utilizes a range of data sources to calculate measures. The measures listed below were
developed using Medicare claims data submitted for Medicare Fee-For-Service patients. Each
measure is calculated using unique specifications and methodologies specific to the measure.
Information regarding measure specifications and reporting details is publicly available and can
be accessed on the IRF Quality Reporting Measures Information website. Below are the
Medicare claims-based measures included in the IRF QRP as of October 1, 2019 and hyperlinks
that provide information about each measure, including measure descriptions and definitions,
specifications (e.g., numerator, denominator, exclusions, calculations), care setting, and risk-
adjustment:

Potentially Preventable 30-Day Post-Discharge Readmission Measure for Inpatient
Rehabilitation Facility Quality Reporting Program (CMS ID: I017.01)

- This measure estimates the risk-standardized rate of unplanned, potentially preventable
  readmissions for patients (Medicare fee-for-service beneficiaries) who receive services in
  one of the following post-acute care settings: skilled nursing facilities (SNFs), inpatient
  rehabilitation facilities (IRFs), and long-term care hospitals (LTCH).

Potentially Preventable Within Stay Readmission Measure for Inpatient Rehabilitation
Facilities (CMS ID: I018.01)

- This measure assesses potentially preventable readmissions during the IRF stay. The
  definition for this measure was developed concurrently with the post-discharge
  readmission measures and measures the risk-standardized rate of unplanned, potentially
  preventable readmissions for patients (Medicare fee-for-service beneficiaries) who
  receive services in one of the following post-acute care settings: skilled nursing facilities
  (SNFs), inpatient rehabilitation facilities (IRFs), and long-term care hospitals (LTCH).

Discharge to Community-Post Acute Care (PAC) Inpatient Rehabilitation Facility (IRF)
Quality Reporting Program (QRP) (NQF #3479) (CMS ID: I019.01)

- This measure reports an IRF’s risk-standardized rate of Medicare fee-for-service patients
  who are discharged to the community following an IRF stay, and do not have an
  unplanned readmission to an acute care hospital or LTCH in the 31 days following
  discharge to community, and who remain alive during the 31 days following discharge to
  community. Community, for this measure, is defined as home or self-care, with or
  without home health services.

---

5 The IRF Quality Reporting Measures Information website can be found at the following link:
https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/IRF-Quality-Reporting/IRF-Quality-
Reporting-Program-Measures-Information-.html
Medicare Spending Per Beneficiary-Post Acute Care (PAC) Inpatient Rehabilitation Facility (IRF) Quality Reporting Program (QRP) (CMS ID: I020.01)

- This measure evaluates IRF providers’ efficiency relative to the efficiency of the national median IRF provider. Specifically, the measure assesses the cost to Medicare for services performed by the IRF provider during an MSPB-PAC IRF episode. The measure is calculated as the ratio of the price-standardized, risk-adjusted MSPB-PAC amount for each IRF divided by the episode-weighted median MSPB-PAC amount across all IRF providers.

- [Medicare Claims-Based: Medicare Spending Per Beneficiary](#)
Chapter 4
Record Selection for Assessment-Based Quality Measures (IRF-PAI)

Section 4.1: Quality Measures Based on the Calendar Year

This section presents the record selection criteria for the assessment-based (IRF-PAI) quality measures that require stay-level record data to be included in the measure calculation and whose target period is 12 months (four quarters).

Quality measures included in this section:

- Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)
- Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01)
- Application of Percent of Residents Experiencing One or More Falls with Major Injury (NQF #0674) (CMS ID: I013.01)
- Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631) (CMS ID: I008.02)
- IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)
- IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients (NQF #2634) (CMS ID: I010.03)
- IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03)
- IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)
- Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

The eligible stay-level records for these quality measures are selected as follows:

1. Select all IRF-PAI stays with a target date (discharge date (Item 40)) within the data target period.
2. For each IRF-PAI record (i.e., IRF stay), do the following:
   a. Sort the records according to the sort order defined in Chapter 1, Section 1.2.
   b. Select all stay-level records that meet the patient stay-level record definition in Chapter 1, Section 1.2 and whose discharge date is within the target period. These are target period patient stay-level records. If a patient has multiple stay-level
records with a discharge date within the target period, then include each eligible patient stay in the measure.

3. Apply the respective quality measure calculations from **Chapter 6** to the eligible target period patient stay-level records. Additionally, **Chapter 7** provides the instructions in table format, which are listed below:

   a. Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02), **Table 7-1**
   
   b. Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01), **Table 7-2**
   
   c. Application of Percent of Residents Experiencing One or More Falls with Major Injury (NQF #0674) (CMS ID: I013.01), **Table 7-3**
   
   d. Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631) (CMS ID: I008.02), **Table 7-4**
   
   e. IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03), **Table 7-5**
   
   f. IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients (NQF #2634) (CMS ID: I010.03), **Table 7-6**
   
   g. IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03), **Table 7-7**
   
   h. IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03), **Table 7-8**
   
   i. Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01), **Table 7-9**

Chapter 5
Internet Quality Improvement and Evaluation System (iQIES) Data Selection for Assessment-Based Quality Measures (IRF-PAI)

The purpose of this chapter is to present the data selection criteria for the iQIES Review and Correct Reports and the iQIES Quality Measure (QM) Reports for quality measures that are included in the IRF QRP and are specific to those quality measures calculated using the IRF-PAI data. Information about the iQIES reports can be found on the CMS website at the following link: iQIES Reports

- The iQIES Review and Correct Reports contain facility-level and patient-level measure information and are updated on a quarterly basis with data refreshed weekly as data become available.
  - These reports allow providers to obtain facility-level performance data and its associated patient-level data for the past 12 months (four full quarters) and are restricted to only the assessment-based measures. The intent of this report is for providers to have access to reports prior to the quarterly data submission deadline to ensure accuracy of their data. This also allows providers to track cumulative quarterly data that includes data from quarters after the submission deadline (“frozen” data).

- The iQIES QM Reports are refreshed monthly and separated into two reports: one containing measure information at the facility-level and another at the patient-level, for a single reporting period. The intent of these reports is to enable tracking of quality measure data regardless of quarterly submission deadline (“freeze”) dates.
  - The assessment-based (IRF-PAI) measures are refreshed monthly, at the facility- and patient-level, as data becomes available. The performance data contains the current quarter (may be partial) and the past three quarters.
  - The claims-based measures are updated annually at the facility-level only.
  - The CDC NHSN measures are provided at the facility-level only.

The iQIES Review and Correct Reports and the iQIES QM Reports can help identify data errors that affect performance scores. They also allow the providers to utilize the data for quality improvement purposes.

Section 5.1 contains the data selection for the assessment-based (IRF-PAI) quality measures for the iQIES Review and Correct Reports. Since the criteria and reporting periods for the iQIES QM Reports are consistent across the facility- and patient-level reports, Section 5.2 of this chapter presents data selection information that can be applied to both the iQIES Patient-level QM Reports and the iQIES Facility-level QM Reports.

Section 5.3 of this chapter addresses the transition from IRF-PAI v2.0 to IRF-PAI v3.0. Data collection for IRF-PAI v3.0 begins on October 1, 2019 and will impact certain quality measure specifications.
Section 5.1: iQIES Review and Correct Reports

Below are the specifications for the iQIES Review and Correct Reports for the quality measures presented in Chapter 4, Section 4.1:

1. Quarterly reports contain quarterly rates and a cumulative rate.
   a. The quarterly rates will be displayed using up to one quarter of data.
   b. The cumulative rates will be displayed using all data within one target period.
      i. For all measures, excluding the Change in Self-Care and Change in Mobility measures: the target population is derived by including all stay-level records in the denominator for the target period, which do not meet the exclusion criteria.
      ii. For the Change in Self-Care and Change in Mobility measures: the target population is derived by including all stay-level records for the target period, which do not meet the exclusion criteria, and calculating the change scores for each stay-level record. For instructions on calculating the change scores, please see Chapter 6, Section 6.5 for the Change in Self-Care measure and Chapter 6, Section 6.6 for the Change in Mobility measure.
   c. The data will be “frozen” 4.5 months (15th day of the 5th month) after the end of each calendar quarter (data submission deadline).
      i. e.g., Data will be frozen on August 15th for Quarter 1 (January 1 through March 31) data collection.
   d. The measure calculations for the quarterly rates and the cumulative rates are refreshed weekly.

2. Complete data (full target period) are available for previously existing quality measures. Only partial data will be available for new measures until a target period of data has accumulated. Once a target period of data have accumulated, as each quarter advances, the subsequent quarter will be added and the earliest quarter will be removed.

3. Patient-level data will be displayed for each reporting quarter in the report.

4. The illustration of reporting timeline for the iQIES Review and Correct Reports for the following quality measures is provided in Table 5-3 for the quarterly rates and Table 5-4 for the cumulative rates:
   a. Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)
   b. Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01)
      i. Please refer to Chapter 6, Section 6.1.A on the effective date for data collection and implementation date for the iQIES reports.
   c. Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (CMS ID: I013.01)
   d. Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631) (CMS ID: I008.02)
e. IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)

f. IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients (NQF #2634) (CMS ID: I010.03)

g. IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03)

h. IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)

i. Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

5. **Data calculation rule**: The calculations include stay-level records with discharge dates through the end of the quarter.

*Table 5-1* defines the discharge dates included for each calendar year quarter. *Table 5-2* displays whether the quality measure was considered new or existing for iQIES reporting in the user-requested year. For new measures, data are accumulated until 4 quarters have been collected and then rolling quarters occur for subsequent years. For existing measures, data are displayed based on rolling quarters.

Section 5.2: iQIES Quality Measure (QM) Reports

Below are the specifications for the iQIES QM Reports for measures presented in Chapter 4, Section 4.1:

1. Measures are calculated consistent with the methods in the previous section, Chapter 5, Section 5.1, “iQIES Review and Correct Reports”.
   a. Only the cumulative rates will be displayed using all data in the target period.

2. The illustration of reporting timeline for the monthly iQIES QM Reports is provided in Table 5-5 for the following measures:
   a. Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)
   b. Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01)6
   c. Application of Percent of Residents Experiencing One or More Falls with Major Injury (NQF #0674) (CMS ID: I013.01)
   d. Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631) (CMS ID: I008.02)
   e. IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)
   f. IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients (NQF #2634) (CMS ID: I010.03)
   g. IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03)
   h. IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)
   i. Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

3. Data calculation rule: The calculations include stay-level records with discharge dates through the end of the month.

Section 5.3: Measure Calculations During the Transition from IRF-PAI v2.0 to IRF-PAI v3.0

For IRFs, IRF-PAI data are submitted on one assessment record (covering both admission and discharge) and new measure specifications are to be applied based on the discharge date.

The new measure specifications begin for records of patients discharged on or after October 1, 2019 with the implementation of the IRF-PAI v3.1 on October 1, 2019.
[This page intentionally left blank.]
Chapter 6
Measure Calculations for Assessment-Based
Quality Measures (IRF-PAI)

The purpose of this chapter is to present the measure calculation criteria for the assessment-based quality measures that are included in the IRF QRP. Note that IRF-PAI data are submitted for Medicare Part A and Medicare Advantage patients only. In this chapter, each section is specific to an assessment-based quality measure. Within each section the iQIES Review and Correct Report measure calculations are presented first, followed by the iQIES QM Report measure calculations. If the measure is risk-adjusted for the QM Reports, then additional details regarding the risk-adjusted calculations are provided; otherwise, the Review and Correct Report calculations can be used to calculate the QM Report measure calculation. Prior to the measure specifications steps in Chapter 6, please refer to Chapter 1, Section 1.2 on instructions to define the patient stay for the QM sample and Chapter 4 for the record selection criteria.

Section 6.1: Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)

iQIES Review and Correct Report Measure Calculations for Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)

For the Review and Correct Reports, only the facility-level observed score is computed; the facility’s risk-adjusted score is not reported. Using the definitions from Table 7-1, the following steps are used to calculate the quality measure.

1. Identify excluded patient stay-level records (steps 1.1 through 1.2).

1.1 Patient stay-level record is excluded if the patient died during the IRF stay; i.e., Item 44C = [0].

1.2 Patient stay-level record is excluded if data on new or worsened Stage 2, 3, and 4 pressure ulcer(s) are missing at discharge:

1.2.1 Using IRF-PAI Version 1.3:7 Patient stay is excluded if M0300B4 = [-] and M0300C4 = [-] and M0300D4 = [-].

1.2.2 Using IRF-PAI Version 1.4 or IRF-PAI Version 1.5:7 Patient stay is excluded if M0800A = [-] and M0800B = [-] and M0800C = [-].

---

Note that IRF-PAI Version 1.3 was effective beginning for patients discharged on and after October 1, 2015, IRF-PAI Version 1.4 was effective beginning for patients discharged on and after October 1, 2016, and IRF-PAI Version 1.5 was effective beginning for patients discharged on or after October 1, 2017. Some of the items used in calculation of this measure are removed from the IRF-PAI, starting with IRF-PAI version 2.0 (effective October 1, 2018). This measure will be included in the Review and Correct reports until measure is removed per FY2018 IRF PPS Final Rule.
2. **Determine the denominator count.** Determine the total number of patient stay-level records with an IRF-PAI record in the measure target period, which do not meet the exclusion criteria.

3. **Determine the numerator count.** Determine the total number of patient stay-level records with an IRF-PAI indicating the presence of one or more new or worsened pressure ulcers (Stage 2 through Stage 4) at discharge compared to admission:

For IRF-PAI Version 1.3, items used to determine presence of new or worsened Stage 2–4 pressure ulcer(s) at discharge:

- Stage 2 (M0300B4) > 0, or
- Stage 3 (M0300C4) > 0, or
- Stage 4 (M0300D4) > 0

For IRF-PAI Version 1.4 and Version 1.5, items used to determine presence of new or worsened Stage 2–4 pressure ulcer(s) at discharge:

- Stage 2 (M0800A) > 0, or
- Stage 3 (M0800B) > 0, or
- Stage 4 (M0800C) > 0

4. **Calculate the facility-level observed score.** Divide the facility’s numerator count by its denominator count to obtain the facility-level observed score; that is, divide the result of step 3 by the result of step 2.

5. **Calculate the rounded percent value.**

   5.1 Multiply the facility-level observed score by 100 to obtain a percent value.

   5.2 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

   5.3 Drop all the digits following the first decimal place.

---

**iQIES QM Report Measure Calculations for Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)**

This measure is risk-adjusted for the iQIES QM Reports and an observed (i.e., not risk-adjusted) and a risk-adjusted value are reported. Using the definitions in *Table 7-1*, the following steps are used to calculate the measure.

1. **Calculate the facility-level observed score** (steps 1.1 through 1.2).

   1.1 To calculate the facility-level observed score, complete steps 1 – 4 from *Chapter 6, Section 6.1*, “iQIES Review and Correct Report Measure Calculations for NQF #0678.”

   1.2 Do not multiply by 100 or round to the nearest first decimal place. All rounding will be done at the end of the measure calculation.
2. **Calculate the national average observed score** (steps 2.1 through 2.3).

2.1 After excluding stay-level records based on the criteria listed in Table 7-1, these patient stays become the denominator for the national average observed score.

2.2 Identify stay-level records in the denominator of the national average observed score with pressure ulcers that are new or worsened based on the criteria in Table 7-1. These records comprise the numerator of the national average observed score.

2.3 Divide the numerator (2.2) by the denominator (2.1) to calculate the national average observed score.

*Note: Because there is limited public accessibility to national assessment data, this document provides a national average observed score based on the reporting period of the regression intercept and coefficients. The national average observed score can be seen in the Risk Adjustment Appendix File. Please note that, depending on the reporting period and time of calculation, the national average observed score used in the iQIES QM Report, Provider Preview Report, and on public display on the Compare Website may vary from the national average observed score provided by these documents.*

3. **Calculate the facility-level expected score for each patient** (steps 3.1 through 3.3).

3.1 Determine presence or absence of the pressure ulcer covariates for each patient.

3.2 Using the covariate definitions in Table 7-1, assign covariate values (COV), either ‘0’ for covariate condition not present or ‘1’ for covariate condition present, for each patient for each of the four covariates as reported on the admission assessment.

3.3 Calculate the expected score for each patient using the following formula:

\[
\text{[1]} \quad \text{Patient-level expected score} = \frac{1}{\left[1 + e^{-x}\right]} 
\]

Where:

- \(e\) is the base of natural logarithms
- \(X\) is a linear combination of the constant and the logistic regression coefficients times the covariate scores (from Formula [2], below):

\[
\text{[2]} \quad X = \beta_0 + \beta_1(COV_1) + \beta_2(COV_2) + \beta_3(COV_3) + \beta_4(COV_4) 
\]

Where:

- \(X\) identifies if patient is part of the numerator count (i.e., triggering the quality measure: 1 = yes, 0 = no).
- \(\beta_0\) is the logistic regression constant or intercept.
- \(\beta_1\) is the logistic regression coefficient for the first covariate “functional limitation” and \(COV_1\) is the patient-level covariate value.

---

8 The national average observed score is calculated using the patient stay as the unit of analysis.
• $\beta_2$ is the logistic regression coefficient for the second covariate “bowel incontinence” and $COV_2$ is the patient-level covariate value.

• $\beta_3$ is the logistic regression coefficient for the third covariate “diabetes or peripheral vascular disease/peripheral artery disease (PVD/PAD)” and $COV_3$ is the patient-level covariate value.

• $\beta_4$ is the logistic regression coefficient for the fourth covariate “low body mass index (BMI)” and $COV_4$ is the patient-level covariate value.

See Appendix A, Table A-2, and the associated Risk Adjustment Appendix File for the regression constant and coefficients.\(^9\) The regression constant and coefficients are values obtained through statistical logistic regression analysis. Please note that the iQIES QM and Provider Preview Reports use fixed regression constants and coefficients based on the target period stated in Table A-2 and the Risk Adjustment Appendix File.

4. **Calculate the mean facility-level expected score** (step 4.1).

4.1 Once patient-level expected scores have been calculated, calculate the mean facility-level expected score as the mean of the facility’s patient-level expected scores.

5. **Calculate the facility-level risk-adjusted score** (step 5.1 through 5.3).

5.1 Calculate the facility-level risk-adjusted score based on the:

• Facility-level observed quality measure score (steps 1.1 through 1.2)

• Mean facility-level expected quality measure score (step 4.1)

• National average observed quality measure score (step 2.1 through 2.3)

• The calculation of the risk-adjusted score uses the following equation:

$$Adj = \frac{1}{1 + e^{-y}}$$

Where:

• $e$ is the base of natural logarithms

• $Adj$ is the facility-level risk-adjusted quality measure score

• $y$ is the product of the following formula:

$$y = \ln\left(\frac{Obs}{1 - Obs}\right) - \ln\left(\frac{Exp}{1 - Exp}\right) + \ln\left(\frac{Nat}{1 - Nat}\right)$$

Where:

• $Obs$ is the facility-level observed quality measure score

• $Exp$ is the mean facility-level expected quality measure score

---

\(^9\) The regression constant (intercept) and coefficient values have been rounded to four decimal places. When applying these values to the equation to calculate facility-level QM scores, these intercept and coefficient values should be used; do not round to fewer than four decimal places. This is to ensure consistency and accuracy of measure calculations.
• \( Nat \) is the national average observed quality measure score
• \( Ln \) indicates a natural logarithm

5.2 Multiply the risk-adjusted score (Adj) by 100 and round the percent value to one decimal place.

5.2.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

5.2.2 Drop all digits following the first decimal place.

5.3 Facility-level recoding instructions.

5.3.1 If the facility-level observed score (step 1) equals 0, then the facility-level observed percent and the facility-level risk-adjusted percent values are set to 0.0.

5.3.2 If the facility-level observed score (step 1) equals 1, then the facility-level observed percent and the facility-level risk-adjusted percent values are set to 100.0.

**National Average Calculation for Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02)**

To calculate the patient stay-level (i.e., prevalence) national average, refer to step 2 under the iQIES QM Report Measure Calculations for this measure.
Section 6.1.A: Transition of the Pressure Ulcer Quality Measures

Data collection for the measure Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02) stopped on September 30, 2018 and data collection for the replacement measure, Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01), began on October 1, 2018. The measure Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02) will continue to be publicly reported on the Compare website until new quarterly data are no longer available to report. The replacement measure, Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01), will be publicly reported on the Compare website by October 2020. The two measures will not be publicly reported on the Compare website at the same time. See Table 6-1 for additional information regarding the data collection and iQIES report display schedule:

Table 6-1
Data Collection and iQIES Report Display Schedule for the Pressure Ulcer Measures

<table>

</tbody>
</table>

There are seven major differences in the two pressure ulcer measures and associated items. Due to differences between the measures, coefficient values and national mean values differ between the measures. These values will be reported in Appendix A and the associated Risk Adjustment Appendix File.

1. The measures use different items. Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02) is calculated using discharge M0800 items, while the Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) is calculated using discharge M0300 items. As of October 1, 2018, the M0800 items are no longer collected as part of the IRF-PAI.

2. The new measure is calculated using a subtraction method to determine inclusion in the numerator. Inclusion in the numerator of Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) is determined by subtracting discharge item

---

10 The FY 2018 IRF PPS final rule can be found at the following link: [https://www.gpo.gov/fdsys/pkg/FR-2017-08-03/pdf/2017-16291.pdf](https://www.gpo.gov/fdsys/pkg/FR-2017-08-03/pdf/2017-16291.pdf)
pairs for each type of pressure ulcer (e.g., Stage 2 \([\text{M0300B1} - \text{M0300B2}] > 0\), Stage 3 \([\text{M0300C1} - \text{M0300C2}] > 0\)).

3. The new measure includes unstageable pressure ulcers in the measure numerator. The numerator for Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) includes discharge items to include new or worsened unstageable pressure ulcers (i.e., Unstageable – Non-removable dressing/device (M0300E1 and M0300E2); Unstageable – Slough and/or eschar (M0300F1 and M0300F2) and Unstageable – Deep tissue injury (M0300G1 and M0300G2).

4. One of the exclusion criteria for the new measure is different, to reflect changes in the data needed to calculate the measure. For the Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02) measure, patient stay-level record was excluded if data on new or worsened Stage 2, 3, and 4 were missing at discharge, based on discharge M0800 items. For the Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) measure, this is expanded to add unstageable pressure ulcers, including deep tissue injuries, missing at discharge, and is based on discharge M0300 items.

5. Measure item names have changed. The items to be collected starting October 1, 2018 reflect current pressure ulcer terminology. The term “injuries” has been added to items: M0300, M0300A, M0300E–M0300E2, and M0300G–M0300G2 and the term “suspected deep tissue injury in evolution” has been replaced with “deep tissue injury” in items M0300G and M0300G1.

6. The item used to indicate the functional limitation covariate has changed. FIM® item 39I (Transfers: Bed, Chair, Wheelchair) was used to determine the functional limitation covariate for each patient stay in the Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02) measure. For the Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) measure, GG0170C (Lying to Sitting on Side of Bed) at admission is used to determine the functional limitation covariate for each patient stay.

7. The item used to indicate the bowel incontinence covariate has changed. Item 32 (Bowel Frequency of Accidents) was used to determine the bowel incontinence covariate for each patient stay in the Percent of Residents or Patients With Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) (CMS ID: I001.02) measure. For the Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) measure, H0400 (Bowel Continence) is used to determine the bowel incontinence covariate for each patient stay.
Section 6.2: Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01) Please refer to Chapter 6, Section 6.1.A on the effective date for data collection and implementation date for the iQIES reports.

iQIES Review and Correct Report Measure Calculations for Changes in Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01)

For the Review and Correct Reports, only the facility-level observed score is computed; the facility’s risk-adjusted score is not reported. Using the definitions from Table 7-2, the following steps are used to calculate the quality measure.

1. **Identify excluded patient stay-level records** (steps 1.1 through 1.2).
   1.1 Patient stay-level record is excluded if data on new or worsened Stage 2, 3, 4, and unstageable pressure ulcers, including deep tissue injuries, are missing at discharge i.e., (M0300B1 = [−] or M0300B2 = [−]) and (M0300C1 = [−] or M0300C2 = [−]) and (M0300D1 = [−] or M0300D2 = [−]) and (M0300E1 = [−] or M0300E2 = [−]) and (M0300F1 = [−] or M0300F2 = [−]) and (M0300G1 = [−] or M0300G2 = [−]).
   1.2 Patient stay-level record is excluded if the patient died during the IRF stay; i.e., Item 44C = [0].

2. **Determine the denominator count**. Determine the total number of Medicare Part A and Medicare Advantage patient stay-level records with a discharge date in the measure target period, which do not meet the exclusion criteria.

3. **Determine the numerator count**. Determine the total number Medicare (Part A and Medicare Advantage) patient stay-level records for which the IRF-PAI indicates one or Stage 2-4 pressure ulcer(s), or unstageable pressure ulcers due to slough/eschar, non-removable dressing/device, or deep tissue injury, that are new or worsened at discharge compared to admission:
   - Stage 2 (M0300B1) − (M0300B2) > 0, OR
   - Stage 3 (M0300C1) − (M0300C2) > 0, OR
   - Stage 4 (M0300D1) − (M0300D2) > 0, OR
   - Unstageable – Non-removable dressing/device (M0300E1) − (M0300E2) > 0, OR
   - Unstageable – Slough and/or eschar (M0300F1) − (M0300F2) > 0, OR
   - Unstageable – Deep tissue injury (M0300G1) − (M0300G2) > 0

4. **Calculate the facility-level observed score**. Divide the facility’s numerator count by its denominator count to obtain the facility-level observed score; that is, divide the result of step 3 by the result of step 2.

5. **Calculate the rounded percent value**.
   5.1 Multiply the facility-level observed score by 100 to obtain a percent value.
   5.2 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
5.3 Drop all the digits following the first decimal place.

**iQIES QM Report Measure Calculations for Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01)**

This measure is risk-adjusted for the iQIES QM Reports and an observed and a risk-adjusted value are reported. Using the definitions in *Table 7-2*, the following steps are used to calculate the measure.

1. **Calculate the facility-level observed score** (steps 1.1 through 1.2).
   
   1.1 To calculate the facility-level observed score, complete steps 1 – 4 from *Chapter 6, Section 6.2, “iQIES Review and Correct Report Measure Calculations for Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury.”*
   
   1.2 Do not multiply by 100 or round to the nearest first decimal place. All rounding will be done at the end of the measure calculation.

2. **Calculate the national average observed score**\(^{11}\) (steps 2.1 through 2.3).
   
   2.1 After excluding stay-level records based on the criteria listed in *Table 7-2* these patient stays become the denominator for the national average observed score.
   
   2.2 Identify stay-level records in the denominator of the national average observed score with pressure ulcers that are new or worsened based on the criteria in *Table 7-2*. These records comprise the numerator of the national average observed score.
   
   2.3 Divide the numerator (2.2) by the denominator (2.1) to calculate the national average observed score.

*Note: Because there is limited public accessibility to national assessment data, this document provides a national average observed score based on the reporting period of the regression intercept and coefficients. The national average observed score can be seen in the Risk Adjustment Appendix File. Please note that, depending on the reporting period and time of calculation, the national average observed score used in the iQIES QM Report, Provider Preview Report, and on public display on the Compare Website may vary from the national average observed score provided by these documents.*

3. **Calculate the facility-level expected score for each patient** (steps 3.1 through 3.3).
   
   3.1 Determine presence or absence of the pressure ulcer covariates for each patient.
   
   3.2 Using the covariate definitions in *Table 7-2*, assign covariate values (COV), either ‘0’ for covariate condition not present or ‘1’ for covariate condition present, for each patient for each of the four covariates as reported on the admission assessment.
   
   3.3 Calculate the expected score for each patient using the following formula:

   \[ [1] \text{ Patient-level expected score } = \frac{1}{[1 + e^{-x}]} \]

---

\(^{11}\) The national average observed score is calculated using the patient stay as the unit of analysis.
Where:

- \( e \) is the base of natural logarithms
- \( X \) is a linear combination of the constant and the logistic regression coefficients times the covariate scores (from Formula [2], below):

\[
[2] \quad X = \beta_0 + \beta_1(COV_1) + \beta_2(COV_2) + \beta_3(COV_3) + \beta_4(COV_4)
\]

Where:

- \( X \) identifies if patient is part of the numerator count (i.e., triggering the quality measure: 1 = yes, 0 = no).
- \( \beta_0 \) is the logistic regression constant or intercept.
- \( \beta_1 \) is the logistic regression coefficient for the first covariate “functional limitation” and \( COV_1 \) is the patient-level covariate value.
- \( \beta_2 \) is the logistic regression coefficient for the second covariate “bowel incontinence” and \( COV_2 \) is the patient-level covariate value.
- \( \beta_3 \) is the logistic regression coefficient for the third covariate “diabetes or peripheral vascular disease/peripheral artery disease (PVD/PAD)” and \( COV_3 \) is the patient-level covariate value.
- \( \beta_4 \) is the logistic regression coefficient for the fourth covariate “low body mass index (BMI)” and \( COV_4 \) is the patient-level covariate value.

See Appendix A, Table A-3, and the associated Risk Adjustment Appendix File for the regression constant and coefficients. The regression constant and coefficients are values obtained through statistical logistic regression analysis. Please note that the iQIES QM and Provider Preview Reports uses fixed regression constant and coefficients based on the target period stated in Table A-3 and the Risk Adjustment Appendix File.

4. **Calculate the mean facility-level expected score** (step 4.1).

4.1 Once patient-level expected scores have been calculated, calculate the mean facility-level expected score as the mean of the facility’s patient-level expected scores.

5. **Calculate the facility-level risk-adjusted score** (steps 5.1 through 5.3).

5.1 Calculate the facility-level risk-adjusted score based on the:

- Facility-level observed quality measure score (steps 1.1 through 1.2)
- Mean facility-level expected quality measure score (step 4.1)
- National average observed quality measure score (steps 2.1 through 2.3)
- The calculation of the risk-adjusted score uses the following equation:

---

12 The regression constant (intercept) and coefficient values have been rounded to four decimal places. When applying these values to the equation to calculate facility-level QM scores, these intercept and coefficient values should be used; do not round to fewer than four decimal places. This is to ensure consistency and accuracy of measure calculations.
Where:

- \( e \) is the base of natural logarithms
- \( \text{Adj} \) is the facility-level risk-adjusted quality measure score
- \( y \) is the product of the following formula:

\[
[4] \quad y = \ln \left( \frac{\text{Obs}}{1 - \text{Obs}} \right) - \ln \left( \frac{\text{Exp}}{1 - \text{Exp}} \right) + \ln \left( \frac{\text{Nat}}{1 - \text{Nat}} \right)
\]

Where:

- \( \text{Obs} \) is the facility-level observed quality measure score
- \( \text{Exp} \) is the mean facility-level expected quality measure score
- \( \text{Nat} \) is the national average observed quality measure score
- \( \text{Ln} \) indicates a natural logarithm

5.2 Multiply the risk-adjusted score (\( \text{Adj} \)) by 100 and round the percent value to one decimal place.

5.2.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

5.2.2 Drop the digits following the first decimal place.

5.3 Facility-level recoding instructions.

5.3.1 If the facility-level observed score (step 1) equals 0, then the facility-level observed percent and the facility-level risk-adjusted percent values are set to 0.0.

5.3.2 If the facility-level observed score (step 1) equals 1, then the facility-level observed percent and the facility-level risk-adjusted percent values are set to 100.0.

**National Average Calculation for Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: I022.01)**

To calculate the patient stay-level (i.e. prevalence) national average, refer to Step 2 under the iQIES QM Report Measure Calculations for this measure.
Section 6.3: Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (CMS ID: I013.01)

iQIES Review and Correct Report Measure Calculations for Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (CMS ID: I013.01)

Since this measure is not risk-adjusted or stratified, only the facility-level observed score is computed and the following steps can be applied to both the iQIES Review and Correct Report measure calculation and the iQIES QM report measure calculation. Using the measure specifications from Table 7-3, the following steps are used to calculate the measure.

1. Identify excluded stay-level records.
   1.1 Stay-level record is excluded if the number of falls with major injury was not coded; i.e., J1900C = [-] for the discharge IRF-PAI.

2. Determine the denominator count. Determine the total number of patient stay-level IRF-PAI records with the discharge date in the measure target period that do not meet the exclusion criteria.

3. Determine the numerator count. Determine the total number of patient stay-level records with a discharge date during the selected time window that recorded one or more falls that resulted in major injury (J1900C = [1] or [2]).

4. Calculate the facility-level observed score. Divide the facility’s numerator count by its denominator count to obtain the facility-level observed score; that is, divide the result of step 3 by the result of step 2 and then multiply by 100 to obtain a percent value.

5. Round the percent value to one decimal place.
   5.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   5.2 Drop all of the digits following the first decimal place.

iQIES QM Report Measure Calculations for Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (CMS ID: I013.01)

As previously stated, this measure is not risk-adjusted or stratified. The steps to calculate the iQIES Review and Correct Report can be applied to calculate the iQIES QM Report. Follow the steps provided above for the iQIES QM report measure calculations for the Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (CMS ID: I013.01).

National Average Calculation for Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (CMS ID: I013.01)

Use the following steps to calculate the patient stay-level (i.e., prevalence) national average:

1. Determine the total number of patient stays in the nation after the exclusion criteria, if applicable. This is the denominator for the national average.
2. Identify patient stays in the denominator of the national average that are included in the numerator for this measure. This is the numerator for the national average.

3. Divide the numerator (Step 2) by the denominator (Step 1) then multiply by 100 and round the percent value to one decimal place to obtain the national average.
   a. If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   b. Drop all of the digits following the first decimal place.
Section 6.4: Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan that Addresses Function (NQF #2631) (CMS ID: I008.02)

iQIES Review and Correct Report Measure Calculations for Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan that Addresses Function (NQF #2631) (CMS ID: I008.02)

Since this measure is not risk-adjusted or stratified, only the facility-level observed score is computed and the following steps can be applied to both the iQIES Review and Correct Report and the iQIES QM Report measure calculation. Using the definitions from Table 7-4, the following steps are used to calculate the measure.

1. Identify patient stay records as being complete or incomplete stay records (Steps 1.1 and 1.2).
   1.1 Patients with incomplete stay records are identified based on:
      1.1.1 Discharge to Acute Care: Discharge Destination (Item 44D)
         - 02 = Short-term General Hospital
         - 63 = Long-term Care Hospital (LTCH)
         - 65 = Inpatient Psychiatric Facility
         - 66 = Critical Access Hospital
         OR
      1.1.2 Discharged Against Medical Advice: Patient discharged against medical advice (Item 41 = [1])
         OR
      1.1.3 Died while in IRF: Was the patient discharged alive? (Item 44C = [0])
         OR
      1.1.4 Length of stay less than 3 days: ([Item 40. Discharge Date] minus [Item 12. Admission Date]) < 3 days.

   1.2 Patient stays not meeting the criteria for incomplete stay records will be considered complete stay records.

2. Both types of stay-level records are included in the denominator, but the specifications vary by complete and incomplete stays for the numerator.
   2.1 Complete stays. For patients with complete stays, each functional assessment item listed below must have a valid numeric score indicating the patient’s status [01 – 06], or a valid code indicating the activity was not attempted (e.g., GG0130A1 = [07, 09, 10, 88]). All three of the following criteria are required for inclusion in the numerator:
      2.1.1 A valid numeric score [01 – 06] indicating the patient’s functional status [01 – 06], a valid code indicating the activity was not attempted (e.g., GG0130A1 = [07, 09, 10, 88]) for each of the functional assessment items or a “^” indicating
items affected by the skip pattern. All admission functional assessment items (refer to 2.3 below) must be completed; and

2.1.2 A valid numeric score [01 – 06] or a valid code indicating the activity was not attempted (e.g. GG0130A2 = [07, 09, 10, 88]) for a discharge goal indicating the patient’s expected level of independence, for at least one self-care or mobility item on the admission assessment (refer to 2.4 below); and

2.1.3 A valid numeric score indicating the patient’s functional status [01 – 06], a valid code indicating the activity was not attempted (e.g., GG0130A3 = [07, 09, 10, 88]), or a “^” indicating a skip pattern for each of the functional assessment items on the discharge assessment. All discharge functional assessment items (refer to 2.5 below) must be completed.

2.2 Incomplete stays. For patients with incomplete stays, collection of discharge functional status data might not be feasible. For the admission assessment, each functional assessment item listed below must have a valid numeric score indicating the patient’s status [01 – 06], or a valid code indicating the activity was not attempted (e.g. GG0130A1 = [07, 09, 10, 88]). The following two criteria are required for inclusion in the numerator:

2.2.1 A valid numeric score indicating the patient’s functional status [01 – 06], a valid code indicating the activity was not attempted (e.g., GG0130A1 = [07, 09, 10, 88]), or a “^” indicating a skip pattern for each of the functional assessment items on the admission assessment. All admission functional assessment items (refer to 2.3 below) must be completed; and

2.2.2 A valid numeric score [01 – 06] or a valid code indicating the activity was not attempted (e.g. GG0130A2 = [07, 09, 10, 88]) for a discharge goal indicating the patient’s expected level of independence, for at least one self-care or mobility item on the admission assessment (refer to 2.4 below).

2.3 Admission Functional Performance items included in this measure are:

The Self-Care (GG0130) items are:
- GG0130A1. Eating
- GG0130B1. Oral hygiene
- GG0130C1. Toileting hygiene

The Mobility (GG0170) items are:
- GG0170B1. Sit to lying
- GG0170C1. Lying to sitting on side of bed
- GG0170D1. Sit to stand
- GG0170E1. Chair/bed-to-chair transfer
- GG0170F1. Toilet transfer
- GG0170I1. Walk 10 feet
For patients who are walking, as indicated by GG0170I1 = 01, 02, 03, 04, 05, or 06, include items:

- GG0170J1. Walk 50 feet with two turns
- GG0170K1. Walk 150 feet

For patients who are not walking as indicated by GG0170I1 = 07, 09, 10, or 88, GG0170J1 and GG0170K1 are skipped.

For patients who use a wheelchair, as indicated by GG0170Q1=1, include items:

- GG0170R1. Wheel 50 feet with two turns
- GG0170RR1. Indicate the type of wheelchair/scooter used
- GG0170S1. Wheel 150 feet
- GG0170SS1. Indicate the type of wheelchair/scooter used

For patients who do not use a wheelchair as indicated by GG0170Q1=0, GG0170R1, GG0170RR1, GG0170S1, and GG0170SS1 are skipped.

The following valid scores/codes for the Self-Care (GG0130) and Mobility (GG0170) admission performance items are accepted for this quality measure:

- 06 – Independent
- 05 – Setup or clean-up assistance
- 04 – Supervision or touching assistance
- 03 – Partial/moderate assistance
- 02 – Substantial/maximal assistance
- 01 – Dependent
- 07 – Patient refused
- 09 – Not applicable
- 10 – Not attempted due to environmental limitations
- 88 – Not attempted due to medical condition or safety concerns
- ^ – Skip pattern

Valid codes for the type of wheelchair/scooter used (GG0170RR1 and GG0170SS1) for this quality measure:

- 1 – Manual
- 2 – Motorized
- ^ – Skip pattern

2.4 Discharge Goal items reported on Admission included in this measure (a minimum of one goal must be reported) are:

The Self-Care (GG0130) items are:
• GG0130A2. Eating
• GG0130B2. Oral hygiene
• GG0130C2. Toileting hygiene
• GG0130E2. Shower/bathe self
• GG0130F2. Upper body dressing
• GG0130G2. Lower body dressing
• GG0130H2. Putting on/taking off footwear

The Mobility (GG0170) items are:
• GG0170A2. Roll left and right
• GG0170B2. Sit to lying
• GG0170C2. Lying to sitting on side of bed
• GG0170D2. Sit to stand
• GG0170E2. Chair/bed-to-chair transfer
• GG0170F2. Toilet transfer
• GG0170G2. Car transfer
• GG0170I2. Walk 10 feet
• GG0170J2. Walk 50 feet with two turns
• GG0170K2. Walk 150 feet
• GG0170L2. Walking 10 feet on uneven surfaces
• GG0170M2. 1 step (curb)
• GG0170N2. 4 steps
• GG0170O2. 12 steps
• GG0170P2. Picking up object
• GG0170R2. Wheel 50 feet with two turns
• GG0170S2. Wheel 150 feet

The following valid scores/codes for the Self-Care (GG0130) and Mobility (GG0170) discharge goal items are accepted for this quality measure:
• 06 – Independent
• 05 – Setup or clean-up assistance
• 04 – Supervision or touching assistance
• 03 – Partial/moderate assistance
• 02 – Substantial/maximal assistance
• 01 – Dependent
• 07 – Patient refused
• 09 – Not applicable
• 10 – Not attempted due to environmental limitations
• 88 – Not attempted due to medical condition or safety concerns

2.5 Discharge Functional Performance items included in this measure are:

The Self-Care (GG0130) items are:
• GG0130A3. Eating
• GG0130B3. Oral hygiene
• GG0130C3. Toileting hygiene

The Mobility (GG0170) items are:
• GG0170B3. Sit to lying
• GG0170C3. Lying to sitting on side of bed
• GG0170D3. Sit to stand
• GG0170E3. Chair/bed-to-chair transfer
• GG0170F3. Toilet transfer
• GG0170I3. Walk 10 feet

For patients who are walking, as indicated by GG0170I3 = 01, 02, 03, 04, 05, or 06, include items:
• GG0170J3. Walk 50 feet with two turns
• GG0170K3. Walk 150 feet

For patients who are not walking, as indicated by GG0170I3 = 07, 09, 10, or 88, GG0170J3 and GG0170K3 are skipped.

For patients who use a wheelchair, as indicated by GG0170Q3=1, include items:
• GG0170R3. Wheel 50 feet with two turns
• GG0170RR3. Indicate the type of wheelchair/scooter used
• GG0170S3. Wheel 150 feet
• GG0170SS3. Indicate the type of wheelchair/scooter used

For patients who do not use a wheelchair as indicated by GG0170Q3=0, GG0170R3, GG0170RR3, GG0170S3, and GG0170SS3 are skipped.

The following valid scores/codes for the Self-Care (GG0130) and Mobility (GG0170) discharge performance items are accepted for this quality measure:
• 06 – Independent
• 05 – Setup or clean-up assistance
• 04 – Supervision or touching assistance
• 03 – Partial/moderate assistance
• 02 – Substantial/maximal assistance
• 01 – Dependent
• 07 – Patient refused
• 09 – Not applicable
• 10 – Not attempted due to environmental limitations
• 88 – Not attempted due to medical condition or safety concerns
• ^ – Skip pattern

Valid codes for the type of wheelchair/scooter used (GG0170RR3 and GG0170SS3) for this quality measure are:
• 1 – Manual
• 2 – Motorized
• ^ – Skip pattern

3. **Determine the denominator count.** Determine the total number of stay-level records, both complete and incomplete, with an assessment in the measure target period.

4. **Determine the numerator count.** The numerator for this quality measure is the number of IRF stay-level records with complete functional assessment data and at least one self-care or mobility goal. The counts from step 2.1 (complete stay-level records) and from step 2.2 (incomplete stay-level records) are summed. This sum is the numerator count.

5. **Calculate the facility-level observed score.** Divide the facility’s numerator count by its denominator count to obtain the facility-level observed score; that is, divide the result of step 4 by the result of step 3 and then multiply by 100 to obtain a percent value.

6. **Round the percent value to one decimal place.**
   6.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   6.2 Drop all the digits following the first decimal place.

**iQIES QM Report Measure Calculations for Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan that Addresses Function (NQF #2631) (CMS ID: I008.02)**

As previously stated, this measure is not risk-adjusted or stratified. The steps to calculate the iQIES Review and Correct Report can be applied to calculate the iQIES QM Report. Follow the steps provided above for the iQIES QM Report measure calculation for the Application of Percent of Long-Term Care Hospital (LTCH) Patients With An Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631) (CMS ID: I008.01).

**National Average Calculation for Application of Percent of Long-Term Care Hospital (LTCH) Patients With an Admission and Discharge Functional Assessment and a Care Plan that Addresses Function (NQF #2631) (CMS ID: I008.02)**

Use the following steps to calculate the patient stay-level (i.e. prevalence) national average:
1. Determine the total number of patient stays in the nation after the exclusion criteria, if applicable. This is the denominator for the national average.
2. Identify patient stays in the denominator of the national average that are included in the numerator for this measure. This is the numerator for the national average.
3. Divide the numerator (step 2) by the denominator (step 1) then multiply by 100 and round the percent value to one decimal place to obtain the national average.
   a. If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   b. Drop all of the digits following the first decimal place.
Section 6.5: IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)

iQIES Review and Correct Report Measure Calculations for IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)

For the Review and Correct Reports, only the facility-level observed score is computed; the facility’s risk-adjusted score is not reported. Using the definitions from Table 7-5, the following steps are used to calculate the quality measure.

1. Calculate the admission Self-Care score (steps 1.1 through 1.2) using the admission Self-Care score items and valid codes, identified below:

   The Self-Care assessment items used for admission Self-Care score calculations are:
   - GG0130A1. Eating
   - GG0130B1. Oral hygiene
   - GG0130C1. Toileting hygiene
   - GG0130E1. Shower/bathe self
   - GG0130F1. Upper body dressing
   - GG0130G1. Lower body dressing
   - GG0130H1. Putting on/taking off footwear

   Valid codes and code definitions for the coding of the admission Self-Care items are:
   - 06 – Independent
   - 05 – Setup or clean-up assistance
   - 04 – Supervision or touching assistance
   - 03 – Partial/moderate assistance
   - 02 – Substantial/maximal assistance
   - 01 – Dependent
   - 07 – Patient refused
   - 09 – Not applicable
   - 10 – Not attempted due to environmental limitations
   - 88 – Not attempted due to medical condition or safety concerns
   - - – Not assessed/no information

   1.1 To obtain the score, use the following procedure:
   - If code is between 01 and 06, then use the code as the score.
   - If code is 07, 09, 10, or 88, then recode to 01 and use this code as the score.
• If the self-care item is dashed (-) or missing, recode to 01 and use this code as the score.

1.2 Sum the scores of the admission self-care items to create an admission self-care score for each stay-level record. Scores can range from 7 to 42, with a higher score indicating greater independence.

2. **Calculate the discharge Self-Care score** (steps 2.1 through 2.2) using the discharge Self-Care score items and valid codes, identified below.

   The Self-Care assessment items used for discharge Self-Care score calculations are:
   • GG0130A3. Eating
   • GG0130B3. Oral hygiene
   • GG0130C3. Toileting hygiene
   • GG0130E3. Shower/bathe self
   • GG0130F3. Upper body dressing
   • GG0130G3. Lower body dressing
   • GG0130H3. Putting on/taking off footwear

   Valid codes and code definitions for the coding of the discharge Self-Care items are:
   • 06 – Independent
   • 05 – Setup or clean-up assistance
   • 04 – Supervision or touching assistance
   • 03 – Partial/moderate assistance
   • 02 – Substantial/maximal assistance
   • 01 – Dependent
   • 07 – Patient refused
   • 09 – Not applicable
   • 10 – Not attempted due to environmental limitations
   • 88 – Not attempted due to medical condition or safety concerns
   • ^ – Skip pattern
   • - – Not assessed/no information

   2.1 To obtain the score, use the following procedure:
   • If code is between 01 and 06, then use code as the score.
   • If code is 07, 09, 10, or 88, then recode to 01 and use this code as the score.
   • If the self-care item is skipped (^), dashed (-), or missing, recode to 01 and use this code as the score.
2.2 Sum the scores of the discharge self-care items to create a discharge self-care score for each stay-level record. Scores can range from 7 to 42, with a higher score indicating greater independence.

3. **Identify excluded stays.** Patient is excluded if any of the following are true (steps 3.1 through 3.5).

3.1 **Incomplete stays:**

3.1.1 Length of stay is less than 3 days: Discharge Date (Item 40) – Admission Date (Item 12) is less than 3 days.

3.1.2 Discharged against medical advice: Patient discharged against medical advice (Item 41 = 1).

3.1.3 Died while in IRF: Was the patient discharged alive (Item 44C = 0).

3.1.4 Medical Emergency: Patient’s discharge destination (Item 44D): Short-term General Hospital (Item 44D = [02]), Long-Term Care Hospital (LTCH) (Item 44D = [63]), Inpatient Psychiatric Facility (Item 44D = [65]), Critical Access Hospital (Item 44D = [66])

3.2 Patients who are independent with all self-care activities at the time of admission.

Items used to identify these patient records:

- Eating (Item GG0130A1 = [06]);
- Oral hygiene (Item GG0130B1 = [06]);
- Toileting hygiene (Item GG0130C1 = [06]);
- Shower/bathe self (Item GG0130E1 = [06]);
- Upper body dressing (Item GG0130F1 = [06]);
- Lower body dressing (Item GG0130G1 = [06]); and
- Putting on/taking off footwear (Item GG0130H1 = [06]).

3.3 Patients in a coma, persistent vegetative state, complete tetraplegia, locked-in state, severe anoxic brain damage, cerebral edema or compression of brain.

Items used to identify these patient records:

- Impairment Group (Item 21A = [0004.1221 or 0004.1222 or 0004.2221 or 0004.2222]).
- Etiologic Diagnosis A., B, or C (Item 22 = any one of the ICD-10-CM codes listed in **Appendix A, Table A-4**).
- Comorbid Condition (Item 24 = any of the ICD-10-CM codes listed in **Appendix A, Table A-4**).

3.4 Patients younger than 21 years: Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e. the difference is not rounded to nearest whole number.
3.5 Patients discharged to hospice (home or institutional facility) (Item 44D = 50 or 51).

4. **Determine the included records.** Determine the total number of stay-level records with an IRF-PAI in the measure target period, which do not meet the exclusion criteria. Note that this measure does not have a simple form for the numerator and denominator.

5. **Calculate the observed change in self-care scores for each patient stay-level record.** For each stay-level record included in step 4, subtract the admission self-care score (step 1) from the discharge self-care score (step 2). If a patient’s self-care score decreased from admission to discharge, the difference will be a negative value.

6. **Calculate the facility-level average observed change in self-care score.** Calculate an average observed change in self-care score for each IRF as the mean of the observed change in self-care scores for all patients in the facility who are not excluded from the measure (identified in step 3).

7. **Round the value to one decimal place.**
   
   7.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   
   7.2 Drop all the digits following the first decimal place.

**iQIES QM Report Measure Calculations for IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)**

This measure is risk-adjusted for the iQIES QM Reports and therefore an observed (i.e., not risk-adjusted) and a risk-adjusted value are reported. Using the definitions in Table 7-5, the following steps are used to calculate the measure.

1. **Calculate the facility-level average observed change in self-care score.**
   
   1.1 To calculate the facility-level average observed change in self-care score, complete steps 1 – 6 from Chapter 6, Section 6.5, “iQIES Review and Correct Report Measure Calculations” for NQF #2633.
   
   1.2 Do not round to the nearest first decimal place. All rounding will be done at the end of the measure calculation.

2. **Calculate the national average change in self-care score** as the mean of the observed change in self-care scores for all patient stays calculated from steps 1–5 in Chapter 6, Section 6.5. This will be used in step 5 to calculate the risk-adjusted average change in self-care score.

   Note: Because there is limited public accessibility to national assessment data, this document provides a national average observed score based on the reporting period of the regression intercept and coefficients. The national average observed score can be seen in the Risk Adjustment Appendix File. Please note that, depending on the reporting period and time of calculation, the national average observed score used in the iQIES QM Report, Provider Preview Report, and on public display on the Compare Website may vary from the national average observed score provided by these documents.

---

13 The national average observed score is calculated using the patient stay as the unit of analysis.
3. **Calculate the expected change in self-care score.**

3.1 For each stay-level record, use the intercept and regression coefficients to calculate the expected change in self-care score using the formula below:

\[ \text{Expected change in self-care score} = \beta_0 + \beta_1(COV_1) + \ldots + \beta_n(COV_n) \]

Where:
- **Expected change in self-care score** identifies the expected change in self-care score for each IRF patient.
- \( \beta_0 \) is the regression intercept.
- \( \beta_1 \) through \( \beta_n \) are the regression coefficients for the covariates (see Risk Adjustment Appendix File).

See Appendix A, Table A-5 and Table A-6, and the associated Risk Adjustment Appendix File for the regression intercept and coefficients as well as detailed IRF-PAI coding for each risk adjustor.\(^{14}\) The regression intercept and regression coefficients are values obtained through regression analysis. Please note that the iQIES QM and Provider Preview Reports use fixed regression intercepts and coefficients based on the target period stated in Table A-5 and Table A-6 and the Risk Adjustment Appendix File.

4. **Calculate the facility-level average expected change in self-care score.** Calculate an average expected change in self-care score for each IRF as the mean of the expected change in self-care scores for all patients in the facility.

5. **Calculate the risk-adjusted average change in self-care score** (steps 5.1 through 5.2).

5.1 **Calculate the difference** between the facility-level average observed change in self-care score (step 1) and the facility-level average expected change in self-care score (step 4) to create an observed minus expected difference (difference value).

- A value that is 0 indicates the observed score and expected score are equal.
- A value that is greater than 0 indicates that the observed change in score is higher (better) than the expected score.
- A value that is less than 0 indicates that the observed change in score is lower (worse) than the expected score.

5.2 **Add** each IRF’s difference value (step 5.1) to the national average change in self-care score. This is the risk-adjusted average change in self-care score.

6. **Round the value to one decimal place.**

6.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

\(^{14}\) The regression constant (intercept) and coefficient values have been rounded to four decimal places. When applying these values to the equation to calculate facility-level QM scores, these intercept and coefficient values should be used; do not round to fewer than four decimal places. This is to ensure consistency and accuracy of measure calculations.
6.2 Drop all of the digits following the first decimal place.

**National Average Calculation for IRF Functional Outcome Measure: Change in Self-Care Score for Medical Rehabilitation Patients (NQF #2633) (CMS ID: I009.03)**

To calculate the patient stay-level (i.e., prevalence) national average, refer to step 2 under the iQIES QM Report Measure Calculations for this measure.
For the Review and Correct Reports, only the facility-level observed score is computed; the facility’s risk-adjusted score is not reported. Using the definitions from Table 7-6, the following steps are used to calculate the quality measure.

1. **Calculate the admission Mobility score** (steps 1.3 through 1.4) using the admission Mobility items and valid codes, identified below. Please note there are different items used if the patient does not walk at both admission and discharge (step 1.1) than for the remaining patients (step 1.2):

1.1 For patients who have codes 07, 09, 10, or 88 for the Walk 10 feet item at both admission (GG0170I1, Walk 10 feet) and discharge (GG0170I3, Walk 10 feet), the following Mobility admission items are used for admission Mobility score calculations:
   - GG0170A1. Roll left and right
   - GG0170B1. Sit to lying
   - GG0170C1. Lying to sitting on side of bed
   - GG0170D1. Sit to stand
   - GG0170E1. Chair/bed-to-chair transfer
   - GG0170F1. Toilet transfer
   - GG0170G1. Car transfer
   - GG0170R1. Wheel 50 feet with two turns*
   - GG0170S1. Wheel 150 feet*
   - GG0170M1. 1 step (curb)
   - GG0170N1. 4 steps
   - GG0170O1. 12 steps
   - GG0170P1. Picking up object

*Please count the score for this item twice; 15 items are used to calculate a patient’s score (scores range from 15 – 90).

1.2 For the remaining patients, please use the following Mobility admission items for admission Mobility score calculations:
   - GG0170A1. Roll left and right
   - GG0170B1. Sit to lying
   - GG0170C1. Lying to sitting on side of bed
• GG0170D1. Sit to stand
• GG0170E1. Chair/bed-to-chair transfer
• GG0170F1. Toilet transfer
• GG0170G1. Car transfer
• GG0170H1. Walk 10 feet
• GG0170J1. Walk 50 feet with two turns
• GG0170K1. Walk 150 feet
• GG0170L1. Walking 10 feet on uneven surfaces
• GG0170M1. 1 step (curb)
• GG0170N1 4 steps
• GG0170O1 12 steps.
• GG0170P1. Picking up object

Valid codes and code definitions for the coding of the admission Mobility items are:

• 06 – Independent
• 05 – Setup or clean-up assistance
• 04 – Supervision or touching assistance
• 03 – Partial/moderate assistance
• 02 – Substantial/maximal assistance
• 01 – Dependent
• 07 – Patient refused
• 09 – Not applicable
• 10 – Not attempted due to environmental limitations
• 88 – Not attempted due to medical condition or safety concerns
• ^ – Skip pattern: only valid for items GG0170J1 through GG0170L1; GG0170N1, GG0170O1
• - – Not assessed/no information

1.3 To obtain the score, use the following procedure

• If code is between 01 and 06, then use code as the score
• If code is 07, 09, 10, or 88, then recode to 01 and use this code as the score.
• If the mobility item is skipped (^), dashed (-), or missing, recode to 01 and use this code as the score.

1.4 Sum the scores of the admission mobility items to create an admission mobility score for each patient stay. Scores can range from 15 – 90, with a higher score indicating greater independence.
2. **Calculate the discharge Mobility score** (steps 2.3 through 2.4) using the discharge Mobility items and valid codes, identified below. Please note there are different items used if the patient does not walk at both admission and discharge (step 2.1) than for the remaining patients (step 2.2):

2.1 For patients who have codes 07, 09, 10, or 88 for the Walk 10 feet item at both admission (GG0170I1, Walk 10 feet) and discharge (GG0170I3, Walk 10 feet), the following Mobility assessment items are used for discharge Mobility score calculations:

- GG0170A3. Roll left and right
- GG0170B3. Sit to lying
- GG0170C3. Lying to sitting on side of bed
- GG0170D3. Sit to stand
- GG0170E3. Chair/bed-to-chair transfer
- GG0170F3. Toilet transfer
- GG0170G3. Car transfer
- GG0170R3. Wheel 50 feet with two turns*
- GG0170S3. Wheel 150 feet*
- GG0170M3. 1 step (curb)
- GG0170N3. 4 steps
- GG0170O3. 12 steps
- GG0170P3. Picking up object

*Please count the score for this item twice; 15 items are used to calculate a patient’s score (scores range from 15 – 90).

2.2 For the remaining patients, please use the following Mobility assessment items for discharge Mobility score calculations:

- GG0170A3. Roll left and right
- GG0170B3. Sit to lying
- GG0170C3. Lying to sitting on side of bed
- GG0170D3. Sit to stand
- GG0170E3. Chair/bed-to-chair transfer
- GG0170F3. Toilet transfer
- GG0170G3. Car transfer
- GG0170I3. Walk 10 feet
- GG0170J3. Walk 50 feet with two turns
- GG0170K3. Walk 150 feet
• GG0170L3. Walking 10 feet on uneven surfaces
• GG0170M3. 1 step (curb)
• GG0170N3. 4 steps
• GG0170O3. 12 steps
• GG0170P3. Picking up object

Valid codes and code definitions for the coding of the discharge Mobility items are:
• 06 – Independent
• 05 – Setup or clean-up assistance
• 04 – Supervision or touching assistance
• 03 – Partial/moderate assistance
• 02 – Substantial/maximal assistance
• 01 – Dependent
• 07 – Patient refused
• 09 – Not applicable
• 10 – Not attempted due to environmental limitations
• 88 – Not attempted due to medical condition or safety concerns
• ^ – Skip pattern
• - – Not assessed/no information

2.3 To obtain the score, use the following procedure:
• If code is between 01 and 06, then use code as the score.
• If code is 07, 09, 10, or 88, then recode to 01 and use this code as the score.
• If the mobility item is skipped (^), dashed (-), or missing, recode to 01 and use this code as the score.

2.4 Sum the scores of the discharge mobility items to create a discharge mobility score for each patient stay. Scores can range from 15 – 90, with a higher score indicating greater independence.

3. Identify excluded stays. Patient is excluded if any of the following are true (steps 3.1 through 3.5).

3.1 Incomplete stays:

3.1.1 Length of stay is less than 3 days: Discharge Date (Item 40) – Admission Date (Item 12) < 3 days.

3.1.2 Discharged against medical advice: Patient discharged against medical advice (Item 41 = 1).

3.1.3 Died while in IRF: Was the patient discharged alive (Item 44C = 0).
3.1.4 Medical emergency: Patient discharge destination (Item 44D): Short-term General Hospital (Item 44D = [02]), Long-term Care Hospital (LTCH) (Item 44D = [63]), Inpatient Psychiatric Facility (Item 44D = [65]), Critical Access Hospital (Item 44D = [66])

3.2 Patients who are independent with all mobility activities at the time of admission.

Items used to identify these patient records:
- Roll left and right (Item GG0170A1 = [06]) and;
- Sit to lying (Item GG0170B1 = [06]) and;
- Lying to sitting on side of bed (Item GG0170C1 = [06]) and;
- Sit to stand (Item GG0170D1 = [06]) and;
- Chair/bed-to-chair transfer (Item GG0170E1 = [06]) and;
- Toilet transfer (Item GG0170F1 = [06]) and;
- Car transfer (Item GG0170G1 = [06]) and;
- Walk 10 feet (Item GG0170H1 = [06]) and;
- Walk 50 feet with two turns (Item GG0170J1 = [06]) and;
- Walk 150 feet (Item GG0170K1 = [06]) and;
- Walk 10 feet on uneven surfaces (Item GG0170L1 = [06]) and;
- 1 step (curb) (Item GG0170M1 = [06]) and;
- 4 steps (Item GG0170N1 = [06]) and;
- 12 steps (Item GG0170O1 = [06]) and;
- Picking up object (Item GG0170P1 = [06])

3.3 Patients in a coma, persistent vegetative state, complete tetraplegia, locked-in state, severe anoxic brain damage, cerebral edema or compression of brain.

Items used to identify these patient records:
- Impairment Group (Item 21A = [0004.1221 or 0004.1222 or 0004.2221 or 0004.2222])
- Etiologic Diagnosis A, B, or C (Item 22 = any one of the ICD-10-CM codes listed in Appendix A, Table A-4)
- Comorbid Condition (Item 24 = any of the ICD-10-CM codes listed in Appendix A, Table A-4).

3.4 Patients younger than 21 years: Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e., the difference is not rounded to nearest whole number.

3.5 Patients discharged to hospice (home or institutional facility) (Item 44D = [50 or 51]).
4. **Determine the included records.** Determine the total number of stay-level records with an IRF-PAI in the measure target period, which did not meet the exclusion criteria. Note that this measure does not have a simple form for the numerator and denominator.

5. **Calculate the observed change in mobility scores for each stay-level record.** For each stay-level record included, calculate the difference between the admission mobility score (step 1) from the discharge mobility score (step 2). If a patient’s mobility score decreased from admission to discharge, the difference will be a negative value.

6. **Calculate the facility-level average observed change in mobility score.** Calculate an average observed change in mobility score for each IRF as the mean of the observed change in mobility scores for all patients in the facility who are not excluded (step 3).

7. **Round the value to one decimal place.**
   7.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   7.2 Drop all the digits following the first decimal place.

**iQIES QM Report Measure Calculations for IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients (NQF #2634) (CMS ID: I010.03)**

This measure is risk-adjusted for the iQIES QM Reports and therefore an observed (i.e., not risk-adjusted) and a risk-adjusted value are reported. Using the definitions in Table 7-6, the following steps are used to calculate the measure.

1. **Calculate the facility-level average observed change in mobility score** (steps 1.1 through 1.2).
   1.1 To calculate the facility-level average observed change in mobility score, complete steps 1 – 6 from Chapter 6, Section 6.6, “iQIES Review and Correct Report Measure Calculations” for NQF #2634.
   1.2 Do not round to the nearest first decimal place. All rounding will be done at the end of the measure calculation.

2. **Calculate the national average change in mobility score** as the mean of the observed change in mobility scores for all patient stays calculated from steps 1–5 in Chapter 6, Section 6.6. This will be used in step 5 to calculate the risk-adjusted average change in mobility score.

   *Note: Because there is limited public accessibility to national assessment data, this document provides a national average observed score based on the reporting period of the regression intercept and coefficients. The national average observed score can be seen in the Risk Adjustment Appendix File. Please note that, depending on the reporting period and time of calculation, the national average observed score used in the iQIES QM Report, Provider Preview Report, and on public display on the Compare Website may vary from the national average observed score provided by these documents.*

3. **Calculate the expected change in mobility score.**

---

15 The national average observed score is calculated using the patient stay as the unit of analysis.
3.1 For each stay-level record, use the intercept and regression coefficients to calculate the expected change in mobility score using the formula below:

\[
\text{Expected change in mobility score} = \beta_0 + \beta_1(COV_1) + \ldots + \beta_n(COV_n)
\]

Where:
- \(\text{Expected change in mobility score}\) identifies the expected change in mobility score for each IRF patient
- \(\beta_0\) is the regression intercept
- \(\beta_1\) through \(\beta_n\) are the regression coefficients for the covariates (see Risk Adjustment Appendix File).

See Appendix A, Table A-5 and Table A-6, and the associated Risk Adjustment Appendix File for the regression intercept and coefficients as well as detailed IRF-PAI coding for each risk adjustor. The regression intercept and regression coefficients are values obtained through regression analysis. Please note that the iQIES QM and Provider Preview Reports use fixed regression intercepts and coefficients based on the target period stated in Table A-5 and Table A-6 and the Risk Adjustment Appendix File.

4. Calculate the facility-level average expected change in mobility score. Calculate an average expected change in mobility score for each IRF as the mean of the expected change in mobility scores for all patients in the facility.

5. Calculate the risk-adjusted average change in mobility score (steps 5.1 through 5.2).

5.1 Calculate the difference between the facility-level average observed change in mobility score (step 1) and the facility-level average expected change in mobility score (step 4) to create an observed minus expected difference (difference value).

- A value that is 0 indicates the observed score and expected score are equal.
- A value that is greater than 0 indicates that the observed change in score is higher (better) than the expected score.
- A value that is less than 0 indicates that the observed change in score is lower (worse) than the expected score.

5.2 Add each IRF’s difference value (step 5.1) to the national average change in mobility score. This is the risk-adjusted average change in mobility score.

6. Round the value to one decimal place.

6.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

6.2 Drop all of the digits following the first decimal place.

---

16 The regression constant (intercept) and coefficient values have been rounded to four decimal places. When applying these values to the equation to calculate facility-level QM scores, these intercept and coefficient values should be used; do not round to fewer than four decimal places. This is to ensure consistency and accuracy of measure calculations.
National Average Calculation for IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients (NQF #2634) (CMS ID: I010.03)

To calculate the patient stay-level (i.e. prevalence) national average, refer to step 2 under the iQIES QM Report Measure Calculations for this measure.
Section 6.7: IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03)

iQIES Review and Correct Report Measure Calculations for IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03)

This measure requires risk-adjusted data for the Review and Correct Reports since it estimates the percent of IRF patients who meet or exceed an expected discharge Self-Care score. Using the definitions from Table 7-7, the following steps are used to calculate the quality measure.

1. Calculate the observed discharge Self-Care score (steps 1.1 through 1.2) using the discharge Self-Care items and valid codes, identified below:

   The Self-Care assessment items used for discharge Self-Care score calculations are:
   - GG0130A3. Eating
   - GG0130B3. Oral hygiene
   - GG0130C3. Toileting hygiene
   - GG0130E3. Shower/bathe self
   - GG0130F3. Upper body dressing
   - GG0130G3. Lower body dressing
   - GG0130H3. Putting on/taking off footwear

   Valid codes and code definitions for the coding of the discharge Self-Care items are:
   - 06 – Independent
   - 05 – Setup or clean-up assistance
   - 04 – Supervision or touching assistance
   - 03 – Partial/moderate assistance
   - 02 – Substantial/maximal assistance
   - 01 – Dependent
   - 07 – Patient refused
   - 09 – Not applicable
   - 10 – Not attempted due to environmental limitations
   - 88 – Not attempted due to medical condition or safety concerns
   - ^ – Skip pattern
   - - – Not assessed/no information

   1.1 To obtain the score, use the following procedure:
   - If code is between 01 and 06, then use code as the score.
• If code is 07, 09, 10, or 88, then recode to 01 and use this code as the score.

• If the self-care item is skipped (^), dashed (-) or missing, recode to 01 and use this code as the score.

1.2 Sum the scores of the discharge self-care items to create a discharge self-care score for each patient stay-level record. Scores can range from 7 to 42, with a higher score indicating greater independence.

2. Identify excluded stays. Patient is excluded if any of the following are true (steps 2.1 through 2.4).

2.1 Incomplete stays:

2.1.1 Length of stay is less than 3 days: Discharge Date (Item 40) – Admission Date (Item 12) < 3 days.

2.1.2 Discharged against medical advice: Patient discharged against medical advice (Item 41 = 1).

2.1.3 Died while in IRF: Was the patient discharged alive (Item 44C = 0).

2.1.4 Medical emergency: Patients discharge destination (Item 44D): Short-term General Hospital (Item 44D = [02]), Long-term Care Hospital (LTCH) (Item 44D = [63]), Inpatient Psychiatric Facility (Item 44D = [65]), Critical Access Hospital (Item 44D = [66])

2.2 Patients in a coma, persistent vegetative state, complete tetraplegia, locked-in state, severe anoxic brain damage, cerebral edema or compression of brain.

Items used to identify these patient records:

• Impairment Group (Item 21A = [0004.1221 or 0004.1222 or 0004.2221 or 0004.2222])

• Etiologic Diagnosis A., B. or C (Item 22 = any one of the ICD-10-CM codes listed in Appendix A, Table A-4)

• Comorbid Condition (Item 24 = any of the ICD-10-CM codes listed in Appendix A, Table A-4)

2.3 Patients younger than 21 years: Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e. the difference is not rounded to nearest whole number.

2.4 Patients discharged to hospice (home or institutional facility) (Item 44D = [50 or 51]).

3. Calculate the expected discharge Self-Care score.

3.1 For each stay-level record: use the intercept and regression coefficients to calculate the expected discharge self-care score using the formula below:

\[
[1] \text{Expected discharge of self-care score} = \beta_0 + \beta_1(\text{COV}_1) + \ldots + \beta_n(\text{COV}_n)
\]

Where:
• **Expected discharge self-care score** estimates an expected discharge self-care score

• $\beta_0$ is the regression intercept

• $\beta_1$ through $\beta_n$ are the regression coefficients for the covariates (see Risk Adjustment Appendix File).
  
  – Note that any expected discharge Self-Care score greater than the maximum (i.e., 42) would be recoded to be the maximum score.

See Appendix A, **Table A-5** and **Table A-6**, and the associated Risk Adjustment Appendix File for the regression intercept and coefficients as well as detailed IRF-PAI coding for each risk adjustor. The regression intercept and regression coefficients are values obtained through regression analysis. Please note that the iQIES QM and Provider Preview Reports use fixed regression intercepts and coefficients based on the target period stated in Table A-5 and Table A-6 and the Risk Adjustment Appendix File.

4. **Calculate the difference in observed and expected discharge self-care scores.** For each patient stay-level record, compare each patient’s observed discharge self-care score (step 1) and expected discharge self-care score (step 3) and classify the difference as one of the following:

4.1 Observed discharge score is equal to or higher than the expected discharge score.

4.2 Observed discharge score is lower than the expected discharge score.

5. **Determine the denominator count.** Determine the total number of stay-level records with an IRF-PAI in the measure target period, which do not meet the exclusion criteria.

6. **Determine the numerator count.** The numerator for this quality measure is the number of stay-level records with an observed discharge score that is the same as or higher than the expected discharge score (step 4.1).

7. **Calculate the facility-level discharge self-care percent.** Divide the facility’s numerator count by its denominator count to obtain the facility-level discharge self-care percent; that is, divide the result of step 6 by the result of step 5 and then multiply by 100 to obtain a percent value.

8. **Round the percent value to one decimal place.**

   8.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

   8.2 Drop all the digits following the first decimal place.

---

17 The regression constant (intercept) and coefficient values have been rounded to four decimal places. When applying these values to the equation to calculate facility-level QM scores, these intercept and coefficient values should be used; do not round to fewer than four decimal places. This is to ensure consistency and accuracy of measure calculations.
Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03).

National Average Calculation for IRF Functional Outcome Measure: Discharge Self-Care Score for Medical Rehabilitation Patients (NQF #2635) (CMS ID: I011.03)

Use the following steps to calculate the patient stay-level (i.e., prevalence) national average:

1. Determine the total number of patient stays in the nation after the exclusion criteria, if applicable. This is the denominator for the national average.
2. Identify patient stays in the denominator of the national average that are included in the numerator for this measure. This is the numerator for the national average.
3. Divide the numerator (step 2) by the denominator (step 1) then multiply by 100 and round the percent value to one decimal place to obtain the national average.
   a. If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   b. Drop all of the digits following the first decimal place.
Section 6.8: IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)

iQIES Review and Correct Report Measure Calculations for IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)

This measure requires risk-adjusted data for the Review and Correct Reports since it estimates the percent of IRF patients who meet or exceed an expected discharge mobility score. Using the definitions from Table 7-8, the following steps are used to calculate the quality measure.

1. **Calculate the observed discharge Mobility score** (steps 1.1 through 1.4) using the discharge Mobility items and valid codes, identified below. Please note there are different items used if the patient does not walk at both admission and discharge (step 1.1) than for the remaining patients (step 2.2):

   1.1 For patients who code 07, 09, 10, or 88 for the Walk 10 feet item at both admission (GG0170I1, Walk 10 feet) and discharge (GG0170I3, Walk 10 feet), the following Mobility assessment items are used for discharge Mobility score calculations:

   - GG0170A3. Roll left and right
   - GG0170B3. Sit to lying
   - GG0170C3. Lying to sitting on side of bed
   - GG0170D3. Sit to stand
   - GG0170E3. Chair/bed-to-chair transfer
   - GG0170F3. Toilet transfer
   - GG0170G3. Car transfer
   - GG0170R3. Wheel 50 feet with two turns*
   - GG0170S3. Wheel 150 feet*
   - GG0170M3. 1 step (curb)
   - GG0170N3. 4 steps
   - GG0170O3. 12 steps
   - GG0170P3. Picking up object

   \*Please count the score for this item twice; 15 items are used to calculate a patient’s score (scores range from 15 – 90).

   1.2 For remaining patients, please use the following Mobility assessment items for discharge Mobility score calculations:

   - GG0170A3. Roll left and right
   - GG0170B3. Sit to lying
   - GG0170C3. Lying to sitting on side of bed
• GG0170D3. Sit to stand
• GG0170E3. Chair/bed-to-chair transfer
• GG0170F3. Toilet transfer
• GG0170G3. Car transfer
• GG0170I3. Walk 10 feet
• GG0170J3. Walk 50 feet with two turns
• GG0170K3. Walk 150 feet
• GG0170L3. Walking 10 feet on uneven surfaces
• GG0170M3. 1 step (curb)
• GG0170N3. 4 steps
• GG0170O3. 12 steps
• GG0170P3. Picking up object

Valid codes and code definitions for the coding of the discharge Mobility items are:

• 06 – Independent
• 05 – Setup or clean-up assistance
• 04 – Supervision or touching assistance
• 03 – Partial/moderate assistance
• 02 – Substantial/maximal assistance
• 01 – Dependent
• 07 – Patient refused
• 09 – Not applicable
• 10 – Not attempted due to environmental limitations
• 88 – Not attempted due to medical condition or safety concerns
• ^ – Skip pattern
• - – Not assessed/no information

1.3 To obtain the score, use the following procedure

• If code is between 01 and 06, then use code as the score.
• If code is 07, 09, 10, or 88, then recode to 01 and use this code as the score.
• If the mobility item is skipped (^), dashed (-), or missing, recode to 01 and use this code as the score.

1.4 Sum the scores of the discharge mobility items to create a discharge mobility score for each patient stay. Scores can range from 15 – 90, with a higher score indicating greater independence.
2. **Identify excluded stays.** Patient is excluded if any of the following are true (steps 2.1 through 2.4).

2.1 Incomplete stays:

2.1.1 Length of stay is less than 3 days: Discharge Date (Item 40) – Admission Date (Item 12) < 3 days.

2.1.2 Discharged against medical advice: Patient discharged against medical advice (Item 41 = [1]).

2.1.3 Died while in IRF: Was the patient discharged alive (Item 44C = [0]).

2.1.4 Medical emergency: Patients discharge destination (Item 44D): Short-term General Hospital (Item 44D = [02]), Long-Term Care Hospital (LTCH) (Item 44D = [63]), Inpatient Psychiatric Facility (Item 44D = [65]), Critical Access Hospital (Item 44D = [66]).

2.2 Patients in a coma, persistent vegetative state, complete tetraplegia, locked-in state, severe anoxic brain damage, cerebral edema or compression of brain.

   Items used to identify these patient records:

   - Impairment Group (Item 21A = [0004.1221 or 0004.1222 or 0004.2221 or 0004.2222])
   - Etiologic Diagnosis A., B., or C (Item 22 = any one of the ICD-10-CM codes listed in Appendix A, Table A-4)
   - Comorbid Condition (Item 24 = any of the ICD-10-CM codes listed in Appendix A, Table A-4).

2.3 Patients younger than 21 years: Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e., the difference is not rounded to nearest whole number. Patients discharged to hospice (home or institutional facility) (Item 44D = [50 or 51]).

3. **Calculate the expected discharge Mobility score.**

3.1 For each stay-level record: use the intercept and regression coefficients to calculate the expected discharge mobility score using the formula below:

   Where:

   - **Expected discharge in Mobility score** identifies a patient’s expected discharge mobility score
   - \( \beta_0 \) is the regression intercept
   - \( \beta_1 \) through \( \beta_n \) are the regression coefficients for the covariates (see Risk Adjustment Appendix File).

   - Note that any expected discharge mobility score greater than the maximum (i.e., 90) would be recoded to be the maximum score.
See Appendix A, *Table A-5* and *Table A-6*, and the associated Risk Adjustment Appendix File for the regression intercept and coefficients as well as detailed IRF-PAI coding for each risk adjustor.\(^{18}\) The regression intercept and regression coefficients are values obtained through regression analysis. Please note that the iQIES QM and Provider Preview Reports use fixed regression intercepts and coefficients based on the target period stated in *Table A-5* and *Table A-6* and the Risk Adjustment Appendix File.

4. **Calculate the difference in observed and expected discharge Mobility scores.** For each patient stay-level record which does not meet the exclusion criteria, compare each patient’s observed discharge mobility score (step 1) and expected discharge mobility score (step 3) and classify the difference as one of the following:

4.1 Observed discharge score is equal to or higher than the expected discharge score.

4.2 Observed discharge score is lower than the expected discharge score.

5. **Determine the denominator count.** Determine the total number of stay-level records with an IRF-PAI in the measure target period, which do not meet the exclusion criteria.

6. **Determine the numerator count.** The numerator for this quality measure is the number of stay-level records in which the observed discharge score is the same as or higher than the expected discharge score.

7. **Calculate the facility-level discharge mobility percent.** Divide the facility’s numerator count by its denominator count to obtain the facility-level discharge mobility percent; that is, divide the result of step 6 by the result of step 5 and then multiply by 100 to obtain a percent value.

8. **Round the percent value to one decimal place.**

8.1 If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

8.2 Drop all the digits following the first decimal place.

**iQIES QM Report Measure Calculations for IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)**

This measure requires risk-adjustment for the iQIES QM Reports. Follow the steps provided above for the iQIES Review and Correct Report measure calculations for the IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03).

**National Average Calculation for IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients (NQF #2636) (CMS ID: I012.03)**

Use the following steps to calculate the patient stay-level (i.e. prevalence) national average:

1. Determine the total number of patient stays in the nation after the exclusion criteria, if applicable. This is the denominator for the national average.

---

\(^{18}\) The regression constant (intercept) and coefficient values have been rounded to four decimal places. When applying these values to the equation to calculate facility-level QM scores, these intercept and coefficient values should be used; do not round to fewer than four decimal places. This is to ensure consistency and accuracy of measure calculations.
2. Identify patient stays in the denominator of the national average that are included in the numerator for this measure. This is the numerator for the national average.

3. Divide the numerator (step 2) by the denominator (step 1) then multiply by 100 and round the percent value to one decimal place to obtain the national average.
   a. If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   b. Drop all of the digits following the first decimal place.
Section 6.9: Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

iQIES Review and Correct Report Measure Calculations for Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

Since this measure is not risk-adjusted or stratified, only the facility-level observed score is computed and the following steps can be applied to both the iQIES Review and Correct Report measure calculation and the iQIES QM Report measure calculation. Using the definitions from Table 7-9, the following steps are used to calculate the measure.

1. **Determine the denominator count.** Select any Medicare patient stays (Part A or Medicare Advantage during the reporting period.

2. **Determine the numerator count.**

   Include patient stays in the numerator count if both of the following criteria (2.1 and 2.2) are met:

   2.1. The facility conducted a drug regimen review on admission which resulted in one of the following three scenarios:

      2.1.1. No potential or actual clinically significant medication issues were found during the review (N2001 = [0]); or

      2.1.2. Potential or actual clinically significant medication issues were found during the review (N2001 = [1]) and a physician (or physician-designee) was contacted and prescribed/recommended actions were completed by midnight of the next calendar day (N2003 = [1]); or

      2.1.3. The patient was not taking any medications (N2001 = [9]).

   2.2. Appropriate follow-up occurred each time a potential or actual clinically significant medication issue was identified during the stay (N2005 = [1]); or no potential or actual clinically significant medications issues were identified since admission or patient was not taking any medications (N2005 = [9]).

3. **Calculate the facility-level observed score.** Divide the facility’s numerator count by its denominator count to obtain the facility-level observed score; that is, divide the result of step 2 by the result from step 1 and then multiply by 100 to obtain a percent value.

4. **Round the percent value to one decimal place.**

   4.1. If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.

   4.2. Drop all the digits following the first decimal place.

iQIES QM Report Measure Calculations for Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

As previously stated, this measure is not risk-adjusted or stratified. The steps to calculate the iQIES Review and Correct Report can be applied to calculate the iQIES QM Report. Follow the steps provided above for the iQIES QM Report measure calculation for the Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01).
National Average Calculation for Drug Regimen Review Conducted with Follow-Up for Identified Issues – PAC IRF QRP (CMS ID: I021.01)

Use the following steps to calculate the patient stay-level (i.e. prevalence) national average:

1. Determine the total number of patient stays in the nation after the exclusion criteria, if applicable. This is the denominator for the national average.
2. Identify patient stays in the denominator of the national average that are included in the numerator for this measure. This is the numerator for the national average.
3. Divide the numerator (Step 2) by the denominator (Step 1) then multiply by 100 and round the percent value to one decimal place to obtain the national average.
   a. If the digit in the second decimal place is 5 or greater, add 1 to the first decimal place, otherwise leave the first decimal place unchanged.
   b. Drop all of the digits following the first decimal place.

---

a This measure is NQF-endorsed for use in the IRF setting ([http://www.qualityforum.org/QPS/0678](http://www.qualityforum.org/QPS/0678)) (in addition to being endorsed for use in the Long-Term Care Hospital and Skilled Nursing Facility/Nursing Home (SNF/NH) settings) and finalized for reporting by IRFs under the IRF QRP (Federal Register 78 (6 August 2013): 47903-47919. Web. [http://www.gpo.gov/fdsys/pkg/FR-2013-08-06/pdf/2013-18770.pdf](http://www.gpo.gov/fdsys/pkg/FR-2013-08-06/pdf/2013-18770.pdf) and Federal Register 79 (6 August 2014): 45908-45918. Web. [http://www.gpo.gov/fdsys/pkg/FR-2014-08-06/pdf/2014-18447.pdf](http://www.gpo.gov/fdsys/pkg/FR-2014-08-06/pdf/2014-18447.pdf). The use of the words “resident” and “short stay” in the title of this measure refers to the use of this measure in the SNF/NH setting. CMS’s use of these words does not imply that the IRF patient is a “resident” or that a stay in an IRF is a “short stay.”

c CMS ID: I001.01 refers to IRF-PAI V1.2 and V1.3 pressure ulcer items (M0300). CMS ID: I001.02 refers to IRF-PAI V1.4 and V1.5 pressure ulcer items (M0800).

d To round off the percent value to one decimal place, if the digit in the second decimal place is greater than 5, add 1 to the digit in the first decimal place, otherwise leave the digit in the first decimal place unchanged. Drop all the digits following the digit in the first decimal place.
Table 7-2
Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury (CMS ID: 1022.01)

<table>
<thead>
<tr>
<th>Measure Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This measure reports the percentage of patient stays with Stage 2-4 pressure ulcers, or unstageable pressure ulcers due to slough/eschar, non-removable dressing/device, or deep tissue injury, that are new or worsened since admission.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Measure Specifications*</th>
</tr>
</thead>
<tbody>
<tr>
<td>The measure is calculated by reviewing a patient’s IRF-PAI pressure ulcer discharge assessment data for reports of Stage 2–4 pressure ulcers, or unstageable pressure ulcers due to slough/eschar, non-removable dressing/device, or deep tissue injury, that were not present or were at a lesser stage at the time of admission.</td>
</tr>
</tbody>
</table>

**Numerators**

The numerator is the number of Medicare (Part A and Medicare Advantage) stays for which the IRF-PAI indicates one or more Stage 2–4 pressure ulcer(s), or unstageable pressure ulcers due to slough/eschar, non-removable dressing/device, or deep tissue injury, that are new or worsened at discharge compared to admission.

1) Stage 2 (M0300B1) - (M0300B2) > 0, OR
2) Stage 3 (M0300C1) - (M0300C2) > 0, OR
3) Stage 4 (M0300D1) - (M0300D2) > 0, OR
4) Unstageable – Non-removable dressing/device (M0300E1) - (M0300E2) > 0, OR
5) Unstageable – Slough and/or eschar (M0300F1) - (M0300F2) > 0, OR
6) Unstageable – Deep tissue injury (M0300G1) - (M0300G2) > 0

**Denominator**

The denominator is the total number of Medicare (Part A and Medicare Advantage) patient stays with discharge date in the measure target period, except those that meet the exclusion criteria.

**Exclusions**

Patient stay-level record is excluded if:

- Data on new or worsened Stage 2, 3, 4, and unstageable pressure ulcers, including deep tissue injuries, are missing at discharge:
  - (M0300B1 = [-] or M0300B2 = [-]) and (M0300C1 = [-] or M0300C2 = [-]) and (M0300D1 = [-] or (M0300D2 = [-]) and (M0300E1 = [-] or M0300E2 = [-]) and (M0300F1 = [-] or M0300F2 = [-]) and (M0300G1 = [-] or M0300G2 = [-])

- The patient died during the IRF stay:
  - Item 44C = [0]

(continued)
### Covariates

**Data for each covariate are derived from the IRF-PAI admission assessment data included in the target stay-level records.**

1. **Functional Mobility Admission Performance:**
   Coding of dependent or substantial/maximal assistance for the functional mobility item Lying to Sitting on Side of Bed at admission:
   b. Covariate = [0] (no) if GG0170C = [03, 04, 05, 06, -] ([03] = Partial/moderate assistance, [04] = Supervision or touching assistance, [05] = Setup or clean-up assistance, [06] = Independent, [-] = No response available)

2. **Bowel Incontinence:**
   Bowel Continence (H0400) at admission
   b. Covariate = [0] (no) if H0400 = [0, 9, -] ([0] = Always continent, [9] = Not rated, [-] = Not assessed/no information)

3. **Peripheral Vascular Disease / Peripheral Arterial Disease or Diabetes Mellitus:**
   a. Covariate = [1] (yes) if any of the following are true:
      i. I0900 = [1] (checked)
      ii. I2900 = [1] (checked)
   b. Covariate = [0] (no) if I0900 = [0, -] AND I2900 = [0, -] ([0] = No, [-] = No response available)

4. **Low body mass index (BMI), based on height (25A) and weight (26A):**
   b. Covariate = [0] (no) if BMI < [12.0] OR BMI > [19.0]
   c. Covariate = [0] (no) if Item 25A = [0, 00, -] OR Item 26A = [-] ([0] = No response available)

Where: \( \text{BMI} = \frac{\text{weight} \times 703}{\text{height}^2} = \frac{\text{Item 26A} \times 703}{\text{Item 25A}^2} \) and the resulting value is rounded to one decimal place.\(^b\)

Note: Please refer to Chapter 6, Section 6.1.A on the effective date for data collection and implementation date for the iQIES reports.

\(^b\) To round off the percent value to one decimal place, if the digit in the second decimal place is greater than 5, add 1 to the digit in the first decimal place, otherwise leave the digit in the first decimal place unchanged. Drop all the digits following the digit in the first decimal place.

**Application of Percent of Long-Term Care Hospital (LTCH) Patients with an Admission and Discharge Functional Assessment and a Care Plan that Addresses Function (NQF #2631) (CMS ID: I008.02)**

<table>
<thead>
<tr>
<th>Measure Description</th>
<th>Measure Specifications(^b)</th>
</tr>
</thead>
</table>
| This measure reports the percentage of all Inpatient Rehabilitation Facility (IRF) patient stay-level records with an admission and discharge functional assessment and a care plan that addresses function. | Numerator

Total number of patient stay-level records in the denominator meeting the following criteria on the selected functional assessment data:

**For patients with a complete stay, the record is counted in the numerator if:**

- a. a valid score indicating functional status (01 to 06) or a valid code indicating the activity was not attempted/not assessed (07, 09, 10, 88 or ^) for each of the functional assessment items on the admission assessment, and
- b. a valid score indicating functional status (01 to 06) for a discharge goal indicating the patient’s expected level of independence or a valid code indicating the activity was not attempted/not assessed (07, 09, 10, 88), for at least one self-care or mobility item on the admission assessment, and
- c. a valid score indicating functional status (01 to 06) or a valid code indicating the activity was not attempted/not assessed (07, 09, 10, 88 or ^) for each of the functional assessment items on the discharge assessment

**For patients with an incomplete stay, the record is counted in the numerator if:**

- a. a valid score indicating functional status (01 to 06) or a valid code indicating the activity was not attempted/not assessed (07, 09, 10, 88 or ^) for each of the functional assessment items on the admission assessment, and
- b. a valid score indicating functional status (01 to 06) for a discharge goal indicating the patient’s expected level of independence or a valid code indicating the activity was not attempted/not assessed (07, 09, 10, 88), for at least one self-care or mobility item on the admission assessment

</tr>
</tbody>
</table>

| **Denominator** |
| The total number of Medicare Part A and Medicare Advantage patient stay-level IRF-PAI records with a discharge date in the measure target period, which do not meet the exclusion criteria. |

| **Exclusions** |
| Patient stay-level record is excluded if: |
| **Patient had an incomplete stay:** |
| • Length of stay is less than 3 days; i.e., Item 40 (Discharge Date) – Item 12 (Admission Date) is less than 3 days; |
| • Discharged against medical advice (Item 41 = [1]); |
| • Died while in IRF (Item 44C = [0]); |
| • Discharge destination (Item 44D) indicates the patient had a medical emergency (Item 44D = [02, 63, 65, 66]). |

| **Patient is independent on all self-care activities at the time of admission:** |
| • Items used to identify these patient records are as follows: Eating (Item GG0130A1), Oral hygiene (Item GG0130B1), Toileting hygiene (Item GG0130C1), Shower/Bathe self (Item GG0130E1), Upper body dressing (Item GG0130F1), Lower body dressing (Item GG0130G1), Putting on/taking off footwear (Item GG0130H1). |

| **Patient has the following medical conditions:** |
| • Coma, persistent vegetative state, complete tetraplegia, locked-in syndrome, or severe anoxic brain damage, cerebral edema or compression of brain. |

| **Patient is younger than age 21:** |
| • Truncate (Item 12 (Admission Date) – Item 6 (Birth Date)). |
| • Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e. the difference is not rounded to nearest whole number. |

| **Patient is discharged to hospice:** |
| • Item 44D (Discharge destination/Living setting) = [50, 51]). |

<table>
<thead>
<tr>
<th>Measure Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>This measure estimates the percentage of Inpatient Rehabilitation Facility (IRF) Medicare patients who meet or exceed an expected discharge self-care score.</td>
<td></td>
</tr>
</tbody>
</table>

**Measure Specifications\(^b\)**

**Numerator**

The numerator is the number of patients in an IRF with a discharge self-care score that is equal to or higher than the calculated expected discharge self-care score.\(^c\)

**Denominator**

The total number of Medicare Part A and Medicare Advantage patient stay-level IRF-PAI records with a discharge date in the measure target period, which do not meet the exclusion criteria.

**Exclusions**

Patient stay-level record is excluded if:

- **Patient had an incomplete stay:**
  - Length of stay is less than 3 days; i.e., Item 40 (Discharge Date) – Item 12 (Admission Date) is less than 3 days;
  - Discharged against medical advice (Item 41 = [1]);
  - Died while in IRF (Item 44C = [0]);
  - Discharge destination (Item 44D) indicates the patient had a medical emergency (Item 44D = [02, 63, 65, 66]).

- **Patient has the following medical conditions:**\(^d\)
  - Coma, persistent vegetative state, complete tetraplegia, locked-in syndrome, or severe anoxic brain damage, cerebral edema or compression of brain.

- **Patient is younger than age 21:**
  - Truncate (Item 12 (Admission Date) – Item 6 (Birth Date)).
  - Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e., the difference is not rounded to nearest whole number.

- **Patient is discharged to hospice:**
  - Item 44D (Discharge destination/Living setting) = [50, 51]).

(continued)
### Covariates

11. Stage 3, 4, or unstageable pressure ulcer/injury
12. Cognitive function
13. Communication impairment
14. Bladder incontinence
15. Bowel incontinence
16. Swallowing ability
17. Low BMI
18. Comorbidities

See covariate details in **Appendix A, Table A-5** and **Table A-6** and the associated Risk Adjustment Appendix File.

---

d The medical conditions are identified by: Impairment Group 0004.1221 or 0004.1222 or 0004.2221 or 0004.2222 or on Item 21A or; ICD-10-CM on Item 22 or Item 24 (see **Appendix A, Table A-4** and **A-5**).
### Table 7-8
IRF Functional Outcome Measure: Discharge Mobility Score for Medical Rehabilitation Patients  
(NQF #2636) (CMS ID: 1012.03)

<table>
<thead>
<tr>
<th>Measure Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This measure estimates the percentage of Inpatient Rehabilitation Facility (IRF) Medicare patients who meet or exceed an expected discharge mobility score.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Measure Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Numerator</strong></td>
</tr>
<tr>
<td>The numerator is the number of patients in an IRF with a discharge mobility score that is equal to or higher than the calculated expected discharge mobility score.</td>
</tr>
<tr>
<td><strong>Denominator</strong></td>
</tr>
<tr>
<td>The total number of Medicare Part A and Medicare Advantage patient stay-level IRF-PAI records with a discharge date in the measure target period, which do not meet the exclusion criteria.</td>
</tr>
</tbody>
</table>

**Exclusions**
- Patient stay-level record is excluded if:
  - **Patient had an incomplete stay:**
    - Length of stay is less than 3 days; i.e., Item 40 (Discharge Date) – Item 12 (Admission Date) is less than 3 days;
    - Discharged against medical advice (Item 41 = [1]);
    - Died while in IRF (Item 44C = [0]);
    - Discharge destination (Item 44D) indicates the patient had a medical emergency (Item 44D = [02, 63, 65, 66]).
  - **Patient has the following medical conditions:**
    - Coma, persistent vegetative state, complete tetraplegia, locked-in syndrome, or severe anoxic brain damage, cerebral edema or compression of brain.
  - **Patient is younger than age 21:**
    - Truncate (Item 12 (Admission Date) – Item 6 (Birth Date)).
    - Age in years is calculated based on the truncated difference between admission date (Item 12) and birth date (Item 6); i.e., the difference is not rounded to nearest whole number.
  - **Patient is discharged to hospice:**
    - Item 44D (Discharge destination/Living setting) = [50, 51].

<table>
<thead>
<tr>
<th>Covariates</th>

a This measure was finalized for reporting by IRFs under the FY 2017 IPPS/IRF PPS final rule (81 FR 24178)

Appendix A:
Model Parameters
Appendix A provides the following information:

- Tables listing the covariates and associated IRF-PAI items used to calculate each covariate for assessment-based quality measures requiring risk-adjustment (Section A.1).
- Overview of the Risk-Adjustment Appendix File for the Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual (Risk-Adjustment Appendix File) (Section A.2).
- Procedure on how to use the Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual and the associated Risk-Adjustment Appendix File information to apply intercept and coefficient values for measure calculations (Section A.3).

The risk-adjusted quality measures addressed in this Appendix are listed in Table A-1 below. Note that a “✔” indicates that the national average observed score or covariate values are included in the risk-adjustment calculation for that quality measure. An “n/a” indicates that it is not applicable in the risk-adjustment calculation for that quality measure.

HCC = Hierarchical Condition Category

Note: ‘n/a’ in a measure’s coefficient column indicates a 0 value, and the risk adjuster can be left out of the regression model; The logic for calculating most risk adjusters is summarized as “new variable = [1] if old item = [X]; else = [0]”. Thus, any instances of missing, a caret, or a dash should be coded as 0 for that risk adjuster item and the patient stay would not be dropped.

\(^a\) Calculation steps are run in the order in which they are presented so that exceptions to the coding logic are accurately applied.

\(^b\) When calculating the admission self-care and mobility score risk adjusters, first recode each function item so that a code of 07, 09, 10, or 88 is recoded to 01. Use this code as the score. If the mobility item is dash (-), skipped (^), or missing, recode to 01 and use this code as the score. If code is between 01 and 06, then use code as the score. The self-care – continuous covariate will have a range of scores from 7 to 42, and the mobility – continuous covariate will have a range of 15 to 90 after recoding.

\(^c\) The 13 Primary Diagnosis Groups should account for all patient stay-level records. If a record is not included in one of the 13 groups due to missing information, please default to coding = [1] for Hip and Knee Replacement so all records are included in one of the 13 groups. Please note that these groups are mutually exclusive.

\(^d\) Although Complete Tetraplegia is originally part of this HCC, it has been excluded from this comorbidity in our model because it is an exclusion criterion for the IRF Discharge Self-Care Score Quality Measure. Patients with Incomplete or Unspecified Tetraplegia would be included in this category.

<sup>a</sup> HCC Group number matches the numbers listed in column 1 of Table A-5 for the comorbidities. Table A-5 and A-6 are used in tandem to calculate the QM expected scores. A patient may be coded a “1, yes” for having a specific HCC comorbidity according to Table A-5 but Table A-6 must also be checked to ensure the comorbidity is not already accounted for under the Primary Diagnosis Group codes or the Impairment Group Codes. If the condition is already accounted for in another risk adjustor, the HCC Group the risk adjustor is changed to “0, no” for the comorbidity, because the diagnosis is a patient’s primary condition. See coding in this table to determine which items have these exclusions.
Section A.2: Risk-Adjustment Appendix File Overview

The intercept and coefficient values for each of the covariates listed by quality measure in Section A-1 are available in the Risk-Adjustment Appendix File, which can be accessed on the IRF Quality Reporting Measures Information website. This Risk-Adjustment Appendix File, which is used alongside this appendix, contains current and historical intercept and coefficient values and the risk-adjustment schedule including applicable discharge dates for each update to the intercept and coefficient values.

**Excel Worksheets in the Risk-Adjustment Appendix File:**

**Overview:** Brief description of the document and its content.

**Schedule:** The risk-adjustment schedule for each quality measure.

- **Quality Measure Name:** Full measure name as referenced throughout the Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual V3.1. A National Quality Forum (NQF) identification number is provided with the quality measure name, as applicable.

- **Measure Reference Name:** Abbreviated name for the quality measure.

- **Risk-Adjustment Update ID:** Number assigned to the initial and subsequent updates of the coefficient and intercept values for a unique risk-adjusted quality measure.

- **QM User’s Manual Specification Version:** Number assigned to the initial and subsequent versions of the Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual, located on the title page.

- **QM User’s Manual Specification Posting Date:** Month and year of the Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual posting on the IRF Quality Reporting Measures Information website.

- **Measure Calculation Application Dates:** Discharge dates associated with the intercept and coefficient values for each Risk-Adjustment Update ID.

**National Average:** This document provides a national average observed score for each Risk-Adjustment Update ID to be used for applicable risk-adjusted quality measures. Values are provided because there is limited public accessibility to national assessment data. Please note that, depending on the reporting period and time of calculation, the national average observed score used in the iQIES QM Reports, Provider Preview Reports, and on public display on the Compare Website may vary from the national average observed score provided by this document.

**Quality Measure Specific Tabs:** Lists each covariate and its associated coefficient value for each risk-adjustment update ID.
Section A.3: Risk-Adjustment Procedure

Below is the procedure on how to use the Inpatient Rehabilitation Facility Quality Reporting Program Measure Calculations and Reporting User’s Manual and the associated Risk-Adjustment Appendix File information to apply intercept and coefficients values to calculate the risk-adjusted score. Steps to calculate the risk-adjusted quality measure may vary by each measure. The following procedure contain the general steps:

1. Utilize the record selection guidance as listed in Chapter 4 Record Selection for Assessment-Based Quality Measures (IRF-PAI) in this manual.
2. Follow the guidance for the version or versions of the IRF-PAI applicable to the assessment dates (based on discharge date) required for your calculation found in Chapter 5, Section 5.3: Measure Calculations During the Transition from IRF-PAI v2.0 to IRF-PAI v3.0.
3. Use the specific calculation steps provided in Chapter 6 Measure Calculations for Assessment-Based Quality Measures (IRF-PAI) for the measure(s).
   a. Refer to Appendix A on details to calculate the covariates for each quality measure.
4. Refer to the Risk-Adjustment Appendix File information to apply intercept and coefficient values to measure calculations. Under the Schedule tab, refer to the QM User’s Manual Specification Version relevant to the timeframe for which you want to calculate the measure.
5. Use the column “Measure Calculation Application Dates” to select the applicable discharge dates then identify the Risk-Adjustment Update ID associated with those discharge dates.
6. Select the applicable quality measure tab then use the applicable Risk-Adjustment Values Update ID column. Apply the intercept and coefficient values for each covariate.
   a. For quality measures using the national average observed score in the measure calculation, select the National Average tab and use the national average observed score that corresponds to the Risk-Adjustment Values Update ID column used.

Example (Steps 4–6): IRF Functional Outcome Measure: Change in Mobility Score for Medical Rehabilitation Patients

- IRF-PAI record had a discharge date of 06/15/2017
- In the Schedule tab of the Risk-Adjustment Appendix File, refer to the Change in Mobility measure.
  - The discharge date of 06/15/2017 is within the discharge date range for Risk-Adjustment Update ID 1 (01/01/2017 – 12/31/2017). Therefore, the user should use the information provided in the Risk-Adjustment ID 1 column.
- Select the Change in Mobility tab and apply the intercept and coefficient values in the Risk-Adjustment ID 1 column for each covariate.
- Select the National Average tab and use the Risk-Adjustment Update ID 1 column for the Change in Mobility national average observed score.
