</table>

We received no public comments on the measures proposed for addition to this specialty set; therefore, we are finalizing the measures for addition to the Endocrinology Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
B.11. Family Medicine

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Family Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

</thead>
</table>
| * ! (Care Coordination) | 0576 / N/A | 391 | N/A | MIPS CQM Specifications | Process | Communication and Care Coordination | **Follow-Up After Hospitalization for Mental Illness (FUH):** The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness or intentional self-harm diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are submitted:  
- The percentage of discharges for which the patient received follow-up within 30 days after discharge.  
- The percentage of discharges for which the patient received follow-up within 7 days after discharge. | National Committee for Quality Assurance | We proposed to add this measure to the Family Medicine specialty set. Stakeholders commented, as we agreed, that the Family Medicine set includes several quality measures that address mental health and substance use disorders. Given the high rates that patients are assessed or treated for these conditions within this specialty, they recommended the inclusion of this measure within the Family Medicine specialty set. |

**Comment:** Two commenters opposed the addition of measure Q391 to the Family Medicine set, and noted that the measure specifications require a visit with a mental health professional to satisfy the measure (i.e., a visit with a family physician does not satisfy the measure); therefore application to family medicine is inappropriate.

**Response:** We thank the commenters for their comments. We believe that measure Q391 supports the facilitation of follow up care for patients that have been hospitalized with mental illness and represents a meaningful measure within MIPS. However, we understand the concern provided by the commenters and recognize that the quality action of the measure indicates the follow up is with a mental health practitioner. Therefore, we agree that this measure should not be added to the Family Medicine set.

After consideration of public comments, we are not finalizing measure Q391 for addition to the *Family Medicine Specialty Measure Set* as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
B.11. Family Medicine

### PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE FAMILY MEDICINE SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

<table>

</tr>
</tbody>
</table>

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the Family Medicine Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.
B.12. Gastroenterology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Gastroenterology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

<td>Hepatitis C: Discussion and Shared Decision Making Surrounding Treatment Options: Percentage of patients aged 18 years and older with a diagnosis of hepatitis C with whom a physician or other qualified healthcare professional reviewed the range of treatment options appropriate to their genotype and demonstrated a shared decision making approach with the patient. To meet the measure, there must be documentation in the patient record of a discussion between the physician or other qualified healthcare professional and the patient that includes all of the following: treatment choices appropriate to genotype, risks and benefits, evidence of effectiveness, and patient preferences toward treatment.</td>
<td>American Gastroenterological Association</td>
<td>This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.</td>
</tr>
</tbody>
</table>

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the Gastroenterology Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.
B.13 General Surgery

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the General Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

</tbody>
</table>

**Comment:** One commenter indicated that measures Q047, Q128, Q130, Q226, Q317, and Q374, included in the General Surgery set, have substantive changes proposed under the applicable D Tables (D.9, D.24, D.25, D.46, D.64, and D.73) that measure preventive care services, which do not directly align with most surgical workflows. The commenter believes that administering and measuring population health and preventive care activities are important, but these measures should not make up the majority of the General Surgery set as they offer little support in understanding the quality of surgical care.

**Response:** We did not propose any changes to the General Surgery set. Of note, the substantive changes finalized for the aforementioned measures do not change the intent of the measures. We encourage the commenter to submit this comment during the Solicitation for Specialty Sets for potential implementation in future years.
B.14. Geriatrics

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Geriatrics specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

<td>This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.</td>
</tr>
</tbody>
</table>

**Comment:** One commenter supported the removal of measures Q412 and Q414 from the Geriatrics set.

**Response:** We thank the commenter for supporting the removal of these measures.

After consideration of public comments, we are finalizing the measures for removal from the Geriatrics Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program. Also note that measure Q408: Opioid Therapy Follow-up Evaluation should have been included in the removal table for the Geriatrics set in the 2021 PFS proposed rule as it is being removed from the MIPS program.
B.15. Hospitalists

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Hospitalists specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.16. Infectious Disease

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Infectious Disease specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

## B.18. Interventional Radiology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Interventional Radiology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that are maintained within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

**B.20. Nephrology**

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Nephrology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

**Comment:** One commenter supported the addition of measures Q277 and Q279 to the Neurology set.

**Response:** We thank the commenter for supporting the addition of these measures to the Neurology set.

After consideration of public comments, we are finalizing the measures for addition to the *Neurology Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
**PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE NEUROLOGY SET**

Note: In this final, we proposed the removal of the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

**Comment:** One commenter supported the removal of the three retired opioid measures, Q408, Q412, and Q414 from the Neurology set.

**Response:** We thank the commenter for supporting the removal of measures Q408, Q412, and Q414 from the Neurology set, as they are being removed from the MIPS program.

After consideration of public comments, we are finalizing the measures for removal from the Neurology Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.22. Neurosurgical

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Neurosurgical specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.25a. Oncology/Hematology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Oncology/Hematology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

<td>This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.</td>
</tr>
</tbody>
</table>

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the Oncology/Hematology Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.
B.25b. Radiation Oncology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Radiation Oncology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

<td>We proposed in Table D.48 to expand the measure’s applicability to include the ophthalmology patient population. With the expanded patient population and the clinical relevance to this clinician type, we proposed to add to the Ophthalmology Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</td>
</tr>
</tbody>
</table>

We received no public comments on the measures proposed for addition to this specialty set; therefore, we are finalizing the measures for addition to the Ophthalmology Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## B.27. Orthopedic Surgery

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Orthopedic Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

</table>

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the Orthopedic Surgery Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.
B.28. Otolaryngology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Otolaryngology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

<td>We proposed in Table D.18 to expand the measure’s applicability to include the pediatric patient population. With the expanded patient population and the clinical relevance to this clinician type, we proposed to add to the Pediatric specialty set.</td>
</tr>
</tbody>
</table>

We received no public comments on the measures proposed for addition to this specialty set; therefore, we are finalizing the measures for addition to the Pediatrics Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## B.31. Physical Medicine

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Physical Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

<td>American Academy of Neurology</td>
<td>We proposed to include this measure in the Physical Therapy/Occupational Therapy specialty set as it is clinically relevant to this clinician type.</td>
</tr>
</tbody>
</table>

**Comment:** Once commenter was supportive of adding measures Q283 and Q286 to the Physical Therapy/Occupational Therapy set.

**Response:** We thank the commenter for supporting the addition of measures Q283 and Q286 to this specialty set.

After consideration of public comments, we are finalizing the measures for addition to the *Physical Therapy/Occupational Therapy Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## B.32. Physical Therapy/Occupational Therapy

### PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE PHYSICAL THERAPY/OCCUPATIONAL THERAPY SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

<table>
<thead>
<tr>
<th>NQF # / eCQM NQF #</th>

<td>Process</td>
<td>Effective Clinical Care</td>
<td>Dementia: Functional Status Assessment: Percentage of patients with dementia for whom an assessment of functional status was performed at least once in the last 12 months.</td>
<td>American Psychiatric Association/ American Academy of Neurology</td>
<td>We proposed to remove this measure from the Physical Therapy/Occupational Therapy set as it is duplicative of measure Q182: Functional Outcome Assessment. Measure Q182 includes much of the patient population in measure Q282, but is more robust in that it requires more frequent assessments and a plan of care.</td>
</tr>
</tbody>
</table>

**Comment:** One commenter supported the removal of measure Q282 from the Physical Therapy/Occupational Therapy set and agreed with the rationale that the measure is duplicative to measure Q182.

**Response:** We thank the commenter for supporting the removal of measure Q282 from this specialty set.

After consideration of public comments, we are finalizing the measures for removal from the Physical Therapy/Occupational Therapy Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.
B.33. Plastic Surgery

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Plastic Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.36. Pulmonology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Pulmonology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

**B.38. Skilled Nursing Facility**

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Skilled Nursing Facility specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.41. Urgent Care

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE URGENT CARE SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

<table>
<thead>
<tr>

<td>Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse): Percentage of patients aged 18 years and older, with a diagnosis of acute sinusitis who had a computerized tomography (CT) scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis.</td>
<td>American Academy of Otolaryngology - Head and Neck Surgery Foundation</td>
<td>This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.</td>
<td></td>
</tr>
</tbody>
</table>

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the Urgent Care Specialty Measure Set as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.
B.42. Urology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Urology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

Wisconsin Collaborative for Healthcare Quality (WCHQ)
### TABLE Group C: Previously Finalized Quality Measures Finalized for Removal in the 2023 MIPS Payment Year and Future Years

In this final rule, we are removing 11 previously finalized quality measures from the MIPS Program for the 2021 MIPS performance period/2023 MIPS payment year and future years. These measures are discussed in detail below. Our measure removal criteria was discussed in the CY 2019 PFS final rule (83 FR 59763 through 59765).

Further considerations are given in the evaluation of the measure’s performance data, to determine whether there is or no longer is variation in performance. As discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763), additional criteria that we use for the removal of measures also includes extremely topped out measures, which means measures that are topped out with an average (mean) performance rate between 98-100 percent. Beginning with the 2020 MIPS performance period/2022 MIPS payment year, we also refer readers to the CY 2020 PFS final rule (84 FR 62957 through 62959) for additional quality measure removal criteria.

**NOTE:** Since publication of the measures in Table C in CY 2021 PFS proposed rule, we have determined the following measures will be retained in the 2021 MIPS performance period/2023 MIPS payment year: Q024, Q048 (MIPS CQMs Specifications collection type only), and Q337. As such, these measures have been removed from Table C and integrated back into the relevant previously finalized measure sets under Table B in this final rule. Our decisions not to finalize these measures for removal in this final rule are detailed in our responses to the public comments for these measures in Table Group C.
### TABLE Group C: Previously Finalized Quality Measures Finalized and Not Finalized for Removal in the 2023 MIPS Payment Year and Future Years

**C.1. Communication with the Physician or Other Clinician Managing On-Going Care Post-Fracture for Men and Women Aged 50 Years and Older**

<tr>
<td>Measure Steward:</td>
<td>National Committee for Quality Assurance</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
</tbody>
</table>

**Rationale for Removal**

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because the measure supports communication between the physician treating the fracture and the clinician managing the patient’s on-going care, but does not ensure that the patient receives the appropriate treatment or testing for osteoporosis. We believe measure Q418: Osteoporosis Management in Women Who Had a Fracture represents a more robust quality outcome in the management of patients with osteoporosis who experience a fracture since the clinical focus of this measure is the care of the patient rather than just the communication of the care plan for on-going post fracture care.

**In the Circumstance the Measure is Retained**

There are no substantive changes or specialty set movement finalized for this measure.

**Comment:** One commenter opposed the removal of measure Q024, stating that it does not believe this measure is duplicative of measure Q418 as that measure only focuses on women, and not the entire population of possible concern. While the commenter appreciated the measure is a process measure that does not address appropriate treatment or testing, this measure captures an important aspect of care continuity for a large proportion of Medicare beneficiaries with fractures that is not addressed in any other MIPS quality measures.

**Response:** We agree that treatment of osteoporosis is important, however, measure Q024 does not ensure treatment of the patient only that the fracture was communicated to the clinician managing the patient’s on-going care. Measure Q418 is more robust in that it requires a bone mineral density test or pharmacologic therapy. After careful consideration, we will maintain this measure for consistency and stability as it is not topped out and still in alignment with guidelines, but may consider removal in the future.

After consideration of public comments, we are not finalizing the removal of measure Q024 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### C.2. Urinary Incontinence: Assessment of Presence or Absence of Urinary Incontinence in Women Aged 65 Years and Older

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>

<tr>
<td>Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Measure Description:</td>
<td>Percentage of female patients aged 65 years and older who were assessed for the presence or absence of urinary incontinence within 12 months.</td>
</tr>
<tr>
<td>Measure Steward:</td>
<td>National Committee for Quality Assurance</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>No</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale for Removal:</td>
<td>We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure does not align with the meaningful measures initiative. This is a process measure that only requires an assessment for the presence or absence of urinary incontinence, which by itself may not have a meaningful direct impact on patient care as the screening itself does not indicate a plan of care was implemented. Additionally, the Medicare Part B Claims Measure Specifications collection type has reached the end of the topped out lifecycle (82 53640).</td>
</tr>
<tr>
<td>In the Circumstance the Measure is Retained</td>
<td>There are no substantive changes or specialty set movement finalized for this measure.</td>
</tr>
</tbody>
</table>

#### Comment:
One commenter opposed removal of measure Q048, stating that according to the Women’s Preventive Services Initiative, screening for urinary incontinence is important as this condition is underdiagnosed and undertreated in the United States. This practice screens for urinary incontinence in order to provide the appropriate diagnosis and ultimately the plan of care, and screens all women over 65 as it is clinically relevant for its practice.

#### Response:
While we agree that this is an important concept, the measure for assessment alone is low-bar and may not drive quality outcomes. Removal allows eligible clinicians to support patients to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File.

#### Comment:
Two commenters opposed removal of measure Q048 from the MIPS program and therefore the Obstetrics/Gynecology and Geriatrics specialty sets because evaluation of incontinence is an important initial evaluative process for female patients 65 or older. While sensible to remove the measure due to the topped out status, it seems reasonable to consider modification to transition this measure to an outcomes measure. The commenter received requests to delay removing this measure until MVPs are implemented and because many TINs using this measure are short of their required six measures for MIPS reporting.

#### Response:
Measure Q048 does not require a quality action (follow up, plan of care, etc.) that links to improved outcomes. The measure does not assess a clinical outcome nor one of the defined MIPS high priority areas. Measure Q050 is a more robust measure that requires a quality action (plan of care) for the appropriate patient population screened and diagnosed with urinary incontinence. We encourage the commenter to collaborate with the measure to expand the population of Q050 to include all women to be screened for urinary incontinence and if positive, develop a plan of care to create a single comprehensive quality measure. After careful consideration, we will maintain the MIPS CQMs Specifications collection type for consistency and stability as it is not topped out and still in alignment with guidelines, but may consider removal in the future. The Medicare Part B Claims Measure Specifications collection type has reached the end of the topped out lifecycle, which does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File.

After consideration of public comments, we are finalizing the removal of measure Q048 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years for the Medicare Part B Claims Measure Specifications collection type only (see Table D.113). Measure Q048 will remain in the MIPS program for 2021 for the MIPS CQMs Specifications collection type.

---

</tr>
</tbody>
</table>

**Measure Description:** Percentage of final reports for screening mammograms that are classified as "probably benign".

**Measure Steward:** American College of Radiology

**High Priority Measure:** Yes

**Measure Type:** Process

**Rationale for Removal**

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is considered a standard of care that has limited opportunity to improve clinical outcomes. Performance on this measure is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance for this inverse measure is 0.428 percent for the MIPS CQMs Specifications collection type and 0.253 percent for the Medicare Part B Claims Measure Specifications collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. As such, the MIPS CQMs Specifications collection type and the Medicare Part B Claims Measure Specifications collection type are considered extremely topped out. The average performance rate is based on the current MIPS benchmarking data located at https://qpp-cm-prod-content.s3.amazonaws.com/uploads/824/2020%20MIPS%20Quality%20Benchmarks.zip

**In the Circumstance the Measure is Retained**

There are no substantive changes or specialty set movement finalized for this measure.

**Comment:** One commenter did not support the removal of measure Q146 since reporting difficulties created by the COVID-19 pandemic may limit relevancy of some measures due to reduced services provided. The use of performance period benchmarks for the 2021 performance year introduces uncertainty in measure selection. The removal of this measure would also limit the pool of measures available for breast imagers, and many groups carve out mammography services into separate TINs, thus group reporting does not broaden the list of available measures for these specialists. In addition, the measure could be useful as part of a measure set for a breast imaging MVP. A second commenter urged CMS to temporarily halt the removal of topped out measures for the 2021 performance year to provide clinicians with consistency as they recover from the COVID-19 PHE, particularly those that may be aligned with future MVPs. A third commenter said removal of this measure would limit the number of measures for radiologists and wanted this topped out measure to remain. A fourth commenter acknowledged the topped out data but suggested retaining the measure with an increase in the data completeness threshold to 90-95 percent since there have been no new radiology measures since 2017. A fifth commenter recommended maintaining the existing MIPS quality measures to ensure consistency, reduce a burden, and allow options in the future for MVPs.

**Response:** While we acknowledge the hardships faced due to the COVID-19 PHE and the specializations found within diagnostic radiation, the performance for measure Q146 has an extremely high and unvarying performance rate. This does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File. The policy for data completeness is established for all measures and is not varied between measures. We encourage the commenter to reach out to measure developers/stewards to develop new outcome/high-priority measures for submission to the Call for Measures for possible future implementation. We understand that ensuring there are measure available for future use in MVPs is important, however, we strive to ensure that all measures align with the Meaningful Measures Initiative, including removal of measures that are extremely topped out.

After consideration of public comments, we are finalizing the removal of measure Q146 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
C.5. Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse)

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>333</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>

</tr>
<tr>
<td>Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Measure Description:</td>
<td>Percentage of patients aged 18 years and older, with a diagnosis of acute sinusitis who had a computerized tomography (CT) scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis.</td>
</tr>
<tr>
<td>Measure Steward:</td>
<td>American Academy of Otolaryngology – Head and Neck Surgery Foundation</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Efficiency</td>
</tr>
</tbody>
</table>

**Rationale for Removal**

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure has reached the end of the topped out lifecycle and has a high performance rate of 2.834 percent for the MIPS CQMs Specifications collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. Given this measure’s continued topped out status, we believe it has a limited opportunity to improve clinical outcomes. The average performance rate is based on the current MIPS benchmarking data located at https://qpp-cm-prod-content.s3.amazonaws.com/uploads/824/2020%20MIPS%20Quality%20Benchmarks.zip.

**In the Circumstance the Measure is Retained**

We proposed to update the denominator eligible encounters to include telehealth encounters as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter opposed removal of measure Q333, stating that while performance on this measure has historically been high, it is still possible to further improve clinical outcomes. Patients who undergo CT scans are exposed to radiation, which is correlated with an increased risk of cancer. This measure disincentivizes CT scans when diagnosing uncomplicated cases of adult sinusitis, which leads to better clinical outcomes. Removing this measure also reduces wasteful spending incurred by ordering CT scans.

A second commenter stated that the removal of measure Q333 would impact the Emergency Medicine and Urgent Care sets. The commenter recognizes that it is not necessarily productive to keep measures that have demonstrated consistently high performance over time. At the same time, measure removal policies limiting the number of measures available to emergency medicine impact the ability of emergency medicine physicians to participate in the MIPS program. The commenter indicated that CMS must adopt a process that allows specialties to more rapidly test and replace obsolete measures. CMS should also work with clinical experts to consider ways to encourage the long-term tracking of topped out measures and allow for the reintroduction of previously topped out measures if a performance gap is later identified.

A third commenter urged CMS to temporarily halt the removal of topped out measures for the 2021 performance year to provide clinicians with consistency as they recover from the COVID-19 PHE, particularly those that may be aligned with future MVPs. A fourth commenter recommended maintaining the existing MIPS quality measures to ensure consistency, reduce a burden, and allow options in the future for MVPs. A fifth commenter requested that CMS consider extending the life of this measure with an updated denominator that adds telehealth as an eligible encounter, and the commenter also thought this would be an excellent measure to include in a future MVP.

**Response:** We agree that this is an important concept and we can appreciate the difficulties of the COVID-19 PHE. We understand that ensuring there are measures available for future use in MVPs is important, however, we strive to ensure that all measures align with the Meaningful Measures Initiative, including the removal of measures that are at the end of the topped out lifecycle. Additionally, by removing measures at the end of the topped out lifecycle, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File. The policy for data completeness is established for all measures and is not varied between measures. We appreciate the comment regarding inclusion of telehealth as an eligible encounter of the measure and encourage the commenter to communicate their request to the measure steward for consideration in future years.

We ensure there is an annual review of quality measures with measure stewards to ensure we maintain measures that reflect meaningful measurement. We believe that measures that are submitted to Call for Measures, vetted by CMS, and reviewed by Measure Applicability Partnership ensure that included MIPS measures are robust and fulfill our goal of incorporating meaningful measurement.

After consideration of public comments, we are finalizing the removal of measure Q333 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

Unauthorized disclosure may result in prosecution to the full extent of the law.
C.6. Psoriasis: Tuberculosis (TB) Prevention for Patients with Psoriasis, Psoriatic Arthritis and Rheumatoid Arthritis on a Biological Immune Response Modifier

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>337</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

**Measure Description:**
Percentage of patients, regardless of age, with psoriasis, psoriatic arthritis and/or rheumatoid arthritis on a biological immune response modifier whose providers are ensuring active tuberculosis prevention either through negative standard tuberculosis screening tests or are reviewing the patient’s history to determine if they have had appropriate management for a recent or prior positive test.

**Measure Steward:** American Academy of Dermatology

**High Priority Measure:** No

**Measure Type:** Process

**Rationale for Removal**
We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure is duplicative to measure Q176: Rheumatoid Arthritis (RA): Tuberculosis Screening because we are proposing in Table D.33 substantive changes to measure Q176 that would broaden the denominator by removing the disease specificity criteria. Therefore, the patient population will overlap between these measures; however, measure Q176 has a broader eligible patient population. In the event the proposed substantive change to measure Q176 was not finalized, we considered maintaining this measure to ensure this patient population is being assessed for appropriate tuberculosis screening.

**In the Circumstance the Measure is Retained**
There are no substantive changes or specialty set movement finalized for this measure.

**Comment:** One specialty dermatology practice said it does not have a broad selection of measures to choose from and opposed the removal of measure Q337, stating that the measure is not duplicative to measure Q176. The practice does not diagnosis rheumatoid arthritis, and there is no mention of psoriasis in measure Q176. The commenter suggested that psoriasis be added to measure Q176, or as an alternative, that measure Q176 be eliminated instead since rheumatoid arthritis is mentioned in measure Q337.

A second commenter opposed the removal of measure Q337, citing that the rationale for removal is the proposed substantive changes under Table D.33 to measure Q176, where the measure population would then overlap with measure Q337. However, if changes to measure Q176 are not finalized, measure Q337 would be retained. The commenter stated that the revision to measure Q176 does not sufficiently cover the patients that dermatologist treat or the medications that are used, as are currently reported under measure Q337. See comments under Table D.33 for further recommendations from this commenter.

**Response:** We proposed a substantive change to measure Q176 in Table D.33 to broaden the denominator by removing the disease specificity criteria. The denominator will now include all patients aged 18 years and older receiving their first course of therapy using a biologic DMARD, regardless of diagnosis. We encourage the commenter to reach out to the measure stewards for measures Q176 and/or Q337 to discuss revisions for possible implementation of a single all-encompassing measure in future years. However, we agree the changes to measure Q176 do not adequately cover all dermatologic medications seen within measure Q337. For this reason, we will maintain measure Q337 for PY2021.

After consideration of public comments, we are not finalizing the removal of measure Q337 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### C.7. Implantable Cardioverter-Defibrillator (ICD) Complications Rate

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>

<tr>
<td>Measure Steward:</td>
<td>American College of Cardiology Foundation</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Outcome</td>
</tr>
</tbody>
</table>

#### Rationale for Removal

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure does not align with the meaningful measures initiative. The limited patient population and adoption of the quality measure does not allow for the creation of benchmarks to provide a meaningful impact to quality improvement. The limited adoption over multiple performance periods suggests this is not an important clinical topic for MIPS eligible clinicians.

#### In the Circumstance the Measure is Retained

There are no substantive changes or specialty set movement finalized for this measure.

**Comment:** One commenter opposed removal of measure Q348, citing the removal rationale that there is limited patient population and adoption of the quality measure does not allow for the creation of benchmarks. The commenter indicated that MIPS policies prevent this measure from being used, such as scoring policies that cap the number of performance achievement points that can be earned on measures that lack a benchmark. It also leaves cardiac electrophysiology with only two relevant measures to report and discourages specialty societies from developing new MIPS measures. The commenter discouraged the removal of highly specialized measures that fill an important clinical gap.

**Response:** We would encourage the commenter to submit comments regarding the MIPS scoring policies. As shown by the continued low adoption rates, measure Q348 is not being implemented by clinicians and a meaningful benchmark cannot be created, meaning this measure is not driving quality care and positive outcomes and is not in alignment with the Meaningful Measure Initiative. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s inability to create a benchmark would limit the score awarded per the 2020 Benchmark File.

After consideration of public comments, we are finalizing the removal of measure Q348 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
C.8. Hepatitis C: Discussion and Shared Decision Making Surrounding Treatment Options

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF #/eCQM NQF #:</td>
<td>N/A/N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>390</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Person and Caregiver-Centered Experience and Outcomes</td>
</tr>
<tr>
<td>Collection Type:</td>
<td>MIPS CQM Specifications</td>
</tr>
</tbody>
</table>

**Measure Description:** Percentage of patients aged 18 years and older with a diagnosis of hepatitis C with whom a physician or other qualified healthcare professional reviewed the range of treatment options appropriate to their genotype and demonstrated a shared decision making approach with the patient. To meet the measure, there must be documentation in the patient record of a discussion between the physician or other qualified healthcare professional and the patient that includes all of the following: treatment choices appropriate to genotype, risks and benefits, evidence of effectiveness, and patient preferences toward treatment.

**Measure Steward:** American Gastroenterological Association

**High Priority Measure:** Yes

**Measure Type:** Process

**Rationale for Removal**
We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the request of the measure steward because this measure does not align with the advancements in hepatitis C treatments. There are now curative treatments over an 8-12-week period with few side effects. Additionally, the measure is at risk of capturing “chronic HCV” patients who are no longer viremic, which would not necessitate HCV shared decision making.

**In the Circumstance the Measure is Retained**
There are no substantive changes or specialty set movement finalized for this measure.

**Comment:** One commenter supported the removal of measure Q390 from the MIPS program.

**Response:** We thank the commenter for supporting the removal of measure Q390. After consideration of public comments, we are finalizing the removal of measure Q390 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### C.9. Opioid Therapy Follow-up Evaluation

| In the Circumstance the Measure is Retained | There are no substantive changes or specialty set movement finalized for this measure. |

**Comment:** One commenter opposed removal of measure Q408, stating that opioid treatment agreements ensure that patients have important information regarding potential risks, benefits, and expectations for patient responsibility before using these medications. It is important that clinicians regularly engage patients during opioid treatment, and there are no other measures to achieve this goal. Providers need to continue to educate and follow up with patients regarding their opioid regimens to help combat the opioid crisis. The commenter recommended that this measure be developed further in future rulemaking to include robust evaluation methods.

Several commenters opposed the removal of measure Q408 and stated that following discussion with the measure steward, there are no newer opioid measures to replace the three measures proposed for removal: Q408, Q412, and Q414. The commenters did not agree that these measures do not align with the most recent guidelines and that the measures related to relevant clinical quality activities. Also, without a pain management specialty measure set it is an administrative burden, as there are not an adequate number of quality measures that apply to the specialty of pain management. A commenter cautioned against actions that may limit the current list of quality measures addressing opioid misuse and related issues. Opioid misuse, and substance use disorders more broadly, have become more prevalent during the COVID-19 PHE. CMS must consider additional quality measures that address opioid misuse and related issues to help acknowledge the invaluable work of physicians in addressing such issues among the most vulnerable Medicare beneficiaries.

**Response:** We thank the commenters for their comments opposing the removal of measure Q408. We agree that this is an important topic and would encourage the commenter to reach out to measure developers to collaborate/work towards a more comprehensive measure with robust evaluation methods for future consideration for implementation into MIPS. The measure steward believed the measure was no longer aligned with current guidelines and is currently topped out. Given the measure steward is no longer supporting the measure, we are unable to continue implementation within MIPS.

After consideration of public comments, we are finalizing the removal of measure Q408 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
C.10. Documentation of Signed Opioid Treatment Agreement

</tr>
<tr>
<td>Measure Steward:</td>
<td>American Academy of Neurology</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Patient Reported Outcome</td>
</tr>
</tbody>
</table>

**Rationale for Removal**

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the measure steward’s request as it is no longer being maintained for inclusion. As there are various tools that providers may choose to use, it difficult to compare measure performance across MIPS eligible clinicians. Additionally, the scores are difficult to capture within the EHR leading to difficulties in determining whether the QoL is being maintained or improving over time.

**In the Circumstance the Measure is Retained**

There are no substantive changes or specialty set movement finalized for this measure.

We received no public comments on the removal of this measure; therefore, we are finalizing the removal of measure Q435 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### C.13. Rate of Surgical Conversion from Lower Extremity Endovascular Revascularization Procedure

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>

<tr>
<td>Measure Description:</td>
<td>Inpatients assigned to endovascular treatment for obstructive arterial disease, the percent of patients who undergo unplanned major amputation or surgical bypass within 48 hours of the index procedure.</td>
</tr>
<tr>
<td>Measure Steward:</td>
<td>Society of Interventional Radiology</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Outcome</td>
</tr>
</tbody>
</table>

#### Rationale for Removal

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is considered a standard of care that has limited opportunity to improve clinical outcomes. Performance on this measure is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance for this inverse measure is 1.854 percent for the MIPS CQMs Specifications collection type and 1.031 percent for the Medicare Part B Claims Measure Specifications collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. As such, the MIPS CQMs Specifications collection type and the Medicare Part B Claims Measure Specifications collection type are considered extremely topped out. The average performance rate is based on the current MIPS benchmarking data located at https://qpp-cm-prod-content.s3.amazonaws.com/uploads/824/2020%20MIPS%20Quality%20Benchmarks.zip

#### In the Circumstance the Measure is Retained

There are no substantive changes or specialty set movement finalized for this measure.

#### Comment

One commenter did not support the removal of measure Q437 since reporting difficulties created by the COVID-19 pandemic may limit relevancy of some measures due to reduced services provided. The use of performance period benchmarks for the 2021 performance year introduces uncertainty in measure selection. The removal of this measure would also limit the pool of measures available for radiologists. A second commenter urged CMS to temporarily halt the removal of topped out measures for the 2021 performance year to provide clinicians with consistency as they recover from the COVID-19 PHE, particularly those that may be aligned with future MVPs. A third commenter said removal of this measure would limit the number of measures for radiologists and wanted this topped out measure to remain.

#### Response

While we acknowledge the hardships faced due to the COVID-19 PHE and the specializations found within radiology the performance for measure Q437 has an extremely high and unvarying performance rate. This does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File.

After consideration of public comments, we are finalizing the removal of measure Q437 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### C.14. All-Cause Hospital Readmission

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>1789 / N/A</td>

<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Communication and Care Coordination</td>
</tr>
<tr>
<td>Collection Type:</td>
<td>Administrative Claims</td>
</tr>
<tr>
<td>Measure Description:</td>
<td>The 30-day All-Cause Hospital Readmission measure is a risk-standardized readmission rate for beneficiaries age 65 or older who were hospitalized at a short-stay acute care hospital and experienced an unplanned readmission for any cause to an acute care hospital within 30 days of discharge.</td>
</tr>
<tr>
<td>Measure Steward:</td>
<td>Yale University</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Outcome</td>
</tr>
</tbody>
</table>

**Rationale for Removal**

We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is duplicative to the new measure being proposed in Table A.1. for the 2021 performance period: Table A.1: Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment Program (MIPS) Eligible Clinician Groups. This proposed new measure is a re-specification of the hospital-level measure and promotes a systems level approach by clinicians, making it a more applicable measure to MIPS eligible clinicians. In the event we did not finalize the proposed new measure: Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment Program (MIPS) Eligible Clinician Groups, we would have maintained this current measure Q458: All-Cause Hospital Readmission.

**In the Circumstance the Measure is Retained**

There are no substantive changes or specialty set movement finalized for this measure.

We received no public comments on this measure proposed for removal; therefore, we are finalizing the removal of measure Q458 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

Comments citing measure Q458, due to the replacement of this measure with new measure Q479, Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment System (MIPS) Groups, are addressed under Table A.1.
TABLE Group D: Previously Finalized Quality Measures with Substantive Changes
Finalized and Not Finalized for the 2023 MIPS Payment Year and Future Years

NOTE: Electronic Clinical Quality Measures (eCQMs) that are National Quality Forum (NQF) endorsed are shown in Table D as follows: NQF # / eCQM NQF #.

The D Tables within this final rule provide the substantive changes finalized for the quality measures in CY 2021. The changes that are made to the denominator codes sets are generalizations of the revisions communicated from the measure stewards to CMS. Additionally, International Classification of Diseases Tenth Edition (ICD-10) and Current Procedural Terminology (CPT) codes that are identified as invalid for CY 2021 may not be identified within the NPRM due to the availability of these changes to the public. If coding revisions to the denominator are impacted due to the timing of 2021 CPT and ICD-10 updates and assessment of these codes inclusion by the Measure Steward, these changes may be postponed until CY 2022. The 2021 Quality Measure Release Notes provide a comprehensive, detailed reference of exact codes changes to the denominators of the quality measures. The Quality Measure Release Notes are available for each of the collection types in the Quality Payment Program Resource Library at https://qpp.cms.gov/about/resource-library under the measure specifications. For eCQM Release Notes, see the eCQI Resource Center at https://ecqi.healthit.gov/ep-ec?globalyearfilter=2020.

In addition to the finalized substantive changes, there may be changes to the coding utilized within the denominator that are not considered substantive in nature but we believe are important to communicate to stakeholders. These changes align with the scope of the current coding, however, this will expand or contract the current eligible population, therefore, review the current year measure specification and the 2021 Quality Measure Release Notes or the eCQM Technical Release Notes once posted to review all coding changes. Language has also been added, to all applicable 2021 quality measure specifications, in the form of an ‘Instructions Note’, to clarify that telehealth encounters are allowed for determination of denominator eligibility. Only in the instance telehealth encounters have not been previously allowed as denominator eligible, will the D table corresponding to that measure reflect an update to the denominator allowing for telehealth encounters in the ‘Substantive Change’ cell.
D.1 Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)

<td>Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients 18-75 years of age with diabetes who had hemoglobin A1c &gt; 9.0% during the measurement period.</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications.</td>
</tr>
<tr>
<td></td>
<td>Updated denominator exclusion: For the eCQM Specification collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</td>
</tr>
<tr>
<td></td>
<td>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are &quot;on or&quot; before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to &quot;Frailty LTI Advanced Illness and Frailty Exclusion Not Including Over Age 80&quot;.</td>
</tr>
<tr>
<td></td>
<td>Updated denominator exclusion: For Medicare Part B Claims Measure Specifications and MIPS CQMs Collection types: Revised: Patients age 66 and older in Institutional Special Needs Plans (SNP) or residing in long-term care with a POS code 32, 33, 34, 54 or 56 for more than 90 consecutive days during the measurement period.</td>
</tr>
<tr>
<td></td>
<td>Updated denominator exclusion: For the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection type: Added: identify patients with advanced illness and frailty</td>
</tr>
<tr>
<td></td>
<td>Updated numerator options: For the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</td>
</tr>
<tr>
<td></td>
<td>Updated numerator instructions: For the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection type: Added: Do not include HbA1c levels reported by the patient. Added: Only patients with a diagnosis of Type 1 or Type 2 diabetes should be included in the denominator of this measure; patients with a diagnosis of secondary diabetes due to another condition should not be included.</td>
</tr>
<tr>
<td>Steward:</td>
<td>National Committee for Quality Assurance</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Intermediate Outcome</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to update the denominator exclusion language and logic to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period.</td>
</tr>
<tr>
<td></td>
<td>Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. The numerator options for Performance Not Met were stratified to have the ability to better assess hemoglobin A1c levels within the patient population that showed better control. Instructions have been added to ensure the correct patient population as the measure intent is to assess hemoglobin A1c control in Type 1 or Type 2 diabetics and not those patients who have diabetes due to another condition.</td>
</tr>
<tr>
<td></td>
<td>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.(c)(1)(c) of this final rule.</td>
</tr>
<tr>
<td>Comment:</td>
<td>One commenter opposed the proposed changes to the numerator for measure Q001. The removal of patient-reported HbA1cs could increase unnecessary testing for measure compliance. In addition, further clarification on acceptable sources is necessary.</td>
</tr>
</tbody>
</table>

Two commenters did not agree with the proposal to add a third level of stratification to the "Performance Not Met" numerator option only for the manual MIPS CQM and Medicare Part B Claims collection types. The commenters stated that by dividing the latter option into two – Most recent hemoglobin A1c (HbA1c) level greater than or equal to 7.0 percent and less than 8.0 percent; and Most recent hemoglobin A1c (HbA1c) level greater than or equal to 8.0 percent and less than or equal to 9.0 percent, CMS is creating additional burden and additional time required to report for administrative staff, particularly those in small and rural practices without an EHR. The commenter is concerned that CMS is making this measure more difficult to complete and report, but only for manual collection types. This creates burden for small and rural practices. In addition, ophthalmology practices have seen a significant reduction in visits due to COVID-19. The commenter urged CMS not to finalize either of these changes. A second commenter stated that having new stratifications means that CMS may not have sufficient data to establish reliable benchmark for this measure for each stratification. In addition, given the fact that CMS proposed to keep this measure in the APP quality measure list, we believe that CMS should keep the measures as are to reduce any further complication already caused by the transition from the

INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:

Unauthorized disclosure may result in prosecution to the full extent of the law.
### Category | Description
--- | ---
current MIPS APM reporting standard to APP reporting. If CMS finalizes this measure with 3 stratifications, the commenter asked that CMS clarify which stratification will be pay-for-performance and which will be pay-for-reporting measure, and that CMS identify the benchmark for the pay-for-performance stratification early in the performance year.

**Response:** While we understand the desire to ensure there is not unnecessary testing, the measure only requires the assessment of one hemoglobin A1c measurement each performance period and it is important to ensure accurate results are documented. The measure steward believes, and we agree, that it is important to have a more granular picture of hemoglobin A1c levels to ascertain the level of control currently being achieved as diabetes is a leading cause of death in the United States. Additionally, there is ongoing discussions regarding acceptable levels of hemoglobin A1c, it is important to obtain this granular information to continue these discussions and drive quality outcomes. With regard to the benchmark, all ‘performance not met’ numerator options will be combined and removed from the performance rate calculation. The addition of these stratifications will have no bearing on the ability to create a reliable benchmark for the measure. We encourage the commenter to communicate this request to the measure steward for consideration in future years.

After consideration of public comments, we are finalizing the changes to measure Q001 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.
### D.2 Heart Failure (HF): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) or Angiotensin Receptor Neprilysin Inhibitor (ARNI) Therapy for Left Ventricular Systolic Dysfunction (LVSD)

<table>

<td>0081 / 0081e</td>
</tr>
<tr>
<td>Quality#:</td>
<td>005</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS135v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 18 years and older with a diagnosis of heart failure (HF) with a current or prior left ventricular ejection fraction (LVEF) &lt; 40% who were prescribed ACE inhibitor or ARB or ARNI therapy either within a 12-month period when seen in the outpatient setting OR at each hospital discharge.</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>Updated the denominator exception logic: For the eCQM Specifications collection type: Added sacubitril in the Allergy/Intolerance logic.</td>
</tr>
<tr>
<td></td>
<td>Updated denominator: For all collection types: Submission Criteria 1: Added telehealth as eligible for all encounters.</td>
</tr>
<tr>
<td>Steward:</td>
<td></td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>No</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to include sacubitril in the Allergy/Intolerance logic as this is one of the components of ARNI and an allergy to this ingredient would be a clinically appropriate reason for allowing a denominator exception for this patient population.</td>
</tr>
<tr>
<td></td>
<td>We proposed to add telehealth encounters as denominator eligible for submission criteria 1 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</td>
</tr>
<tr>
<td>Comment:</td>
<td>Several commenters supported the addition of telehealth reporting for measure Q005.</td>
</tr>
<tr>
<td>Response:</td>
<td>We thank the commenters for supporting the addition of telehealth reporting for this measure.</td>
</tr>
</tbody>
</table>

After consideration of public comments, we are finalizing the changes to measure Q005 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of additional telehealth encounter eligibility for eCQM Specifications collection type as this is already in the current measure.

After consideration of public comments, we are finalizing the changes to measure Q006 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.4 Coronary Artery Disease (CAD): Beta-Blocker Therapy – Prior Myocardial Infarction (MI) or Left Ventricular Systolic Dysfunction (LVEF < 40%)

**Category**
- Description

**NQF # / eCQM NQF #:** 0070 / 0070e

**Quality #:** 007

**CMS eCQM ID:** CMS145v9

**National Quality Strategy Domain:** Effective Clinical Care

**Current Measure Description:** Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12-month period who also have a prior MI or a current or prior LVEF < 40% who were prescribed beta-blocker therapy.

**Substantive Change:**

**Updated logic: For the eCQM Specifications collection type:** Added constraint to measure logic in instances when the patient has both prior (within the past 3 years) MI and LVEF < 40%.

The guidance is revised to read: For the eCQM Specifications collection type:

- Beta-blocker therapy:
  - For patients with prior MI, beta-blocker therapy includes any agent within the beta-blocker drug class. As of 2015, no recommendations or evidence are cited in current stable ischemic heart disease guidelines for preferential use of specific agents
  - For patients with prior LVEF <40%, beta-blocker therapy includes the following: bisoprolol, carvedilol, or sustained release metoprolol succinate.

The requirement of two or more visits is to establish that the eligible professional or eligible clinician has an existing relationship with the patient.

A range value should satisfy the logic requirement for 'Ejection Fraction' as long as the ranged observation value clearly meets the less than 40% threshold noted in the denominator logic. A range that is inclusive of or greater than 40% would not meet the measure requirement.

If a patient has had a myocardial infarction (MI) within the past 3 years and a current or prior LVEF < 40% (or moderate or severe LVSD), the patient should only be counted in Population Criteria 1.

This eCQM is a patient-based measure.

This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM. - Beta-blocker therapy:

**The instructions are revised to read: For the MIPS CQMs Specifications collection type:** This measure is to be submitted a minimum of once per performance period for all patients with a diagnosis of CAD seen during the performance period. Only patients who had at least two denominator-eligible visits during the performance period will be counted for Submission Criteria 1 and Submission Criteria 2 of this measure. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure for the primary management of patients with CAD based on the services provided and the measure-specific denominator coding.

The MIPS eligible clinician should submit data on one of the submission criteria, depending on the clinical findings. If the patient has CAD or history of cardiac surgery and a current or prior LVEF < 40% (or moderate or severe LVSD), use Submission Criteria 1. If the patient has CAD or history of cardiac surgery and has a prior (within the past 3 years) MI, use Submission Criteria 2. The 3-year lookback period for the prior MI should be from the time of the encounter that is used to qualify for the denominator and evaluate the numerator. If the patient has had an MI within the past 3 years and has a current or prior LVEF < 40% (or moderate or severe LVSD), the MIPS eligible clinician should submit quality-data codes for Submission Criteria 1 and this will count as appropriate submission for this patient.

**Updated denominator criteria: For all collection type:** Added telehealth as eligible for all encounters.

**Updated denominator criteria: For the MIPS CQMs Specifications collection type:**

- Denominator Criteria One: Revised: Left ventricular ejection fraction (LVEF) < 40% or documentation of moderate or severe LVSD.

**Updated denominator exception: For eCQM Specifications collection type:** Removed coding from the ‘Medical Reason’ value set for concepts not indicating medical contraindication.

**Steward:**

**High Priority Measure:** No

**Measure Type:** Process

We proposed to update the eCQM Specifications collection type logic to improvement alignment with measure intent as it will add constraints to help prevent double counting of patients who had both a myocardial infarction and LVEF < 40% within the past 3 years. Additionally, the guidance was revised to help clarify which population eligible patients should be included for the purposes of this measure. We also proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.

For both the eCQM Specifications and MIPS CQMs Specifications collection types, the guidance and instructions have been updated, respectively, to add moderate or severe LVSD as a proxy for LVEF < 40%. The measure steward’s Technical Expert Panel (TEP) determined that moderate or severe LVSD is an appropriate proxy and aligns with the intent of the measure. We agreed with this addition as LVSD can be “defined as a left ventricular ejection fraction less than 40 percent or a narrative description consistent with moderate or severe systolic dysfunction.” (Per the Joint Commission Specifications Manual (v2018A)). Additionally, we proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to the measure.

**Rationale:**

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

</tr>
</tbody>
</table>

**Substantive Change:**

- **Modified collection type:** eCQM Specifications
- **Updated denominator exception:** For eCQM Specifications collection type: Removed coding from the ‘Medical Reason’ value set for concepts not indicating medical contraindication.
- **Per the ‘Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting’:** Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.

**Steward:** American Academy of Ophthalmology

**High Priority Measure:** No

**Measure Type:** Process

**Rationale:**

- We proposed to remove the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types as they have reached the end of the topped out lifecycle as finalized in 82 FR 53640. However, the benchmarking data continues to show a gap for the eCQM Specifications collection type, as such, the measure will be retained for this collection type.
- We also proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.
- We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.

**Comment:** One commenter opposed CMS’s proposal to remove the Medicare Part B Claims Measure Specifications collection type for measure Q012 because it would adversely impact ophthalmologists, particularly those in small and rural practices who must rely on the claims reporting collection type because they cannot afford to adopt CEHRT. The commenter recognized the topped out status under the claims and MIPS CQM collection types, but removing this measure entirely from the claims collection type will result in even fewer measures relevant to ophthalmologists’ scope of practice.

**Response:** We strive to ensure that all measures align with the Meaningful Measures Initiative, including the removal of measures that are at the end of the topped out lifecycle. Additionally, by removing collection types at the end of the topped out lifecycle, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File.

After consideration of public comments, we are finalizing the changes to measure Q012 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.7 Age-Related Macular Degeneration (AMD): Dilated Macular Examination

<table>
<thead>
<tr>
<th>Category</th>

<tr>
<td>Steward:</td>
<td>American Academy of Ophthalmology</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to remove the “sender” and “recipient” attributes from the numerator logic and the value set/coding of the eCQM Specifications collection type and reverted to the numerator logic from performance year 2019. These attributes increased burden and were difficult to implement. We also proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception. We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.</td>
</tr>
<tr>
<td>Comment:</td>
<td>One commenter supported CMS’s proposed removal of “sender” and “recipient” attributes. This will decrease burden and make the measure technically easier to report. The commenter also supported the proposed removal of denominator exception “Medical Reason” codes as they are inappropriate for this measure.</td>
</tr>
<tr>
<td>Response:</td>
<td>We thank the commenter for supporting the changes to this measure. After consideration of public comments, we are finalizing the changes to measure Q019 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</td>
</tr>
</tbody>
</table>
## D.9 Advance Care Plan

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>0326 / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>047</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Communication and Care Coordination</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 65 years and older who have an advance care plan or surrogate decision maker documented in the medical record or documentation in the medical record that an advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan.</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>Updated denominator: For all collection types: Added clinical social worker clinician type.</td>
</tr>
<tr>
<td>Steward:</td>
<td>National Committee for Quality Assurance</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to add the clinical social worker clinician type to the denominator eligible encounters as this clinical concept is applicable to their scope of practice since these clinicians are integral to ensuring patients have up to date advance care plans and/or surrogate decision makers documented within the medical record.</td>
</tr>
</tbody>
</table>

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q047 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.10 Chronic Obstructive Pulmonary Disease (COPD): Long-Acting Inhaled Bronchodilator Therapy

<table>

<td>0069 / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>065</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS154v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Efficiency and Cost Reduction</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of children 3 months - 18 years of age who were diagnosed with upper respiratory infection (URI) and were not dispensed an antibiotic prescription on or 3 days after the episode.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

The title is revised from ‘Appropriate Treatment for Children with Upper Respiratory Infection (URI)’ to: Appropriate Treatment for Upper Respiratory Infection (URI)

The description is revised to read: Percentage of episodes for patients 3 months of age and older with a diagnosis of upper respiratory infection (URI) that did not result in an antibiotic dispensing event.

The initial patient population is revised to read: For the eCQM Specifications collection type: Outpatient visits, telephone visits, online assessments, observation stays or emergency department visits with a diagnosis of URI during the measurement period among patients 3 months of age and older.

Updated stratification: For the eCQM Specifications collection type: 3 months-17 years, 18-64 years, 65 years and older.

The guidance is revised to read: For the eCQM Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period. This eCQM is an episode-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

The denominator is revised to read: For the MIPS CQMs Specifications collection type: Outpatient visits, telephone visits, online assessments, observation stays or emergency department visits with a diagnosis of upper respiratory infection (URI) during the measurement period among patients 3 months of age and older.

Updated denominator criteria: For the MIPS CQMs Specifications collection type: Revised: Patients aged 3 months of age and older on date of encounter. Revised denominator eligible coding to include telehealth with qualified nonphysician health care professional.

The denominator instruction is revised to read: For the MIPS CQMs Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period. If the patient has more than one episode in a 31-day period, include only the first episode.

Updated denominator exclusion:

For the eCQMs Specifications collection type: Added:

1. Exclude URI episodes when the patient had a competing comorbid condition during the 12 months prior to or on the episode date.

Revised:

1. Exclude URI episodes when the patient had a new or refill prescription of antibiotics in the 30 days prior to or on the episode date.
2. Exclude URI episodes when the patient had competing diagnosis on or 3 days after the episode date.
3. Exclude URI episodes when the patient had hospice care overlapping with the measurement period.

For MIPS CQMs Specifications collection type: Added:

1. URI episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date (e.g., tuberculosis, neutropenia, cystic fibrosis, chronic bronchitis, pulmonary edema, respiratory failure, rheumatoid lung disease).
2. URI episodes when the patient had a new or refill prescription of antibiotics (Table 1) in the 30 days prior to or on the episode date.

Revised:

1. URI episodes when the patient had competing diagnoses on or 3 days after the episode date (e.g., intestinal infection, pertussis, bacterial infection, Lyme disease, otitis media, acute sinusitis, acute pharyngitis, acute tonsillitis, chronic sinusitis, infection of the pharynx/larynx/tonsils/adenoids, prostatitis, cellulitis, mastoiditis, or bone infections, acute lymphadenitis, impetigo, skin staph infections, pneumonia/gonococcal infections, venereal disease (syphilis, chlamydia, inflammatory diseases [female reproductive organs]), infections of the kidney, cystitis or UTI, and acne).

Removed:

1. Children who are taking antibiotics in the 30 days prior to the date of the encounter during which the diagnosis was established.

The numerator is revised to read:

For the eCQMs Specifications collection type: URI episodes without a prescription for antibiotic medication on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.

---

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
For the MIPS CQMs Specifications collection type:
URI episodes without a prescription for antibiotic medication (from Table 1) on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.

**Rationale:**
We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding overuse of antibiotics are not limited to the pediatric population. This will allow for clinicians to report on both pediatric and adult patients. The denominator instructions and guidance are revised to clarify that only the first episode should be included if a patient has multiple episodes in a 31 day period. The denominator exclusions have been updated to reflect the change in age range and to align language with the measure submission frequency. Additionally, a denominator exclusion has been added to remove patients with competing comorbid conditions from the denominator population as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care.

**Updated value set:** For the eCQM Specifications collection type: Added ‘Aggressive periodontitis’ to the value set for competing diagnosis.

We proposed a substantive change to the Numerator for the MIPS CQMs Specifications collection type: however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to: URI episodes without a prescription for antibiotic medication (Table 1) on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.

**Comment:** One commenter stated that placing an acute and transient diagnosis on the patient problem list has the potential to inappropriately identify URI encounters because problem lists do not have expiration dates. The commenter recommended that a URI is an acute diagnosis that should only be captured as a visit diagnosis. The commenter also stated that antibiotics ordered without an end date have the potential to be included in the measure even if the antibiotic order was placed months prior to the URI encounter. The commenter recommended that the logic should not look at any antibiotics outside of the 30 day window.

**Response:** We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q065 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.

</thead>
<tbody>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
</tbody>
</table>

**Rationale:**
We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding overuse of antibiotics are not limited to the pediatric population. This will allow for clinicians to report on both pediatric and adult patients. The denominator instructions and guidance are revised to clarify that only the first episode should be included if a patient has multiple episodes in a 31 day period. The denominator exclusions have been updated to reflect the change in age range and to align language with the measure submission frequency. Additionally, a denominator exclusion has been added to remove patients with competing comorbid conditions from the denominator population as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care.

The numerator note for the MIPS CQMs Specifications collection type was updated to clarify use of delayed prescriptions and the antibiotic medication table. Given the intent of the measure is to assess appropriate antibiotic use, delayed prescriptions will be considered numerator non-compliant as this would still constitute prescribing an antibiotic. The antibiotic medication table was also updated to be clinically relevant.

The eCQM Specifications collection type value set for competing diagnosis was updated to include aggressive periodontitis as it is clinically relevant to the denominator exclusion intent. Additionally, a telehealth services value set was added to the eligible encounters for a more complete patient population.

We proposed a substantive change to the Numerator for the MIPS CQMs Specifications collection type: however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to: URI episodes without a prescription for antibiotic medication (Table 1) on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.

This additional refinement of revising ‘(from Table 1)’ to ‘(Table 1)’ does not affect the intent of the proposed substantive change.

**Comment:** One commenter stated that placing an acute and transient diagnosis on the patient problem list has the potential to inappropriately identify URI encounters because problem lists do not have expiration dates. The commenter recommended that a URI is an acute diagnosis that should only be captured as a visit diagnosis. The commenter also stated that antibiotics ordered without an end date have the potential to be included in the measure even if the antibiotic order was placed months prior to the URI encounter. The commenter recommended that the logic should not look at any antibiotics outside of the 30 day window.

**Response:** We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q065 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## D.12 Appropriate Testing for Children with Pharyngitis

<td>eCQM Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of children 3-18 years of age who were diagnosed with pharyngitis, ordered an antibiotic and received a group A streptococcus (strept) test for the episode.</td>
</tr>
</tbody>
</table>

### Substantive Change:

**The title is revised from ‘Appropriate Testing for Children with Pharyngitis’ to: Appropriate Testing for Pharyngitis**

The description is revised to read: The percentage of episodes for patients 3 years and older with a diagnosis of pharyngitis that resulted in an antibiotic dispensing event and a group A streptococcus (strept) test.

The guidance is revised to read: For the eCQM Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period.

This eCQM is an episode-based measure.

This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

The initial patient population is revised to read: For the eCQM Specifications collection type: Outpatient, telephone, online assessment, observation, or emergency department (ED) visits with a diagnosis of pharyngitis and an antibiotic dispensing event among patients 3 years or older.

The denominator is revised to read: For the MIPS CQMs Specifications collection type: Outpatient, telephone, online assessment, observation, or emergency department (ED) visits with a diagnosis of pharyngitis and an antibiotic dispensing event among patients 3 years or older.

Updated denominator criteria: For the MIPS CQMs Specifications collection type: Revised denominator eligible coding to include telehealth with qualified nonphysician health care professional.

The denominator instructions are revised to read: For the MIPS CQMs Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period. If a patient has more than one eligible episode in a 31-day period, include only the first eligible episode.

Updated denominator exclusion: For the eCQMs Specifications collection type: Added: 1. Exclude episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date.

Revised: 1. Exclude episodes where the patient is taking antibiotics in the 30 days prior to the episode date.

2. Exclude episodes when the patient had hospice care overlapping with the measurement period.

3. Exclude episodes where the patient had a competing diagnosis within 3 days after the episode date.

For MIPS CQMs Specifications collection type: Added: 1. Episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date (e.g., tuberculosis, neutropenia, cystic fibrosis, chronic bronchitis, pulmonary edema, respiratory failure, rheumatoid lung disease).

Revised: 1. Episodes where the patient is taking antibiotics (Table 1) in the 30 days prior to the episode date.

2. Episodes where the patient had a competing diagnosis within 3 days after the episode date (e.g., intestinal infection, pertussis, bacterial infection, Lyme disease, otitis media, acute sinusitis, chronic sinusitis, infection of the pharynx/larynx/tonsils/adenoids, prostatitis, cellulitis, mastoiditis, or bone infections, acute lymphadenitis, impetigo, skin staph infections, pneumonia/gonococcal infections, venereal disease (syphilis, chlamydia, inflammatory diseases [female reproductive organs]), infections of the kidney, cystitis or UTI).

Updated Table 1: For the MIPS CQMs Specifications collection type: Added: Note: This list should be used when assessing antibiotic prescriptions for the denominator and denominator exclusion components.

Revised: Table 1 – Antibiotic Medication: Added Penicillin G benzathine and removed ‘Miscellaneous Antibiotics Category’ (Erythromycin-sulfisoxazole).

The numerator is revised to read: For all collection types: A group A streptococcus test in the 7-day period from 3 days prior to the episode date through 3 days after the episode date.

Updated stratification: For the eCQM Specifications collection type: 3-17 years, 18-64 years, 65 years and older.

Updated value set: For the eCQM Specifications collection type: Added telehealth services value set to eligible encounters.

Steward: National Committee for Quality Assurance

High Priority Measure: Yes
<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
</tbody>
</table>

Rationale:
We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding appropriate testing are not limited to the pediatric population. This will allow for clinicians to report on both pediatric and adult patients. The denominator instructions and guidance are revised to clarify that only the first episode should be included if a patient has multiple episodes in a 31-day period. The denominator exclusions have been updated to reflect the change in age range and to align language with the measure submission frequency. Additionally, a denominator exclusion has been added to remove patients with competing comorbid conditions from the denominator population as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care. For the MIPS CQMs Specifications collection type, Table 1 was updated to remain clinically relevant and a note was added to clarify usage of Table 1 for the purposes of this measure.

The eCQM Specifications collection type value set for competing diagnosis was updated to include aggressive periodontitis as it is clinically relevant to the denominator exclusion intent. Additionally, a telehealth services value set was added to the eligible encounters for a more complete patient population.

We proposed a substantive change to the denominator exclusion for the MIPS CQMs Specifications collection type: however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

**Added:**
1. Episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date (e.g., tuberculosis, neutropenia, cystic fibrosis, chronic bronchitis, pulmonary edema, respiratory failure, rheumatoid lung disease).

**Revised:**
1. Episodes where the patient is taking antibiotics (Table 1) in the 30 days prior to the episode date.
2. Episodes where the patient had a competing diagnosis within three days after the episode date (e.g., intestinal infection, pertussis, bacterial infection, Lyme disease, otitis media, acute sinusitis, chronic sinusitis, infection of the adenoids, prostatitis, cellulitis, mastoiditis, or bone infections, acute lymphadenitis, impetigo, skin staph infections, pneumonia/gonococcal infections, venereal disease (syphilis, chlamydia, inflammatory diseases [female reproductive organs]), infections of the kidney, cystitis or UTI)

This additional refinement of language within the competing diagnosis exclusion does not affect the intent of the proposed substantive change, but removes the duplication in denominator eligible clinical encounters that present with a bacterial infection therefore allowing reporting eligible clinicians to report a denominator exclusion for these patients would not influence overall performance of the measure.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q066 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.13 Acute Otitis Externa (AOE): Systemic Antimicrobial Therapy – Avoidance of Inappropriate Use

<td>Substantive Change:</td>
<td>Updated guidance: Added: In recognition of the growing use of integrated and team-based care, the diagnosis of dementia and the assessment of cognitive function need not be performed by the same provider or clinician.</td>
</tr>
<tr>
<td></td>
<td>The initial patient population is revised to read: Patient visits during which a new diagnosis of MDD, single or recurrent episode, was identified.</td>
</tr>
<tr>
<td></td>
<td>The numerator is revised to read: Patient visits during which a new diagnosis of MDD, single or recurrent episode, was identified and a suicide risk assessment was completed during the visit.</td>
</tr>
</tbody>
</table>

| Steward:                    | Mathematica                                                                 |
| High Priority Measure:      | No                                                                         |
| Measure Type:               | Process                                                                    |

**Rationale:**

We proposed to update the description, initial patient population, and numerator language to better align with the measure intent and clarify that the measure is episodic in nature. The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q107 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.15 Preventive Care and Screening: Influenza Immunization

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>0041 / 0041e</td>
</tr>

<td>Quality#:</td>
<td>110</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS147v10</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Community/Population Health</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 6 months and older seen for a visit between October 1 and March 31 who received an influenza immunization OR who reported previous receipt of an influenza immunization.</td>
</tr>
</tbody>
</table>

#### Substantive Change:

- **Updated guidance:** For the eCQM Specifications collection type: Revised:
  
  Due to the changing stance of the CDC/ACIP recommendations regarding the live attenuated influenza vaccine (LAIV) for a particular flu season, this measure will not include the administration of this specific formulation of the flu vaccination. Given the variance of the timeframes for the annual update cycles, program implementation, and publication of revised recommendations from the CDC/ACIP, it has been determined that the coding for this measure will specifically exclude this formulation, so as not to inappropriately include this form of the vaccine for flu seasons when CDC/ACIP explicitly advise against it. However, it is recommended that all eligible professionals or eligible clinicians to review the guidelines for each flu season to determine appropriateness of the LAIV in other formulations of the flu vaccine. Should the LAIV be recommended for administration for a particular flu season, eligible professional or clinician may consider one of the following options: 1) satisfy the numerator by reporting either previous receipt or using the CVX 88 for unspecified formulation, 2) report a denominator exception, either as a patient reason (e.g., for patient preference) or a system reason (e.g., the institution only carries LAIV). This is a patient-based measure.

- **Updated denominator note:** For the Medicare Part B Claims Measure Specifications collection type: Added:
  
  For the purposes of the program, to submit on the flu season 2020-2021, the patient must have a qualifying encounter between January 1 and March 31, 2021. To submit on the flu season 2021-2022, the patient must have a qualifying encounter between January 1 and December 31, 2021. A qualifying encounter needs to occur within the flu season that is being submitted; any additional encounter(s) may occur at any time within the measurement period.

- **Updated denominator exception:** For the eCQM Specifications collection type: Removed coding from the ‘Medical Reason’ value set for concepts not indicating medical contraindication.

- **Updated denominator:** For all collection types: Added telehealth as eligible encounter.

#### Rationale:

- **Rationale:**
  
  We proposed to update the denominator note for the Medicare Part B Claims Measure Specifications collection type to add clarity and align the language with the MIPS CQMs Specifications collection type.

- **Rationale:**
  
  We proposed to update the guidance for the eCQM Specifications collection type to better align with the updated CDC/ACIP clinical guidelines and to clarify the intent of the measure. We also proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.

- **Rationale:**
  
  We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

- **Rationale:**
  
  We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

---

We proposed a substantive change to the Denominator Note for the Medicare Part B Claims Measure Specifications collection type; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: For the purposes of the program, in order to submit on the flu season 2020-2021, the patient must have a qualifying encounter between January 1 and March 31, 2021. In order to submit on the flu season 2021-2022, the patient must have a qualifying encounter between October 1 and December 31, 2021. A qualifying encounter needs to occur within the flu season that is being submitted; any additional encounter(s) may occur at any time within the measurement period.

This additional refinement of including the language ‘in order’ preceding the instance of ‘to submit’ within the proposed language does not affect the intent of the proposed substantive change.

**Comment:** One commenter supported the addition of telehealth reporting for measure Q110.

**Response:** We thank the commenter for supporting the addition of telehealth reporting for this measure.

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comment:</td>
<td>One commenter did not support the addition of telehealth reporting for measure Q110.</td>
</tr>
<tr>
<td>Response:</td>
<td>We believe that it is important to ensure all patients have received an influenza vaccine as this is critical to the community and population health. It is important to have a complete denominator patient population to assess numerator compliance, which should include those encounters that occur via telehealth.</td>
</tr>
</tbody>
</table>

After consideration of public comments, we are finalizing the changes to measure Q110 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications. In addition, we are not finalizing the proposed additional telehealth encounter eligibility substantive change for the eCQM Specifications collection type because this is already specified in the current measure.
D.16 Breast Cancer Screening

<table>
<thead>

<td>Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of women 50 - 74 years of age who had a mammogram to screen for breast cancer in the 27 months prior to the end of the measurement period.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

- **Modified collection type:** Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications

- **Updated denominator exclusion:** For the eCQM Specifications collection type: Removed logic and value set related to unilateral mastectomy.

- **Updated denominator exclusion:** For the eCQM Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.

- **Updated denominator exclusion logic:** For the eCQM Specifications collection type: Updated encounters so they are “on or before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to ”FrailtyLTI Advanced Illness and Frailty Exclusion Not Including Over Age 80”.

- **Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during the measurement period.

- **Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications collection type and the MIPS CQMs Specifications collection type: Added coding to identify patients with advanced illness and frailty.

**Steward:** National Committee for Quality Assurance

**High Priority Measure:** No

**Measure Type:** Process

We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period.

For the eCQM Specifications collection, we proposed removing the logic and value set related to unilateral mastectomy to ensure that all patients with existing breast tissue are included in the initial patient population as it is important they receive screening for breast cancer on remaining breast tissue.

Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

**Comment:** One commenter had concerns about removing unilateral mastectomy from the mammogram quality measure. Current specifications clarify that both a right and left unilateral mastectomy is completed to count as an exclusion. The commenter saw no reason to remove that logic, as it still accomplishes what CMS is asking for by ensuring that, “all patients with existing breast tissue are included in the initial patient population as it is important they receive screening for breast cancer on remaining breast tissue.” A second commenter requested that CMS provide clarification on the statement “Removed logic and value set related to unilateral mastectomy,” as the commenter believed the intent of this statement is unclear.

**Response:** This revision was made to ensure that the logic is in alignment with the measure intent. As the logic is currently, a patient would be excluded if they had two unilateral mastectomy codes. However, it is possible for a patient to have two partial mastectomies on the same breast. Therefore, instances of mastectomies without indication of right or left side are being removed to increase specificity and ensure only those patients with total mastectomies are excluded. This will capture a more complete patient population for the assessment of the quality action and ensure patients with existing breast tissue are screened for breast cancer.

After consideration of public comments, we are finalizing the changes to measure Q112 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
D.17 Colorectal Cancer Screening

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>0034 / N/A</td>
</tr>
<tr>

</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients 50-75 years of age who had appropriate screening for colorectal cancer.</td>
</tr>
</tbody>
</table>

Substantive Change:

**Modified collection type:** Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications,

**Updated denominator exclusion:** For the eCQM Specifications collection type:

1. Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.
2. Exclude patients with a diagnosis or past history of total colectomy or colorectal cancer.

**Updated denominator exclusion logic:** For the eCQM Specifications collection type: Updated encounters so they are "on or before" the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "FrailtyLTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".

**Updated denominator criteria:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Removed coding not applicable to preventive value sets.

**Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised:

- Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during the measurement period.

**Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added coding to identify patients with advanced illness and frailty.

**Steward:** National Committee for Quality Assurance

**High Priority Measure:** No

**Measure Type:** Process

We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period. For the eCQM Specifications collection type We also proposed to revise the language for the exclusion for diagnosis or past history of total colectomy or colorectal cancer for clarity and to align with the other denominator exclusions.

Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. We proposed to remove denominator eligible coding that is not applicable to a preventive value set and may not be appropriate for inclusion in the measure’s denominator eligible patient population.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

Rationale:

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q113 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.
D.18 Avoidance of Antibiotic Treatment in Adults With Acute Bronchitis

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>0058 / N/A</td>
</tr>

<tr>
<td>National Quality Strategy Domain:</td>
<td>Efficiency and Cost Reduction</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>The percentage of adults 18–64 years of age with a diagnosis of acute bronchitis who were not prescribed or dispensed an antibiotic prescription.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

The title is revised from ‘Avoidance of Antibiotic Treatment in Adults With Acute Bronchitis’ to: Avoidance of Antibiotic Treatment for Acute Bronchitis/Bronchiolitis.

The description is revised to read: The percentage of episodes for patients ages 3 months and older with a diagnosis of acute bronchitis/bronchiolitis that did not result in an antibiotic dispensing event.

The instructions are revised to read: This measure is to be submitted at each occurrence of acute bronchitis/bronchiolitis during the performance period. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding.

The denominator is revised to read: All patients aged 3 months or older with an outpatient, telephone visit, online assessment, observation visit or emergency department (ED) visit with a diagnosis of acute bronchitis/bronchiolitis during the measurement period.

Updated denominator criteria: Revised:

- Patients 3 months of age and older on date of encounter.
- Diagnosis for bronchiolitis.

Updated denominator exclusion: Revised:

- Outpatient, ED or Observation visits that result in an inpatient admission.
- Acute bronchitis/bronchiolitis episodes when the patient had a new or refill prescription of antibiotics (Table 1) in the 30 days prior to or on the episode date.

The denominator note is revised to read: Do not include outpatient, ED or observation visits that result in an inpatient admission. When an outpatient, ED or observation visit and an inpatient stay are billed on separate claims, the visit results in an inpatient stay when the outpatient/ED/observation date of service occurs on the day prior to the admission date or any time during the admission (admission date through discharge date). An outpatient, ED or observation visit billed on the same claim as an inpatient stay is considered a visit that resulted in an inpatient stay.

The numerator instructions are revised to read: For performance, the measure will be calculated as the number of patient encounters where antibiotics were neither prescribed nor dispensed on or within 3 days of the episode for acute bronchitis/bronchiolitis over the total number of encounters in the denominator (patients aged 3 months and older with an outpatient, telephone, online assessment, observation or ED visit for acute bronchitis/bronchiolitis). A higher score indicates appropriate treatment of patients with acute bronchitis/bronchiolitis (e.g., the proportion for whom antibiotics were not prescribed or dispensed on or 3 days after the encounter). Delayed prescriptions (where an antibiotic was prescribed and patient was instructed to delay taking the antibiotic) are considered “Performance Not Met”.

Updated numerator instructions: Added: Note: This list should be used when assessing antibiotic prescriptions for the denominator exclusion and numerator components.

- Removed "Norfloxacin” from Table 1 – Antibiotic Medications.

Steward: National Committee for Quality Assurance

High Priority Measure: Yes

Measure Type: Process

Rationale: We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding appropriate use of antibiotics are not limited to the adult population. This will allow for clinicians to report on both pediatric and adult patients. The title, description, instructions, and denominator are also being revised to include the diagnosis of bronchiolitis as denominator eligible to better align with the broadened age range as bronchiolitis is more commonly seen in babies and children. The diagnosis is clinically relevant to the intent of this measure. The denominator exclusion and denominator note are revised to better clarify that all visits resulting in an inpatient admission should be excluded as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care. The numerator instructions have been updated to align language with the denominator patient population updates, as well as to clarify that delayed prescriptions are still considered to be a “Performance Not Met” as the clinician is still prescribing or dispensing a prescription, which does not align with the measure’s intent.

We proposed a substantive change to the denominator; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

All patients aged 3 months or older with an outpatient visit, telephone visit, online assessment, observation visit or emergency department (ED) visit with a diagnosis of acute bronchitis/bronchiolitis during the measurement period.

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
<table>

<tbody>
<tr>
<td></td>
<td>diagnosis of acute bronchitis/bronchiolitis during the measurement period.</td>
</tr>
</tbody>
</table>

This additional refinement of ‘outpatient’ to ‘outpatient visit’ does not affect the intent of the proposed substantive change.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q116 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.19 Diabetes: Eye Exam

<table>

</tr>
</tbody>
</table>

**Current Measure Description:** Percentage of patients 18-75 years of age with diabetes and an active diagnosis of retinopathy overlapping the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or diabetics with no diagnosis of retinopathy overlapping the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or within the 12 months prior to the measurement period.

**Updated denominator exclusion:** For the eCQM Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.

**Updated denominator exclusion logic:** For the eCQM Specifications collection type: Updated encounters so they are “on or” before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "Frailty/LTI Advanced Illness and Frailty Exclusion Not Including Over Age 80”.

**Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications: Revised: Patients age 66 and older in Institutional Special Needs Plans (SNP) or residing in long-term care with a POS code 32, 33, 34, 54 or 56 for more than 90 consecutive days during the measurement period.

**Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added coding to identify patients with advanced illness and frailty.

**Updated numerator options note:** For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.

**Substantive Change:**
- Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed.
- Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed; without evidence of retinopathy.
- 7 standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed.
- 7 standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed; without evidence of retinopathy.
- Eye imaging validated to match diagnosis from 7 standard field stereoscopic photos results documented and reviewed.
- Eye imaging validated to match diagnosis from 7 standard field stereoscopic photos results documented and reviewed, without evidence of retinopathy.
- Low risk for retinopathy (no evidence of retinopathy in the prior year).

**Updated denominator exclusion logic:** For the eCQM Specifications collection type: Updated encounters so they are “on or” before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "Frailty/LTI Advanced Illness and Frailty Exclusion Not Including Over Age 80”.

**Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications: Revised: Patients age 66 and older in Institutional Special Needs Plans (SNP) or residing in long-term care with a POS code 32, 33, 34, 54 or 56 for more than 90 consecutive days during the measurement period.

**Updated denominator exclusion:** For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added coding to identify patients with advanced illness and frailty.

**Updated numerator options note:** For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.

**Substantive Change:**
- Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed.
- Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed; without evidence of retinopathy.
- 7 standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed.
- 7 standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed; without evidence of retinopathy.
- Eye imaging validated to match diagnosis from 7 standard field stereoscopic photos results documented and reviewed.
- Eye imaging validated to match diagnosis from 7 standard field stereoscopic photos results documented and reviewed, without evidence of retinopathy.
- Low risk for retinopathy (no evidence of retinopathy in the prior year).

**Performance Not Met:**
- Dilated eye exam was not performed, reason not otherwise specified.

**Updated numerator options note:** For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type: Removed: **Note:** For Performance Year 2020 reporting, the Centers for Medicare & Medicaid Services and the American Medical Association have approved the use of the 8P modifier with HCPCS codes to report the Performance Not Met numerator option for Quality ID #117.

**High Priority Measure:**
- No

**Measure Type:**
- Process

**Rationale:**
We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period.

Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. The numerator options are being updated to stratify numerator compliant patients into those who are compliant and those who are compliant with evidence of retinopathy. This granularity will give a better picture of the patient population and the percentage of those patients who did not have evidence of retinopathy, and may fall into low risk for retinopathy, for the purposes of this measure. The numerator option note associated with the “Performance Not Met” option is being removed as it will not be applicable as the numerator options are being updated.

**Comment:** One commenter supported the inclusion of this measure for 2021 MIPS participants, but urged CMS to ensure that application of the measure is consistent with NCQA’s update to this measure in its 2021 measure set, namely, NCQA’s clarification that “eye exam results read by a system that provides an artificial intelligence (AI) interpretation meet criteria,” as stated in NCQA’s changes to HEDIS MY 2020 and MY 2021. The commenter is concerned that, absent this clarification, there will be confusion for practitioners who participate in MIPS and read the measure to require an eye exam by an “eye care professional,” as indicated in CMS’ table of Previously Finalized Measures in the Family Medicine Set for MIPS measure Q117. Such a clarification would also be consistent with the American Diabetes Association (ADA) 2020 standards for diabetes care, which provide, “Artificial intelligence systems that detect more than mild diabetic retinopathy and diabetic macular edema authorized for use by the FDA represent an alternative to traditional screening approaches.”

**Response:** We support technology that enhances a clinician’s ability to diagnosis and treat patients safely and efficiently. Annually, we collaborate with measure stewards to gather revisions and incorporate them into the MIPS quality measures to ensure the program reflects the most recent version of the specification. We continue to work with measure stewards to ensure that any updates are consistent and aligned with the most recent evidence and standards. Additionally, we have updated the measure language to reflect the most recent version of the American Diabetes Association (ADA) 2020 standards for diabetes care, which provide, “Artificial intelligence systems that detect more than mild diabetic retinopathy and diabetic macular edema authorized for use by the FDA represent an alternative to traditional screening approaches.”
are not responsible to ensure the revisions provided by the measure steward align with specifications outside of MIPS. Additionally, there may be timing considerations for revisions to be updated within MIPS that did not allow the measure steward to align the MIPS version of the specification to the HEDIS specification. We believe that we captured the measure steward’s intent for this measure for this performance period. We believe by stratifying the numerator options, more granular data can be captured to discern between patients with and without evidence of retinopathy. This information may give insight into those patients with controlled blood sugar and those with uncontrolled blood sugar. We encourage the commenters to collaborate with the measure steward regarding the request of further stratification of the numerator for this measure to be considered for future years.

**Comment:** One commenter opposed the changes to the numerator for measure Q117. CMS proposed to add stratification to the “Performance Met” numerator option only for the manual MIPS CQM and Medicare Part B Claims collection types. The commenter stated that currently, “Performance Met” includes the following four options: G2102 Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed Or; G2103 Seven standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed Or; G2104 Eye imaging validated to match diagnosis from seven standard field stereoscopic photos results documented and reviewed; Or 3072F Low risk for retinopathy (no evidence of retinopathy in the prior year).

CMS is proposing to add further stratification by dividing the first three of these current options into two each – one as currently written and a second with “; without evidence of retinopathy” addended to the end of the option description. The commenter stated that not only is this information irrelevant to the measure, but CMS is also creating significant additional burden by nearly doubling the number of classifications that manual reporters must organize patients into in order to report the measure. This created burden on small and rural practices without an EHR, which also concerning due to COVID-19. The commenter urged CMS not to finalize this additional stratification of the numerator options for measure Q117.

**Response:** We support technology that enhances a clinician’s ability to diagnosis and treat patients safely and efficiently. Annually, we collaborate with measure stewards to gather revisions and incorporate them into the MIPS quality measures to ensure the program reflects the most recent version of the specification. We believe that we captured the measure steward’s intent for this measure for this performance period. We believe by stratifying the numerator options, more granular data can be captured to discern between patients with and without evidence of retinopathy. This information may give insight into those patients with controlled blood sugar and those with uncontrolled blood sugar. We encourage the commenters to collaborate with the measure steward regarding the request of further stratification of the numerator for this measure to be considered for future years.

After consideration of public comments, we are finalizing the changes to measure Q117 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.20 Coronary Artery Disease (CAD): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy - Diabetes or Left Ventricular Systolic Dysfunction (LVEF < 40%)

<table>

<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12-month period who also have diabetes OR a current or prior Left Ventricular Ejection Fraction (LVEF) &lt; 40% who were prescribed ACE inhibitor or ARB therapy.</td>
</tr>
</tbody>
</table>
| Substantive Change:       | Updated denominator criteria: Added: Eligible coding for the additional patient encounter is identical to ‘Patient encounter during the performance period’ criteria.  
                              | Updated denominator: Added telehealth as eligible for all encounters.                                                                       |
| Steward:                  | American Heart Association                                                                                                                |
| High Priority Measure:    | No                                                                                                                                         |
| Measure Type:             | Process                                                                                                                                   |
| Rationale:               | We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. Additionally, we proposed to clarify the denominator eligible coding for the two visits necessary for denominator eligibility. |
| Comment:                  | One commenter supported the addition of telehealth reporting for measure Q118.                                                              |
| Response:                 | We thank the commenter for supporting the addition of telehealth reporting for this measure.                                                |
|                          | After consideration of public comments, we are finalizing the changes to measure Q118 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. |
### D.21 Diabetes: Medical Attention for Nephropathy

<table>

<td>We proposed to add a denominator exclusion for bilateral lower extremity amputee as this patient population is not applicable to this measure and should not be included in the denominator eligible patient population.</td>
</tr>
</tbody>
</table>

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q127 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## Substantive Change:

**Description:**

Current Measure Description:

Percentage of patients aged 18 years and older with a BMI documented during the current encounter or during the previous 12 months AND with a BMI outside of normal parameters, a follow-up plan is documented during the encounter or during the previous 12 months of the current encounter.

**Normal Parameters:**

- Age 18 years and older BMI ≥ 18.5 and < 25 kg/m²

**The description is revised to read:**

Percentage of patients aged 18 years and older with a BMI documented during the current encounter or within the previous 12 months AND who had a follow-up plan documented if most recent BMI was outside of normal parameters.

**Updated guidance:**

**For the eCQM Specifications collection type:** Removed:

Review the following to apply the Medical Reason exception criteria:

- The Medical Reason exception could include, but is not limited to, the following patients as deemed appropriate by the health care provider:
  - Elderly patients (65 or older) for whom weight reduction/weight gain would complicate other underlying health conditions such as the following examples:
    - Illness or physical disability
    - Mental illness, dementia, confusion
    - Nutritional deficiency such as Vitamin/mineral deficiency
  - Patients in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient’s health status

**Revised:**

See denominator exception section for examples.

**Updated definition:**

**For all collection types:** Added:

Normal BMI Parameters – Age 18 years and older BMI ≥ 18.5 and < 25 kg/m²

**For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types:**

Revised:

Not Eligible for BMI Calculation or Follow-Up Plan (Denominator Exclusion) – A patient is not eligible if one or more of the following reasons are documented:

- Patients receiving palliative or hospice care on the date of the current encounter or any time prior to the current encounter
- Patients who are pregnant on the date of the current encounter or any time during the measurement period prior to the current encounter

**Substantive Change:**

Patients with no documented BMI or a documented BMI outside normal parameters and a documented reason for not completing BMI follow-up plan during the current encounter or within the previous 12 months of the current encounter (Denominator Exception) –

- Patients with a documented medical reason for not documenting BMI or for not documenting a follow-up plan for a BMI outside normal parameters (e.g., elderly patients (65 or older) for whom weight reduction/weight gain would complicate other underlying health conditions such as illness or physical disability, mental illness, dementia, confusion, or nutritional deficiency such as vitamin/mineral deficiency; patients in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient’s health status)
  - Patients who refuse measurement of height and/or weight on the date of the current encounter or any time during the measurement period prior to the current encounter

**Updated denominator exclusion:**

**For the eCQM Specifications collection type:** Removed:

Patients who refuse measurement of height and/or weight.

**Added:**

Hospice care value sets

**Updated denominator exception:**

**For the eCQM Specifications collection type:** Added:

Patients who refuse measurement of height and/or weight.

Revised:

Patients with a documented medical reason for not documenting BMI or for not documenting a follow-up plan for a BMI outside normal parameters (e.g., elderly patients (65 or older) for whom weight reduction/weight gain would complicate other underlying health conditions such as illness or physical disability, mental illness, dementia, confusion, or nutritional deficiency such as vitamin/mineral deficiency; patients in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient’s health status).

**For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection type:** Added:

BMI not documented due to medical reason OR patient refusal of height or weight measurement.

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
After consideration of public comments, we are finalizing the changes to measure Q128 as proposed in the 2021 MIPS performance period/2023 MIPS payment year and future years.

The follow-up plan documented if most recent BMI was outside of normal parameters. This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
### D.25 Documentation of Current Medications in the Medical Record

</tbody>
</table>

#### Current Measure Description:
Percentage of visits for patients aged 18 years and older for which the MIPS eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter. 

#### The description is revised to read: For all collection types:
Percentage of visits for patients aged 18 years and older for which the eligible professional or eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.

The guidance is revised to read: For the eCQM Specifications collection type: This eCQM is an episode-based measure. This measure is to be reported for every encounter during the measurement period. Eligible professionals or eligible clinicians reporting this measure may document medication information received from the patient, authorized representative(s), caregiver(s) or other available healthcare resources. This list must include all known prescriptions, over-the-counter (OTC) products, herbs, vitamins, minerals, dietary (nutritional) supplements AND must contain the medications' name, dosage, frequency, and route of administration. This measure should also be reported if the eligible professional or eligible clinician documented the patient is not currently taking any medications. By reporting the action described in this measure, the provider attests to having documented a list of current medications utilizing all immediate resources available at the time of the encounter. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

#### Current Measure Notes:
This list must include ALL known prescriptions, over-the-counter (OTC) products, herbs, vitamins, minerals, dietary (nutritional) supplements AND must contain the medications' name, dosage, frequency, and route of administration. By reporting the action described in this measure, the provider attests to having documented a list of current medications utilizing all immediate resources available at the time of the encounter. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

#### Substantive Change:
- The denominator exception is revised to read: For the eCQM Specifications collection type: Documentation of a medical reason(s) for not documenting, updating, or reviewing the patient's current medications list (e.g., patient is in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status).
- The numerator is revised to read: For all collection types: Eligible professional or eligible clinician attests to documenting, updating or reviewing the patient's current medications using all immediate resources available on the date of the encounter.
- Updated numerator note: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added: This list must include ALL known prescriptions, over-the-counter (OTC) products, herbs, vitamins, minerals, dietary (nutritional) supplements AND must contain the medications' name, dosage, frequency, and route of administration.
- Updated denominator exception: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection type: Revised: Documentation of a medical reason(s) for not documenting, updating, or reviewing the patient's current medications list (e.g., patient is in an urgent or emergent medical situation).

#### Steward:
Centers for Medicare & Medicaid Services

#### High Priority Measure:
Yes

#### Measure Type:
Process

#### Rationale:
We proposed to update the measure description to remove language that is more appropriate for the guidance/notes sections of the measure specification. This will help with measure intent, clarity, and readability. The guidance for the eCQM Specifications collection type has been updated to clarify the intent of the measure. The intent is to document all known prescriptions, since the measure steward believes that MIPS eligible clinician should not be held accountable for information that is not available utilizing all immediate resources. The denominator exception was updated in all collection types to add clarity regarding use of the denominator exception and to align the language throughout the specification. The numerator notes for the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types was updated with information removed from the description. This information outlines what is necessary for numerator compliance and is better suited for the numerator notes section for ease of use.

#### Comment:
One commenter supported CMS's proposal to update the measure description to clarify that clinicians must only document all known medications and that clinicians should not be held accountable for information that is not available utilizing all immediate resources. This clarification will decrease burden on MIPS eligible clinicians reporting this measure.

#### Response:
We thank the commenter for supporting the change to this measure.

#### Comment:
One commenter stated that inclusion of the Dialysis SNOMED code creates a burden for Nephrology providers who report this measure. The commenter urged CMS to consider creating a denominator exclusion for measure Q130 (CMS 68v10) for patients who are undergoing dialysis, OR remove the current dialysis SNOMED code from the measure's value set.

The 2020 eCQM Specification for this measure states that the initial population for this measure includes "All visits occurring during the 12-month measurement period for patients aged 18 years and older" (a). Additionally, the "Encounter to Document Medications" Value Set currently included in the measure includes SNOMED code 385973000 - Dialysis care management (procedure). The consequence of using this SNOMED code is that any patients who are undergoing dialysis are eligible for the measure each time they have a Dialysis visit. Clinically, dialysis patients have eligible encounters multiple times a week and it is

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
unnecessary to reconcile a dialysis patient's medications mere days after their previous encounter, as no significant changes are likely to have occurred. The frequency that providers are required to reconcile medications discourages Nephrology TIN’s from using this measure.

**Response:** As the measure steward, we will take this feedback into consideration during the annual revisions for possible implementation in future years. Part of the Meaningful Measures Initiative is to align with current medical guidelines and implementing measures that drive quality care, reduce risk factors, and promote positive patient outcomes.

After consideration of public comments, we are finalizing the changes to measure Q130 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
**D.26 Preventive Care and Screening: Screening for Depression and Follow-Up Plan**

<table>

<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 12 years and older screened for depression on the date of the encounter or 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the eligible encounter.</td>
</tr>
</tbody>
</table>

**Modified collection type:** Medicare Part B Claims Measure Specifications, eCQM Specifications, and MIPS CQMs Specifications.

The description is revised to read: For all collection types: Percentage of patients aged 12 years and older screened for depression on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the eligible encounter.

The definition is revised to read: For all collection types:

Screening: Completion of a clinical or diagnostic tool used to identify people at risk of developing or having a certain disease or condition, even in the absence of symptoms.

Example of a follow-up plan include but are not limited to:

- Referral to a practitioner who is qualified to diagnose and treat depression
- Pharmacological interventions
- Other interventions or follow-up for the diagnosis or treatment of depression

**Standardized Depression Screening Tool:** A normalized and validated depression screening tool developed for the patient population in which it is being utilized.

Examples of standardized depression screening tools include but are not limited to:

- * Adolescent Screening Tools (12-17 years)
  - Patient Health Questionnaire for Adolescents (PHQ-A)
  - Beck Depression Inventory-Primary Care Version (BDI-PC)
  - Mood Feeling Questionnaire (MFQ)
  - Center for Epidemiologic Studies Depression Scale (CES-D)
  - Patient Health Questionnaire (PHQ-9)
  - Pediatric Symptom Checklist (PSC-17)
  - PRIME MD-PHQ2
- * Adult Screening Tools (18 years and older)
  - Patient Health Questionnaire (PHQ9)
  - Beck Depression Inventory (BDI or BDI-II)
  - Center for Epidemiologic Studies Depression Scale (CES-D)
  - Depression Scale (DEPS)
  - Duke Anxiety-Depression Scale (DADS)
  - Geriatric Depression Scale (GDS)
  - Cornell Scale for Depression in Dementia (CSDD)
  - PRIME MD-PHQ2
  - Hamilton Rating Scale for Depression (HAM-D)
  - Quick Inventory of Depressive Symptomatology Self-Report (QID-SR)
  - Computerized Adaptive Testing Depression Inventory (CAT-DI)
  - Computerized Adaptive Diagnostic Screener (CAD-MDD)
- * Perinatal Screening Tools
  - Edinburgh Postnatal Depression Scale
  - Postpartum Depression Screening Scale
  - Patient Health Questionnaire 9 (PHQ-9)
  - Beck Depression Inventory
  - Beck Depression Inventory-II
  - Center for Epidemiologic Studies Depression Scale
  - Zung Self-rating Depression Scale

**Follow-Up Plan:**

Documented follow-up for a positive depression screening must include one or more of the following:

- Referral to a practitioner who is qualified to diagnose and treat depression
- Pharmacological interventions
- Other interventions or follow-up for the diagnosis or treatment of depression

The numerators definition is revised to read: For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type:

Examples of a follow-up plan include but are not limited to:

- Referral to a practitioner or program for further evaluation for depression, for example, referral to a psychiatrist, psychologist, social worker, mental health counselor, or other mental health service such as family or group therapy, support group, depression management program, or other service for treatment of depression
- Other interventions designed to treat depression such as behavioral health evaluation, psychotherapy, pharmacological interventions, or additional treatment options

Patients with a Documented Reason for not Screening for Depression (Denominator Exception)

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**

<td><strong>Patient Reason(s)</strong></td>
<td>Patient refuses to participate OR Medical Reason(s) Documentation of medical reason for not screening patient for depression (e.g., cognitive, functional, or motivational limitations that may impact accuracy of results; patient is in an urgent or emergent situation where time is of the essence and to delay treatment would jeopardize the patient’s health status)</td>
</tr>
<tr>
<td><strong>Updated denominator exclusion definition:</strong></td>
<td>For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type: Revised: Not Eligible for Depression Screening or Follow-Up Plan (Denominator Exclusion) Patients who have been diagnosed with bipolar disorder- F31.10, F31.11, F31.12, F31.13, F31.12, F31.30, F31.31, F31.32, F31.4, F31.5, F31.60, F31.61, F31.62, F31.63, F31.64, F31.70, F31.71, F31.73, F31.74, F31.75, F31.76, F31.77, F31.78, F31.81, F31.89, F31.9 Patients who have been diagnosed with depression-- F01.51, F32.0, F32.1, F32.2, F32.3, F32.4, F32.5, F32.89, F32.9, F33.0, F33.1, F33.2, F33.3, F33.40, F33.41, F33.42, F33.8, F33.9, F34.1, F34.81, F34.89, F43.21, F43.23, F53.0, F53.1, O90.6, O99.340, O99.341, O99.342, O99.343, O99.345 The guidance is revised to read: For the eCQM Specifications collection type: A depression screen is completed on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan must be documented on the date of the encounter, such as referral to a practitioner who is qualified to treat depression, pharmacological interventions or other interventions for the treatment of depression. This eCQM is a patient-based measure. Depression screening is required once per measurement period, not at all encounters. The intent of the measure is to screen for depression in patients who have never had a diagnosis of depression or bipolar disorder prior to the eligible encounter used to evaluate the numerator. Patients who have ever been diagnosed with depression or bipolar disorder will be excluded from the measure. Screening Tools: * An age-appropriate, standardized, and validated depression screening tool must be used for numerator compliance. * The name of the age-appropriate standardized depression screening tool utilized must be documented in the medical record * The depression screening must be reviewed and addressed in the office of the provider, filing the code, on the date of the encounter. Positive pre-screening results indicating a patient is at high risk for self-harm should receive more urgent intervention as determined by the provider practice * The screening should occur during a qualifying encounter or up to 14 days prior to the date of the qualifying encounter * The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, because that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool Follow-Up Plan: The follow-up plan must be related to a positive depression screening, for example: &quot;Patient referred for psychiatric evaluation due to positive depression screening.” Examples of a follow-up plan include but are not limited to: * Referral to a practitioner or program for further evaluation for depression, for example, referral to a psychiatrist, psychologist, social worker, mental health counselor, or other mental health service such as family or group therapy, support group, depression management program, or other service for treatment of depression * Other interventions designed to treat depression such as behavioral health evaluation, psychotherapy, pharmacological interventions, or additional treatment options Should a patient screen positive for depression, a clinician should opt to complete a suicide risk assessment when appropriate and based on individual patient characteristics. However, for the purposes of this measure, a suicide risk assessment or additional screening using a standardized tool will not qualify as a follow-up plan. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (<a href="https://ecqi.healthit.gov/qdm">https://ecqi.healthit.gov/qdm</a>) for more information on the QDM. Updated denominator criteria: For the Medicare Part B Claims Measures Specifications and the MIPS CQMs Specifications collection types: Revised: Patients aged ≥ 12 years. For the eCQM Specifications collection type: Added physical therapy MIPS eligible clinician. Updated denominator note: For the Medicare Part B Claims Measures Specifications and the MIPS CQMs Specifications collection types: Added: The intent of the measure is to screen for depression in patients who have never had a diagnosis of depression or bipolar disorder prior to the eligible encounter used to evaluate the numerator. Patients who have ever been diagnosed with depression or bipolar disorder will be excluded from the measure. Updated denominator exclusion: For the eCQM Specifications collection type: Revised: Patients who have been diagnosed with depression or with bipolar disorder. For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type: Revised: Documentation stating the patient has had a diagnosis of depression or has had a diagnosis of bipolar disorder.</td>
</tr>
</tbody>
</table>
Updated numerator: For the eCQM Specifications collection type: Removed additional evaluation or assessment for depression and suicide risk assessment as follow-up from the measure in header and from technical specifications and add guidance statement regarding suicide risk assessment.

The numerator instruction is revised to read: For the Medicare Part B Claims Measures Specifications collection type and the MIPS CQM Specifications collection type: A depression screen is completed on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan must be documented on the date of the encounter, such as referral to a practitioner who is qualified to treat depression, pharmacological interventions or other interventions for the treatment of depression. Depression screening is required once per measurement period, not at all encounters. An age-appropriate, standardized, and validated depression screening tool must be used for numerator compliance. The name of the age-appropriate standardized depression screening tool utilized must be documented in the medical record. The depression screening must be reviewed and addressed in the office of the provider on the date of the encounter. Positive pre-screening results indicating a patient is at high risk for self-harm should receive more urgent intervention as determined by the provider practice. The screening should occur during a qualifying encounter or up to 14 days prior to the date of the qualifying encounter.

The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, because that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool.

Should a patient screen positive for depression, a clinician should opt to complete a suicide risk assessment when appropriate and based on individual patient characteristics. However, for the purposes of this measure, a suicide risk assessment or additional screening using a standardized tool, will not qualify as a follow-up plan.

We proposed to update the description to provide clarity and better align with the measure intent. We proposed to update the measure language in the definitions, guidance, and numerator note sections to provide clarity as to what constitutes a follow-up plan. The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, since that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool.

Additionally, suicide risk assessments have been removed as a numerator compliant follow-up option as this should be completed when appropriate and based on the assessment by the clinician regarding the severity of the patient’s symptoms of depression at the time of depression screening. We also proposed to update the measure language and denominator exclusions to reflect that this measure is screening of depression for patients who have not been previously diagnosed or have an active diagnosis of depression or bipolar disorder. This preventive measure assesses screening and follow up plan for patients that are screened positive for depression. We also proposed to update the denominator criteria for the Medicare Part B Claims Measure Specifications and the MIPS CQM Specifications collection types to align with the measure language and based on individual patient characteristics. We also proposed to add the physical therapy MIPS eligible clinician type based on stakeholder feedback regarding the applicability of this measure to this clinician type.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

We proposed a substantive change to the numerator instruction for the Medicare Part B Claims Measures Specifications collection type and the MIPS CQM Specifications collection type; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

A depression screen is completed on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan must be documented on the date of the encounter, such as referral to a practitioner who is qualified to treat depression, pharmacological interventions or other interventions for the treatment of depression. Depression screening is required once per measurement period, not at all encounters. An age-appropriate, standardized, and validated depression screening tool must be used for numerator compliance. The name of the age-appropriate standardized depression screening tool utilized must be documented in the medical record. The depression screening must be reviewed and addressed in the office of the provider on the date of the encounter. Positive pre-screening results indicating a patient is at high risk for self-harm should receive more urgent intervention as determined by the provider practice. The screening should occur during a qualifying encounter or up to 14 days prior to the date of the qualifying encounter.

The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, because that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool.

Should a patient screen positive for depression, a clinician should opt to complete a suicide risk assessment when appropriate and based on individual patient characteristics. However, for the purposes of this measure, a suicide risk assessment or additional screening using a standardized tool, will not qualify as a follow-up plan.

This additional refinement of adding ‘In order’ prior to ‘to satisfy’ does not affect the intent of the proposed substantive change.
### Category | Description
--- | ---
**Comment:** One commenter cited follow-up plan may not follow provider workflow. For example, an EHR software may capture the date the order was signed which may be signed by the provider the next day (not the day of the order). The commenter recommended that grace period be allowed for providers to get caught up with paper work (1 to 3 days after the encounter).

**Response:** We thank the commenter for their comment. As the measure steward, we will take this feedback into consideration during the annual revisions for possible implementation in future years.

**Comment:** One commenter agreed with the proposal to remove suicide risk assessment from a numerator option. A suicide risk assessment is a screening tool, and if needed, should be done at the initial screening point, rather than a follow up.

**Response:** We thank the commenter for supporting the change to this measure.

After consideration of public comments, we are finalizing the changes to measure Q134 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Measure Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Measure Specifications. For this measure, we note that 2020 CMS Web Interface Measure Specifications included the following change, Numerator/Numerator Codes/Numerator Drug Codes: Follow-up Plan (For Positive Screen) REMOVED ADDITIONAL_EVAL_CODE SNM. Such change is applicable for the 2021 MIPS performance period/2023 MIPS payment year given that the 2021 CMS Web Interface Measure Specifications reflect the 2020 CMS Web Interface Measure Specifications. Also, it should be noted that the CMS Web Interface Specifications collection type is not able to establish a benchmark for this measure. Thus, this measure will be excluded from the Merit-based Incentive Payment System (MIPS) scoring in accordance with § 414.1380(b)(1)(i)(A)(2)(i) provided that the measure meets the data completeness requirement and the data applicable to the measure is reported via the CMS Web Interface Measure Specifications.
### D.27 Melanoma: Continuity of Care – Recall System

<table>

<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>
| Current Measure Description | Percentage of patients, regardless of age, with a current diagnosis of melanoma or a history of melanoma whose information was entered, at least once within a 12-month period, into a recall system that includes:  
\- A target date for the next complete physical skin exam, AND  
\- A process to follow up with patients who either did not make an appointment within the specified timeframe or who missed a scheduled appointment. |
| Substantive Change    | Updated denominator: Added telehealth as eligible encounter.                                                                                                                                                  |
| Steward               | American Academy of Dermatology                                                                                                                                                                             |
| High Priority Measure | Yes                                                                                                                                                                                                         |
| Measure Type          | Structure                                                                                                                                                                                                   |
| Rationale             | We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. |
| Comment               | One commenter supported the addition of telehealth reporting for measure Q137.                                                                                                                                  |
| Response              | We thank the commenter for supporting the addition of telehealth reporting for this measure.                                                                                                                   |

After consideration of public comments, we are finalizing the changes to measure Q137 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.28 Primary Open-Angle Glaucoma (POAG): Reduction of Intraocular Pressure (IOP) by 15% OR Documentation of a Plan of Care

<table>
<thead>
<tr>

<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Outcome</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to remove the Medicare Part B Claims Measure Specifications as it shows very high performance year after year leaving little opportunity to drive improvement in quality outcomes. However, the benchmarking data continues to show a gap for the MIPS CQMs Specifications collection type, as such, the measure will be retained for this collection type.</td>
</tr>
</tbody>
</table>

Comment: One commenter opposed CMS’s proposal to remove the claims collection type from measure Q141. Removal of the measure from claims would adversely impact ophthalmologists, particularly those in small and rural practices who must rely on the claims reporting collection type because they cannot afford to adopt CEHRT. The commenter recognized that this measure is topped out under the claims collection type, but clinicians reporting these measures are already limited in the number of points they can receive for this measure.

Response: We understand that ensuring there are measures available for small and rural practices is important; however, we strive to ensure that all measures align with the Meaningful Measures Initiative. After careful considerations, we will maintain the Medicare Part B Claims Measure Specifications collection type for consistency and stability as it is not extremely topped out and still in alignment with guidelines, but may consider removal in the future.

After consideration of public comments, we are not finalizing the changes to measure Q141 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.29 Oncology: Medical and Radiation – Pain Intensity Quantified

#### Category | Description
--- | ---
NQF # / eCQM NQF #: | CMS157v9
Quality#: | 143
CMS eCQM ID: | CMS157v9
National Quality Strategy Domain: | Person and Caregiver-Centered Experience and Outcomes
Current Collection Type: | eCQM Specifications, MIPS CQMs Specifications
Current Measure Description: | Percentage of patient visits, regardless of patient age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy in which pain intensity is quantified.

#### Substantive Change:
- **Updated logic: For the eCQM Specifications collection type:** Revised logic to limit the date range for chemotherapy administered within 31 days before and after the measurement period.
- **Added definition:** Chemotherapy within 30 days Prior and After the Measurement Period.
- **The guidance is revised to read:** For the eCQM Specifications collection type:
  - This eCQM is an episode-of-care measure; the level of analysis for this measure is every visit for patients with a diagnosis of cancer who are also currently receiving chemotherapy or radiation therapy during the measurement period.
  - For patients receiving radiation therapy, pain intensity should be quantified at each radiation treatment management encounter where the patient and physician have a face-to-face interaction. Due to the nature of some applicable coding related to radiation therapy (e.g., delivered in multiple fractions), the billing date for certain codes may or may not be the same as the face-to-face encounter date. In this instance, for the reporting purposes of this measure, the billing date should be used to pull the appropriate patients into the initial population. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face encounter during the series of treatments. A lookback (retrospective) period of 7 days, including the billing date, may be used to identify the actual face-to-face encounter, which is required to assess the numerator. Therefore, pain intensity should be quantified during the face-to-face encounter occurring on the actual billing date or within the 6 days prior to the billing date.
  - For patients receiving chemotherapy, pain intensity should be quantified at each face-to-face encounter with the physician while the patient is currently receiving chemotherapy. For purposes of identifying eligible encounters, patients “currently receiving chemotherapy” refers to patients administered chemotherapy within 30 days prior to the encounter AND administered chemotherapy within 30 days after the date of the encounter.
  - Pain intensity should be quantified using a standard instrument, such as a 0-10 numerical rating scale, visual analog scale, a categorical scale, or pictorial scale. Examples include the Faces Pain Rating Scale and the Brief Pain Inventory (BPI).
- **This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.**

- **Updated Instructions: For the MIPS CQM Specifications collection type:** Revised note to reflect both face-to-face and telehealth encounters are allowed.

- **The denominator note is revised to read:** For the MIPS CQMs Specifications collection type: For the reporting purposes for this measure, in instances where CPT code 77427 is reported, the billing date, which may or may not be the same date as the face-to-face or telehealth encounter with the physician, should be used to pull the appropriate patient population into the denominator. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face or telehealth encounter occurring on the actual billing date or within the 6 days prior to the billing date.
  - For patients receiving chemotherapy, pain intensity should be quantified at each face-to-face encounter with the physician while the patient is currently receiving chemotherapy. For purposes of identifying eligible encounters, patients “currently receiving chemotherapy” refers to patients administered chemotherapy within 30 days prior to the encounter AND administered chemotherapy within 30 days after the date of the encounter.
  - Pain intensity should be quantified using a standard instrument, such as a 0-10 numerical rating scale, visual analog scale, a categorical scale, or pictorial scale. Examples include the Faces Pain Rating Scale and the Brief Pain Inventory (BPI). This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

- **Updated denominator: For all collection types:** Added telehealth as eligible encounter.

#### Steward:
- American Society of Clinical Oncology

#### High Priority Measure:
- Yes

#### Measure Type:
- Process

#### Rationale:
- We proposed to update the logic within the eCQM Specifications collection type to limit the range of time for chemotherapy procedures to only capture the chemotherapy procedures that satisfy the measure requirements. This will decrease implementation burden for some MIPS eligible clinicians while improving reporting capabilities for some practices. Additionally, the eCQM Specifications and MIPS CQMs Specifications collection types the guidance/denominator note was proposed to be revised to allow for a lookback period when utilizing CPT codes that may not have the same billing and encounter date. This will align more closely with actual clinical workflow and encounter billing practices.
  - We proposed to add telehealth encounters as denominator eligible for submission criteria 1 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

#### Comment: One commenter indicated that the rationale included in the 2021 PFS proposed rule for Table D.29 should be corrected to read: “We propose to add telehealth encounters as denominator eligible for submission criteria 1 and 2 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.” Another commenter supported the addition of telehealth reporting for this measure.

#### Response: We thank the commenter for their comment regarding telehealth for measure Q143. As currently specified for PY 2020, the measure allows for telehealth visits for denominator submission criteria two, but contains a telehealth exclusion for denominator submission criteria one. For PY2021, we proposed to allow for telehealth as an eligible encounter for submission criteria one so both submission criteria will allow for telehealth encounters to ensure a complete patient population is captured for assessment of the quality action.

---

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**
This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
Comment: One commenter supported the proposed changes to measure Q143, which ensure pain assessment and subsequent management is incorporated into virtual health care and align with current cancer care guidelines. It is critical to account for the growing need and utilization of virtual care, and the variety of providers qualified to conduct these visits, including advanced practice providers.

Response: We thank the commenter for supporting the changes to this measure. After consideration of public comments, we are finalizing the changes to measure Q143 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.30 Oncology: Medical and Radiation - Plan of Care for Pain

<table>
<thead>

<tr>
<td>Quality #:</td>
<td>144</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
</tbody>
</table>

#### National Quality Strategy Domain:
Person and Caregiver-Centered Experience and Outcomes

#### Current Collection Type:
MIPS CQMs Specifications

| Current Measure Description: | Percentage of visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain with a documented plan of care to address pain. |

#### Updated instructions:
**THERE ARE TWO SUBMISSION CRITERIA FOR THIS MEASURE:**
1. All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain
2. All visits for patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy who report having pain

**The denominator is revised to read:**
Submission Criteria 1: All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy who reporting having pain
Denominator (Submission Criteria 1): All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy who report having pain
Submission Criteria 2: All visits for patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy who report having pain
Denominator (Submission Criteria 2): All visits for patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy who report having pain

**Updated denominator: For all collection types:** Added telehealth as eligible encounter.

**Updated denominator criteria:**
Submission Criteria One
- Removed coding for radiation therapy
Submission Criteria Two
- Added coding for cancer diagnosis
- Added coding for patient procedure

**Updated denominator note:** For Submission Criteria Two: Added: For the reporting purposes of this measure, in instances where CPT code 77427 is reported, the billing date, which may or may not be the same date as the face-to-face or telehealth encounter with the physician, should be used to pull the appropriate patient population into the denominator. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face encounter during the series of treatments.

**The numerator is revised to read:**
NUMERATOR (SUBMISSION CRITERIA 1): Patient visits that included a documented plan of care to address pain.
NUMERATOR (SUBMISSION CRITERIA 2): Patient visits that included a documented plan of care to address pain.

**Updated numerator instructions:** For Submission Criteria Two: A documented plan of care may include: use of opioids, nonopioid analgesics, psychological support, patient and/or family education, referral to a pain clinic, or reassessment of pain at an appropriate time interval.

**Updated numerator options:** For Submission Criteria Two: Added: Plan of care to address pain documented

**Performance Not Met:** Plan of care for pain not documented, reason not otherwise specified

#### Steward:
American Society of Clinical Oncology

#### High Priority Measure: Yes

#### Measure Type:
Process

**Rationale:**
We proposed to separate the measure into two submission criteria based upon treatment to add clarity based on stakeholder feedback. This also aligns the measure with the format of measure Q143: Oncology: Medical and Radiation – Pain Intensity Quantified. The patient procedure coding was updated to ensure only coding applicable to the updated submission criteria is included within the denominator criteria.

We proposed to add telehealth encounters as denominator eligible for submission criteria 1 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

We proposed a substantive change to the denominator note for submission criteria 2; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

For the reporting purposes of this measure, in instances where CPT code 77427 is reported, the billing date, which may or may not be the same date as the face-to-face or telehealth encounter with the physician, should be used to pull the appropriate patient population into the denominator. It is expected, though, that the

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**
This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
numerator criteria would be performed at the time of the actual face-to-face or telehealth encounter during the series of treatments.

This additional refinement of the addition of ‘or telehealth’ in the final sentence does not affect the intent of the proposed substantive change, but clarifies and aligns with the other revisions.

**Comment:** One commenter indicated that the rationale included in the 2021 PFS proposed rule for Table D.30 should be corrected to read: “We propose to add telehealth encounters as denominator eligible for submission criteria 1 and 2 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.” Another commenter supported telehealth reporting for this measure.

**Response:** We thank the commenter for their comment regarding telehealth for measure Q144. As currently specified for PY 2020, the measure allows for telehealth visits for all procedural codes, but contains a telehealth exclusion for patient encounters associated with the chemotherapy patient population. For PY2021, we proposed to allow for telehealth as an eligible encounter for submission criteria one, which is those patients who are receiving chemotherapy and the only criteria for a patient encounter, so both submission criteria will allow for any available telehealth encounters and procedures, to ensure a complete patient population is captured for assessment of the quality action.

**Comment:** One commenter supported the proposed changes to measure Q144, which ensures pain assessment and subsequent management is incorporated into virtual health care and align with current cancer care guidelines. It is critical to account for the growing need and utilization of virtual care, and the variety of providers qualified to conduct these visits, including advanced practice providers.

**Response:** We thank the commenter for supporting the changes to this measure.

After consideration of public comments, we are finalizing the changes to measure Q144 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
**D.31 Radiology: Exposure Dose Indices or Exposure Time and Number of Images Reported for Procedures Using Fluoroscopy**

<table>

</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to update the denominator to account for encounter codes that can be utilized for imaging other than bone scintigraphy. This will narrow the eligible patient population to those using bone imaging agents and only assess MIPS eligible clinicians that are relevant to this measure’s intent.</td>
</tr>
<tr>
<td>Comment:</td>
<td>One commenter supported the changes to measure Q147 as they better fit the intent of this measure and will lessen clinical burden to some extent.</td>
</tr>
<tr>
<td>Response:</td>
<td>We thank the commenter for supporting the changes to this measure.</td>
</tr>
</tbody>
</table>

After consideration of public comments, we are finalizing the changes to measure Q147 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
The title is revised from "Rheumatoid Arthritis (RA): Tuberculosis Screening" to: Tuberculosis Screening Prior to First Course Biologic Therapy

The description is revised to read: If a patient has been newly prescribed a biologic disease-modifying anti-rheumatic drug (DMARD) therapy, then the medical record should indicate TB testing in the preceding 12-month period.

The instructions are revised to read: This measure is to be submitted a minimum of once per performance period for patients who are being considered or prescribed a first course of biologic disease-modifying anti-rheumatic drug therapy seen during the performance period. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding.

The denominator is revised to read: All patients aged 18 years and older who are receiving a first course of therapy using a biologic DMARD.

The denominator instructions are updated to read: Patients are considered to be receiving a first course of therapy using a biologic DMARD only if they have been prescribed DMARD biologic therapy during the measurement period and were not prescribed DMARD biologic therapy in the 12 months preceding the encounter where DMARD biologic therapy was newly started. Biologic DMARD therapy includes: Abatacept (Orencia) - Adalimumab (HUMIRA) - Anakinra (Kineret) - Baricitinib (Olumiant) - Canakinumab (ILARIS) - Certolizumab pegol and lymphilized certolizumab pegol (CIMZIA) - Denosumab (Prolia) - Etanercept (Enbrel) - Golimumab (Simponi) - Infliximab (REMCIDE) - Infliximab-dyyb (Inflectra) - Infliximab-abda (Renflexis) - Sarilumab (KEVZARA) - Secukinumab (Cosentyx) - Tocilizumab (ACTEMRA) - Tofacitinib (XELJANZ) - Ustekinumab (STELARA) The list of biologic DMARD therapies is subject to change as new therapies are approved by the FDA.

Updated denominator criteria: Removed: 'Diagnosis for RA' criteria
Revised: Patient receiving first-time biologic disease modifying anti-rheumatic drug therapy

Updated denominator: Added telehealth as eligible encounter.

The numerator is revised to read: Patients for whom any record of TB testing is documented or performed (PPD, IFN-gamma release assays, or other appropriate method) in the medical record during the 12 months preceding the biologic prescription.

Updated numerator definition: Removed 'Biologic DMARD Therapy' definition.

Updated numerator options: Revised: 
Performance Met: TB screening performed and results interpreted within 12 months prior to initiation of first-time biologic disease modifying anti-rheumatic drug therapy.

We proposed a substantive change to the denominator instructions; however, during review of this proposed substantive change, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

Patients are considered to be receiving a first course of therapy using a biologic DMARD only if they have been prescribed DMARD biologic therapy during the measurement period and were not prescribed DMARD biologic therapy in the 12 months preceding the encounter where DMARD biologic therapy was newly started. Biologic DMARD therapy includes: Abatacept (Orencia) - Adalimumab (HUMIRA) - Anakinra (Kineret) - Baricitinib (Olumiant) - Canakinumab (ILARIS) - Certolizumab pegol and lymphilized certolizumab pegol (CIMZIA) - Etanercept (Enbrel) - Golimumab (Simponi) - Infliximab (REMCIDE) - Infliximab-dyyb (Inflectra) - Infliximab-abda (Renflexis) - Sarilumab (KEVZARA) - Secukinumab (Cosentyx) - Tocilizumab (ACTEMRA) - Tofacitinib (XELJANZ) - Ustekinumab (STELARA) The list of biologic DMARD therapies is subject to change as new therapies are approved by the FDA.

This refinement removes the medication Denosumab (Prolia) from the list of biological DMARD therapies as it is not necessary to complete a TB test prior to use of this medication. Inclusion of this medication would be in contradiction of current medical guidelines and would subject patients to unnecessary testing, with potential of deleterious effects, while creating additional and unnecessary costs. It is for these reasons that we feel Denosumab (Prolia) must be removed as patient safety and making care affordable are healthcare priorities.

INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW: This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Comment:</strong></td>
<td>One commenter supported the addition of telehealth reporting for measure Q176.</td>
</tr>
<tr>
<td><strong>Response:</strong></td>
<td>We thank the commenter for supporting the addition of telehealth reporting for this measure.</td>
</tr>
</tbody>
</table>

**Comment:** Several commenters opposed the removal of measure Q337: Psoriasis: Tuberculosis (TB) Prevention for Patients with Psoriasis, Psoriatic Arthritis and Rheumatoid Arthritis on a Biological Immune Response Modifier as stated under Table C.6. The proposed update to measure Q176 would mean the denominator population would overlap with measure Q337. Instead of the measure being specific to rheumatoid arthritis (measure Q176) or psoriasis patients (measure Q337), it looks to assess all patients prescribed a first course biologic DMARD therapy. The commenters stated that the revision to measure Q176 does not sufficiently cover the patients that dermatologist treat or the medications that are used, as are currently reported under measure Q337.

**Response:** After consideration of public comments, we are no longer finalizing the removal of measure Q337. See Table C.6 of the final rule for further information. We encourage the commenters to reach out to the measure steward to work towards possible revisions in an effort to develop a unified measure reflecting a broader patient population and more inclusive medication therapy for possible future implementation.

After consideration of public comments, we are finalizing the changes to measure Q176 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.34 Rheumatoid Arthritis (RA): Functional Status Assessment

</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to add coding applicable to chronic care management services as these capture encounters where screening may occur and is an appropriate patient population for this measure.</td>
</tr>
</tbody>
</table>

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q181 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.37 Functional Outcome Assessment

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality#:</td>
<td>182</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Communication and Care Coordination</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of visits for patients aged 18 years and older with documentation of a current functional outcome assessment using a standardized functional outcome assessment tool on the date of the encounter AND documentation of a care plan based on identified functional outcome deficiencies on the date of the identified deficiencies.</td>
</tr>
</tbody>
</table>

#### Substantive Change:
- **Updated denominator: For all collection types:** Added home health and domiciliary/rest home settings.
- **The numerator note is revised to read:** For all collection types: The intent of this measure is for a functional outcome assessment tool to be utilized at a minimum of every 30 days but submission is only required at each qualifying encounter due to coding limitations. Therefore, for visits occurring within 30 days of a previously documented functional outcome assessment, the numerator quality-data code G8942 should be used for submission purposes.
- **Updated numerator definition: For all collection types:** Revised: Current (Functional Outcome Assessment) – A patient having a documented functional outcome assessment utilizing a standardized tool and a care plan if indicated at a qualifying encounter within the previous 30 days.

#### Steward:
Centers for Medicare & Medicaid Services

#### Rationale:
We proposed to add the home health and domiciliary/rest home settings as denominator eligible settings as functional assessments may occur at these visits and would lead to a more complete denominator eligible patient population. Additionally, we proposed to update the definition for ‘Current (Functional Outcome Assessment)’ and the numerator note to clarify the measure intent, which is to only report for qualifying encounters and not each visit.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q182 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## D.38 Cataracts: 20/40 or Better Visual Acuity within 90 Days Following Cataract Surgery

<table>

<tr>
<td>Rationale:</td>
<td>For the eCQM Specifications collection type, we proposed to add a data element for “Best Corrected Visual Acuity Exam Using Snellen Chart” allowing an alternative method to capture an exam commonly used in clinical practice that may not have been accurately captured prior. This added numerator compliant option is clinically in line with the measure intent and appropriate for inclusion.</td>
</tr>
</tbody>
</table>

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q191 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## D.39 Radiology: Stenosis Measurement in Carotid Imaging Reports

<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of final reports for carotid imaging studies (neck magnetic resonance angiography [MRA], neck computed tomography angiography [CTA], neck duplex ultrasound, carotid angiogram) performed that include direct or indirect reference to measurements of distal internal carotid diameter as the denominator for stenosis measurement.</td>
</tr>
</tbody>
</table>
| Substantive Change: | The instructions are revised to read: For all collection types: This measure is to be submitted each time a carotid imaging study is performed during the performance period for patients aged 18 years and older during the submission period. There is no diagnosis associated with this measure. Merit-based Incentive Payment System (MIPS) eligible clinicians who provide the professional component of diagnostic imaging studies of the carotids will submit this measure.  

The denominator is revised to read: For all collection types: All final reports for carotid imaging studies (neck MR angiography [MRA], neck CT angiography [CTA], neck duplex ultrasound, carotid angiogram) performed on patients aged 18 years and older during the submission period.  

Updated denominator criteria: For all collection types: Added: Patients aged ≥ 18 years on date of encounter. |
| Steward: | American College of Radiology |
| High Priority Measure: | No |
| Measure Type: | Process |
| Rationale: | We proposed to update the measure’s eligible patient population to include only patients aged 18 years and older. This will allow for closer monitoring regarding who is eligible and more appropriate for inclusion in the eligible patient population, which will decrease overall burden for the clinicians reporting this measure. |
| Comment: | One commenter recognized the changes to measure Q195 without issue. A second commenter supported the changes to this measure as they better fit the intent of this measure and will lessen clinical burden to some extent. |
| Response: | We thank the commenters for supporting the changes to this measure. After consideration of public comments, we are finalizing the changes to measure Q195 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. |
**D.40 Functional Status Change for Patients with Knee Impairments**

<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

**Current Measure Description:**
A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with hip impairments. The change in functional status (FS) is assessed using the Hip FS patient-reported outcome measure (PROM) (©2009-2019 Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).

**Substantive Change:**
The description is revised to read: A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with hip impairments. The change in functional status (FS) is assessed using the FOTO Lower Extremity Physical Function (LEPF) patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).

**Updated definition:**
Encounter – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit.

**Updated denominator exclusion:**
Patient unable to complete the LEPF PROM at Initial Evaluation and/or Discharge due to blindness, illiteracy, severe mental incapacity or language incompatibility and an adequate proxy is not available.

**Updated numerator statement:**
Patients who were presented with the LEPF PROM at Initial Evaluation (Intake) and at or near Discharge (Status) for the purpose of calculating the patient’s Risk-Adjusted Functional Status Change Residual Score.

**Updated denominator exception:**
1. Ongoing care not clinically indicated because the patient needed a home program only, referral to another provider or facility, or consultation only, as documented in the medical record.
2. Ongoing care not medically possible because the patient was discharged early due to specific medical events, documented in the medical record, such as the patient became hospitalized or scheduled for surgery.
3. Ongoing care not possible because the patient self-discharged early (e.g., financial or insurance reasons, transportation problems, or reason unknown).

**Updated numerator options:**
Performance Not Met: Risk-Adjusted Functional Status Change Residual Score for the hip impairment not measured because the patient did not complete the LEPF PROM at Initial Evaluation and/or near discharge, reason not given.

**Rationale:**
We proposed to update the description, denominator exclusion, numerator statement, and numerator options to reflect the change in functional assessment tool, Hip FS PROM to the LEPF PROM. The assessment is being revised to address scientific updates and maintenance necessary for item-response theory based outcome measures. We proposed to update the denominator exception language to add clarity and better align with measure’s intent.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q218 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

Steward: National Committee for Quality Assurance
High Priority Measure: No

INFORMATION NOT releasable to the public unless authorized by law:
This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
We proposed to revise the measure to shorten the look back period to 12 months and require that tobacco screening and cessation, if patient screened positive, occur every 12 months. The revision is based upon stakeholder feedback, input from the eCQM clinical review process, and the measure steward’s technical expert panel (TEP). We agreed that it is important to do this annually as tobacco use is an important population health concern and smoking is the leading cause of preventable death (https://www.cdc.gov/tobacco/data_statistics/fact_sheets/index.htm). The language throughout the measure specification is being revised to reflect this update. Additionally, we proposed to add physical therapy MIPS eligible clinicians to the denominator eligible encounters as this is applicable to their scope of practice.

For the eCQM Specifications collection type we proposed to unlink the intervention from having to occur after the tobacco status within the measure logic. This revision is better aligned with the clinical reality that for patients actively trying to quit a plan will be in place and further tobacco cessation intervention is redundant, as well as lessening the burden of clinicians, especially for those patients who are not planning on quitting. The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows. Additionally, we proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.

**Rationale:**

We proposed to revise the measure to shorten the look back period to 12 months and require that tobacco screening and cessation, if patient screened positive, occur every 12 months. The revision is based upon stakeholder feedback, input from the eCQM clinical review process, and the measure steward’s technical expert panel (TEP). We agreed that it is important to do this annually as tobacco use is an important population health concern and smoking is the leading cause of preventable death (https://www.cdc.gov/tobacco/data_statistics/fact_sheets/index.htm). The language throughout the measure specification is being revised to reflect this update. Additionally, we proposed to add physical therapy MIPS eligible clinicians to the denominator eligible encounters as this is applicable to their scope of practice.

For the eCQM Specifications collection type we proposed to unlink the intervention from having to occur after the tobacco status within the measure logic. This revision is better aligned with the clinical reality that for patients actively trying to quit a plan will be in place and further tobacco cessation intervention is redundant, as well as lessening the burden of clinicians, especially for those patients who are not planning on quitting. The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows. Additionally, we proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.

**Comment:** One commenter supported the update of the denominator to add physical therapy MIPS-eligible clinicians and telehealth as eligible encounters for measure Q226. Multiple commenters supported the addition of telehealth reporting for this measure.

**Response:** We thank the commenters for supporting adding physical therapists to this measure and for supporting the adding telehealth as eligible encounters.

**Comment:** One commenter greatly appreciated the numerator change to tobacco cessation for eCQMs, specifically the language “Additionally, revised the logic to unlink the intervention from having to occur after the tobacco user status.”

**Response:** We thank the commenter for supporting this change to the numerator language for eCQMs.

**Comment:** One commenter agreed, and one commenter disagreed with the proposal to shorten the lookback period for evidence of tobacco use screening from 24 to 12 months. The vast majority of smokers pick up the habit before age 18. Consequently, while tobacco screening and intervention should – of necessity – be more frequent in the years of patient adolescence and young adulthood, there is little evidence to indicate more frequent screening is warranted in older adults. The commenter preferred that the lookback period stay at 24 months. An alternative – though admittedly a burdensome one – is for the lookback period to vary by age to account for clinical realities.

**Response:** We thank the commenters for their comments. The U.S. Preventive Services Task Force indicated that “Tobacco use is the leading preventable cause of disease, disability, and death in the United States. Cigarette smoking results in more than 480,000 premature deaths each year and accounts for approximately 1 in every 5 deaths”. Due to the harmful effect tobacco use can have on patients’ health, we believe that clinicians should engage with their patients to screen for tobacco use and, if positive, provide tobacco cessation counseling annually.

After consideration of public comments, we are finalizing the changes to measure Q226 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications. In addition, we are not finalizing the proposed additional telehealth encounter eligibility substantive change for the eCQM Specifications collection type because this is already specified in the current measure.
### D.47 Controlling High Blood Pressure

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**
This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
### Comment

One commenter stated that although telehealth is available for this measure, it is restricted to using only remote devices (via Bluetooth technology). The concern is that this may be restrictive to some patients who might benefit from telehealth (virtual visits) but do not have and/or cannot afford a new device and/or technology. The commenter recommended that the measure follow AHRQ specifications that allows visual confirmation on the blood pressure measuring device by the provider during the virtual visit and then to record the blood pressure in the EHR.

### Response

We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q236 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.

We have identified a technical error in the language for the update to the eCQM Specifications collection type for the denominator logic. For the eCQM Specifications collection type, we inadvertently indicated that the timeframe for the hypertension diagnosis must be present prior to “and” during the measurement period. To resolve this technical error, the “and” was replaced with “or”. We have updated the language for the logic from the proposed change for the eCQM Specifications collection type as follows:

**Technical error:** Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to and during the measurement period.

**To resolve technical error:** Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to OR during the measurement period.

This reflects the change to the denominator logic proposed for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types. The 2021 performance period eCQM measure specifications have been published since May 7, 2020 on the CMS Electronic Clinical Quality Improvement (eCQM) Resource Center website at [https://ecqm.healthit.gov/ecqm/ep/2021/cms165v9](https://ecqm.healthit.gov/ecqm/ep/2021/cms165v9) and we have not received feedback or public comments regarding this change in denominator logic.

Further refinements were made to the measure specifications in order to align with the proposed update to the denominator note for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types. We are finalizing a modification of the Measure Description for the Medicare Part B Claims Measure Specifications, eCQM Specification, and MIPS CQMs Specifications collection types as follows:

**Current:** Percentage of patients 18-85 years of age who had a diagnosis of hypertension overlapping the measurement period and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.

**Revised to read:** Percentage of patients 18-85 years of age who had a diagnosis of hypertension overlapping the measurement period or the year prior to the measurement period, and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.

Additionally, we are finalizing a modification to the Denominator Statement for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types, and the Initial Patient Population for the eCQM Specifications collection type. The following finalized modification pertains to the Denominator Statement for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types.

**Current:** Patients 18-85 years of age who had a visit and a diagnosis of hypertension overlapping the measurement period.

**Revised to read:** Patients 18-85 years of age who had a visit and diagnosis of essential hypertension overlapping the measurement period or the year prior to the measurement period.

The following finalized modification pertains to the Initial Patient Population for the eCQM Specifications collection type.

**Current:** Patients 18-85 years of age who had a visit and diagnosis of essential hypertension overlapping the measurement period.

**Revised to read:** Patients 18-85 years of age who had a visit and diagnosis of essential hypertension overlapping the measurement period or the year prior to the measurement period.

We are finalizing the denominator note for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types as proposed. For the reasons noted above, we are finalizing a modification of the logic for the eCQM Specifications collection type: Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to or during the measurement period.

The additional changes to the description, denominator statement, and initial patient population do not affect the intent of the proposed substantive change, but adds alignment and clarity between the collection types in order to ensure proper implementation within and across collection types.

---

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**
This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. ## D.48 Use of High-Risk Medications in the Elderly

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NQF # / eCQM NQF #:</strong></td>
<td>0022 / N/A</td>
</tr>
<tr>
<td>** CMS eCQM ID:**</td>
<td>CMS156v9</td>
</tr>
<tr>
<td><strong>National Quality Strategy Domain:</strong></td>
<td>Patient Safety</td>
</tr>
<tr>
<td><strong>Current Collection Type:</strong></td>
<td>eCQM Specifications, MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

### Current Measure Description:
- Percentage of patients 65 years of age and older who were ordered high-risk medications. Two rates are submitted.
  1. Percentage of patients who were ordered at least one high-risk medication.
  2. Percentage of patients who were ordered at least two of the same high-risk medications.

### Substantive Change:
- **Updated title:** From ‘Use of High-Risk Medications in the Elderly’ to: Use of High-Risk Medications in Older Adults.
  - The description is revised to read: Percentage of patients 65 years of age and older who were ordered at least two of the same high-risk medications.

### Updated Measure Analytics:
- For all collection types: One performance rate.

### Updated Guidance:
- **For the eCQM Specifications collection type:**
  - The intent of the measure is to assess if the patient has been prescribed at least two of the same high-risk medications on different days.
  - The intent of the measure is to assess if the reporting provider ordered the high-risk medication previously prescribed by another provider, they would not be counted towards the numerator unless the reporting provider also ordered a high-risk medication for them.
  - This eCQM is a patient-based measure.
  - This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

### Updated Instructions:
- For the MIPS CQMs Specifications collection type: Removed language related to the submission of two performance rates and two submission criteria.

### Updated Denominator:
- For all collection types: Removed submission criteria one.

### For MIPS CQMs Specifications collection type:
- Added ophthalmology, skilled nursing facility, and domiciliary/rest home settings and preventive care services.

### The Numerator is Revised to Read:
- For all collection types: Patients with at least two orders for the same high-risk medication on different days during the measurement period.

### Updated Numerator:
- For the MIPS CQMs Specifications collection type: Removed submission criteria one numerator.
  - Revised High-Risk Medications at any dose or duration Table 1:
    - Added: Pyrilamine, Orphenadrine, Chloralhydrate-clidinium, Methscopolamine, Glimepiride
    - Removed: Clidinium Chloralizepoxide, Ticlopidine, Pentazocine
  - For the eCQM Specifications collection type: Added medication value sets:
    - Scopolamine, Secobarbital, Propantheline, Dicyclam, Ergoloid Mesylates, Butalbital, Amobarbital, pentobarbital

### Steward:
- National Committee for Quality Assurance

### High Priority Measure:
- Yes

### Measure Type:
- Process

### Rationale:
- We proposed to remove submission criteria one from this measure and continue to assess the percentage of patients 65 years of age and older who were ordered at least two of the same high-risk medications. This change will lessen clinician burden while still assessing an important aspect of patient safety. This patient population is a better assessment of the riskier, longer-term use and allows MIPS eligible clinicians/groups to address potentially inappropriate medication dispensing to improve quality outcomes. The eCQM Specifications collection type added medication value sets to the numerator to align with the Beers Criteria for Potentially Inappropriate Medication list, as well as to reflect expert review and stakeholder feedback. These updates ensure all high-risk medications are being assessed for numerator compliance. The MIPS CQMs Specifications collection type was revised to align medications across collection types.

- In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q238 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.49 Cardiac Rehabilitation Patient Referral from an Outpatient Setting

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>0643 / N/A</td>
</tr>
<tr>
<td>Quality#:</td>
<td>243</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Communication and Care Coordination</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

#### Current Measure Description:
Percentage of patients evaluated in an outpatient setting who within the previous 12 months have experienced an acute myocardial infarction (MI), coronary artery bypass graft (CABG) surgery, a percutaneous coronary intervention (PCI), cardiac valve surgery, or cardiac transplantation, or who have chronic stable angina (CSA) and have not already participated in an early outpatient cardiac rehabilitation/secondary prevention (CR) program for the qualifying event/diagnosis who were referred to a CR program.

#### Substantive Change:
Updated denominator: Added Skilled Nursing Facility, Domiciliary/Rest Home, Home Visit, and Outpatient Consultation settings. Added telehealth as eligible encounter.

#### Steward:
American Heart Association

#### High Priority Measure:
Yes

#### Measure Type:
Process

#### Rationale:
- We proposed to add settings, Skilled Nursing Facility, Domiciliary/Rest Home, Home Visit, and Outpatient Consultation, as denominator eligible as they are clinically relevant settings that can ensure that patients receive or continue outpatient cardiac rehabilitation to support positive outcomes in their clinical care.
- We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

#### Comment:
Several commenters supported the addition of telehealth reporting for measure Q243.

#### Response:
We thank the commenters for supporting the addition of telehealth reporting for this measure.

After consideration of public comments, we are finalizing the changes to measure Q243 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

## D.51 Epilepsy: Counseling for Women of Childbearing Potential with Epilepsy

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>268</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of all patients of childbearing potential (12 years and older) diagnosed with epilepsy who were counseled at least once a year about how epilepsy and its treatment may affect contraception and pregnancy.</td>
</tr>
</tbody>
</table>

### Substantive Change:

**Modified collection type:** MIPS CQMs Specifications

**The denominator is revised to read:** All females, including all individuals of childbearing potential (12 years and older) with a diagnosis of epilepsy.

**Updated denominator:** Added telehealth as eligible encounter.

### Rationale:

We proposed to remove the Medicare Part B Claims Measure Specifications collection type. The limited patient population and adoption of the quality measure for this collection type does not allow for the creation of benchmarks to provide a meaningful impact to quality improvement.

We proposed the denominator statement be revised to be more inclusive of the eligible patient population.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

### Comment:

One commenter requested the removal of Medicare Part B Claims Measure Specifications for measure Q268 through the measure review process. The commenter noted that these changes were not reflected in the 2021 PFS proposed rule and the measure specifications should be removed, as the measure steward is no longer maintaining these specifications.

### Response:

We did propose to modify the collection type to only include the MIPS CQMs Specifications collection type. We thank the commenter for their support in the removal of the Medicare Part B Claims Measure Specifications collection type.

One commenter supported the addition of telehealth reporting for measure Q268.

We thank the commenter for supporting the addition of telehealth reporting for this measure.

After consideration of public comments, we are finalizing the changes to measure Q268 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.52 Sleep Apnea: Severity Assessment at Initial Diagnosis

<table>

</tbody>
</table>

After consideration of public comments, we are finalizing the changes to measure Q279 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / 2872e</td>
</tr>
<tr>
<td>Quality#:</td>
<td>281</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS149v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients, regardless of age, with a diagnosis of dementia for whom an assessment of cognition is performed and the results reviewed at least once within a 12-month period.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

The guidance is revised to read:

Use of a standardized tool or instrument to assess cognition other than those listed will meet numerator performance. Standardized tools can be mapped to the concept “Intervention, Performed”: “Cognitive Assessment” included in the numerator logic below.

The requirement of two or more visits is to establish that the eligible professional or eligible clinician has an existing relationship with the patient.

In recognition of the growing use of integrated and team-based care, the diagnosis of dementia and the assessment of cognitive function need not be performed by the same provider or clinician.

The DSM-5 has replaced the term dementia with major neurocognitive disorder and mild neurocognitive disorder. For the purposes of this measure, the terms are equivalent.

This eCQM is a patient-based measure.

This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

**Steward:** American Academy of Neurology

**High Priority Measure:** No

**Measure Type:** Process

**Rationale:**

The measure steward’s technical expert panel suggested adding language within the guidance statement to reflect that team-based care is appropriate for this measure. We agreed that this is an important concept and applicable to this measure, adding the language helps to clarify the measure intent.

**Comment:** One commenter supported the changes for measure Q281 related to dementia and associated screening assessments.

**Response:** We thank the commenter for supporting the changes to this measure.

After consideration of public comments, we are finalizing the changes to measure Q281 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.55 Dementia: Functional Status Assessment

<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients with dementia for whom an assessment of functional status was performed at least once in the last 12 months.</td>
</tr>
</tbody>
</table>

**The definition is revised to read:** Assessment of functional status - Functional status is assessed by use of a validated tool, direct assessment of the patient, or by querying a knowledgeable informant. A direct assessment of functional status includes an evaluation of the patient’s ability to perform instrumental activities of daily living (IADL) and basic activities of daily living (ADL).

**Updated denominator:** Added telehealth as eligible encounter.

**The numerator instructions are revised to read:**

1. **IADL Assessment (users must meet one of the two below bullets to meet IADL assessment component)**
   - To meet the measure’s IADL component using a validated tool, providers must use one of the following tools:
     - Lawton Instrumental Activities of Daily Living Scale
     - Katz Index of Independence in Activities of Daily Living
     - Functional Activities Questionnaire
     - Functional Independence Measure Instrument
   - To meet the measure’s IADL component using a direct assessment, providers must document 3 out of the following 5 domains.
     - Cleaning or hobbies
     - Money management
     - Medication management
     - Transportation
     - Cooking or communication

2. **ADL Assessment (users must meet one of the two below bullets to meet ADL assessment component)**
   - To meet the measure’s ADL component using a validated tool, providers must use either:
     - Barthel ADL Index
     - Bristol Activities of Daily Living Scale
   - To meet the measure’s ADL component using a direct assessment, providers must document 3 out of the following 7 domains.
     - Grooming
     - Bathing
     - Dressing
     - Eating
     - Toileting
     - Gait
     - Transferring

**The numerator notes is revised to read:**

The 12-month look back period is defined as 12 months from the date of the denominator eligible encounter. Documentation of advanced stage dementia and caregiver knowledge is limited would meet the measure exception criteria.

**The denominator exception is revised to read:** Documentation of advanced stage dementia and caregiver knowledge is limited.

**Substantive Change:**

We proposed the measure definition and numerator instructions to provide clarity regarding expectations for numerator compliance. This updated language should address any stakeholder confusion for implementing the measure. The denominator note was updated to align with revised denominator exception. We proposed to update the denominator exception to reduce ambiguity regarding patient scenarios where an exception is clinically appropriate.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter supported the changes for measure Q282 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to the measure. Another commenter support adopting language in its guidance recognizing the growing use of integrated and team-based care in the diagnosis of dementia and the assessment of cognitive impairment and concur with CMS’s continued recognition that functional status includes an evaluation of a patient’s ability to perform instrumental activities of daily living (IADLs) and activities of daily living (ADLs). The commenter also applauded CMS’s ongoing monitoring and measurement of the percentage of patients with dementia for whom there is documented screening because it reflects CMS’s recognition of the critical importance of regular screening, assessment, and management of patients with dementia for other behavioral and psychiatric symptoms.

**Response:** We thank the commenters for supporting the changes to this measure.

<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

**Current Measure Description:** Percentage of patients with dementia for whom there was a documented screening for behavioral and psychiatric symptoms, including depression, and for whom, if symptoms screening was positive, there was also documentation of recommendations for management in the last 12 months.

**Substantive Change:**

**Updated denominator:** Added telehealth as eligible encounter.

**The definition is revised to read:** Behavioral and Psychiatric Symptoms Screening - Screening is defined as using a validated instrument or directly examining the patient or knowledgeable informant to determine the presence or absence of symptoms from three domains: Activity disturbances, mood disturbances (including depression), and thought and perceptual disturbances. The following validated instruments can be used to meet the measure:

- Dementia Signs and Symptoms (DSS) Scale
- Neuropsychiatric Inventory (NPI)
- Minimum Data Set (MDS) (suggested for nursing home only).

**Updated numerator instructions:** Added: Thought and perceptual disturbances under ‘Thought and perceptual disturbances’. Revised: Examples of reliable and valid instruments that can be used to assess behavioral and psychiatric symptoms are: Dementia Signs and Symptoms (DSS) Scale or Neuropsychiatric Inventory (NPI). For patients residing in nursing homes, it may be the Minimum Data Set (MDS). Other reliable and valid instruments may be used to assess individual measure components for activity disturbances, mood disturbances including depression, and thought and perceptual disturbances.

**Steward:** American Academy of Neurology

**High Priority Measure:** No

**Measure Type:** Process

**Rationale:** We proposed to update the definition to remove ‘positive’, as this was not appropriate or aligned with the definition for the purposes of this measure. Additionally, information regarding approved screening instruments was moved to this section as it is more appropriately in this section of the measure specification. We proposed to update the numerator instructions to add ‘thought and perceptual disturbance’ and provide greater clarity regarding the requirements of numerator compliance for this measure.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter supported the changes for measure Q283 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure.

**Response:** We thank the commenter for supporting the changes to this measure.

After consideration of public comments, we are finalizing the changes to measure Q283 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.57 Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality#:</td>
<td>286</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Patient Safety</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients with dementia or their caregiver(s) for whom there was a documented safety concerns screening in two domains of risk: 1) dangerousness to self or others and 2) environmental risks; and if safety concerns screening was positive in the last 12 months, there was documentation of mitigation recommendations, including but not limited to referral to other resources.</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>The denominator exception is revised to read: Documentation patient unable to communicate and informant not available. Updated denominator: Added telehealth as eligible encounter.</td>
</tr>
<tr>
<td>Steward:</td>
<td>American Academy of Neurology</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
</tbody>
</table>

**Rationale:**
- We proposed to revise the denominator exception to better align with real-world clinical scenarios where safety screening could not be completed and therefore no mitigation recommendations could be provided. This change aids clinicians reporting the measure with an exception to excuse them from performance in a clinical situation they are unable to control.
- We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter supported the changes for measure Q286 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure.

**Response:** We thank the commenter for supporting the changes to this measure.

After consideration of public comments, we are finalizing the changes to measure Q286 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.58 Dementia: Education and Support of Caregivers for Patients with Dementia

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quality#</td>
<td>288</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>

<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients with dementia whose caregiver(s) were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months.</td>
</tr>
</tbody>
</table>

**Substantive Change:**
- **Updated denominator:** Added telehealth as eligible encounter.
- **Updated denominator exceptions:**
  - Revised: Patient does not have a caregiver.
  - Added:
    1. Documentation caregiver is trained and certified in dementia care.
    2. Patient/caregiver dyad has been referred to appropriate resources and connection to those resources is confirmed.

**Steward:** American Academy of Neurology

**High Priority Measure:** Yes

**Measure Type:** Process

**Rationale:**
We proposed to revise the denominator exception to reduce ambiguity regarding patient scenarios where an exception is clinically appropriate. Additionally, we proposed to add two denominator exceptions to further clarify clinical scenarios where it may not be appropriate to attribute the quality action to that MIPS eligible clinician.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter supported the changes for measure Q288 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure.

**Response:** We thank the commenter for supporting the changes to this measure.

After consideration of public comments, we are finalizing the changes to measure Q288 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.59 Parkinson’s Disease: Psychiatric Symptoms Assessment for Patients with Parkinson’s Disease

<table>
<thead>

</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of all patients with a diagnosis of Parkinson’s Disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (i.e., physical, occupational, and speech therapy) discussed in the past 12 months.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

The description is revised to read: Percentage of all patients with a diagnosis of Parkinson’s Disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (i.e., physical, occupational, and speech therapy) discussed once in the past 12 months.

Updated denominator exception: Removed: Documentation of medical reason(s) for not discussing rehabilitative therapy options with patient (or caregiver).

Updated denominator: Added telehealth as eligible encounter.

**Steward:** American Academy of Neurology

**High Priority Measure:** Yes

**Measure Type:** Process

**Rationale:**

We proposed to update the measure description to include the word ‘once’ to provide added clarity regarding measure intent. Additionally, we proposed to remove the denominator exception, which allowed for medical reason(s) for not discussing rehabilitative therapy options. We agreed that MIPS eligible clinicians should discuss rehabilitative therapy options with all patients/caregivers as these therapies play an important role in not only improving function in the patient, but also their quality of life.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter supported the addition of telehealth reporting for measure Q293.

**Response:** We thank the commenter for supporting the addition of telehealth reporting for this measure.

After consideration of public comments, we are finalizing the changes to measure Q293 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.62 Initiation and Engagement of Alcohol and Other Drug Dependence Treatment

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>305</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS137v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications</td>
</tr>
</tbody>
</table>

**Current Measure Description:**
- Percentage of patients 13 years of age and older with a new episode of alcohol or other drug abuse or (AOD) dependence who received the following. Two rates are reported.
  - Percentage of patients who initiated treatment including either an intervention or medication for the treatment of AOD abuse or dependence within 14 days of the diagnosis.
  - Percentage of patients who engaged in ongoing treatment including two additional interventions or a medication for the treatment of AOD abuse or dependence within 34 days of the initiation visit. For patients who initiated treatment with a medication, at least one of the two engagement events must be a treatment intervention.

**Substantive Change:**

- **The definition is revised to read:** The initiation visit is the first visit for alcohol or other drug dependence treatment within 14 days after a diagnosis of alcohol or other drug dependence. Treatment includes inpatient AOD admissions, outpatient visits, intensive outpatient encounters or partial hospitalization.
- The Intake Period: January 1 - November 13 of the measurement year. The Intake Period is used to capture new episodes of Alcohol or Drug Dependence. The November 13 cut-off date ensures that all services can occur before the measurement period ends.

- **Updated numerator logic:** Updated 47 days to 48 days for the period within which Initial Dependence Diagnosis must occur.

- **Updated stratification logic:** Refinement of CQL logic to include patients at age 17 at end of measurement period.

**Steward:** National Committee for Quality Assurance

**High Priority Measure:** Yes

**Measure Type:** Process

**Rationale:** We proposed to update the definition to revise the intake period to ensure all services can occur before the performance period ends. The numerator logic timing is also updated to reflect this change.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q305 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.63 Cervical Cancer Screening

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality#:</td>
<td>309</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS124v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications</td>
</tr>
</tbody>
</table>
| Current Measure Description: | Percentage of women 21-64 years of age who were screened for cervical cancer using either of the following criteria:  
- Women age 21-64 who had cervical cytology performed every 3 years  
- Women age 30-64 who had cervical cytology/human papillomavirus (HPV) co-testing performed every 5 years. |

#### Substantive Change:

**The description is revised to read:** Percentage of women 21-64 years of age who were screened for cervical cancer using either of the following criteria:  
- Women age 21-64 who had cervical cytology performed within the last 3 years  
- Women age 30-64 who had cervical human papillomavirus (HPV) testing performed within the last 5 years

**The guidance is revised to read:** To ensure the measure is only looking for a cervical cytology test only after a woman turns 21 years of age, the youngest age in the initial population is 23. Patient self-report for procedures, as well as diagnostic studies should be recorded in ‘Procedure, Performed’ template or ‘Diagnostic Study, Performed’ template in QRDA-1. This version of the eCQM uses QDM version 5.5. Please refer to the eCQM resource center (https://ecqm.healthit.gov/qdm) for more information on the QDM. This eCQM is a patient-based measure.

**The numerator is revised to read:** Women with one or more screenings for cervical cancer. Appropriate screenings are defined by any one of the following criteria:  
- Cervical cytology performed during the measurement period or the two years prior to the measurement period for women who are at least 21 years old at the time of the test  
- Cervical human papillomavirus (HPV) testing performed during the measurement period or the four years prior to the measurement period for women who are 30 years or older at the time of the test.

**Updated logic:** Updated logic definition to use HPV only every 5 years and remove Pap test.

| Steward: | National Committee for Quality Assurance |
| High Priority Measure: | No |
| Measure Type: | Process |
| Rationale: | We proposed to update the measure to align with current clinical guidelines, which removes the Pap test requirement and allow HPV only testing every 5 years. This update is reflected in revisions to the description, guidance, numerator, and logic. |
| Comment: | One commenter opposed the proposed changes to measure Q309, citing that the proposal was to update the measure to align with the current clinical guidelines, which removes the Pap/HPV test (co-testing) requirement and allow only HPV testing every 5 years. While this proposed change would align to the recently updated American Cancer Society (ACS) cervical cancer screening guidelines, the commenter stated the change is not consistent with the current recommendations from the American College of Obstetricians and Gynecologists (ACOG), the United States Preventive Services Task Force (USPSTF), the National Committee for Quality Assurance (NCQA), and numerous other guideline bodies or current clinical practice in the United States. |

In response to the ACS guidelines, ACOG issued a statement affirming their current guidelines, which encompasses all three screening regimens (high-risk human papillomavirus testing alone, cervical cytology alone, and co-testing). In August 2018, the USPSTF recommended screening women aged 30 to 65 years, screening every 3 years with cervical cytology alone, every 5 years with high-risk human papillomavirus (hrHPV) testing alone, or every 5 years with hrHPV testing in combination with cytology (contesting)3 with an “A” rating.

In addition, the NCQA HEDIS measure is also in conflict with the proposed revisions to the MIPS measure. The NCQA HEDIS measure for cervical cancer screening includes all three screening regimens (high-risk human papillomavirus testing alone, cervical cytology alone, and co-testing). Lastly, the proposed change to the MIPS quality measure eliminated the recommended option of co-testing for cervical cancer, a change that is inconsistent with current guidelines recommended by ACOG, the USPSTF and NCQA. Accordingly, the leading authorities in cervical cancer screening are on record that co-testing is a valuable cervical cancer screening test. The commenter asked for measure Q309 to be retained without any revisions. A second commenter sought clarification on whether the measure is specifically looking at HPV only testing every 5 years. The description and logic have conflicting definitions between the usage of cervical cytology and HPV testing, and solely HPV testing. A third commenter cited the proposal to change the measure description to remove “co-testing” from the criteria for HPV testing. The commenter indicated that it had affirmed its 2018 Practice Advisory, which includes all three cervical cancer screening strategies (high-risk human papillomavirus testing alone, cervical cytology alone, and co-testing). The commenter’s current screening guidelines reflect a balance of benefit and potential harms and support shared decision-making between patients and their clinicians and recommended that changes to this measure not be finalized.

**Response:** We thank the commenters for their comments. The revisions to this measure are in alignment with the updated clinical guidelines. The guidelines for patients 30 to 65 years of age recommend that either; cervical cytology only be completed every 3 years or hrHPV testing alone every 5 years or co-testing (hrHPV + cervical cytology) every 5 years. The guidelines now allow hrHPV testing alone every 5 years as opposed to requiring that co-testing be completed every 5 years. However, if co-testing was completed every 5 years this would be numerator compliant as co-testing contains the hrHPV testing component. Conversely, if co-testing was completed every 3 years, this would also suffice for numerator compliance as the co-testing has the cervical cytology component. Therefore, the components of screening are all still included for the purposes of achieving the quality action for this measure, but the requirements have been revised to align with the updated guidelines. We encourage the commenters to reach out to the measure steward to discuss revisions in language to help clarify the numerator component for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q309 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

---

D.64 Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality#:</td>
<td>317</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS22v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Community/Population Health</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Specifications, eCQM Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 18 years and older seen during the submitting period who were screened for high blood pressure AND a recommended follow-up plan is documented based on the current blood pressure (BP) reading as indicated.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

- The description is revised to read: For all collection types: Percentage of patient visits for patients aged 18 years and older seen during the measurement period who were screened for high blood pressure AND a recommended follow-up plan is documented, as indicated, if blood pressure is pre-hypertensive or hypertensive.

- The guidance is revised to read: For the eCQM Specifications collection type: This eCQM is an episode-based measure and should be reported at every visit for patients aged 18 years and older. This measure will be calculated based upon the clinical actions performed at every visit during the measurement period for each patient. The measure requires that blood pressure measurements (i.e., diastolic and systolic) be obtained during each visit to determine the blood pressure reading used to evaluate if an intervention is needed. Both the systolic and diastolic blood pressure measurements are required for inclusion. If there are multiple blood pressures obtained during a patient visit, only the last, or most recent, pressure measurement will be used to evaluate the measure requirements. The intent of this measure is to screen patients for high blood pressure and provide recommended follow-up as indicated. The documented follow-up plan must be related to the current blood pressure reading as indicated, example: "Patient referred to primary care provider for BP management."

The version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.

- The instructions are revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs collections type: This measure is to be submitted at each visit for patients seen during the measurement period. Merit-based Incentive Payment System (MIPS) eligible clinicians who submit the measure must perform the blood pressure screening at each patient visit by a MIPS eligible clinician and may not obtain measurements from external sources.

- The initial patient population is revised to read: For the eCQM Specifications collection type: All patient visits for patients aged 18 years and older at the beginning of the measurement period. The denominator is revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs collection type: All patient visits for patients aged 18 years and older at the beginning of the measurement period.

- The denominator exception is revised to read: For the eCQM Specifications collection type:
  1. Documentation of medical reason(s) for not screening for high blood pressure (e.g., patient is in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient’s health status).
  2. Documentation of patient reason(s) for not screening for blood pressure measurements or for not ordering an appropriate follow-up intervention if patient is pre-hypertensive or hypertensive (e.g., patient refuses).

  Updated denominator exception logic: For the eCQM Specifications collection type: Added:
  1. Follow-up within 1 year
  2. Follow-up within 4 weeks

- The numerator is revised to read: For all collection types: Patient visits where patients were screened for high blood pressure AND have a recommended follow-up plan documented, as indicated, if the blood pressure is pre-hypertensive or hypertensive.

  Updated numerator definition: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: Patients with a Documented Reason for not Screening or no Follow-Up Plan for High Blood Pressure (Denominator Exception) –
  • Documentation of medical reason(s) for not screening for high blood pressure (e.g., patient is in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient’s health status).
  • Documentation of patient reason(s) for not screening for blood pressure measurements or for not ordering an appropriate follow-up intervention if patient is pre-hypertensive or hypertensive (e.g., patient refuses).

- The numerator notes is revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Although the recommended screening interval for a normal BP reading is every 2 years, to meet the intent of this measure, BP screening and follow-up must be performed at every patient visit. For patients with Normal blood pressure, a follow-up plan is not required (G8783). Denominator Exception(s) are determined on the date of the denominator eligible encounter.

  Per the ‘Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting’: Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.

Steward: Centers for Medicare & Medicaid Services

</tbody>
</table>

### Rationale:

We proposed to update the measure frequency so that the clinical quality action is occurring at all denominator eligible visits. Hypertension is a prevalent condition, and the United States Preventive Services Task Force (USPSTF) found good evidence that screening for and treatment of high blood pressure in adults substantially reduces the incidence of cardiovascular events. In alignment with this update, the measure language has been revised to reflect the change in frequency to all visits.

Additionally, the eCQM Specifications collection type revised the logic to align with the measure’s reporting frequency update, as well as updating the denominator exception logic to add two elements that were missing from the existing logic to ensure that all valid denominator exception options are accounted for within the logic. The denominator exception language was revised in the eCQM Specifications collection type to follow best practices and add clarity to implementing the measure. To align with this update, the definition for denominator exception was revised in the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types.

We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.

In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.

### Comment:

One commenter opposed the proposed change in the frequency of blood pressure screening required for this measure from annual to every patient encounter. CMS states that this is in response to the update on screening recommendations from the United States Preventive Services Task Force (USPSTF).

The USPSTF is updating their guidance, but their most recent draft guidance states the following on recommended screening frequency: The USPSTF suggests annual screening for hypertension in adults age 40 years or older and for adults at increased risk for hypertension (such as persons with high-normal blood pressure, who are overweight or obese, or who are African American). Screening less frequently (i.e., every 3 to 5 years) is appropriate for adults ages 18 to 39 years not at increased risk for hypertension and with a prior normal blood pressure reading. CMS’s proposed change is in opposition to recommended best practices and unnecessarily creates additional burden for clinicians. Meaningful measures should be based on best evidence.

**Response:** While the USPSTF does give these suggestions, they also note that available evidence regarding optimal screening intervals for hypertension are limited. However, given the prevalence of the condition, as hypertension affects approximately 45% of the adult U.S. population (https://www.cdc.gov/nchs/products/databriefs/db364.htm), and is a major contributing factor to chronic conditions such as heart failure, heart attack, stroke, and chronic kidney disease, we believe it is important to screen blood pressure often to ensure the opportunity to offer a timely diagnoses.

After consideration of public comments, we are finalizing the changes to measure Q317 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## D.65 Falls: Screening for Future Fall Risk

<table>

<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications, CMS Web Interface Measure Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients 65 years of age and older who were screened for future fall risk during the measurement period.</td>
</tr>
</tbody>
</table>

### Substantive Change:
- **Modified collection type:** eCQM Specifications
- **Updated denominator exclusion:** For the eCQM Specifications collection type: Removed: Exclude patients who were non-ambulatory at some point in the measurement period.

### Rationale:
We proposed to remove the denominator exclusion for non-ambulatory patients to address implementation challenges as there is a lack of available documentation for a non-ambulatory status. We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

### Comment:
One commenter supported the proposal to remove the denominator exclusion for non-ambulatory patients.

### Response:
We thank the commenter for supporting the change to this measure. After consideration of public comments, we are finalizing the changes to measure Q318 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.
### D.66 Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>

<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications; MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients aged 18 years and older with nonvalvular atrial fibrillation (AF) or atrial flutter who were prescribed warfarin OR another FDA-approved oral anticoagulant drug for the prevention of thromboembolism during the measurement period.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

- The denominator is revised to read: For all collection types: All patients aged 18 years and older with a diagnosis of nonvalvular AF or atrial flutter who do not have a documented CHA$_2$DS$_2$-VASc risk score of 0 or 1 for men or 0, 1, or 2 for women.

- The denominator/numerator note is revised to read: For all collection types: The intent of the denominator exclusion G9931 is to allow patients with a low risk for a thromboembolic event (i.e. a CHA$_2$DS$_2$-VASc score of 0 or 1 for men or 0, 1, or 2 for women) to be excluded from the sample. This denominator exclusion serves as documentation that a patient’s risk for a thromboembolic event was appropriately assessed using the CHA$_2$DS$_2$-VASc scoring tool and that the risk was low enough to not warrant anticoagulation treatment. To exclude low risk patients, eligible clinicians must use the CHA$_2$DS$_2$-VASc assessment tool to determine a patient’s risk score and must document either the numeric score (i.e. 0 or 1 for men or 0, 1, or 2 for women) or all the individual risk factors assessed to support an assessment of the CHA$_2$DS$_2$-VASc score.

- Updated denominator exclusion: For all collection types: Revised: Documentation of CHA$_2$DS$_2$-VASc risk score of 0 or 1 for men; 0, 1, or 2 for women.

- Updated denominator: For all collection types: Added telehealth as eligible encounter.

**Steward:** American Heart Association

**High Priority Measure:** No

**Measure Type:** Process

**Rationale:**

- We proposed to revise the measure to reflect the updated guidelines regarding when it is clinically appropriate to prescribe an oral anticoagulant for patients that are diagnosed with atrial fibrillation or atrial flutter. This update is reflected in the denominator statement, denominator note, and denominator exclusion.

- We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

**Comment:** One commenter supported the addition of telehealth reporting for measure Q326.

**Response:** We thank the commenter for supporting the addition of telehealth reporting for this measure.

After consideration of public comments, we are finalizing the changes to measure Q326 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.67 Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse)

**Comment:** Several commenters supported the addition of telehealth as an eligible encounter to measure Q332. The commenter appreciated CMS recognizing telehealth as an appropriate modality for effective, high quality patient care.

**Response:** We thank the commenters for supporting the change to measure Q332.

After consideration of public comments, we are finalizing the changes to measure Q332 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.69 Maternity Care: Elective Delivery or Early Induction Without Medical Indication at < 39 Weeks (Overuse)

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>335</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Patient Safety</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients, regardless of age, who gave birth during a 12-month period who delivered a live singleton at &lt; 39 weeks of gestation completed who had elective deliveries or early inductions without medical indication.</td>
</tr>
</tbody>
</table>

#### Substantive Change:

- **The description is revised to read:** Percentage of patients, regardless of age, who gave birth during a 12-month period who delivered a live singleton at < 39 weeks of gestation completed who had elective deliveries by cesarean section (C-section), or early inductions of labor, without medical indication.

- **Updated instructions:** Revised: This measure is to be submitted each time a procedure is performed for patients undergoing delivery by C-section, or induction of labor, at less than 39 weeks gestation during the performance period.

- **The denominator is revised to read:** All patients, regardless of age, who gave birth during a 12-month period delivering a live singleton at < 39 weeks gestation completed.

- **The numerator is revised to read:** Patients who had elective deliveries by C-section, or early inductions of labor, without medical indication.

- **Updated numerator options:** Revised:
  - **Performance Met:** Early elective delivery by C-section, or early elective induction, not performed (< 39 weeks gestation).
  - **Performance Not Met:** Early elective delivery by C-section, or early elective induction, performed (< 39 weeks gestation).

#### Steward:
- Centers for Medicare & Medicaid Services

#### High Priority Measure:
- Yes

#### Measure Type:
- Outcome

#### Rationale:
- We proposed to update the description and instructions to provide further clarity regarding what suffices for elective deliveries. Additionally, we proposed to move the “without medical indication” from the denominator to the numerator as the denominator should capture all patients with a single live birth at less than 39 weeks gestation. The numerator assesses whether or not there was medical indication for an early elective delivery by C-section, or early elective induction. This update will better align the language with the measure intent.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q335 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
**D.70 Maternity Care: Postpartum Follow-up and Care Coordination**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>

<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to update the measure description for clarity and readability so that it is easy to understand the measure intent. We proposed a substantive change to the description; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care before or at 8 weeks of giving birth and received the following at the postpartum visit: breast-feeding evaluation and education, postpartum depression screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update. This additional refinement does not affect the intent of the proposed substantive change.</td>
</tr>
<tr>
<td></td>
<td>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q336 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</td>
</tr>
</tbody>
</table>
### D.71 Optimizing Patient Exposure to Ionizing Radiation: Appropriateness: Follow-up CT Imaging for Incidentally Detected Pulmonary Nodules According to Recommended Guidelines

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>364</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Communication and Care Coordination</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of final reports for CT imaging studies with a finding of an incidental pulmonary nodule for patients aged 35 years and older that contain an impression or conclusion that includes a recommended interval and modality for follow-up (e.g., type of imaging or biopsy) or for no follow-up, and source of recommendations (e.g., guidelines such as Fleischner Society, American Lung Association, American College of Chest Physicians).</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>Updated denominator note: Added: Granulomas, hamartomas or lesions with internal fat, or other characteristically benign findings are not considered incidental findings in the context or intent of this measure. Therefore, they are not included in the measure denominator. However, generally accepted radiology practices should be followed for communication and management of these characteristically benign findings.</td>
</tr>
<tr>
<td>Steward:</td>
<td>American College of Radiology</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to add language to the denominator note to add clarity as to which incidental findings are not appropriate for the purposes of this measure. Some incidental findings are widely known to be benign and would therefore not necessitate a specific documentation of a recommendation of no follow-up. This will reduce clinician burden and ensure only the appropriate patients are included in the denominator eligible population.</td>
</tr>
</tbody>
</table>

We proposed a substantive change to the denominator note; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Granulomas, hamartomas or lesions with internal fat, or other characteristically benign findings are not considered incidental findings in the context or intent of this measure. Therefore, they are not included in the measure denominator. However, generally accepted radiology practices should be followed with respect to communication and management of these characteristically benign findings.

**Comment:** One commenter recognized the changes to measure Q364 without issue. A second commenter supported the changes as they better fit the intent of these measures and will lessen clinical burden to some extent.

**Response:** We thank the commenters for supporting the changes to this measure.

After consideration of public comments, we are finalizing the changes to measure Q364 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.72 Depression Remission at Twelve Months

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NQF # / eCQM NQF #:</strong></td>
<td>0710 / 0710e</td>

<td>CMS159v9</td>
</tr>
<tr>
<td><strong>National Quality Strategy Domain:</strong></td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td><strong>Current Collection Type:</strong></td>
<td>eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td><strong>Current Measure Description:</strong></td>
<td>The percentage of adolescent patients 12 to 17 years of age and adult patients 18 years of age or older with major depression or dysthymia who reached remission 12 months (+/- 60 days) after an index event date.</td>
</tr>
<tr>
<td><strong>Modified collection type:</strong></td>
<td>eCQM Specifications and MIPS CQMs Specifications</td>
</tr>
<tr>
<td><strong>Updated guidance:</strong></td>
<td>For the eCQM Specifications collection type: Added: When a baseline assessment is conducted with PHQ 9M, the follow-up assessment can use either a PHQ 9M or PHQ 9. This eCQM is a patient-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (<a href="https://ecqi.healthit.gov/qdm">https://ecqi.healthit.gov/qdm</a>) for more information on the QDM.</td>
</tr>
<tr>
<td><strong>Updated denominator:</strong></td>
<td>For the MIPS CQMs Specifications collection type: Added telehealth with qualified non-physician healthcare professional.</td>
</tr>
<tr>
<td><strong>Updated denominator exclusion:</strong></td>
<td>For the eCQM Specifications collection type: Revised: Patients with a diagnosis of personality disorder emotionally labile.</td>
</tr>
<tr>
<td><strong>Steward:</strong></td>
<td>Minnesota Community Measurement</td>
</tr>
<tr>
<td><strong>High Priority Measure:</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Measure Type:</strong></td>
<td>Outcome</td>
</tr>
</tbody>
</table>

**Rationale:**

We proposed to update the guidance for eCQM Specifications collection type to add clarity regarding the assessment that may be used for the follow-up assessment for the purposes of meeting performance for this measure. Additionally, we proposed to revise the denominator exclusion language for a diagnosis of personality disorder to further clarify ensuring the correct patient population is being excluded from quality action assessment.

We proposed to update the denominator of the MIPS CQMs Specifications collection type to include telehealth encounters with qualified non-physician healthcare professionals as it would be appropriate to assess this patient population for numerator compliance.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q370 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Measure Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Measure Specifications. Also, it should be noted that the CMS Web Interface Specifications collection type is not able to establish a benchmark for this measure. Thus, this measure will be excluded from the Merit-based Incentive Payment System (MIPS) scoring in accordance with § 414.1380(b)(1)(ii)(A)(2)(i) provided that the measure meets the data completeness requirement and the data applicable to the measure is reported via the CMS Web Interface Measure Specifications.

<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients with referrals, regardless of age, for which the referring provider receives a report from the provider to whom the patient was referred.</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>Updated logic: For the eCQM Specifications collection type: Updated logic for ‘First Referral During Measurement Period’ to allow an additional, optional way to capture the first referral.</td>
</tr>
<tr>
<td></td>
<td>Updated denominator: For all collection types: Added telehealth as eligible encounter.</td>
</tr>
<tr>
<td></td>
<td>Updated numerator: For the eCQM Specifications collection type: Removed pathology consult note from ‘Consultant Report’ value set.</td>
</tr>
<tr>
<td>Steward:</td>
<td>Centers for Medicare &amp; Medicaid Services</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to update the logic for ‘First Referral During Measurement Period’ to allow for a referral order, in addition to a referral being performed. This revision is consistent with the measure intent and provides options to capture the first referral within the electronic medical record. Additionally, we proposed to remove the pathology consult note from the ‘Consultant Report’ value set based upon terminology updates as the availability of the general consult note is available as an option.</td>
</tr>
<tr>
<td></td>
<td>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</td>
</tr>
<tr>
<td>Comment:</td>
<td>One commenter supported the addition of telehealth reporting for measure Q374.</td>
</tr>
<tr>
<td>Response:</td>
<td>We thank the commenter for supporting the addition of telehealth reporting for this measure.</td>
</tr>
<tr>
<td>Comment:</td>
<td>One commenter requested additional clarification on the proposed updated eCQM logic to capture a referral order without a referral actually being made or conducted. It is unclear how a clinician can close the referral loop if a referral does not occur.</td>
</tr>
<tr>
<td>Response:</td>
<td>This revision is in alignment with the intent of the measure, which is to ensure patient’s referred for an outside consultation complete the encounter with a consult report being returned to the referring physician. As the measure steward, we will review and consider revision of the coding within the measure for possible implementation in future years.</td>
</tr>
</tbody>
</table>

After consideration of public comments, we are finalizing the changes to measure Q374 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.74 Functional Status Assessments for Congestive Heart Failure

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality#:</td>
<td>377</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS90v9</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Person and Caregiver-Centered Experience and Outcomes</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients 18 years of age and older with congestive heart failure who completed initial and follow-up patient-reported functional status assessments.</td>
</tr>
</tbody>
</table>

**Substantive Change:**
- **Updated logic:**
  - **Initial Patient Population:** Revised timing of congestive heart failure (CHF) diagnosis in the initial population logic so it overlaps before the measurement period.
  - **Qualifying Encounter:** Revised timing of the encounter from the start of the measurement period to the end of the measurement period.
- **Numerator:**
  - Revised to ensure assessments completed during the encounter count toward the numerator.
  - Revised KCCQ logic to address the 6 domain subcategories used to account for the KCCQ assessment total score.
  - Added the KCCQ Total Assessment Score logic to include the summary score as an option to meet the KCCQ assessment requirement.
  - Revised timing and logic of the follow-up functional status assessment (FSA) to relate to the initial FSA performed and not the encounter.
  - Revised measurement period for the Veterans RAND 12 Item Health Survey (VR-12) to allow for the initial FSA to occur prior to the measurement period if the encounter occurs within the first few days of the measurement period.

**Rationale:**
We proposed to update the initial patient population logic to ensure the CHF diagnosis occurs before the denominator eligible encounter, which aligns more closely with the measure intent. We proposed to update the qualifying encounter logic to account for leap year. This refinement will eliminate the need to adjust the number of days for leap years. Additionally, we proposed to update the numerator logic for the Kansas City Cardiomyopathy Questionnaire (KCCQ) FSA so that it can be reported by either utilizing the six domain subcategories or the total score. This added flexibility better aligns with different clinical workflows, and is consistent with measure intent. The logic and timing were revised to relate to the initial functional status (FSA) and not the encounter to better align with the measure intent. We proposed, to all the VR-12, to allow for the initial FSA to occur prior to the measurement in the instance the encounter occurs within the first few days of the measurement period to improve harmonization with the measure intent.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q377 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
## D.75 Children Who Have Dental Decay or Cavities

<table>
<thead>

</tr>
<tr>
<td>Current Collection Type:</td>
<td>eCQM Specifications</td>
</tr>
</tbody>
</table>

| Current Measure Description: | Percentage of children, age 0-20 years, who have had tooth decay or cavities during the measurement period. |

### Substantive Change:
- **The description is revised to read:** Percentage of children, 6 months - 20 years of age, who have had tooth decay or cavities during the measurement period.
- **The initial patient population is revised to read:** Children, 6 months - 20 years of age, with a visit during the measurement period.
- **Updated denominator:** Removed:
  - "Office Visit" (2.16.840.1.113883.3.464.1003.101.12.1001)
  - "Preventive Care - Established Office Visit, 0 to 17" (2.16.840.1.113883.3.464.1003.101.12.1024)
  - "Preventive Care Services - Established Office Visit, 18 and Up" (2.16.840.1.113883.3.464.1003.101.12.1025)
  - "Preventive Care Services-Initial Office Visit, 18 and Up" (2.16.840.1.113883.3.464.1003.101.12.1023)
  - "Preventive Care- Initial Office Visit, 0 to 17" (2.16.840.1.113883.3.464.1003.101.12.1022)

**Steward:** Centers for Medicare & Medicaid Services

**High Priority Measure:** Yes

**Measure Type:** Outcome

**Rationale:**
We proposed to raise the minimum age for this measure to 6 months to better align with average tooth eruption. Children under 6 months of age are less likely to have teeth and would therefore not meet numerator criteria, which is why they are being removed from the initial patient population. Additionally, we proposed to update the denominator to limit the denominator eligible encounters to the “Clinical Oral Evaluation” value set as the clinical quality action is more appropriate for the dentistry MIPS eligible clinician.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q378 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.76 Primary Caries Prevention Intervention as Offered by Primary Care Providers, including Dentists

<td>Percentage of patient visits for those patients aged 6 through 17 years with a diagnosis of major depressive disorder with an assessment for suicide risk.</td>
</tr>
<tr>
<td>Substantive Change:</td>
<td>Updated guidance: Added: In recognition of the growing use of integrated and team-based care, the diagnosis of depression and the assessment for suicide risk need not be performed by the same provider or clinician.</td>
</tr>
<tr>
<td>Steward:</td>
<td>Mathematica</td>
</tr>
<tr>
<td>High Priority Measure:</td>
<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows.</td>
</tr>
</tbody>
</table>

**Comment:** One commenter stated that guidance reads “A suicide risk assessment should be performed at every visit for major depressive disorder during the measurement period.” Feedback from specialists in this field voice the following: “Our concern is that therapists provide group visits and some of those teens have MDD on their problem list. Currently, suicide risk assessments are not conducted at group visits. Most patients who attend group visits also have a cadence of seeing their therapists separately.” The commenter recommended that this requirement make exceptions of the required suicide assessment during group visits.

**Response:** We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q382 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.78 Adherence to Antipsychotic Medications For Individuals with Schizophrenia

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>1879 / N/A</td>

</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

#### Current Measure Description:
Percentage of individuals at least 18 years of age as of the beginning of the measurement period with schizophrenia or schizoaffective disorder who had at least two prescriptions filled for any antipsychotic medication and who had a Proportion of Days Covered (PDC) of at least 0.8 for antipsychotic medications during the measurement period (12 consecutive months).

#### Rationale:
We, as the measure steward, have decided not to finalize the substantive change to revise the timing for the diagnosis of schizophrenia or schizoaffective disorder to be prior to the performance period. We proposed to update the measure language to reflect that the diagnosis of schizophrenia or schizoaffective disorder should be prior to the performance period as this aligns more closely to the intent of the measure and allows for assessment of medication adherence over a longer timeframe. We proposed to remove the “12 consecutive months” from the description as this was causing confusion amongst MIPS eligible clinicians. The denominator exclusion coding was expanded to include opioid abuse with intoxication with perceptual disturbance as this is appropriate for identifying patients with a dementia diagnosis and therefore, applicable to the denominator exclusion. Additionally, we proposed to update the numerator note to clarify that the index date is the date the prescription was first filled during the performance period.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q383 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years, with the exception of the revisions in the timing of diagnosis for schizophrenia or schizoaffective disorder. This revision is located within the description, instructions, denominator statement, and denominator criteria and will be updated as needed for clarity of the concept as needed within the specification.

#### Revisions:
- **Rationale:** We proposed to update the measure language to reflect that the diagnosis of schizophrenia or schizoaffective disorder should be prior to the performance period as this aligns more closely to the intent of the measure and allows for assessment of medication adherence over a longer timeframe. We proposed to remove the “12 consecutive months” from the description as this was causing confusion amongst MIPS eligible clinicians. The denominator exclusion coding was expanded to include opioid abuse with intoxication with perceptual disturbance as this is appropriate for identifying patients with a dementia diagnosis and therefore, applicable to the denominator exclusion. Additionally, we proposed to update the numerator note to clarify that the index date is the date the prescription was first filled during the performance period.

### Substantive Change:
- **The description is revised to read:** Percentage of individuals at least 18 years of age with schizophrenia or schizoaffective disorder as of the beginning of the performance period who had at least two prescriptions filled for any antipsychotic medication and who had a Proportion of Days Covered (PDC) of at least 0.8 for antipsychotic medications during the performance period.

- **Updated instructions:** Revised: This measure is to be submitted a minimum of once per performance period for all patients with a preexisting (before the performance period) diagnosis of schizophrenia or schizoaffective disorder who are seen during the performance period.

- **The denominator statement is revised to read:** Individuals at least 18 years of age with schizophrenia or schizoaffective disorder as of the beginning of the performance period and at least two prescriptions filled for antipsychotic medications during the performance period.

- **Updated denominator criteria:** Revisited the timing for the diagnosis for schizophrenia or schizoaffective disorder to be prior to the performance period.

- **Updated denominator exclusion:** Added opioid abuse with intoxication with perceptual disturbance to diagnosis for dementia.

- **Updated numerator note:** Revised: PDC NUMERATOR:

  The PDC numerator is the sum of the days covered by the days’ supply of all antipsychotic prescriptions. The period covered by the PDC starts on the day within the performance period when the first prescription is filled (i.e., the index date) and lasts through the end of the performance period, or death, whichever comes first. For prescriptions with a days’ supply that extends beyond the end of the performance period, count only the days for which the drug was available to the individual during the performance period. If there are prescriptions for the same drug (generic name) on the same date of service, keep the prescription with the largest days’ supply. If prescriptions for the same drug (generic name) overlap, then adjust the prescription start date to be the day after the previous fill has ended.

#### Steward:
Centers for Medicare & Medicaid Services

| Current Measure Description: | Percentage of final reports for imaging studies for patients aged 18 years and older with one or more of the following noted incidentally with a specific recommendation for no follow-up imaging recommended based on radiological findings:  
- Cystic renal lesion that is simple appearing* (Bosniak I or II)  
- Adrenal lesion less than or equal to 1.0 cm  
- Adrenal lesion greater than 1.0 cm but less than or equal to 4.0 cm classified as likely benign by unenhanced CT or washout protocol CT, or MRI with in- and opposed-phase sequences or other equivalent institutional imaging protocols |
| Substantive Change: | The description is revised to read: Percentage of final reports for imaging studies for patients aged 18 years and older with one or more of the following noted incidentally with a specific recommendation for no follow-up imaging recommended based on radiological findings:  
- Cystic renal lesion that is simple appearing* (Bosniak I or II)  
- Adrenal lesion less than or equal to 1.0 cm  
- Adrenal lesion greater than 1.0 cm but less than or equal to 4.0 cm classified as likely benign or diagnostic benign by unenhanced CT or washout protocol CT, or MRI with in- and opposed-phase sequences or other equivalent institutional imaging protocols  

The denominator is revised to read: For all collection types: All final reports for imaging studies for patients aged 18 years and older with one or more of the following incidentally noted:  
- Cystic renal lesion that is simple appearing (Bosniak I or II)  
or  
- Adrenal lesion less than or equal to 1.0 cm  
or  
- Adrenal lesion greater than 1.0 cm but less than or equal to 4.0 cm classified as likely benign or diagnostic benign by unenhanced CT or washout protocol CT, or MRI with in- and opposed-phase sequences or other equivalent institutional imaging protocols |
| Updated denominator criteria: | For all collection types: Removed diagnostic ultrasound procedures. |
| Updated numerator note: | Removed diagnostic ultrasound procedures. |
| Updated numerator options: | For the Medicare Part B Claims Measure Specifications collection type: Removed numerator note. |
| Performance Not Met: | Revised: Final reports for imaging studies with follow-up imaging recommended, or final reports that do not include a specific recommendation of no follow-up. |

Steward: American College of Radiology

High Priority Measure: Yes

Measure Type: Process

Rationale: We proposed to update the numerator options to add clarifying language that accounts for those instances where no follow-up recommendation is given within the final reports for imaging studies. The intent of the measure includes the documentation of follow-up recommendations within the final report. Additionally, we proposed to remove diagnostic ultrasound procedures from the denominator eligible criteria as it does not align with the intent of the measure.

We proposed a substantive change to the denominator note; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:  
The intent of this measure is to ensure patients with incidental findings that are highly likely to be benign do not receive follow-up imaging routinely. * “Simple-appearing criteria”:  
- § Incidental renal mass on non-contrast enhanced abdominal CT that does not contain fat, is homogenous in appearance, -10-20 HU or ≥70 HU. (ACR, 2017)  
- § Incidental renal mass on contrast-enhanced abdominal CT that does not contain fat, is homogenous in appearance, -10-20 HU. (ACR, 2017)  
When reporting this measure, masses and lesions that do not meet all the criteria for “no further work-up” as provided in Management of the Incidental Renal Mass on CT: A White Paper of the ACR Incident Findings Committee or the Management of the Incidental Adrenal Mass on CT: A White Paper of the ACR Incident Findings Committee or the Management of the Incidental Adrenal Mass on CT: A White Paper of the ACR.
Incidental Findings Committee should not be considered in the context or intent of this measure. However, generally accepted radiology practices should be followed with respect to communication and management of any characteristically benign findings. A measure performance goal of 100% should not substitute for clinical judgment in individual cases.

This additional refinement of changing ‘for communication’ to ‘with respect to communication’ does not affect the intent of the proposed substantive change.

**Comment:** One commenter supported the changes to measure Q405 as they better fit the intent of these measures and will lessen clinical burden to some extent.

**Response:** We thank the commenter for supporting the changes to this measure.

**Comment:** One commenter believed that the changes to measure Q405 should be more comprehensive. The measure focuses exclusively on reporting “no-follow up recommended” for incidental and likely benign renal and adrenal lesions. While the commenter understood the intention to address inappropriate use of imaging, the measure neglects appropriate usage. It should also support evidence-based recommendations for follow-up of worrisome lesions. A more balanced approach would indicate performance met when specific evidence-based guidance is used for necessary follow-up and when no follow-up is necessary, as included in the measure steward’s two white papers referenced in the measure.

**Response:** We encourage the commenter to reach out the measure steward to discuss possible revisions for consideration for future implementation.

After consideration of public comments, we are finalizing the changes to measure Q405 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.

After consideration of public comments, we are finalizing the changes to measure Q410 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.87 Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 18 Years and Older

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>415</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Efficiency and Cost Reduction</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of emergency department visits for patients aged 18 years and older who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who have an indication for a head CT.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

**Updated denominator criteria:** Diagnosis for minor blunt head trauma - removed coding for fracture of skull and facial bones and superficial injury of neck.

The definition is revised to read:

Indications for a head CT in patients presenting to the emergency department for minor blunt head trauma:

Patients with no loss of consciousness (LOC) AND no post-traumatic amnesia AND any one of the following:

- GCS score less than 15
- Severe headache
- Vomiting
- Age 65 years and older
- Physical signs of a basilar skull fracture (signs include haemotympanum, "raccoon" eyes, cerebrospinal fluid leakage from the ear or nose, Battle's sign)
- Focal neurological deficit
- Coagulopathy
- Thrombocytopenia
- Currently taking any of the following anticoagulant medications**: apixaban, argatroban, betrixaban, bivalirudin, dabigatran, dalteparin, desirudin, edoxaban, enoxaparin, fondaparinux, heparin, rivaroxaban, warfarin
- Dangerous mechanism of injury (i.e., ejection from a motor vehicle, a pedestrian struck, and a fall from a height of more than 3 feet or 5 stairs)

OR

Patients with either LOC OR Posttraumatic amnesia AND any one of the following:

- GCS score less than 15
- Headache
- Age 60 years and older, and less than 65 years
- Drug/alcohol intoxication
- Short-term memory deficits
- Evidence of trauma above the clavicles (physical location, any trauma to the head or neck [i.e., laceration, abrasion, bruising, ecchymosis, hematoma, swelling, fracture])
- Posttraumatic seizure.

**Steward:** American College of Emergency Physicians

**High Priority Measure:** Yes

**Measure Type:** Efficiency

**Rationale:** We proposed to update the coding for ‘Diagnosis of minor blunt head trauma’ base on the measure steward’s clinical expert input as closed fractures of the skull and facial bones, as well as concepts that relate to neck of below the head anatomical locations. The measures intent is to capture those patients with minor blunt head trauma and the fractures captured above are not clinically appropriate for the denominator criteria and should not be assessed for the purposes of this measure. We proposed revisions to the definition language to improve clarity regarding indications for a head CT for the purposes of this measure. We agreed that these revisions better define how to determine appropriate indication(s) for a head CT.

**Comment:** One commenter supported the substantive changes to measure Q415, which will improve clarity regarding indications for a head CT for the purposes of this measure.

**Response:** We thank the commenter for supporting the changes to measure Q415.

After consideration of publication comments, we are finalizing the changes to measure Q415 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.88 Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 2 Through 17 Years

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>

<tr>
<td>National Quality Strategy Domain:</td>
<td>Efficiency and Cost Reduction</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of emergency department visits for patients aged 2 through 17 years who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who are classified as low risk according to the Pediatric Emergency Care Applied Research Network (PECARN) prediction rules for traumatic brain injury.</td>
</tr>
</tbody>
</table>

**Substantive Change:**

**Updated denominator criteria:** Diagnosis for minor blunt head trauma - removed coding for fracture of skull and facial bones and superficial injury of neck.

**The numerator definition is revised to read:** For all collection types:

Low Risk for Traumatic Brain Injury according to PECARN prediction rules – Patients can be classified as low risk if ALL of the following are met:

- No signs of altered mental status (e.g., agitation, somnolence, repetitive questioning, slow response to verbal communication)
- OR no GCS < 15
- No signs of basilar skull fracture (signs include haemotympanum, “raccoon” eyes, cerebrospinal fluid leakage from the ear or nose, Battle’s sign)
- No loss of consciousness
- No vomiting
- No severe mechanism of injury (i.e., motor vehicle crash with patient ejection, death of another passenger, or rollover; pedestrian or bicyclist without helmet struck by a motorized vehicle; falls of more than 5 feet; or head struck by a high-impact object)
- No severe headache.

**Steward:** American College of Emergency Physicians

**High Priority Measure:** Yes

**Measure Type:** Efficiency

**Rationale:** We proposed to update the coding for ‘Diagnosis of minor blunt head trauma’ base on the measure steward’s clinical expert input as closed fractures of the skull and facial bones, as well as concepts that relate to neck of below the head anatomical locations. The measures intent is to capture those patients with minor blunt head trauma and the fractures captured above are not clinically appropriate for the denominator criteria and should not be assessed for the purposes of this measure. We proposed revisions to the definition language to improve clarity regarding low risk for traumatic brain injury (TBI) for the purposes of this measure. We agreed that these revisions better define how to appropriately determine whether the patient is low risk for traumatic brain injury or not.

**Comment:** One commenter supported the substantive changes to measure Q416, which will improve clarity regarding indications for a head CT for the purposes of this measure.

**Response:** We thank the commenter for supporting the changes to measure Q416.

After consideration of public comments, we are finalizing the changes to measure Q416 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.89 Osteoporosis Management in Women Who Had a Fracture

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>0053 / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>418</td>
</tr>

<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>The percentage of women age 50-85 who suffered a fracture in the six months prior to the performance period through June 30 of the performance period and who either had a bone mineral density test or received a prescription for a drug to treat osteoporosis in the six months after the fracture.</td>
</tr>
</tbody>
</table>

**Updated denominator criteria: For all collection types:**
Option 1: Added denominator eligible patient encounters including discharge, outpatient observation, outpatient consultation, emergency department, home services, preventive medicine and counseling, work related/medical disability, care planning, and annual well check.

**Updated denominator exclusions: For all collection types:** Option 1 and Option 2: Revised:
1. Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during 6 months prior to the measurement period through December 31 of the measurement period.
2. Patient 66 - 80 years of age and had at least one claim/encounter for frailty during the measurement period AND either one acute inpatient encounter with a diagnosis of advanced illness or two outpatient, observation, ED or nonacute inpatient encounters on different dates of service with an advanced illness diagnosis during the measurement period or the year prior to the measurement period.
3. Patients 66 - 80 years of age and had at least one claim/encounter for frailty during the measurement period AND a dispensed medication for dementia during the measurement period or the year prior to the measurement period.

**Updated definition: For all collection types:** Revised: Pharmacologic Therapy – U.S. Food and Drug Administration approved pharmacologic options for osteoporosis prevention and/or treatment of postmenopausal osteoporosis include: bisphosphonates, alendronate, alendronate-cholecalciferol, ibandronate, risedronate, zoledronic acid, teriparatide, denosumab, abaloparatide, romosozumab, and raloxifine.

**Steward:** National Committee for Quality Assurance
**High Priority Measure:** No
**Measure Type:** Process

We proposed to expand the eligible encounter coding for Option 1 to include all relevant encounters and create a more complete eligible patient population.

We proposed that the denominator exclusion language and logic be updated in all collection types to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period. A denominator exclusion was added to remove patient 81 years of age and older with a frailty encounter during the measurement period as patients within this age stratification are more appropriately assessed less stringently when determine if they should be excluded from the eligible patient population. Additionally, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure.

We proposed to update the definition for pharmacologic therapy to align with the current U.S. Food and Drug Administration approved pharmacologic options for osteoporosis prevention and/or treatment of postmenopausal osteoporosis.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q418 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.

**INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:**
This information has not been publicly disclosed and may be privileged and confidential. **D.90 Overuse of Imaging for the Evaluation of Primary Headache**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>419</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Efficiency and Cost Reduction</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of patients for whom imaging of the head (CT or MRI) is obtained for the evaluation of primary headache when clinical indications are not present.</td>
</tr>
</tbody>
</table>

**Rationale:**

- We proposed to remove the Medicare Part B Claims Measure Specifications collection type. The limited adoption of the quality measure for this collection type does not allow for the creation of benchmarks to provide a meaningful impact to quality improvement.

- We proposed to update the denominator criteria to remove the inpatient setting as this measure is appropriate for the outpatient setting only. We proposed to remove the denominator criteria for patients with no clinical indications for head imaging and replace it with a denominator exclusion that clarifies patients with clinical indications for whom imaging of the head would be clinically relevant and warranted. The denominator instructions were removed as they were duplicative of the added denominator exclusion. Additionally, we proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. The denominator exception is being updated to delete outdated language and no longer allows for system reason(s).

**Comment:** One commenter requested the removal of Medicare Part B Claims Measure Specifications for measure Q419 through the measure review process. The commenter noted that these changes were not reflected in the 2021 PFS proposed rule and the measure specifications should be removed, as the measures steward is no longer maintaining these specifications. A second commenter opposed the removal of the Claims collection type because it would adversely impact ophthalmologists, particularly those in small and rural practices who must rely on the claims reporting collection type because they cannot afford to adopt CEHRT.

**Response:** We refer the commenter to the substantive change proposed to include a modification to the collection type resulting in the removal of the Medicare Part B Claims Measure Specification. We thank the commenter for their support in the removal of the Medicare Part B Claims Measure Specification collection type.

**Comment:** One commenter supported and one commenter did not support the addition of telehealth reporting for measure Q419.

**Response:** We believe that including telehealth encounters as denominator eligible as this will lead to a more complete patient population to ensure appropriate use of imaging for a diagnosis of primary headache. We encourage the commenter who did not support adding telehealth to this measure to reach out to the measures steward to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q419 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
**D.91 Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMS/ECQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Community/Population Health</td>
</tr>
<tr>
<td>MIPS CQMs Specifications</td>
<td>N/A</td>
</tr>
<tr>
<td>Current Measure Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

**Current Measure Description:** Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 24 months AND who received brief counseling if identified as an unhealthy alcohol user.

**The description is revised to read:** Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months AND who received brief counseling if identified as an unhealthy alcohol user.

**Updated instructions:**
Revised:
For the purposes of the measure, the most recent denominator eligible encounter should be used to determine if the numerator action for the submission criteria was performed within the 12-month look back period.

**Added:**
This measure will be calculated with 3 performance rates:

1) Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months
2) Percentage of patients aged 18 years and older who were identified as unhealthy alcohol users who received brief counseling
3) Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months AND who received brief counseling if identified as unhealthy alcohol users

The denominator of submission criteria 2 is a subset of the resulting numerator for submission criteria 1, as submission criteria 2 is limited to assessing if patients identified as unhealthy alcohol users received brief counseling. For all patients, submission criteria 1 and 3 are applicable, but submission criteria 2 will only be applicable for those patients who are identified as unhealthy alcohol users. Therefore, data for every patient that meets the age and encounter requirements will only be submitted for submission criteria 1 and 3, whereas data submitted for submission criteria 2 will be for a subset of patients who meet the age and encounter requirements, as the denominator has been further limited to those who were identified as unhealthy alcohol users.

**THERE ARE THREE SUBMISSION CRITERIA FOR THIS MEASURE:***

1) All patients who were screened for unhealthy alcohol use using a systematic screening method AND
2) All patients who were identified as unhealthy alcohol users who received brief counseling AND
3) All patients who were screened for unhealthy alcohol use using a systematic screening method and, if identified as unhealthy alcohol users received brief counseling, or were not identified as unhealthy alcohol users

This measure contains three submission criteria which aim to identify patients who were screened for unhealthy alcohol use using a systematic screening method (submission criteria 1), patients who were identified as unhealthy alcohol users and who received brief counseling (submission criteria 2), and a comprehensive look at the overall performance on unhealthy alcohol use screening and brief counseling (submission criteria 3). By separating this measure into various submission criteria, the MIPS eligible professional or MIPS eligible clinician will be able to better ascertain where gaps in performance exist, and identify opportunities for improvement. The overall rate (submission criteria 3) should be utilized to compare performance to published versions of this measure prior to the 2021 performance year, when the measure had a single performance rate. For accountability reporting in the CMS MIPS program, the rate for submission criteria 2 is used for performance.

**The denominator is revised to read:**
Submission Criteria 1: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period.

Submission Criteria 2: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period who were screened for unhealthy alcohol use and identified as an unhealthy alcohol user.

Submission Criteria 3: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period.

**Updated denominator:** Added telehealth as eligible encounter.

**The numerator is revised to read:**
Submission Criteria 1: Patients who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months.

Submission Criteria 2: Patients who received brief counseling.

Submission Criteria 3: Patients who were screened for unhealthy alcohol use using a systematic screening method at least once within 12 months AND who received brief counseling if identified as an unhealthy alcohol user.

**The numerator definition is revised to read:**
Submission Criteria 1:
Systematic screening method – For purposes of this measure, one of the following systematic methods to assess unhealthy alcohol use must be utilized. Systematic screening methods and thresholds for defining unhealthy alcohol use include:
- AUDIT Screening Instrument (score ≥ 4)
- AUDIT-C Screening Instrument (score ≥ 4 for men; score ≥ 3 for women)
We proposed to update the measure overall by splitting the measure into separate populations for three submission criteria. This will allow MIPS eligible clinicians to more readily find where the gaps in performance lie, allowing them to be better informed and able to adjust to improve quality care and patient outcomes. We proposed to revise the measure to shorten the look back period to 12 months and require that unhealthy alcohol screening who received brief counseling, if patient screened positive, occur every 12 months. The revision is based upon stakeholder feedback and input from the eCQM Clinical Review Process (CRP) and the measure steward’s technical expert panel (TEP) and we agreed that it is important to do this annually excessive alcohol use is one of the most common causes of premature mortality in the United States [1]. The numerator definition for Systematic screening method has been revised to align with current recommendations for the AUDIT C and the Single Questions Screening threshold.

We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>CMS347v4</td>
</tr>
<tr>
<td>National Quality Strategy Domain:</td>
<td>Effective Clinical Care</td>
</tr>
</tbody>
</table>

**Current Collection Type:** eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications

**Current Measure Description:**
- Percentage of the following patients - all considered at high risk of cardiovascular events - who were prescribed or were on statin therapy during the measurement period:
  - Adults aged ≥ 21 years who were previously diagnosed with or currently have an active diagnosis of clinical atherosclerotic cardiovascular disease (ASCVD); OR
  - Adults aged ≥ 21 years who have ever had a fasting or direct low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL or were previously diagnosed with or currently have an active diagnosis of familial or pure hypercholesterolemia; OR
  - Adults aged 40-75 years with a diagnosis of diabetes with a fasting or direct LDL-C level of 70-189 mg/dL.

**Substantive Change:**
- **Modified collection type:** eCQM Specifications, MIPS CQMs Specifications
  - Updated denominator logic: For the eCQM Specifications collection type: Added “CABG, PCI Procedure” 2.16.840.1.113762.1.4.1138.566 value set.
  - Updated denominator exclusion logic: For the eCQM Specifications collection type: Added Hospice Care value sets.
  - The numerator definition is revised to read: For the MIPS CQMs Specifications collection type:
    - Statin therapy - Administration of one or more of a group of medications that are used to lower plasma lipoprotein levels in the treatment of hyperlipoproteinemia.
  - Table 1 - Statin Medication Therapy List (NOTE: List does NOT include dosage):
    - Atorvastatin, Fluvastatin, Lovastatin (Mevinolin), Pitavastatin, Pravastatin Sodium, Rosuvastatin Calcium, Simvastatin, Amlodipine Besylate/Atorvastatin, Ezetimibe/Simvastatin
  - Updated denominator note: For the MIPS CQMs Specifications collection type: Revised: Denominator Exclusions should be active at any time during the measurement period.
  - Updated denominator: For the MIPS CQMs Specifications collection type: Added telehealth as eligible encounters for all submission criteria.

**Steward:** Centers for Medicare & Medicaid Services

**High Priority Measure:** No

**Measure Type:** Process

We proposed to add a value set to the eCQM Specifications collection type denominator to allow for the use of CPT and HCPCS codes for reporting patients who have had a CABG or PCI for inclusion within the denominator. This will improve data capture to ensure a more complete patient population. Additionally, a Hospice Care value set was added to align with the measure intent to exclude both palliative care and hospice patients.

We proposed to add telehealth encounters as denominator eligible for the MIPS CQMs Specifications collection type as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.

We proposed to the numerator definition for the MIPS CQMs Specifications collection type to include a table of medications within this section and not in the clinical recommendations statement to ensure MIPS eligible clinicians are following these recommendations based on the clinical guidelines. Additionally, we proposed to update the denominator note to add clarity regarding when the denominator exclusion would be assessed within the medical record for the purposes of reporting this measure.

We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.

**Comment:** Several commenters supported the addition of telehealth reporting for measure Q438.

**Response:** We thank the commenters for supporting the addition of telehealth reporting for this measure.

**Comment:** One commenter was not opposed to CMS being more prescriptive with the qualifying medications as long as frequent updates are made to the acceptable medications list.

**Response:** We thank the commenter for supporting the substantive change to the medication list for measure Q438.

After consideration of public comments, we are finalizing the changes to measure Q438 as proposed for the 2021 MIPS performance period/2022 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024
MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Measure Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Measure Specifications. Also, it should be noted that the CMS Web Interface Specifications collection type is not able to establish a benchmark for this measure. Thus, this measure will be excluded from the Merit-based Incentive Payment System (MIPS) scoring in accordance with § 414.1380(b)(1)(i)(A/2(i) provided that the measure meets the data completeness requirement and the data applicable to the measure is reported via the CMS Web Interface Measure Specifications.
The description is revised to read: The percentage of patients greater than or equal to 85 years of age who received a screening colonoscopy from January 1 to December 31.

The denominator is revised to read: All screening colonoscopies performed on patients greater than or equal to 86 years of age from January 1 to December 31.

Updated denominator criteria: Revised: All patients greater than or equal to 50 years of age on date of encounter receiving a colonoscopy for screening purposes only.

The numerator is revised to read: Screening colonoscopies performed in patients greater than or equal to 86 years of age.

The numerator options are revised to read: Performance Met: Patients greater than or equal to 86 years of age who underwent a screening colonoscopy and did not have a history of colorectal cancer or other valid medical reason for the colonoscopy, including: iron deficiency anemia, lower gastrointestinal bleeding, Crohn’s Disease (i.e., regional enteritis), familial adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits.

Denominator Exception: Documentation of medical reason(s) for a colonoscopy performed on a patient greater than or equal to 86 years of age (e.g., iron deficiency anemia, lower gastrointestinal bleeding, Crohn’s Disease (i.e., regional enteritis), familial history of adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits).

Performance Not Met: Patients greater than or equal to 86 years of age who received a colonoscopy for an assessment of signs/symptoms of GI tract illness, and/or because the patient meets high risk criteria, and/or to follow-up on previously diagnosed advanced lesions.

Performance Not Met: Patients between 50 and 85 years of age who received a screening colonoscopy during the performance period.

We proposed to update the denominator population to include all patients aged 50 and older to ensure a more complete patient population as the intent of the measure is to assess age appropriate screening colonoscopies, which include patients under the age of 86 years. The description, denominator, and denominator criteria have been updated to reflect these revisions. The numerator and numerator options have been revised to more clearly reflect the patient population and a performance not met numerator option was added to reflect the expanded denominator eligible patient population.

In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data submitted after the implementation of these substantive changes.

We proposed a substantive change to the numerator options; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

The numerator options are revised to read: Performance Met: Patients greater than or equal to 86 years of age who underwent a screening colonoscopy and did not have a history of colorectal cancer or other valid medical reason for the colonoscopy, including: iron deficiency anemia, lower gastrointestinal bleeding, Crohn’s Disease (i.e., regional enteritis), familial adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits.

Performance Not Met: Documentation of medical reason(s) for a colonoscopy performed on a patient greater than or equal to 86 years of age (e.g., iron deficiency anemia, lower gastrointestinal bleeding, Crohn’s Disease (i.e., regional enteritis), familial history of adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits).

Performance Not Met: Patients greater than or equal to 86 years of age who received a colonoscopy for an assessment of signs/symptoms of GI tract illness, and/or because the patient meets high risk criteria, and/or to follow-up on previously diagnosed advanced lesions.

Performance Not Met: Patients between 50 and 85 years of age who received a screening colonoscopy during the performance period.

This additional refinement of changing the Denominator Exception to a Performance Not Met does not affect the intent of the proposed substantive change. This revision aligns with the current measure specification and will not affect the final performance as this is an inverse measure. It is just a reclassification of the numerator option.

We thank the commenter for supporting the changes to measure Q439.

After consideration of public comments, we are finalizing the changes to measure Q439 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.

Response: We thank the commenter for their comment. This list has been reviewed for accuracy; however, we encourage the commenter to reach out to the measure steward regarding the medication list for potential revisions for possible inclusion in future years.

After consideration of public comments, we are finalizing the changes to measure Q444 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
D.95 Trastuzumab Received By Patients With AJCC Stage I (T1c) – III And HER2 Positive Breast Cancer Receiving Adjuvant Chemotherapy

<table>

</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of female patients (aged 18 years and older) with AJCC stage I (T1c) – III, human epidermal growth factor receptor 2 (HER2) positive breast cancer receiving adjuvant chemotherapy who are also receiving Trastuzumab.</td>
</tr>
</tbody>
</table>

The title is revised from 'Trastuzumab received by patients with AJCC stage I (T1c) - III and HER2 positive breast cancer receiving adjuvant chemotherapy' to: Appropriate Treatment for Patients with Stage I (T1c) - III HER2 Positive Breast Cancer.

The description is revised to read: Percentage of female patients aged 18 to 70 with stage I (T1c) - III HER2 positive breast cancer for whom appropriate treatment is initiated.

The denominator is revised to read: All female breast cancer patients aged 18 to 70 with stage I (T1c) - III HER2 positive breast cancer.

Updated denominator criteria:
Revised: Female patients age 18-70 years on date of encounter.
Removed: Breast Adjuvant Chemotherapy administered.

Updated denominator exclusions: Removed:
- Patient transferred to practice after initiation of chemotherapy.
- Patient has metastatic disease at diagnosis.
Added:
- Patients with pregnancy during adjuvant treatment course.

The numerator is revised to read: Patients whose adjuvant treatment course includes both chemotherapy and HER2-targeted therapy.

The numerator note is revised to read: The quality action of this measure is the appropriateness of treatment rather than timeliness of treatment. The timing of administration of HER2-targeted therapies is expected to vary depending on the cytotoxic agents used. The numerator statement is intended to capture an adjuvant treatment course that includes both chemotherapy and HER2-targeted therapy, independent of possible administration sequences. Adjuvant chemotherapy is defined as a chemotherapy regimen initiated within 6 months of cancer diagnosis. An FDA-approved trastuzumab biosimilar is an appropriate substitute for trastuzumab.

The numerator options are revised to read:
- Performance Met: Patient received adjuvant treatment course including both chemotherapy and HER2-targeted therapy.
- Denominator Exception: Reason for not administering adjuvant treatment course including both chemotherapy and HER2-targeted therapy (e.g. poor performance status (ECOG 3-4; Karnofsky ≤50), cardiac contraindications, insufficient renal function, insufficient hepatic function, other active or secondary cancer diagnoses, other medical contraindications, patients who died during initial treatment course or transferred during or after initial treatment course).
- Performance Not Met: Patient did not receive adjuvant treatment course including both chemotherapy and HER2-targeted therapy.

Steward: American Society of Clinical Oncology

High Priority Measure: Yes

Measure Type: Process

We proposed to expand the scope and clinical focus of the measure to include all female patients age 18 – 70 years with stage I (T1c) - III HER2 positive breast cancer, allowing for assessment of chemotherapy within the numerator, necessitating the removal of the denominator criteria for chemotherapy. NCCN recommendations support the administration of chemotherapy and trastuzumab for this patient population.

We proposed to remove the current denominator exclusions and add new denominator exclusions based upon feasibility testing which determined these histologies are rare enough and are unlikely to have HER2 positivity such that it is not necessary to specifically target for removal from the denominator population. We agreed that these exclusions are not appropriate for inclusion. The added denominator exclusions reflect the measure’s change in clinical scope and allows for removal of patients for whom treatment with chemotherapy and HER2-targeted therapy would not be appropriate.

The measure steward’s technical expert panel acknowledged that patients who fail to receive timely treatment may also fail to receive appropriate treatment. Because the quality action of this measure is appropriateness rather than timeliness of treatment, a broader timeframe is utilized to capture patients who may be less likely to receive appropriate treatment, therefore, 6 months was chosen to define adjuvant chemotherapy. The inclusion of an FDA-approved trastuzumab biosimilar as substitute for trastuzumab is in accordance with updated NCCN breast cancer guidelines. We agreed with this revision to the numerator note as it clarifies the updated measure scope and aligns with current clinical guidelines.

INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW: This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
Additionally, we proposed to update the numerator options to reflect the updated scope and clinical focus of the measure.

In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.

We received no public comments on the substantive changes propose for this measure; therefore, we are finalizing the changes to measure Q450 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

<tr>
<td>Rationale:</td>
<td>We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.</td>
</tr>
</tbody>
</table>

**Comment:** One commenter was concerned about adding a telehealth exclusion to measure Q457 because CMS claimed that telehealth encounters were not applicable to this measure. The commenter disagreed with this statement and believed it would be appropriate to include telehealth encounters in this measure. This measure aims to identify patients who either did not have a hospice referral prior to death or received hospice care too late. Including telehealth encounters would help CMS to more comprehensively and accurately identify patients who were unable to benefit from hospice services.

**Response:** We thank the commenter for their comment. This measure currently requires two or more encounters at the reporting site and that the patient be enrolled in hospice as part of the denominator eligibility criteria. The inclusion of a telehealth modifier exclusion for the patient encounters aligns with the intent of the measure. To be eligible for this measure, the patient must already be enrolled in hospice. This measure assesses whether or not patients were enrolled in hospice in a timely manner in order to maximize benefits that may be attained from this service. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.

After consideration of public comments, we are finalizing the changes to measure Q457 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

<td>Yes</td>
</tr>
<tr>
<td>Measure Type:</td>
<td>Process</td>
</tr>
<tr>
<td>Rationale:</td>
<td>We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.</td>
</tr>
</tbody>
</table>

**Comment:** One commenter supported the addition of telehealth reporting for measure Q464. The commenter noted that there is an error in the substantive change: “Updated denominator: Added telehealth exclusion to patient encounter.” The substantive change should instead read, “Updated denominator: Telehealth exclusion to patient encounter is removed” as telehealth encounters are applicable to this measure and these patients should not be excluded in the denominator.

**Response:** We agree that the measure specification currently excludes telehealth and the substantive change was to remove the telehealth exclusion as it would be appropriate to include these patients into the measure denominator eligible population.

After consideration of public comments, we are finalizing the changes to measure Q464 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.106 Continuity of Pharmacotherapy for Opioid Use Disorder (OUD)

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NQF # / eCQM NQF #:</td>
<td>N/A / N/A</td>
</tr>
<tr>
<td>Quality #:</td>
<td>468</td>
</tr>
<tr>
<td>CMS eCQM ID:</td>
<td>N/A</td>
</tr>
<tr>
<td>National Quality Strategy</td>
<td>Effective Clinical Care</td>
</tr>
<tr>
<td>Domain:</td>
<td></td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
<tr>
<td>Current Measure Description:</td>
<td>Percentage of adults aged 18 years and older with pharmacotherapy for opioid use disorder (OUD) who have at least 180 days of continuous treatment.</td>
</tr>
</tbody>
</table>

**Updated instructions:** Revised: This measure is to be submitted a minimum of once per performance period for all adults aged 18 years and older with pharmacotherapy for OUD seen during the measurement period that meet additional denominator criteria described below.

**The denominator is revised to read:** Adults aged 18 years and older who had a qualifying encounter during the performance year, and a diagnosis of OUD and pharmacotherapy for OUD during the denominator identification period. Eligibility to submit results for a patient requires a qualifying encounter in the performance year, i.e., between January 1, 2021, and December 31, 2021. Solely administering or prescribing OUD medication does not convey eligibility to submit.

If a patient has a qualifying encounter within the performance year, the patient is included in the denominator, if the following criteria are met in the denominator identification period between July 1, 2020, and June 30, 2021:
- Have a diagnosis of OUD
- Receive pharmacotherapy for OUD

**Updated denominator definition:** Added:
Qualifying Encounter – Encounter during the performance year.

**Updated denominator criteria:** Revised:
Adults aged ≥ 18 years on date of qualifying encounter.
Encounter during the measurement period.

**Updated denominator exclusion:** Removed: Pharmacotherapy for OUD initiated after June 30th of 2020.

**The numerator note is revised to read:** Numerator compliance is expected to be determined within an 18-month period that includes the measurement period and the 6 months prior to the measurement period (July 1, 2020 – December 31, 2021).

**Steward:** University of Southern California

**High Priority Measure:** Yes

**Measure Type:** Process

**Rationale:**
We proposed to update the measure to ensure the denominator eligible encounter occurs within the current performance period and the initiation of pharmacotherapy for opioid use disorder (OUD) occurs within the denominator identification period to allow for assessment of at least 180 days for continuous pharmacotherapy for OUD. Additionally, we proposed to update the definitions by adding an additional definition of qualifying encounter to clarify which encounters are denominator eligible and revising the denominator identification period definition to align with the timing and eligibility. The numerator note is being revised to align with these changes outlined above and reiterates the guidance pertaining to the timeframes allowed for clinicians to determine if the patient was on at least 180 days for continuous pharmacotherapy for OUD.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q468 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.107 Functional Status After Lumbar Fusion

<td>Rationale:</td>
<td>We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.</td>
</tr>
</tbody>
</table>

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q469 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.108 Functional Status After Primary Total Knee Replacement

<table>
<thead>

</tr>
<tr>
<td>Current Measure Description:</td>
<td>For patients age 18 and older who had a primary total knee replacement procedure, functional status is rated by the patient as greater than or equal to 37 on the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively.</td>
</tr>
</tbody>
</table>

**The description is revised to read:** For patients age 18 and older who had a primary total knee replacement procedure, functional status is rated by the patient as greater than or equal to 37 on the Oxford Knee Score (OKS) or a KOOS, JR target at one year (9 to 15 months) postoperatively.

**Updated instructions:** Revised: NOTE: This measure is a target-based measure, where the numerator is met by having a one-year postoperative Oxford Knee Score (OKS) greater than or equal to 37 or a KOOS, JR score greater than or equal to 71. It is expressed as a proportion or rate. Patients having received a primary total knee replacement procedure who are not assessed for functional status postoperatively remain in the denominator and are considered as not meeting the target. The measure intent is that MIPS eligible clinicians will submit all denominator eligible procedures for performance calculation.

**The numerator is revised to read:** All eligible patients whose functional status is greater than or equal to 37 on the Oxford Knee Score (OKS) or greater than or equal to 71 on the KOOS, JR patient reported outcome tool at one year (9 to 15 months) postoperatively.

**Updated numerator definition:** Added: KOOS, JR - The KOOS, JR was developed from the original long version of the Knee injury and Osteoarthritis Outcome Score (KOOS) survey using Rasch analysis. The KOOS, JR contains 7 items from the original KOOS survey, items are coded from 0 to 4, none to extreme respectively. KOOS, JR is scored by summing the raw response (range 0-28) and then converting it to an interval score using the table provided below. The interval score ranges from 0 to 100 where 0 represents total knee disability and 100 represents perfect knee health. This short form tool was developed by Stephen Lyman, PhD at the Hospital for Specialty Surgery in 2017. [https://www.hss.edu/hoos-jr-koos-jr-outcomes-surveys.asp](https://www.hss.edu/hoos-jr-koos-jr-outcomes-surveys.asp)

KOOS, JR Target - A patient who is assessed postoperatively at one year (9 to 15 months) after the procedure rates their functional status score as greater than or equal to 71.

**The numerator note is revised to read:** The following situations are those in which the numerator targets cannot be reached and Performance Not Met (M1046) is submitted:

- Oxford Knee Score (OKS) or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) is not administered postoperatively at one year (9 to 15 Months)
- Functional status is measured using a different patient-reported functional status tool or Oxford Knee Score (OKS) version or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR)
- Postoperative Oxford Knee Score (OKS) or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) is administered less than 9 Months or greater than 15 Months
- Postoperative Oxford Knee Score (OKS) is less than 37 or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) is less than 71.

**The numerator options are revised to read:**

**Performance Met:** Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was greater than or equal to 37 on the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was greater than or equal to 71.

**Performance Not Met:** Functional status measured by the Oxford Knee Score (OKS) or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) at one year (9 to 15 months) postoperatively was less than 37.

**Steward:** Minnesota Community Measurement

**High Priority Measure:** Yes

**Measure Type:** Patient Reported Outcome

**Rationale:** We proposed to update the measure to allow for the inclusion of the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) tool as numerator compliance. The KOOS, JR is recommended by the American Academy of Orthopaedic Surgeons (AAOS) and is part of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) accreditation and is an appropriate tool for the purposes of this measure. The language was updated throughout the measure to reflect this update and to define numerator compliance when utilizing the KOOS, JR tool.

We proposed a substantive change to numerator options; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

**Performance Met:** Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was greater than or equal to 37 or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was greater than or equal to 71.

**Performance Not Met:** Functional status was not measured by the Oxford Knee Score (OKS) or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) at one year (9 to 15 months) postoperatively

We proposed a substantive change to numerator options; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:

**Performance Met:** Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was greater than or equal to 37 or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was greater than or equal to 71.

**Performance Not Met:** Functional status was not measured by the Oxford Knee Score (OKS) or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) at one year (9 to 15 months) postoperatively was less than 37 or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was less than 71.

<tr>
<td>National Quality Strategy Domain:</td>
<td>Person and Caregiver-centered Experience and Outcomes</td>
</tr>
<tr>
<td>Current Collection Type:</td>
<td>MIPS CQMs Specifications</td>
</tr>
</tbody>
</table>

**Current Measure Description:**

This is a patient-reported performance measure (PM) consisting of a patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients aged 14+ with neck impairments. The change in FS is assessed using the Neck FS PROM.* The measure is risk-adjusted to patient characteristics known to be associated with FS outcomes. It is used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.

*The Neck FS PROM is an item-response theory-based computer adaptive test (CAT). In addition to the CAT version, which provides for reduced patient burden, it is available as a 10-item short form (static/paper-pencil).

**The description is revised to read:** This is a patient-reported outcome measure of risk-adjusted change in functional status for patients aged 14+ with neck impairments. The change in functional status (FS) is assessed using the FOTO Neck FS patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk-adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static/paper-pencil).

**The definition is revised to read:**

**Functional Deficit** – Limitation or impairment of physical abilities/function resulting in evaluation and inclusion in a treatment plan of care.

**Treatment Episode** – A Treatment Episode is defined as beginning with an Initial Evaluation for a functional neck deficit, progressing through treatment without interruption (for example, a hospitalization or surgical intervention), and ending with Discharge signifying that the treatment has been completed. A patient currently under clinical care for a neck deficit remains in a single Treatment Episode until the Discharge is conducted and documented by the MIPS eligible clinician.

**Initial Evaluation** – An Initial Evaluation is the first encounter for a functional deficit involving the neck and includes an evaluation (CPT 97161, 97162, 97163, 97165, 97166, 97167, 99201, 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 98940, 98941, 98942, or 98943), or an Initial Evaluation Status M-code (M1143). A patient presenting with a neck impairment, who has had an interruption of a Treatment Episode for the same functional neck deficit secondary to an appropriate reason like hospitalization or surgical intervention, is an Initial Evaluation.

**Discharge** – Discharge is accompanied by a treatment finalization and evaluation completion M-Code (Mxxx) identifying the close of a Treatment Episode for the same neck deficit identified at the Initial Evaluation and documented by a Discharge report by the MIPS eligible clinician. An interruption in clinical care for an appropriate reason like hospitalization or surgical intervention requires a discharge from the current Treatment Episode.

**Encounter** – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit. Patient Reported – The patient directly provides answers to the FS measure items using a standardized, reliable and valid, computerized adaptive testing or short form (static/paper and pencil-type) method. If the patient cannot reliably respond independently (for example, in the presence of cognitive deficits), a suitable proxy may provide answers.

**The denominator is revised to read:** All patients aged 14 years and older with neck impairments who initiated a Treatment Episode.

**Updated denominator criteria:**

Revised: All patients aged ≥14 years on date of Initial Evaluation.

Added: With a neck impairment and/or diagnosis pertaining to a functional deficit affecting the neck.

**Updated denominator exclusions:**

Removed: Ongoing care not indicated, patient seen only 1-2 visits (e.g., home program only, referred to another provider or facility, consultation only).

Added: Patient unable to complete the Neck FS PROM at Initial Evaluation and/or Discharge due to blindness, illiteracy, severe mental incapacity or language incompatibility, and an adequate proxy is not available.

**The numerator is revised to read:** Patients who were presented with the Neck FS PROM at Initial Evaluation (Intake) and at or near Discharge (Status) for the purpose of calculating the patient’s Risk-Adjusted Functional Status Change Residual Score.

**The numerator definition is revised to read:**

**Patient’s Functional Status Score** – A functional status score is produced when the patient completes the functional status patient-reported outcome measure (either by short form or computerized adaptive testing administration). The functional status score is continuous and linear. Scores range from 0 to 100 with higher scores meaning higher functional abilities. The measure is standardized, and the scores are validated for the measurement of function for this population.

**Predicted Functional Status Change Score** – A functional status change score is calculated by subtracting the Patient’s Functional Status Score at Initial Evaluation from the Patient’s Functional Status Score at Discharge.

---

[INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW]

This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
**Category** | **Description**
--- | ---
Functional Status Change Score is the dependent variable. For each patient completing a functional status assessment at Initial Evaluation (Intake), the regression model provides a risk-adjusted prediction of functional status change at Discharge.

**Risk-Adjusted Functional Status Change Residual Score** – The difference between the raw non-risk-adjusted Patient’s Functional Status Change Score and the Risk-Adjusted Predicted Functional Status Change Score (raw minus predicted) is the Risk-Adjusted Functional Status Change Residual Score, which is in the same units as the Patient’s Functional Status Scores, and should be interpreted as the unit of functional status change different than predicted given the risk-adjustment variables of the patient being treated. As such, the Risk-Adjusted Residual Change Score represents Risk-Adjusted Change corrected for the level of severity of the patient. Risk-Adjusted Residual Change Scores of zero (0) or greater (> 0) should be interpreted as functional status change scores that were predicted or better than predicted given the risk-adjustment variables of the patient, and risk-adjusted residual change scores less than zero (< 0) should be interpreted as functional status change scores that were less than predicted given the risk-adjustment variables of the patient. Aggregated Risk-Adjusted Residual Scores allow meaningful comparisons amongst clinicians or clinics.

**Updated numerator note:** Removed all.

The numerator options are revised to read:

**Performance Met:** Risk-Adjusted Functional Status Change Residual Score for the neck impairment successfully calculated and the score was equal to zero (0) or greater than zero (> 0)

**Denominator Exceptions:**
1. Ongoing care not clinically indicated because the patient needed a home program only, referral to another provider or facility, or consultation only, as documented in the medical record.
2. Ongoing care not medically possible because the patient was discharged early due to specific medical events, documented in the medical record, such as the patient became hospitalized or scheduled for surgery.
3. Ongoing care not possible because the patient self-discharged early (e.g., financial or insurance reasons, transportation problems, or reason unknown.
4. Patient refused to participate.

**Performance Not Met:** Risk-Adjusted Functional Status Change Residual Score for the neck impairment not measured because the patient did not complete the Neck FS PROM at Initial Evaluation and/or near Discharge, reason not given.

**Performance Not Met:** Risk-Adjusted Functional Status Change Residual Score for the neck impairment successfully calculated and the score was less than zero (< 0).

**Steward:** Focus on Therapeutic Outcomes, Inc.

**High Priority Measure:** Yes

**Measure Type:** Patient Reported Outcome

**Rationale:**
We proposed to update the measure to align with the other Focus on Therapeutic Outcomes, Inc. (FOTO) measures within MIPS. This will lessen MIPS eligible clinician burden when reporting this measure in conjunction with FOTO’s other measures as the structure and content will now align. Definitions were included to add clarity and provide guidance when reporting this measure. Additional denominator criteria for patients with a neck impairment and/or diagnosis pertaining to a functional deficit affect the neck was included to further define the appropriate patient population for this measure. Additionally, the denominator exclusions and exceptions were updated, along with the other numerator options, to align across all FOTO measures for consistency.

In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.

We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q478 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.
### D.113 Urinary Incontinence: Assessment of Presence or Absence of Urinary Incontinence in Women Aged 65 Years and Older

</tbody>
</table>

After consideration of public comments received under Table C.2, we are finalizing the removal of measure Q048 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years for the Medicare Part B Claims Specifications collection type only. Measure Q048 will remain in the MIPS program for 2021 for the MIPS CQMs Specifications collection type.
MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes. In addition, some comments summarized below are out-of-scope to our proposed changes to the MIPS quality measure set.

**Comment:** One commenter was supportive of the proposal to remove 14 quality measures that do not add value to the quality of care, and instead add more meaningful measurements.

**Response:** We thank the commenter for supporting the removal of measures from the MIPS program that do not add value to the quality of care.

**Comment:** One commenter recommended maintaining the existing MIPS quality measures to ensure consistency, reduce a burden, and allow options in the future for MVPs.

**Response:** We understand that ensuring there are measures available for future use in MVPs is important; however, we strive to ensure that all measures align with the Meaningful Measures Initiative, which includes removing those measures that are duplicative, extremely topped out or at the end of the topped out lifecycle, no longer in alignment with the current clinical guidelines, or where a meaningful benchmark cannot be created. By removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. We encourage stakeholders to submit potential new measures that will align with the Meaningful Measures Initiative and allow MIPS eligible clinicians to maximize their potential performance within MIPS during the annual Call for Measures.

**Comment:** One commenter stated that CMS is proposing to expand the list of telehealth visits that include quality and cost measures in 2021. The commenter supported having expanded telehealth services. However, inclusion in the denominator across its measures does not translate to numerator compliance. There is certainly impact to administrative burden, and the commenter wanted to ensure data is captured and mapped appropriately for reporting. Use of telemedicine services for important clinical conditions is not yet fully understood. Some types of quality measurements (numerator compliance) may not be easily obtained via telemedicine or require additional infrastructure development such as remote monitoring. There should be additional time for adaptation.

**Response:** We thank the commenter for their comment. Each year the measure specifications are revised and reviewed to ensure coding updates and the inclusion of telehealth encounters aligns with the measure’s intent, are clinically appropriate and applicable, and are feasible for implementation. The allowance of telehealth for denominator eligibility does not translate into numerator compliance, as some quality actions are not able to be performed via telehealth, however, it is important to ensure a complete patient population is assessed for numerator compliance therefore supporting the assessment of providing quality care. We encourage the commenter to reach out to measure stewards to review expanding telehealth as a possible revision for implementation in future years and review the 2021 MIPS specifications to determine if or how telehealth is included within the measure.

**Comment:** One commenter indicated that in terms of numerator compliance, CMS guidance has stated that there may be instances where the quality action cannot be completed during the telehealth visit. If an eligible clinician is providing services via telehealth but unable to complete the quality action in the numerator via telehealth, the commenter strongly believes that measure should be excluded from the list of telehealth eligible measures.

**Response:** We agree that there are some measures available via the eCQM Specifications collection type that include telehealth encounters as denominator eligible with a quality action that cannot be met via telehealth. This decision is driven by how each measure is structured and ensuring a complete and appropriate patient population. Measures that do not require a quality action for every encounter, but allow for patient report, look back periods, or completion at encounter, would be appropriate for inclusion of telehealth. For measures that have defined performance or assessment of the quality action (e.g., measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented), telehealth encounters would not be appropriate. We would encourage the commenter to review 2021 eCQM guidance found on the eCQI Resource Center at https://ecqi.healthit.gov/ec-qiglobalyearfilter=2020.

**Comment:** Current eCQM standards do not allow for the use of modifiers and therefore do not clearly include or exclude telehealth encounters when these “telehealth-eligible” CPT and HCPCS codes are used.

**Response:** We do recognize that value sets by eCQMs do not include codes modifiers and would encourage stakeholders to review the 2021 eCQM guidance found on the eCQI Resource Center. In instances where a modifier is submitted, the code is used by the eCQM, however the modifier is not. As such, eCQM logic and value sets do not differentiate between in-person encounters or telehealth encounters when these “telehealth-eligible” codes are applied. Therefore, it is the eligible professionals’ and eligible clinicians’ responsibility to make sure they can meet all other aspects of the quality action within the measure specification, including other quality actions that cannot be completed via telehealth when considering which measure to report. And, that the encounter, either in-person or via telehealth, is in alignment with current measure specification level guidance. In instances where a POS modifier is applied for billing and is submitted for the eCQM, only the encounter code is used by the eCQM and the modifier is not used.

**Comment:** Current eCQM standards do not allow for the use of modifiers and therefore do not clearly include or exclude telehealth encounters when these “telehealth-eligible” CPT and HCPCS codes are used.

**Response:** We do recognize that value sets by eCQMs do not include codes modifiers and would encourage stakeholders to review the 2021 eCQM guidance found on the eCQI Resource Center. In instances where a modifier is submitted, the code is used by the eCQM, however the modifier is not. As such, eCQM logic and value sets do not differentiate between in-person encounters or telehealth encounters when these “telehealth-eligible” codes are applied. Therefore, it is the eligible professionals’ and eligible clinicians’ responsibility to make sure they can meet all other aspects of the quality action within the measure specification, including other quality actions that cannot be completed via telehealth when considering which measure to report. And, that the encounter, either in-person or via telehealth, is in alignment with current measure specification level guidance. In instances where a POS modifier is applied for billing and is submitted for the eCQM, only the encounter code is used by the eCQM and the modifier is not used.

**Comment:** Current eCQM standards do not allow for the use of modifiers and therefore do not clearly include or exclude telehealth encounters when these “telehealth-eligible” CPT and HCPCS codes are used.

**Response:** We do recognize that value sets by eCQMs do not include codes modifiers and would encourage stakeholders to review the 2021 eCQM guidance found on the eCQI Resource Center. In instances where a modifier is submitted, the code is used by the eCQM, however the modifier is not. As such, eCQM logic and value sets do not differentiate between in-person encounters or telehealth encounters when these “telehealth-eligible” codes are applied. Therefore, it is the eligible professionals’ and eligible clinicians’ responsibility to make sure they can meet all other aspects of the quality action within the measure specification, including other quality actions that cannot be completed via telehealth when considering which measure to report. And, that the encounter, either in-person or via telehealth, is in alignment with current measure specification level guidance. In instances where a POS modifier is applied for billing and is submitted for the eCQM, only the encounter code is used by the eCQM and the modifier is not used.

**Comment:** Current eCQM standards do not allow for the use of modifiers and therefore do not clearly include or exclude telehealth encounters when these “telehealth-eligible” CPT and HCPCS codes are used.

**Response:** We do recognize that value sets by eCQMs do not include codes modifiers and would encourage stakeholders to review the 2021 eCQM guidance found on the eCQI Resource Center. In instances where a modifier is submitted, the code is used by the eCQM, however the modifier is not. As such, eCQM logic and value sets do not differentiate between in-person encounters or telehealth encounters when these “telehealth-eligible” codes are applied. Therefore, it is the eligible professionals’ and eligible clinicians’ responsibility to make sure they can meet all other aspects of the quality action within the measure specification, including other quality actions that cannot be completed via telehealth when considering which measure to report. And, that the encounter, either in-person or via telehealth, is in alignment with current measure specification level guidance. In instances where a POS modifier is applied for billing and is submitted for the eCQM, only the encounter code is used by the eCQM and the modifier is not used.

**Comment:** Current eCQM standards do not allow for the use of modifiers and therefore do not clearly include or exclude telehealth encounters when these “telehealth-eligible” CPT and HCPCS codes are used.

**Response:** We do recognize that value sets by eCQMs do not include codes modifiers and would encourage stakeholders to review the 2021 eCQM guidance found on the eCQI Resource Center. In instances where a modifier is submitted, the code is used by the eCQM, however the modifier is not. As such, eCQM logic and value sets do not differentiate between in-person encounters or telehealth encounters when these “telehealth-eligible” codes are applied. Therefore, it is the eligible professionals’ and eligible clinicians’ responsibility to make sure they can meet all other aspects of the quality action within the measure specification, including other quality actions that cannot be completed via telehealth when considering which measure to report. And, that the encounter, either in-person or via telehealth, is in alignment with current measure specification level guidance. In instances where a POS modifier is applied for billing and is submitted for the eCQM, only the encounter code is used by the eCQM and the modifier is not used.
**APPENDIX 2: IMPROVEMENT ACTIVITIES**

**NOTE:** In this final rule, for the CY 2021 performance period and future years, we are modifying two previously adopted improvement activities in the Inventory, removing one previously adopted improvement activity, and finalizing one improvement activity that was originally adopted in the March 31st COVID-19 IFC (85 FR 19277) and continued with modification in the September 2nd COVID-19 IFC (85 FR 54850 through 54851). These improvement activities are discussed in detail below.

**Table A: Changes to Previously Adopted Improvement Activities for the MIPS CY 2021 Performance Period and Future Years**

<table>
<thead>

</thead>
<tbody>
<tr>
<td>Current Subcategory:</td>
<td>Beneficiary Engagement</td>
</tr>
<tr>
<td>Current Activity Title:</td>
<td>Engagement of patient through implementation of improvements in patient portal</td>
</tr>
<tr>
<td>Current Activity Description:</td>
<td>Access to an enhanced patient portal that provides up to date information related to relevant chronic disease health, blood pressure control, and includes interactive features allowing patients to enter health information and/or enables bidirectional communication about medication changes and adherence.</td>
</tr>
<tr>
<td>Current Weighting:</td>
<td>Medium</td>
</tr>
<tr>
<td>Proposed Change and Rationale:</td>
<td>This improvement activity was originally finalized in the CY 2017 QPP final rule (81 FR 77825). This modification would add language to include caregivers as additional potential users of the patient portal, instead of just patients and clinicians, given the important role caregivers can play in bidirectional information exchange regarding the clinical care of the patient. This modification would also add language to clarify that the portal’s use should be for “bidirectional information exchange between the patient and their provider” and “the primary use…should be clinical, and not administrative.” In addition, the modifications would replace existing description with a nonexhaustive list of examples of bidirectional portal functions that are clinical rather than administrative. The list of examples would include: “brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; and any relevant acute or chronic disease management.”</td>
</tr>
<tr>
<td>Proposed Revised Activity Description:</td>
<td>To receive credit for this activity, MIPS eligible clinicians must provide access to an enhanced patient/caregiver portal that allows users (patients or caregivers and their clinicians) to engage in bidirectional information exchange. The primary use of this portal should be clinical and not administrative. Examples of the use of such a portal include, but are not limited to: brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; or any relevant acute or chronic disease management.</td>
</tr>
<tr>
<td>Comments:</td>
<td>Several commenters supported the modification of this improvement activity. Several commenters noted that caregivers are a critical component of patient-centered care. A few commenters noted the importance of bidirectional information exchange in the provision of care.</td>
</tr>
<tr>
<td>Response:</td>
<td>The modification to this improvement activity includes caregivers in the bidirectional information exchange regarding the clinical care of patients and provides clarity that the portal should be used for bidirectional information exchange that is clinical not administrative in nature.</td>
</tr>
</tbody>

</tr>
</thead>
<tbody>
<tr>
<td>Subcategory:</td>
<td>Achieving Health Equity</td>
</tr>
<tr>
<td>Activity Title:</td>
<td>Comprehensive Eye Exams</td>
</tr>
</tbody>
</table>
| Activity Description: | To receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by providing literature and/or facilitating a conversation about this topic using resources such as the “Think About Your Eyes” campaign and/or referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology’s EyeCare America and the American Optometric Association’s VISION USA. This activity is intended for:

- Non-opthalmologists / optometrists who refer patients to an ophthalmologist/optometrist;
- Ophthalmologists/optometrists caring for underserved patients at no cost; or
- Any clinician providing literature and/or resources on this topic.

This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams. |
| Current Weighting: | Medium |

| Proposed Change and Rationale: | This improvement activity was originally finalized in the CY 2019 PFS final rule (83 FR 59452). This modification would add language that expands the types of services that eligible clinicians can promote to underserved and/or high-risk populations to receive credit for this activity. Specifically, we are proposing to add the following sentence: “promoting access to vision rehabilitation services as appropriate for individuals with chronic vision impairment.” Also, “or vision rehabilitation services” would be added to the end of the activity description. These modifications would broaden this improvement activity to eligible clinicians who promote vision rehabilitation services, if they are serving patients with vision impairments detected during comprehensive eye exams. |
| Proposed Revised Activity Description: | To receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by any one or more of the following:

- providing literature,
- facilitating a conversation about this topic using resources such as the “Think About Your Eyes” campaign,
- referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology’s EyeCare America and the American Optometric Association’s VISION USA, or

INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:

Unauthorized disclosure may result in prosecution to the full extent of the law.
- promoting access to vision rehabilitation services as appropriate for individuals with chronic vision impairment.

This activity is intended for:
- Non-ophthalmologists / optometrists who refer patients to an ophthalmologist/optometrist;
- Ophthalmologists/optometrists caring for underserved patients at no cost; or
- Any clinician providing literature and/or resources on this topic.

This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams or vision rehabilitation services.

| Comments: | Several commenters supported the modification of this improvement activity.

| Response: | We appreciate the support for this modification. The modification to this improvement activity allows clinicians also to receive credit by providing vision rehabilitation services to patients who are underserved and/or high-risk with vision impairments detected during comprehensive exams.

| Final Action: | After consideration of the public comments received, we are finalizing changes to this improvement activity as proposed.

### Finalized Improvement Activity

| Activity ID: | IA_AHE_7
| Subcategory: | Achieving Health Equity
| Activity Title: | Comprehensive Eye Exams
| Activity Description: | To receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by any one or more of the following:

- Ophthalmologists/optometrists caring for underserved patients at no cost; or
- Any clinician providing literature and/or resources on this topic.

This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams or vision rehabilitation services.

| Weighting: | Medium
TABLE B: Improvement Activity for Removal for the MIPS CY 2021 MIPS Performance Period and Future Years

In this final rule, we are finalizing the removal of one previously finalized improvement activity from the MIPS Program for the MIPS CY 2021 performance period/2023 MIPS payment year and future years. This improvement activity is discussed in detail below. Improvement activity removal factors are discussed in the MIPS CY 2020 final rule (84 FR 62568 through 63563).

<table>
<thead>
<tr>
<th>Current Improvement Activity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Current Activity ID:</strong> IA_CC_5</td>
</tr>
<tr>
<td><strong>Current Subcategory:</strong> Care Coordination</td>
</tr>
<tr>
<td><strong>Current Activity Title:</strong> CMS Partner in Patients Hospital Engagement Network</td>
</tr>
<tr>
<td><strong>Current Activity Description:</strong> Membership and participation in a CMS Partnership for Patients Hospital Engagement Network.</td>
</tr>
<tr>
<td><strong>Current Weighting:</strong> Medium</td>
</tr>
<tr>
<td><strong>Removal Rationale:</strong> Subsequent to publication of the proposed rule, we became aware that the underlying program, which forms the basis for this improvement activity, has expired. The Partner in Patients Hospital Engagement Network activity description requires membership and participation in a CMS Partnership for Patients Hospital Engagement Network which ended March 31, 2020, and may be found at <a href="https://innovation.cms.gov/innovation-models/partnership-for-patients">https://innovation.cms.gov/innovation-models/partnership-for-patients</a>. Because the Partnership for Patients Hospital Engagement Network has ended and performance of this activity will no longer be possible starting with the CY 2021 performance year, this improvement activity is obsolete (Factor 7, 84 FR 62988) and no longer available for clinicians to participate in; therefore, we are finalizing removal of this improvement activity beginning with the CY 2021 performance year/2023 MIPS payment year to avoid any potential confusion.</td>
</tr>

INFORMATION NOT RELEASABLE TO THE PUBLIC UNLESS AUTHORIZED BY LAW:
This information has not been publicly disclosed and may be privileged and confidential. It is for internal government use only and must not be disseminated, distributed, or copied to persons not authorized to receive the information. Unauthorized disclosure may result in prosecution to the full extent of the law.
the subject of approximately 30 percent of the inquiries to the Quality Payment Program help desk, demonstrating the desire for clinicians to improve clinical care and overall outcomes for patients diagnosed with COVID-19 by conducting this improvement activity, but also indicating the need for further clarity in its activity description. As a result, we expanded the improvement activity to include clinicians participating in the care of a patient diagnosed with COVID-19 who simultaneously submit their clinical patient data to a clinical data registry for research. Thus, in order to receive credit for this improvement activity, a MIPS eligible clinician or group must: (1) Participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. Data would be submitted to the extent permitted by applicable privacy and security laws.

We also modified the improvement activity title to reflect this change. We had previously added the improvement activity to the Inventory for the CY 2020 performance period only in response to the PHE for COVID-19. In this IFC, we extended the newly modified COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity through the CY 2021 performance period due to the increased rate of COVID-19 infection we were experiencing nationwide. We anticipated the need for COVID-19 clinical trials and data collection/sharing through registries to continue through CY 2021 at which time we would reassess whether there remains a need for additional data sharing or if preventive measures and clinical treatments have advanced to the point where these type of data are not needed. We wanted eligible clinicians to be able to attest to this improvement activity if it is still pertinent. We believed that participation in this improvement activity was likely to result in improved outcomes by improving the collection of data clinicians use for the care of their patients as they monitor and manage COVID-19.

Modified Activity Description:

To receive credit for this improvement activity, a MIPS eligible clinician or group must: (1) participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. Data would be submitted to the extent permitted by applicable privacy and security laws. Examples of COVID-19 clinical trials may be found on the U.S. National Library of Medicine website at https://clinicaltrials.gov/ct2/results?cond=COVID-19. In addition, examples of COVID-19 clinical data registries may be found on the National Institute of Health website at https://search.nih.gov/search?utf8=%E2%9C%93&affiliate=nih&query=COVID19+registries&commit=Search.

For purposes of this improvement activity, clinical data registries must meet the following requirements: (1) the receiving entity must declare that they are ready to accept data as a clinical registry; and (2) be using the data to improve population health outcomes. Most public health agencies and clinical data registries declare readiness to accept data from clinicians via a public online posting. Clinical data registries should make publically available specific information on what data the registry gathers, technical requirements or specifications for how the registry can receive the data, and how the registry may use, re-use, or disclose individually identifiable data it receives. For purposes of credit toward this improvement activity, any data should be sent to the clinical data registry in a structured format, which the registry is capable of receiving. A MIPS eligible clinician may submit the data using any standard or format that is
supported by the clinician’s health IT systems, including but not limited to, certified functions within those systems. Such methods may include, but are not limited to, a secure upload function on a web portal, or submission via an intermediary, such as a health information exchange. To ensure interoperability and versatility of the data submitted, any electronic data should be submitted to the clinical data registry using appropriate vocabulary standards for the specific data elements, such as those identified in the United States Core Data for Interoperability (USCDI) standard adopted in 45 CFR 170.213.

This improvement activity was continued through the CY 2021 performance period.

</table>

**Comments:**

In response to the September 2nd COVID-19 IFC (85 FR 54850 through 54851), several commenters supported the proposal to expand this improvement activity to include clinicians participating in the care of a patient diagnosed with COVID-19 who simultaneously submit their clinical patient data to a clinical data registry for research. Commenters noted that this expansion will increase clinician participation in this improvement activity and increase the availability of COVID-19 patient data. One commenter specifically noted this proposal will improve data for a COVID-19 registry focused on cancer patients and appreciated that a cancer registry is acceptable to meet this improvement activity. A few commenters noted support for the extension of this improvement activity into 2021.

Additionally, in response to the September 2nd COVID-19 IFC, a few commenters recommended additional clarifications or expansions around the COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity. One commenter requested that CMS clarify whether anyone submitting COVID-19 related data to a registry would qualify for credit for this improvement activity, whether it is a Qualified Registry (QR), Qualified Clinical Data Registry (QCDR), or a data registry that collects clinical data, provided it meets the other outlined criteria. Another commenter recommended that CMS add additional research targets to the improvement activity, including research related to diagnostic and medical devices rather than just therapeutics. One commenter noted that reporting for the COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity represents an opportunity to meet Promoting Interoperability performance category requirements and recommended that CMS coordinate with both the CDC and ONC to develop common electronic case reporting (eCR) standards.

In response to the PFS for the CY 2021 performance period and future years NPRM, several commenters also provided support for the COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity, including extension of this improvement activity until at least the end of the 2021 reporting period. One commenter provided their disappointment that as a group reporter, they would be unable to attest to this improvement activity because they would not be able to have more than 50 percent of their group participate in clinical data reporting.

**Response:**

We appreciate the commenters support for the improvement activity. We believe that this improvement activity will increase clinical data reporting and ultimately improve the collection of data clinicians use for the care of their patients. We anticipate that clinical data gathered in the treatment of patients with COVID-19 may be helpful in finding a solution to end this pandemic. To clarify, to receive credit for this improvement activity, a MIPS eligible clinician or group must either: (1) participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. If the clinician or group is participating in a COVID-19 clinical trial, it must utilize a drug or biological
product. On the other hand, the clinician or group could participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. This latter option is more broad and could include use of diagnostics and medical devices. In addition, for purposes of this improvement activity, clinical data registries must meet the following requirements: (1) the receiving entity must declare that they are ready to accept data as a clinical registry; and (2) be using the data to improve population health outcomes. We refer readers to the activity description for full details. In many cases, this could include a Qualified Registry (QR), Qualified Clinical Data Registry (QCDR), or a data registry that collects clinical data, so long as it meets the stated requirements.

We will take into consideration the recommendation that we coordinate with CDC and ONC to develop common electronic case reporting (eCR) standards related to this improvement activity. We understand the disappointment that this improvement activity is more difficult for group reporters to attest.

Final Action: After consideration of the public comments received, we are adopting this improvement activity as finalized in the September 2nd COVID-19 IFC (85 FR 54850 through 54851) to apply through the CY 2021 performance year.
