Advancing health equity and improving health equity-related data collection are priorities for the Biden-Harris Administration, as detailed in Executive Order 13985 (Advancing Racial Equity and Support for Underserved Communities Through the Federal Government), released in January 2021, and subsequent equity-focused Executive Orders, including Executive Order 14031 (Advancing Equity, Justice, and Opportunity for Asian Americans, Native Hawaiians, and Pacific Islanders, released in May 2021, Executive Order 14075 (Advancing Equality for Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex Individuals), released in June 2022, and Executive Order 14091 (Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government), released in February 2023. In alignment with these Executive Orders, Advance Equity is the first of the Centers for Medicare & Medicaid Services (CMS)'s six Strategic Pillars, highlighting the importance of addressing the health disparities that underlie the United States’ health care system. Health equity-related data collection is critical for advancing equity as the lack of data impedes measurement of disparities and the identification of opportunities to drive action. Standardized data collection and stratification allow for comprehensive analyses that can be combined or compared across multiple programs or initiatives; and in turn, offer an important first step towards improving population health.

In 2022, CMS released its Framework for Health Equity 2022-2032, which contains five health equity priorities for reducing disparities in health. Priority 1, “Expand the Collection, Reporting, and Analysis of Standardized Data” reflects the importance of ensuring that CMS’s collection of health equity-related data, including but not limited to sociodemographic and social determinants of health (SDOH) information, is comprehensive, consistent, and interoperable. Efforts toward achieving this priority – i.e., addressing current gaps in relevant data collection, reporting, and analysis – will not only enhance overall CMS data integrity by better capturing the experiences of people marginalized by the healthcare system, but will drive meaningful transformation in policies and programs for the individuals that CMS serves.

This document serves as a technical resource that can be used by organizations and entities, such as providers, states, community organizations, and others, that wish to harmonize with CMS when collecting, stratifying, and/or analyzing health equity-related data. It may also clarify differences in results that may arise when different data standards and definitions are used. This document includes suggested definitions, standards, and stratification practices for the following sociodemographic elements:

- Race and Ethnicity
- Sex (assigned at birth)
- Gender identity
- Sexual orientation
- Disability status
- Primary Language
- English language proficiency
- Rurality/urbanicity or residence
Both “basic” and “preferred” standards are provided in the tables that follow for each of the above sociodemographic elements. “Basic” in this context is intended to refer to the lowest level of data granularity, while “preferred” refers to a level of granularity or complexity that goes beyond the basic standard.

NOTE:

CMS has prepared the following table as a technical resource for organizations and entities, such as providers, states, community organizations, and others. We hope these standards can be useful as different organizations and entities work to improve their data collection. Where applicable to a given organization or entity and appropriate, CMS recommends harmonization with the United States Core Data for Interoperability (USCDI) standards. We may update this resource in the future to reflect advancements in sociodemographic data collection. We note that this resource does not create or override any data collection or stratification requirements.

  - Irish  
  - Italian  
  - Polish  
  - Scottish  
  - [write in] Enter, for example, French, Swedish, Norwegian, etc. | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | • Note this standard conceptualizes race together with ethnicity.  
• Recommend sufficient sample size to produce reliable estimates, as noted in the Standard Guidance.  
• When using race data from Medicare enrollment (SSA) or the RTI race code, it is recommended not to stratify by "Other" or "Unknown".  
• Recommend using high quality, self-reported data when available.  
• When data are not self-reported, agencies are encouraged to transparently describe how the data were collected or generated, and how nonresponse or other missing data were assigned or allocated. For statistical survey reporting, agencies are required, rather than encouraged, to transparently describe whether race and ethnicity data are self-reported or collected by proxy, along with any imputation or coding procedures.  
• When data quality / missingness are a concern, recommend using imputed race (Medicare Bayesian Improved Surname Geocoding (MBISG) for Medicare, which are more updated than the RTI Race Code; Bayesian Improved First Name Surname Geocoding (BIFSG) for Medicaid and CHIP).  
• Consider focus group testing or formal "cognitive testing" if translating to a different language to ensure the adequacy of translations.

| **Gender Identity (Question 1 of 2)** | Modified NASEM Standard | Gender identity is a core element of a person's individual identity | What is your gender? | • Woman  
• Man  
• Non-binary  
[If respondent is American Indian or Alaska Native:] Two-Spirit  
• I use a different term: [free text]  
• Prefer not to answer [if this is an option for other demographic questions] | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | • Gender identity and sex assigned at birth should not be conflated.  
• Gender identity should be self-reported.  
• Consideration should be given if the question is asked in languages other than English.  
• Using sex assigned at birth together with these gender identity codes is necessary for mapping to USCDI v4.  
• Where data are available, stratify by sex assigned at birth as well as gender identity.  
• Consider limits to generalizability if the distribution is unexpected.  
• AI/AN response option should be reserved for those data vehicles that can enable skip logic and ensure that the response option appears only for those who have already self-identified as AI/AN.  
• Consider focus group testing or formal "cognitive testing" if translating to a different language to ensure the adequacy of translations. |
| **Sex (as Assigned at Birth) (Question 2 of 2)** | Modified NASEM Standard | A multidimensional construct based on a cluster of anatomical and physiological traits (sex traits) | What is your sex assigned at birth, for example on your original birth certificate? | • Female  
• Male  
• I don’t know | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | Same as Basic Standard | • Sex assigned at birth and Gender Identity should not be conflated.  
• If statutory requirement mandates the collection of sex, then it may not be necessary to collect sex assigned at birth.  
• Where data are available, stratify by sex assigned at birth as well as gender identity.  
• Consider limits to generalizability if the distribution is unexpected.  
• Using sex assigned at birth together with gender identity codes is necessary for mapping to USCDI v4.  
• Consider including "Intersex" for new data collection as feasible, consistent with EO 14075.  
• Consider using "Sex Parameter for Clinical Use (SPCU)", a newly proposed sex characteristic defined within the HL7 gender harmony model.  
• Consider focus group testing or formal "cognitive testing" if translating to a different language to ensure the adequacy of translations. |

**Notes:**
- "Basic Standard" in this context is intended to refer to a lower level of data granularity.
- "Preferred standard" is recommended for use where possible, including when updating data collection methods/standards. "Preferred" in this context generally refers to a level of data granularity or complexity that goes beyond the "basic" standard.
Frequently Asked Questions

1. What is this resource document and why is CMS releasing it?

This document is a technical resource of definitions, standards, and stratification practices for health equity-related data elements that can be used by organizations/entities such as providers, states, community organizations, and others that wish to harmonize with CMS when collecting, stratifying, and/or analyzing health equity-related data. It may also clarify differences in results that may arise when different data standards and definitions are used.

CMS’s Framework for Health Equity 2022-2032 contains five priorities for reducing health disparities. Priority 1, “Expand the Collection, Reporting, and Analysis of Standardized Data” reflects the importance of ensuring that CMS’s health equity-related data and social determinants of health (SDOH) data are comprehensive, consistent, and interoperable. Standardized data collection and stratification allow for comprehensive analyses that can be combined or compared across multiple programs or initiatives; and in turn, offer an important first step towards improving population health.

2. What data elements are included in the resource document?

This document includes suggested definitions, standards, and stratification practices to address populations and areas identified in Executive Order 13985 “Advancing Racial Equity and Support for Underserved Communities Through the Federal Government” and Executive Order 14091 “Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government.” The included data elements are race, ethnicity, sex, disability status, gender identity, sexual orientation, primary language, English language proficiency, and rurality/urbanicity of residence.

3. How were these standards selected?

We selected the standards based upon broadest applicability and feasibility for the various data collection methods and systems, as well as usage of the data to help harmonize assessment of the included data elements across CMS.

4. Will all CMS data collection efforts align with the information in the resource document?

Under certain situations, some of the standards listed in this resource document are binding on CMS as a federal agency (e.g., OMB standards for race and ethnicity, HHS standards for the collection of demographic data in population health surveys). Other standards listed in this document are not binding but CMS programs will begin moving towards the voluntary adoption of these standards where practicable and legally permissible to facilitate consistency on the “front end” collection of demographic data and its analysis.

Regardless of the standard adopted for the “front end” collection of demographic data, CMS recommends where applicable and appropriate harmonization with the Office of the National Coordinator for Health Information United States Core Data for Interoperability (USCDI) standards on the “back end” to facilitate the sharing of interoperable data.

5. Why do some CMS data collection efforts use different standards and will that change?

Many CMS programs adopted standards prior to the development of this resource document. Where practicable and legally permissible, some collection will align with these listed standards over time. Additionally, taking into consideration the program and the enrollees whom we ask the questions, we perform cognitive and/or consumer testing on the question and response options to ensure our enrollees understand and are able to respond appropriately. CMS is continuing to explore how to implement questions and response options for different use cases such as benefits applications (eligibility/enrollment), surveys, and model patient forms in care settings, and consider how the method of consumer engagement may require different approaches to best support the interaction channel, for example a self-service online form vs. a phone interaction (live representative vs. an automated telephone system).

6. Will this resource be updated as standards are revised?

Standards continuously evolve and may be subject to change. We will update this resource as applicable.

7. Are the listed data standards now required of CMS partners for alignment?

This document is solely a technical resource of suggested data definitions, standards, and stratification practices. Unless and until otherwise noted in statute, regulation, guidance, or formal agreement (including, but not limited to, CMS terms and conditions included in contracts and other binding agreements), these standards are non-binding for CMS partners.

8. What does this mean for state Medicaid and CHIP agencies?

As noted earlier, this document is a technical resource. Any actual data collection requirements for Medicaid and CHIP agencies would be described in statute or regulation as interpreted in guidance, or state-specific documents like the State’s Medicaid State plan, section 1915 waivers, or section 1115 demonstration special terms and conditions.
There are many different ways state Medicaid and CHIP agencies could collect this information, such as standalone surveys, surveys fielded as addenda to state Medicaid and CHIP applications, and by leveraging demographic data collected through health information exchanges and electronic health records.

As required in regulations at 42 CFR 435.907(b) and 457.330, the single, streamlined application that individuals use to apply for Medicaid or CHIP benefits must be either the model application, or an alternative developed by the state and approved by CMS through a state plan amendment (SPA). In addition to the single, streamlined application, many states have applications or supplemental forms for determining eligibility on a basis other than MAGI, or other alternative applications not subject to CMS approval.

States that wish to update their Medicaid or CHIP alternative, single streamlined application to include these standards may need to work with CMS to determine whether CMS approval and a SPA is needed. States may need to submit a SPA if they want to add questions that are not needed for an eligibility determination or are not for a purpose directly connected to the administration of the state plan, or if they want to make substantive changes that significantly deviate from the model application.

More detailed information on the development, review, and approval of alternative applications is available in the June 18, 2013, joint Center for Consumer Information and Insurance Oversight (CCIIO) and Center for Medicaid and CHIP Services (CMCS) guidance entitled “Guidance on State Alternative Applications for Health Coverage”3 and in the November 9, 2023 CMCS informational bulletin entitled “Guidance on Adding Sexual Orientation and Gender Identity Questions to State Medicaid and CHIP Applications for Health Coverage.”4

9. Are there any additional considerations when it comes to data collection and stratification for American Indian/Alaska Native (AI/AN) populations?

States are encouraged to use Tribal consultation in developing Tribal data collection, analysis, and data distribution approaches, and may be required to conduct Tribal consultation in certain circumstances (such as prior to submitting a Medicaid SPA that is likely to have a direct effect on Indians and Indian health programs). CMS and Tribes share the goals of eliminating health disparities for AI/ANs and ensuring access to critical health services, including those made available through Medicare, Medicaid, CHIP, and the Health Insurance Marketplace,5 is maximized, to advance or enhance Tribal members’ physical, mental, and economic status. To achieve these goals, and to the extent practicable and permitted by law, it is important that CMS, States, and Indian Tribes engage in open, continuous, and meaningful consultation.

5 Health Insurance Marketplace® is a registered service mark of the U.S. Department of Health & Human Services.
More information on the CMS consultation policy can be found here:

10. What is the recommended solution when it is not feasible to align with the standards in this resource?

This document is a technical resource of suggested definitions, standards, and stratification practices. Alignment with these standards may not be feasible under certain circumstances, necessitating deviations. Regardless of which data standards are adopted for “front end” collection of demographic data, CMS recommends harmonization with the ONC USCDI standards to facilitate “back-end” data interoperability.

11. How can one receive assistance in implementing these standards?

Each of the listed standards provide documentation and guidance for implementation that can be reviewed in detail. Where assistance is needed with regard to CMS usage of these standards and stratification practices, the Health Equity Technical Assistance program can be contacted at HealthEquityTA@cms.hhs.gov.
