

APPENDIX C

RESIDENT ASSESSMENT PROTOCOLS

SECTION V. RESIDENT ASSESSMENT PROTOCOL SUMMARY

Resident's Name:	Medical Record No.:
<p>1. Check if RAP is triggered.</p> <p>2. For each triggered RAP, use the RAP guidelines to identify areas needing further assessment. Document relevant assessment information regarding the resident's status.</p> <ul style="list-style-type: none"> • Describe: <ul style="list-style-type: none"> — Nature of the condition (may include presence or lack of objective data and subjective complaints). — Complications and risk factors that affect your decision to proceed to care planning. — Factors that must be considered in developing individualized care plan interventions. — Need for referrals/further evaluation by appropriate health professionals. • Documentation should support your decision-making regarding whether or not to proceed with a care plan for a triggered RAP and the type(s) of care plan intervention(s) that are appropriate for a particular resident. • Documentation may appear anywhere in the clinical record (e.g., progress notes, consults, flow sheets, etc.). <p>3. Indicate under the <u>Location of RAP Assessment Documentation</u> column where information related to the RAP assessment can be found.</p> <p>4. For each triggered RAP, indicate whether or not a new care plan, care plan revision, or continuation of current care plan is necessary to address the problem(s) identified in your assessment. The Care Planning Decision column must be completed within 7 days of completing the RAI (MDS and RAPs).</p>

1. RESIDENT ASSESSMENT PROTOCOL: DELIRIUM

I. PROBLEM

Delirium (often referred to in the past as an acute confusional state) is a common indicator or nonspecific symptom of a variety of acute, treatable illnesses. It is a medical emergency, with high rates of morbidity and mortality, unless it is recognized and treated appropriately. Delirium is never a part of normal aging. Some of the classic signs of delirium may be difficult to recognize and may be mistaken for the natural progression of dementia, particularly in the late stages of dementia when delirium has high mortality. Thus careful observation of the resident's inattentiveness and review of potential causes is essential.

Delirium is characterized by fluctuating states of consciousness, disorientation, decreased environmental awareness, and behavioral changes. The onset of delirium may vary, depending on severity of the cause(s) and the resident's health status; however, it usually develops rapidly, over a few days or even hours. Even with successful treatment of cause(s) and associated symptoms, it may take several weeks before cognitive abilities return to pre-delirium status.

Successful management depends on accurate identification of the clinical picture, correct diagnosis of specific cause(s), and prompt nursing and medical intervention. Delirium is often caused and aggravated by multiple factors. Thus, if you identify and address one cause, but delirium continues, you should continue to review the other major causes of delirium and treat any that are found.

II. TRIGGERS

Delirium problem suggested if one or more of following present:

- Easily Distracted^(a)
[B5a = 2]
- Periods of Altered Perception or Awareness of Surroundings^(a)
[B5b = 2]
- Episodes of Disorganized Speech^(a)
[B5c = 2]
- Periods of Restlessness^(a)
[B5d = 2]
- Periods of Lethargy^(a)
[B5e = 2]
- Mental Function Varies Over the Course of the Day^(a)
[B5f = 2]
- Cognitive Decline^(a)
[B6 = 2]
- Mood Decline^(a)
[E3 = 2]
- Behavior Decline^(a)
[E5 = 2]

^(a) **Note:** All of these items also trigger on the Psychotropic Drug Use RAP (when psychotropic drug use present).

III. GUIDELINES

Detecting signs and symptoms of delirium requires careful observation. Knowledge of a person's baseline cognitive abilities facilitates evaluation.

- Staff should become familiar with resident's cognitive function by regularly observing the resident in a variety of situations so that even subtle but important changes can be recognized.

When observed in this manner, the presence of any trigger signs/symptoms may be seen as a potential marker for acute, treatable illness.

An approach to detection and treatment of the problem can be selected by reviewing the items that follow in the order presented. Also refer to the RAP KEY for guidance on the MDS items that are relevant.

DIAGNOSES AND CONDITIONS

By correctly identifying the underlying cause(s) of delirium, you may prevent a cycle of worsening symptoms (e.g., an infection-fever-dehydration-confusion syndrome) or a drug regimen for a suspected cause that worsens the condition. The most common causes of delirium are associated with circulatory, respiratory, infectious, and metabolic disorders. However, finding one cause or disorder does not rule out the possibility of additional contributing causes and/or multiple interrelated factors.

MEDICATIONS

Many medications given alone or in combination can cause delirium.

- If necessary, check doctor's order against med sheet and drug labels to avoid the common problem of medication error.
- Review the resident's drug profile with a physician.
- Review all medications (regularly prescribed, PRN, and "over-the-counter" drugs).

Number of Medications. The greater the number, the greater the possibility of adverse drug reaction/toxicity.

- Review meds to determine need and benefit (ask if resident is receiving more than one class of a drug to treat a condition).
- Check to determine whether nonpharmacological interventions have been considered (e.g., a behavior management program, rather than antipsychotics, to address the needs of a resident who has physically or verbally abusive behavioral symptoms).

New Medications

- Review to determine whether or not there is a temporal relationship between onset or worsening of delirium and start of new medication.

Drugs that Cause Delirium

1. PSYCHOTROPIC
 - Antipsychotics
 - Antianxiety/hypnotics
 - Antidepressants
2. CARDIAC
 - Digitalis glycosides (Digoxin)
 - Antiarrhythmics, such as quinidine, procainamide (Pronestyl), and disopyramide (Norpace)
 - Calcium channel blockers, such as verapamil (Isoptin), Nifedipine (Procardia), and Diltiazem (Cardizem)
 - Antihypertensives, such as methyldopa (Aldomet), and propranolol (Inderal)
3. GASTROINTESTINAL
 - H2 antagonists, such as cimetidine (Tagamet) and ranitidine (Zantac)
4. ANALGESICS such as Darvon, narcotics (e.g., morphine, dilaudid)
5. ANTI-INFLAMMATORY
 - Corticosteroids, such as prednisone
 - Nonsteroidal anti-inflammatory agents, such as ibuprofen (Motrin)
6. OVER-THE-COUNTER DRUGS, especially those with anticholinergic properties
 - Cold remedies (antihistamines, pseudoephedrine)
 - Sedatives (antihistamines, e.g., Benadryl)
 - Stay-awakes (caffeine)
 - Antinauseants
 - Alcohol

PSYCHOSOCIAL

After serious illness and drug toxicity are ruled out as causes of delirium, consider the possibility that the resident is experiencing psychosocial distress that may produce signs of delirium.

Isolation

- Has the resident been away from people, objects and situations?
- Is resident confused about time, place, and meaning?
- Has the resident been in bed or in an isolated area while recuperating from an illness or receiving a treatment?

Recent Loss of Family/Friend. Loss of someone close can precipitate a grief reaction that presents as acute confusion, especially if the person provided safety and structure for a demented resident.

- Review the MDS to determine whether or not the resident has experienced a recent loss of a close family member/friend.

Depression/Sad or Anxious Mood. Mood states can lead to confusional states that resolve with appropriate treatment.

- Review the MDS to determine whether the resident exhibits any signs or symptoms of sad or anxious mood, or has a diagnosis of a psychiatric illness.

Restraints. Restraints often aggravate the conditions staff are trying to treat (e.g., confusion, agitation, wandering).

- Did the resident become more agitated and confused with their use?

Recent Relocation

- Has the resident recently been admitted to a new environment (new room, unit, facility)?
- Was there an orientation program that provided a calm, gentle approach with reminders and structure to help the new resident settle into the environment?

SENSORY LOSSES

Sensory impairments often produce signs of confusion and disorientation, as well as behavior changes. This is especially true of residents with early signs of dementia. They can also aggravate a confusional state by impairing the resident's ability to accurately perceive or cope with environmental stimuli (e.g., loud noises; onset of evening). This can lead to the resident experiencing hallucinations/delusions and misinterpreting noises and images.

Hearing

- Is hearing deficit related to easily remedied situations - impacted ear wax or hearing aid dysfunction?
- Has sensory deprivation led to confusion?
- Has physician input been sought?

Vision

- Has vision loss created sensory deprivation resulting in confusion?
- Have major changes occurred in visual function without the resident's being referred to a physician?

CLARIFYING INFORMATION

- Does the resident have a recent sleep disturbance?
- Does the resident have Alzheimer's or other dementia?

- Has the time of onset of the resident's cognitive and behavioral function been within the last few hours to days?

ENVIRONMENT

- Is the resident's environment conducive to reducing symptoms (e.g., quiet, well-lit, calm, familiar objects present)?
- Is the resident's daily routine broken down into smaller tasks (task segmentation) to help him/her cope?

1. DELIRIUM RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Delirium problem suggested if one or more of following present:</i></p>	<p><i>Factors that may be associated with signs and symptoms of delirium:</i></p>
<ul style="list-style-type: none"> • Easily Distracted^(a) [B5a = 2] • Periods of Altered Perception or Awareness [B5b = 2] • Episodes of Disorganized Speech^(a) [B5c = 2] • Periods of Restlessness^(a) [B5d = 2] • Periods of Lethargy^(a) [B5e = 2] • Mental Function Varies Over the Course of the Day^(a) [B5f = 2] • Deterioration in Cognitive Status^(a) [B6 = 2] • Deterioration in Mood^(a) [E3 = 2] • Deterioration in Behavioral Symptoms^(a) [E5 = 2] 	<ul style="list-style-type: none"> • Diagnoses and Conditions – Diabetes [I1a], Hyperthyroidism [I1b], Hypothyroidism [I1c], Cardiac Dysrhythmias [I1e], CHF [I1f], CVA [I1t], TIA [I1bb], Asthma [I1hh], Emphysema/COPD [I1ii], Anemia [I1oo], Cancer [I1pp], Dehydration [J1c] or Fever [J1h], Myocardial Infarction [I3], any Viral or Bacterial Infection [I2], Surgical Abdomen [I3], Head Trauma [I3], Hypothermia [I3], Hypoglycemia [I3]. • Medications – Number of Meds [O1], New Meds [O2], Antipsychotics [O4a], Antianxiety [O4b], Hypnotics [O4d], Analgesics (Pain Meds), Cardiac Meds, GI Meds, Anti-inflammatory, Anticholinergics, [from med charts]. • Psychosocial – Sad or Anxious Mood [E1, E2, E3], Isolation [F2e; from record], Recent Loss [F2f], Depression [I1ee], Restraints [P4c,d,e], Recent Relocation [AB1; A4a]. • Sensory Impairment – Hearing [C1], Vision [D1]. <p><i>Clarifying information to be considered in establishing a diagnosis:</i> Sleep disturbance [E1k], Alzheimer's [I1q], Other Dementia [I1u], Time of symptom onset within hours to days [from record or observation];</p> <p><i>Environment conducive to reducing symptoms:</i> Quiet, well-lit, calm, familiar objects [from observation]; Task segmentation [G7].</p>

^(a) **Note:** All of these items also trigger on the Psychotropic Drug Use RAP (when psychotropic drug use is present).

2. RESIDENT ASSESSMENT PROTOCOL: COGNITIVE LOSS/DEMENTIA

I. PROBLEM

Many residents in nursing facilities exhibit signs and symptoms of decline in intellectual functioning. Recovery will be possible for few of these residents, for example, those with a reversible condition such as an acute confusional state (delirium). For most residents, however, the syndrome of cognitive loss or dementia is chronic and progressive, and appropriate care focuses on enhancing quality of life, sustaining functional capacities, minimizing decline, and preserving dignity.

Confusion and/or behavioral disturbances present the primary complicating care factors. Identifying and treating acute confusion and behavior problems can facilitate assessment of how chronic cognitive deficits affect the life of the resident.

For residents with chronic cognitive deficits, a therapeutic environment is supportive rather than curative and is an environment in which licensed and nonlicensed care staff are encouraged (and trained) to comprehend a resident's experience of cognitive loss. With this insight, staff can develop care plans focused on three main goals: (1) to provide positive experiences for the resident (e.g., enjoyable activities) that do not involve overly demanding tasks and stress; (2) to define appropriate support roles for each staff member involved in a resident's care; and (3) to lay the foundation for reasonable staff and family expectations concerning a resident's capacities and needs.

II. TRIGGERS

A cognitive loss/dementia problem suggested if one or more of following are present:

- Short-term Memory Problem
[B2a = 1]
- Long-term Memory Problem
[B2b =1]
- Impaired Decision-Making^(a)
[B4 = 1, 2, 3]
- Problem Understanding Others^(b)
[C6 = 1, 2, or 3]

^(a) **Note:** These codes also trigger on the Communication RAP.

^(b) **Note:** Code 3 also triggers on the ADL (Maintenance) RAP.

III. GUIDELINES

Review the following MDS items to investigate possible links between these factors and the resident's cognitive loss and quality of life. The four triggers identify residents with differing levels of cognitive loss. Even for those who are most highly impaired, the RAP seeks to help identify areas in which staff intervention might be useful. Refer to the RAP KEY for specific MDS and other specific issues to consider.

NEUROLOGICAL

Fluctuating Cognitive Signs and Symptoms/Neurological Status - Co-existing delirium and progressive cognitive loss can result in erroneous impressions concerning the nature of the resident's chronic limitations. Only when acute confusion and behavioral disturbances are treated, or when the treatment effort is judged to be as effective as possible, can a true measure of chronic cognitive deficits be obtained.

Recent Changes in the Signs/Symptoms of the Dementia Process - Identifying these changes can heighten staff awareness of the nature of the resident's cognitive and functional limitations. This knowledge can assist staff in developing reasonable expectations of the resident's capabilities and in designing programs to enhance the resident's quality of life. This knowledge can also challenge staff to identify potentially reversible causes for recent losses in cognitive status.

Mental Retardation, Alzheimer's Disease, and Other Adult-Onset Dementias - The most prevalent neurological diagnoses for cognitively impaired residents are Alzheimer's disease and multi-infarct dementia. But increasing numbers of mentally retarded residents are in nursing facilities, and many adults suffering from Down's syndrome appear to develop dementia as they age. The diagnostic distinctions among these groups can be useful in reminding staff of the types of long-term intellectual reserves that are available to these residents.

MOOD/BEHAVIOR

Specific treatments for behavioral distress, as well as treatments for delirium, can lessen and even cure the behavioral problem. At the same time, however, some behavior problems will not be reversible, and staff should be prepared (and encouraged) to learn to live with their manifestations. In some situations where problem/distressed behavior continues, staff may feel that the behavior poses no threat to the resident's safety, health, or activity pattern and is not disruptive to other residents. For the resident with declining cognitive functions and a behavioral problem, you may wish to consider the following issues:

- Have cognitive skills declined subsequent to initiation of a behavior control program (e.g., psychotropic drugs or physical restraints)?
- Is decline due to the treatment program (e.g., drug toxicity or negative reaction to physical restraints)?
- Have cognitive skills improved subsequent to initiation of a behavior control program?
- Has staff assistance enhanced resident self-performance patterns?

CONCURRENT MEDICAL PROBLEMS

Major Concurrent Medical Problems

Identifying and treating health problems can positively affect cognitive functioning and the resident's quality of life. Effective therapy for congestive heart failure, chronic obstructive pulmonary disease, and constipation can lead, for example, to functional and cognitive improvement. Comfort (pain avoidance) is a paramount goal in controlling both acute and chronic conditions for cognitively impaired residents. Verbal reports from residents should be one (but not the only) source of information. Some residents will be unable to communicate sufficiently to pinpoint their pain.

FAILURE TO THRIVE

Cognitively impaired residents can reach the point where their accumulated health/neurological problems place them at risk of clinical complications (e.g., pressure ulcers) and death. As this level of disability approaches, staff can review the following:

- Do emotional, social, and/or environmental factors play a key role?
- If a resident is not eating, is this due to a reversible mood problem, a basic personality problem, a negative reaction to the physical and interactive environment in which eating activity occurs; or a neurological deficit such as deficiency in swallowing or loss of hand coordination?
- Could an identified problem be remedied through improved staff education -- trying an antidepressant medication, referral to OT for training or an innovative counseling program?
- If causes cannot be identified, what reversible clinical complication can be expected as death approaches (e.g., fecal impaction, UTI, diarrhea, fever, pain, pressure ulcers)?
- What interventions are or could be in place to decrease complications?

FUNCTIONAL LIMITATIONS

Extent and Rate of Change of Resident Functional Abilities

Functional changes are often the first concrete indicators of cognitive decline and suggest the need to identify reversible causes. You may find it helpful to determine the following:

- To what extent is resident dependent for locomotion, dressing and eating?
- Could the resident be more independent?
- Is resident going downhill (e.g., experiencing declines in bladder continence, locomotion, dressing, vision, time involved in activities)?

SENSORY IMPAIRMENTS

Perceptual Difficulties

Many cognitively impaired residents have difficulty identifying small objects, positioning a plate to eat, or positioning the body to sit in a chair. Such difficulties can cause a resident to become cautious and ultimately cease to carry out everyday activities. If problems are vision-based, corrective programs may be effective. Unfortunately, many residents have difficulty indicating that the source of their problem is visual. Thus, the cognitively impaired can often benefit if tested for possible visual deficits.

Ability to Communicate

Many individuals suffering from cognitive deficits seem incapable of meaningful communication. However, many of the seemingly incomprehensible behaviors (e.g., screaming, aggressive behavior) in which these individuals engage may constitute their only form of communication. By observing the behavior and the pattern of its occurrence, one can frequently come to some understanding of the needs of individuals with dementia. For example, residents who are restrained for their own safety may become noisy due to bladder or bowel urgency.

- Is resident willing/able to engage in meaningful communication?
- Does staff use non-verbal communication techniques (e.g., touch, gesture) to encourage resident to respond?

MEDICATIONS

Psychoactive and other medications can be a factor in cognitive decline. If necessary, review Psychotropic Drug Use RAP.

INVOLVEMENT FACTORS

Opportunities for Independent Activity

Staff can encourage residents to participate in the many available activities, and staff can guard against assuming an overly protective attitude toward residents. **Decline in one functional area does not indicate the need for staff to assume full responsibility in that area nor should it be interpreted as an indication of inevitable decline in other areas.** Review information in the MDS when considering the following issues:

- Are there factors that suggest that the resident can be more involved in his/her care (e.g., instances of greater self-performance; desire to do more independently; retained ability to learn; retained control over trunk, limbs, and/or hands)?
- Can resident participate more extensively in decisions about daily life?
- Does resident retain any cognitive ability that permits some decision-making?
- Is resident passive?

- Does resident resist care?
- Are activities broken into manageable subtasks?

Extent of Involvement in Activities of Daily Life

Programs focused on physical aspects of the resident's life can lessen the disruptive symptoms of cognitive decline for some residents. Consider the following:

- Are residents with some cognitive skills and without major behavioral problems involved in the life of the facility and the world around them?
- Can modifying task demands, or the environmental circumstances under which tasks are carried out, be beneficial?
- Are small group programs encouraged?
- Are special environmental stimuli present (e.g., directional markers, special lighting)?
- Does staff regularly assist residents in ways that permit them to maintain or attain their highest predictable level of functioning (e.g., verbal reminders, physical cues and supervision regularly provided to aid in carrying out ADLs; ADL tasks presented in segments to give residents enough time to respond to cues; pleasant, supportive interaction)?
- Has the resident experienced a recent loss of someone close (e.g., death of spouse, change in key direct care staff, recent move to the nursing facility, decreased visiting by family and friends)?

2. COGNITIVE LOSS/DEMENTIA RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES

3. RESIDENT ASSESSMENT PROTOCOL: VISUAL FUNCTION

I. PROBLEM

The aging process leads to a gradual decline in visual acuity: a decreased ability to focus on close objects or to see small print, a reduced capacity to adjust to changes in light and dark, and diminished ability to discriminate color. The aged eye requires about 3-4 times more light in order to see well than the young eye.

The leading causes of visual impairment in the elderly are macular degeneration, cataracts, glaucoma, and diabetic retinopathy. In addition, visual perceptual deficits (impaired perceptions of the relationship of objects in the environment) are common in the nursing facility population. Such deficits are common consequence of cerebrovascular events and are often seen in the late stages of Alzheimer's disease and other dementias. The incidence of all these problems increases with age.

In 1974, 49% of all nursing facility residents were described as being unable to see well enough to read a newspaper with or without glasses. In 1985, over 100,000 nursing facility residents were estimated to have severe visual impairment or no vision at all. Thus vision loss is one the most prevalent losses of residents in nursing facilities. A significant number of residents in any facility may be expected to have difficulty performing tasks dependent on vision as well as problems adjusting to vision loss.

The consequences of vision loss are wide-ranging and can seriously affect physical safety, self-image, and participation in social, personal, self-care, and rehabilitation activities. This RAP is primarily concerned with identifying two types of residents: 1) Those who have treatable conditions that place them at risk of permanent blindness (e.g., Glaucoma: Diabetes, retinal hemorrhage); and 2) those who have impaired vision whose quality of life could be improved through use of appropriate visual appliances. Further, the assumption is made that residents with new acute conditions will have been referred to follow-up as the conditions were identified (e.g., sudden loss of vision; recent red eye; shingles; etc). To the extent that this did not occur, the RAP KEY follow-up questions will cause staff to ask whether or not such a referral should be considered.

II. TRIGGERS

An acute, reversible (R) visual function problem or the potential for visual improvement (I) suggested if one or more of following present:

- Side Vision Problem (*Reverse*)
[D2a = checked]
- Cataracts (*Reverse*)
[I1jj = checked]

- Glaucoma (*Reverse*)
[I111 = checked]
- Vision Impaired (*Improve*)
[D1 = 1, 2, 3]

III. GUIDELINES

Visual impairment may be related to many causes, and one purpose of this section is to screen for the presence of major risk factors and to review the resident's recent treatment history. This section also includes items that ask whether the visually impaired resident desires or has a need for increased functional use of eyes.

Eye Medications

Of greatest importance is the review of medications related to glaucoma (phospholine iodide, pilocarpine, propine, epinephrine, Timoptic or other Beta-Blockers, diamox, or Neptazane).

- Is the resident receiving his/her eye medication as ordered?
- Does the resident experience any side effects?

Diabetes, Cataracts, Glaucoma, or Macular Degeneration

Diabetes may affect the eye by causing blood vessels in the retina to hemorrhage (retinopathy). All these conditions are associated with decreased visual acuity and visual field deficits. If resident is able to cooperate it is very possible to test for glaucoma and retinal problems.

Exam by Ophthalmologist or Optometrist Since Problem Noted

- Has the resident been seen by a consultant?
- Have the recommendations been followed (e.g. medications, refraction [new glasses], surgery)?
- Is the recommendation compatible with the resident's wishes (e.g., medical rehab. vs. surgery)?

If Neurological Diagnosis or Dementia Exam by Physician Since Problem Noted

Check the medical record to see if a physician has examined the resident for visual/perceptual difficulties. Some residents with diseases such as myasthenia gravis, stroke, and dementia will have such difficulties associated with central nervous system in the absence of diseases of the eye.

Sad or Anxious Mood

Some residents, especially those in a new environment, will complain of visual difficulties. Visual disorganization may improve with treatment of the sad or anxious mood.

Appropriate Use of Visual Appliances

Residents may have more severe visual impairment when they do not use their eyeglasses. Residents who wear reading glasses when walking, for example, may misperceive their environment and bump into objects or fall.

- Are glasses labelled or color-coded in a fashion that enables the resident/staff to determine when they should be used?
- Are the lenses of glasses clean and free of scratches?
- Were glasses recently lost? Were they being recently used, and now they are missing?

Functional Need for Eye Exam/New Glasses

Many residents with limited vision will be able to use the environment with little or no difficulty, and neither the resident nor staff will perceive the need for new visual appliances. In other circumstances, needs will be identified, and for residents who are capable of participating in a visual exam, new appliances, surgery to remove cataracts, etc., can be considered.

- Does resident have peripheral vision or other visual problem that impedes his/her ability to eat food, walk on the unit, or interact with others?
- Is residents's ability to recognize staff limited by a visual problem?
- If resident is having difficulty negotiating his environment or participating in self-care activities because of visual impairment has he/she been referred to low vision services?
- Does resident report difficulty seeing TV/reading material of interest?
- Does resident express interest in improved vision?
- Has resident refused to have eyes examined? How long ago did this occur? Has it occurred more than once?

Environmental Modifications

Residents whose vision cannot be improved by refraction, or medical and/or surgical intervention may benefit from environmental modifications.

- Does the resident's environment enable maximum visual function (e.g., low-glare floors and table surfaces, night lights)?
- Has the environment been adapted to resident's individual needs (e.g., large print signs marking room, color coded tape on dresser drawers, large numbers on telephone, reading lamp with 300 watt bulb)? Could the resident be more independent with different visual cues (e.g., labeling items, task segmentation) or other sensory cues (e.g., cane for recognizing there are objects in path)?

Acute Problems that May Have Been Missed: Eye Pain, Blurry Vision, Double Vision, or Sudden Loss of Vision

These symptoms are usually associated with acute eye problems.

- Has resident been evaluated by a physician or ophthalmologist?

Residents with communication impairments may be very difficult to assess. Residents who are unable to understand others may have problems following the directions necessary to test visual acuity.

3. VISUAL FUNCTION RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>An acute, reversible visual function problem or the potential for visual improvement suggested if one or more of following present:</i></p> <ul style="list-style-type: none"> • Side Vision Problem (<i>Reverse</i>) [D2a = checked] • Cataracts (<i>Reverse</i>) [I1jj = checked] • Glaucoma (<i>Reverse</i>) [I1ll = checked] • Vision Impaired (<i>Improve</i>) [D1 = 1, 2, 3] 	<p><i>Issues and problems to be reviewed that may suggest need for intervention:</i></p> <ul style="list-style-type: none"> • Eye Medications [from record]. • Diabetes [I1a], Cataracts [I1jj], Glaucoma [I1ll], Macular Degeneration [I1mm]. • Exam by Ophthalmologist Since Problem Noted [from record]. • Neurological Diagnosis or Dementia [I1q to I1cc]. • Indicators of Depression, Anxiety, Sad Mood [E1]. • Appropriate Use of Visual Appliances [D3; from record observation]. • Functional Need for Eye Exam/New Glasses [from observation]. • Environmental Modifications [from record, observation]. • Other Acute Problems: Eye Pain, Blurry Vision, Double Vision, Sudden Loss of Vision [from record, observation].

4. RESIDENT ASSESSMENT PROTOCOL: COMMUNICATION

I. PROBLEM

Good communication enables residents to express emotion, listen to others, and share information. It also eases adjustment to a strange environment and lessens social isolation and depression.

EXPRESSIVE communication problems include changes/difficulties in: speech and voice production, finding appropriate words, transmitting coherent statements, describing objects and events, using nonverbal symbols (e.g., gestures), and writing. RECEPTIVE communication problems include changes/difficulties in: hearing, speech discrimination in quiet and noisy situations, vocabulary comprehension, vision, reading, and interpreting facial expressions.

When communication is limited, assessment focuses on reviewing several factors: underlying causes of the deficit, the success of attempted remedial actions, the resident's ability to compensate with nonverbal strategies (e.g., ability to visually observe nonverbal signs and signals), and the willingness and ability of staff to engage with residents to ensure effective communication. As language use recedes with dementia, both the staff and the resident must expand their nonverbal communication skills -- one of the most basic and automatic of human abilities. Touch, facial expression, eye contact, tone of voice, and posture all are powerful means of communicating with the demented resident, and recognizing and using all practical means is the key to effective communication.

II. TRIGGERS

Potential for improved communication suggested if one or more of following present:

- Hearing Problem
[C1 = 1, 2, 3]
- Problem Making Self Understood*
[C4 = 1, 2, 3]
- Problem Understanding Others
[C6 = 1, 2, 3]

* **Note:** This code also triggers on the Cognitive Loss/Dementia RAP.

III. GUIDELINES

The communication trigger suggests residents for whom a corrective communication treatment program may be beneficial. Specify those residents with potentially correctable problems. An effective review requires a special effort by staff to overcome any preconceived notions or fixed perceptions they may have about the resident's probable responsiveness to treatment.

These perceptions may be based on the failure of prior treatment programs, as well as on assumptions that may not have been recently tested about the resident's unwillingness to begin a corrective program.

Review items listed on the RAP KEY as follows:

Confounding Problems

As these confounding problems lessen or further decline is prevented, the resident's communication abilities should be reviewed.

Components of Communication

Details of resident strengths and weaknesses in understanding, hearing, and expression are the direct or indirect focus of any treatment program.

Factors to Review for Possible Relationship to Communication Problems:

- For chronic conditions that are unlikely to improve, consider communication treatments or interventions that might compensate for losses (e.g., for moderately impaired residents with Alzheimer's, the use of short, direct phrases and tactile approaches to communication can be effective).
- Are there acute or transitory conditions which, if successfully resolved, may result in improved ability to communicate?
- Are medications in use that could cause or complicate communication deficits, where titration or substitution may result in improved ability to communicate?
- Are opportunities to communicate limited in ways that could be remedied -- e.g., availability of partners?

Clarifying Issues:

Treatment/Evaluation History

- Has resident received an evaluation by an audiologist or speech-language pathologist? How recently?
- Has the resident's condition deteriorated since the most recent evaluation?
- If such an evaluation resulted in a plan of care, has it been followed as specified?

4. COMMUNICATION RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Potential for improved communication suggested if one or more of following present:</i></p> <ul style="list-style-type: none"> • Hearing Problem [C1 = 1, 2, 3] • Problem Making Self Understood [C4 = 1, 2, 3] • Problem Understanding Others* [C6 = 1, 2, 3] 	<p><i>Confounding problems that may require resolution:</i></p> <ul style="list-style-type: none"> • Decline in Cognitive Status [B6] • Increased Mood problems [E3] • Decline in ADL Status [G9] <p><i>Components of communication to be considered:</i></p> <ul style="list-style-type: none"> • Hearing [C1]. • Communication Devices/Modes of Expression [C2, C3] • Decline in Communication/Hearing [C7] • Medical Status of Ear – Discharges, Cerumen Accumulation, Hearing Changes [from record or exam] • Vision [D1] <p><i>Factors to be reviewed for possible relationship to communication problems:</i></p> <ul style="list-style-type: none"> • Chronic Conditions – Alzheimer’s or Other Dementia [I1q, I1u], Aphasia [I1r], CVA [I1t], Parkinson’s [I1y], Psychiatric Disorders [I1dd to I1gg], Asthma [I1hh], Emphysema/COPD [I1ii], Cancer [I1pp] • Transitory Conditions – Delirium [B5], Infections [I2], Acute Episode [J5b] • Medications – Psychotropic [04a-d], Narcotics, Parkinson’s Meds, Gentamycin, Tobramycin, Aspirin Toxicity [from record] • Opportunities to Communicate – Quality/Quantity of Communication is (or is not) Commensurate with Apparent Ability to Communicate [staff judgement] <p><i>Clarifying issues to be considered:</i></p> <ul style="list-style-type: none"> • Memory [B2, B3]. • Recent audiology/language pathology evaluation [P1ba; from record] • Resident’s condition deteriorated since last assessment [Q2]
<p>* Note: This code also triggers on the Cognitive Loss/Dementia RAP.</p>	

5. RESIDENT ASSESSMENT PROTOCOL: ACTIVITIES OF DAILY LIVING - FUNCTIONAL REHABILITATION POTENTIAL

I. PROBLEM

Personal mastery of ADL and mobility are as crucial to human existence in the nursing facility as they are in the community. The nursing facility is unique only in that most residents require help with self-care functions. ADL dependence can lead to intense personal distress -- invalidism, isolation, diminished self-worth, and a loss of control over one's destiny. As inactivity increases, complications such as pressure ulcers, falls, contractures, and muscle wasting can be expected.

The ADL RAP assists staff in setting positive and realistic goals, weighing the advantages of independence against risks to safety and self-identity. In promoting independence staff must be willing to accept a reasonable degree of risk and active resident participation in setting treatment objectives.

Rehabilitative goals of several types can be considered:

- To restore function to maximum self-sufficiency in the area indicated;
- To replace hands-on assistance with a program of task segmentation and verbal cueing;
- To restore abilities to a level that allows the resident to function with fewer supports;
- To shorten the time required for providing assistance;
- To expand the amount of space in which self-sufficiency can be practiced;
- To avoid or delay additional loss of independence; and
- To support the resident who is certain to decline in order to lessen the likelihood of complications (e.g., pressure ulcers and contractures).

II. TRIGGERS

The two MDS trigger categories (A and B) suggest the types of residents for who special care interventions may be most important. Such residents may have either the need and potential to improve (Rehabilitation) or the need for services to prevent decline (Maintenance).

ADL TRIGGERS A (Rehabilitation)

Rehabilitation/restorative plans suggested if one or more of following present:

- Bed Mobility - Not Independent
[G1aA = 1-4]^(a)
- Transfer - Not Independent
[G1bA = 1-4]
- Walk in Room - Not Independent
[G1cA = 1-4]

- Walk in Corridor - Not Independent
[G1dA = 1-4]
- Locomotion on Unit - Not Independent
[G1eA = 1-4]
- Locomotion off Unit - Not Independent
[G1fA = 1-4]
- Dressing - Not Independent
[G1gA = 1-4]
- Eating - Not Independent
[G1hA = 1-4]
- Toilet Use - Not Independent
[G1iA = 1-4]
- Personal Hygiene - Not Independent
[G1jA = 1-4]
- Bathing - Not Independent
[G2aA = 1-4]
- Resident believes he/she is capable of increased independence in at least some ADLs
[G8a = checked]
- Staff believe resident is capable of increased independence in at least some ADLs
[G8b = checked]

ADL TRIGGERS B (Maintenance)

Maintenance/Complication Avoidance Plan Suggested If: [Note: When both triggers present (A & B), B takes precedence in the RAP Review]

- No ability to make decisions
[B4 = 3]^(b)

^(a) **Note:** Codes 2,3, and 4 also trigger on the Pressure Ulcer RAP.

^(b) **Note:** This code also triggers on the Cognitive Loss/Dementia RAP.

III. GUIDELINES

Base an approach to a resident's ADL difficulty on clinical knowledge of:

- The causes of dependence;
- The expected course of the problem(s); and
- Which services work or do not work.

The MDS goal is to assist the clinician in identifying residents for whom rehabilitative/restorative goals can be reasonably established. Many ADL-restricted residents can regain partial ability for self-care. Certain types of disease-generated losses will respond to therapy. In addition, the removal of inappropriate restraints and the close monitoring of potentially toxic medications can often result in increased functioning.

Use the items in the ADL RAP KEY to consider the resident's risk of decline and chance of rehabilitation. Responses to these items permit a focused approach to specific ADL deficits (i.e., selecting and describing the specific ADL areas where decline has been observed or improvement is possible). The first thing that needs to be considered is the possible presence of *confounding problems* that may require resolution before rehabilitation goals can be reasonably attempted.

The second task is to clarify the resident's potential for improved functioning. The clinician might find the following sequence of questions useful in initiating an evaluation:

- Does the resident have the ability to learn? To what extent can the resident call on past memory to assist in current problem-solving situations?
- What is the resident's general functional status? How disabled is the resident, and does status vary?
- Is mobility severely impaired?
- Is trunk, leg, arm and/or hand use severely impaired?
- Are there distinct behavioral problems?
- Are there distinct mood problems?
- Is the resident motivated to work at a rehabilitative program?

Where rehabilitation goals are envisioned, use of the *ADL Supplement* will help care planners to focus on those areas that might be improved, allowing them to choose from among a number of basic tasks in designated areas. Part 1 of the Supplement can assist in the evaluation of all residents triggered into the RAP. Part 2 of the Supplement can be helpful for residents with rehabilitation potential (ADL Triggers A), to help plan a treatment program.

ADL SUPPLEMENT
(Attaining maximum possible Independence)

PART 1: ADL Problem Evaluation						
INSTRUCTIONS: For those triggered - In areas physical help provided, indicate reason(s) for this help.	DRESSING	BATHING	TOILETING	LOCOMOTION	TRANSFER	EATING
	Mental Errors: Sequencing problems, incomplete performance, anxiety limitations, etc. Physical Limitations: Weakness, limited range of motion, poor coordination, visual impairment, pain, etc. Facility Conditions: Policies, rules, physical layout, etc.					
PART 2: Possible ADL Goals						
INSTRUCTIONS: For those considered for rehabilitation or decline prevention treatment - Indicate specific type of ADL activity that might require: 1. Maintenance to prevent decline. 2. Treatment to achieve highest practical selfsufficiency (selecting ADL abilities that are just above those the resident can now perform or participate in).	Locates/ selects/ obtains clothes	Goes to tub/ shower	Goes to toilet (include commode/ urinal at night)	Walks in room/ nearby <input type="checkbox"/>	Positions self in preparation	Opens/ pours/ unwraps/ cuts etc.
	Grasps/puts on upper/ lower body	Turns on water/ adjusts temperature	Removes/ opens clothes in preparation	Walks on unit <input type="checkbox"/>	Approaches chair/bed	Grasps utensils and cups
	Manages snaps, zippers, etc.	Lathers body (except back)	Transfers/ positions self	Walks throughout building (uses elevator) <input type="checkbox"/>	Prepares chair/bed (locks pad, moves covers)	Scoops/ spears food (uses fingers when necessary)
	Puts on in correct order	Rinses body	Eliminates into toilet	Walks outdoors <input type="checkbox"/>	Transfers (stands/sits/ lifts/turns)	Chews, drinks, swallows
	Grasps, removes each item	Dries with towel	Tears/uses paper to clean self	Walks on uneven surfaces <input type="checkbox"/>	Repositions/ arranges self	Repeats until food consumed
	Replaces clothes properly	Other	Flushes	Other <input type="checkbox"/>	Other	Uses napkins, cleans self
	Other		Adjusts clothes, washes hands			Other

^(a) **Note:** Codes 2, 3 and 4 also trigger on the Pressure Ulcer RAP.

^(b) **Note:** This code also triggers on the Cognitive Loss/Dementia RAP.

6. RESIDENT ASSESSMENT PROTOCOL: URINARY INCONTINENCE AND INDWELLING CATHETER

I. PROBLEM

Urinary incontinence is the inability to control urination in a socially appropriate manner. Nationally, approximately 50% of nursing facility residents are incontinent. Incontinence causes many problems, including skin rashes, falls, isolation, and pressure ulcers, and the potentially troubling use of indwelling catheters. In addition, continence is often an important goal to many residents, and incontinence may affect residents' psychological well-being and social interactions. Urinary incontinence is curable in many elderly residents but realistically not all will benefit from an evaluation. Catheter use increases the risk of life-threatening infections, bladder stones and cancer. Use of catheters also contributes to patient discomfort and the needless use of toxic medications often required to treat the associated bladder spasms. For many (but not all) residents, urinary incontinence is curable, and safer and more comfortable approaches are often practical for residents with indwelling catheters.

This RAP, the purpose of which is to improve incontinence, goes far beyond bladder training. Even if a patient is not believed to be a candidate for bladder training, the assessment should still be done since many other treatable conditions may be found, the treatment of which will not only improve incontinence, but the overall quality of life for the patient.

The goal of this assessment is to detect reversible causes of incontinence, such as infections and medications, and situationally induced incontinence; to identify individuals whose incontinence is caused by harmful conditions such as bladder tumors or spinal cord diseases; and to consider the appropriateness of catheter use. Staff judgment is clearly required to realize these aims. Detailed instructions are provided to facilitate this clinical process.

Continence depends on many factors. Urinary tract factors include a bladder that can store and expel urine and a urethra that can close and open appropriately. Other factors include the resident's ability (with or without staff assistance) to reach the toilet on time (locomotion), his/her ability to adjust clothing so as to toilet (dexterity), cognitive function and social awareness (e.g., recognizing the need to void in time and in an appropriate place), and the resident's motivation. Fluid balance and the integrity of the spinal cord and peripheral nerves will also have an effect on continence. Change in any one of these factors can result in incontinence, although alterations in several factors are common before incontinence develops.

II. TRIGGERS

Incontinence care plan suggested if one or more of following present:

- Incontinent 2+ Times a Week
[H1b = 2, 3 or 4]

- Use of External (Condom) Catheter
[H3c = checked]
- Use of Indwelling Catheter
[H3d = checked]
- Use of Intermittent Catheter
[H3e = checked]
- Use of Pads/Briefs
[H3g = checked]

III. GUIDELINES

For residents with incontinence (including those with condom catheters), all MDS items described in Section A should be addressed, unless exclusionary criteria have been met. If incontinence persists, complete Section B and, if necessary, Section C. For residents with indwelling catheters, first complete Sections A and B and then complete Section D.

A. ITEMS NECESSARY TO EVALUATE INCONTINENCE OR NEED FOR CATHETER

Review the reversible problems listed on the RAP KEY. Virtually all are easily diagnosed, and their treatment will improve not only incontinence but functional status as well. Also, most of these factors can be identified by a nurse, but some will take a physician's order to carry out.

UTI

Urinary tract infections are common causes of incontinence, especially new incontinence. Therefore, they should be looked for in all residents. If a clean catch urine is not feasible and the resident both has no memory recall and requires at least extensive assistance in self-transfer you may choose to forego catheterization to obtain a specimen, since identification and treatment of UTIs in this population has not been shown to make a difference.

- Send a clean catch or sterile urine specimen for microscopic analysis. If >5 WBC are found, send a fresh and sterilely obtained specimen for urine culture. If UTI is found, consider treatment.
- For residents with an indwelling catheter, a new catheter should be sterilely inserted to obtain the specimen.

Fecal Impaction

Impaction is very common and can cause incontinence by preventing the bladder from emptying well. Thus, check for impaction in all residents who are incontinent.

- To find bowel impaction, insert a gloved finger into resident's rectum.

- The finding of no stool or small amount of soft stool indicates that impaction is unlikely to be the cause of incontinence. A record demonstrating that the resident has recently passed stool is not sufficient to rule out bowel impaction.

Delirium

If Present, This is the Most Important Problem - Often when delirium is treated, incontinence will resolve. In the meantime, regular toileting will help.

Lack of Toilet Access

Daily use of restraints can result in a resident's inability to get to the toilet; quick staff response is necessary. The toilet may also be too far away for a resident who does not get adequate warning (e.g., there may not be a toilet room near the activities room). Environmental modifications such as a bedside commode, urinal, or a room closer to the toilet can be useful. To remain continent, residents may also require more staff support, such as more timely responses to requests for assistance.

Immobility

Immobility may correlate with incontinence. Improving the resident's ability in transferring, locomotion and toileting will often reduce incontinence, as will providing timely staff assistance when needed.

Depression

Severe depression can result in loss of the motivation to stay dry. Prompted toileting is often helpful as a means of positive reinforcement.

Congestive Heart Failure (CHF) or Pedal Edema

CHF and pedal edema are especially troublesome when the resident is lying down: diuresis overwhelms the bladder. Treatment of these conditions is not difficult and will improve both incontinence and functional status.

Recent Stroke

Once the resident is stable, delirium has cleared, and locomotion has improved, continue workup if incontinence persists. Most stroke patients are continent at this point.

Diabetes Mellitus

Diabetes with persistently high blood sugar causes fluid loss that can cause or worsen incontinence. Treatment will improve incontinence and functional status.

Medications

Many medications can affect the bladder or urethra and result in incontinence. Physicians would usually discontinue suspect medication if possible, weighing the risks and benefits of doing so. For instance, where a calcium channel blocker is used for mild hypertension, another medication might be easily substituted; a medication for arrhythmia, however, might not have an appropriate substitute.

- Review all medications - regularly prescribed, occasional or “PRN”, and any nonprescribed (“over-the-counter”) medications.

Medications that can affect continence include the following classes and types of drugs:

1. Diuretics, especially those that act quickly, such as furosemide (Lasix), bumetanide (Bumex), and metolozone (Zaroxilyn), and, less frequently, thiazide agents such as hydrochlorothiazide.
2. Sedative hypnotics, i.e., sleeping pills and antianxiety drugs such as diazepam (Valium), lorazepam, Xanax, Halcion, and Dalmane.
3. Any drug with anticholinergic properties:
 - Antipsychotics (e.g., Haldol, Mellaril)
 - Antidepressants (e.g., Elavil, Triavil)
 - Narcotics (e.g., Morphine, Dilaudid, Darvon)
 - Medication for Parkinson’s disease (except Sinemet and Deprenyl)
 - Disopyramide
 - Antispasmodics (e.g., Donnatal, Bentyl)
 - Antihistamines (e.g., medications for colds)
4. Calcium channel blockers (e.g., verapamil, nimodipine, nicardipine, nifedipine, and diltiazem).
5. Drugs that affect the sympathetic nervous system:
 - Alpha blockers (e.g., prazosin and phenoxybenzamine)
 - Alpha stimulants (e.g., ephedrine, pseudoephedrine, phenylpropanolamine, and nosedrops)

B. OTHER POTENTIAL CAUSES OR FACTORS CONTRIBUTING TO INCONTINENCE OR USE OF CATHETERS

Much of the information asked for above will appear in a completed MDS. However, other items of information should be obtained and reviewed if incontinence persists. Identification and treatment of these factors will frequently not only improve incontinence, but may prevent further deterioration such as paralysis. However, in the resident who both

has no memory recall, requires at least extensive assistance in self-transfer, and is free of related pain, there is, as of yet, no evidence that identification and treatment of such factors would benefit the resident.

Pain

Pain in the bladder, related to urination, is a distinctly rare and abnormal symptom in the incontinent patient, and often indicates another pathological process, which may be treatable. Physician evaluation is recommended.

Excessive or Inadequate Urine Output

If daily urine output is less than 1 liter, incontinence may worsen because of very strong, concentrated urine. A daily output over 1.5 liters can overwhelm the bladder. If present, the identification of the underlying cause of the high urine output (e.g., diabetes, high calcium, or excessive fluid intake) is required before restricting fluids.

- The amount of fluid excreted daily should be measured for 1 to 2 days. This can be done using a voiding record or, if patient is severely incontinent, by inserting a *temporary* catheter.

Atrophic Vaginitis

Caused by reduced amount of the female hormone estrogen, this condition causes or contributes to incontinence in many women.

- Examine vagina for evidence of estrogen deficiency.

Optimally, a pelvic exam checks for signs of atrophic vaginitis.

If a resident is impaired, or appropriate equipment is not readily available, an exam may be done in the resident's bed by spreading the labia and looking inside for redness, dryness, pinpoint hemorrhages, or easy bleeding.

- Pain or irritation during the insertion of a catheter is another useful sign of the condition (catheterization normally may be uncomfortable, but should not be painful).
- Atrophic vaginitis can be treated with a low dose of oral conjugated estrogens. Contraindications to estrogen therapy include a history of breast or endometrial cancer.

Abnormal Lab Values

Several conditions detectable only by laboratory tests can cause incontinence. These include high blood calcium or glucose and Vitamin B12 deficiency. It is also important to check the blood urea nitrogen (BUN) or creatinine because some causes of incontinence also can damage the kidneys. All of these tests should have been done within the last 60 days, except the B12, which should have been checked within the past 3 years.

Serious Conditions that Cause or Accompany Incontinence (to be Considered by Primary Doctor)

A doctor or a nurse practitioner can identify potentially life-threatening conditions that cause or accompany urinary incontinence. These include bladder cancer or bladder stones, prostate cancer, spinal cord or brain lesions (such as slipped discs and metastatic tumors), poor bladder compliance, and tabes dorsalis.

- Bladder cancer or stones are suggested by the presence of any amount of blood in the urine (even in microscopic amounts) without evidence of UTI. To investigate for bladder cancer, the first morning urine is sent for 2 or 3 days for cytology examinations. Residents more likely to have bladder cancer are men, smokers, and those with suprapubic pain or discomfort, a history of work exposure to certain dyes, or recent onset of urge incontinence. The physician will decide who is worked up or referred to an urologist.
- Suspected prostate cancer can be detected by a rectal exam.
- Spinal cord diseases are detected by a neurological exam.
- Decreased bladder compliance can result in damage to the kidneys and should be suspected in residents with a history of conditions that result in decreased bladder compliance (pelvic radiation therapy, abdominal/pelvic resection, radical hysterectomy or prostatectomy, or spinal cord disease).
- Another cause of incontinence is tabes dorsalis (an advanced stage of syphilis), which is treatable with antibiotics.

C. FINAL EVALUATION IF INCONTINENCE PERSISTS

After the above causes of easily treatable incontinence have been eliminated and most serious underlying conditions have been investigated, conclude the evaluation with an assessment of the four causes of incontinence that are due to abnormalities within the bladder itself. The following section first describes these abnormalities and then describes the tests to detect their presence. A variety of treatment options are available for each type of incontinence, including treatment and care plans appropriate for every resident. In each case, the care plan can be tailored to the needs and characteristics of the resident with dementia, immobility, etc. Notably, bladder training and medications have been shown to significantly improve incontinence in even severely demented residents. The options are discussed in full detail in the educational material.

Exclusions - Although demented residents have been shown to benefit from targeted therapy, certain patients have a low probability of responding. Therefore, if a resident has no memory recall, is extensively dependent in self-transfer, and the facility's ability to toilet the resident on a regular schedule is limited, then the patient may not benefit from this part of the evaluation, and should be managed with pads, frequent turning and changing, or external catheters. Indications for an indwelling catheter are: the resident is in a coma or has terminal illness, a stage 3 or 4 pressure ulcer in an area affected by the incontinence, untreatable urethral blockage, the need for exact measurement of urine output, a history of

being unable to void after having a catheter removed in the past, or a resident with quad/paraplegia who failed a past attempt to remove a catheter.

The bladder abnormalities can be simply understood: either (1) the bladder contracts when it should not (“uninhibited bladder”), abruptly soaking the patient (“urge incontinence”); or (2) the bladder fails to contract when it should (“atonic” or underactive bladder), so that urine builds up and spills over as “overflow incontinence.” Alternatively the urethra, through which the bladder empties, is either (3) blocked by an obstruction (e.g., a large prostate) or (4) unable to close tightly enough (“stress incontinence”).

By doing a “stress test” and measuring the amount of urine that remains in the bladder after voiding (Post Void Residual -- PVR) these conditions can be separated: the uninhibited bladder generally has little residual urine (<100 ml) and a negative stress test, while the atonic bladder has a much larger residual (e.g., >400 ml). Women with stress incontinence (it is rare in men) have <100 ml residual urine and a positive stress test. Men with a blocked urethra (rare in women) have >100 ml residual urine and a negative stress test.

Post-Void Residual (PVR)

The PVR (post-void residual) is the amount of urine left in the bladder after a void. Research has shown that many elderly people have large amounts left in the bladder after a void, even though they demonstrate no signs of this. That is, they do not feel full or uncomfortable, have good urine output, and do not seem to have a large bladder by palpation or percussion. Also, in men, a high PVR can signal a variety of problems, and in both men and women, knowledge of the PVR can help guide the selection of medication. Therefore, a PVR should be determined in all patients who reach this point of the evaluation. In some cases, a physician’s order may be necessary to perform a PVR. If the physician chooses not to allow this, it should be documented in the chart.

- When the resident feels relatively full, he/she should void as normally as possible into a commode, bedpan, urinal, or a toilet equipped with a collection device (hat). Measure volume voided. Within 15 minutes of voiding, under sterile conditions, insert a nonpermanent catheter to measure the residual volume (PVR). Adding the volume voided to PVR gives the Total Bladder Volume (TBV).

Attention to several points will ensure that the test is done correctly. First, if the resident cannot void intentionally, do the test after an episode of incontinence. Second, after allowing the urine to drain, apply gentle pressure with your hand to the abdomen to increase the drainage. When the urine has stopped draining, withdraw the catheter slowly, continuing to press on the lower abdomen. If possible, have the resident sit up during the catheter withdrawal. Under sterile conditions, the risk of causing an infection is under 3%. Residents with known valvular heart disease (who receive antibiotic prophylaxis for dental work) probably should receive a dose of antibiotics before the PVR is checked.

Kidney Ultrasound Test for Men with a PVR Greater than 100 ml

- Ultrasound of the kidneys is indicated in male residents with a PVR greater than 100 ml to rule out hydronephrosis (inability of the kidneys to drain properly), which could be due to bladder obstruction and result in preventable kidney damage.

This test has no risks (compared to the risk of the dye injection in an IVP). Evidence of urine backing into the kidneys strongly suggests the need for urologic referral; if this is not done, the resident needs chronic indwelling catheterization.

Bladder Stress Test for Female Patients

- **Bladder Stress Test** - When the resident has a relatively full bladder, *but not a strong urge to void*, have her stand or assume as upright a position as possible, relax, and cough vigorously or strain. The test is positive if there is immediate leakage similar in volume and circumstance to usual incontinence. The stress test is negative if there is a delay of more than 5 seconds, no leakage, or leakage of only a few drops, or if it is dissimilar to the usual volume and circumstance of leakage.
- Measure void plus PVR as described above (i.e., calculate Total Bladder Volume).
- **Repeat Stress Test** - If the bladder stress test is negative AND the Total Bladder Volume is less than 200 ml, another test is needed for verification. Insert a sterile catheter into the bladder (preferably do this while the catheter for PVR measurement is still in the bladder) and fill it with at least 200 ml of sterile water, if possible. Remove the catheter, have the patient stand up (if possible), and repeat the stress test as above.

D. FINAL EVALUATION FOR RESIDENTS WITH INDWELLING CATHETERS

After the resident with an indwelling catheter has been treated for infection and all the other treatable conditions listed above, a voiding trial can be attempted -- unless the resident has terminal illness, stage 3 or 4 pressure ulcers, or untreatable urethral blockage. This trial may reveal that the catheter is not necessary after all.

Exclusions - The resident is in a coma or has terminal illness, a stage 3 or 4 pressure ulcer in an area affected by the incontinence, untreatable blockage, the need for exact measurement of urine output, a history of being unable to void after having a catheter removed in the past, or a resident with quad/paraplegia who failed a past attempt to remove a catheter.

- If appropriate, institute a voiding trial.
- (1) Before removing the catheter, record urine output every 6 hours for one or two days. Use this record to plan when to remove the catheter so that the expected urine will not be over 800 mls during the time of the voiding trial.

- (2) Remove catheter and observe. For example, if the resident usually puts out 500 ml on the day shift, remove the catheter at the beginning of that shift and observe; if resident has not voided by the end of the shift, wait until the volume gets higher, but do not exceed a volume of 800 ml.
- (3) If resident is able to void, check the PVR, as detailed in **Section C**.
 - If volume is greater than 400 ml, reinsert indwelling catheter permanently or until resident can be referred to a urologist.
 - If PVR is between 100 and 400 ml, observe resident carefully as urinary retention may redevelop over a few days to a few weeks. If not, check for presence of incontinence: if present, complete **Section C** (above).
 - If PVR is less than 100 ml, check for presence of incontinence; if present, complete **Section C** (above).
- (4) If resident has not voided by the time the expected volume is 800 ml, and there is no sensation of fullness, no urge to void, and no void, reinsert an indwelling catheter and record the volume. Residents who fail the voiding trial need either urologic referral, if appropriate, or permanent catheterization.
- (5) If the resident has no memory recall, is unable to transfer independently, and has incontinence that is resistant to all therapy for more than 2 weeks after removing the catheter, a catheter may be reinserted if deemed appropriate by the staff.

6. URINARY INCONTINENCE AND INDWELLING CATHETER RAP KEY

TRIGGER – REVISION	GUIDELINES
<p><i>Incontinence care plan suggested if one or more of following present:</i></p> <p>Incontinent 2+ Times a Week [H1b = 2, 3 or 4]</p> <p>Use of External (Condom) Catheter [H3c = checked]</p> <p>Use of Indwelling Catheter [H3d = checked]</p> <p>Use of Intermittent Catheter [H3e = checked]</p> <p>Use of Pads/Briefs [H3g = checked]</p>	<p><i>Possible reversible problems to be reviewed in evaluating incontinence or need for catheter:</i></p> <ul style="list-style-type: none"> • Conditions: Delirium [B5], Fecal Impactions [H2d], Depression [I1ee], UTI [I2j], Edema [J1g]. • Environment: Locomotion [G1c,d,e,f], Lack of access to toilet, Barriers [observation], Restraints [P4]. • Diagnoses: Diabetes [I1a], CHF [I1f], CVA [I1t], Parkinson's [I1y]. • Medications: Diuretics [O4e], Parkinson's meds, Disopyramide, Antispasmodics, Antihistamines, Drugs that stimulate or block sympathetic nervous system, Calcium channel blockers (verapamil, nifedipine, diltiazem), Narcotics [from record]. • Psychoactive Medications: Anti-psychotics, Antianxiety, Anti-depressants, Hypnotics, [O4a,b,c,d]. <p><i>Other potential factors contributing to incontinence or use of catheter:</i></p> <ul style="list-style-type: none"> • Conditions: Pain [J2]; Excessive or inadequate urine output, Atrophic vaginitis, Cancer of bladder, prostate, brain, or spine, tabes dorsalis [from record or exam]. • Abnormal Lab Values: High blood calcium, High blood glucose, Low B₁₂, High BUN or Creatinine [P9; from record]. <p><i>Final evaluation if incontinence persists:</i></p> <ul style="list-style-type: none"> • Specific Tests: Post Void Residual, bladder stress test for females, reflux test (kidney ultrasound for males with PVR>100 ml.) [Note: Tests not indicated when Comatose [B1] or when No memory recall [B3e] AND Dependent in Transfer, Locomotion [G1b,c,d,e,f] are both present]. <p><i>Final evaluation for residents with indwelling catheters:</i> If indwelling catheter [H3d], do Voiding Trial unless Untreatable urethral blockage [I3], terminal illness [J5c], or stage 3 or 4 pressure ulcer [M2a] present.</p>

7. RESIDENT ASSESSMENT PROTOCOL: PSYCHOSOCIAL WELL-BEING

I. PROBLEM

Well-being refers to feelings about self and social relationships. Positive attributes include initiative and involvement in life; negative attributes include distressing relationships and concern about loss of status. On average, 30% of residents in a typical nursing facility will experience problems in this area, two-thirds of whom will also have serious behavior and/or mood problems. When such problems coexist, initial treatment is often focused on mood and behavior manifestations. In such situations, treatment for psychosocial distress is dependent on how the resident responds to the primary mood/behavior treatment regimen.

II. TRIGGERS

Well-being problem (P) or need to maintain psychosocial strengths (S) suggested if one or more of following present:

- Withdrawal from Care/Activities (*Problem*)*
[E1o = 1,2]
- Conflict with Staff (*Problem*)
[F2a = checked]
- Unhappy with Roommate (*Problem*)
[F2b = checked]
- Unhappy with Other Resident (*Problem*)
[F2c = checked]
- Conflict with Family/Friends (*Problem*)
[F2d = checked]
- Grief Over Lost Status/Roles (*Problem*)
[F3b = checked]
- Daily Routine is Very Different from Prior Pattern in the Community (*Problem*)
[F3c = checked]
- Establishes Own Goals (*Strength*)
[F1d = checked]
- Strong Identification with Past (*Strength*)
[F3a = checked]

* **Note:** This item also triggers on the Mood State RAP.

III. GUIDELINES

Sequentially review the items found on the RAP KEY.

Confounding Problems

Treatments for mood/behavior problems are often immediately beneficial to well-being.

- Does the resident have an increasing or persistently sad mood?
- Does the resident have increasing frequency or daily disturbing behavior?
- Did the mood/behavior problems appear before the reduced sense of well-being?
- Has the resident's condition deteriorated since last assessment?
- Have ongoing treatment programs been effective?

Situational Factors that May Impede Ability to Interact with Others

Environmental and situational problems are often amenable to staff intervention without the burden of staff having to "change the resident."

- Have key social relationships been altered/terminated (e.g., loss of family member, friend or staff)?
- Have changes in the resident's environment altered access to others or to routine activities -
- for example, room assignment, use of physical restraints, new dining area assignment?

Resident Characteristics that May Impede Ability to Interact with Others

These items focus on areas where the resident may lack the ability to enter freely into satisfying social relationships. They represent substantial impediments to easy interaction with others and highlight areas where staff intervention may be crucial.

- Do cognitive/communication deficits or a lack of interest in activities impede interactions with others?
- Does resident indicate unease in social relationships?

Lifestyle Issues

Residents can withdraw or become distressed because they feel life lacks meaning.

- Was life more satisfactory prior to entering the nursing facility?
- Is resident preoccupied with the past, unwilling to respond to the needs of the present?
- Has the facility focused on a daily schedule that resembles the resident's prior lifestyle?

Additional Information to Clarify the Nature of the Problem

Supplemental assessment items can be used to specify the nature of the well-being problem for residents for whom a well-being care plan is anticipated. These items represent topics around which to phrase questions and to establish a trusting exchange with the resident. Each item includes the positive and negative end of a continuum, representing the possible range that staff can use in thinking about these issues. Staff can use or not use the items in this list. For those items selected, the following issues should be considered:

- How do staff/resident perceive the *severity* of the problem?
- Has the resident ever demonstrated (while in the facility) *strengths* in the area under review?
- Are corrective strategies now being used? Have they been used in the past? To what effect?
- Is this an area that might be improved?

* **Note:** This item also triggers on the Mood State RAP.

8. RESIDENT ASSESSMENT PROTOCOL: MOOD STATE

I. PROBLEM

Depression and other mood disorders are common in nursing facility residents, but are often under-diagnosed and under-treated. Such signs are often expressed as sad mood, feelings of emptiness, anxiety, or uneasiness. They are also manifested in a wide range of bodily complaints and dysfunctions, such as loss of weight, tearfulness, agitation, aches and pains.

II. TRIGGERS

A mood problem suggested if one or more of following present:

- Resident Made Negative Statements
[E1a = 1, 2]
- Repetitive Questions
[E1b = 1, 2]
- Repetitive Verbalizations
[E1c = 1, 2]
- Persistent Anger with Self or Others
[E1d = 1, 2]
- Self-Deprecation
[E1e = 1, 2]
- Expressions of what Appear to be Unrealistic Fears
[E1f = 1, 2]
- Recurrent Statements that Something Terrible is About to Happen
[E1g = 1, 2]
- Repetitive Health Complaints
[E1h = 1, 2]
- Repetitive Anxious Complaints/Concerns
[E1i = 1, 2]
- Unpleasant Mood in Morning
[E1j = 1, 2]
- Insomnia/Change in Usual Sleep Pattern
[E1k = 1, 2]
- Sad, Pained, Worried Facial Expressions
[E1l = 1, 2]
- Crying, Tearfulness
[E1m = 1, 2]
- Repetitive Physical Movements^(a)
[E1n = 1, 2]
- Withdrawal from Activities of Interest^(b)
[E1o = 1, 2]

- Reduced Social Interaction
[E1p = 1, 2]
- Mood Persistence
[E2 = 1, 2]

^(a) **Note:** This item also triggers on the Psychotropic Drug Use RAPs when psychotropic drug use present.

^(b) **Note:** This item also triggers on the Psychosocial Well-Being RAP.

III. GUIDELINES

Specific conditions stated below suggest the need for an altered/new care strategy. They are not exhaustive; other situations may arise in which staff decides that an altered care plan is necessary. The most obvious are instances of drug-induced side effects (addressed in Psychotropics Drug Use RAP). Residents whose mood problems do not call for care plan alterations are those with stable behavior and no unusual confounding problems.

Many of the questions and issues that follow relate to the MDS items listed on the Mood State RAP KEY. An altered care strategy is suggested when specified conditions are met.

Indicators of the need to consider a new/altered care strategy:

Has Mood Recently Declined or Problems Intensified?

- Were mood problems present 6 months ago?
- Does resident have a cyclic history of decline and improvement in mood state?
- Has loss of appetite with accompanying weight loss occurred?
- Has interest in activities declined, even though resident remains physically capable?

Mood Unimproved and Potentially Reversible Causes Present

Resolution of delirium (fluctuating consciousness) behavioral, relationship and/or communication problems often affect a resident's mood state. Only when these conditions have been addressed can the nature of a mood problem be fully understood.

Also, consider the possible presence of other complicating factors, such as:

- Delirium.
- Review recent changes in the life of the resident (e.g., death of a child, transfer to new environment, separation from loved ones, loss of functional abilities or change in body image, loss of autonomy).
- Review nature and intensity of relationship and/or behavior problems.

ADL decline can be both a cause and a consequence of distressed mood. Reviewing the sequence of ADL and mood decline may be informative. In any case, where mood seems to impair ADL functioning, useful strategies include modifying the physical environment,

separating the resident's performance of ADL activities into a series of subtasks, and using verbal reminders and cues.

- Review record to determine whether there has been a sudden onset or worsening of cognitive symptoms or communication skills following initiation of treatment (e.g., medications).
- Review to determine whether or not the resident is using any medications known to cause mood shifts, such as psychotropics; antihypertensives, such as clonidine (Catapres), guanethidine (Ismelin), methyldopa (Aldomet), propranolol (Inderal), reserpine; cimetidine (Tagamet); cytotoxic agents; digitalis; digoxin, lanoxin; immunosuppressives; sedatives; steroids; stimulants.

Mood Unimproved and Other Conditions to Consider

The passive resident with distressed mood may be overlooked. Such a resident may be erroneously assumed to have no mood state problem.

- Does the resident show little/no initiative?
- Does he/she remain uninvolved in activities (alone or with others)?
- Is the sad mood persistent?

Does Sad Mood Appear to Respond to Treatment (e.g., Drug Regimen)?

- Has the mood problem remained relatively unchanged for the last 90 days, or has it improved with the current treatment program?
- Have there been cycles of decline and improvement?
- Is resident receiving medications and/or psychosocial therapy?

Confounding Issues:

Are There Indications of New or Intensified Problems With Conditions That May Affect Mood Problems?

These conditions include: Alzheimer's Disease, cancer, cardiac disease, metabolic and endocrine disorders (e.g., hypercalcemia, Cushing's disease, Addison's disease, hypoglycemia, hypokalemia, porphyria), Parkinson's disease, stroke, or other neurological disease, and thyroid disease.

8. MOOD STATE RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES

9. RESIDENT ASSESSMENT PROTOCOL: BEHAVIORAL SYMPTOMS

I. PROBLEM

Many residents in a nursing facility may exhibit emotional, social, and/or behavior disorders; some have purely behavioral symptoms (i.e., wandering, verbal abuse, physically aggressive and/or socially inappropriate behaviors). Residents with behavioral symptoms also frequently have other related problems. Those who have behavioral symptoms may have some type or cognitive deficit; others will have mood and/or relationship problems.

Behavioral symptoms are often seen as a source of danger and distress to the residents themselves and sometimes to other residents and staff. It is important to address behavioral symptoms for several reasons. Behaviors are often the only means some residents have for communicating health problems, discomfort, personal needs, preferences, or fears. To ignore such communication attempts by the resident may further isolate someone already burdened by the physical and cognitive losses associated with Alzheimer's disease or other types of dementia. Residents with behavioral symptoms represent a risk to other residents and staff and are much more likely to be abused or neglected.

II. TRIGGERS

The MDS trigger items identify two types of residents for whom further review is suggested: residents who exhibit the behavioral symptoms of wandering, being verbally abusive, being physically aggressive and/or exhibiting socially inappropriate behavioral symptoms AND residents who have improved behavioral symptoms but who are receiving treatment or intervention that might mask manifestations of the behavior (e.g., decreased wandering because resident restrained).

Review of behavior status suggested if one or more of following present:

- Wandering*
[E4aA = 1, 2, 3]
- Verbally Abusive
[E4bA = 1, 2, 3]
- Physically Abusive
[E4cA = 1, 2, 3]
- Socially Inappropriate
[E4dA = 1, 2, 3]
- Resists Care
[E4eA = 1, 2, 3]
- Behavior Improved
[E5 = 1]

* **Note:** This Item also triggers on the Fall RAP.

III. GUIDELINES

The items in this RAP (and in the RAP KEY) begin with those items that help to draw the distinction between serious behavioral symptoms and others that can be more easily accommodated. This followed by a section on potential causes or factors involved in the manifestation of problem behaviors the resolution, of which might reduce or eliminate the behavior(s).

EVALUATING THE SERIOUSNESS OF BEHAVIORAL SYMPTOMS

The first trigger identifies residents who currently exhibit some type of behavioral symptoms for which additional or new treatment programs may be considered. Not all behaviors need an extensive intervention. Some behaviors neither endanger nor distress the resident or others. For example, many hallucinations and delusions (when not a sign of psychosis or an acute condition such as delirium) are benign. Residents with such behavioral manifestations may be accommodated (e.g., tolerated, behavior rechanneled or redirected) within the environment of the nursing facility. Thus, determining whether or not a particular behavioral manifestation is a problem is an important step and involves determining the nature and severity of the behavior(s) in question and the effects of the behavior(s).

Observing Specific Behavioral Manifestations in the Most Recent 7-Day Period

- Review to determine the intensity, duration, and frequency of behavior problems over the last 7-day and 14-day periods. Did these changes vary over time?
- Is there a pattern to the behavior manifestations based on observations over a 7-14 day time period? (Consider such factors as time of day, nature of the environment, what the resident and others were doing at the time the problem behavior was manifested.)

Identifying Stability/Change in the Nature of Behavioral Problems

Identifying patterns of behaviors over time may help clarify the underlying causes of problem behaviors. For example, such a review may reveal a pattern in which a resident's catastrophic reactions typically occur only in the presence of a particular combination of stressors (e.g., a person who can tolerate large groups for singing but not for meals). Similarly, observing a resident over time may reveal that a resident's seemingly random behaviors are associated with particular events (e.g., yelling/screaming associated with objecting to someone changing the channel during a favored television program; wandering associated with the need to toilet). Addressing the causes of such patterns may reduce or eliminate the behavior.

- How did behavior develop over time? Were problem signs evident earlier in the resident's stay or even earlier in the resident's life?
- Has resident experienced recent changes (e.g., movement to a new unit, assignment of new nonlicensed direct care staff to the unit, change in medication, withdrawal from a treatment program, decline in cognitive status)?

Determine the Ways in Which Behavior Problems Impinges on Other Functioning

Understanding that a behavior can - but does not always - interfere with a resident's self-performance and treatment regimens is useful in considering the need for interventions. This view can also help to ensure that aggressive treatments or interventions (e.g., physical restraints or antipsychotics) are not introduced simply to keep the resident "looking normal."

- Does the behavior endanger the resident? Others? If so, in what ways does it endanger the resident or others?
- Are behavior problems related to daily variations in functional performance? If so, how?
- Does behavior problem lead to resistance to care?
- Does it lead to difficulties dealing with people and coping in the facility?

REVIEW OF POTENTIAL CAUSES OF BEHAVIORAL SYMPTOMS

Many behaviors, however, are problematic for the resident or others. Many are directly associated with acute health conditions, neurological diseases, or psychiatric conditions. Still others originate in the resident's reaction to external factors, such as psychotropic medications, the use of physical restraints, and stressors in the environment (e.g., loud noises, changes in familiar routines). Identifying the various factors involved in the manifestation of behavioral symptoms is critical. Such a process may reveal conditions that can be resolved, thus eliminating or reducing the behavioral symptoms. Further, distinguishing among potential causes or interrelationships is essential to developing an appropriate care plan (e.g., distinguishing between behaviors originating with a neurological condition as contrasted to a psychotic syndrome). Consideration of the items in the Behavioral Symptoms RAP KEY (as well as in related RAPs as indicated) should facilitate this process.

Cognitive Status Problem Interactions

Decision-making ability is a key indicator of effective cognitive skills. Resolving acute confusional state or delirium, a potentially reversible problem, can be critical to behavior management. (See Delirium RAP if a diagnosis or signs and symptoms of delirium are present.)

For many residents with chronic progressive dementia, certain behaviors may continue in spite of remedial treatments or interventions. In some instances, the behaviors will be distressing; however, in many instances behaviors can be accommodated. For example, many residents who wander can be accommodated without restraints in a hazard-free environment. Similarly, the needs and patterns of demanding residents or those with catastrophic reactions can often be anticipated or the most disrupting reactions to the distress alleviated. The Cognitive Loss/Dementia RAP refers to several issues that can be considered for such residents. Thus, that RAP should be completed prior to this RAP on Behaviors for residents who have cognitive problems.

Presence of Mood and/or Relationship Problem Interactions

Mood and relationship problems often produce disturbed behavioral symptoms. If the underlying problems are resolved, the behavior may lessen or stop.

- Does the resident have an unresolved mood state or relationship problem that may lead to behavioral symptoms (e.g., anxiety disorder and agitation; depression or isolation and verbally abusive behavior)? Refer to the Psychosocial Well-Being RAP and to the Mood State RAP.
- Is there an association among mood state, relationship, and behavioral symptoms?
- Can a cause and effect relationship be determined?
- Does the resident experience a sense of frustration because of rejection by family? If so, does this frustration result in the resident verbally abusing staff or other residents?

Relationship Difficulties that May Affect Behavior

- Does the presence or absence of other persons precipitate an event?
- Was a combative act prompted by paranoid delusions about another's motives or actions?
- Did recent loss of loved one, change in staff, an intrafacility move, or placement with a roommate with whom the resident cannot communicate lead to disruptive behavioral symptoms?

Environmental Conditions

A review of the resident's behaviors over time may, as noted earlier, reveal a pattern of behaviors that helps identify the causes of the behaviors. Because environmental conditions often have a profound effect on residents' behaviors, these factors should be given special consideration.

- Are staff sufficiently responsive? Do they recognize stressors for the resident and early warning signs of problem behavior?
- Do staff follow the resident's familiar routines?
- Do noise, crowding or dimly lit areas affect resident's behavior?
- Are other residents physically aggressive?

Illness/Conditions

Sometimes, the onset of acute illnesses and/or the worsening of a chronic illness produce disturbed behaviors. Often identification and treatment of the illness will resolve the problem behavior. In addition, a resident with certain chronic conditions, particularly difficulties in making his/her needs understood or in understanding others may also exhibit problem behaviors that can be eliminated or reduced if more effective methods of communication are adopted by staff and families. Sensory impairments (vision, hearing) may also produce disruptive behaviors that would lessen or disappear if the underlying condition were addressed.

- Can physical health factors close in time to the disturbed behavior be identified (e.g., pain or discomfort from physical conditions such as arthritis, constipation, or headache)?
- Can the observed behavior be associated with an acute illness (e.g., urinary tract infection, other infections, fever, hallucinations/delusions, sleep deprivation, fall with physical trauma, nutritional deficiencies, weight loss, dehydration/insufficient fluids, electrolyte disorder, or acute hypotension)?
- Can the observed behavior be associated with the worsening of a chronic illness (e.g., congestive heart failure, diabetes, psychoses, Alzheimer's disease or other dementia, CVA, or hypoglycemia for a diabetic)?
- What was the role of impaired hearing, vision, or ability to communicate or understand others?

Current Treatment/Management Procedures: Positive and Negative Consequences

A number of treatment or management interventions may affect a resident's behavior. Some may have had a positive effect, while others may exacerbate existing behavioral symptoms - or produce new problems. Both are important to consider in reaching a decision about whether or not to proceed with a care plan intervention. For example, review the resident's interest in, use of, or participation in psychological treatment program(s). This review will be especially important for residents who have recently experienced improved behavioral status. For some residents and some management programs, continuation of treatments may be central to maintaining their newfound control. In other cases, either the interventions can be reduced (at least on a trial basis), or the side effects of the intervention may be so severe that alterations in the treatment regimen should be considered. For example, a drug or restraint program may result in increased confusion and agitation, reduced ADL self-performance, a decline in mood, or a general decrease in the quality of life for the resident. On the other hand, breaking tasks of daily life down into smaller steps that the resident can comprehend and perform may reduce stress and prevent problem behavior.

- Has the resident been evaluated by a psychiatrist, etc.? When?
- Are there indicators that treatments have helped resident gain increased control over life? What were they?
- Can improvement be attributed to an identifiable treatment?
- If behavioral symptoms have decreased, can medication or behavior management programs be withdrawn?
- Is the onset or change of behaviors associated with the start of (or change in prescription of) a medication(s)?
- Is the behavior associated with the use of a physical restraint (e.g., increased agitation and anger)?
- Has the resident received care in a specially designed therapeutic unit?
- Are there special staff training/support programs that focus on managing behavioral symptoms?
- What disciplines are involved? How frequent/consistent is the training?
- Has task segmentation been used to maximize resident involvement?

9. BEHAVIORAL SYMPTOMS RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Review of behavior status suggested if one or more of following present:</i></p> <ul style="list-style-type: none"> • Wandering* [E4aA = 1, 2, 3] • Verbally Abusive [E4bA = 1, 2, 3] • Physically Abusive [E4cA = 1, 2, 3] • Socially Inappropriate [E4dA = 1, 2, 3] • Resists Care [E4eA = 1, 2, 3] • Behavior Improved [E5 – 1] 	<p><i>Review and describe behavioral symptoms:</i></p> <ul style="list-style-type: none"> • Evaluating the Seriousness and Stability/ Change of Behavioral Symptoms - Review of intensity, duration, frequency and, if any, pattern of behaviors, their development over time, and their effect on the resident and others [E4aB, E4bB, E4cB, E4dB, E4eB, from record] <p><i>Review potential causes that would be addressed or resolved:</i></p> <ul style="list-style-type: none"> • Cognitive Status Problems - Delirium [B5], Alzheimer’s Disease [I1q] or Other Dementia [I1u], Effects of Stroke [C4, C5, C6, G5, G6, I1r, I1t] • Mood or Relationship Problems - Sad or Anxious Mood [E1], Unsettled Relationships [F2], Psychiatric Diagnosis [I1dd, I1ee, I1ff, I1gg] • Environmental Conditions - Departure from Resident’s Normal Routines Prior to Entering Facility [F3c], Staff Responses, Presence of Stressful Conditions of Physically Aggressive Resident [from record, interviews with staff, resident] • Illness/Conditions - Onset of Acute Illness, Worsening of Chronic Illness [J5a,b], and Other Related Problems, such as Constipation [H2b], Diabetes [I1a], CHF [I1f], Pneumonia [I2e], Septicemia [I2g], UTI [I2j], or Other Infection [I2, I3], Fever [J1h], Delusions [J1e], Hallucinations [J1i], Pain [J2], Fall with Physical Trauma to Head [J4a,b; I1cc] • Communication Deficits - Difficulty Making Self Understood [C4], or Understanding Others [C6] • Sensory Impairments - Hearing Problem [C1], Visual Problem [D1], Visual Limitations [D2] <p>Treatment /Management Procedures – Anti-psychotics, Antianxiety, Antide-pressants, Hypnotics [O4a,b,c,d], Behavior Management Program [P2], Trunk, Limb or Chair Restraints [P4c,d,e]</p>
<p>* Note: This item also triggers on the Fall RAP.</p>	

10. RESIDENT ASSESSMENT PROTOCOL: ACTIVITIES

I. PROBLEM

The Activities RAP targets residents for whom a revised activity care plan may be required to identify those residents whose inactivity may be a major complication in their lives. Resident capabilities may not be fully recognized: the resident may have recently moved into the facility or staff may have focused too heavily on the instrumental needs of the resident and may have lost sight of complications in the institutional environment.

Resident involvement in passive as well as active activities can be as important in the nursing facility as it was in the community. The capabilities of the average resident have obviously been altered as abilities and expectations change, disease intervenes, situational opportunities become less frequent, and extended social relationships less common. But something that should never be overlooked is the great variability within the resident population: many will have ADL deficits, but few will be totally dependent; impaired cognition will be widespread, but so will the ability to apply old skills and learn new ones; and sense may be impaired, but some type of two-way communication is almost always possible.

For the nursing facility, activity planning is a universal need. For this RAP, the focus is on cases where the system may have failed the resident, or where the resident has distressing conditions that warrant review of the activity care plan. The types of cases that will be triggered are: (1) residents who have indicated a desire for additional activity choices; (2) cognitively intact, distressed residents who may benefit from an enriched activity program; (3) cognitively deficient, distressed residents whose activity levels should be evaluated; and (4) highly involved residents whose health may be in jeopardy because of their failure to “slow down.”

In evaluating triggered cases, the following general questions may be helpful:

- Is inactivity disproportionate to the resident’s physical/cognitive abilities or limitations?
- Have decreased demands of nursing facility life removed the need to make decisions, to set schedules, to meet challenges? Have these changes contributed to resident apathy?
- What is the nature of the naturally occurring physical and mental challenges the resident experiences in everyday life?
- In what activities is the resident involved? Is he/she normally an active participant in the life of the unit? Is the resident reserved, but actively aware of what is going on around him/her? Or is he/she unaware of surroundings and activities that take place?
- Are there proven ways to extend the resident’s inquisitive/active engagement in activities?
- Might simple staff actions expedite resident involvement in activities? For example: Can equipment be modified to permit greater resident access of the unit? Can the resident’s location or position be changed to permit greater access to people, views, or programs? Can time and/or distance limitations for activities be made less demanding without destroying the challenge? Can staff modes of interacting with the resident be more accommodating, possibly less threatening, to resident deficits?

II. TRIGGERS

ACTIVITIES TRIGGERS A (Revise)

Consider revising activity plan if one or more of following present:

- Involved in Activities Little or None of Time
[N2 = 2, 3]
- Prefers Change in Daily Routine
[N5a = 1, 2]
[N5b = 1, 2]

ACTIVITIES TRIGGERS B (Review)

Review of activity plan suggested if both of following present:

- Awake all or most of time in morning
[N1a = checked]
- Involved in activities most of time
[N2 = 0]

III. GUIDELINES

The followup review looks for factors that may impede resident involvement in activities. Although many factors can play a role, age as a valid impediment to participation can normally be ruled out. If age continues to be linked as a major cause of lack of participation, a staff education program may prove effective in remedying what may be overprotective staff behavior.

Issues to Consider as Activity Plan is Developed

Is Resident Suitably Challenged, Overstimulated? To some extent, competence depends on environmental demands. When the challenge is not sufficiently demanding, a resident can become bored, perhaps withdrawn, may resort to fault-finding and perhaps even behave mischievously to relieve the boredom. Eventually, such a resident may become less competent because of the lack of challenge. In contrast, when the resident lacks the competence to meet challenges presented by the surroundings, he or she may react with anger and aggressiveness.

- Do available activities correspond to resident lifetime values, attitudes, and expectations?
- Does resident consider “leisure activities” a waste of time - he/she never really learned to play, or to do things just for enjoyment?
- Have the resident’s wishes and prior activity patterns been considered by activity and nursing professionals?
- Have staff considered how activities requiring lower energy levels may be of interest to the resident - e.g., reading a book, talking with family and friends, watching the world go by, knitting?

- Does the resident have cognitive/functional deficits that either reduce options or preclude involvement in all/most activities that would otherwise have been of interest to him/her?

Confounding Problems to be Considered

Health-Related Factors That May Affect Participation in Activities - Diminished cardiac output, an acute illness, reduced energy reserves, and impaired respiratory function are some of the many reasons that activity level may decline. Most of these conditions need not necessarily incapacitate the resident. All too often, disease-induced reduction of activity may lead to progressive decline through disuse, and further decrease in activity levels. However, this pattern can be broken: many activities can be continued if they are adapted to require less exertion or if the resident is helped in adapting to a lost limb, decreased communication skills, new appliances, and so forth.

- Is resident suffering from an acute health problem?
- Is resident hindered because of embarrassment/unease due to presence of health-related equipment (tubes, oxygen tank, colostomy bag, wheelchair)?
- Has the resident recovered from an illness? Is the capacity for participation in activities greater?
- Has an illness left the resident with some disability (e.g., slurred speech, necessity for use of cane/walker/wheelchair, limited use of hands)?
- Does resident's treatment regimen allow little time or energy for participation in preferred activities?

Other Issues To Be Considered

Recent Decline, in Resident Status - Cognition, Communication, Function, Mood, or Behavior - When pathologic changes occur in any aspect of the resident's competence, the pleasurable challenge of activities may narrow. Of special interest are problematic changes that may be related to the use of psychoactive medications. When residents or staff overreact to such losses, compensatory strategies may be helpful - e.g., impaired residents may benefit from periods of both activity and rest; task segmentation can be considered; or available resident energies can be reserved for pleasurable activities (e.g., using usual stamina reserves to walk to the card room, rather than to the bathroom) or activities that have individual significance (e.g., sitting unattended at a daily prayer service rather than at group activity program).

- Has staff or the resident been overprotective? Or have they misread the seriousness of resident cognitive/functional decline? In what ways?
- Has the resident retained skills, or the capacity to learn new skills, sufficient to permit greater activity involvement?
- Does staff know what the resident was like prior to the most recent decline? Has the physical/other staff offered a prognosis for the resident's future recovery, or change of continued decline?
- Is there any substantial reason to believe that the resident cannot tolerate or would be harmed by increased activity levels? What reasons support a counter opinion?

- Does resident retain any desire to learn or master a specific new activity? Is this realistic?
- Has there been a lack of participation in the majority of activities which he/she stated as preference are as even though these types of activities are provided?

Environmental Factors - Environmental factors include recent changes in resident location, facility rules, season of the year, and physical space limitations that hinder effective resident involvement.

- Does the interplay of personal, social, and physical aspects of the facility's environment hamper involvement in activities? How might this be addressed?
- Are current activity levels affected by the season of the year or the nature of the weather during the MDS assessment period?
- Can the resident choose to participate in or to create an activity? How is this influenced by facility rules?
- Does resident prefer to be with others, but the physical layout of the unit gets in the way? Do other features in the physical plant frustrate the resident's desire to be involved in the life of the facility? What corrective actions are possible? Have any been taken?

Changes in Availability of Family/Friends/Staff Support - Many residents will experience not only a change in residence but also a loss of relationships. When this occurs, staff may wish to consider ways for resident to develop a supportive relationship with another resident, staff member or volunteer that may increase the desire to socialize with others and/or to participate in activities with this new friend.

- Has a staff person who has been instrumental in involving a resident in activities left the facility/been reassigned?
- Is a new member in a group activity viewed by a resident as taking over?
- Has another resident who was a leader on the unit died or left the unit?
- Is resident shy, unable to make new friends?
- Does resident's expression of dissatisfaction with fellow residents indicate he/she does not want to be a part of an activities group?

Possible Confounding Problems to be Considered for Those Now Actively Involved in Activities - Of special interest are cardiac and other diseases that might suggest a need to slow down.

10. ACTIVITIES RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><u>ACTIVITIES TRIGGERS A (Revise)</u></p> <p><i>Consider revising activity plan if one or more of following present:</i></p> <ul style="list-style-type: none"> • Involved in Activities Little or None of Time [N2=2, 3] • Prefers Change in Daily Routine [N5a=1, 2] [N5b=1, 2] <p><u>ACTIVITIES TRIGGERS B (Review)</u></p> <p><i>Review of activity plan suggested if both of following present:</i></p> <ul style="list-style-type: none"> • Awake All or Most of Time in Morning [N1a = checked] • Involved in Activities Most of Time [N2 = 0] 	<p><i>Issues to be considered as activity plan is developed:</i></p> <ul style="list-style-type: none"> • Time in Facility [AB1]. • Cognitive Status [B2, B4] • Walking/Locomotion Pattern [G1c,d,e,f] • Unstable Acute/Chronic Health Conditions [J5a,b] • Number of Treatments Received [P1] • Use of Psychoactive Medications [O4a,b,c,d] <p><i>Confounding problems to be considered:</i></p> <ul style="list-style-type: none"> • Performs Tasks Slowly and at Different Levels (Reduced Energy Reserves) [G8c,d] • Cardiac Dysrhythmias [I1e] • Hypertension [I1h] • CVA [I1t] • Respiratory diseases [I1hh, I1ij] • Pain [J2] <p><i>Other issues to be considered:</i></p> <ul style="list-style-type: none"> • Customary Routines [AC] • Mood [E1, E2] and Behavioral Symptoms [E4] • Recent Loss of Close Family Member/Friend or Staff [F2f; from record] • Whether or Not Daily Routine is Very Different from Prior Pattern in the Community [F3c]

11. RESIDENT ASSESSMENT PROTOCOL: FALLS

I. PROBLEM

Falls are a leading cause of morbidity and mortality among the elderly who reside in nursing facilities. Approximately 50% of residents fall annually, and 10% of these falls result in serious injury, especially hip fractures. Most elders are afraid of falling and this fear can limit their activities. Falls may be an indicator of functional decline and the development of other serious conditions such as delirium, adverse drug reactions, dehydration, and infections. External risk factors include medication side effects, the use of appliances and restraints, and environmental conditions. This RAP provides a systematic approach to the evaluation of a fall and assessment guidelines to assist staff in identifying common fall risk factors and developing care plan interventions.

II. TRIGGERS

Potential for additional falls [A] or risk of initial fall [R] suggested if one or more of following present:

- Fell in Past 30 Days (*Additional*)^(c)
[J4a = checked]
- Fell in Past 31-180 Days (*Additional*)^(c)
[J4b = checked]
- Wandering (*Risk*)^(a)
[E4aA = 1,2,3]
- Dizziness (*Risk*)^(c)
[J1f = checked]
- Use of Trunk Restraint (*Risk*)^(b)
[P4c = 1,2]
- Use of Antianxiety Drugs (*Risk*)^(d)
[O4b = 1-7]
- Use of Antidepressant Drugs (*Risk*)^(d)
[O4c = 1-7]

^(a) **Note:** This item also triggers on the Behavior Symptom RAP.

^(b) **Note:** Code 2 also triggers on the Pressure Ulcer RAP. Both codes trigger on the Physical Restraint RAP.

^(c) **Note:** This item also triggers on the Psychotropic Drug Use RAP (when psychotropic drugs present).

^(d) **Note:** When present with specific condition, this item is part of trigger on Psychotropic Drug Use RAP.

III. GUIDELINES

To reach a decision on a care plan, begin by reviewing whether or not one or more of the major risk factors listed on the RAP KEY are present. Clarifying information on the nature of the risk or type of issue to be considered for the RAP KEY items follows.

Multiple Falls: Is There a Previous History of Falls, or was the Fall an isolated Event?

Refer to the MDS, reports of the family, and incident reports.

Internal Risk Factors

Review to determine whether or not the items listed on the RAP KEY under the following headings are present. Each of these represents an underlying health problem or condition that can cause falls and may be addressed so as to prevent future falls.

- Cardiovascular
- Neuromuscular/Functional
- Orthopedic
- Perceptual
- Psychiatric or Cognitive

External Risk Factors

These risk factors can often be modified to reduce the resident's risk of falls.

Medications - Certain drugs can produce falls by causing related problems (hypotension, muscle rigidity, impaired balance, other extrapyramidal side effects [e.g., tremors], and decreased alertness). These drugs include: antipsychotics, antianxiety/hypnotics, antidepressants, cardiovascular medications, and diuretics.

- Were these medications administered prior to or after the fall?
- If prior to the fall, how close to it were they first administered?

Appliances and Devices:

- If the resident who falls (or is at risk of falling) uses an appliance, observe his/her use of the appliance for possible problems.
- Review the MDS and the resident's record to determine whether or not restraints were used prior to the fall and might have contributed to the fall, (e.g., causing a decline function or an increase in agitation).

Environmental/Situational Hazards - Many easily modifiable hazards (e.g., poor lighting, patterned carpeting, poorly arranged furniture) in the environment may cause falls both in relatively healthy and in frail elderly residents.

For Those who have Fallen Previously, Review the Circumstances under which the Fall Occurred

Attempt to gather information on most recent fall. Needed information includes:

- Time of day, time since last meal.
- Was resident doing usual or unusual activity?
- Was he/she standing still or walking? Reaching up or down? Not reaching?
- Was resident in a crowd of people? Responding to bladder/bowel urgency?
- Was there glare or liquid on floors? Foreign objects in walkway? New furniture placement or other changes in environment?
- Is there a pattern of falls in any of the above circumstances?
- If you know what the resident was doing during the fall, have her/him perform that activity and observe (protect resident to ensure that a fall does not occur during this test).

Take Necessary Vital Signs

- At time of fall, obtain supine and upright blood pressure and heart rate, IF the resident does not have a serious injury such as a fracture of the hip or lower extremity.
- When reproducing circumstances of a fall (e.g., if the resident fell 10 minutes after eating a large meal, take vital signs 10 minutes after the residents eats).
- Measure blood pressure and heart rate when the resident is supine AND 1 and 3 minutes after standing; note temperature and respiratory rate.

For Residents at Risk of Future Falls, Review Environmental/Situational Factors to Determine Whether or Not Modifications are Needed

- Observe resident's usual pattern of interaction with his/her environment -- the way he/she gets out of bed, walks, turns, gets in and out of chairs, uses the bathroom. Observations may reveal environmental solutions to prevent falls.
- Observe him/her get out of bed, walking 20 feet, turn in a 360° circle, standing up from a chair without pushing off with his/her arms (fold arms in front), and using the bathroom.

11. FALLS RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Potential for additional falls or risk of initial fall suggested if one or more of following present:</i></p> <ul style="list-style-type: none"> • Fell in past 30 Days (<i>Additional</i>)^(C) [J4a = checked] • Fell in Past 31-180 Days (<i>Additional</i>)^(C) [J4b = checked] • Wandering (<i>Risk</i>)^(a) [E4aA = 1, 2, 3] • Dizziness (<i>Risk</i>)^(C) [J1f = checked] • Use of Trunk Restraint (<i>Risk</i>)^(b) [P4c = 1, 2] • Use of Antianxiety Drugs (<i>Risk</i>)^(d) [O4b = 1-7] • Use of Antidepressant Drugs (<i>Risk</i>)^(d) [O4c = 1-7] <p>^(a) Note: This item also triggers on the Behavior Symptom RAP.</p> <p>^(b) Note: Code 2 also triggers on the Pressure Ulcer RAP. 12. RESIDENT ASSESSMENT PROTOCOL: NUTRITIONAL STATUS

I. PROBLEM

Malnutrition is not a response to normal aging; it can arise from many causes. Its presence may signal the worsening of a life-threatening illness, and it should always be seen as a dramatic indicator of the resident's risk of sudden decline. Severe malnutrition is, however, relatively rare, and this RAP focuses on signs and symptoms that suggest that the resident may be at risk of becoming malnourished. For many who are triggered, there will be no obvious, outward signs of malnutrition. Prevention is the goal, and early detection is the key.

Early problem recognition and care planning can help to ensure appropriate and timely nutritional intervention. For many residents, simple adjustments in feeding patterns may be sufficient. For others, compensation or correction for food intake problems may be required.

Within a nutrition program, food intake is best accomplished via oral feedings. Tube (enteral) feeding is normally limited to residents who have a demonstrated inability to orally consume sufficient food to prevent major malnutrition or weight loss. Parenteral feeding is normally limited to life-saving situations where both oral and enteral feeding is contraindicated or inadequate to meet nutrient needs. Oral feeding is clearly preferred. Depending on the nature of the problem, residents can be encourage to use finger foods; to take small bites; to use the tongue to move food in the mouth from side to side; to chew and swallow each bite; to avoid food that causes mouth pain, etc. Therapeutic programs can also be designed to review for the need for adaptive utensils to compensate for problems in sucking, closing lips, or grasping utensils; to help the confused resident maintain a fixed feeding routine, etc.

II. TRIGGERS

Malnutrition problem suggested if one or more of following observed:

- Weight Loss
[K3a = 1]
- Taste Alterations
[K4a = checked]
- Leaves 25% or More Food Uneaten at Most Meals
[K4c = checked]
- Parenteral/IV Feeding^(a)
[K5a = checked]
- Mechanically Altered Diet
[K5c = checked]
- Syringe (Oral Feeding)
[K5d = checked]
- Therapeutic Diet
[K5e = checked]

- Pressure Ulcer^(b)
[M2a = 2, 3, or 4]

^(a) **Note:** These items also trigger on the Dehydration/Fluid Maintenance RAP.

^(b) **Note:** These items also trigger on the Pressure Ulcer RAP.

III. GUIDELINES

RESIDENT FACTORS THAT MAY IMPEDE ABILITY TO CONSUME FOOD

Reduced Ability to Feed Self

Reduced ability to feed self can be due to arthritis, contractures, partial or total loss of voluntary arm movement, hemiplegia or quadriplegia, vision problems, inability to perform activities of daily living without significant assistance, and coma.

Chewing Problems

Residents with oral abscesses, ill-fitting dentures, teeth that are broken, loose, carious or missing, or those on mechanically altered diets frequently cannot eat enough food to meet their calorie and other nutrient needs. Significant weight loss can, in turn, result in poorly fitting dentures and infections that can lead to more weight loss.

Losses from Diarrhea or an Ostomy

Swallowing Problems

Swallowing problems arise in several contexts: the long-term result of chemotherapy, radiation therapy, or surgery for malignancy (including head and neck cancer); fear of swallowing because of COPD/emphysema/asthma; stroke; hemiplegia or quadriplegia; Alzheimer's disease or other dementia; and ALS.

Possible Medical Causes

Numerous conditions and diseases can result in increased nutrient requirements (calories, protein, vitamins, minerals, water, and fiber) for residents. Among these are cancer and cancer therapies, Parkinson's disease with tremors, septicemia, pneumonia, gastrointestinal influenza, fever, vomiting, diarrhea and other forms of malabsorption including excessive nutrient loss from ostomy, burns, pressure ulcers, COPD/ emphysema/asthma, Alzheimer's disease with concomitant pacing or wandering, and hyperthyroidism.

Malignancy and Nutritional Consequences of Chemotherapy, Radiation Therapy/Surgery -
For the resident undergoing therapy aimed at remission or cure, aggressive nutritional support is necessary to achieve the goal; for the resident with incurable malignancy who is undergoing palliative therapy or is not responding to curative therapy, aggressive nutritional support is often medically inappropriate.

- Have the wishes of the resident and family concerning aggressive nutritional support been ascertained?

Anemia (nutritional deficiency, not malnutrition) - A hematocrit of less than 41% is predictive of increased morbidity and mortality for residents.

- Are shortness of breath, weakness, paleness of mucous membranes and nailbeds, and/or clubbing of nails present?

Chronic COPD - Increases calorie needs and can be complicated by an elevated fear of choking when eating or drinking.

Shortness of Breath (frequently seen with congestive heart failure, hypertension, edema, and COPD/emphysema/asthma) - This is another condition that can cause a fear of eating and drinking, with a consequent reduction in food intake.

Constipation/Intestinal Obstruction/Pain - Can inhibit appetite.

Drug-Induced Anorexia - Often causes decreased or altered ability to taste and smell foods.

Delirium

PROBLEMS TO BE REVIEWED FOR POSSIBLE RELATIONSHIP TO NUTRITIONAL STATUS PROBLEM (Causal link)

Mental Problems

Mental retardation, Alzheimer's or other dementia, depression, paranoid fears that food is poisoned, and mental retardation can all lead to anorexia, resulting in significant amounts of uneaten food and subsequent weight loss.

Behavior Patterns and Problems

Residents who are fearful, who pace or wander, withdraw from activities, cannot communicate, or refuse to communicate, often refuse to eat or will eat only a limited variety and amount of foods. Left untreated, behavior problems that result in refusal to eat can cause significant weight loss and subsequent malnutrition.

- Does resident use food to gain staff attention?
- Is resident unable to understand the importance of eating?

Inability to Communicate

For most residents, enjoying food and mealtimes crucially affects quality of life. Inability to make food and mealtime preferences known can result in a resident eating poorly, losing weight, and being unhappy. Malnutrition due to poor communication usually indicates substandard care. Early correction of communication problems, where possible, can prevent malnutrition.

- Does the area in which meals are served lend itself to socialization among residents? Is it a place where social communication can easily take place?
- Has there been a failure to provide adequate staff and/or adequate time in feeding or assisting residents to eat?
- Has there been a failure to recognize the need and supply adaptive feeding equipment for residents who can be helped to self-feed with such assistance?
- Is the resident capable of telling staff that he/she has a problem with the food being served—e.g., finds it to be unappetizing or unattractively presented?

Amputation

Weight loss may be due to an amputation.

12. NUTRITIONAL STATUS RAP KEY

^(b) **Note:** These items also trigger on the Pressure Ulcer RAP.

13. RESIDENT ASSESSMENT PROTOCOL: FEEDING TUBES

I. PROBLEM

The efficacy of tube feedings is difficult to assess. When the complications and problems are known to be high and the benefits difficult to determine, the efficacy of tube feedings as a long-term treatment for individuals requires careful evaluation.

Where residents have difficulty eating and staff have limited time to assist them, insertion of feeding tubes for the convenience of nursing staff is an unacceptable rationale for use. The only rationale for such feedings is demonstrated medical need to prevent malnutrition or dehydration. Even here, all possible alternatives should be explored prior to using such an approach for long-term feeding, and restoration to normal feeding should remain the goal throughout the treatment program.

Use of nasogastric and nasointestinal tubes can result in many complications including, but not limited to: agitation, self-extubation (removal of the tube by the patient), infections, aspiration, unintended misplacement of the tube in the trachea or lungs, inadvertent dislodgment, and pain.

This RAP focuses on reviewing the status of the resident using tubes. The Nutritional Status and Dehydration/Fluid Maintenance RAPs focus on resident needs that may warrant the use of tubes. To help clarify the latter issue, the following guidelines indicate the type of review process required to ensure that tubes are used in only the exceptional and acceptable situation. As a general rule, residents unable to swallow or eat food and unlikely to eat within a few days due to physical problems in chewing or swallowing (e.g., stroke or Parkinson's disease) or mental problems (e.g., Alzheimer's depression) should be assessed regarding the need for a nasogastric or nasointestinal tube or an alternative feeding method. In addition, if normal caloric intake is substantially impaired with endotracheal tubes or a tracheostomy, a nasogastric or nasointestinal tube may be necessary. Finally, tubes may be used to prevent meal-induced hypoxemia (insufficient oxygen to blood), which occurs with patients with COPD or other pulmonary problems that interfere with eating (e.g., use of oxygen, bronchodilators, tracheostomy, endotracheal tube with ventilator support).

1. Assess causes of poor nutritional status that may be identified and corrected as a first step in determining whether or not a nasogastric tube is necessary (see Nutritional Status RAP).
 - (a) Eating, swallowing and chewing disorders can negatively affect nutritional status (low weight in relation to height, weight loss, serum albumin level, and dietary problems) and the initial task is to determine the potential causes and period of time such problems are expected to persist. Recent lab work should also be reviewed to determine if there are electrolyte imbalances, fluid volume imbalances, BUN, creatinine, low serum albumin, and low serum protein levels before treatment decisions are made. Laboratory measurement of sodium and potassium tell whether or not an electrolyte imbalance exists. Residents taking diuretics may have potassium losses requiring potassium supplements. If these types of imbalances cannot be

corrected with oral nutrition and fluids or intravenous feedings, then a nasogastric or nasointestinal tube may be considered.

- (b) Determine whether fluid intake and hydration problems are short term or long term.
 - (c) Review for gastrointestinal distention, gastrointestinal hemorrhage, increased gastric acidity, potential for stress ulcers, and abdominal pain.
 - (d) Identify pulmonary problems (e.g., COPD and use of endotracheal tubes, tracheostomy, and other devices) that interfere with eating or dehydration.
 - (e) Review for mental status problems that interfere with eating such as depression, agitation, delirium, dementia, and mood disorders.
 - (f) Review for other problems such as cardiovascular disease or stroke.
2. Determine the need for such a tube. Examine alternatives.

Alternatives to nasogastric and nasointestinal tubes should always be considered. Intravenous feedings should be used for short-term therapy as a treatment of choice or at least a first option. Jejunostomy may have some advantages for long-term therapy, although may increase the risk for infection. A gastrostomy is better tolerated by agitated patients and those requiring prolonged therapy (more than 2 weeks). Gastrostomy with bolus feedings is preferable to nasogastric or nasointestinal tubes for long-term therapy for comfort reasons and to prevent the dislodgement and complications associated with nasal tubes. It is also less disfiguring as it can be completely hidden under clothing when not in use.

3. Assure informed consent and right to refuse treatment. Informed consent is essential before inserting a nasogastric or nasointestinal tube. Potential advantages, disadvantages, and potential complications need to be discussed. Resident preferences are normally given the greatest weight in decisions regarding tube feeding. State laws and judicial decisions must also be taken into account. If the resident is not competent to make the decision, a durable power of attorney or living will may determine who has the legal power to act on the resident's behalf. Where the resident is not competent or no power of attorney is in effect, the physician may have the responsibility for making a decision regarding the use of tube feeding. In any case, when illness is terminal and/or irreversible, technical means of providing fluids and nutrition can represent extraordinary rather than ordinary means of prolonging life.
4. Monitor for complications and correct/change procedures and feedings when necessary. Periodic changing of the nasogastric and intestinal tubes is necessary, although the appropriate interval for changing tubes is not clear. Assessment and determination of continued need should be completed before the tube is reinserted. Specific written orders by the physician are required.

- Determine if the assessment for the resident's needs (calories, protein, and fluid) is met by the physician's enteral order (formula and flush). Determine if the actual formula and flush delivered is the same as ordered. Determine if there is a safe and sanitary handling of the feeding tube.

Individuals at risk of pulmonary aspiration (such as those with altered pharyngeal reflexes or unconsciousness) should be given a nasointestinal tube rather than a nasogastric tube, or other medical alternative. Those at risk for displacement of a nasogastric tube, such as those with coughing, vomiting, or endotracheally intubated, should also be given a nasointestinal tube rather than a nasogastric tube or other medical alternative.

II. TRIGGER

Consider efficacy and need for feeding tubes if:

- Feeding Tube Present*
[K5b = checked]

* **Note:** This item also triggers on the Dehydration RAP.

III. GUIDELINES

COMPLICATIONS OF TUBE FEEDING

To reiterate, serious potential negative consequences include agitation, depression, mood disorders, self-extubation (removal of the tube by the patient), infections, aspirations, misplacement of tube in trachea or lung, pain, and tube dysfunction. Abnormal lab values can be expected and should be reviewed.

Infection in the Trachea or Lungs

Gastric organisms grow as a result of alkalizing (raising) the gastric pH. Gastric colonization results in transmission of gastric organisms to the trachea and the development of nosocomial pneumonia. In one study, colonization in 89% of patients within 4 days in ventilated patients with enteral nutrition was found with nosocomial respiratory infection in 62% of the patients studied. Symptoms of respiratory infections to be monitored include coughing, shortness of breath, fever, chest pain, respiratory arrest, delirium, confusion, and seizures.

Aspiration of Gastric Organisms into the Trachea and the Lungs

The incidence is difficult to determine, but most studies suggest it is relatively high.

Inadvertent Respiratory Placement of the Tube

This is the most common side effect of tube placement. In one study, 15% of small-bore nasogastric tubes and 27-50% of nasointestinal tubes were found to be out of their intended position upon radiographic examination without any other evidence of displacement.

Respiratory placement can occur in any patient, but is most likely in those who are neurologically depressed, heavily sedated, unable to gag, or endotracheally intubated. Detecting such placement is difficult; the following comments address this issue:

- Radiologic detection is the most definitive means to detect tube displacement. Under this procedure, pneumothorax and inadvertent placement in the respiratory tract can be avoided by first placing the feeding tube in the esophagus with the tip above the xiphoid process and then securing the tube and confirming placement with a chest x-ray. Then the tube may be advanced into the stomach and another x-ray taken to confirm the position. The stylet can then be removed and tube feeding begun. Unfortunately, nursing facilities are highly unlikely to have appropriate radiological technology and it is normally unreasonable to expect them to make arrangements to have patients transported to available radiology.
- pH testing of gastric aspirates to determine whether a tube is in the gastric, intestine, or the respiratory area is a promising method for testing feeding tube placement. However, parameters for various secretions from the three areas have not yet been clinically defined.
- Aspiration of visually recognizable gastrointestinal secretions, although a frequently used method of determining placement of tubes, is of questionable value as the visual characteristics of secretions can be similar to those from the respiratory tract.
- Auscultatory method: although “shooshing” or gurgling sounds can indicate placement in the stomach, the same sounds can occur when feeding tubes are inadvertently placed in the pharynx, esophagus and respiratory tract. Although small-bore tubes make the auscultatory method more difficult to use, large-bore nasogastric tubes may also be placed inadvertently in the respiratory tract producing false gurgling.

Inadvertent Dislodgement of the Tubes

Nonweighted tubes appear to be more likely to be displaced than weighted tubes (with an attached bolus of mercury or tungsten at the tip).

Other Complications Include:

Pain, epistaxis, pneumothorax, hydrothorax, nasal alar necrosis, nasopharyngitis, esophagitis, eustachitis, esophageal strictures, airway obstruction, pharyngeal and esophageal perforations. Symptoms of respiratory infections are to be reviewed.

Complications of Gastric Tract Infections and Gastric Problems

Symptoms include abdominal pain, abdominal distention, stress ulcers, and gastric hemorrhage. There is also a need to monitor for complications including diarrhea, nausea, abdominal distention, and asphyxia. Such complications signal the need for a change in the type of formula or diagnostic work for other pathology.

Complications for the Cardiovascular Systems

Symptoms of cardiac distress or arrest to be monitored include chest pain, loss of heartbeat, loss of consciousness, and loss of breathing.

Periodic Tests to Assure Positive Nitrogen Balance During Enteral Feeding

Where positive balance is not achieved, a formula with high nitrogen density is needed. The absorptive capacity is impaired in many elderly patients so that serum fat and protein should be monitored. Effective nutrients should result in positive nitrogen balance, maintenance or increases in body weight, triceps skinfold and midarm muscle circumference maintenance, total iron binding capacity maintenance, and serum urea nitrogen level maintenance. Caloric intake and resident weight should be monitored on a regular basis.

13. FEEDING TUBES STATUS RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Consider efficacy and need for feeding tubes if:</i></p> <ul style="list-style-type: none"> • Feeding Tube Present* [K5b = checked] 	<p><i>Factors that may impede removal of tube:</i></p> <ul style="list-style-type: none"> • Comatose [B1] • Failure to Eat [K4c] AND Resists Assistance in Eating [E4e] • Diagnoses: CVA [I1t], Gastric Ulcers [I3] • Gastric Bleeding [from record] • Chewing Problem [K1a] • Swallowing Problem [K1b] • Mouth Pain [K1c] • Length of Time Feeding Tube Has Been in Use [from record] <p><i>Potential complications of tube feeding:</i></p> <ul style="list-style-type: none"> • Diagnostic Conditions: Delirium [B5], Repetitive Physical Movements [E1n], Anxiety [I1dd], Depression [I1ee], Recurrent Lung Aspirations [J1k] • Self-Extubation (removal of tube by resident) [from record] • Limb Restraints in Use to Prevent Self-Extubation [P4d] • Infections in Lung/Trachea: Pneumonia [I2e], Fever [J1h], Shortness of Breath [J1i], Placement or Dislodgement of Tube in to Lung [from exam, record] • Side-Effects of Enteral Feeding Solutions: Constipation [H2b], Diarrhea [H2c], Fecal Impaction [H2d], Abdominal Distention or Pain [exam], Dehydrated [J1c] • Respiratory Problems: Pneumothorax, Hydrothorax, Airway Obstruction, Acute Respiratory Distress, Respiratory Distress [I3; from observation, record] • Cardiac Distress/Arrest: Chest Pain [J3c], Loss of Heart Beat, Loss of Consciousness, Loss of Breathing [from observation, record] • Abnormal Lab Values [P9]

* **Note:** This item also triggers on the Dehydration RAP.

14. RESIDENT ASSESSMENT PROTOCOL: DEHYDRATION/FLUID MAINTENANCE

I. PROBLEM

Water is necessary for the distribution of nutrients to cells, elimination of waste, regulation of body temperature, and countless other complex processes. On average, one can live only four days without water. Dehydration is a condition in which water or fluid loss (output) far exceeds fluid intake. The body becomes less able to maintain adequate blood pressure, deliver sufficient oxygen and nutrients to the cells, and rid itself of wastes. Many distressing symptoms can originate from these conditions, including:

- **Dizziness on Sitting/Standing** (blood pressure insufficient to supply oxygen and glucose to brain);
- **Confusion or Change in Mental Status** (decreased oxygen and glucose to brain);
- **Decreased Urine Output** (kidneys conserve water);
- **Decreased Skin Turgor**, dry mucous membranes (symptoms of dryness);
- **Constipation** (water insufficient to rid body of wastes); and
- **Fever** (water insufficient to maintain normal temperature).

Other possible consequences of dehydration include: decreased functional ability, predisposition to falls (because of orthostatic hypotension), fecal impaction, predisposition to infection, fluid and electrolyte disturbances, and ultimately death.

Nursing facility residents are particularly vulnerable to dehydration. It is often difficult or impossible to access fluids independently; the perception of thirst can be muted; the aged kidney can have a decreased ability to concentrate urine; and acute and chronic illness can alter fluid and electrolyte balance.

Unfortunately, many symptoms of this condition do not appear until significant fluid has been lost. Early signs and symptoms tend to be unreliable and nonspecific; staff will often disagree about the clinical indicators of dehydration for specific cases; and the identification of the most crucial symptoms of the condition are most difficult to identify among the aged. Early identification of dehydration is thus problematic, and the goal of this RAP is to identify any and all possible high-risk cases, permitting the introduction of programs to prevent the condition from occurring.

When dehydration is in fact observed, treatment objectives focus on restoring normal fluid volume, preferably orally. If the resident cannot drink a minimum recommended 1500 cc's of fluid every 24 hours, water and electrolyte deficits can be made up in a timely fashion via other routes to prevent dehydration. Fluids can be administered intravenously, subcutaneously, or by tube until resident is adequately hydrated and can take and retain sufficient fluids orally.

II. TRIGGERS

Dehydration suggested if one or more of following present:

- Dehydration
[J1c = checked]
- Insufficient Fluid/Did Not Consume All Liquids Provided
[J1d = checked]
- UTI
[I2j = checked]
- Dehydration Diagnosis
[I3 = 276.5, 276.50, 276.51, 276.52]
- Weight Fluctuation of 3+ Pounds
[J1a = checked]
- Fever
[J1h = checked]
- Internal Bleeding
[J1j = checked]
- Parenteral/IV^(a)
[K5a = checked]
- Feeding Tube^(b)
[K5b = checked]
- Taking Diuretic
[O4e = 1-7]

^(a) **Note:** This item also triggers on the Nutritional Status RAP.

^(b) **Note:** This item also triggers on the Feeding Tube RAP.

III. GUIDELINES

RESIDENTS FACTORS THAT MAY IMPEDE ABILITY TO MAINTAIN FLUID BALANCE

Moderate/Severely Impaired Decision-Making Ability

- Has there been a recent unexplainable change in mental status?
- Does resident seem unusually agitated or disoriented?
- Is resident delirious?
- Is resident comatose?
- Does dementia, aphasia or other condition seriously limit resident's understanding of others, or how well others can understand the resident?

Comprehension/Communication Problems

Body Control Problems

- Does resident require extensive assistance to transfer?
- Does resident freely move on the unit?
- Has there been recent ADL decline?

Hand Dexterity Problem

- Can resident grasp cup?

Bowel Problems

- Does the resident have constipation or a fecal impaction that may be interfering with fluid intake?

Swallowing Problems

- Does resident have mouth sore(s) ulcer(s)?
- Does resident refuse food, meals, meds?
- Can resident drink from a cup or suck through a straw?

Use of Parenteral/IV

- Are feeding tubes in use?

RESIDENT DEHYDRATION RISK FACTORS

Dehydration risk factors can be categorized in terms of whether they decrease **fluid intake** or **increase fluid loss**. The higher the number of factors present, the greater the risk of dehydration. Ongoing fluid loss through the lungs and skin occurs at a normal rate of approximately 500 cc/day and increases with rapid respiratory rate and sweating. Therefore, **decreased fluid intake** for any reason can lead to dehydration.

Purposeful Restriction of Fluid Intake

- Has there been a decrease in thirst perception?
- Is resident unaware of the need to intake sufficient fluids?
- Has resident or staff restricted intake to avoid urinary incontinence?
- Are fluids restricted because of diagnostic procedure or other health reason?
- Does sad mood, grief, or depression cause resident to refuse foods/liquids?

Presence of Infection, Fever, Vomiting/Diarrhea/Nausea, Excessive Sweating (e.g., a Heat Wave)**Frequent Use of Laxatives, Enemas, Diuretics**

Excessive Urine Output (Polyuria)

Excessive urine output (polyuria) may be due to:

- Drugs (e.g., lithium, phenytoin), alcohol abuse
- Disease (e.g., diabetes mellitus, diabetes insipidus)
- Other conditions (e.g., hypoaldosteronism, hyperparathyroidism)

Other Test Results

Relevant test results to be considered:

- Does systolic/diastolic blood pressure drop 20 points on sitting/standing?
- On inspection, do oral mucous membranes appear dry?
- Does urine appear more concentrated and/or decreased in volume?

14. DEHYDRATION/FLUID MAINTENANCE STATUS RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Dehydration suggested if one or more of the following present:</i></p> <ul style="list-style-type: none"> • Dehydrated [J1c = checked] • Insufficient Fluid/Did Not Consume All Liquids [J1d = checked] • UTI [I2j = checked] • Dehydration Diagnosis [I3 = 276.5] • Weight Fluctuation of 3+ Pounds [J1a = checked] • Fever [J1h = checked] • Internal Bleeding [J1j = checked] • Parenteral/IV^(a) [K5a = checked] • Feeding Tube^(b) [K5b = checked] • Taking Diuretic [O4e = 1-7] 	<p><i>Resident factors that may impede ability to maintain fluid balance:</i></p> <ul style="list-style-type: none"> • Indicators of Delirium [B5] • Moderate/Severely Impaired Decision-Making Ability [B4] • Comprehension/Communication Problem [C4, C6] • Body Control Problems [G3, G4] • Hand Dexterity Problem [G4c] • Constipation [H2b] • Fecal Impaction [H2d] • Swallowing Problem [K1b] • Recent (Within 7 Days) Deterioration in ADLs [observe, ask Direct Care Staff] <p><i>Resident dehydration risk factors:</i></p> <ul style="list-style-type: none"> • Purposeful Restriction of Fluids [J1d; from record] • Diarrhea [H2c], Presence of Infection [I2], Fever [J1h], Vomiting [J1o], Nausea [from record], Excessive Sweating [from record, exam] • Frequent Laxative/Enema/Diuretic Use [from record; H3h, O4e] • Excessive Urine Output [from record, exam] • Other tests: Standing/sitting blood pressure, Status of oral mucous membranes, Urine output volume [from record]

^(a) **Note:** This item also triggers on the Nutritional Status RAP.

^(b) **Note:** This item also triggers on the Feeding Tube RAP.

15. RESIDENT ASSESSMENT PROTOCOL: DENTAL CARE

I. PROBLEM

Having teeth/dentures that function properly is an important requisite for nutritional adequacy. Having teeth/dentures that are clean and attractive can promote a resident's positive self-image as well as personal appearance thereby enhancing social interactions among residents, residents and staff, and residents and visitors. Good oral health can decrease a resident's risk of oral discomfort and in some instances, systemic illness from oral infections/cancer. Residents at greatest risk due to impaired abilities are primarily those with multiple medical conditions and medications, functional limitations in self-care, and communication deficits. Also at risk are more self-sufficient residents who lack motivation or have no consistent history of performing oral health functions. Residents with a history of alcohol and/or tobacco use have a greater risk of developing chronic oral lesions.

II. TRIGGERS

Dental care or oral health problem suggested if:

- Mouth Debris (*Dental Care*)
[L1a = checked]
- Less than Daily Cleaning of Teeth/Dentures (*Dental Care*)
[L1f = not checked]
- Mouth Pain (*Oral Health*)
[K1c = checked]
- Some/All Natural Teeth Lost and Does Not Have or Does Not Use Dentures (*Oral Health*)
[L1c = checked]
- Broken, Loose or Carious Teeth (*Oral Health*)
[L1d = checked]
- Inflamed Gums, oral Abscesses, Swollen/Bleeding Gums, Ulcers, Rashes (*Oral Health*)
[L1e = checked]

III. GUIDELINES

CONFOUNDING PROBLEMS

Debris on teeth, gums, and oral tissues may consist of food and bacteria-laden plaque that may begin to decay teeth or cause foul denture odors if not removed at least once daily. The purpose of this section is to examine confounding problems (from the MDS) that may be prohibiting a resident from adequately removing oral debris.

Impaired Cognitive Skills

- Does the resident need reminders to clean his/her teeth/dentures?
- Does he remember the steps necessary to complete oral hygiene?
- Would he benefit from task segmentation or supervision?

Impaired Ability to Understand

- Can the resident follow verbal directions or demonstrations for mouth care?
- If the resident has language difficulties, does he/she know what to do when handed a toothbrush/toothpaste and placed at the bathroom sink?

Impaired Vision

- Is resident's vision adequate for performing mouth care or checking its adequacy?

Impaired Personal Hygiene

- Did the resident receive supervision or assistance with oral/dental care during the last 7 days?
- Has he/she been assessed to see if he/she could do it independently?
- Does the resident have partial/total loss of voluntary arm movement or impaired hand dexterity that interferes with self-care?
- What would the resident need to be more independent?

Resists ADL Assistance

- Does the resident resist mouth care? If so, why (e.g., would rather do own care, painful mouth, apathy related to depression, not motivated - never cared for teeth/mouth, approach of staff, fear)?

Motivation/Knowledge of Resident who is Independent in Oral/Dental Care but Still has Debris or Performs Care Less than Daily

- Is he/she brushing adequately?
- Does he/she know that it is most important to brush near the gumline?
- Does he/she need to be shown how or be given reinforcement for maintaining good hygiene?

Adaptive Equipment for Oral Hygiene

- Has the resident tried or would he/she benefit from using a built-up, long-handled, or electric toothbrush, or suction brush for cleaning teeth?

- If resident has dentures, does he/she have denture cleaning devices (e.g., denture brush, soaking bath)?

Dry Mouth from Dehydration or Medications

- Dry mouth can contribute to the formation of debris. Is the resident's lips, tongue, or mouth dry, sticky, or coated with film?
- Is the resident taking enough fluids? Is lip balm being applied to resident that has painful, cracking or bleeding lips?
- Is he/she taking any medications that can cause dry mouth (e.g., decongestants, antihistamines, diuretics, antihypertensives, antidepressants, antipsychotic, antineoplastics)?
- If these medications are necessary, has the resident tried saliva substitutes to stimulate moisture?

TREATMENT HISTORY AND OTHER RELEVANT FACTORS

Mouth Pain or Sensitivity

These factors can be related to either minor and easily treatable (e.g., gum irritation from ill-fitting dentures, localized periodontal problem) or more serious problems (e.g., oral abscess, cancer, advanced tooth decay or periodontal disease). The presence of pain may prevent the resident from eating adequately.

Residents with cognitive impairment and/or those who have difficulty making their needs known are difficult to assess. They may not complain specifically of mouth pain but may instead have decreased food intake or changes in behavior.

The Presence of Lesions, Ulcers, Inflammation, Bleeding, Swelling, or Rashes

These symptoms may be representative of a minor problem (e.g., irritation from wearing dentures for 24 hours/day), which resolves when the cause is alleviated (e.g., combination of mouth care and leaving dentures out.) However, these signs may also indicate more serious problems, even dental emergencies (e.g., infection). If the problem does not resolve with specific local treatment after a couple of days OR if these signs are accompanied by pain, fever, lymphadenopathy (swollen glands) and/or signs of local infection (e.g., redness), chewing or swallowing problems, or changes in mental status or behavior, a dental consult should be considered.

Review Mouth for Candidiasis (white areas that appear to be removable anywhere in mouth, mostly on tongue)

Perform this review on lethargic residents who have one or more of following diagnoses: stroke, Alzheimer's, Parkinson's, anxiety disorder, depression, diabetes, osteoporosis, or septicemia.

Broken, Loose, or Carious Teeth

These teeth may progress into more severe problems (e.g., dislodging a decayed tooth and swallowing or aspirating it). Although, not emergencies, a dental consult should be considered.

If a Resident has Lost Some or All of His/Her Natural Teeth and Does Not have Dentures (or partial plates)

Staff should consider if the resident has the cognitive ability and motivation to wear dentures.

- Has a dentist evaluated resident for dentures?
- Why doesn't resident use his/her dentures (or partial plates)?
- Are teeth in good repair?
- Do they fit well?
- Are they comfortable to wear when eating or talking?
- Does the resident like the way he/she looks when wearing them?
- Has a dentist evaluated resident for dentures?
- Has a dental hygienist interviewed and made recommendations regarding oral hygiene care?

Exam by Dentist Since Problem Noted

When evaluating a resident with mouth pain or the presence of any of the other trigger signs, check the record to see if a dentist has examined the resident since the problem was first noted.

- Was the current problem addressed?
- What were the recommendations?

Use of Anticoagulants

- Is the resident on coumadin or heparin that would put him/her at risk for bleeding if dental work were necessary?
- Is it noted on the medical record?

Valvular Heart Disease or Prosthesis (e.g., heart valve, false hip, etc.)

- Is either of these conditions present?
- If so are they clearly noted in the medical record so that necessary precautions be taken prior to dental work?

15. DENTAL CARE RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Dental care or oral health problem suggested if one or more of the following present:</i></p> <ul style="list-style-type: none"> • Mouth Debris (<i>Dental Care</i>) [L1a = checked] • Less Than Daily Cleaning of Teeth/Dentures (<i>Dental Care</i>) [L1f = not checked] • Mouth Pain (<i>Oral Health</i>) [K1c = checked] • Some/All Natural Teeth Lost and Does Not Have or Does Not Use Dentures (<i>Oral Health</i>) [L1c = checked] • Broken, Loose or Carious Teeth (<i>Oral Health</i>) [L1d = checked] • Inflamed Gums, Oral Abscesses, Swollen/Bleeding Gums, Ulcers, Rashes (<i>Oral Health</i>) [L1e = checked] 	<p><i>Confounding problems to be considered:</i></p> <ul style="list-style-type: none"> • Impaired Cognitive Skills [B1, B4] • Impaired Ability to Understand [C1, C6] • Impaired Vision [D1] • Resists ADL Assistance [E4e] • Impaired Personal Hygiene [G1j] • Motivation/Knowledge [from observation] • Adaptive Equipment for Oral Hygiene [from record] • Dry Mouth from Dehydration [J1c, d] or from Medications [from medication sheet] <p><i>Treatment history/relevant factors:</i></p> <ul style="list-style-type: none"> • Mouth Pain or Sensitivity [K1c] • Presence of Lesions, Ulcers, Inflammation, Bleeding, Swelling or Rashes [L1e] • Broken, Loose or Carious Teeth [L1d] • Natural Teeth Lost/No Dentures [L1c] • Exam by Dentist/Dental Hygienist since Problem Noted [from record] • Use of Anticoagulants [from record] • Valvular Heart Disease or Valvular Appliance [I3]

16. RESIDENT ASSESSMENT PROTOCOL: PRESSURE ULCERS

I. PROBLEM

Most nursing facility residents are typically considered to be at risk to develop pressure ulcers (pressure sores, decubitus ulcers, bedsores). Pressure ulcers can have serious consequences for the elderly and are costly and time consuming to treat. However, they are one of the most common, preventable and treatable conditions among the elderly who have restricted mobility. Successful outcomes can be expected with preventive and treatment programs.

Assessment goals are: (1) to ensure that a treatment plan is in place for residents with pressure ulcers; and (2) to identify residents at risk for developing a pressure ulcer who are not currently receiving some type of preventive care program.

II. TRIGGERS

Pressure ulcer present or there is a risk for occurrence if one or more of following present (risk):

- Pressure Ulcer(s) Present (*Present*)^(a)
[M2a = 1, 2, 3, 4]
- Bed Mobility Problem (*Risk*)
[G1aA = 2, 3, 4, 8]^(b)
- Bedfast (*Risk*)
[G6a = checked]
- Bowel Incontinence (*Risk*)
[H1a = 1, 2, 3, 4]
- Peripheral Vascular Disease (*Risk*)
[I1j = checked]
- Previous Pressure Ulcer (*Risk*)
[M3 = 1]
- Skin desensitized to pain or pressure (*Risk*)
[M4e = checked]
- Daily Trunk Restraint (*Risk*)^(c)

^(c) **Note:** This code also triggers on the Falls RAP and Physical Restraints RAP.

III. GUIDELINES

Review the MDS items listed on the RAP KEY for relevance in understanding the type of care that may be required.

Diagnoses, Conditions and Treatments that Present Complications

Consider carefully whether the resident exhibits conditions or is receiving treatments that may either place the resident at higher risk of developing pressure ulcers or complicate their treatment. Such conditions include:

Diabetes, Alzheimer's Disease and Other Dementias - Impairment in cognitive ability, particularly in severe end-stage dementia, can lead to immobility.

Edema - The presence of extravascular fluid can impair blood flow. If prolonged or excess pressure is applied to an area with edema, skin breakdown can occur.

Antidepressants and Antianxiety/Hypnotics - These medications can produce or contribute to lessened mobility, worsen incontinence, and lead to or increase confusion.

Interventions/Programs to Consider if the Resident Develops a New Pressure Ulcer, or an Ulcer Being Treated is Not Resolved

A variety of factors may explain this occurrence; however, they may suggest the need to evaluate current interventions and modifications of the care plan.

- Review the resident's medical condition, medications, and other risk factors to determine whether or not the care plan (for prevention or cure) addresses all potential causes or complications.
- Review the care plan to determine whether or not it is actually being followed (e.g., is the resident being turned often enough to prevent ulcer formation).

Things to Consider if the Resident is at Risk for Pressure Ulcers but is Not Receiving Preventive Skin Care

Even if pressure ulcers are not present, determine why this course of prevention is not being provided to a resident with risk factors.

- Is the resident new to the unit?
- Do few or many risk factors for the development of pressure ulcers apply to this resident?
- Are staff concentrating on other problems (e.g., resolution of behavior problems) so that the risks pressure of ulcers are masked?

16. PRESSURE ULCERS CARE RAP KEY

(For MDS Version 2.0)

TRIGGER – REVISION	GUIDELINES
<p><i>Pressure ulcer present or risk for occurrence if one or more of following present:</i></p> <ul style="list-style-type: none"> • Pressure Ulcer(s) Present (<i>Present</i>)^(a) [M2a = 1, 2, 3, 4] • Bed Mobility Problem (<i>Risk</i>) [G1aA = 2, 3, 4, 8]^(b) • Bedfast (<i>Risk</i>) [G6a = checked] • Bowel Incontinence (<i>Risk</i>) [H1a = 1, 2, 3, 4] • Peripheral Vascular Disease (<i>Risk</i>) [I1j = checked] • Previous Ulcer (<i>Risk</i>) [M3 = 1] • Skin Desensitized to Pain or Pressure (<i>Risk</i>) [M4e = checked] • Daily Trunk Restraint (<i>Risk</i>)^(c) [P4c = 2] 	<p><i>Other factors that address or may complicate treatment of pressure ulcers or risk of ulcers:</i></p> <ul style="list-style-type: none"> • Diagnoses or Conditions: Diabetes [I1a], Alzheimer’s Disease [I1q], Other Dementia [I1u], Hemiplegia/Hemiparesis [I1v], Multiple Sclerosis [I1w], Edema [J1g] • Interventions/Programs: <ul style="list-style-type: none"> - Pressure Relieving Chair/Beds [M5a, M5b] - Turning/Repositioning [M5c] - Nutrition or Hydration Program to Manage Skin Care Problems [M5d] - Ulcer Care [M5e] - Surgical Wound Care/Treatment [M5f] - Application of Dressings (With or Without Topical Medications) Other Than to Feet [M5g] - Application of Ointment/Medications (Other Than to Feet) [M5h] - Preventative or Protective Skin Care (Other Than to Feet) [M5i] - Preventative or Protective Foot Care [M6e] - Application of Dressings to Feet (With or Without Topical Medications) [M6f] - Use of Restraints [P4c,d,e] • Medications: <ul style="list-style-type: none"> - Antipsychotics [O4a] - Antianxiet [O4b] - Antidepressants [O4c] - Hypnotics [O4d]

17. RESIDENT ASSESSMENT PROTOCOL: PSYCHOTROPIC DRUG USE

I. PROBLEM

Psychotropic drugs (i.e., drugs that affect the mind, emotions, or behavior) are among the most frequently prescribed agents for elderly nursing facility residents. Studies in nursing facilities have shown that 35% to 65% of residents receive psychotropic medications. When used appropriately and judiciously, these medications can enhance the quality of life of residents who need them. For instance, greater than 70% of patients with major depression respond to single antidepressant treatment with complete remission of symptoms. However, all psychotropic drugs have the potential for producing undesirable side effects or aggravating problematic signs and symptoms of existing conditions. An important example is postural hypotension, that may be caused by some commonly prescribed psychotropic medications, and which can be serious or life threatening. Another example is acute confusion (delirium), which can be caused by a single drug, or by the interaction of two or more drugs, and can occur just as easily with prescription or non-prescription (i.e., “over-the counter”) medications. Independent risk factors for development of delirium include older age, concurrent medical illness, greater number of medications and the presence of dementia.

Maximizing the resident’s functional potential and well-being while minimizing the hazards associated with drug side effects are important goals of therapy. In reviewing a psychotropic drug regimen there are several rules of thumb:

- Evaluate the need for the drug (e.g., consider intensity and quality of distress, response to nonpharmacologic interventions, pros and cons of drug treatment vs. no drug treatment). Distinguish between treating specific diagnosed psychiatric disorders and treating symptoms. Specific psychiatric disorders (e.g., schizophrenia, major depression) have specific drug treatments with published guidelines for dosage and duration of treatment. However, a recorded diagnosis of a psychiatric disorder does not necessarily require drug treatment if symptoms are not present or are not posing a problem.
- Start low and go slow. If needed, psychotropic drugs should be started at the lowest dosage possible. To minimize side effects, doses should be increased slowly until there is a therapeutic effect, side effects emerge, or the maximum recommended dose is reached. Keep in mind that many elders may show a clinical response and possibly complete resolution of symptoms at drug doses and intervals lower than those recommended.
- Each drug has its own set of actions and side effects, some more serious than others; these should be evaluated in terms of each user's medical-status profile, including interaction with other medications.
- Consider symptoms or decline in functional status as a potential side effect of medication.
- Remember that any drug, prescription or non-prescription can cause problems in some patients.

II. TRIGGERS

TO BE TRIGGERED, RESIDENT MUST FIRST USE A PSYCHOTROPIC DRUG [Antipsychotic, antidepressant, or antianxiety] [O4a, b, or c = 1-7]. If used, go to RAP review if one or more of following present:

PSYCHOTROPIC TRIGGERS A

Potential for drug-related hypotension or gait disturbances if:

- Repetitive Physical Movement^(a)
[E1n = 1,2]
- Balance While Sitting
[G3b = 1,2,3]
- Hypotension
[I1i = checked]
- Dizziness/Vertigo^(b)
[J1f = checked]
- Syncope
[J1m = checked]
- Unsteady Gait
[J1n = checked]
- Fell in Past 30 Days^(b)
[J4a = checked]
- Fell in Past 31-180 Days^(b)
[J4b = checked]
- Hip fracture
[J4c = checked]
- Swallowing Problem
[K1b = checked]

Potential for drug-related cognitive/behavioral impairment if:^(c)

- Delirium/Disordered Thinking
 - Easily Distracted
[B5a = 2]
 - Periods of Altered Perception or Awareness of Surroundings
[B5b = 2]
 - Episodes of Disorganized Speech
[B5c = 2]
 - Periods of Restlessness
[B5d = 2]
 - Periods of Lethargy
[B5e = 2]
 - Mental Function Varies Over the Course of the Day
[B5f = 2]

- Deterioration in Cognitive Status^(c)
[B6 = 2]
- Deterioration in Communication
[C7 = 2]
- Deterioration in Mood^(c)
[E3 = 2]
- Deterioration in Behavioral Symptoms^(c)
[E5 = 2]
- Depression
[I1ee = checked]
- Hallucinations
[J1i = checked]

Potential for drug related discomfort if:

- Constipation
[H2b = checked]
- Fecal Impaction
[H2d = checked]
- Lung Aspiration
[J1k = checked]

^(a) **Note:** This item also triggers on the Mood RAP.

^(b) **Note:** These items also trigger on Falls RAP.

^(c) **Note:** All of these items also trigger on the Delirium RAP.

III. GUIDELINES

If any of the triggered conditions are present complete the following:

Step One:

Conduct the following reviews:

1. Drug Review [from record]

- Length of time between when the drug was first taken and onset of problem
- Dose of drug and how frequently taken
- Number of classes of psychotropics taken
- Reason drug prescribed

2. Review Resident's Conditions that Impair Drug Metabolism/Excretion

- Impaired liver/renal function
- Acute condition(s)

- Dehydration

3. Review Behavior/Mood/Psychiatric Status

- Current problem status
- Recent changes in mood and behavior
- Behavior management program
- Psychiatric conditions

Step Two:

Compare the drugs the resident is currently taking with common side effects listed below. Refer to Tables A, B, and C for clarification.

POTENTIAL PSYCHOTROPIC DRUG-RELATED SIDE EFFECTS

Clarifying Information if Hypotension Present

Postural (orthostatic) hypotension (decrease in blood pressure upon standing) is one of the major risk factors for falls related to psychotropic drugs. It is commonly seen with the low-potency antipsychotic drugs (chlorpromazine, thioridizene) and with tricyclic antidepressants. Both classes of drugs have anticholinergic properties. Within each class, drugs with the most potent anticholinergic properties also seem to produce the greatest hypotensive effects. Symptoms of dizziness/vertigo upon sitting or standing from a lying position, syncope (fainting), and falls/fractures, should be seriously considered as potential indicators of psychotropic-drug-induced hypotension. In addition, these symptoms may be due to a disturbance of heart rhythm, which could be aggravated by a tricyclic antidepressant. The occurrence of any of the aforementioned symptoms requires assessment of postural vital signs and heart rhythm.

- ***Measurement of Postural Vital Signs*** - Measure blood pressure and pulse when the resident is lying down. Remeasure blood pressure and pulse after the resident has been on his/her feet for one to five minutes (if unable to stand, measure after the resident has been sitting). Occasionally, further drops in blood pressure occur after the person has been up for some time. While a drop of more than 20 mm Hg systolic is always abnormal, it is particularly significant if accompanied by dizziness, loss of balance, or a standing blood pressure of less than 100 mm Hg. A large drop may be clinically significant even if the lower pressure is not abnormally low, particularly in residents who have some degree of cerebrovascular disease.

Clarifying Information if Movement Disorder Present

High Fever AND/OR Muscular Rigidity - Antipsychotic drugs can interfere with temperature regulation, which can lead to the potentially fatal problem of hyperthermia. Also, when high fever is accompanied by severe muscular rigidity, “neuroleptic malignant” syndrome must be suspected. Fever above 103 degrees in a resident on an antipsychotic drug is a medical emergency because of the disturbed temperature regulation. Even lesser degrees of fever, if

accompanied by severe muscular rigidity, are medical emergencies. Temperature must therefore be monitored especially closely in residents on psychotropic drugs with anticholinergic properties. In addition, nonantipsychotic drugs with anticholinergic properties, such as antidepressants, may aggravate fever by impairing sweating.

Parkinson's Disease - Is aggravated by all antipsychotic drugs. At times, it is difficult to know whether parkinsonian symptoms (e.g., tremors, especially of hands; pill-rolling of hands; muscle rigidity of limbs, necks, trunk) are due to Parkinson's disease or to present or recent antipsychotic drug therapy. There should be a strong bias in favor of reducing or eliminating antipsychotic drugs in residents with Parkinson's disease unless there are compelling behavioral or psychotic indications. Antiparkinson drugs should be considered when antipsychotic drugs are clinically necessary in residents with Parkinson's disease.

Five movement disorders are commonly encountered in residents on antipsychotic drugs. All of these disturbances can adversely affect a resident's quality of life as well as increase his/her risk of accidents. The triggered MDS items in Group 2 are signs/symptoms of these disorders. To clarify whether or not the resident is suffering from one of these disorders, all residents on antipsychotic drugs should be periodically screened for the following conditions:

Parkinsonism - As with Parkinson's disease, this condition may involve ANY combination of tremors, postural unsteadiness, and rigidity of muscles in the limbs, neck, or trunk. Although the most common is a pill-rolling or alternating tremor of the hands, other kinds of tremors are occasionally seen. At times, a resident with Parkinsonism will have no tremor, only rigidity and shuffling gait. Symptoms respond to antiparkinson drugs, but not always completely. Dosage reduction or substitution of nonantipsychotic drug, when feasible, is the preferred management.

Akinesia - This condition is characterized by marked decrease in spontaneous movement, often accompanied by nonparticipation in activity and self-care. It is managed by reducing the antipsychotic drug or adding an antiparkinson drug.

Dystonia - This disorder is marked by holding of the neck or trunk in a rigid, unnatural posture. Usually the head is either hyperextended or turned to the side. The condition is uncomfortable and prompt treatment with an antiparkinson drug can be helpful.

Akathisia - The inability to sit still. The resident with this disorder is driven to constant movement, including pacing, rocking, or fidgeting, which can, at times persist for weeks, even after the antipsychotic drug is stopped. The condition responds occasionally to antiparkinson drugs, but less consistently than parkinsonism or dystonia. Sometimes benzodiazepines or beta-blockers are helpful in treating the symptom, although dosage reduction is the most desirable treatment when possible.

Tardive Dyskinesia - Persistent, sometimes permanent movements induced by long-term antipsychotic drug therapy. Most typical are thrusting movements of the tongue, movements of the lips, or chewing or puckering movements. These involuntary movements can clearly interfere with chewing and swallowing. When they do, the dyskinesia can be suppressed by raising the dose of the antipsychotic drug, **but this will make the problem more permanent.**

When possible, it is usually preferable to reduce or eliminate the antipsychotic drug, because the symptoms of dyskinesia will often decrease over time after drug discontinuation.

Other variations of tardive dyskinesia include abnormal limb movements, such as peculiar and recurrent postures of the hands and arms, or rocking or writhing trunk movements. There is no consistently effective treatment. Withdrawal of the antipsychotic drug leads to eventual reversal of the symptoms over many months, in about 50% of cases.

Clarifying Information if Gait Disturbance Present (other than that induced by antipsychotics)

Long-acting benzodiazepine antianxiety drugs have been implicated in increasing the risk of falls and consequent injury by producing disturbances of balance, gait, and positioning ability. They also produce marked sedation often manifested by short-term memory loss, decline in cognitive abilities, slurred speech, drowsiness in the morning/daytime sedation, and little/no activity involvement. If an antianxiety drug is needed to treat an anxiety disorder, a short-acting benzodiazepine or buspirone would be preferable to a long-acting benzodiazepine. Buspirone is nonsedating and takes several weeks to work. Dosage should be increased slowly.

Clarifying Information if Cognitive/Behavior Impairment Present

Acute Confusion/Delirium - The MDS items that tap the syndrome of acute confusion or delirium, can all be caused or aggravated by psychotropic drugs of any of the major classes. If the resident does not have acute confusion related to a medical illness or severe depression consider the psychotropic drug as a cause. The most helpful information in establishing a relationship is the linkage between starting the drug and the occurrence of the change in cognitive status.

Depression - Both anti-anxiety and antipsychotic drugs may cause symptoms of depression as a side effect, or may aggravate depression in a resident with a depressive disorder who receives these drugs rather than specific antidepressive therapy.

Hallucinations/Delusions - While these are often symptoms of mental illness, all of the major classes of psychotropic drugs can actually produce or aggravate hallucinations. The antidepressant drugs, the more anticholinergic antipsychotic drugs, and the shorter-acting benzodiazepines such as triazolam and lorazepam are most implicated in causing visual hallucinations. Visual hallucinations in the aged are virtually always indicative of brain related disturbance (e.g., delirium) rather than a psychiatric disorder.

Major Differences in AM/PM Self-Performance - All classes of psychotropic drugs can have an effect on a resident's ability to perform activities of daily living. Establishing a link between the times a drug is taken and the change in self-performance is helpful in evaluating the problem.

Decline in Cognition/Communication - Decline in these areas signals the possibility that the decline is drug-induced and the need to review the relationship of the decline with initiation or change in drug therapy. All major classes of psychotropics can cause impairment of memory and other cognitive skills in vulnerable residents. While memory loss in nursing facility residents is caused primarily by dementing disorders and other neurologic disease, psychotropic drugs, particularly those with anticholinergic side effects, and long-acting benzodiazepines, definitely contribute to memory impairment. In contrast, treatment of depression or psychosis can actually improve usable memory, which is very much disrupted by severe psychiatric illness. If memory worsens after initiating or increasing the dose of a psychotropic drug, consider reducing or discontinuing the drug, or substituting a less anticholinergic drug. For a resident with anxiety, a short-acting benzodiazepine or buspirone is preferable to a long-acting benzodiazepine.

Decline in Mood (See reference to Depression above)

Decline in Behavior - Problem behaviors may be aggravated and worsened by psychotropic drugs as they can contribute to confusion, perceptual difficulties, and agitation.

Decline in ADL Status - Drug side effects must always be considered if a resident becomes more dependent in ADLs. In addition, psychotropic drugs can precipitate or worsen bladder incontinence either through a change in cognition or through a direct action on bladder function.

Clarifying Issues if Drug-Related Discomfort Present

Dehydration; Reduced Dietary Bulk; Lack of Exercise

Constipation/Fecal Impaction - Any psychotropic drug with anticholinergic effects can cause or aggravate constipation; the effects are pronounced with tricyclic antidepressants and with low-potency antipsychotic drugs such as chlorpromazine or thioridazine. Milder cases of constipation can be treated with stool softeners, bulk-forming agents, and increased fluid; more severe constipation is best managed by substituting a less anticholinergic agent, or decreasing or discontinuing the psychotropic drug if possible. Antianxiety drugs can contribute to constipation if they sedate the resident to the point that fluid intake or excretion is impaired. The problem can be handled by switching to a less sedating drug, decreasing dosage, or discontinuing the drug, if possible.

Urinary Retention - This condition may be manifested by the inability to urinate, or new onset or worsening of urinary incontinence (caused by overflow of urine from a full bladder that cannot empty properly). Any psychotropic drug with anticholinergic properties can produce or aggravate urinary retention. The problem is best managed by substituting a less anticholinergic agent, or decreasing or discontinuing the psychotropic drug if possible.

Dry Mouth - This symptom is a common side effect of any psychotropic drug with anticholinergic properties. Dry mouth can aggravate chewing and swallowing problems. Substituting a less anticholinergic drug may be helpful. Other remedies include artificial saliva or sugar-free mints or candies (sugar contributes to cavity formation).

WHEN TO DISCONTINUE DRUG TREATMENT

1. Drug treatment that is ineffective after a reasonable trial should be discontinued or changed. The definition of a reasonable trial depends on the drug class and therapeutic indication.
2. When a medication is effective, but produces troublesome side effects, either the dose should be reduced or the medication should be replaced, with a therapeutically equivalent agent less likely to cause the problematic side effect. If this is not feasible, or if doing it leads to a recurrence of symptoms, specific medical therapy for the troublesome side effects should be considered. For example, if the best drug for treating a resident's depression causes constipation, stool softeners, laxatives, or bulk-forming agents can be prescribed.
3. When a medication is effective and does not cause troublesome side effects, it should be continued for a defined period, and then efforts should be made to taper and eventually discontinue the drug.
4. Psychotropic medication should be prescribed on a permanent basis only if symptoms have recurred on at least two previous attempts to taper the medication after a defined period of therapy.

Note: The drug tables of commonly prescribed psychotropic medications by category and brand have been deleted. See Appendix E of the RAI Manual.

18. RESIDENT ASSESSMENT PROTOCOL: PHYSICAL RESTRAINTS

I. PROBLEM

Research and standards of practice show that the belief that restraints ensure safety is often unfounded. In practice, restraints have many negative side effects and risks that, in some cases, far outweigh any possible benefit that can be derived from their use. Physical restraints not only may not prevent falls, but can cause greater harm including strangulation, loss of muscle tone, decreased bone density (with greater susceptibility for fractures), pressure sores, decreased mobility, depression, agitation, loss of dignity, incontinence, constipation, and in some cases, resident death. Benefits of refraining from the use of physical restraints have been well documented in long-term care literature; they include improvement in residents' quality of life, greater independence and functional capacity, use of fewer antipsychotic medications, less skin break down, and fewer serious injuries due to falls.

The experience of many health care providers suggests that facility goals can often be met without the use of physical restraints. In part, this involves identifying and treating health, functional, or psychosocial problems. This may be accomplished through resident care management alternatives, such as modifying the environment to make it safer; maintaining an individual's customary routine; using less intrusive methods of administering medications and nourishment; and recognizing and responding to residents' needs for psychosocial support, responsive health care, meaningful activities and regular exercise.

II. TRIGGERS

Definition: Physical restraints are any manual method or physical or mechanical device, material, or equipment attached or adjacent to the resident's body that the individual cannot remove easily and which restricts freedom of movement or normal access to one's body.

- Use of Trunk Restraint^(a)
[P4c = 1,2]
- Use of Limb Restraint
[P4d = 1,2]
- Use of Chair that Prevents Rising
[P4e = 1,2]

^(a) **Note:** Code 2 also triggers on the Pressure Ulcer RAP. Both codes trigger on the Falls RAP.

III. GUIDELINES

In evaluating and reconsidering the use of restraints for a resident, consider needs, problems, conditions, or risk factors that, if addressed, could eliminate the need for using restraints. Refer to the RAP KEY for specific MDS items to consider as you review the following issues.

WHY ARE RESTRAINTS USED?

The first step in determining whether use of a restraint can be reduced or eliminated is to identify the reasons a restraint was applied.

- Review the resident's record and consult primary caregivers to determine the medical symptom that warrants the use of the restraint.

CMS Guidance: “**Medical Symptom**” is defined as an indication or characteristic of a physical or psychological condition. The resident's medical symptoms should not be viewed in isolation; rather the symptoms should be viewed in the context of the resident's condition, circumstances, and environment. Objective findings derived from clinical evaluation and the resident's subjective symptoms should be considered to determine the presence of the medical symptom. The resident's subjective symptoms may not be used as the sole basis for using a restraint. Before a resident is restrained, the facility must determine the presence of a specific medical symptom that would require the use of the restraint, and how the use of the restraint would treat the medical symptom, protect the resident's safety, and assist the resident in attaining or maintaining his or her highest practicable level of physical and psychosocial well-being. Medical symptoms that warrant the use of restraints must be documented in the resident's medical record, ongoing assessments, and care plans.

Ask the following questions:

- **Why** is the resident restrained?
- **What type(s)** of restraint is used?
- **During what time of day** is each type(s) used?
- **Where** is the resident restrained (e.g., own room in bed, chair in hallway)?
- **How long** is the resident restrained each day?
- **Under what circumstances** (e.g., when left alone, after family leave, when not involved in structured activity, when eating)?
- **Who** suggested that the resident be restrained (e.g., staff, family, resident)?

CONDITIONS ASSOCIATED WITH RESTRAINT USE

It may be possible to identify and resolve the physical or psychological condition that caused restraints to be used. By addressing the underlying condition(s) and cause(s), the facility may eliminate the medical symptom that warrants the use of the restraint(s).

In addition, a review of underlying needs, risks, or problems may help to identify other potential kinds of treatments. After determining why a restraint is used, review the appropriate areas described below.

Problem Behavioral Symptoms

To determine the presence of a behavioral symptom, review the MDS. If the behavioral symptom for which the resident is restrained was not exhibited in the last 7 days, was it because the restraint prohibited the behavior from occurring (e.g., resident was restrained and could not pull out the feeding tube). If a behavioral symptom was

present during the last 7 days or the resident was restrained to prevent a behavioral symptom, consider the resident to have a behavioral symptom and review Behavioral Symptom RAP as indicated.

Risk of Falls

Although restraints have *not* been shown to safeguard residents from injury, one of the most common reasons given by facilities for restraining residents is to prevent falls. In some instances, restraints have been reported to contribute to falls and injuries. Because of the complications associated with restraint use, many physicians and geriatric clinicians recommend exploring alternatives for preventing falls, such as treating health problems and making environmental modifications.

Review risk factors for falls on RAP KEY. Refer to Falls RAP if these risks are present or if the restraint is being used to prevent falls.

Conditions and Treatments

Another reason facilities give for using restraints is to prevent a resident from removing tubes.

If the resident is being restrained to manage resistance to any type of tube or mechanical device (e.g., indwelling/external catheter, feeding tube, intravenous line, oxygen mask/cannula, wound dressing), review the following to facilitate decision-making:

- Is the tube/mechanical device used to treat a life-threatening condition?
- Does the resident actually need a particular intervention that may be potentially burdensome to him/her? Are there less intrusive treatment options?
- Why is the resident reacting to the tube/mechanical device with resistance? (e.g., Does the device produce discomfort or irritation? Is the resident really resisting or is the device just something to fidget with? Is the treatment compatible with the resident's wishes? Does the resident understand the reason for the method of treatment? Has the resident/family been informed about the risks and benefits of treatment options?)
- If an indwelling or external catheter is present, review the Urinary Incontinence RAP for alternatives.
- If a feeding tube is present, review the Feeding Tube RAP.

CMS Guidance: If a resident needs emergency care, restraints may be used for brief periods to permit medical treatment to proceed, unless the facility has a notice indication that the resident has previously made a valid refusal of the treatment in question.

ADL Self-Performance

In rare instances, a restraint can enhance a resident's ability to be more self-sufficient, IF the restraint use is supportive and time-limited.

Review the MDS, to determine if the restraint contributes to the resident's self-performance of an activity (e.g., wheelchair belt supports trunk while resident wheels self, geriatric chair used only at meals enables wandering resident to attend to feeding self).

Confounding Problems to be Considered

Many problem behaviors are manifestations of unmet health, functional, and/or psychosocial needs that can often be reduced, eliminated, or managed by addressing the conditions that produced them. (See RAP on Behavioral Symptoms). Conditions associated with behavioral symptoms and restraint use include:

- Delirium (a state of temporary mental confusion with an acute onset)
- Impaired Cognition
- Impaired Communication (e.g., difficulty making needs/wishes understood or understanding others)
- Unmet Psychosocial Needs (e.g., social isolation, disruption of familiar routines, anger with family members)
- Sad or Anxious Mood
- Resistance to Treatment, Medication, Nourishment
- Psychotropic Drug Side Effects (e.g., motor agitation, confusion, gait disturbance)
- If a behavior management program is in place, does it adequately address the causes of the resident's particular problem behaviors?

OTHER FACTORS TO BE CONSIDERED

Resident's Response to Restraints

In evaluating restraint use, it is important to review the resident's reaction to restraints (e.g., positive and negative, such as passivity, anger, increased agitation, withdrawal, pleas for release, calls for help, constant attempts to untie/release self). This will help determine whether or not presumed benefits are outweighed by negative side effects.

Review MDS items for other potential negative effects of restraint use, such as declines in functional self-performance, body control, skin condition, mood or cognition that may have occurred since the physical restraint was initiated.

Alternatives to Restraints

Many interventions may be as effective or even more effective than physical restraints in managing a resident's needs, safety risks, and problems. To be effective the intervention must address the underlying problem.

- Review resident's record and confer with staff to determine whether or not alternatives to restraints have been tried.
- If alternatives to restraints have been tried, what were they?

- How long were the alternatives tried?
- What was the resident's response to the alternatives at the time?
- If the alternative(s) attempted were ineffective, what else was attempted?
- How recently were alternatives other than restraints attempted?

Philosophy and Attitudes

CMS Guidance: In order for a resident to be fully informed, the facility must explain, in the context of the individual resident's condition and circumstances, the potential risks and benefits of all options under consideration, including using a restraint, not using a restraint, and alternatives to restraint use. Whenever restraint use is considered, the facility must explain to the resident how the use of restraints would treat the resident's medical symptoms and assist the resident in attaining or maintaining his/her highest practicable level of physical or psychological well-being. In addition, the facility must explain the potential negative outcomes of restraint use. In the case of a resident who is incapable of making a decision, the legal surrogate or representative may exercise this right based on the same information that would have been provided to the resident. However, the legal surrogate or representative cannot give permission to use restraints for the sake of discipline or staff convenience or when a restraint is not necessary to treat the resident's medical symptom. That is, the facility may not use restraints in violation of the regulations solely based on a legal surrogate or representative's request or approval. While Federal regulations affirm the resident's right to participate in care planning and to refuse treatment, the regulations do not create the right for a resident, legal surrogate or representative to demand the facility use specific medical interventions or treatments that the facility deems inappropriate. Statutory requirements hold the facility ultimately accountable for the resident's care and safety, including clinical decisions.

18. PHYSICAL RESTRAINTS RAP KEY
