CMS-4068-P-1201-Attach-1.doc

Horizon Healthcare Services is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Horizon Healthcare services the home infusion needs of thousands of patients in south central Pennsylvania every year including many Medicare recipients. Founded in 1984, our highly trained healthcare professionals have the experience and skills necessary to create positive clinical outcomes for the patients we serve while at the same time conserving scarce healthcare dollars by treating patients at home and avoiding costly hospitalizations.

Horizon Healthcare Services appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

* Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS "S" codes, already used by commercial and Medicare managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payer sector. We recommend that CMS reference the National Home Infusion Association National Definition of Per Diem for a list of the products and services included in the home infusion per diem, available at http://www.nhianet.org/perdiemfinal.htm <http://www.nhianet.org/perdiemfinal.htm> .

* CMS should establish specific requirements for prescription drug plans to contract with sufficient numbers of infusion pharmacies to ensure adequate enrollee access to home infusion therapy under Part D.

* CMS should require specific standards for home infusion pharmacies under Part D. The national accreditation organizations' standards for infusion therapy reflect the community standard of care for the provision of home infusion therapy, which far exceed the OBRA 1990 standards established for retail pharmacies.

* CMS should adopt the X12N 837 P billing format for home infusion claims under Part D so as to be consistent with the format that private sector health plans use for infusion claims.

* CMS should mandate that prescription drug plans maintain open formularies for infusion drugs to ensure that this population of vulnerable patients has appropriate access to necessary medications.

Thank you in advance for your consideration of these important issues.

Sincerely,

Glenn S. Kamen

CMS-4068-P-1202-Attach-1.doc

Comments on 42 CFR (CMS-4068-P)

Subpart B-Eligibility. Election and Enrollment

This section invites comment on the auto-enrollment process for full benefit dual eligible individuals who do not select a MA-PD or PDP plan. We recommend that CMS consider auto-enrollment of full benefit dually eligible individuals who do not select an MA-PD or PDP plan into an MA Special Needs plan, if that plan currently provides prescription drug coverage under Medicaid to such individuals. This would help CMS maintain continuity of care and to minimize potential beneficiary disruption.

Subpart C-Benefits and Beneficiary Protections

Many dually eligible individuals have multiple chronic medical and behavioral health conditions. Adverse selection is a potential issue among MA Special Needs plans, as well as MA-PD or PDP plans that enroll large numbers of dual eligibles. MA Special Needs plans may have an incentive to structure their formularies to minimize enrollment of specific types of high needs dually eligible individuals. The proposed rule does not appear to establish any additional formulary requirements for MA Special Needs plans that provide prescription drug coverage. We recommend that CMS consider requiring MA Special Needs plans to provide more extensive coverage of certain types of prescription drugs than required for other MA-PD or PDP plans. In particular, CMS should consider mandating more extensive coverage of anti-retrovirals and mental health drugs. This may help to prevent some of the potential adverse selection that could occur through formulary design.

Subpart J-Coordination Under Part D with Other Prescription Drug Coverage and Coordination of Benefits

This section delineates the drug coverage under Part D with respect to coordination of benefits for drugs covered by other plans, including Medicaid. It states there are relatively limited applicability of coordination of benefits between Part D plans and State Medicaid programs because drugs that must be excluded from Medicare coverage are drugs that also may be excluded from Medicaid. Drugs such as benzodiazepines are frequently utilized in the Medicaid population; this coordination issue will result in a large number of medically necessary drugs that must be covered by State Medicaid plans. Additionally, coverage of Drugs under Part B must meet very strict approval criteria. According to Medicare guidelines, certain medical services, which are deemed reasonable and necessary for the diagnosis or treatment of illness or injury or to improve the functioning of a malformed body member, are, covered services. FDA approval is often one of the main criteria of Medicare's coverage guidelines for drugs and biologicals. However, in the case of chemotherapeutic agents, for example, FDA approval does not always keep pace with clinically indicated efficacy. Therefore, the need exists to address off-label drug uses, which have been validated by clinical trials.

Otherwise a large number of drugs potentially covered under Part B will fall on Part D plans. There is also the potential for "double-dipping" for drugs potentially covered under Part B and Part D. Ideally, Part B drug coverage should be eliminated altogether (with all drugs covered through Part D).

Fax: 864.235.4514

Med Four LLC is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Med Four is an independently owned home infusion company located in Taylors, SC just outside of Greenville, SC which has been servicing the home infusion needs of the Upstate South Carolina region since 1989.

Med Four appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

* Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. Issue Areas/Comments

Issues 1-10

APPLICATION PROCEDURES AND CONTRACTS WITH PDP SPONSORS

423.120 (b) P&T Committee Decisions should be binding

We strongly recommend that the final rule ensures that decisions made by a PDP?s P&T committee are considered binding. We feel that congress?s intentions in requiring P&T committees will be undermined if they are not empowered to make binding decisions and recommendations regarding proposed formularies. We also feel that decisions regarding cost-containment strategies, as they related to access to covered Part D Medications and formulary structures, should be subject to binding recommendations of the P&T committee. We fell that only with these provisions will beneficiaries be ensured access to the covered Part D medications as intended by congress.

423.120(b)(1) Regarding the independence of P&T committees

Although we support the intentions in the proposed rule to ensure the independence of P&T committees from PDP-sponsor influences, we feel that the provisions in the proposed rule are wholly inadequate. We strongly encourage the final rule to include the following provisions:

1. P&T committee members must not only be ?free and independent? of the PDP sponsor, but also of pharmaceutical manufacturers. This should be explicitly stated in the final rule.
2. Committee appointments should be public record, and CMS must be required to create a process whereby the ?independence? of a committee member can be challenged and reviewed.
3. All PDP sponsors should be explicitly required in the final rule to operate a P&T committee, regardless of whether they initially plan to have a formulary.
4. All P&T committee meetings should be public to encourage accountability. In addition, the minutes and decisions of P&T committees should be available upon request to beneficiaries and their advocates.
5. Because the proposed rules only required a numerical value for independent members but not for the size of the committee, a statistical majority of free and independent members needs to be required.
6. Regardless of the final requirements regarding independent membership, the final rules should stipulate that the free and independent members must be present at any given meeting in order to make a binding decision.
7. The final rule must not only encourage but require P&T committees to seek input from plan enrollees, or in initial decisions before January of 2006, from Part-D eligible beneficiaries within that plan?s service area, and specifically from within the most vulnerable populations: disabled individuals, those with rare or pharmacologically complex conditions, and beneficiaries over the age of 75.

This is not an exhaustive list of ways to strength the power and independence of P&T committees. We strongly urge CMS to consider additional and alternative provisions

BENEFITS AND BENEFICIARY PROTECTIONS

423.104 Definition of "person"

We recommend that the definition of "person" explicitly include family members, charities, and caretakers. Also, we encourage individuals who receive prescription medications through pharmaceutical manufacturer patient assistance programs be allowed to count these medications as ?incurred costs? consistent with the average cost of these medications through an individual?s PDP. Pharmaceutical manufacturer patient assistance programs provided medications only to individuals whom they certify, in conjunction with the treating physician, as not able to afford medications without assistance. Due to the nature of the vulnerable populations receiving this type of assistance, we feel that it is unfair to restrict their access to catastrophic coverage.

423.104 (e)(2)(ii) Limiting cost-sharing tiers

The proposed rules do not include a limit on tiered cost-sharing. We strongly encourage such a limit to be placed on the use of cost-sharing tiers. Also, applying different cost-sharing tiers to different classes of drugs would inherently discriminate against certain populations and we urge CMS to explicitly prohibit this as a valid cost-containment mechanism. We believe that unlimited cost-sharing tiers undermine Congress? stipulation for representation of every drug class within a formulary, and strongly oppose unlimited tiers. We suggest three cost-sharing tiers as an appropriate and acceptable limit to cost-sharing tiers.

On-formulary Drugs

We encourage the final rule to include all beneficiary expenses towards covered Part D drugs to count towards ?incurred costs?, even if the drug was denied coverage by the Part D Plan. On-formulary drugs prescribed by a physician should be explicitly state as counting towards incurred costs in the final regulations.

423.120 (a) Access Standards

We strongly support the provision to require PDP sponsors to meet access standards in each local area as opposed to meeting access standards across a region.

We also strongly support the explicit inclusion of the provision to count only retail pharmacies towards meeting access standards, and the proposed definition of ?retail pharmacy? as stated in the preamble.

COST AND UTILIZATION MANAGEMENT, QUALITY IMPROVEMENT, AND MEDICATION THERAPY MANAGEMENT

Section 423.153 Cost Management

We strongly recommend that cost containment strategies of individual PDP sponsors are subject other P&T committee. Because their P&T committees exist as an independent entity to protect Medicare beneficiaries, they should be empowered to protect beneficiaries in all aspects. It is unacceptable to allow PDP sponsors? concerns for their profit margins to superseded beneficiaries? well-being. It is also unrealistic to expect sponsors and other businesses associated with the sponsors to willingly emphasis beneficiaries? needs over profits. This must be subject to outside, independent regulation this is more extensive and ongoing than the initial approval by CMS.

Error Rates

The preamble notes that ?In the future, we may require quality reporting that includes error rates?? This should be required immediately, and made public as soon as possible in order to encourage accountability.

Section 423.156 Consumer Satisfaction Surveys

The proposed rules do not enumerate an effective date for consumer surveys. We strongly urge consumer satisfaction surveys to being in conjunction with the beginning of the Part D benefit in 2006.

GENERAL PROVISIONS

Second public commenting period

The first draft of the proposed rules poses many questions, and leaves the rules regarding many areas unwritten. These areas deserve the scrutiny of public comment as much as the regulation proposed in this draft. We urge the consideration of a second commenting period after the unwritten sections of regulations are completed.

423.120 (b) P&T Committee Decisions should be binding

We strongly recommend that the final rule ensures that decisions made by a PDP?s P&T committee are considered binding. We feel that congress?s intentions in requiring P&T committees will be undermined if they are not empowered to make binding decisions and recommendations regarding proposed formularies. We also feel that decisions regarding cost-containment strategies, as they related to access to covered Part D Medications and formulary structures, should be subject to binding recommendations of the P&T committee. We fell that only with these provisions will beneficiaries be ensured access to the covered Part D medications as intended by congress.

423.120(b)(1) Regarding the independence of P&T committees

Although we support the intentions in the proposed rule to ensure the independence of P&T committees from PDP-sponsor influences, we feel that the provisions in the proposed rule are wholly inadequate. We strongly encourage the final rule to include the following provisions:

1. P&T committee members must not only be ?free and independent? of the PDP sponsor, but also of pharmaceutical manufacturers. This should be explicitly stated in the final rule.
2. Committee appointments should be public record, and CMS must be required to create a process whereby the ?independence? of a committee member can be challenged and reviewed.
3. All PDP sponsors should be explicitly required in the final rule to operate a P&T committee, regardless of whether they initially plan to have a formulary.
4. All P&T committee meetings should be public to encourage accountability. In addition, the minutes and decisions of P&T committees should be available upon request to beneficiaries and their advocates.
5. Because the proposed rules only required a numerical value for independent members but not for the size of the committee, a statistical majority of free and independent members needs to be required.
6. Regardless of the final requirements regarding independent membership, the final rules should stipulate that the free and independent members must be present at any given meeting in order to make a binding decision.
7. The final rule must not only encourage but require P&T committees to seek input from plan enrollees, or in initial decisions before January of 2006, from Part-D eligible beneficiaries within that plan?s service area, and specifically from within the most vulnerable populations: disabled individuals, those with rare or pharmacologically complex conditions, and beneficiaries over the age of 75.

This is not an exhaustive list of ways to strength the power and independence of P&T committees. We strongly urge CMS to consider additional and alternative provisions.

Issues 11-20

GRIEVANCES, ORGANIZATION DETERMINATIONS AND APPEALS

423.882 Employment-based Retiree Coverage and Subsidies

We are very concerned about the possibility of employer windfalls resulting from the retirement benefit subsidy. Although we believe the cost to the beneficiaries should be taken into account when determining ?creditable coverage?, the subsidy should be based solely on the contributions of the employer. We understand that the accounting and determining of employer subsidies will be a complicated procedure, and we support measures to increase accountability and decrease fraud, including making this accounting public record. We support and encourage involving employee groups and advocates in the monitoring of this accounting, and feel that it could lead to reduced fraud and errors.

423.884 (a) Assuring validity of employer?s actuarial attestation

Information regarding an employer?s actuarial attestation should be made public record so as to allow employee groups and advocates to best work for the protection of their retirees. We also feel that CMS proposed used of random audits to ensure that employment-based retiree coverage meets actuarial equivalence tests in insufficient. We recommend that additional quality control measures be proposed and evaluated as possibilities.

The regulations should explicitly state that employees will not be held responsible for late enrollment penalties in the event that a retiree plan is found to have been in violation of creditable coverage due to error or misrepresentation. Additionally, employees should not be held responsible for late enrollment fees in the event of a failure on behalf of an employer plan to notify retirees of changes in the certification of creditable coverage.

423.890 Appeals

We recommend that third-parties (including employee groups) should be granted the right to appeal a CMS determination regarding actuarial equivalence of an employer?s retiree coverage. We further recommend that CMS be required to provide information regarding their decision on the actuarial equivalence test and how to appeal the decision to all affected beneficiaries and their advocates upon request.

423.120(b)(1) Regarding the independence of P&T committees

Although we support the intentions in the proposed rule to ensure the independence of P&T committees from PDP-sponsor influences, we feel that the provisions in the proposed rule are wholly inadequate. We strongly encourage the final rule to include the following provisions:

1. P&T committee members must not only be "free and independent" of the PDP sponsor, but also of pharmaceutical manufacturers. This should be explicitly stated in the final rule.
2. Committee appointments should be public record, and CMS must be required to create a process whereby the "independence" of a committee member can be challenged and reviewed.
3. All PDP sponsors should be explicitly required in the final rule to operate a P&T committee, regardless of whether they initially plan to have a formulary.
4. All P&T committee meetings should be public to encourage accountability. In addition, the minutes and decisions of P&T committees should be available upon request to beneficiaries and their advocates.
5. Because the proposed rules only required a numerical value for independent members but not for the size of the committee, a statistical majority of free and independent members needs to be required.
6. Regardless of the final requirements regarding independent membership, the final rules should stipulate that the free and independent members must be present at any given meeting in order to make a binding decision.
7. The final rule must not only encourage but require P&T committees to seek input from plan enrollees, or in initial decisions before January of 2006, from Part-D eligible beneficiaries within that plan's service area, and specifically from within the most vulnerable populations: disabled individuals, those with rare or pharmacologically complex conditions, and beneficiaries over the age of 75.

This is not an exhaustive list of ways to strength the power and independence of P&T committees. We strongly urge CMS to consider additional and alternative provisions.

Re: Medicare Program; Medicare Prescription Drug Benefit, Section 423.153 (d) [CMS-4068-P]. 69 Fed. Reg. 46632 (August 3, 2004).

Dear Dr. McClellan:

The Healthcare Distribution Management Association submits the following comments in response to the Centers for Medicare and Medicaid Services (CMS) proposed rule, *Medicare Program; Medicare Prescription Drug Benefit*. 69 Fed. Reg. 46632 (August 3, 2004). I am writing to commend CMS for its efforts to implement the Medication Therapy Management Programs (MTMPs) included in the new Medicare Part D benefit, to be codified in section 423.153 of the proposed rule. HDMA believes that MTMPs will be an important addition to the benefits that seniors can receive under the Medicare program and we encourage you to work with the pharmacy community to craft a benefit program that adequately meets the needs of chronically ill beneficiaries.

HDMA is the national trade association representing full-service distribution companies responsible for ensuring that billions of units of medication are safely distributed to retail pharmacies, hospitals, nursing homes, clinics, and other provider sites across the United States. HDMA's distributor members provide services to approximately 141,591 pharmacy settings, including: 17,913 independent pharmacies; 19,824 chain pharmacies; 9,918 food stores; 9,992 hospital pharmacies; 4,872 mass merchandisers; 5,397 long-term care and home health facilities; 62,364 clinics; 1,170 healthcare plans; and 366 mail order pharmacies.[1] It is within these settings that patients interact with their pharmacists and receive important direction regarding their medications.

[1] Table 228 – Class of Trade Analysis – Manufacturer Sales by Customer Categories: 2002-2003.HDMA Industry Profile and Healthcare Factbook, Healthcare Distribution Management Association. (2004).

HDMA has long-believed that appropriate use of prescription drugs not only enhances the patient's quality of life but can also decrease the need for hospitalization or surgery. We believe that disease management and medication therapy management programs will contribute to obtaining favorable patient outcomes. Additionally, when chronically ill patients have access to specialized guidance regarding their medications and their drug therapies are more carefully monitored, it is possible that they can achieve greater results from their course of treatment and perhaps suffer fewer adverse events related to their illness or drug interaction.

It is also important for CMS to recognize the demonstrated value of individualized patient care services and to ensure appropriate and fair reimbursement for the professionals who provide such services. MTMPs involve the collaboration of the pharmacist with physicians, nurses and other healthcare professionals to ensure that medications are used appropriately to improve patient health status, improve the patient's quality of life and contain healthcare costs. CMS should devise appropriate payment mechanisms that acknowledge the important role of the pharmacist and the resources involved in providing individualized guidance for beneficiaries in order to ensure that they receive the most favorable results possible from their prescribed course of treatment.

HDMA distributor members do not serve patients directly, but as part of our role in facilitating patient access to necessary medications, we believe that it is important to support development of MTMPs that contribute to favorable outcomes and that are flexible enough to provide individualized patient care. In addition, MTMPs can lead to an overall reduction in healthcare costs. Therefore, it is critical that CMS develop this benefit in cooperation with the pharmacist and pharmacy communities. In determining the parameters of MTMPs, CMS should consider patient-specific treatment requirements; patient education relative to prescribed medications; the pharmacist's ability to monitor patient progress, and identify and resolve problems that are medication related; in-person consultations between the pharmacist and patient; and reimbursement rates that accurately reflect the resources and expertise that are required to provide effective medication therapy management. HDMA supports development of a MTMP benefit that ensures that the beneficiaries who have the greatest need for such programs are identified and ensured access to these important services.

HDMA appreciates this opportunity to provide CMS with its comments regarding the new Medicare Part D benefit and CMS policy regarding Medication Therapy Management. If we can be of assistance as you continue implementation of Part D regulations, please contact me or Elizabeth Gallenagh, Manager, Regulatory Affairs at 703-787-0000 ext. 234.

Sincerely,

Scott Melville

Scott Melville
Sr. Vice President of Government Relations

Re: Comments on CMS-4068-P
The Proposed Rule for the Medicare Prescription Drug Benefit

Dear Dr. McClellan:

On behalf of Apria Healthcare Inc., I am pleased to submit these comments regarding the proposed rule to implement the new Medicare Part D prescription drug benefit. Specifically, these comments pertain to the recent notice published in the *Federal Register* on August 3, 2004.[1]

Apria is a leading provider of integrated home care services and products. Apria offers a full range of home infusion drug therapy, as well as home medical equipment and home respiratory therapy. Through 30 wholly-owned, licensed and JCAHO-accredited infusion pharmacies, Apria serves adult and pediatric patients with a wide range of infectious diseases, nutritional disorders, cancer and chronic illnesses such as Lou Gehrig's Disease and multiple sclerosis. Aside from the thousands of people covered by private managed care organizations who benefit from Apria's home infusion services, the company also cares for a significant number of elderly patients throughout the United States who have complex medical problems and multiple co-morbidities who require home infusion therapy and are covered by Medicare Advantage (MA. formerly Medicare+Choice) plans.

These comments are divided into the following sections:

I. General
II. Dispensing Fees for Home Infusion Drug Therapy
III. Contracting with Home Infusion Drug Pharmacies
IV. Formulary Development

[1] Medicare Program; Medicare Prescription Drug Benefit; 69 *Fed. Reg.* 46632 (Aug. 3, 2004).

I. General

We wish to commend CMS for engaging in the research necessary to understand many of the unique characteristics of home infusion drug therapy. These findings are reflected in the preamble of the proposed rule, which summarizes the various services and functions that are required to provide home infusion drug therapy safely and effectively in the home care setting.

We applaud CMS for recognizing in the proposed rule the clinical and cost benefits of home infusion drug therapy, as well as the essential role this area of therapy plays in the private sector health system and under Medicare managed care programs. The proposed regulation describes an interpretation of the Part D benefit that would include the essential services, supplies and equipment that are integral to the provision of infusion drug therapy provided in the home (see discussion of "Dispensing Fee Option 3" below).

If Dispensing Fee Option 3 is adopted in the final regulation, as we recommend, then the Medicare fee-for-service program can offer coverage of home infusion drug therapy comparable to what private sector health plans and Medicare Advantage plans have offered for years. In doing so, Medicare would realize the significant system-wide savings that come from the provision of infusion drug therapy in the most cost-effective setting.

A. Home infusion drug therapy provides an opportunity for Medicare Part D to replicate the success achieved by private sector health plans and Medicare Advantage plans.

Currently, many of the infusion drug therapies used commonly in the private sector, such as antibiotic therapy used in the treatment of severe infections, are not covered under the Medicare Part B durable medical equipment (DME) benefit. Coverage under the DME benefit is based on the use of an item of DME – in this case, an infusion pump − and extends only to a few designated drugs, most of which are used in the treatment of cancer and intractable pain. As a result, Medicare beneficiaries who could have received infusion drug therapy at home have been forced into far more costly settings, such as acute care hospitals, hospital outpatient departments, hospital emergency rooms and long term care facilities.

In contrast to the limited coverage that exists under Medicare Part B, Medicare coverage of home infusion therapy has worked well under Part C with the Medicare Advantage plans. Many if not most Medicare Advantage plans provide coverage for a broad range of home infusion therapies and related services as a <u>medical</u> benefit. Examples include Aetna US Healthcare, Humana Health Plans, PacifiCare's Secure Horizons plans and Presbyterian Salud in New Mexico. Clearly, these plans would not provide this optional coverage unless they were convinced that coverage of home infusion therapy in the home setting is cost-effective.

For Medicare Advantage plans, home infusion has provided significant system-wide savings by enabling beneficiaries to receive infusion therapy without incurring hospital or nursing facility costs. Medicare Advantage plans cover the homecare pharmacy, nursing and other in-home services, supplies, equipment and same-day, in-home delivery/patient teaching necessary for the provision of home infusion therapy. The effectiveness of home infusion therapy under Part C, and the manner in which Medicare Advantage plans define and cover this therapy, can be a model for infusion coverage under Part D.

B. Specific requirements must be established by CMS to ensure that Medicare Part D makes use of home infusion drug therapy in the same fashion as private sector and Medicare Advantage plans.

Stand-alone Part D prescription drug plans (PDPs), in the absence of specific requirements or direction from CMS, will not embrace drug therapies such as home infusion drug therapy because the PDPs will be rewarded for contributing to system-wide savings on the drugs alone. As a result, the financial incentives that have driven private payer acceptance and use of home infusion drug therapy will not exist for stand-alone PDPs.

As a result, specific requirements and direction from CMS are necessary for the coverage of home infusion drugs to work properly. We urge CMS to ensure that the Final Rule contains provisions relating to home infusion drug therapy on the issues discussed in the remainder of these comments, including such issues as dispensing fees, pharmacy access, formulary provisions and the formatting of claims.

II. Dispensing Fees for Home Infusion Drug Therapy

A. CMS should adopt Dispensing Fee Option 3, which is the only proposed option that would adequately recognize the services and items that are necessary to provide home infusion drug therapy.

Congress' definition of prescription drugs under the statute clearly includes infusion drugs provided in the home, and the proposed rule likewise reinforces the fact that infusion drugs (other than the few drugs currently covered under Part B) are included in the Part D benefit.

However, for the coverage of home infusion drugs to be meaningful for Medicare beneficiaries, CMS also must cover the services, supplies and equipment related to the provision of these drugs. Limiting coverage to the drugs only without the services, supplies and equipment will not produce meaningful coverage of infusion drugs in outpatient settings. This is because infusion pharmacies will be unable to provide infusion drugs without adequate payment for the services, supplies and equipment.

The most appropriate mechanism for such coverage of infusion services, supplies and equipment provided under the proposed rule is the dispensing fee. In the preamble, CMS sets out three options for defining dispensing fees under the new benefit and invites comment on each.

- Option 3 comes closest to accurately recognizing the fundamental elements – including the services, supplies and equipment – that are essential for the provision of home infusion drug therapy. Option 3 is the only option that reflects the fundamental elements of home infusion drug therapy (see additional discussion in subsequent sections of these comments).

- In contrast, Option 1 only provides the perspective of retail pharmacies and does not meet the needs of Medicare beneficiaries requiring home infusion drug therapy.

- Although Option 2 captures the supplies and equipment used in the provision of home infusion drug therapy, this option falls far short of recognizing the essential professional services required to provide home infusion drug therapy because it does not recognize the professional services that are required to provide safe and effective infusion therapy in the home.

B. CMS should adopt Dispensing Fee Option 3 because it is consistent with the well-established standards of practice for home infusion drug therapy.

The major independent accreditation organizations, including the Joint Commission on Accreditation of Healthcare Organizations (JCAHO), have established extensive, detailed standards regarding the patient management, support services, facilities, patient safety, policies, procedures and functions that must be provided by home infusion pharmacies. These standards, which address issues ranging from the requirements for sterile preparation of infusion drugs to the oversight of patient therapy, are significantly different from the standards governing traditional retail pharmacies.

Option 3 is the only dispensing fee option that adequately reflects the content of these national accreditation standards. For example, one major difference between retail pharmacies and home infusion pharmacies is the urgency surrounding the initial referral from a physician or hospital and the resulting home delivery/patient education requirements. Due to the severity of the patient's illness (such as a serious infection which has not responded to oral medications), pressures on hospitals to discharge patients as soon as possible, and stability/refrigeration requirements for many medications, home infusion pharmacy staff frequently have to deliver directly to patients' homes the same day as the referral. This is considerably more expensive than a retail pharmacy model where the patient or caregiver visits the pharmacy in person to pick up the drug. All of this must take place in conjunction with insurance verification, coordination with the nurse who will teach the patient, compounding by a home infusion pharmacist, and eventually, billing third party payors and collecting patient co-pays – all activities that are not applicable to the retail setting.

The well-established understanding of the professional services involved in providing in home infusion drug therapy is not merely an industry definition. Payers, clinicians, clinical societies, providers and accrediting organizations share a common understanding of what is involved in providing these therapies in outpatient settings.

C. CMS should adopt accreditation requirements under Dispensing Fee Option 3 as a straightforward means to protect Part D enrollees.

As the first homecare provider to seek and obtain JCAHO accreditation in the 1980s, Apria has a longstanding commitment to ensuring that the professional services and functions we provide meet a demanding set of quality standards. Apria recently completed its latest triennial survey cycle, with a successful outcome in all infusion pharmacies, respiratory and medical equipment locations. Our company has served as a pilot for innovative survey techniques developed by the JCAHO, and our management has formally served on advisory committees of the organization. Today, our quality standards meet or exceed JCAHO's requirements, which is a requirement of the over 2500 private sector managed care plans with which we contract to provide home infusion services.

In the final rule, CMS should address the qualifications of the infusion pharmacies that may provide the elements of care described under Dispensing Fee Option 3. We recommend that CMS require every pharmacy providing infusion services to be accredited as a home care pharmacy by a recognized national accrediting organization. We also recommend that every entity that provides nursing services to Part D infusion patients be either accredited as a nursing agency as an extension of their existing home infusion accreditation, or be a Medicare-certified home health agency.

Private sector plans require accreditation as a basic assurance that the pharmacists and nurses are experienced and the pharmacies are staffed properly to provide the necessary care. The quality standards required of home infusion pharmacies and nursing agencies by the accreditation organizations have become the community standard for the provision of home infusion therapy.

D. CMS should use a refined version of Dispensing Fee Option 3 to define the full scope of necessary professional infusion pharmacy services.

All infusion patients, whether or not they qualify for the home health benefit, require professional pharmacy services that again differ from those found in the retail setting. The general categories of such services are:

- Compounding medications in a sterile environment
- Dispensing
- Ongoing Clinical Monitoring
- Care Coordination with other agencies involved in patient care

- Provision of Supplies and Equipment
- Multiple Categories of Pharmacy Professional Services, such as pharmacokinetic drug monitoring or parenteral nutrition formula development
- Administrative Services
- In-home delivery, patient and caregiver education
- Third party billing
- Other Support Costs

These services are described in greater detail in a number of accreditation materials and other forums, including a document on the website of the National Home Infusion Association describing the "per diem" model.[2]

We propose a modification to Dispensing Fee Option 3 to more explicitly describe the pharmacy professional services that are needed for home drug infusion therapy. The pharmacy services referenced above in the model per diem definition (and generally described in Dispensing Fee Option 3) should be included in the dispensing fee for all Part D infusion patients. Most of these functions would be captured in the Option 3 definition of dispensing fees.

Both private payers and Medicare Advantage plans use per diem payments that are tied to the intensity level of the particular infusion therapy. For over 20 years, these plans have essentially developed resource-based relative value scales to capture the intensity, in terms of time and resources involved in providing each infusion therapy safely and effectively. Thus, the plans do not use a single per diem amount for all infusion therapies. We recommend that the PDPs follow this approach under Medicare Part D.

E. CMS can establish easily-administered safeguards to avoid any duplicate payments for nursing services

CMS raises a question in the proposed rule regarding how to ensure that the services captured in Dispensing Fee Option 3 are not reimbursed under the home health benefit or otherwise.

The potential area of concern involves the infusion patients who also qualify for the Medicare home health benefit. For this subset of infusion patients who also qualify for the home health benefit, it would be a simple matter to first determine whether a beneficiary qualifies for the home health benefit before reimbursing Part D funds for nursing services. The majority of beneficiaries who require infusion drug therapy do not qualify for the home health benefit, and their nursing services should be paid under the Part D benefit as part of the dispensing fee.

---

[2] National Home Infusion Association. National Definition of Per Diem. June 2003. *Available at* www.nhianet.org/perdiemfinal.htm.

Importantly, the home health benefit does not cover any of the pharmacy services described in the preceding subsection of these comments.

By first identifying beneficiaries who qualify for the home health benefit, the nursing component, when medically necessary, should be reflected in the dispensing fee but only for beneficiaries who do not qualify under the home health benefit for nursing services. Importantly, nursing care is not included in the model per diem definition (discussed above) nor in the HCPCS "S" coding structure (discussed below) used by private payers.

Private payers typically separate out nursing from the pharmacy-related costs represented by the per diem. They share the Medicare program's natural concern about nursing costs, and these plans have concluded the best means of tracking and controlling nursing costs is to use a separate payment mechanism for nursing.

F. CMS can establish easily-administered safeguards to avoid duplicate payments under Medication Therapy Management Programs.

CMS asks for comments regarding how to ensure that the Medicare program avoids making duplicate payments if the PDPs pay for infusion-related dispensing fees as well as medication therapy management services.

Generally, the dispensing fee as defined in Dispensing Fee Option 3 will capture most of the services and functions described in our per diem model plus the nursing component, and there will not be a clear need for a separate payment to infusion pharmacies for additional medication therapy management services. We believe that the primary situation where medication therapy management services may be indicated is where an infusion pharmacy has to coordinate the activities of another pharmacy.

However, if CMS does not choose Dispensing Fee Option 3 for defining dispensing fees, then CMS should not consider the medication therapy management program as a substitute for covering the services, supplies and equipment required to provide infusion drug therapy. The limitations on the applicability of the medication therapy management program (*i.e.*, it is limited to patients with chronic conditions and multiple medications) make it a poor vehicle for capturing the clinical monitoring functions required of infusion pharmacies for all infusion patients.

III. Contracting with Home Infusion Pharmacies

A. CMS should establish separate and distinct requirements for PDPs to contract with sufficient numbers of home infusion pharmacies to ensure adequate enrollee access to home infusion drug therapy under Medicare Part D.

CMS should establish specific safeguards for home infusion pharmacies to ensure meaningful enrollee access to home infusion drug therapies. A number of important differences exist between home infusion pharmacies and traditional retail pharmacies that highlight the need to create separate requirements for the two types of pharmacies. For example–

- Home infusion pharmacies provide specific essential services that are not provided by the vast majority of retail pharmacies or mail order pharmacies.

- Home infusion pharmacies must maintain facilities, equipment and safeguards for compounding and storing sterile parenteral drug solutions, which is not common among retail pharmacies.

- Home infusion pharmacies are responsible for the care of their patients 24 hours a day, seven days a week, while retail pharmacies are not.

- Home infusion pharmacies are subject to separate state licensure, regulations and accreditation standards from retail pharmacies.

- The contracts used by private health plans for home infusion pharmacies are structured differently from the contracts used for retail pharmacies.

- The total number of traditional retail pharmacies in the United States far outweighs the total number of home infusion pharmacies.

These differences are echoed in the preamble of the proposed rule, where CMS discusses its findings regarding important distinctions between home infusion pharmacies and retail pharmacies.[3]

To ensure that Part D enrollees have sufficient access to home infusion drug therapy, CMS should adopt its proposal to establish distinct access standards for home infusion pharmacies in the Final Rule. This would be consistent with Congress' general mandate that CMS must ensure enrollees have convenient access to pharmacies, as access to a retail pharmacy does not by itself meet the needs of a beneficiary who requires infusion therapy.

B. CMS should require use of the ASC X12N 837 claims format for infusion drug therapy, consistent with CMS' recent determination, because infusion claims formats are different from retail pharmacy claims.

CMS' Office of HIPAA Standards has carefully reviewed how home infusion therapy is provided, and recently issued a Program Memorandum[4] and a Frequently Asked Question (FAQ)[5] document on the CMS website summarizing its conclusion.

[3] 69 *Federal Register* at 46648 and 46658.

For example, the FAQ document states:

> …Home infusion therapy typically has components of professional services and products that include ongoing clinical monitoring, care coordination, supplies and equipment, and the drugs and biologics administered – all provided by the home infusion therapy provider.

In a letter dated April 8, 2003, Jared Adair, director of the CMS Office of HIPAA Standards, wrote:

> …we have determined that home drug infusion therapy services are different from services provided by retail pharmacies, and that the business model for home drug infusion therapy providers is fundamentally different from a retail pharmacy for dispensing drugs…. We also acknowledge that a requirement to bill home infusion drugs using the NCPDP format would fail to meet the administrative, clinical, coordination of care, and medical necessity requirements for home drug infusion therapy claims." (emphasis added)

As a result, CMS determined that the National Council for Prescription Drugs Program (NCPDP) claim format, which is the HIPAA standard for the processing of retail pharmacy drug claims, is not appropriate for the filing of home infusion drug therapy claims. Instead, CMS instructed that home infusion claims, to be compliant with HIPAA, must be filed under the ASC X12N 837 claims format.

Please note that the description of infusion therapy as described in the FAQ tracks very closely with the language of Dispensing Option 3 in the proposed rule. We recommend that the specific wording already posted on CMS's FAQ be included as the infusion claiming requirement in Part D regulations. To do so will increase the level of administrative standardization in infusion claims transactions per the objectives of HIPAA, while also ensuring that home infusion providers and Part D payers comply with the HIPAA regulation when implementing Part D claiming transactions. If CMS does not require that Part D home infusion therapy claims be submitted on the 837, then it would open up the possibility for some Part D payers to ignore the fundamental differences of home infusion therapy from retail pharmacy and implement only NCPDP claiming—forcing infusion pharmacies to be out of compliance with HIPAA.

---

[4] Centers for Medicare & Medicaid Services, Program Memorandum, Carriers, Transmittal B-03-024 (4/11/03), *available at* http://cms.hhs.gov/manuals/pm_trans/B03024.pdf.

[5] Centers for Medicare & Medicaid Services, Frequently Asked Questions (FAQs), "Are Drug Transactions Conducted by HIT Providers Retail Pharmacy Drug Claim Transactions Billed Using NCPDP Formats?" (Answer ID 1880) (3/31/03), *available at* http://questions.cms.hhs.gov.

This would deprive the PDPs and CMS of a valuable tool for tracking important patient-specific data. Consolidated 837 claiming would facilitate the consolidation of all drugs along with the professional pharmacy "per diem" services, equipment and supplies into single claims billed for infusion therapies, easily mapped into patient services utilization data bases for analysis—whereas the possibility of billing infusion drugs separately via the retail NCPDP claim format results in loss of this consolidated data for analysis.

C. CMS should recognize that infusion coding is different from retail pharmacy drug coding.

Since 2002 the Healthcare Common Procedure Coding System (HCPCS) provides approximately 80 "S" codes for home infusion therapy services. Most codes reflect a "bundled" per diem approach in which most or all of the supplies and services provided to a home infusion patient are billed under a single code. This complete system of "S" codes for home infusion therapy services is specifically designed for use by private payers, and are available for use by government payers that adopt this widely used private sector methodology for infusion coding and payment. These codes are not used in coding of retail pharmacy drug claims and are not permitted for HIPAA-compliant use on the NCPDP transaction).

Although CMS does not have a single HIPAA coding standard for drugs, we believe that the PDPs and CMS will find requiring NDC drug coding for Part D claims will provide best opportunity for patient utilization analysis and tracking of total Part D drug costs for CMS's program administration. We believe the Part D regulations should require that all claims for drugs be coded with NDC numbers.

D. Coordination of benefits.

In addition to these reasons for infusion claiming and coding consistency, the COB portion of the Part D program is also best implemented by CMS's establishing a requirement for 837 claiming and use of the established coding systems. The majority of COB will occur with commercial payers such as the Blues and other private health plans. As the private sector has already widely adopted the established coding systems described above, it will be important for CMS to require consistent coding adoption to make COB work, ensuring that the allocation of payment for services between Part D plans and other primary or secondary plans works well.

Since the private payer sector accepts home infusion therapy claims using the HIPAA-compliant X12 N 837 format, for COB to work effectively is another reason that CMS should require PDPs to use the 837 claim format for infusion claims. Because a very large majority of private infusion payers use the HIPAA-complaint *professional* 837 (837P) claim format, to make COB work we believe that CMS's Part D regulations should require PDPs to adopt the HIPAA-compliant 837P format only, excluding both the *institutional* 837 and NCPDP transaction from use.

E. CMS should clarify the any willing provider requirements with respect to home infusion drug therapy.

CMS should clarify that this access safeguard is to be applied to any willing provider of home infusion therapy meeting the infusion-specific quality standards (see below), as distinct from retail pharmacies. Such a requirement is consistent with the statutory language.[6]

In addition, for the purpose of the any willing provider requirements, CMS should clarify that prescription drug plans should have a standard contract for home infusion pharmacies.

These recommendations for the network access standards will help safeguard enrollee access by ensuring that the Medicare Part D benefit reflects common private sector practices for home infusion drug therapy. In addition, the recommended clarifications will not impose significant burdens on PDPs.

F. CMS should recognize that OBRA 1990 standards do not represent the standard of care for infusion pharmacies.

In the preamble, CMS refers to Section 54401 of the Omnibus Reconciliation Act of 1990, stating that the regulations issued pursuant to that section in 42 CFR 456.705 "describe currently accepted standards for contemporary pharmacy practice and our intent is to require plans to continue to comply with contemporary standards." CMS seeks comments on whether these standards are industry standards and whether they are appropriate for Part D.

The OBRA 1990 standards were written for retail pharmacies. The drafters of these standards did not attempt to address the standard of care for infusion pharmacies. Infusion pharmacies that are in compliance with the infusion-specific standards established by accrediting organizations meet the OBRA 1990 standards, but the OBRA 1990 standards do not reflect "contemporary pharmacy practice" for infusion pharmacies. The community standard of care for infusion pharmacies is found in the accreditation standards that are required by virtually every private health plan, as well as numerous MA plans, to participate in their provider networks.

The quality assurance standards followed by home infusion pharmacies—and as required for accreditation--far exceed the OBRA 1990 standards. Due to advances in newly-approved drugs and technology and additional laws and regulations established in the intervening years (such as HIPAA), and development of knowledge surrounding patient safety and medication management at home, the level of patient data collection, assessment and intervention in the infusion clinical model goes far above and beyond the quality standards currently used for Medicaid. Again we respectfully direct your attention to Jared Adair's April 8, 2003 comments concerning the key differences between retail and home infusion pharmacies.

[6] Social Security Act, Section 1860D-4(b)(1)(A).

IV. Formulary Development

A. CMS should mandate that PDP and MA-PD plan sponsors maintain an open formulary for infusion drugs to ensure this population of vulnerable patients has appropriate access to necessary medications.

Much of the MMA is based on the premise that Medicare can take advantage of cost-savings techniques commonly used in the private sector and still deliver quality services to Medicare beneficiaries. CMS should note that although private health plans commonly use restricted or preferred formularies for drugs delivered orally, via patch or other non-invasive methods, private plans rarely apply these formulary restrictions to infusion drugs.

As discussed in greater detail below, there are numerous clinical and operational barriers to establishing formularies for infusion drugs. As a result, with respect to infusion drugs, formularies should remain open.

B. CMS should recognize that PDPs and pharmacy and therapeutics committees are not well situated to evaluate infusion drugs.

It will be difficult for PDPs and traditional pharmacy and therapeutics committees (P&T committees) to evaluate infusion drugs in the same manner that they evaluate orally administered drugs.

P&T committees generally evaluate the relative safety, efficacy, and effectiveness of prescription drugs within a class of prescriptions drugs and make recommendations to a health plan for the development of a formulary or preferred drug list. Frequently, P&T committees focus on the "therapeutic equivalence" of different multisource drugs (*i.e.*, whether one drug will have the same desired clinical impact as another). However, such evaluations are performed in a context where the method of administering the drug is not significant.

In contrast to oral drugs, the method of administration for an infusion drug may have separate and significant clinical and cost implications. All infusion drugs require a device of some type to deliver the drug into the body, including various catheters temporarily or semi-permanently implanted in each patient depending on the anticipated duration of therapy, potential side effects of the drug and the patient's diagnosis itself. Various methods of drug delivery also exist, from IV bags hung on poles to sophisticated external or internal infusion pumps. A patient's clinical condition may determine not only what device is selected for delivery, but also what drug should be used. For instance, many patients receiving infusion therapy are at high risk of infection or complications from infection. Consequently, a physician may need to choose a medication that can be prepared in advance in a pharmacy clean room and administered once a day to reduce the risk of infection from preparation in the home or multiple intravenous access device manipulations.

Similarly, in selecting a medication for a patient, a physician often needs to consider administration access type and what delivery technology will be best suited for use in a particular patient's home. If the patient is capable of managing a portable infusion pump, drugs requiring longer infusion times may become more clinically appropriate. If other technologies are used, such as IV bags hung on poles, the patient may require more frequent nursing visits to monitor the risk of infection.

The typical P&T Committee would usually not have the experience to evaluate the administration technology or professional support requirements, such as nursing visits, in reviewing infusion drugs. Furthermore, such committees do not typically make decisions considering all available treatment options throughout the continuum. Drugs considered ideal in an inpatient setting are often not desirable in the home setting and visa versa, especially where the first dose of the drug is concerned. Examples include Taxol® for ovarian cancer, Lovenox® for deep vein thromboses and certain immune globulins.

In addition, most infusion drugs must be compounded by the pharmacy. Once compounded, these drugs lose stability over time or be impacted by changes in temperature. For oral drugs, the frequency of administration or stability issues usually do not pose challenges for a P&T Committees as they try to determine therapeutic equivalence.

Ultimately, the infrastructure for protecting patient interests in formulary decisions—the traditional P&T Committee—does not have the ability to evaluate the extra-pharmacological considerations that must be taken into account for infusion treatment, including the administration device, drug stability, proximity to a compounding pharmacy, available administration access site and infection risk. Typically, these factors would be addressed by a physician or pharmacist knowledgeable about an individual's patient's circumstances and history when selecting a drug and delivery device.

C. CMS should recognize home infusion patients as a particularly vulnerable population that requires additional protection.

Patients receiving home infusion therapy are one of the truly vulnerable populations of the Medicare population, and as CMS acknowledged in the Proposed Rule,[7] the medical needs of such populations necessitate that they receive special protection under Medicare Part D. Infusion drugs are used to treat some of the most severe illnesses, including cancer, severe infections, pain and loss of gastrointestinal integrity.

Although the Medicare Part D regulations do create an appeals process for patients if their physician's choice of medication is not on formulary, patients with these compromising illnesses are the least capable of exercising an appeals right. If a patient does not have a family member or physician willing to take on the burden of being an advocate, then the patient's care could be compromised.

[7] 69 Fed. Reg. at 46661.

* * * *

We commend CMS for its initial efforts to understand and accurately define home infusion drug therapy under Medicare Part D. There is an important opportunity for the program to replicate the successes achieved by private health plans and Medicare managed care plans. There is also a risk that in the absence of sufficient direction from CMS and some targeted safeguards, the benefits of home infusion drug therapy will be lost for both beneficiaries and the overall Medicare program.

We would be pleased to provide additional assistance regarding these important issues. Please contact Lisa Getson, Apria's executive vice president, at 949-639- 2021 if you have any questions or comments.

Sincerely,

Lawrence M. Higby
President and Chief Executive Officer

Re: Comments On Medicare Program; Medicare- Prescription Drug Benefit, Proposed Rule, 69 Federal Register 46632, August 3, 2004, CMS-4068-P

Dear Dr. McClellan,

PharMerica appreciates the opportunity to comment on the proposed rule *Medicare Program; Medicare- Prescription Drug Benefit, Proposed Rule, 69 Federal Register 46632, August 3, 2004, CMS-4068-P*. PharMerica Inc., is the third largest long-term care (LTC) pharmacy provider in the United States servicing more than 200,000 frail elderly in 2,000 skilled nursing facilities as well as hundreds of other dually eligible residents in similar institutional settings.

In the preamble for the MMA, CMS recognizes the value that LTC pharmacy providers bring to institutionalized residents of nursing facilities. This value extrapolates into enhanced patient care for our frailest, sickest and most unfortunate senior citizens. A synergistic one-to-one relationship has evolved between the skilled nursing and LTC pharmacy provider industries to provide optimal pharmaceutical care to these residents. PharMerica feels strongly that extreme care must be exercised during the implementation of the MMA to ensure that the one-to-one relationship between a skilled nursing facility and a LTC pharmacy provider is not weakened. A diminished one-to-one relationship could result in a decrease in the quality of pharmaceutical care for LTC residents. This

3625 Queen Palm Drive
Tampa, FL 33619
813-318-6000

has the potential to produce cost shifting to other healthcare providers and venues, such as state Medicaid and federal Medicare programs, when LTC residents require hospitalization due to drug related problems.

In order to reduce the potential for drug related problems and medication related errors and incidents, nursing homes and LTC pharmacy providers have invested significant time and resources to develop facility specific standards, policies and procedures, formulary management guidelines, dispensing systems, compliance packaging and other systems designed to decrease process variation and medication errors associated with that variation. Just as many nursing homes once had their own pharmacy within their walls (similar to hospitals), to provide optimal care to their residents; the current external one-to-one relationship has been designed to form a partnership that serves to improve medication therapy and outcomes.

In addition to safety related issues, long-term care pharmacies also work to develop and implement streamlined processes around ordering and delivery of medications. These systems allow nursing home staff to spend more time with direct patient care and less time managing pharmacy processes.

Multiple pharmacies servicing a single nursing home would require nursing home staff to manage multiple processes and systems, which in our experience would be detrimental to resident care. To assure patient safety while optimizing therapy, it is important to assure rapid access to safe and efficacious medications. If a nursing home is forced to interact with multiple pharmacies and PDPs, it is expected that formulary variations will cause confusion and delays in therapy. A delay in the commencement of therapy, in this patient population, could have significant negative results.

Nursing homes now care for the frailest and sickest of our elderly citizens. The litany of diseases and conditions that afflict nursing home residents commonly requires the administration of multiple medications each day. When prescribed and administered properly, medications can prolong survival and enhance quality of life. When prescribed or administered improperly or in error, these medications can cause morbidity and mortality.

Contracting With PDP's

PDPs should be required to contract with LTC pharmacies, and establish standards of access in order to preserve the one-to-one relationship between the LTC pharmacy provider and a nursing facility. Skilled nursing facilities must be able to continue their contractual relationships with their LTC pharmacy provider to maintain the quality and continuity of service for their residents. By requiring a contractual

3625 Queen Palm Drive
Tampa, FL 33619
813-318-6000

relationship between PDPs and LTC pharmacies, LTC pharmacies will be able to maintain the one-to-one pharmacy to facility relationship and ensure that plans have the capacity to meet the specialized needs of all Medicare enrollees in long term care facilities and ensure that long term care facilities meet federal and state quality, licensure and certification standards.

PDP's should also provide standardized long term care pharmacy contracts that recognize LTC pharmacy's essential role in the delivery of needed services to long term care facility residents.

Closed Versus Open Formularies

CMS should mandate an open, broad, geriatric-based formulary for all PDP's. Closed formularies for the geriatric population will result in a negative impact on quality of care and patient outcomes. The geriatric institutionalized patient has unique needs due to differences in drug clearance and metabolism, resulting in varied medication response from patient to patient. Additionally, unique concerns of the long term care resident, such as dysphasia and feeding tubes, require varied dose forms to ease administration (i.e. liquids, medications that can be crushed, injectibles, soluble dose forms). Each skilled nursing facility should have only one formulary to administer to its residents. Dealing with multiple formularies may result in medication errors due to the complexity and restrictions of ordering and administering. If a medication is not covered under a certain formulary, the nursing staff may not have the order changed to a covered item in a timely manner, resulting in a missed dose or possibly borrowing the unavailable medication from another resident. All LTC facilities are inspected at least annually by state and/or federal surveyors, and could be cited and fined for not administering medications according to physician's orders. Multiple formularies may delay the start of therapy – potentially putting the LTC facility at risk for regulatory non-compliance.

Inclusion of the Proposed Formulary Non-covered Drugs

PharMerica recommends that drugs proposed as exclusions in the MMA be covered for institutionalized patients and that payment for these medications be available by appeal for non-institutionalized patients. The draft regulations exclude benzodiazepines, barbiturates, medications used for weight gain, and over-the counter medications. Benzodiazepines are most often used in LTC facilities to treat anxiety, often associated in the adjustment process of being admitted to a facility. Additionally, some benzodiazepines are used to treat status epilepticus, a life threatening condition. Withdrawing benzodiazepines from patients who have been using them for an extended period may result in severe withdrawal symptoms and increased healthcare costs. Barbiturates are also excluded from coverage under the draft guidelines. Barbiturates such as phenobarbital are used to treat epilepsy in the geriatric population, and should be covered. Medications used to stimulate weight gain should also be covered.

3625 Queen Palm Drive
Tampa, FL 33619
813-318-6000

Unintentional weight loss in the elderly may result in unfavorable sequelae, such as a decrease in activities of daily living, and increased chance of depression and infection. Additionally, unintentional weight loss is a federal quality indicator used by federal and state surveyors to assess the quality of care in skilled nursing facilities. Lastly, if over-the-counter medications are categorically not covered, it may result in cost shifting to more expensive prescription medications, when a less expensive over-the-counter alternative is available.

Procedural Requirements for Expedited Coverage

CMS must mandate that PDP's provide an adjudication process that assures timely availability of non-formulary medications to institutionalized residents. If the formulary provisions of this regulation are implemented as proposed, CMS should anticipate an enormous number of formulary appeals. This will be due to that fact that many currently preferred medications for geriatric patients will not be included in PDP formularies because of their costs.

PDP appeal processes for non-covered medications should be streamlined, standardized, and approved by CMS. We also recommend that CMS should mandate that claims be adjudicated at point of sale. Appeal response time should be no longer than 24 hours. To assure that the long term care resident does not miss treatment, PDP's should cover a 3 day supply of the non-formulary medication to treat the resident while the appeal is under review. An appeal should be able to be initiated by the attending physician or the long-term care facility.

Payment for Non-formulary Yet Medically Necessary Drugs

If a PDP refuses or fails to pay for a non formulary medication that is determined to be medically necessary by the treating physician, CMS must establish who will cover these costs for a dually eligible institutionalized Medicare D recipient. Such reimbursement dilemmas are sure to occur unless provisions are included in the final regulations.

Fair Reimbursement Model for LTC Pharmacies.

LTC pharmacies focus on serving the needs of the frail elderly or disabled who reside in institutional settings. The patients we service represent some of the most dependent patients in the Medicare and Medicaid programs. Statistics now show that the average patient serviced is 83 years of age, has 7.8 different medical diagnoses, and takes 8 to 10 medications at any given time. (1)

3625 Queen Palm Drive
Tampa, FL 33619
813-318-6000

The needs of these patients differ vastly from the needs of a typical ambulatory (retail serviced) geriatric patient. To meet these needs a LTC pharmacy provides services greatly in excess of a retail pharmacy. These services include unit dose packaging for medications, emergency services, intravenous therapy, delivery, consulting services and medical records services. These services are necessary to ensure the best possible pharmacy care to these patients.

With the implementation of Medicare Part D the majority of a LTC pharmacy's reimbursement will come directly from a federal program. In order for this industry to continue to ensure the safety and care of LTC patients, reimbursement must be commensurate with the services provided.

Reimbursement should be adjusted periodically for inflation and must take into account the costs of administering the program. Payment terms should be comparable or better than payment terms with current Medicaid programs which vary between 7 - 30 days.

Usual and Customary Fee for A LTC Pharmacy

The dispensing fee paid should reflect the services provided. PharMerica recommends that CMS provide for a dispensing fee under Option 1 that encompasses the services that LTC pharmacies perform such as unit dose packaging for medications, emergency services, intravenous therapy, delivery, consulting services and medical records services. These services are vastly different from a retail pharmacy. A study done by BDO Seidman (see attached) in April, 2002 found that it costs long term care pharmacies, on average, $11.37 to dispense a prescription. This figure did not include a return on equity or a profit margin – it simply reflected the costs of operating a long-term care pharmacy. This study should guide CMS in establishing dispensing fees paid to LTC pharmacies. In contrast, the National Association of Chain Drug Stores (NACDS) estimated in 2000 that it costs a chain pharmacy, on average, $7.05 to dispense a prescription to a retail customer.

It is important to note that without adequate reimbursement, LTC pharmacies will have two options – reduce service levels or close their doors. Either scenario will negatively impact institutionalized patients, the most dependent segment of the Medicare and Medicaid populations.

PDP Assignments for Dual Eligibles

3625 Queen Palm Drive
Tampa, FL 33619
813-318-6000

Upon admission to a long term care facility, CMS should seek ways to limit the auto enrollment of dual eligible beneficiaries into PDP's that includes the LTC pharmacy that is serving the resident's nursing facility. If this is not possible, the beneficiary should be auto enrolled and the servicing pharmacy should have the ability to provide services for the resident as an out-of network provider.

The coordination with the LTC pharmacy will ensure the most efficient drug delivery system for the facility. Admission to a long term care facility should be construed as an address change for the resident and open the administrative option to enact a change in the dual eligible beneficiary's PDP election.

Expand the Definition of LTC

Based upon our experience, as a national provider to all types of facilities where residents and patients require assistance with the administration of their medications, we recommend that CMS expand the definition to cover assisted living facilities, ICFMR facilities, group home facilities and other waiver groups where dual eligibles are serviced. LTC pharmacies exist because of the needs of institutionalized patients. These patients typically require a large number of medications, need assistance with medication administration, and need more pharmacist oversight due to the complexity of their pharmaceutical care.

All of these needs equate to more stringent medication packaging and delivery systems. These requirements are typically met by a LTC pharmacy but in some cases are handled by a retail pharmacy. Any pharmacy that provides these services because of the needs of the institution should be reimbursed for these services. Service level should determine the reimbursement.

Conclusion

In summary, we provide the following list of recommendations to CMS.

- CMS should require, PDP plans to contract with LTC pharmacies by requiring plans serving LTC facilities to abide by a one nursing home – one LTC pharmacy relationship.

- CMS should mandate a broad, open and geriatric – based formulary for all PDP's.

- CMS should work closely with state Medicaid programs to ensure, in the short-term, that benzodiazepines and barbiturates, over-the-counter drugs, and medications used for intended weight loss be covered.

3625 Queen Palm Drive
Tampa, FL 33619
813-318-6000

- CMS should mandate that all PDP's provide a timely adjudication and appeals process to assure availability of medications to all long term care residents.

- CMS should determine adequate coverage and payment for non-formulary medications determined to be medically necessary for a long term care resident.

- CMS should provide for a fair and adequate reimbursement method including separate dispensing fees based on the complexity of dispensing a drug. We recommend a separate dispensing fee which recognizes the costs of specialized packaging, around – the –clock service and delivery, emergency services, services and supplies associated with infusion therapy, and other considerations deemed appropriate.

- CMS should expand the definition of "long-term care facility" to include residents of congregate alternative living arrangements for the elderly that "assist with" or "manage" medication administration for its residents. These facilities include intermediate care facilities for the mentally retarded and hospice, as well as any facilities regulated by State law.

We appreciate the opportunity to comment to CMS and want to express our appreciation to the agency for its hard work during the implementation process. We trust that our comments will assist the agency in developing regulations and policies which will enhance the delivery of medications to the nation's frail elderly residents of nursing homes and ensure their safety and well being.

Sincerely,

Jon B. Rawlson

Issue Areas/Comments

GENERAL

GENERAL

Please see attached

CMS-4068-P-1211-Attach-1.doc

Horizon Healthcare Services is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Horizon Healthcare services the home infusion needs of thousands of patients in south central Pennsylvania every year including many Medicare recipients. Founded in 1984, our highly trained healthcare professionals have the experience and skills necessary to create positive clinical outcomes for the patients we serve while at the same time conserving scarce healthcare dollars by treating patients at home and avoiding costly hospitalizations.

Horizon Healthcare Services appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

* Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS "S" codes, already used by commercial and Medicare managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payer sector. We recommend that CMS reference the National Home Infusion Association National Definition of Per Diem for a list of the products and services included in the home infusion per diem, available at http://www.nhianet.org/perdiemfinal.htm <http://www.nhianet.org/perdiemfinal.htm> .

* CMS should establish specific requirements for prescription drug plans to contract with sufficient numbers of infusion pharmacies to ensure adequate enrollee access to home infusion therapy under Part D.

* CMS should require specific standards for home infusion pharmacies under Part D. The national accreditation organizations' standards for infusion therapy reflect the community standard of care for the provision of home infusion therapy, which far exceed the OBRA 1990 standards established for retail pharmacies.

* CMS should adopt the X12N 837 P billing format for home infusion claims under Part D so as to be consistent with the format that private sector health plans use for infusion claims.

* CMS should mandate that prescription drug plans maintain open formularies for infusion drugs to ensure that this population of vulnerable patients has appropriate access to necessary medications.

Thank you in advance for your consideration of these important issues.

Sincerely,

Michael F. Wolf, Jr

Re: Medicare Program; Medicare Prescription Drug Benefit, Section 423.153 (d) [CMS-4068-P]. 69 Fed. Reg. 46632 (August 3, 2004).

Dear Dr. McClellan:

The Healthcare Distribution Management Association submits the following comments in response to the Centers for Medicare and Medicaid Services (CMS) proposed rule, *Medicare Program; Medicare Prescription Drug Benefit*. 69 Fed. Reg. 46632 (August 3, 2004). I am writing to commend CMS for its efforts to implement the Medication Therapy Management Programs (MTMPs) included in the new Medicare Part D benefit, to be codified in section 423.153 of the proposed rule. HDMA believes that MTMPs will be an important addition to the benefits that seniors can receive under the Medicare program and we encourage you to work with the pharmacy community to craft a benefit program that adequately meets the needs of chronically ill beneficiaries.

HDMA is the national trade association representing full-service distribution companies responsible for ensuring that billions of units of medication are safely distributed to retail pharmacies, hospitals, nursing homes, clinics, and other provider sites across the United States. HDMA's distributor members provide services to approximately 141,591 pharmacy settings, including: 17,913 independent pharmacies; 19,824 chain pharmacies; 9,918 food stores; 9,992 hospital pharmacies; 4,872 mass merchandisers; 5,397 long-term care and home health facilities; 62,364 clinics; 1,170 healthcare plans; and 366 mail order pharmacies.[1] It is within these settings that patients interact with their pharmacists and receive important direction regarding their medications.

[1] Table 228 – Class of Trade Analysis – Manufacturer Sales by Customer Categories: 2002-2003.HDMA Industry Profile and Healthcare Factbook, Healthcare Distribution Management Association. (2004).

HDMA has long-believed that appropriate use of prescription drugs not only enhances the patient's quality of life but can also decrease the need for hospitalization or surgery. We believe that disease management and medication therapy management programs will contribute to obtaining favorable patient outcomes. Additionally, when chronically ill patients have access to specialized guidance regarding their medications and their drug therapies are more carefully monitored, it is possible that they can achieve greater results from their course of treatment and perhaps suffer fewer adverse events related to their illness or drug interaction.

It is also important for CMS to recognize the demonstrated value of individualized patient care services and to ensure appropriate and fair reimbursement for the professionals who provide such services. MTMPs involve the collaboration of the pharmacist with physicians, nurses and other healthcare professionals to ensure that medications are used appropriately to improve patient health status, improve the patient's quality of life and contain healthcare costs. CMS should devise appropriate payment mechanisms that acknowledge the important role of the pharmacist and the resources involved in providing individualized guidance for beneficiaries in order to ensure that they receive the most favorable results possible from their prescribed course of treatment.

HDMA distributor members do not serve patients directly, but as part of our role in facilitating patient access to necessary medications, we believe that it is important to support development of MTMPs that contribute to favorable outcomes and that are flexible enough to provide individualized patient care. In addition, MTMPs can lead to an overall reduction in healthcare costs. Therefore, it is critical that CMS develop this benefit in cooperation with the pharmacist and pharmacy communities. In determining the parameters of MTMPs, CMS should consider patient-specific treatment requirements; patient education relative to prescribed medications; the pharmacist's ability to monitor patient progress, and identify and resolve problems that are medication related; in-person consultations between the pharmacist and patient; and reimbursement rates that accurately reflect the resources and expertise that are required to provide effective medication therapy management. HDMA supports development of a MTMP benefit that ensures that the beneficiaries who have the greatest need for such programs are identified and ensured access to these important services.

HDMA appreciates this opportunity to provide CMS with its comments regarding the new Medicare Part D benefit and CMS policy regarding Medication Therapy Management. If we can be of assistance as you continue implementation of Part D regulations, please contact me or Elizabeth Gallenagh, Manager, Regulatory Affairs at 703-787-0000 ext. 234.

Sincerely,

Scott Melville

BENEFITS AND BENEFICIARY PROTECTIONS

See attachment for comments

CMS-4068-P-1213-Attach-1.doc

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

Summary: The definition of a covered Part D drug is described, as well as those drugs which are excluded from coverage. Drugs covered under Part A or Part B are excluded from Part D coverage, although there may be potential problems in defining some drugs. The definition of dispensing fee is not yet final and currently there are several options being discussed. The definitions of standard prescription drug coverage and alternative prescription drug coverage are discussed in detail. The definition of incurred costs toward spending against out-of-pocket expenses is also defined. Covered Part D drugs for Part D eligible individuals are not taken into account in "best price" calculations. We will be required to disclose aggregate negotiated price concessions to CMS. PDP plan service areas are being defined and we will need to determine whether our pharmacy network meets the pharmacy access requirements. A model formulary is being developed by USP. We are not required to use the model formulary, but we will need to obtain approval for our current formulary. USP will define therapeutic classes and we are required to have at least two drugs for each therapeutic class. We are required to issue ID cards and conform to a specific standard in designing these cards. Out-of-network pharmacy use must be allowed for certain situations and we need to develop a process to capture out-of-pocket expenses at these pharmacies. The formularies, along with other information, is required to be posted on a public website, accessible to both members and non-members. We are also required to send monthly reports to beneficiaries who use Part D services. These reports will contain individualized information. CMS is proposing to offer waivers for the requirement to always disclose the differential in price of a covered part D drug and the lowest generic version of that drug at the point of service. Confidentiality requirements are similar to those we currently have as a MA plan.

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46646 46646 423.100 C.1.a P 84	*Definition of covered Part D drugs* "… a covered Part D drug must be available only by prescription, approved by the Food and Drug Administration (FDA), used and sold in the United States, and used for a medically accepted indication (as defined in section 1927(k)(6) of the Act). A covered Part D drug would include prescription drugs, biological products, and insulin as described in specific paragraphs of section 1927(k) of the Act and vaccines licensed under section 351 of the Public Health Service Act. The definition also includes 'medical supplies associated with the injection of insulin (as defined in regulations of the Secretary).' We propose to define those medical supplies to include syringes, needles, alcohol swabs, and gauze.	1. We still don't know which vaccines are required to be covered under Part D. Currently, no vaccines are dispensed from a pharmacy except oral typhoid vaccine. 2. Are orphan drugs considered to be Part D drugs? Some of the drugs in this classification are provided free of charge from the manufacturer, but not all. Would coverage be dependent upon the FDA approval status of the orphan drug? One paragraph on page 46662 (second column, last paragraph) implies that orphan drugs may be considered a Part D drug. 3. Are needle-free insulin injectors covered under Part D? This product costs several hundred dollars and requires the purchase replacement supplies, such as special syringes and vial adapters. 4. As mentioned in previous e-mail, we may want to confirm our presumption that imported drugs are not covered by Part D. 5. The goal to cover the gap for Part B drugs administered pursuant to a physician's visit via Part D has merit but is fraught with operational problems. There may be overlaps where drugs that are administered pursuant to a physician's visit may also be dispensed as an outpatient ambulatory prescription. PBMs administering the drug benefit need as much specificity as possible to build formularies or files for specific adjudication at the point of service. PBMs have no way of coordinating adjudication with drugs that may have been administered or paid via Part B. Concurrently, national PBMs have no way to deal with local medical review board policies in all the different regions. Formularies are plan specific, not regional and certainly not LMRB directed.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
46646 46646 423.100 C.1.a P 84	*Smoking cessation agents* "In accordance with section 1860D-2(e)(2) of the Act, the definition of a covered Part D drug would specifically exclude drugs or classes of drugs, or their medical uses, which may be excluded from coverage or otherwise restricted under Medicaid, with the exception of smoking cessation agents."	1. Can we still continue to require proof of patient attendance of smoking cessation classes as a condition of drug coverage? Members currently pay a fee to attend the class and obtain nicotine patches as a covered benefit. Would the cost of the class accrue to the out-of-pocket expense? 2. Some smoking cessation agents are classified as OTC drugs. Would these products require a prescription in order to be covered as a Part D drug or for the costs to incur as part of the out-of-pocket expense? 3. MCO with MA PDs may have varying policies regarding smoking cessation regarding limits to number of courses of treatment and required corresponding education and course work. We would need to allow flexibility in this realm, particularly where PBMs may adjudicate the number of treatments within a given time frame. 4. This section describes the exclusion of drugs restricted under Medicaid, but the concern arises over the grievance process. Will the grievance process allow for coverage of "excluded" drugs? Will the law permit this?

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46646 46646 423.100 C.1.a P 84	*Excluded Part D drugs* "..the drugs or classes of drugs that may currently be excluded or otherwise restricted under Medicaid include – (1) Agents when used for anorexia, weight loss, or weight gain; (2) agents when used to promote fertility; (3) agents when used for cosmetic purposes or hair growth; (4) agents when used for the symptomatic relief of cough and colds; (5) prescription vitamins and mineral products, except prenatal vitamins and fluoride preparations; (6) nonprescription drugs; (7) outpatient drugs for which the manufacturer to require that associated tests or monitoring services be purchased exclusively from the manufacturer or its designee as a condition of sale; (8) barbiturates; and (9) benzodiazepines."	1. This list of excluded Part D drugs is identical to the list provided for the Drug Discount Card. Some of the classes of drugs are fairly straightforward, but some are more difficult to define. The list sometimes defines a class of drugs by its intended use or indication and, at other times, the list defines a type of drug by its chemical and/or pharmacologic classification. Barbiturates and benzodiazepines are fairly straightforward in their definition. However, "drugs used for the symptomatic relief of cough and colds" may be more difficult to define since drugs are often used for multiple indications. For example, guaifenesin tablets are commonly prescribed to treat symptoms of cough and cold. However, guaifenesin is sometimes prescribed off-label for the treatment of fibromyalgia. Would we be responsible for determining whether a given indication is appropriate for an excluded drug in these circumstances? What type of process and documentation would CMS require? 2. For the Drug Discount Card program, CMS provided sponsors with a list of NDC numbers for drugs that fall in the categories of barbiturates and benzodiazepines. We believe this list will be expanded to include all categories but #7 3. If CMS has a specific foundation list of drugs covered under Part B, please provide such that we can build an appropriate file for adjudication. Also, we would like to review the assumptions behind the selection or exclusion of drugs if such is available. 4. If CMS has a specific foundation list of drugs covered under Part B, please provide such that we can build an appropriate file for adjudication. Also, we would like to review the assumptions behind the selection or exclusion of drugs if such is available. 5. Please describe the procedure for instances where a prescription drug becomes OTC during a contract year. This could change the beneficiary coverage and formulary composition and minimum formulary requirements. How would these situations be handled?

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	Excluded Part D drugs *(Continuted)*	6. CMS is requesting comments regarding their exclusion of drugs for which there is a manufacturer requirement for lab tests through a manufacturer relationship. CMS is wondering if this is a broad enough exclusion. We should advocate for exclusion of drugs under any manufacturer restricted distribution system due to the administrative burden of repatriating these claims and beneficiary OOP costs back into our accumulator. 7. The concern arises over the exclusion of the 9 specified areas and in the specific circumstance where a drug product is included in a drug class, but it a medically necessary product for valid medical conditions (e.g. diazepam and clonazepam are benzodiazepines, but have valid medical uses for seizure related medical conditions), are these precluded from coverage, even with the grievance procedure?

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46647 46647 423.100 C.1.a P 85	*Exclusion of drugs currently covered by Medicare* "Section 1860D-2(e)(2)(B) of the Act that specifies that a drug prescribed to a Part D eligible individual that would otherwise qualify as a Part D drug cannot be considered a covered Part D drug if payment for drug '* * * *is available* (or would be available but for the application of a deductible) under part A or B for that individual.'" "The Part D drug coverage described in this proposed rule does not alter the coverage or associated rules for drugs that are currently covered by Medicare prior to the MMA, such as those included in the following list….. 1. …Drugs used in immunosuppressive therapy furnished to a beneficiary who receives an organ transplant for which Medicare makes payment. "...We intend to ensure that the Part D benefit 'wraps around' Part B drug benefits to the greatest extent possible. For example, Part D would cover immunosuppressive drugs furnished to Medicare beneficiaries who did not have their transplant paid for by Medicare (e.g. a beneficiary who had his or her transplant paid for by a private insurer when he or [sic] was employed, and the beneficiary has not enrolled in Part B)."	1. CMS is requesting comments on how to avoid coverage gaps between Part B and Part D. This will be somewhat problematic for plans since Part B coverage varies by geographic region. Plans will be left to interpret correct Part B and D coverage based upon the historical Part B coverage interpretation in their geographic area. The fix is obvious in that CMS should rationalize Part B coverage, however, they lack the statutory authority to change existing Part B coverage. 2. In order to properly process prescriptions for immunosuppressive agents, the pharmacy staff will need to know whether 1) if the medication is used for immunosuppression following a transplant and 2) if the transplant was paid for by Medicare. In addition, these medications are usually quite expensive. For patients in the "donut hole", one or two prescriptions could easily surpass the $2850 out-of-pocket expenses and push the patient into catastrophic coverage, so it will be important for the pharmacies to correctly identify whether the drugs are being covered under Part B or Part D.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***

	Exclusion of drugs currently covered by Medicare (Continued)	3. The intent to insure that Part D wraps around Part B is positive in intent but likewise creates operational problems. Our broad strategic guidance to CMS is to allow a degree of flexibility to the MA-PD or PDP in this instance. PBMs do not have systems yet developed to coordinate between B & D. The data is not readily available nor easily extracted to be provided to a PBM for quick POS adjudication at a pharmacy. The simplest way, would be for CMS to develop specific lists that allow some product overlap to be covered in BOTH B & D. The PBM has no way of knowing whether transplants are paid by CMS or some other private insurer. The interlink between Part B providers and pharmacy systems does not exist. Is it possible for CMS to become a clearinghouse for such data to cover all CMS regions?
		• How will pharmacists at Point-of-Sale know the medical indication for appropriate billing?
		  ◦ If a transplant was paid for by Medicare, then the claims should be adjudicated under Part B.
		  ◦ Otherwise, the claims should be submitted under Part D.
		• When a beneficiary transfers from a Medicare Employer Group, and is now covered under Part D, how will the pharmacy know if their drug should be covered under a prior Medicare paid procedure or submitted for Part D payment?
		• Currently there is no standard method to communicate medical procedure information to PBM's for appropriate determination of adjudication.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46647-48 46647-48 423.100 C.1.b P 87	*Dispensing Fees* "Because the statute is ambiguous on the meaning of "dispensing fee," in this proposed rule we are not proposing a specific definition of "dispensing fee," but instead are offering three different options…."	1. CMS has three definitions of dispensing fee. Option 1 allows for the cost of only those activities related to the transfer of possession of the covered Part D drug from the pharmacy to the beneficiary, including charges associated with mixing drugs, delivery, and overhead. MedImpact's recommendation would be to follow OPTION ONE. Our systems and contracts with the pharmacy network are built upon this key fundamental financial fact. The notion is that all functions such as phone calls, or pharmacist follow up are included within that negotiated fee. Clearly, pharmacies create additional margin in the spread between acquisition cost and sales price of the drug. Pricing network pharmacy contracted services at an actual acquisition cost plus a fully loaded dispensing fee is a complex issue and not within the Part D scope. 2. Option 2: This option would include supplies and equipment which may be required for or pursuant to administration of a prescribed outpatient drug. Dispensing fee should NOT include these components. Treat the components of supplies and equipment as a a prescription for a product. Have the product as a covered item as a drug or have it sold with an appropriate margin. A dispensing fee for the equipment or supply may then be applied separately for each piece. The equipment and supplies should be treated as prescriptions. 3. Option 3: This option would include Option 2 plus clinical services required to assure safe administration of the drug. This is NOT something that PBMs can currently administer. These are fees which may be paid to nursing or other ancillary staff besides pharmacists. These fees may in fact be included in contracts established between the health plan and the IV therapy vendor. We would have to check the NCPDP capability for providing a different field for services other than dispensing a prescription. Again, keep the products separate from the dispensing, administrative, or clinical service fee. This Option affects PBM network agreements and would require potential renegotiations with 55,000 pharmacies.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	Dispensing Fees *(Continued)*	4. The crux of the differing definitions is how to limit the payment for clinical services in the outpatient pharmacy through dispensing fees versus the need to pay for appropriate clinical services for home infusion patients. 5. As a PBM, MedImpact would prefer to NOT administer clinical service fees in the home IV arena. PBMS may administer dispensing fees for prescriptions for IV drugs, for each supply item, or piece of equipment given the existence of an NDC for such. Home IV infusion pharmacies could be a part of a pharmacy network. Each IV drug supply should be dispensed as a prescription pursuant to state and federal law. We are not clear on the types of in house pharmacy systems used by home infusion facilities nor are we familiar with their ability to have claims adjudicated via a PBM. They may do medical claims processing to a payor.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46649 C2a	*Benefit Requirements* PDPs and MA-PDs are required to offer "qualified prescription drug coverage", which is either standard prescription drug coverage (§423.104(e)) or alternative prescription drug coverage (§423.104(f)). These two coverages are illustrated in a chart in the Appendix to this summary. In addition to the benefits discussed below, PDPs and MA-PDs must also make available to their enrollees negotiated prices. • **Standard prescription drug coverage.** Standard prescription drug coverage for 2006 (amounts are indexed by the per capita increase in Part D expenditures) includes a $250 deductible and 25% coinsurance for the next $2,000 of costs for covered Part D drugs. At the point the costs are equal to $2,250, termed the initial coverage limit, the individual is responsible for all of the costs up to the annual out-of-pocket threshold. The PDP or MA-PD may revise the cost-sharing between the $250 deductible and the $2,250 initial coverage limit as long as the cost-sharing is actuarially equivalent to 25% coinsurance. At the point that catastrophic coverage commences, which is when the enrollee has incurred costs of $3,600, enrollees will pay a copayment of the greater of (1) 5% of the cost of the drug or (2) $2 for a generic drug or a preferred drug that is a multiple source drug and $5 for any other drug. PDPs and MA-PDPs may offer tiered copayments provided that the standard for being actuarially equivalent to the 25% coinsurance, noted above, is met. [Note: Medicare Advantage plans may also apply all or a portion of any beneficiary rebates achieved by submitting bids below the benchmark for Part A and B benefits to reducing Part D beneficiary premiums.]	1. CMS would review and approve PDP sponsors', MA-PD proposed prescription drug plans. All will be trying to develop products that are actuarially equivalent to the standard Part D model. It would be helpful if CMS would have its actuaries develop models showing variables as well as CMS assumptions supporting the model. We request that these be developed in detail as examples for the final rules and solicitation forthcoming. This could also save a lot of time and provide valuable guidance for all approved sponsors. What will be the process and infrastructure used by CMS to evaluate for actuarial equivalence? 2. The language requires sponsors to accept without restrictions all individuals who are eligible for an MA plan. What is a capacity waiver? And, why would a PDP not be allowed the same consideration as an MA? 3. C.2.a.1 to 3 46649 describes incurered costs for purposes of applicability towards the beneficiary spending against the OOP limit. The incurred costs must be tracked by a PDP of MA-PD using the standard Part D. The language also describes special circumstances where there are price differentials between mail & retail and OON and usual prices within network. Such OOP differentials count. Also charitable and certain individual costs are allowed to count towards incurred costs. Insurance contributions and wrap around programs are noted to NOT count towards incurred costs. We concur with this policy but wish to comment that tracking such accumulated costs from a multiplicity of sources outside the adjudication process is NOT something within the current capabilities of PBMs. The OOP differentials incurred at a POS Pharmacy may be tracked provided there is adjudication to a benefit design. Contributions from charitable sources and other insurance may not be known to and thus not trackable by PBMs. We would support the notion of a CMS sponsored facilitation center tracking such such incurred costs and providing such data in an NCPD file format to the requesting or designated PDPs, MA-PDs. Tracking accumulator for approved incurred costs will necessitate major systems design and development for enrollment, eligibility, and pharmacy systems and databases. These changes are not minor and require significant time and money resources to accomplish. Such system development will be required prior to adjudicating Plan D benefit designs.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
	Benefit Requirements (Continued) • **Alternative prescription drug coverage**. To qualify as alternative prescription drug coverage, which encompasses basic alternative coverage and enhanced alternative coverage, the following four requirements must be met: 2. Has an annual deductible that does not exceed the deductible for standard prescription drug coverage; 3. Imposes cost-sharing no more than the 5% or $2/$5 amounts stated above at the point the annual out-of-pocket threshold is reached; 4. Has an unsubsidized value that is at least equal to the unsubsidized value of standard prescription drug coverage; and 5. Provides coverage that is designed to provide for payment that is at least equal to the amount that would be paid under standard prescription drug coverage.	
46653 2.b.ii.	• **Enhanced alternative coverage**. A PDP sponsor may offer enhanced alternative coverage if it also provides basic prescription drug coverage in the area. Basic prescription drug coverage is either the standard coverage (above) or alternative prescription drug coverage that is actuarially equivalent to standard coverage. Enhanced alterative coverage is basic prescription drug coverage and supplemental benefits, which includes: 1. Coverage of drugs other than covered Part D drugs: and/or 2. Any of the following changes or combination of changes that increase the actuarial value of benefits: o A reduction of the annual deducible; o A reduction in the cost-sharing; or o An increase in the initial coverage limit.	1. MMA seeks to allow sponsors to develop alternative actuarially equivalent benefits to the basic design that will allow more effective utilization management. The described benefit options will necessitate changes to our enrollment, eligibility and pharmacy systems. Likewise a multiplicity of designs approved for different MA-PDs within the market place decreases PBM efficiency and could increase costs to the PBM or PD administrator. Reality indicates that different MAs and PDPs will NOT have precisely the same benefit designs. Nor will plans have only one product in a competitive market. New benefits, edits, cost shares will be created to be actuarially equivalent. Each may require CMS review. CMS has recognized that actuarially equivalence is difficult to define with specificity and thus may need to allow flexibility in this regard. There are too many variables and untested assumptions in this new arena with the noted potential reduction variables. Modeling from CMS may give additional guidance.

MedImpact Healthcare Systems Inc, Comments for Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
46649-50 46649-50 423.100 C.2.a P 91 46659	*Costs considered incurred against the out-of-pocket limit* "As a point of clarification, we also propose that beneficiary costs incurred under the following circumstances count as incurred cots consistent with the definition of that term in §423.100 of our proposed rule (with plans explicitly accounting for such price differentials in the actuarial valuation of their coinsurance in their bids): 1. Any differential between a network retail pharmacy's negotiated price and a network mail-order pharmacy's negotiated price for an extended (for example, 90-day) supply of a covered Part D drug, as described in section II.C.4.1 of this preamble, and 2. Any differential between an out-of-network pharmacy's usual and customary price for a covered Part D drug purchased in accordance with the out-of-network access rules described in section II.C.5 of this preamble and the plan allowance for that covered Part D drug." "Thus, as provided under §423.120(a)(6) of the proposed rule, a plan enrollee who chooses to obtain an extended supply of a covered Part D drug through a network retail pharmacy would be responsible for any differential between the network retail pharmacy's and the network mail-order pharmacy's negotiated price for that covered Part D drug.	1. COMMENT: Pharmacy systems vary and do not have the capability at this time to track TrOOP from ALL the various sources CMS has outlined as allowable incurred costs. How would we get costs from SPAP or ADAP & Ryan White? As a PBM, MedImpact recommends that CMS contract with a central TrOOP Facilitator Contractor to provide a NCPDP approved format file to PBMs and PDPs to allow efficient management and reconciliations at the prescription POS and to populate our accumulators. Furthermore adding 340B utilization as contributing to incurred costs towards catastrophic and to insure access to Part D creates an operations challenge which will take significant investments to coordinate. We would assume that ADAP & Ryan White beneficiaries have established retail pharmacy and designated 340B pharmacies for service points. Data from these service points or from 340B reporting may perhaps be provided to CMS for reporting, reconciliations, and financials on a broader basis outside of the existing pharmacy systems. We would look to CMS to bring the data from such sources to a Central Facilitator to distribute to PBMs, PDPs, MA-PDs in a desired NCPDP format to populate our cost accumulators for incurred costs.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46650 46650 423.100 C.2.a P 91	*Charity contributions incurred against the out-of-pocket limit* "Section 1860D-2(b)(4)(C)(ii) of the Act provides that any costs for which a Part D individual is reimbursed by insurance or otherwise, a group health plan, or other third-party payment arrangement do not count toward incurred costs…"	1. We need to identify which regions have SPAPs as these programs can pay members cost-sharing and it will count as part of their true OOP costs. Again, this speaks to the need for a national facilitator for tracking TrOOP for incurred costs and to allow ALL sponsors the information needed for accurate POS tracking towards the catastrophic benefit. 2. CMS requests comments on coordination of ADAP with Part D: ADAP would be allowed to pay bene premiums for PART D to assure access for AIDS population to Part D as well as deductibles and cost-sharing. The ADAP paid deductibles and cost sharings, however do not count towards incurred costs. Our perspective is that if such costs DO NOT count towards the incurred costs, then we have no position as we will not need to track such on our accumulators. However, if our MA-PD needs such data for adjustments to their own charitable programs, we will not have the capability to provide. Perhaps CMS should provide the actuarial data defining the forecast for how many beneficiaries will reach the $3600 TrOOP and help to assess what systems costs need to be invested to track the various contributing sources to TrOOP. Can an actuarial adjustment be made for AIDS RYAN WHITE patients enrolled in such programs pending development of sophisticated COB systems?

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46654 46654 423.100 C.2.c P 101	*Part D negotiated prices exempt from "best price"* "As required under section 1860D-2(d)(1)(C) of the Act, prices negotiated with manufacturers for: (1) Covered Part D drugs by either a prescription drug plan or an MA-PD plan; or (2) a qualified retiree prescription drug plan, as described in §423.882 of our proposed regulation on the Medicare retiree drug subside, with respect to covered Part D drugs provided on behalf of part D eligible individuals would not be taken into account in making "best price" determinations under the Medicaid program."	1. Currently, MedImpact passes through negotiated prices to the beneficiary at the point of sale in its DDC program. We retain only those administration fees permitted by the negotiate contract with the drug company. Relative to PART D, some of our MA PD clients who negotiate their own drug prices may wish to pass these discounts on to the beneficiary via premium subsidies as well as lower prices at the point of sale. We support these options as provided by MMA. We note that CMS will require reports relative to the aggregated savings. These reports deserve the highest level of confidentiality protection. We would ask CMS to develop rules that allow MA-PD plans to provide those reports direct to CMS with needed utilization data provided by the PBM administering the PD component. 2. Relative to negotiated prices, we recommend that CMS publicly urge the pharmaceutical industry to begin developing its public policy and commitment to the Part D initiative. For DDC, negotiations for discounts were prolonged and difficult due to the uncertainty of the rules, utilization, and application of a new process. Prices were not finalized until after open enrollment in many instances. Thus it was difficult to forecast prices for reporting to CMS. Prices shown on the Price Compare were initially higher pending negotiations with drug companies which take time and resources. Thus, any political pressure that may be asserted to prompt pharmaceutical industry support for Part D may be of great societal benefit. It would also be encouraging if the work done for discounts in DDC could be touted as a strong foundation for moving forward into Part D.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
46654 46654 423.100 C.2.c P 101	*Passing savings from negotiated prices to members* "Section 423.104(h)(3) would require, as stated in the provisions of section 1860D-2(d)(2) of the Act, that PDP sponsors offering a prescription drug plan and MA organizations offering an MA-PD plan disclose to us all aggregate negotiated price concessions – including discounts, direct or indirect subsidies, and direct or indirect renumerations- they obtain from each pharmaceutical manufacturer that are passed through to the Medicare program in the form of lower subsidies or to beneficiaries in the form of: (1) Lower monthly beneficiary premiums, and/or (2) lower covered Part D drug prices at the point of sale."	1. If a MA-PD choose to pass along savings in the form of lower monthly beneficiary premiums negotiated prices need to be determined well in advance of premium announcements. There will have to be an aggressive timeline to finalize contracts with pharmaceutical companies or to forecast potential rebates in order to estimate the reduction in premiums for 2006. This puts our MA PD clients at some risk, particularly if the forecasts for discounts are not achived in drug price negotiations. Adjustments in prescription pricing would then need to be made at the POS to offset lost premium revenue. Again, we speak to the point above. We all want the best possible drug prices and will need CMS assistance and political support to establish an environment which compels effective negotiations with drug industry in the immediate future. PBMs who may be serving MA-PD Plans almost need to begin discussions immediately to allow effective MA PD marketing and premium announcements in the late summer/Fall of 2005.
46655 46655 423.100 C.2.c P 102	*Periodic audits by the OIG on pricing practices* "We would be authorized to conduct periodic audits – either directly or through contracts with other organizations – of the financial statements and records of PDP sponsors and MA organizations pertaining to the prescription drug plans and MA-PD plans they offer."	MedImpact rebate and discount contracts are continuously subject to audit by clients, their accountancy firms, and by pharmaceutical industry. We are confident that we will be able to pass OIG periodic audit reviews.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46655 C.4 P 138	*Access to covered Part D drugs (§423.120)* NOTE: Congress gave CMS broad authority to waive Part D requirements that duplicate or are in conflict with requirements under Medicare Part C (or under Section 1876 for cost plans and Sections 1894 and 1934 for PACE organizations). • **Assuring pharmacy access.** PDPs and MA-PDs must have a contracted pharmacy network, consisting of pharmacies other than mail-order pharmacies, that meet certain access standards. These access standards apply differently to urban, suburban and rural areas under which a specified percentage of beneficiaries, on average, must live within specified miles of a network pharmacy. The access standards do not apply to an MA-PD plan that provides enrollees with access to Part D drugs through pharmacies owned and operated by the organization. MA private fee-for-service plans that provide coverage for drugs from all pharmacies without differentials in cost-sharing are also not subject to the access standards. • **Any willing provider.** A PDP sponsor or MA organization is obligated to contract with any pharmacy willing to meet its terms and conditions. PDP sponsors and MA organizations may not require a pharmacy to accept insurance risk as a condition of participation. • **Discounts for preferred providers.** The proposed rules allow for a PDP sponsor or MA organization to reduce cost-sharing as part of a non-standard drug benefit plan when the enrollee receives drugs from a preferred pharmacy. Any cost-sharing must not increase CMS payments.	1. MedImpact has potential MA-PD clients who are fully integrated and own their pharmacies. These pharmacies exclusively serve their membership for commercial and MA plans. We recommend that CMS provide waivers to such clients regarding Pharmacy Access Standards. The rule waivers that were provided for DDC should likewise be considered for Part D in that exclusive provider pharmacies were exempt from posting as public pharmacies on the CMS website. There is no business rationale for mandating ANY WILLING PROVIDER to serve exclusive MA-PD beneficiaries. 2. MedImpact has a national network of over 50,000 pharmacies. We meet the current TRICARE standards. Thus, irrespective of the final CMS ruling on how the Regions will be designed, we are confident that our network can solve beneficiaries on a national basis using national retail chains. 3. MedImpact has contracts with national mail order vendors to allow access to remote rural areas. We have the ability to truly provide national service and access. This may serve snowbirds well. Snowbirds may also utilize key participating pharmacies in our network to obtain their prescriptions nationally via a “mail at retail” rate for 90 day drug supplies. We would offer this service and price convenience for our Part D plan.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	Access to covered Part D drugs (§423.120) (Continued) • **Level playing field between mail-order and network pharmacies.** A PDP sponsor and an MA organization must allow enrollees to obtain a 90 day supply of covered Part D drugs from a network retail pharmacy. In such a case, the enrollee may be obligated to pay the differential between the price of the mail-order pharmacy and the retail pharmacy.	4. LTC PHARMACIES: If CMS proceeds with the notion of including LTC pharmacies within the required network, negotiations would need to be undertaken to define the roles, responsibilities of such LTC pharmacies as well as the price, discounts to be provided to the beneficiary residing at the LTC. The relationship between the LTC Pharmacy and the contracting payer will enter into the process and may thus preclude a practical role for a PBM serving a MA PD. This portion of costs may be best addressed in the payer contract with CMS. Relative to special clinical services provided by a LTC pharmacy, we would recommend keeping that component separate from the dispensing fee for providing the appropriate unit dosed product to the LTC for administration to the beneficiary. A bundled cost does not allow effective negotiation. LTC Pharmacies are required by state and federal law to provide a range of consulting and clinical services somewhat similar but less stringent than an inpatient hospital setting. Negotiation of their prices via a PBM network concept may run contrary to the contract between the LTC FACILITY and the LTC CONTRACTED PHARMACY. There are financial relationships and margins in which the PBM or MA-PD will be viewed as an interloper. There may be opportunities for residents of LTC facilities to have their prescriptions filled OUTSIDE of the LTC Facility/contracted LTC Pharmacy and delivered to the facility in appropriate UNIT DOSE (Unit of use) containers. Potential savings may be achieved therein, but there will be resistance from the LTC facility and pharmacy as it changes their usual processes and will require the contracted LTC pharmacy to examine the drugs to assure they are correct. This is another complex area which has been far removed from public debate.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	Access to covered Part D drugs (§423.120) (Continued)	5. MedImpact currently contracts with over 50,000 pharmacies nationally. The Service Agreement language is consistent throughout. However, financial terms, reimbursement, conditions required by a plan sponsor, credentialing, state or local legal requirements may compel differences. The Service Areas have not yet been defined by CMS and these SAs may cut across multiple states. It is NOT feasible to have a singular "standard" contract for participation. Also, given the necessity to develop actuarially equivalent benefit designs which suggest total cost equivalence, the PBM or MA-PD must be given the flexibility to use all the tools at its disposal to help manage costs and utilization. The network contract is a financial management tool on behalf of the Plan Sponsor. A MA-PD or PDP may need to have customized networks with tiered pricing and reimbursement in a same Service Area. Credentialing requirements pursuant to Medication Therapy Management may further define capacity to participate within a network. Thus, we support the notion of distinctions between "preferred" and "non-preferred" pharmacies within a network. We support the ideas suggested in the access requirements relative to mail, rural, cost share, and price differentiation within a network. We therefore concur with inclusion of such differential costs towards the incurred costs. 6. With the noted comments above, we can provide focused networks for MA-PD clients requiring such to expand beyond their integrated models. In such instance benefit designs with price differentiation would suffice to allow a balance of choice and cost management.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***

46659 46659 423.120 C.4.b P 111	*P&T Committee membership* "The majority of members comprising the P&T Committee would be required to be practicing physicians and/or practicing pharmacists. In addition, at least one practicing pharmacist and one practicing physician member would have to be experts in the care of elderly and disabled individuals." "Section §423.120(b)(1)(ii) of the proposed rule also provides that at least one practicing pharmacist and one practicing physician members on a plan's P&T Committee be independent experts. We interpret the statutory language at section 1860D-4(b)(3)(A)(ii) of the Act requiring certain members of the P&T Committee to be 'independent and free of conflict with respect to sponsor and plan' to mean that such P&T committee members must have no stake, financial or otherwise, in formulary determinations."	1. In order to comply with these proposed regulations, the P&T memberships will need to include at least one physician and pharmacist who specialize in the care of the elderly and disabled individuals for each P&T Committee. The key term is "at least one practicing pharmacist and one practicing physician member would have to be experts in the care of the elderly and disabled." This language suggests having geriatricians available to serve on P & T. Disabled is difficult to define as there are a host of disease which create eligibility for disability benefits. W e recommend that a broad interpretation of "expert" be applied in that many internists and family practitioners care for the elderly and would certainly be considered "experts". We would venture to guess that there are not enough board certified geriatricians available to serve on all the P & Ts across the nation. Nor are there likewise enough geriatric specialty pharmacists available. The key focus would be on appropriate dosage and posology for our senior population. The assignment of members to P & T is usually a CMO or Medical Staff process. We are confident that the Chairs of the P & T committees can appropriately assess the membership roster to determine which member has the appropriate "expert" credentials or whether there is a need to expand the membership to ensure such representation. 2. What is the CMS definition of a practicing pharmacist? Pharmacists may be experts in geriatrics care from a wide range of practice settings which include ambulatory clinical, LTC, dispensing to nursing homes, and even pharmacokinetics experts. The latter are experts in metabolism, excretion, and impact of age on the patients' ability to tolerate drugs. We wish to emphasize that practicing is much broader than dispensing. 3. Relative to the terminology "independent and free of conflict with respect to the sponsor and plan", we would like CMS to expand upon the associated term "independent and free of conflict with respect not only to a PDP sponsor and its prescription drug plan or an organization and its MA-PD plan, but also with respect to pharmaceutical manufacturers." Does this mean that MA-PDs must contract or hire consultant pharmacists and physicians to fulfill this role? How is the confidentiality of proprietary data protected? Does employment or contracting with a MA-PD plan preclude a physician or pharmacist from participation in its P & T? We would argue that physicians employed as part of group where the group subscribes to strong principles of responsibility will be much less at risk of financial influence than in other more independent practice modes which lack group guidance and commitment to core principles.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	P&T Committee membership (Continued)	In our situation, P & T members are NOT compensated for these roles to assure optimal objectivity. We believe that our P & T is free of conflict based upon stringent qualification rules. Total independence would require CONTRACTING and paying for consultants with defined contractual agreements to roles, responsibilities, and confidentiality which increases administrative costs. There is significant preparation time prior to meetings. We would envision such contracted physicians and pharmacists potentially serving competing MA-PDs. Also, nationally recognized physician experts in key therapeutic arenas frequently do presentations or attend advisory boards or panels sponsored by pharmaceutical industry. Does this type of relationship between physicians and pharma preclude participation on a P & T? Seeking physician experts from teaching hospitals and universities may likewise create problems in that research grants are frequently provided by pharmaceutical industry. Does having received such a grant preclude participation on a P & T? It may be interesting to have CMS solicit a panel of experts to develop a strawman or model selection criteria and Principles of Responsibility statement for P & T membership. "No Stake, financial or otherwise, in formulary determinations" for independent P & T members suggests that other P & T members attached to a MA or MA-PD are not capable of appropriate clinical decisions based on quality and affordability.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	USP model formulary "Although the USP will develop guidelines, under section 1860D-4(b)(3) of the Act PDP sponsors and MA organizations would have the flexibility to develop their own classification schemes." "If, on the other hand a PDP sponsor or MA organization offering an MA-PD plan designs its own formulary using therapeutic classes that vary from the USP classification model, CMS would evaluate the submitted formulary design to ensure that the proposed therapeutic classification system does not substantially discourage enrollment by certain Part D eligible individuals." "We interpret this requirement to mean that a PDP sponsor or MA organization's formulary be required to include at least two drugs within each therapeutic category and class of covered Part D drugs within the PDP sponsor or MA organization's formulary."	1. This section could be problematic for those drugs in which currently only one drug exists, but a "me-too" enters the market. Would we be obligated to add the "me-too" drug to the formulary for the sole purpose of meeting the two drug/class requirement? 2. We envision the USP draft model guidelines as exactly that: Model Guidelines to be finalized. It is up to the PDP and MA-PD to match or enhance this guideline to be competitive in the marketplace with a high quality, affordable, and accessible drug benefit. We would oppose developing stringent mandatory rules and support options and choices for the MA-PD and PDP which will be reflective of their organizations philosophy and commitment to serve the beneficiary population. The beneficiary will make the consumer choice for a PDP or MA PD plan. 3. What will be the CMS process for reviewing formularies to assure actuarial equivalence to Part D standard?
46660 46660 423.120(b)(2) C.4.b P 114	*Formulary coverage of dosages and strengths* "Section 423.120(b)(2) of our proposed rule would also require that the drugs included in each therapeutic class or category include a variety of strengths and doses to the extent that this is feasible."	1. Since we sometimes preferentially use only specific strengths of certain drugs (e.g. Actos 15 mg tablets, Lumigan 2.5 mL bottles), this may be problematic from a contracting perspective if CMS disallows this practice
46661 46661 423.120(b)(3) C.4.b P 115	*Frequency of changes in formulary therapeutic categories and classes* "…PDP sponsors and MA organizations could not change therapeutic categories and classes in a formulary other than at the beginning of a plan year, except as we would permit to take into account new therapeutic uses and newly approved covered Part D drugs."	We believe that this rule will have minimal impact.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
46661 46661 423.120(b)(3) C.4.b P 115	*Frequency of formulary treatment protocol and procedure evaluations* "…PDP sponsors and MA organizations offering MA-PD plans would periodically be required to evaluate and analyze treatment protocols and procedures related to their formularies to ensure that their plan members were receiving the best possible care for conditions related to their use of covered Part D drugs. We invite comments as to minimum timeframes for periodic evaluation of protocols and procedures related to a plan's formulary by PDP plans and MA organizations offering MA-PD plans (for example, quarterly, annually)."	1. This statement appears to require us to review all formulary drugs and formulary guidelines on a routine basis. Recommend that the frequency of the review coincide with the annual formulary review (NCQA requirement?).

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46661 46661 423.120(b)(3) 423.120(b)(5) C.4.b P 115	*Notification to CMS upon removing a drug from the formulary* "…PDP sponsors and MA organizations provide "appropriate notice" to us, affected enrollees, authorized prescribers, pharmacists, and pharmacies regarding any decision to either: (1) Remove a drug from its Formulary, or (2) make any change in the preferred or tiered-cost sharing status of a drug. Section 423.120(b)(5) would implement that requirement by defining appropriate notice as at least 30 days prior to such change taking effect during a given contract year."	1. This requirement will hinder the flexibility of Drug Use Management activities as initiatives may be delayed and the potential to capture maximal cost savings may decrease. 2. Note that the "appropriate notice" is not well-defined. It appears that website postings alone are insufficient for beneficiaries. MedImpact has over 50,000 pharmacies in its networks. We serve several hundred MCOs and employer groups. There are thousands of authorized prescribers contracted to serve the MCOs, TPAs, and employer groups. We anticipate serving a large population of Medicare enrollees. We urge CMS to consider the broad impact of such requirements on systems, communications processes, and costs. Communications to large populations is complex and must rely upon leveraging existing communications within the MCO infrastructure or via electronic mass communications on the internet. We would envision posting updated formularies on a MD-PD website as communications to all enrollees who should have a responsibility to manage their own care and knowledge of services. We would envision constant updates on our adjudication database as our mechanism for real time communication to network pharmacies. It makes NO SENSE to fax paper documents to 50,000 pharmacies. Specific benefit changes relative to tiers and cost share should be communicated as required by state and federal regulations in planned collaterals distributed by MA Plans. PBMs serving as PDPs or MA-PD engines are constantly working with clients to achieve the best possible prices and discounts on drugs. When serving populations, the ability to move quickly to affect the price of millions of prescriptions can save consumers and payers millions of dollars in premiums or direct costs. A formulary is not static. Drugs may be removed for safety reasons such as most recently with Vioxx. Drugs become generic and tiers can change instantly with PBM adjudication systems. If a newly negotiated price on a product available immediately is delayed access to the market, millions of dollars in savings may be lost. Appropriate notice needs to be flexible with reliance upon the MCO or MA PD to undertake business decisions based upon clinical quality and affordability. Benefits designs are usually coordinated on an annual basis for enrollment for the following year.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	Notification to CMS upon removing a drug from the formulary (Continued)	3. For tiered cost sharing status, does this also include drugs that become multi-source or generic? Would members need to wait to take advantage of generic copays until 30 days after it becomes available? 4. For the purposes of tiered cost sharing, we should clearly define the tier for single-source generic drugs (i.e. brand vs. generic copays?). Older generic drugs may become single-source if all other manufacturers elect to discontinue production due to low use and the price for the single-source generic can escalate. CMS needs to be aware that our price files are updated frequently with national database vendors such as FDB.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46661 46661 423.36(b)(2) C.4.b P 116	*Prohibition against removing drugs from the formulary around the coordinated election period* "…PDP sponsors and MA organizations would be prohibited from removing a covered Part D drug or changing its preferred or tiered cost-sharing status of a covered Part D drug between the beginning of the annual coordinated election period described in §423.36(b)(2) and 30 days subsequent to the beginning of the contract year associated with that annual coordinated election period."	1. This requirement will hinder the flexibility of Drug Use Management activities as initiatives may be delayed and our capability to capture maximum cost savings will diminish. We would be unable to remove a drug from the Formulary between Nov 15 and Jan 30 (approximately 2.5 months) in a 12 month period of time. 2. Presumably, this requirement was added to prevent "bait and switch" by MA-PD plans. However, if a drug is slated to be removed from the formulary, would the enrollee be less angry/upset if the drug is removed in February versus a few months earlier? 3. The regulatory effort to protect beneficaries needs to balance the prevention of "bait and switch" with the loss of opportunity to achieve savings for beneficiaries and payors. This rule effectively precludes the ability to exercise formulary changes during 21% of the year (November 15th to January 30th). The frequency of bait and switch may be minimal. Would it be more direct and effective if CMS prohibited bait and switch rather than restrict formulary changes for 2.5 months a year? The prohibition as described can have serious cost consequences and effectively delays potential cost savings. Again, the ability for PBMs, MA-PDs, PDPs to rapidly take advantage of cost savings using our adjudication technology is hindered. There needs to be a balance in interpreting media and consumer concerns with the challenges and opportunities for managing the costs for large populations of potentially high utilizers. Drug costs are about 15% of the total medical costs. A beneficiaries decision to choose a PDP or MA-PD during an ACE period may not be totally focused on the formulary. Are there corresponding restrictions prohibiting surgeons from providing high risk surgeries during open enrollment to minimize adverse media complaints about increased morbidity and mortality for a hospital?

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
46661 46661 xxx.xx C.4.b P 116	*Publication of formularies on public website* "…PDP sponsors and MA organizations can get information regarding formulary changes to beneficiaries via an Internet Web site, as well as via explanations of benefits sent to enrollees who utilize their Part D benefits."	1. This requirement is vague regarding the precise information posted on the website. Do we only need to post drug name, or will we be required to post dosage forms, strengths, package sizes, formulary guidelines etc?
46662 46662 423.124 C.4.c P 117	*Access to out-of-network pharmacies* "…we would require that PDP sponsors and MA organizations offering MA-PD plans assure that their enrollees have adequate access to drugs dispensed at out-of-network pharmacies when they cannot reasonably be expected to obtain covered Part D drugs at a network pharmacy."	1. MedImpact will construct a national network for its MA-PD clients. We anticipate that this network will be more aggressively priced than the cash DDC program. Likewise we are assuming that the network will consist of more than 50,000 pharmacies. We anticipate that OON utilization will be minimal. However, if an emergent situation arises whereby such service is required, we will work with the MA-PD to develop a Direct Member Reimbursement process for the unlikely and rare circumstance. The benefit design and cost share component for this access will be the decision of the MA-PD.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46663 46663 423.124 (a) C.5 P 119	*Incurred costs at out-of-network pharmacies* "When an enrollee purchases a covered Part D drug at an out-of-network pharmacy consistent with §423.124(a) of our proposed rule, the cost-sharing he or she pays relative to the plan allowance….counts as an incurred cost…." "…As with the price differential that a beneficiary could incur by purchasing an extended supply (for example, 90 days) of covered Part D drugs purchased at a retail pharmacy rather than a mail-order (discussed in section II.C.4.a of this preamble), the price differential between out-of-network pharmacies' U&C costs and the plan allowance would also be counted as an incurred costs against a beneficiary's annual out-of-pocket threshold." "Under this approach, plans would be required to explicitly account for such price differentials in the actuarial valuation of their coinsurance in their bids."	1. We can capture accumulator costs for TrOOP if network pharmacies are used. Patients going OON with a covered DMR will be providing us with the information needed to add to the TrOOP. However, there is beneficiary responsibility to provide the needed information. It is difficult if not impossible to forecast such OOP OON incurred costs to build into an actuarial forecast or valuation in a MA PD or PDP bid. To "explicitly account for such" suggests that we have OON data for an heretofore unmanaged population. We will need to make assumptions which may or may be financially fair to the MA-PD, PDP, or CMS as the payor for a segment of the risk. 2. We would ask that CMS consider beneficiary responsibility to use the defined network and to go OON only for emergent needs. If a beneficiary chooses OON for convenience, we would argue that these are costs that the beneficiary chooses to accept. It is not reasonable to have systems or costs incurred to manually track and capture such potentially not covered services for the incurred cost accumulator for annual OOP Threshold.
46663-64 46663-64 423.128 (a) C.6.a P 185	*Content of plan description* "The plan description would include information about …. How any formulary used by the plan works, the process for obtaining an exception to a prescription drug plan's or MA-PD plan's tiered cost sharing structure…..	1. The required information seems reasonable. However, we ask that CMS consider the adverse cost impact of suggesting to beneficiaries that exceptions are easily and readily granted. Physicians contracted to a MA-PD are not direct staff or employees and may be subjected to customer pressure to provide prescriptions for which there are equally efficacious and cost effective drugs. Physicians are under pressure and time constraints and wish to please and can yield easily to patient pressure, especially if they are not at risk for the drug cost. We need to have a balance in this arena to allow the MA PD, PDP, to assert a reasonable level of management on drug spend.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
466664 46664 423.128 (d)(1)(i)(ii) C.6.c P 188	*Call center access* "We strongly recommend, however, that plans provide some sort of 24-hour-a-day/7 day a week access to their toll-free customer call centers in order to provide timely responses to time-sensitive questions"	1. MedImpact STRONGLY opposes the notion of a mandated 24x7 standard for toll free call center access to time sensitive questions such as how to find an OON pharmacy. We are not convinced that finding an OON pharmacy merits the cost investment for such a service by every PDP, MA-PD, PBM. We would imagine such an emergent situation to be truly a medical emergency and may warrant a visit to an emergency department or 24 hour clinic. In that scenario, the patient would be provided the immediate drugs incident to that emergent need. 2. 3. The website strategy for providing information to beneficiaries for pharmacy access is most efficient. Likewise it is our expectation that beneficiaries need to take responsibility for managing their health and medication needs. True emergent needs may require 911 support.
46664 46664 423.128(d)(2)(ii) C.6.c P 189-190	*Website formulary update requirements and access* " In addition, per §§423.128(d)(2)(ii) and (iii) of our proposed rule, plans would have to post current versions of their formularies at least weekly…." "…Plan websites would have to be available both to current and prospective part D enrollees….	1. Our formularies usually change on a quarterly basis, although the P&T Committees do occasionally make formulary decisions outside of a regularly scheduled meeting. Would it be possible to modify this requirement to state that the website will be updated in conjunction with formulary changes? 2. We would request some flexibility on this issue. Theoretically, if formulary changes are prohibited during 21% of the year, no changes need to be posted during that time frame. 3. CMS clearly has concerns regarding deletions. We find that ADDITIONS are made sometimes on a more frequent basis and may occur weekly. New drug strengths and dosage forms are frequently released for existing formulary drugs. The new dosage forms need to be added. Likewise, release of new drugs may require emergent P & T meetings for approval of an advantageous essential new product. Are the rules structured to prevent changes including additions at designated points? There are the formularies which have the list of drugs available for review. There is the formulary used for adjudication which is constantly monitored by staff other than P& T.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections

FR Page #	*Excerpt*	*Comment/Question*
46664 46664 423.128(e)(6) C.6.d P 191	*Monthly explanation of benefits* "We would require, under §423.128(e)(6) of our proposed rule, that an explanation of benefits be provided at least monthly for those utilizing their prescription drug benefits in a given month."	1. The explanation of benefits includes individualized components, such as cumulative YTD cumulative incurred costs and applicable formulary changes. This requirement creates significant systems, operations, and cost issues. The current NCPDP 5.1 Transaction record from the pharmacy will not support the data described for EOB purposes. PBMs have not provided EOB reports prior. Monthly generation and mailing of such a report will create significant added administrative costs. The costs estimated for this requirement must far exceed $1 PMPM in materials, mailing, costs, and time. These dollars may be more effectively spent on drugs rather than reports which should be requested on-line or as information requested by telephone. 2. We would recommend that CMS allow MA PDs, PDPs, sub-contracted PBMs to make the prescription profile with use available on-line at the appropriate website for the plan sponsor. The website could provide access to the accumulator for TrOOP. Likewise, the beneficiary could view a current formulary on-line. Technology will allow the beneficiary to print such data as required. 3. Requirement to produce information about formulary changes is broad. Again, costs associated with generating such a document and mailing on a monthly basis may not be the most efficient use of tax payer dollars. 4. We would urge CMS to consider simplified processes or annualized reporting accessed through the network pharmacy where prescription service is provided. The systems at a pharmacy may be able to provide prescription utilization record for tax purposes and should likewise satisfactory as an EOB. 5. The right to receive an itemized statement may also be noted in the EOC at the time the beneficiary registers with a MA-PD, PDP, or other provider. 6. It would also make more sense to provide the drug use data with the EOB statements MA-PDs, PDPs, will be required to provide to beneficiary for medical and other Medicare costs. PBMs could provide a file of prescriptions filled, accumulator for TrOOP status, to the MCO MA-PD for generation of EOB data within existing infrastructure. It would be more cost effective for quarterly rather than monthly statements.

Subpart C: Voluntary Prescription Drug Benefits and Beneficiary Protections		
FR Page #	***Excerpt***	***Comment/Question***
	Monthly explanation of benefits *(Continued)*	7. The comprehensive information regarding cumulative, YTD amount of benefits relative to deductible, initial coverage limit, and the annual OOP thresholds creates added cost structures which ultimately increases administrative costs to the program and the taxpayer. This will require IT systems development between the MA and its PD subcontractor or provider. PBMs who are considering PDP strategies will have to construct this capability.
46665 46665 423.132 c C.7 P 193	*Disclosure of pricing for equivalent drugs* "…we are permitted to waive the requirement that information on differential prices between a covered Part D drug and generic equivalent covered Part D drugs be made available to prescription drug plan enrollees at the point of sale (or at the time of delivery of a drug purchased through a mail-order pharmacy.)	1. This regulation is currently in effect for DDC and network pharmacies should continue to abide by this codified section. Network agreements developed for the Part D networks will incorporate language re full compliance to 42 CFR 423.132. 2. We do not understand the rationale for waiving this requirement for those plans who employ a wide open unrestricted network. 3. We would recommend that LTC pharmacies disclose the drug price differentials in their contracts to the LTC facilitiy, to payers as well as to individuals responsible for the LTC resident.

Comments on the Proposed Rule on Establishment of the Medicare Advantage Program

CMS – 4068 – P

By

Group Health Cooperative
Seattle Washington

October 4, 2004

Contact: Eileen O'Donnell, odonnell.e@ghc.org, 206.448.6444
Mimi Haley, haley.m@ghc.org, 206.448.6146

I. Background on Group Health Cooperative

Group Health Cooperative ("Group Health") is a consumer-governed nonprofit healthcare system that integrates health coverage with medical care. About 540,000 residents in Washington State and Northern Idaho obtain medical care through Group Health Cooperative health plans. More than 70 percent of our members receive care in Group Health medical facilities.

Group Health was founded in 1947 by a community coalition dedicated to making quality healthcare available and affordable. As one of the few healthcare organizations in the country governed by consumers, the consumer elected board of trustees works closely with internal management and medical staff to ensure that the organization puts the needs of patients first.

Group Health was one of the original participants in the Medicare Risk Share program, contracting with the federal government since 1976 to provide prospectively paid, capitated, care to Medicare beneficiaries. We currently care for approximately 60,000 Medicare members.

Group Health, as an integrated delivery system, already has extensive experience designing, delivering and financing pharmacy benefit plans. Almost all of our 540,000 members, including almost half of our Medicare enrollees (approximately 30,000 members), currently receive their prescription medications through Group Health owned or contracted pharmacies.

II. Provisions of the Proposed Rule

Subpart B – Eligibility, Election and Enrollment

(Sec.423.34, p. 46639)
Dual eligibles. For full-benefit dual eligible individuals enrolled in MA plans, CMS proposes enrolling them in one of the MA-PD plans offered by their MA organization. CMS further proposes that if the basic premium of the MA-PD plan exceeds the low-income benchmark premium amount, CMS would not permit automatic enrollment in the MA-PD plan.

The regulations appear to drive dual eligibles into the lowest cost plan by limiting enrollment into MA-PDs or PDPs that bid at or below the low-income benchmark. We believe that continuity of care should be a paramount concern for CMS, especially for this patient population. Therefore, we request that dual eligibles currently enrolled in a MA plan be enrolled into that organization's MA-PD plan, regardless of that plan's bid amount.

The proposed rules do not contemplate individuals who are currently enrolled in MA plans at the time of initial eligibility for Medicare benefits. Such individuals should also

be auto-enrolled in a MA-PD plan offered by the MA organization in which the individual is enrolled at the time of initial Medicare eligibility. This ensures continuity of care for individuals and minimizes administrative confusion about enrollment.

Finally, it appears that MA-PDs will be excluded from receiving new enrollments of dual eligibles even if the MA-PD plan bid is at or below benchmark, if that individual was not previously enrolled in a MA plan. For purposes of level playing field and beneficiary choice, we believe that MA-PD plans that bid at or below benchmark should be an enrollment option for all dual eligible individuals.

We request that CMS clarify enrollment rules for full-benefit dual eligible individuals as noted above, with attention paid to administrative efficiency as well as enrollee health and continuity of care needs.

Subpart C – Benefits and Beneficiary Protections

(Section 423.100, p. 46646)
Dispensing Fees. CMS requests comments on the preferred option for dispensing fees.

We believe that Option 3 best represents the operational reality for integrated health systems where the financing and delivery of care are integrated. Group Health's clinical pharmacists perform both health plan functions and clinical functions in the course of performing their jobs on all patients regardless of Medicare eligibility status. For this reason, the total cost of providing both health plan and delivery system functions for integrated MA organizations need to be incorporated into the dispensing fees so that the total cost of care for MA-PD plans can be captured.

(Section 423.120(a)(1), p. 46655)
Assuring pharmacy access. PDPs and MA-PDs must have a contracted pharmacy network consisting of pharmacies, other than mail-order pharmacies, that meet certain access standards. These access standards apply differently to urban, suburban and rural areas under which a specified percentage of beneficiaries, on average, must live within specified miles of a network pharmacy. The access standards do not apply to an MA-PD plan that provides enrollees with access to Part D drugs through pharmacies owned and operated by the organization. MA private fee-for-service plans that provide coverage for drugs from all pharmacies without differentials in cost sharing are also not subject to the access standards.

(p.46656)
Long-term care pharmacy access. CMS is expecting that access to covered Part D drugs would be assured through MA-PD plan contracts with participating long term care facilities. CMS invites comments on a requirement for plan sponsors to contract with some or all LTC pharmacies in their areas, in particular how to balance access needs with reasonable dispensing costs associated with such pharmacies.

(p. 46658)
Any willing provider. A PDP sponsor or MA organization is obligated to contract with any pharmacy willing to meet its terms and conditions. PDP sponsors and MA organizations may not require a pharmacy to accept insurance risk as a condition of participation. CMS seeks comments on the idea of plans using a standard contract for such pharmacies.

We believe the draft regulations in these three areas appear overly prescriptive, calling for redundant systems that add cost but no real value to established MCOs. As such, we believe these provisions should be waived in instances where contracting plans can demonstrate adequate compliance with the intent of the law.

Group Health has a contracting process in place that is carefully crafted to meet customer demand, including a process to respond to both pharmacy and patient requests for network pharmacy expansion. Implementing provisions mandating a network for our population of patients would result in increased administrative costs, challenges in coordinating care, member confusion and potential risk to patients. MA organizations already have access standards in place to conform to existing regulations regarding medical care delivery; these standards should suffice for pharmacy access as well. Any willing provider provisions are antithetical to the essence of managed care systems, interfering with coordinated care and quality outcomes.

We strongly believe Tri-care and any willing pharmacy (AWP) provisions should be waived for MA-PD plans – both for plans with owned and operated pharmacies as well as contracted network pharmacies. We will investigate the need to supplement our existing long term care pharmacy with selected vendors as needed, based on quality, access measures and demand by enrollees in our MA-PD plan.

Group Health's current network of 225 pharmacies allows for appropriate quality review. AWP requirements, in principle, violate the basis of defined network, managed care delivery systems that are accountable for both cost- and medical-effectiveness. We would not endorse a standard contract for any participating pharmacy, as each contract would need to be individually structured to meet myriad market specific issues as well as reimbursement, digital connectivity and account administration requirements.

(Section 423.120, p. 46659)
P&T Committee membership. Under the proposed rules, the majority of members comprising the P&T Committee would be practicing physicians and/or practicing pharmacists. In addition, at least one practicing pharmacist and one practicing physician member would have to be experts in the care of elderly and disabled individuals.

This also provides that at least one practicing pharmacist and one practicing physician members on a plan's P&T Committee be independent experts, interpreted by CMS to be 'independent and free of conflict with respect to sponsor and plan' (having no stake, financial or otherwise, in formulary determinations).

CMS seeks comment on whether to limit such outside experts to one each, or to additional physician and pharmacy specialists. CMS also requests comment on whether the determinations of the P&T Committee should be binding on the MA-PD plan.

As with the pharmacy access standards, noted above, the draft regulations in this area are overly prescriptive and propose unacceptable expansion of one of the more troubling aspects of MMA: the composition and scope of MA organization's P&T committees. We believe the regulations should limit themselves to strict interpretation of the law as it is written, and not propose additional representatives to, or binding authority of, the MA organization's P&T Committee.

Group Health has a highly functioning physician led P&T Committee that includes actively practicing physicians and pharmacists from both our integrated group practice as well as our contracted network. It also includes a consumer representative. MMA proposes augmenting MA organization P&T committees with representatives who are independent of the plan and who have highly specialized backgrounds. We believe the degree of specificity related to these additional representatives is a troubling and unprecedented incursion by a payer into MA-PD plan operations. We question the benefit of broadening the current P&T committee composition, which has been an effective and functioning body for current Group Health pharmacy benefit plans and formularies for both commercial and Medicare members. We will seek legislative relief, requesting that this provision be waived for MA-PD plans that demonstrate a well functioning P&T committee with broad committee representation/composition.

In the interim, Group Health requests that the additional representatives proposed for the P&T committee be contracted physicians and pharmacists. Given that all P&T Committee members are compensated for their participation in the committee, we do not believe that "independence" as defined by CMS is operable or necessary for a well-functioning P&T Committee.

(Section 423.120, p. 46660)
Formulary Requirements. CMS seeks to solicit comments on the proposed USP Draft Model Guidelines.

Group Health agrees in principle with the therapeutic categories and classes released in the Draft Model Guidelines. They are an important first step to assist health plans develop formularies that comply with the Medicare Modernization Act. Overall, we believe these Model Guidelines:

1) Give plans the flexibility to drive industry competition and therefore improve affordability of the benefit by allowing either one drug (subdivisions) or two drugs (classes) on the formulary.
2) Allow Medicare beneficiaries a broader array of drugs than two within pharmacologic classes where therapeutics dictate a need for more than two drugs (e.g., insulins).

3) Create choice for both plans and patients choosing plans by allowing flexibility to choose MA-PDs or PDPs with a broader formulary than the model requires so long as the plans adhere to the minimum requirements.
4) Create a reasonable balance of incentives for affordability and choice of drugs available on plan formularies.

(Section 423.124, p. 46662)
Access to out-of-network pharmacies. CMS proposes to require that PDP sponsors and MA organizations offering MA-PD plans assure that their enrollees have adequate access to drugs dispensed at out-of-network pharmacies when they cannot reasonably be expected to obtain covered Part D drugs at a network pharmacy. CMS proposes to meet the requirements of this section by establishing a broader out-of-network access requirement.

We are troubled with such an expansion of out-of-network requirements and that CMS has precipitously abandoned the prudent layperson standard for MA enrollees obtaining medications under the Part D benefit. The out-of-network medical benefit for emergent and urgent care is well-established CMS policy, well understood by beneficiaries, and well managed by existing Medicare contracting organizations. We believe that MA-PD plans should be able to continue to apply this standard for purposes of receiving medications out-of-network. CMS should allow managed care organizations the flexibility to tie receipt of out-of-network emergency pharmacy benefits to receipt of emergent or urgent medical benefits, as those benefits are currently administered.

(Section 423.128, p. 46665)
Monthly explanation of benefits. CMS proposes to require that an explanation of Part D benefits be provided at least monthly for those utilizing their prescription drug benefits in a given month.

The explanation of benefits includes individualized components, such as year-to-date cumulative incurred costs and applicable formulary changes. Distributing this information through the dispensing process may be a preferred route, however we request that that the requirements be changed to allow patients to obtain the EOB at any time upon request rather than monthly. In addition, we support allowing MA organizations to use the required toll-free 1-800 number to supply enrollees with status updates on their true out-of-pocket costs.

In addition, we request elimination of the requirement to inform members of the availability of the lowest cost generic alternative when the prescribing physician or other licensed prescriber has requested that no generic be dispensed (i.e., dispense as written). We believe in such an instance that disclosure of the lower cost alternative would be without value, as it could not be dispensed, per the physician's order.

Subpart F – Submission of Bids and Monthly Beneficiary Premiums; Plan Approval

(Section 423.265, p. 46678)
Specification of information (data, methodologies, assumptions, and data elements related to calculating actuarial equivalence, etc.). We concur with the detailed comments related to these proposed regulations made by AHIP, which encourage CMS to collect only information and data that are necessary to accomplish program objectives and requirements.

(Section 423.272, p 46679)
Review and negotiation of bid and approval of plans submitted by potential PDP sponsors or MA organizations planning to offer MA-PD – General Comments. We strongly concur with the detailed comments related to these proposed regulations made by AHIP on behalf of member plans.

(Section 423.272, p. 46680)
Rebate Reallocation for MA-PD Plans. The bid negotiation process will require resubmission of the bid once the outcome of the National Average is known, since it affects the beneficiary premium. After the rebate reallocation, the bid could either be excessive or insufficient to achieve the desired premium level.

While the bid process proposed in CMS regulations refers to it as a negotiation, it is unclear from the regulations whether this would be a two-way or one-way negotiation between MA organizations and CMS. Please clarify the extent of negotiations that would be allowed under these rules.

Part B Only Beneficiaries. The proposed regulations are silent on bid rules for Part B only enrollees in MA organizations. The eligibility rules for Medicare Part D could be interpreted to mean that Part B only beneficiaries are not eligible to enroll in MA-PD plans. Please clarify the enrollment and offering requirements for this subpopulation of grandfathered enrollees.

Subpart G – Payments to PDP Sponsors and MA Organizations offering MA-PD Plans

(Section 423.322, p. 46686)
Data elements and frequency. CMS requests comments on the content, format, and optimal frequency of data feeds for Part D administration, as well as for the risk-adjustment process, reinsurance subsidy payment, risk-sharing and program audit processes.

Similar to the data submission requirements originally contemplated for risk-adjustments that were significantly reduced based on discussion with M+C plans, we believe that CMS should limit data elements and frequency to those strictly required for reconciliation activities. The depth and breadth of new requirements, for both CMS and for participating PPO, MA or PDP-sponsor organizations, envisioned in toto (?) under MMA, beg for CMS to use expediency and minimalism as criteria for data submission. We believe these criteria should be used for both the data elements and the submission frequency requirements proposed by CMS.

(Section 423.343(a), p. 46693)
Retroactive Adjustment (i.e., reinsurance, low income cost-sharing). CMS is requesting comments on how best to make retroactive adjustments and reconciliations to PDP sponsors: in a lump sum or through monthly apportionment in the next year's payments.

We recommend that CMS pay or collect the difference through a lump sum payment, rather than through apportioning over the future payment year. This would be consistent with how CMS is administering retroactive adjustment for risk adjustment and would enable plans to more accurately track current cash flow. An additional option would be for CMS to allow plans an individual choice of making a lump sum adjustment or applying prospective adjustments through future payment year.

Subpart K – Proposed Application Procedures and Contracts with PDP Sponsors

(p. 46707)
Contracting requirements. We do not believe that the provisions specified in this subpart apply to MA-PDs, as they are inconsistent with terms, definitions and requirements of MA organizations in Title II. However, the proposed regulations of this Title I, Subpart K are so ambiguous and vague as to be unclear whether specific provisions apply to all PDP sponsors, including MA-PDs, or just to PDPs. We request clarification about the provisions, if any, in this subpart that apply to MA-PDs.

Subpart M – Grievances, Coverage, Reconsiderations, and Appeals

(Section 423.578, p. 46720)
Exceptions to tiered-cost sharing structure. CMS is considering a set of rules for exceptions to tiered cost-sharing arrangements that may be problematic to enrollees, including specific criteria that should be included in a PDP.

The proposed criteria would require development of a seemingly complex set of rules to manage these exceptions. In addition to adverse effects, a particular drug may be ineffective for a given patient, which would be another appropriate reason to use an alternative drug. The regulations already specify notification requirements and timelines for changes to the MA-PD plan formulary. Given these, we request a simple exception process for Part D members for exceptions to tiered cost sharing, consistent with the existing requirements for plan exceptions for medical benefits.

(p. 46723)
Employer-sponsored benefits and appeals. CMS is soliciting comments on the degree to which parallel appeal procedures under Part D and ERISA might pose a problem for plans, employers and enrollees.

Currently, MA organizations that contract with CMS have elaborate and functional procedures to process routine and urgent appeals from enrollees or their providers about

benefits and coverage determinations made by the plan. We urge CMS to allow MA organization to process appeals under an employer-sponsored plan as any other appeal. Parallel reviews by both CHDR and the employer group create costly redundancies and potential confusion and/or conflicting determinations.

Subpart P – Premium and Cost-Sharing Subsidies for Low-Income Individuals

(Section 423.800, p. 46732)
CMS seeks comment on the process of CMS notification to the PDP sponsor or MA organization that an individual is eligible for a subsidy and the amount of the subsidy. In addition, CMS requests comment on the process the PDP sponsor or MA organization should use to notify CMS that premiums or cost-sharing have been reduced, including the amount of the reduction.

CMS will be the entity tracking and assigning subsidy amounts for low-income individuals eligible for Part D benefits. In addition, CMS will already have on file each MA-PD or PDP plan available to enrollees in any given geography each year. Therefore, we request that CMS eliminate the requirement that MA-PDs and PDPs notify CMS of premium or cost-share reductions for individual enrollees. Instead, it would be administratively more efficient and less time-consuming if CMS retained the authority to track individual enrollee premium and subsidy amounts, and pay MA or PDP organizations accordingly at time of assignment.

In addition, it may be inferred from the proposed regulations that PDP sponsors, including MA-PDs, are required to calculate and submit separate bids for Low-Income Individuals. We strongly discourage such an idea as actuarially invalid and administratively cumbersome. We request, instead, one MA-PD plan and one bid for all enrollees, with premium discounts and subsidies applied to low-income eligibles as determined by CMS at the time of enrollment.

Subpart R – Payments to Sponsors of Retiree Prescription Drug Plans

(Section 423.884, p. 46743)
Data Reporting. CMS requests comments on the approach that employer group sponsors would be required to use for requesting a subsidy payment, including the timeframe for reporting and the proposed information list for submittal.

It is our experience that the timeframes proposed by CMS would be incompatible with the open enrollment season of most employer groups; however, we will defer to comments submitted by such employer sponsors for this proposed requirement.

It is likely that employer groups seeking subsidy payments for prescription drug benefit plans will require that data elements be supplied by the contracted MA-PD or PDP organization. Therefore, we request that CMS limit required data to those minimally necessary to calculate the subsidy amount, consistent with current requirements for risk-adjusters. In addition, we question the ability of employer groups to have access to many

of the proposed data elements without violation of HIPAA privacy and state patient confidentiality laws currently in force and request that CMS ensure compatibility between these proposed regulations and existing federal and state laws.

GENERAL

GENERAL

The disabled community has worked hard to get prescription coverage with the medicaid buy-in for working disabled. It's unfair that new laws want to take away prescription coverage for people on both medicare and medicaid. This would be a disincentive for people to go back to work. The disabled community is already at a disadvantage in life. You would be creating more obstacles in our struggle to better our living conditions. I hope you look at other options and help our community. Thank you

Re: Medicare Program; Medicare Prescription Drug Benefit
Comments on Proposed Rule
69 Federal Register 46632

Volunteers of America welcomes the opportunity to provide comments on the proposed rule. Volunteers of America is a national, nonprofit, faith based housing and human services organization. Through our local affiliates and National Services Board, we serve thousands of low-income persons who rely on prescription drugs as part of their daily regimen, including older adults with chronic care needs and people with mental retardation and other developmental disabilities.

We are concerned that the proposed rule does not provide sufficient protections for the 13 million Medicare beneficiaries with disabilities and chronic health conditions. The following are six critical recommendations:

1. **Delay the implementation of the Part D program for dual eligibles.**

Dual eligibles (Medicare beneficiaries who also have Medicaid coverage) have more extensive needs and lower incomes than the rest of the Medicare population. They also rely extensively on prescription drug coverage to maintain basic health needs and are the poorest and most vulnerable of all Medicare beneficiaries. We are very concerned that there is not enough time to adequately address how drug coverage for these beneficiaries will be transferred to Medicare on Jan. 1, 2006.

CMS and the private plans that will offer prescription drug coverage through the Part D program are faced with serious time constraints to implement a prescription drug benefit staring on January 1, 2006. This does not take into consideration the unique and complex set of issues raised by the dual eligible population. Given the high improbability that it is possible to identify, educate, and enroll 6.4 million dual-eligibles in six weeks (from November 15th – the beginning of the enrollment period to January 1, 2006), we strongly recommend that transfer of drug coverage from Medicaid to Medicare for dual eligibles be delayed by at least six months. We view this as critical to the successful implementation of the Part D program and absolutely essential to protect the health and safety of the sickest and most vulnerable group of Medicare beneficiaries. We recognize that this may require a legislative change and hope that CMS will actively support such legislation in the current session of Congress.

2. **Fund collaborative partnerships with organizations representing people with disabilities are critical to an effective outreach and enrollment process.**

Targeted outreach to Medicare beneficiaries with disabilities, especially those with low-incomes, is vitally important in the enrollment process. We strongly recommend CMS develop a specific plan for facilitating enrollment of beneficiaries with disabilities in each region that incorporates collaborative partnerships with state and local agencies and disability advocacy organizations.

3. **Designate special populations who will receive affordable access to an alternative, flexible formulary.**

For people with serious and complex medical conditions, access to the right medications can make the difference between living in the community, being employed and leading a healthy and productive life on the one hand; and facing bed rest, unnecessary hospitalizations and even death, on the other. Often, people with disabilities need access to the newest medications, because they have fewer side effects, and may represent a better treatment option than older less expensive drugs. Many individuals have multiple disabilities and health conditions making drug interactions a common problem.

Frequently, extended release versions of medications are needed to effectively manage these serious and complex medical conditions. In other cases, specific drugs are needed to support adherence to a treatment regimen. Individuals with cognitive impairments may be less able to articulate problems with side effects making it more important for the doctor to be able to prescribe the best medication for the individual. Often that process takes time since many people with significant disabilities must try multiple medications, and only after much experimentation, find the medication that is most effective for their circumstance. The consequences of denying the appropriate medication for an individual with a disability or chronic health condition are serious and can include injury, debilitating side effects, hospitalization, or other types of costly medical interventions.

We strongly support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs, and the enormous potential for serious harm (including death) if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must have access to all medically necessary prescription drugs at a plan's preferred level of cost-sharing. We recommend that this treatment apply to the following overlapping special populations:

- people who are dually eligible for Medicare and Medicaid;
- people who live in nursing homes, ICF-MRs and other residential facilities;
- people who have life threatening conditions; and

- people who have pharmacologically complex condition such as epilepsy, Alzheimer's disease, multiple sclerosis, mental illness, and HIV/AIDS.

4. Impose new limits on cost management tools.

In addition to providing for special treatment for certain special populations, we urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. We strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We urge CMS to prohibit or place limits on the use of certain cost containment policies, such as unlimited tiered cost sharing, dispensing limits, therapeutic substitution, mandatory generic substitution for narrow therapeutic index drugs, or prior authorization.

We are also concerned that regulations will create barriers to having the doctor prescribe the best medication for the individual including off-label uses of medications, which are common for many conditions. We strongly recommend that the final rule prohibit plans from placing limits on the amount, duration and scope of coverage for covered part D drugs.

5. Strengthen and improve inadequate and unworkable exceptions and appeals processes.

We are also concerned that the appeals processes outlined in the proposed rule are overly complex, drawn-out, and inaccessible to beneficiaries with disabilities. We strongly recommend CMS establish a simpler process that puts a priority on ensuring ease of access and rapid results for beneficiaries and their doctors and includes a truly expedited exceptions process for individuals with immediate needs. We believe that the proposed rule fails to meet Constitutional due process requirements and fails to satisfy the requirements of the statute. Under the proposed rule, there are too many levels of internal appeal that a beneficiary must request from the drug plan before receiving an independent review by an administrative law judge (ALJ). Additionally, the timeframes for plan decisions are unreasonably long.

The provisions in the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) that call for the creation of an exceptions process are a critical consumer protection that, if properly crafted through enforceable regulations, could ensure that the unique and complex needs of people with disabilities receive a quick and individualized coverage determination for on-formulary and off-formulary drugs.

As structured in the proposed rule, however, the exceptions process would not serve a positive role for ensuring access to medically necessary covered Part D drugs. Rather, the exceptions process only adds to the burden on beneficiaries and physicians by creating an ineffectual and unfair process before an individual can access an already

inadequate grievance and appeals process. We recommend that CMS revamp the exceptions process to:

- Establish clear standards by which prescription drug plans must evaluate all exceptions requests;
- Minimize the time and evidence burdens on treating physicians; and
- Ensure that all drugs provided through the exceptions process are made available at the preferred level of cost-sharing.

6. Require plans to dispense a temporary supply of drugs in emergencies:

The proposed system does not ensure that beneficiaries' rights are protected and does not guarantee beneficiaries have access to needed medications. For many individuals with disabilities such as epilepsy, mental illness or HIV, treatment interruptions can lead to serious short-term and long-term problems. For this reasons the final rule must provide for dispensing an emergency supply of drugs pending the resolution of an exception request or pending resolution of an appeal.

Thank you for your consideration of our views.

Sincerely,

Ronald H. Field
Vice President of Public Policy

The provisions in the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) that call for the creation of an exceptions process are a critical consumer protection that, if properly crafted through enforceable regulations, could ensure that the unique and complex needs of people with disabilities receive a quick and individualized coverage determination for on-formulary and off-formulary drugs.

As structured in the proposed rule, however, the exceptions process would not serve a positive role for ensuring access to medically necessary covered Part D drugs. Rather, the exceptions process only adds to the burden on beneficiaries and physicians by creating an ineffectual and unfair process before an individual can access an already

inadequate grievance and appeals process. We recommend that CMS revamp the exceptions process to:

- Establish clear standards by which prescription drug plans must evaluate all exceptions requests;
- Minimize the time and evidence burdens on treating physicians; and
- Ensure that all drugs provided through the exceptions process are made available at the preferred level of cost-sharing.

6. Require plans to dispense a temporary supply of drugs in emergencies:

The proposed system does not ensure that beneficiaries' rights are protected and does not guarantee beneficiaries have access to needed medications. For many individuals with disabilities such as epilepsy, mental illness or HIV, treatment interruptions can lead to serious short-term and long-term problems. For this reasons the final rule must provide for dispensing an emergency supply of drugs pending the resolution of an exception request or pending resolution of an appeal.

Thank you for your consideration of our views.

Sincerely,

Ronald H. Field
Vice President of Public Policy

Re: Comments on Medicare Prescription Drug Benefit

Highmark Inc. and its wholly owned subsidiary, Keystone Health Plan West, Inc. (collectively referred to herein as "Highmark"), are submitting the following comments on the proposed rule implementing provisions of the Medicare Program: Medicare Prescription Drug Plan.

Highmark is uniquely qualified to comment on the proposed rule. We have been offering MA (formerly Medicare+Choice) products with prescription drug benefits to Medicare eligibles in western Pennsylvania for almost 10 years. Highmark's MA Health Maintenance Organization (HMO), SecurityBlue, is currently one of the largest MA plans in the country with over 180,000 members. Given our experience and success offering seniors prescription drug coverage, we believe that we can provide valuable comments on the proposed rule.

Finally, while we largely agree with the comments the Blue Cross Blue Shield Association and America's Health Insurance Plans have submitted, we feel it is important to comment further in a few key areas.

Subpart B – Eligibility and Enrollment

§423.34 Part D Enrollment Process (§423.34; P: 46638; R: 46811)

Highmark Comment: Dual eligibles should be assigned randomly by CMS, if an eligible does not select a Part D carrier. In addition, if a partnership exists between a PDP and a Medicaid HMO, the PDP should be permitted to provide a smooth transition into its plan for any willing dual eligible.

§423.44 Disenrollment by the PDP (§423.44; P: 46641; R: 46812)

Highmark Comment: Highmark agrees with AHIP concerning members who change their permanent address. If a member permanently moves outside of a region, the member should be allowed to stay with their original plan for a specified amount of time.

However, if the plan does not have the capabilities to provide the member with Part D benefits outside the region, the plan should be permitted to disenroll the member. If the plan decides to disenroll, it must provide the member with 60 days notice.

Subpart C – Benefits and Beneficiary Protections

§423.120 Access to Covered Part D Drugs; Pharmacy Access Standards (§423.120; P: 46655; R: 46818)

Highmark Comment: Contracts with pharmacies cannot be uniform as some pharmacies specialize in particular drugs (i.e., injectables) and are able to offer much lower prices than retail pharmacies. Furthermore, specialty pharmacies are able to deliver additional services such as prior authorizations for these drugs. Because a PDP often only wants to coordinate with one entity for such services, contracting with any willing provider would be administratively burdensome and costly for a PDP. Highmark recommends that contracts with pharmacies do not have to be uniform and available to all willing pharmacies.

§423.128 Dissemination of Plan Information; Disclosure of Information upon Request (§423.128; P: 46663; R: 46819)

Highmark Comment: Highmark agrees that description information regarding Part D plans should be available on a website; however, online application and enrollment should not be mandatory. Until seniors, PDPs, and CMS become more familiar with Part D, mandatory online enrollment may be more burdensome than efficient. In addition, the majority of seniors do not use the Internet.

Subpart D – Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans

§423.159 Electronic Prescription Program (§423.159; P: 46670; R: 46821)

Highmark Comment: There is not adequate industry experience to waive the ePrescribing pilot. Until systems in local communities can communicate, ePrescribing should be supported on a voluntary basis. This support could be in the form of incentives and/ or federally funded activities such as educational ad campaigns and pilots.

CMS also requested comments for determining metrics to track the success of ePrescribing. Highmark believes progress should be noted by the number of electronic prescriptions per provider, the amount of increase in generic fill rate and formulary compliance.

Finally, ePrescribing will help CMS mitigate rising drug costs by increasing formulary adherence, increasing generic fill rate, increasing patient compliance where in turn should

decrease hospital admissions, and increase opportunities for patient care coordination through shared data.

Subpart I – Organization Compliance with State Law and Preemption by Federal Law

§423.440 Preemption of State Laws and Prohibition of Premium Taxes (§423.440; P: 46696; R: 46831)

Highmark Comment: Title II of the MMA (Part C, Medicare Advantage) provides for a sweeping federal preemption of state law, replacing the old narrow provision with a broader preemption providing that "State laws are presumed to be preempted unless they fall into two specified categories [state licensing laws or state laws relating to plan solvency]." (Preamble 46904). In contrast, the guidance for the Title I (Part D, drug benefit) preemption provision limits federal preemption, even though the preemption provisions in both Title I and Title II are virtually identical. Title I guidance states that "to the extent there are Federal standards, those standards supersede any State Law." (Preamble 46696). Under Title I, the preemption authority only applies if there is an extant federal rule that trumps an analogous state rule, rather than having all relevant state laws preempted unless they relate to licensing or solvency. This drastically limits the federal preemption on the Title I side as compared to that on the Title II side.

Nothing in the guidance for Title I suggests that Congress intended the preemption under Title I to be narrower than that under Title II. As Congress intended both MA programs and Part D drug programs to operate as federal programs under federal rules, we ask CMS to conform the Title I guidance to that in Title II to support a broad federal preemption in both Title I and Title II.

Subpart J – Coordination Under Part D Plans with Other Prescription Drug Coverage

§423.464 Coordination of Benefits with Other Providers of Prescription Drug Coverage (§423.464; P: 46700; R: 46832)

Highmark Comment: Currently many Health Plans do not include coordination of benefits (COB) within the scope of managing the prescription drug benefit. This is primarily due to the lack of adequate "other insurance data" collected/exchanged/updated from business partners (groups).

While most PBM's can perform COB at the point-of-sale, they need complete/accurate data. Because this is not readily available (e.g., PACE information is only available monthly), implementing such a process would be challenging on a real time basis. Therefore, Highmark supports Option 2 whereby CMS contracts with a TrOOP facilitator. We also support the comments provided by Medco, our PBM, on this matter. In summary, the facilitator would act as the single point of contact for several purposes, such as: matching claims, helping to determine final beneficiary costs. Finally, because

this will be difficult to achieve, plans should be permitted to conduct COB on a monthly or yearly basis.

Subpart M – Grievances, Coverage Determinations and Appeals

§423.590 Appeals; Redeterminations (§423.580; P: 46721; R: 46845)

Highmark Comment: The proposed regulations allow for oral standard appeals. This is a change from current MA regulations and could pose an administrative burden on the PDPs by increasing the number of appeals and also making it difficult to distinguish between appeals and questions. We recommend that appeals be made in the same manner MA appeals are currently handled.

Subpart R– Payments to Sponsors of Retiree Prescription Drug Plans

§423.882 Definitions (§423.882; P: 46737; R: 46858)

Highmark Comment: Highmark receives drug rebate payments an average of 8 months after the incurred date of the claim. Approximately 10% of rebates are paid more than a year after the incurred date of the claim.

The most straightforward solution would be to:

1. Calculate the actual drug payments between the cost limit and threshold for each member and add these amounts at the group level.
2. Calculate a good faith anticipated rebate (percentage of allowances) across the entire book-of-business based on historical data.
3. Calculate the group level subsidy-eligible payments by reducing the aggregate group payment amount by the anticipated rebate.

Although a true-up calculation at a later date may be possible, it is not recommended. A true-up based on actual rebates at the member level is not possible under current rebate arrangements since rebates are not tracked at the member level. A true-up based on actual rebates at the group level would be more costly in terms of administrative expenses, but (assuming the aggregate rebate estimate was accurate) represent a zero-sum gain to the system as a whole. Any reductions in the estimated rebates for some groups would be offset by increases in the estimated rebates for other groups. There would be no net effect on the level of total government subsidies. If the aggregate rebate estimate was incorrect, there are 3 likely scenarios:

1. The aggregate rebate is fluctuating. In this case, overpayments in some years will (for all practical purposes) balance out against underpayments in other years.
2. The aggregate rebate is increasing. In this case, the government will save a small amount of money by paying lower subsidies than it would pay if the aggregate rebate estimate had been more accurate.

3. The aggregate rebate is decreasing. In this case, the government will lose a small amount of money by paying higher subsidies than would have been paid if the aggregate rebate estimate had been more accurate. This problem is self-solving since, unless the downward trend ceases or is reversed, rebates and the problem of how to account for them would eventually disappear.

If the government believes that a true-up is absolutely necessary, then the true-up should be based on an aggregate rebate (percent of allowances) calculated at least 2 years after the incurred date of the claim. This would, however, add significant administrative expenses to the system without adding much value. If a true-up is required, we recommend that it occur infrequently to limit administrative expenses.

§423.888 Payment Methods, Including Provision of Necessary Information; Payment Methodology (§423.888; P: 46745; R: 46859)

Highmark Comment: CMS is seeking comments on the Payment Methodology for disbursing subsidies to plan sponsors. We suggest that Option 3 be removed, as a monthly process creates a significant burden both on plan sponsors and MA organizations assisting them. Option 2, making interim payments throughout the year, is acceptable if payment is quarterly. Option 1 is most preferable, as it would significantly reduce administrative costs and data collection burdens. Regarding periodicity, we suggest that quarterly disbursement be the standard if Option 2 is chosen, as plan sponsors would still be able to receive regular subsidy payments but the administrative burdens would be more reasonable for smaller businesses with fewer employees.

Thank you for your consideration of these comments. We look forward to working with you to determine the most efficient way to roll out Part D. If you need any further explanation or assistance, please contact me at **sandra.tomlinson@highmark.com** or 412-544-7646.

Sincerely,

Re: CMS-4068-P (Medicare Program; Medicare Prescription Drug Benefit)

Dear Dr. McClellan:

GlaxoSmithKline ("GSK") appreciates this opportunity to comment on the Centers for Medicare and Medicaid Services' ("CMS") Proposed Rule regarding the establishment of a Medicare Prescription Drug Benefit, published in the Federal Register on August 3, 2004 (the "Proposed Rule"),[1] pursuant to the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 ("MMA").[2] GSK is a world leading research-based pharmaceutical company with a mission to improve the quality of human life by enabling people to do more, feel better, and live longer.

GSK applauds CMS for acting quickly to implement the Medicare Prescription Drug, Improvement, and Modernization Act ("MMA"). We are well aware that the MMA has placed an enormous responsibility on the agency to make complex changes to the Medicare program in a short period of time. We appreciate CMS's efforts to appropriately implement the Part D prescription drug benefit. As CMS continues to refine its implementation of the MMA, we hope that it will remain open to comments and dialogue with affected entities and continue to provide clear written guidance to manufacturers on its website or through other means.

Most of our comments focus on protecting patient access to prescription drugs. While the new Medicare prescription drug program holds the potential to greatly increase Medicare enrollees' access to prescription drugs, we are concerned that this access may not be fully realized because of limitations in how the Part D is implemented, most particularly with respect to the design of plan formularies and the limits of a burdensome appeals process.

Following are GSK's detailed comments to the Proposed Rule.

---

[1] 69 Fed. Reg. 46632 (Aug. 3, 2004).

[2] GSK also is a member of both the Pharmaceutical Research and Manufacturers of America ("PhRMA") and the Biotechnology Industry Organization ("BIO") and fully supports those associations' comments to the Proposed Rule.

I. Subpart C -- Evaluation of a Plan's Design and Formulary Review -- § 423.272(b)(2)

CMS needs to carefully scrutinize formularies and formulary design to ensure that certain groups of Medicare enrollees are not discouraged from enrolling in part D plans.

- **GSK recommends that CMS revise §423.272(b)(2) to establish the two separate types of reviews required by statute—one establishing the general review of plan design for risk avoidance characteristics and the second based on criteria for formulary categories and classes.**

- **Also, CMS needs to clarify that the access criteria in section 423.120 are of no relevance for the general risk selection review of plan design under 423.272(b)(2).**

- **Lastly, GSK urges CMS to establish guidelines to be used for its general risk avoidance review of a plan's design that considers, among other things, clinically recognized treatment guidelines for particular diseases or conditions.**

Congress deemed it critical to the structure and success of the Part D benefit that Part D plans not be able to engage in risk selection. The market mechanism being created for part D will not work either to attract beneficiaries to enroll in this optional benefit or to fairly apportion risk among participating Part D plans if entities are able to explicitly or implicitly discourage enrollment by individuals whose care requires specific and/or multiple medications. Under the plain language of the statute, CMS review of a "plan benefit design" not only must encompass the "design of categories and classes" but also must identify **any** feature that would tend to explicitly or implicitly serve as a risk avoidance mechanism by discouraging patients with specific medical conditions from enrolling in that plan. This means that CMS review must also include the plan's formulary management interventions, including formulary tiers, prior authorization, step therapy, and cost sharing.

In our view, the Proposed Rule does not adequately protect against the risk that certain populations of Medicare enrollees will be discouraged from enrolling in Part D plans. CMS has stated that the agency will evaluate a Part D plan's formulary to ensure that the plan has not designed its formulary to discourage the enrollment of certain groups of Medicare beneficiaries[3] – for example, those with diseases or conditions that require significant prescription drug therapies. However, the Proposed Rule at section 423.272(b)(2) can be read as combining the CMS review of risk avoidance as a general matter, with the criteria for meeting but one of many of the elements to be reviewed, i.e., the single characteristic of plan design (categories and classes).

[3] Proposed 42 C.F.R. § 423.272(b)(2).

GSK recommends that the regulation be changed to conform to the statute by separating out measures that may be used by Part D plans to satisfy the "category and class" element from the general requirement that plan design (including formulary management interventions and formulary tiers) cannot discourage enrollment. CMS must clearly separate the general risk avoidance review and any criteria that CMS may apply from guidelines developed pursuant to the statute (i.e. USP Model Guidelines) for ensuring that the formulary categories and classes satisfy the nondiscrimination requirement. This distinction requires that section 423.272(b)(2) be rewritten to establish the two separate types of review required by the statutory authority – one establishing the general review of plan design for risk avoidance characteristics and the second based on criteria for formulary categories and classes.

The MMA explicitly states:

> "The Secretary may approve a prescription drug plan only if"[4] (among other things) "[t]he Secretary does not find that the design of the plan and its benefits … are likely to substantially discourage enrollment by certain part D eligible individuals."[5]

The statutory language is clear that the "design of the plan" being reviewed by CMS under MMA clause 1860D-11(e) (2) (D) (i) of the law is not limited to a list of covered drugs. The statute explicitly states that the review is of the *plan benefit design*, which may include prior authorization, step therapy, and clinical limitations on coverage of specific drugs, as well as the formulary, its categories and classes, *and* any "tiered formulary structure" for co-payments by beneficiaries. It is an entirely *separate* clause of the statute which provides that "the design of categories and classes within a formulary" cannot be the basis for finding that a formulary and its tiered structure discourage enrollment, if the categories and classes used by the Part D plan are "consistent with" the United States Pharmacopeia ("USP") guidelines.[6] Thus, the language of the statute is clear that the use of USP categories and classes under MMA clause 1860D-11(e)(2)(D) (ii) will satisfy merely one of the multiple points of review that the Secretary is required to make under clause (D)(i).

The explicit requirements of the MMA notwithstanding, the reasons for our recommended clarification to Proposed Rule section 423.272(b)(2) are straightforward and will further Congressional intent. First, formularies are clinical tools that must reflect the current state of science and clinical practice for the diseases that physicians treat. The MMA explicitly requires Part D plans to provide information to prospective enrollees about the plans' formularies prior to enrollment. Thus, the statute clearly contemplates that for a person already receiving

---

[4] SSA § 1860D-11(e)(2).

[5] SSA § 1860D-11(e)(2)(D)(i).

[6] SSA § 1860D-11(e)(2)(D)(ii).

medical care for a medical condition, a plan whose design (including formulary, formulary tiers, authorization, and step therapy) does not provide access to drugs consistent with up-to-date medical practice is not a viable option for enrollment. It would be inconsistent with Congress's intent, therefore, to allow a plan to satisfy the requirement that it not be designed "to discourage enrollment by certain part D eligible individuals" simply by using the formulary categories and classes designed by the USP and ensuring that there are a specified number of drugs in each of those categories.

Second, unless CMS clarifies Proposed Rule Section 423.272(b)(2) as recommended above, prospective bidders are likely to be misled about the nature of the risk avoidance review, particularly in light of statements in the commentary to the Proposed Rules[7] and section 423.120(b)(2) of the regulation relating to minimal formulary criteria for assuring access to drugs.[8] For example, in the minimum formulary access provisions (discussed below), CMS has said that it is possible for an adequate formulary to include *only* two drugs per class. If a simple numerical criterion together with use of the USP categories and classes would assure passage of this review, the Proposed Rule would be inconsistent with the statute as a legal matter and would not achieve the stated objective of avoiding the risk that certain populations of Medicare enrollees will be discouraged from enrolling in Part D plans.

Another concern with the current draft of the Proposed Rule is that combining the requirements of sections 423.272(b) (2) and 423.120(b) (3) does not assure clinically sound formularies. The USP categories and classes that are being developed for use by CMS for the review of this one element of plan design may or may not be an appropriate clinical foundation for assuring access to medically appropriate care under part D. GSK understands that the evaluation of the adequacy of the model categories and classes designed by USP is ongoing, and we have urged USP to substantially revise its model guidelines to better reflect accepted medical practice and nationally recognized treatment guidelines. (GSK's comments filed with USP on September 17, 2004, are attached.) Even if there could be agreement on the structure of categories and classes to be used in formulary design, it would not be clinically valid to decide a priori that a specific number of drugs – and the same number for each class – will always be sufficient to provide access to care. Rather, Congress's use of the plural form "drugs" in referring to formulary access is meant to ensure that physicians and patients always have a choice of therapy options, in recognition that medical care in the 21st century is increasingly personalized to meet the specific characteristics of the disease, the patient, and his or her current condition.

---

[7] 69 Fed. Reg. at 46660. This portion of the commentary states, "The USP listing would simply serve as a model set of guidelines. As specified in 1860D-11(e)(2)(d)(ii) of the Act, if the therapeutic classifications within a plan's formulary conform to the USP classifications, we could not determine, based on the formulary's therapeutic classifications, that the plan violates the provision at 1860D-11(e)(2)(d)(i) of the Act and section 423.272(b)(2) that prohibits the design of the plan and its benefits (including any formulary and tiered formulary structure) that substantially discourages enrollment by certain Part D eligible individuals."

[8] 42 C.F.R. § 423.120(b)(2).

CMS should clarify in the final rule that the access criteria in section 423.120 are of no relevance for the general risk selection review of plan design under 423.272(b) (2). Rather, the criteria in section 423.120 are minimal guidelines for ensuring a choice of therapy alternatives when developing a formulary. A Pharmacy and Therapeutics Committee should use sound clinical judgment to create the list of drugs covered by the plan, taking into account authorization requirements, clinical guidelines and step therapy, as well as the categories and classes that are used to sort and create preferential coverage and co-payment for the drugs available for treating specific diseases and conditions. Accordingly, we recommend below in our comments regarding section 423.120(b) (Pharmacy and Therapeutics Committees) that CMS clarify that Pharmacy and Therapeutics Committees should take into account clinical guidelines as well as the therapeutic categories and classes when creating preferential coverage and co-payment for the specific drugs.

GSK urges CMS to establish guidelines to be used for its general risk avoidance review of a plan's design that considers, among other things, clinically recognized treatment guidelines for particular diseases or conditions. Specifically, CMS should establish two types of guidelines for evaluating risk avoidance:

(a) Where there are treatment guidelines and protocols established by recognized entities for use in treating the disease or condition, the formulary design must allow for coverage of the full range of drugs needed to use the treatment guideline or protocol and to provide the doctor and patient with therapeutic options and alternatives.

Many among the elderly and disabled population served by Medicare have conditions for which drug treatments may be especially effective, such as Chronic Obstructive Pulmonary Disease (COPD), diabetes, asthma, heart failure, HIV, cancer and depression. Medications for these conditions must be taken for extended periods, and enrollees with multiple problems may require simultaneous administration of multiple medications. [9] In 2001 for example, people 65 and over who reported a prescribed medication expense purchased an average number of 26.5 medications.[10] The elderly population struggles with medication adherence, and their vulnerability is increased by the creation of extremely limited formularies. Such formularies will disproportionately affect the economically disadvantaged elderly and the sickest members.

Nationally and internationally recognized evidence-based clinical guidelines for chronic diseases such as COPD, asthma, HIV, and diabetes, routinely include combination therapies as

part of their management recommendations and treatment options.[11,12,13,14] Such recommendations include the simplification of therapy by reducing the number of pills and frequency of dosing, and frequently, a discussion of the potential benefits of such strategies relative to medication adherence, drug interactions and side effects.[14, 16]

Additionally, the effectiveness of combination therapies as a means of simplifying treatment regimens and promoting adherence and compliance has been well documented in the literature.[15,16,17,18,19] Using respiratory tract diseases as an example, combination therapies such as Advair® (fluticasone proprionate and salmeterol) are included in both the NIH/NHLBI guidelines for the treatment of asthma, and the ATS/ERS guidelines for managing COPD.[12, 13,14] Supporting evidence from clinical studies, such as Stoloff et al, demonstrate greater refill persistence with the combination therapy Advair® (fluticasone proprionate and salmeterol) compared with the individual components administered seperately.[18] Based on the consistency of such findings and guideline recommendations, CMS's review of plan design for impermissible risk avoidance issues should consider the importance to Medicare enrollees' of having appropriate access to necessary combination therapies.

(b) CMS should ensure that the cost sharing imposed under any tiered formulary structure that does not prefer drugs integral to treatment protocols or guidelines for a disease or condition does not impermissibly shift costs to any specific patient population.

In other words, CMS must ensure that the actuarial value of the Part D benefit does not selectively reward persons with lower aggregate drug costs while imposing higher costs on persons with a particular disease or condition, such as HIV, cancer, COPD, diabetes, or asthma. Such cost shifting is unfair to most enrollees and inconsistent with the risk selection prohibition in the statute. It also unfairly shifts costs to the federal government because such costs are paid by the government for enrollees under 135% FPL and also count toward TrOOP for purposes of "catastrophic coverage." Furthermore, such cost shifting may unduly burden SPAPs, which may pick up the higher cost-sharing amounts through their supplemental coverage or benefits.

Evidence is mounting that good health and good pharmacoeconomics go hand in hand. Dr. Avi Dor from Case Western and William Encinosa from AHRQ recently demonstrated the profound impact of increasing out-of-pocket costs on adherence and overall medical spending in a working paper prepared for the National Bureau of Economic Research.[20] They demonstrated that, as out-of-pocket costs for medications rise, medication adherence decreases, and anticipated savings to the payor are greatly offset by the increase in costs related to hospitalizations and other medical complications.

Many recent studies using analyses of claims databases linked to benefit design across different populations (private pay and government) consistently have noted that as out-of-pocket costs increase, adherence to essential medications decreases. Since out-of-pocket costs could be a barrier to obtaining recommended and appropriate non-formulary medications, overall health care spending could significantly increase. Most notably, thought leaders from RAND,[21] Harvard University,[22] Case Western Reserve University,[23] the Agency for Healthcare Research and Quality,[24] Cleveland Clinic,[25] and the University of Michigan[26] are adding to the body of evidence

II. Comments on Subpart C -- Other Formulary Issues -- § 423.120

a. Inclusion of New Drugs and New Uses – 423.120(b) (3).

GSK recommends that CMS require Part D plans to use the Pharmacy and Therapeutics Committee process to evaluate their formularies at least once each quarter to reflect new drugs and new uses of existing drugs.

GSK strongly supports the provisions in the Proposed Rule that would allow plans to change categories and classes during a calendar year to take into account new therapies or new uses for existing therapies.[40] GSK continually strives to develop new medicines that will fulfill our mission of improving the quality of human life. Because the FDA approves new medicines and new uses for existing therapies throughout the year, the full benefits of continuous medical innovation can be realized only if patients have timely access to innovative treatments. CMS' proposal will help ensure timely patient access to critical therapies by allowing plans to adjust their formularies as medical technology evolves, and it should be implemented in the final rule.

Additionally, we recommend that CMS take further steps to ensure that Part D plans' formularies keep up with the pace of pharmaceutical innovation. Some plans might not take advantage of the opportunity to update their formularies unless CMS requires them to do so. Patient access to life-saving or life-extending therapies could be delayed by plans that fail to update their formularies on a regular basis. *We therefore urge CMS to require Part D plans to evaluate their formularies at least quarterly, using the Pharmacy and Therapeutics Committee process, to reflect new drugs and new uses of existing drugs.*

b. Removal of Drugs from a Formulary and Changes to Cost-Sharing Status – 423.120(b) (5).

CMS should modify the regulation to provide that, upon ninety days notice to physicians, pharmacies, the Secretary, and other financially responsible parties as well as enrollees not yet prescribed a drug, a plan may change the formulary or preference status of a drug. However, such change is not effective as to enrollees with an active prescription for such drug – these enrollees must be ensured continued access to an ongoing therapy during the course of their disease.

The MMA allows Part D plans to remove a drug from a formulary or change its cost-sharing status with "appropriate notice" to certain parties, including affected enrollees, providers

[40] Proposed 42 C.F.R. § 423.120(b)(3).

and the Secretary.[41] In the Proposed Rule, CMS has interpreted this "appropriate notice" provision as permitting a plan to remove a drug from its formulary or change its cost-sharing status with only thirty days notice.[42] We think that this proposal inappropriately confuses appropriate notice to practitioners using the formulary in making treatment decisions for their *new* patients with appropriate notice to Medicare enrollees who have relied on a plan's formulary in making treatment decisions and/or decisions regarding the selection of a Part D plan. Furthermore, we believe that, even for enrollees not currently taking a drug, a thirty day notice is inadequate. As such, the Proposed Rule fails to implement the provisions of the MMA and ultimately ensures a high probability that the Part D benefit will devolve to substandard quality unlikely to meet the medical needs of enrollees

Medical care for the chronic conditions that affect elderly and disabled Medicare beneficiaries is ongoing. For many conditions, care spans many months and even years. Although scientists and clinicians may dispute which of several therapeutic alternates is "best" for *starting* treatment for a patient who has been just diagnosed, there are no principles of good medical practice that would support changing a patient's medications every thirty days if the medication is effectively managing the patient's condition. Yet this is precisely what CMS's proposal would permit.

The entire structure of the Part D benefit depends on enrollees evaluating a plan's design, including its formulary, and through the exercise of choice during each open enrollment period, encouraging plans to improve in quality and coverage to compete for beneficiaries. In fact, CMS has expressly noted that it will be important for beneficiaries to "have the most current formulary information by the time of the annual enrollment period…in order to enroll in the Part D plan that best suits their particular covered Part D drug needs."[43] Yet the Proposed Rule virtually guarantees that this cannot occur. By permitting Part D plans to change which drugs are on its formulary at any time, as many times as it likes, so long as "affected parties" have thirty days notice, CMS would severely undermine the enrollee's plan selection process and the structure of the Part D benefit.

More ominously, the criteria CMS has established would permit a plan to market a clinically rich formulary, modest authorization requirements and clinical guidelines during open enrollment season, and then drop drugs or increase cost-sharing on all drugs after the first 30 day protected period to meet cost containment objectives,[44] so long as the two-drug minimum access

---

[41] SSA § 1860D-4(b)(3)(E).

[42] Proposed 42 C.F.R. § 423.12f0(b)(5). CMS has proposed that plans would not be permitted do make such changes during the annual open enrollment period and at the beginning of each enrollment year.

[43] 69 Fed. Reg. at 46661.

[44] Proposed 42 C.F.R. § 423.120(b)(6).

criterion is met.[45] Thus, the 30-day formulary change criterion established by the Proposed Rule not only fails to meet the statutory criterion of "appropriate" notice established by the MMA, but also fails to protect beneficiaries against the very "bait-and-switch" tactics that have been a major focus of concern and action by CMS in connection with implementation of the Medicare Drug Discount Card. Utilizing these tactics, a plan might seek to attract beneficiaries whose condition is stabilized on popular drugs; and, once the patient is locked in and the premium revenue guaranteed for a year, switch the formulary preference. Such bait-and-switch tactics are prohibited under the consumer protection laws of the United States and the States individually as unfair and deceptive to consumers. The Congress established a market-based system to provide a cost-effective drug benefit for Medicare beneficiaries; it did not intend to permit commercial practices that cause beneficiaries to pay a premium and face administrative hassles and confusing messages about the medical care prescribed by their doctors.

We recommend that because the Congress has established a system in which beneficiaries select plans based on their formularies and because beneficiaries are (except in rare circumstances) not permitted to switch from one plan to another more than once in a year, "appropriate notice" to affected parties cannot be a fixed thirty day period. Rather, we urge CMS to require plans to provide *all* enrollees – whether or not they are taking the affected drug – with a 90 day notice before removing a drug from a formulary or increasing the cost-sharing for a drug. Where a patient had an active prescription for a drug for an ongoing or episodic condition when she or he enrolled in a Part D plan or was first prescribed a drug after enrollment in the plan, the Part D plan should not be permitted to exclude the drug or increase its cost sharing for that patient during the course of the patient's disease.

Thus, we recommend that CMS modify the regulation to provide that, upon ninety days notice to physicians, pharmacies, the Secretary and other financially responsible parties as well as enrollees not yet prescribed a drug, a plan can change the formulary or preference status of a drug. However, such change is not effective as to enrollees with an active prescription for such drug – these enrollees must be ensured continued access to an ongoing therapy during the course of their disease.

c. Special Populations -- § 423.120

We recommend that special populations – such as HIV/AIDS, cancer, mental health conditions, long-term care residents, and dual eligibles – be given access to open formularies.

As CMS has acknowledged, Part D enrollees with serious and chronic disease have special needs that may not adequately be met through a restrictive formulary.[46] In addition,

---

[45] *See* 69 Fed.Reg. at 46661.

[46] 69 Fed.Reg. at 46661

CMS is concerned that plans might inappropriately discriminate against select Medicare populations. These enrollees – among Medicare's most fragile – tend to require multiple medications and are likely to require individualized treatment plans and specific therapies. Also, because of the nature of the diseases and of the complexity of the pharmaceutical therapies available, the patients will tend to incur high plan costs. It is possible that plans might want to restrict access to select therapeutic areas to discourage these patients from enrollment.

GSK urges CMS to provide these enrollees with access to an open formulary requiring plans to institute special formulary standards for these enrollees that reflect their special medical needs. Such standards may include broad access to the range of therapies required by individuals with serious and chronic illnesses, including access to special dosage forms and a special exceptions process should an open formulary not be implemented.

Below we have identified some reasons why certain Medicare populations – those with AIDS, cancer, or mental health conditions, those in long-term care, and those dually eligible for Medicare and Medicaid – may need these special formulary rules.

Part D Enrollees with HIV/AIDS:

GSK recommends that people with HIV/AIDS be given broad access to a full range of therapeutic and supportive care options based on available scientific evidence.

The standard of care in HIV therapy requires at least three HIV drugs, which are typically in the same class.[47] For example, many HIV patients take two drugs from the nucleoside/nucleotide reverse transcriptase inhibitor category. These drugs are in the same pharmaceutical class and have the same general mechanism of action; yet a specific mutation in the HIV virus may render some of these drugs ineffective. Because several such mutations exist, it is not possible to identify two drugs that would be effective in all patients.[48] Further, changing patterns of viral resistance to the antiviral agents used for HIV treatment mandate an opportunity for the treating physician to readily make changes in the treatment regimen without a burdensome exception process.[49] Transmitted human immunodeficiency virus type 1 carrying the D67N or K219Q/E mutation evolves rapidly to zidovudine resistance in vitro and shows a high replicative fitness in the presence of zidovudine.[50]

---

[47] *See, e.g.,* DHHS, Panel on Clinical Practices for Treatment of HIV Infection, "Guidelines for the Use of Antiretroviral Agents in HIV-1-Infected Adults and Adolescents," (March 23, 2004) at 13.

[48] *See id.* at 19.

[49] (2004: which HIV-1 drug resistance mutations are common in clinical practice? AIDS Rev. 2004 Apr-Jun;6(2):107-16

[50] J Virol. 2004 Jul;78(14):7545-52.)

Thus, the minimum two drugs per class will not be sufficient to meet the needs of HIV patients. These individuals will need broader access to drugs under Part D to obtain appropriate medical care; the appeals and exceptions process will not be adequate to ensure sufficient access to necessary therapies for this population.

Part D Enrollees with Cancer:

GSK recommends that cancer patients be given broad access to a full range of therapeutic and supportive care options based on available scientific evidence.

We are particularly concerned about whether cancer patients will be able to access the therapies they need through Part D formularies. This will depend in part on whether the USP properly revises its model guidelines to reflect the range of necessary cancer therapies and whether CMS appropriately considers the specific needs of cancer patients in scrutinizing plan formularies.

Current treatment guidelines for cancer management clearly reflect the need for oncologists and cancer patients to have broad access to a full range of therapeutic and supportive care options based on available scientific evidence. These guidelines are frequently updated based on the rapidly evolving nature of the scientific evidence.[51]

It is particularly difficult to provide appropriate cancer treatment within the confines of a plan formulary. Cancer is actually a wide range of diseases requiring therapies from multiple pharmacological classes depending on factors such as tumor type, stage of disease, available biomarkers, proven combination regiments, and patient tolerability. Appropriate cancer treatments may include antineoplastics, hormone suppressants, immune suppressants, and other immunological agents -- as well as supportive therapies for the management of the severe side effects of chemotherapy or radiation therapy. These therapies include antiemetics and treatments for anemia, neutropenia, and thrombocytopenia.

Cancer patients cannot afford the time lost in a lengthy appeals process that may be required to access the care they need. So this population could face significant risk of being discriminated against by Part D plans seeking to contain drug costs

Part D Enrollees with Mental Health Conditions:

---

[51] NCCN/ACS Treatment Guidelines for Patients. National Comprehensive Cancer Network. 2004. http://www.nccn.org/professionals/physician_gls/f_guidelines.asp#site

GSK recommends that patients with mental health conditions be given broad access to a full range of therapeutic and supportive care options based on available scientific evidence.

Prescription drugs play a critical role in treating and managing mental illnesses such as depression, schizophrenia, and bipolar disorder. For these conditions, a patient typically must try several drugs in the same class before finding the proper drug and dose. In the Conference Report to the MMA, Congress recognized the special needs of the mentally ill, stating its intent that these Part D enrollees have clinically appropriate access to pharmaceutical treatments for mental illnesses[52] and noting that this is a "unique population with unique prescription drug needs as individual responses to mental health medications are different."[53] There are many legitimate reasons for multiple drug therapy in this population.[54] To fully comply with the MMA, the Part D implementing regulations must appropriately reflect the needs of this population to have broader access to medications. *GSK recommends that patients with mental health conditions be given broad access to a full range of therapeutic and supportive care options based on available scientific evidence.*

Part D Enrollees in Long-Term Care Facilities:

GSK recommends that residents of LTC facilities be considered a "special population" with respect to Part D plan formularies and be granted access to an open formulary that supports their unique medical needs.

Residents of long-term care ("LTC") facilities will be especially vulnerable to adverse consequences that inevitably arise from therapeutic substitutions and administrative inefficiencies in the formulary process. *GSK urges CMS to grant this population access to formularies that include a wider range of drugs than may be offered under the restricted or closed formularies of Part D plans.*

The elderly population, which represents the largest group of patients in LTC facilities, typically requires multiple medications across multiple therapeutic categories and classes; and these drugs often are not interchangeable with other drugs within the class without risking drug interaction and/or other substantial complications. Restricting formulary access to medications will force some of these Part D enrollees to seek approval through the exceptions and appeals processes for the therapies they need. Yet because of their unique needs, many of these

---

[52] Conf. Rep at 769-770.

[53] Conf. Rep. at 770.

[54] "Reasons for polypharmacy among psychiatric patients." Pharm World Sci. 2004 Jun;26(3):143-7.

vulnerable enrollees will be unable to meaningfully access the appeals and exceptions processes to appeal the denials and other barriers to access they encounter.

To meet the special needs of this population, GSK recommends that residents of LTC facilities be considered a "special population" with respect to Part D plan formularies and be granted access to an open formulary that supports their unique medical needs.

For a more thorough analysis of these risks and issues, we recommend that you reference the September 17, 2004, Comments to the Draft Model Guidelines submitted by the American Society of Consultant Pharmacists.

Part D Enrollees Dually Eligible for Medicaid:

GSK recommends that CMS establish special formulary rules to provide dual eligibles with continued access to a formulary that is consistent with their current access to prescription drugs under Medicaid.

Dual eligibles are likely to have significant difficulty adjusting to the Part D benefit. Currently, these individuals have access to drugs through Medicaid programs, which generally provide access to medically necessary drugs. Once the Part D benefit begins, these individuals will have access only to those prescription drugs available on their Part D plan's formulary.

It will be critical that CMS establish special formulary rules to provide this population with continued access to a formulary that is consistent with their current access to prescription drugs under Medicaid. Many of these enrollees have special medical needs such as mental health conditions and/or are in long-term care facilities, group homes or other community-based programs that provide long-term care in a setting more conducive to maintaining activities of daily living.

We urge CMS to ensure that these enrollees continue to receive the medications they need by providing them access to medically necessary drugs. Because individuals receiving long-term care in facilities and community settings depend heavily on caregivers for advice and assistance, any transition of these enrollees that requires en masse switching or discontinuation of medicines will be particularly burdensome for physicians (who must participate in exceptions requests and appeals), destructive of the quality of care provided by these community providers, and detrimental to this vulnerable population.

III. Subpart C -- Covered Part D Drugs -- § 423.100

a. Obesity -- § 423.100

Given that numerous Medicare enrollees suffer from health disorders where obesity is a modifiable risk factor, GSK urges CMS to clarify that Part D plans may include in their formularies therapies whose mechanism of action is weight loss when the therapy is medically necessary to improve the outcomes of co-morbid diseases for which obesity is a modifiable risk factor.

Obesity is a modifiable risk factor for a host of diseases including diabetes, heart disease, dyslipidemia, sleep apnea, gallstones, bladder control problems, uric acid nephrolithiasis, psychological disorders, osteoarthritis, and certain cancers.[55] For example, central obesity is one of the risk factors for Metabolic Syndrome – a condition that affects an estimated 20 percent of adults in the U.S., with the prevalence approaching 50% in the elderly.[56] The syndrome is also characterized by dyslipidemia, hypertension, and insulin resistance. Although these combined risk factors do not necessarily manifest in overt symptoms, they are warning signs for increased risk of atherosclerosis, heart disease, stroke, diabetes, kidney disease, or premature death.[57]

Given the recognition and significance by various agencies within HHS of the significance of obesity with regard to health, the number and extent of diseases associated with obesity, and the impact obesity and co-morbidities have on the Medicare population, GSK recommends the following:

GSK urges CMS to consider the significance of obesity and its relation to other co-morbid conditions in the Medicare population and clarify that Part D plans are not prohibited from covering therapies whose mechanisms of action are primarily aimed at obesity, when therapy is medically necessary to improve the outcomes of co-morbid diseases for which obesity is a modifiable risk factor.

Other agencies within HHS recognize the need to combat obesity with regard to improving health. The Food and Drug Administration's ("FDA's") Endocrinologic and Metabolic Drugs Advisory Committee recently held an open meeting to consider changes to the FDA's 1996 guidance document for the clinical evaluation of weight-control drugs and unanimously recommended that indications for the treatment of co-morbidities should not be disqualified simply because the primary mechanism of action was weight loss.

---

55 http://www.cdc.gov/nccdphp/dnpa/obesity/consequences.htm

56 http://www.labtestsonline.org/understanding/conditions/metabolic.html.

57 Id.

CMS has revised a long-standing national coverage policy and indicated that "[s]ervices in connection with the treatment of obesity are covered services when such services are an integral and necessary part of a course of treatment for one of these medical conditions."[58] Not only is coverage of therapies that treat obesity clinically sound, but it also translates into cost-savings. According to the 2001 Surgeon General's Call to Action on Prevent and Decrease Overweight and Obesity, the total direct and indirect costs were estimated at $177 billion nationally in 2000.

GSK applauds the agency's recognition that coverage of obesity treatments is warranted when interrelated to other diseases.

b. Vaccines -- § 423.100

GSK is concerned that Part D plans may interpret § 423.100 in a manner that allows them to exclude coverage of certain vaccines that are reasonable and necessary for prevention. Therefore, we recommend that CMS

1. **specify that plans are required to offer coverage for vaccines and**

2. **actively communicate the value of immunizing Medicare enrollees.**

The MMA defines "covered Part D drugs" to expressly include vaccines.[59] CMS mirrors this definition in the Proposed Rule.[60] However, the potential for confusion exists due to other sections of the MMA.

In addition to the express mention of vaccines as covered Part D drugs, the MMA also allows a Part D plan to exclude a covered Part D drug if payment for that drug "would not be made if section 1862(a) applied to this part."[61] Section 1862(a) of the Social Security Act excludes, among other things, from Part B coverage items and services that are not "reasonable and necessary" for the "diagnosis or treatment of illness or injury or to improve the functioning

[58] Medicare Coverage Issues Manual, § 35-26.

[59] SSA §1860D-2(e)(1).

[60] Proposed 42 C.F.R. § 423.100.

[61] SSA § 1860D-2(e)(3).

of a malformed body member."[62] Yet, Part B also covers certain vaccines, including their administration costs, that are reasonable and necessary for prevention.[63]

By explicitly including vaccines in the definition of "covered Part D drugs," Congress clearly contemplated that Part D plans would provide coverage for vaccines. The provision allowing plans to exclude coverage where § 1862(a) would apply was intended to protect plans from being forced to cover drugs that are not "reasonable and necessary." There is no indication Congress intended to allow plans to exclude preventative therapies such as vaccines from the Part D benefit. In fact, the Conference Report for the MMA describes the covered Part D drugs that plans may exclude from coverage as "any drug which would not meet Medicare's definition of medically necessary or was not prescribed in accordance with the plan or Part D,"[64] thus clarifying the intent of the reference to § 1862(a). *Accordingly, GSK urges CMS to specify that Part D plans are required to offer coverage for vaccines.*

Some adult immunizations are already provided under Medicare Part B (e.g., influenza, pneumococcal, hepatitis B to select populations). However, senior adults may need immunizations not currently covered by Part B. For example, Healthy People 2010 includes an objective of reducing levels of hepatitis A from the 1997 baseline of 11.3 new cases per 100,000 people to 4.5 new cases per 100,000 by 2010.

One of the strategies is to target high risk adults over age 40. The availability of hepatitis A vaccine from a plan offering a Part D benefit would make it easier to meet that objective. In addition, Healthy People 2010 contains an objective to reduce cases of hepatitis B from the 1997 baseline of 15.0 cases per 100,000 to 3.8 cases per 100,000 by 2010. Universal immunization of children will go a long way to reaching that objective, but there are many seniors outside of the traditional high risk groups currently eligible for Medicare covered hepatitis B immunization who have never been immunized. This additional population may still be at risk because hepatitis B is a blood-borne pathogen that may be contracted in a variety of circumstances. In fact, hepatitis B can be easier to contract than HIV.[65] Another category of enrollees who should be vaccinated, according to the CDC, are travelers to selected countries. *GSK urges CMS to actively communicate the value of immunizing Medicare enrollees.*

[65] Recommendations for preventing transmission of human immunodeficiency virus and hepatitis B virus to patients during exposure-prone invasive procedures. CDC. MMWR, 1991; 40 (RR-8): 1-9.

IV. Subpart C -- Pharmacy and Therapeutics Committees – § 423.120(b)

Under the MMA and the Proposed Rule, plan formularies must be reviewed by Pharmacy and Therapeutics ("P&T") committees.[66] In general, GSK supports CMS's efforts to utilize the P&T committee process in a manner that ensures that plan formularies are designed with appropriate emphasis on clinical considerations. We also appreciate CMS's efforts to make this process more transparent. We have commented on particular P&T committee functions below.

a. P&T Committee Decisions as Binding -- § 423.120(b).

P&T Committee decisions should be binding with respect to the list of drugs on the formulary.

CMS proposes that P&T committee decisions be binding on a plan[67] and suggests that the P&T committee be involved in designing any tiers within a formulary.[68] GSK agrees that P&T committee decisions should be binding, but only with respect to which drugs should be placed on the formulary.

Making these decisions binding on the plan will help to ensure that the formulary represents a clinically appropriate range of drugs that will meet the needs of the Medicare population. These decisions should be binding on the Part D plan even where the plan uses an outside subcontractor as its P&T committee. The plan should be permitted greater participation, however, in the process of assigning formulary tiers to specific drugs. This will appropriately reflect the market-based nature of the Part D benefit and will allow plans to consider their negotiations with manufacturers, while also allowing the P&T committee to have appropriate input to ensure that clinical concerns are properly incorporated.

b. Specialists on P&T Committees – Proposed 42 C.F.R. § 423.120(b)(1)(ii).

Committees should include specialists knowledgeable in the diseases facing the elderly.

P&T committees should include specialists that reflect the prevalent diseases of the elderly such as cardiovascular disease, depression, cancer, and diabetes. We appreciate that CMS is encouraging plans to include such specialists,[69] and *we urge CMS to formalize this by requiring plans to include a range of specialists.*

---

[66] Proposed 42 C.F.R. § 423.120(b)(1).

[67] 69 Fed.Reg. at 46659.

[68] Proposed 42 C.F.R. § 423,120(b)(1)(iv); 69 Fed.Reg. at 46659.

[69] 69 Fed.Reg. at 46659.

As a related requirement, the Proposed Rule requires that P&T committees include at least one member who specializes in treatment of the "elderly or disabled."[70] *We urge CMS to clarify what is meant by "disabled" and encourage the adoption of a broad definition to ensure that the needs of Medicare populations with physical disabilities and mental illness are appropriately considered in developing a plan's formulary.*

c. P&T Committee Members Independent and Free of Conflict -- § 423.120(b)(1)(ii).

CMS's proposed extension of the independence requirement to pharmaceutical manufacturers is inconsistent with the intent of the statutory provisions. However, safeguards can be implemented to ensure that physicians or pharmacists with a clear conflict of interest are recused from P&T decisions directly impacted by such conflict.

The MMA requires that at least one practicing physician and one practicing pharmacist on the P&T committee be independent and free of conflict with respect to the Part D plan.[71] CMS proposes to extend this requirement to require these members to be independent and free of conflict not only with respect to the plan[72] but also with respect to pharmaceutical manufacturers.[73] This extension is inconsistent with the intent of the statutory provision, and we are concerned about how this will work in practice.

Congress enacted a number of provisions that seek to ensure that Part D plans will establish formularies that provide a meaningful range of prescription drugs on which elderly patients tend to rely. Congress's apparent intent in setting forth this particular requirement was to provide enrollees with some protection against the possibility that a plan would design its formulary with too much self-interest. In the private market, P&T committees often include members that are independent and free of conflict with respect to the plan. In fact, the recent Merck-Medco consent agreement requires that a majority of P&T committee members be independent of the plan, and members who are not deemed independent have no vote in P&T committee decisions.[74]

CMS's proposed requirement that these members be independent and free of conflict also with respect to pharmaceutical manufacturers will eliminate many of those clinical experts most focused on treatment of the elderly. It is critical to the appropriate development of Part D

---

[70] Proposed 42 C.F.R. § 423.120(b)(1)(ii).

[71] SSA § 1860D-4(b)(3)(A)(ii)(I).

[72] Proposed 42 C.F.R. § 423.120(b)(1)(ii).

[73] 69 Fed.Reg. at 46659.

[74] *U.S. et al v. Merck-Medco Managed Care LLC, (Civ. Act. No. 00-737) 2004 WL 977196 (E.D. Penn).*

formularies that P&T committees include members who are engaged in research on new therapies for the elderly. These are exactly the kinds of experts and specialists who should participate in P&T committee decisions regarding a list of drugs that is clinically appropriate for senior citizens. Many physicians and pharmacists participate in some manner in clinical research related to drug development. *We urge CMS to adopt an approach that would not broadly eliminate all physicians or pharmacists previously or currently engaged in such research.*

Safeguards can be implemented to ensure that physicians or pharmacists with a clear conflict of interest are recused from P&T decisions directly impacted by such conflict. For example, CMS could require that P&T committee members with a conflict regarding a particular drug not participate in P&T committee decisions regarding that drug. CMS also could establish a framework for developing criteria to identify those experts who may have a conflict that would be likely to interfere with objective P&T committee decisions. Such criteria could include financial thresholds or other means of determining when members may have a conflict. These types of measures, along with a requirement that a majority of P&T committee members are independent and that each voting member has an equal vote, will help to ensure that the P&T committee process is designed to best consider the prescription drug needs of the Part D enrollee population.

d. P&T Committees and Drug Utilization Management -- § 423.120(b)(iii).

GSK recommends that robust safety and efficacy data be the primary information considered by P&T committees making formulary decisions. If supplemental information is considered, CMS should ensure such information is critically and appropriately assessed.

The Proposed Rule requires that P&T committees base formulary decisions on clinical considerations such as scientific evidence and standards of practice, including but not limited to peer-reviewed medical literature, randomized clinical trials, pharmacoeconomic studies, outcomes research data and other information as it deems appropriate.[75]

Robust safety and efficacy data should be the primary information considered by P&T committees that are making formulary decisions. While other data can be used, it should supplement the primary information. If supplemental information is considered, CMS should ensure such information is critically evaluated.

In particular, information derived from outcomes, pharmacoeconomic, and database studies can be helpful in assessing the effectiveness of a medicine in real world practice and its place within disease/illness management. Pharmacoeconomics is the scientific discipline that assesses the overall value of pharmaceutical health care products, services, and programs. It

[75] Proposed 42 C.F.R. § 423.120(b(iii).

addresses the clinical, economic, and humanistic aspects of health care interventions in the prevention, diagnosis, treatment, and management of disease. Data to conduct pharmacoeconomic evaluations are obtained from clinical trials, databases, outcome studies, health care and insurance data, epidemiology studies, and patients. Pharmacoeconomic studies often assess important patient driven data such as medication tolerability, as well as quality of life and compliance effects.

Results from pharmacoeconomic studies, however, are dependent on the type of evidence and study design that is used; thus the external and internal validity of the study must be critically assessed. *To this end, we urge CMS to take steps to ensure that P&T committees utilize well accepted economic research practice guidelines, such as those provided in the Academy of Managed Care Pharmacy Format for Formulary Submission, developed specifically to assist managed care organizations to appropriately consider pharmacoeconomic studies, outcomes research data, and other such economic information as a basis, in part, for their formulary decisions.*

This document provides guidance on the use of clinical and economic information in the formulary decision-making process, the transparency of study sponsorship, and the use of accepted standards and methods in conducting pharmacoeconomic research. *In addition, GSK recommends that CMS set standards for the education and experience of P&T committee staff to ensure they have the training necessary to review pharmacoeconomic studies.*

In sum, while scientific evidence of safety and efficacy should be the primary driver for formulary decisions, information on the cost-effectiveness or "value" of a medicine can be extremely helpful in considering the impact of a therapy on the total health care system. Pharmacoeconomic studies can help P&T committees assess the value of a medicine and the impact of utilization on the total health care budget, which is much more critical than a narrow focus solely on the impact a drug budget. *CMS should take steps, to ensure that pharmacoeconomic studies are critically and appropriately assessed.*

V. Subpart D -- Drug Utilization Review and Medication Therapy Management Programs -- § 423.153

a. Cost-Effective Drug Utilization Management -- § 423.153(b)

CMS should define the terms necessary to ensure that drug utilization programs are designed to improve health outcomes and total health care costs rather than to limit enrollee access to important drug therapies.

Under the MMA, a Part D plan sponsor or MA-PD plan must establish a cost-effective drug utilization management program. The Proposed Rule describes cost-effective drug utilization management as including incentives to reduce costs when "medically appropriate"[76] through the use of various cost containment tools. The Proposed Rule does not, however, define "costs," "cost-effective," or "medically necessary" – terms central to understanding how a drug utilization management program should work

GSK recommends that CMS clearly define the terms "costs," "cost-effective," and "medically necessary" in a manner that will ensure that drug utilization management does not impair enrollee access to critical drugs.

"Cost" and "cost-effective" are important concepts in designing a drug utilization management program. Although a Part D plan may bear some of the costs of providing prescription drugs to enrollees, other parts of the Medicare program will reap the benefits of appropriate prescription drug use, including decreased spending on hospitalizations, physicians' services, and nursing home care. "Cost" and "cost-effective" should be defined, therefore, to recognize the effect of appropriate use of drug therapies on total health care spending, not just the cost of the drugs themselves

We recommend that CMS define "cost" and "cost-effective" to include all of the expenses and savings for Medicare and the enrollee. To help stand-alone Part D plans with this assessment, we suggest that CMS provide these plans with information on all Medicare costs incurred by their enrollees.

We understand that a single definition of "medically appropriate" is difficult to form, given the constantly changing nature of medicine and the particular needs of an individual patient. The only way to ensure that drug utilization management fully and accurately considers the needs of the patient is to allow the enrollee's physician to determine what is "medically appropriate."

GSK urges CMS to define "medically appropriate" to mean "medically appropriate, as determined by the beneficiary's physician."

---

[76] Proposed 42 C.F.R. § 423.153(b)(1).

b. Cost Containment Tools -- § 423.153(b)

Drug utilization programs should not be used to discriminate against certain classes of Part D enrollees. CMS should monitor plans' use of cost containment tools to ensure that such tools are not used to negatively affect beneficiary enrollment or health outcomes.

CMS proposes that cost-effective drug utilization management programs use cost containment tools such as requiring use of multiple source drugs, prior authorization, step therapy, and tiered cost-sharing.[77] GSK appreciates the use of private-sector cost-control devices, but we urge CMS to monitor carefully their use in Part D plans.

We are concerned that cost containment efforts, particularly by stand-alone plans, may lead to underutilization of drugs and increased spending for other types of health care services. For example, a stand-alone plan might seek to control costs by requiring enrollees to use an older, less costly therapy before a newer, more advanced drug would be covered. If the older drug is ineffective or causes unpleasant side effects, the patient may stop taking the drug, prolonging his or her illness and requiring more physician and hospital services. In such a case, a cost containment tool may reduce the plan's expenditures, but increase spending in other parts of Medicare. As we discussed above, Part D plans should take into account all costs and savings associated with appropriate drug use when designing their drug utilization management programs.

To this end, we urge CMS to ensure that cost containment efforts do not impair beneficiary access to appropriate drug therapies.

GSK commends CMS for recognizing that "appropriate drug utilization management programs would have policies and systems in place to assist in preventing over utilization and underutilization of prescribed medications."[78] Part D plans should dedicate as much attention to underuse as to overuse. When patients fail to adhere to their prescribed drug regimens by not taking all of their medications or by reducing their doses, they risk serious consequences to their health. These risks are particularly great for patients with chronic conditions such as congestive heart failure, diabetes, hyperlipidemia, asthma, COPD, and hypertension, which often require costly care in hospitals and nursing homes if not controlled through medications.

We encourage Part D plans to design drug utilization management programs to prevent underutilization of important prescription drugs and to help enrollees avoid painful and costly illnesses.

---

[77] 69 Fed. Reg. at 46666-7.

[78] 69 Fed. Reg. at 46667.

Although we generally support drug utilization management programs, we are concerned that they may be used to discriminate against certain classes of Part D enrollees. Plans that direct their cost containment tools toward certain classes of drugs could discourage enrollees who need those therapies from enrolling or remaining in their plans.

GSK urges CMS to monitor plans' use of cost containment tools and direct plans to change their programs if their use affects beneficiary enrollment and health outcomes.

c. Medication Therapy Management Programs (MTMP)

CMS must (i) carefully define targeted populations, (ii) establish clear guidelines to ensure that these programs are used to promote appropriate use of medications and not simply as a cost containment tool, and (iii) ensure that neither program design nor reimbursement structure discourages the enrollment of certain groups of Medicare enrollees or negatively impacts health outcomes.

Under the MMA, a Part D plan must establish a medication therapy management program.[79] CMS proposes to use these programs to "provide services that will optimize therapeutic outcomes for targeted enrollees."[80] GSK supports the suggested uses of MTMPs: to promote the appropriate use of medications and reduce the risk of adverse events, increase enrollee adherence to prescription medication regimens, and detect adverse drug events and patterns of overuse and underuse. [81]

MTMPs are relatively new, and neither CMS nor many private insurers have extensive experience using or reimbursing for their services.[82] *GSK therefore urges CMS to carefully define the targeted populations and establish standards and guidelines for these groundbreaking programs.*

We agree with the Proposed Rule that MTMPs should be targeted toward enrollees with multiple chronic diseases who take multiple Part D covered drugs and who are likely to incur annual costs exceeding a fixed level.[83]

A well designed and implemented MTMP can be very valuable to enrollees with complex conditions. Studies have found that the majority of aged Medicare enrollees have one or more

---

[79] SSA § 1860D-4(c).

[80] 69 Fed. Reg. at 46668.

[81] *Id.*

[82] *Id.*

[83] *Id.*

chronic conditions[84] and take more than eight outpatient prescription medications.[85] *Given the complexity of managing the many Medicare enrollees with co-morbidities and multiple medications, we suggest that CMS adopt a "more than one" approach in defining the multiple chronic diseases necessary to be eligible as a "targeted beneficiary."*

This approach is consistent with MMA's use of the term "multiple" to mean more than one. In addition, any other approach may mean that a significant number of enrollees who need medication therapy management services might not be able to take advantage of these programs. For example, based on CMS's own studies, on average, a beneficiary with one or two chronic conditions has approximately 19 filled prescriptions, whereas a beneficiary with three or four chronic conditions has approximately 32 filled prescriptions.[86] *By defining "multiple" chronic diseases to mean more than one chronic condition, CMS will help to assure that MTMP services are available to the enrollees who need them.*

In addition, when providing guidance on MTMPs, CMS should consider that targeted enrollees with multiple chronic diseases may be receiving care through a number of different physicians, any number of whom who may be providing prescriptions for multiple drugs. For example, enrollees with two chronic conditions have, on average, five physicians, while enrollees with four chronic conditions have eight physicians.[87] Effective MTMPs factor in the multiple prescribers and should educate enrollees about the need for effective communication among the enrollee's physicians.

Establish clear guidelines: These patients' health depends on appropriate use of their prescription medications. We recommend that MTMPs provide these patients with one-on-one education and counseling to help them adhere to their drug regimens and prevent harmful underutilization.

Medication adherence is a significant health care dilemma. Research indicates approximately 50% of patients never fill their initial prescription.[88] Twenty to eighty percent make errors in taking their medications.[89] Additionally, thirty to sixty percent of patients stop

[89] Gotlieb H. Medication nonadherence: finding solutions to a costly medical problem. *Drug Benefit Trends*. 2000;12(60:57-82

taking their medications too soon.[90] Furthermore, eighty-eight percent of prescriptions are filled for chronic conditions, but only twenty percent take the medication as prescribed.[91]

As the *Journal of Clinical Psychiatry* cautions,:

"The consequences of drug noncompliance may be serious in older patients. Estimates of the extent of noncompliance in the elderly vary, ranging from 40% to a high of 75%. Three common forms of drug treatment noncompliance are found in the elderly: overuse and abuse, forgetting, and alteration of schedules and doses. Some older patients who are acutely ill may take more than the prescribed dose of a medication in the mistaken belief that more of the drug will speed their recovery. Such overuse has clearly been associated with adverse drug effects. Forgetting to take a medication is a common problem in older people and is especially likely when an older patient takes several drugs simultaneously. Data suggest that the use of three or more drugs a day places elderly people at particular risk of poor compliance. The use of at least three drugs, and often more, is common in the elderly, with estimates of as many as 25% of older people taking at least three drugs. Averages of drug use among elderly hospitalized patients suggest that eight drugs taken simultaneously may be typical. Problems may also arise when dementia or depression is present, which may interfere with memory. The most common noncompliant behavior of the elderly appears to be underuse of the prescribed drug. Inappropriate drug discontinuation, furthermore, may occur in up to 40% of prescribing situations, particularly within the first year of a chronic care regimen. As many as 10% of elderly people may take drugs prescribed for others; more than 20% may take drugs not currently prescribed by a physician ."[92]

Ensure that neither program design nor reimbursement structure discourages enrollment: GSK recommends that CMS provide clear instructions to Part D plans on reimbursement for MTMP services. We urge CMS to prohibit plans from using reimbursement for MTMP services to direct patients to or away from specific plans or drugs. We also recommend that a plan's reimbursement for MTMP services be included in CMS's review of whether a plan substantially discourages enrollment of certain groups of Medicare enrollees. Finally, although CMS states that it believes payment for MTMP services is separate and distinct from dispensing fees,[93] we recommend that CMS explicitly prohibit any linkage between these payments.

[93] 69 Fed. Reg. at 46669.

d. **Cost Control and Quality Improvement (QI) Requirements for Prescription Drug Plans**

GSK recommends that QI standards and systems used by Part D plans

- **include a focus on potential underutilization,**
- **focus on clinical contraindications and adverse drug-to-drug interaction, and**
- **be subject to oversight by the Part D plan's P&T committee**

Due to the specific characteristics of the Medicare population, it is essential that QI standards and systems designed specifically for this population be utilized by Part D plans. The higher rate of physical morbidity and greater chance of receiving multiple prescription drugs[94] increases the risk that older adults will suffer from adverse drug reactions. In addition, biologic and physiologic changes caused by aging may lead to increased sensitivity to differing drug dosages or altered pharmacokinetics.[95] Finally, when examining the patient's perspective in taking prescribed medicines, it is found that physical, psychological, and economic considerations often interfere with their ability to obtain and comply with their medication regimens.[96]

We support the efforts of CMS in evaluating the status of existing QI programs and considering how to modify such programs for the Medicare population. We encourage CMS to update program requirements on an ongoing basis as best practices for this population are identified. We provide some recommendations for consideration below.

1. CMS's proposal to link the QI programs and DUR is an important one. Cost containment mechanisms must be a component of the Part D program. However, there is the potential for underutilization of necessary medications when DUR is applied and only drug costs are considered. *The QI program should include a focus on potential underutilization, providing a necessary balance between the need for cost containment mechanisms and the dangers of underutilization.*

For example, depressive disorders are estimated to affect nearly 1 in 10 adults in America. NCQA's Antidepressant Medication Management HEDIS measure clearly shows that pharmacological management of depression is far below guideline recommendations, particularly for the Medicare population (Acute Phase = 55.3%,

Continuation Phase = 39.2%).[97] The State of Health Care Quality 2004 reports there has been no improvement in the Medicare rate for the measure from the previous year. Average Medicare scores continue to lag 5 to 10 points below those reported by commercial health plans.

2. *The quality improvement programs should be subject to oversight by the Part D plan's P&T Committee.* This design would allow the P&T Committee to ensure appropriate access and clinical efficacy while allowing the plans autonomy to determine their best organizational structure.

3. *QI programs should focus on clinical contraindications and adverse drug-to-drug interactions would particularly benefit special needs Medicare beneficiaries and Medicare dual-eligibles*.

VI. Subpart C – Patient Assistance Programs and TrOOP -- § 423.100

GSK urges CMS to provide specific guidance in the final rule regarding whether pharmaceutical manufacturers' patient assistance programs ("PAPs") may provide assistance in paying enrollees' out-of-pocket cost-sharing obligations during the doughnut hole, and if so, whether that assistance would count towards the enrollee's TrOOP. In addition GSK urges CMS to seek the input of the Office of the Inspector General ("OIG") to provide manufacturers clear guidance on how PAPs may be allowed to assist enrollees with Part D prescription drug expenditures.

CMS proposes to allow assistance that enrollees receive from certain charitable organizations to count as "incurred costs"[98] for purposes of reaching catastrophic coverage. In doing so, CMS has defined "person" to include bona fide charities "unaffiliated with employers or insurers."[99] The Proposed Rule notes that to be permissible, such arrangements must comply with Federal fraud and abuse laws, including the anti-kickback statute, section 1128B(b) of the Act, as well as the civil monetary penalty provision at section 1128A(a)(5) of the Act. CMS further states that it is "considering whether assistance in paying enrollees' cost-sharing obligations provided through prescription drug patient assistance program sponsored by pharmaceutical manufacturers would be allowed"[100] under these laws.

GSK has a long history of assisting low-income patients. We would like to be able to continue to provide assistance to low-income Medicare enrollees in the doughnut hole who do not qualify for subsidies under Part D. In the first half of 2004, GSK provided more than $162 million worth of medicines to patients through our patient assistance programs. Approximately 35% of the patients enrolled in our programs are Medicare-eligible. Most of those patients have incomes below 135% of the federal poverty level and will receive a full subsidy under Part D, and thus will not be affected by the doughnut hole. However, approximately 10% of our enrollees are Medicare-eligibles with income above 135% of the federal poverty level. They may not be able to bear the burden of paying out-of-pocket for their drugs during the doughnut hole.

We are concerned, based on commentary in the Preamble to the Proposed Rule, that we may not be able to continue to provide assistance under the Proposed Rule and current law. One concern is that the provision of such assistance may result in an enrollee failing to reach a level where they would qualify for reduced cost sharing for all their drugs. In effect, if assistance provided through a PAP does not count toward TrOOP, the individual will still be responsible for paying the full amount of costs for other drugs up to the out-of-pocket threshold for other drugs.

---

98 Proposed 42 C.F.R. § 423.100.

99 69 Fed.Reg. at 46650; *see also* Proposed 42 C.F.R. § 423.100.

100 69 Fed.Reg. at 46650.

Also, as CMS has noted in the Proposed Rule, it is not clear whether such assistance would be allowed under the aforementioned Federal fraud and abuse laws.

To continue to help low-income senior citizens who may not be able to afford the cost-sharing required under the Part D benefit, we will need assurances that assistance provided by manufacturers to enrollees is expressly allowed under the Federal fraud and abuse laws in a program where Medicare also is a payer. For manufacturers to be able to provide such assistance, CMS will need to obtain specific guidance on this issue from the HHS Office of Inspector General ("OIG").

We urge CMS to seek the OIG's input in providing manufacturers clear guidance on how PAPs may be allowed to assist enrollees with Part D prescription drug expenditures. We also urge CMS to clarify the types of assistance that manufacturers can provide, and clarify that the provision of such drugs would count toward an individual's out-of-pocket costs for purposes of qualifying for catastrophic coverage

Furthermore, CMS also needs to provide clear guidance on the valuation of the assistance provided by manufacturer PAPs for purposes of counting towards an enrollee's TrOOP.

VII. SPAPs and Part D

CMS should clarify that prices negotiated with a pharmaceutical manufacturer for Covered Part D drugs by a state pharmaceutical assistance program ("SPAP") as defined in Sections 423.4 and 423.464 of the Proposed Rule may be excluded from a pharmaceutical manufacturer's "best price" calculation for purposes of section 1927 of the Social Security Act (the "Medicaid Rebate Statute")

CMS should clarify that prices negotiated with a pharmaceutical manufacturer for Covered Part D drugs by a state pharmaceutical assistance program ("SPAP") as defined in Sections 423.4 and 423.464 of the Proposed Rule may be excluded from a pharmaceutical manufacturer's "best price" calculation for purposes of section 1927 of the Social Security Act (the "Medicaid Rebate Statute"). To do so, CMS must eliminate the confusion created by contradictory definitions of SPAPs in the Proposed Rule and recent guidance issued by CMS in the context of the Medicaid Rebate Statute.

Specifically, the Medicaid Rebate Statute, at § 1927(c)(1)(C)(i)(III) of the Social Security Act, excludes "prices used under a State pharmaceutical assistance program" from consideration in computing a pharmaceutical manufacturer's "best price" for the drug. However, guidance issued by CMS on June 23, 2003, through Medicaid Rebate Program Release No. 59 (restated in CMS State Medicaid Director Release # 124) ("Release 59"), put in place a set of criteria that have caused CMS to conclude that some SPAPs should not be excluded from best price computation, while other states' programs can be excluded from the best price computations. However, the Proposed Rule and Release 59 can be read as having conflicting definitions, as is explained more fully below.

This is problematic because the definition of an SPAP in the Medicare Modernization Act ("MMA") and the rules ultimately promulgated thereunder will not stand alone. Manufacturers will also have to consider the application of relevant CMS releases when considering the 'best price" implications of the prices negotiated with SPAPs for <u>all</u> the populations that may be served by the SPAP. The definition of SPAP for Medicare part D purposes will apply only to the subset of SPAPs that serve individuals who are also eligible for Medicare part D. Nevertheless, SPAPs also serve indigent, unemployed, and other individuals who are not eligible for Medicare, Medicaid, or other insurance programs. Indeed, some SPAPs serve -- and will likely continue to do so -- both Part D eligible and non-Part D eligible populations.

CMS should make it clear that prices offered by pharmaceutical manufacturers under both types of SPAPs should be excluded from a manufacturer's best price computation. Without clarification, it would be difficult, if not impossible, for a manufacturer to know if prices it has offered to an SPAP could be excluded from its best price calculation as a result of the contradictory definitions of SPAPs. SPAPs may not be able or willing to submit separate utilization data to manufacturers for its Part D eligible and non-Part D eligible enrollees. Such a

clarification would also encourage manufacturers to continue to offer discounts to SPAPs that provide pharmaceutical benefits to non-Part D eligible beneficiaries.

For example, CMS suggests in Release 59 that one defining feature of an SPAP is that the SPAP must be "specifically for disabled, indigent, low-income elderly or other financially vulnerable persons." There is no such "low-income" requirement in the MMA definition of an SPAP or under the Proposed Rule. Similarly, Release 59 suggests that to qualify as an SPAP, the program can not be funded with any Federal dollars. In contrast, the Proposed Rule excludes from the definition of an SPAP, among other things, any "program where the majority of the funding is from Federal grants, awards, contracts, entitlement programs or other Federal sources of funding" (§ 423.464(e)(iv) of the Proposed Rule (emphasis added)), thereby suggesting that some amount of Federal funding is acceptable for SPAPs in the context of the MMA.

It would not be in anyone's interest to permit confusion over definitions in a Medicaid rebate program guidance to undermine the coordination of part D benefits and SPAPs. To prevent this result, we propose that CMS define "State pharmacy assistance program" in the final regulations in a way that applies to SPAPs that serve either Part D eligible beneficiaries or non-Part D eligible beneficiaries, or both, and that will serve as an exemption from best price provision of the Medicaid Rebate Statute.

Furthermore, to make the criteria meaningful, we propose that the regulations provide an assurance that pharmaceutical manufacturers can rely in good faith upon an SPAP's representation that it meets the criteria to be excluded from the best price computation under the Medicaid Rebate Statute.

We propose that CMS clarify the provisions applicable to SPAPs by modifying § 423.464(e)(4) "Construction," by placing "(i)" after the title and adding new subparagraphs (ii) and (iii) at the end thereof, to read as follows:

(ii) Definition of an SPAP for purposes of Section 1927 of the Social Security Act. Notwithstanding § 423.464(e)(1), an SPAP operated by or under contract with a State shall be considered a "State pharmaceutical assistance program" for purposes of Section 1927 of the Social Security Act if it:

(A) is a program designed by or on behalf of a State specifically for disabled, indigent, elderly or other financially vulnerable persons;

(B) is not a State Medicaid program, a section 1115 demonstration program, or any other program where the majority of funding is from Federal grants, awards, contracts, entitlement programs, or other Federal sources of funding; and

(C) either

(I) directly dispenses pharmaceutical products to its qualified beneficiaries or directly reimburses providers, Medicare-endorsed discount cards, a Medicare prescription drug plan, or a Medicare Advantage prescription drug plan; or

(II) provides assistance with the cost-sharing requirements of a private health plan, a Medicare part D plan or a Medicare Advantage prescription drug plan, or provides a pharmaceutical benefit or discount, either alone or in conjunction with other medical benefits or services.

(iii) *Pharmaceutical Manufacturer's Good Faith Reliance. For purposes of filing price reports under § 1927 of the Social Security Act, a pharmaceutical manufacturer can rely in good faith upon an SPAP's assurance that the SPAP meets the criteria of this part.*

VI. Subpart C.1.a. and Subpart J.6.c. – Coordination of Benefits Under Part B and Part D

To minimize confusion by enrollees and physicians and to ensure that patients obtain appropriate access to medically necessary therapies, GSK encourages CMS to provide seamless coordination of the Part B and Part D benefits

We urge CMS to clarify that the statement in the preamble that "*any drug covered under A or B could not be covered under D, whether it was covered for that individual or not*" applies only to individuals who have declined to enroll in Part B, with respect to drugs for which Part B coverage would have been available for that individual under Part B.

GSK supports CMS's recognition of Part D as a benefit intended to fill gaps in existing Medicare coverage of prescription drugs[101] and to implement Part D in a manner that "'wraps around' existing Part B drug benefits to the greatest extent possible."[102] Medicare Part B provides only limited coverage for drugs provided incident to a physician's service. Part D will provide Medicare enrollees with greater access to the therapies they need.

To minimize confusion by enrollees and physicians and to ensure that patients obtain appropriate access to medically necessary therapies, GSK encourages CMS to provide seamless coordination of the Part B and Part D benefits.

The coordination process should allow physicians to submit claims under Part B for consideration if the product was administered by the physician and arrange for any portion of the claim rejected under Part B to be automatically submitted to the patient's plan. The Part D plan would then reimburse the physician as an out-of-network provider. This process would reduce delays in needed care for these enrollees. Additionally, GSK urges CMS to consider the needs of special populations, including cancer patients among others, whose continuity of care should not deteriorate due to the interaction between Part B and Part D. We specifically address our recommendations with respect to special populations elsewhere in this document.

Additionally, we are concerned that the preamble language to Subpart J.6.c. creates some confusion. CMS states that "any drug covered under A or B could not be covered under D, whether it was covered for that individual or not."[103] This appears to be inconsistent with the provisions of the MMA and the Proposed Rule.

---

101 69 Fed.Reg. at 46646.

102 69 Fed.Reg. at 46647.

103 69 Fed.Reg. at 46703.

We urge CMS to clarify that this statement applies only to individuals who have declined to enroll in Part B, with respect to drugs for which Part B coverage would have been available for that individual under Part B.[104]

To highlight some of the potential concerns facing enrollees who may have coverage under both Part B and Part D, we discuss specific examples were the interaction between Part B and D will be complicated. As background, under the MMA and the Proposed Rule, benefits will not be available under Part D for any drug for which payment is available under Part B for that individual.[105]

CMS has clarified that administration and dispensing will include "the setting, personnel, and method involved, and not simply the route of administration."[106] Enrollees will obtain benefits under Part B, where available, unless the Part B coverage criteria are not met. These criteria generally include that the drug is purchased and administered by the physician and that the therapy usually is not self-administered by the patient. If any of these criteria are not met, then the drug will be covered under Part D, as long as the drug is on the formulary or the enrollee has received an exception to the formulary. Thus, Part D coverage will be available in circumstances in which the individual is capable of self-administering a drug that typically is administered in a physician's office or outpatient setting. This interpretation is consistent with the intent of the MMA.

However, there are some products that may not be defined in such a straightforward fashion because they could be covered either under Part B or Part D, depending on the medical use for the product or the medical condition of the individual beneficiary. For example, Zofran® (ondansetron hydrochloride) is a treatment for chemotherapy induced nausea and vomiting (CINV) and for post operative nausea and vomiting (PONV). While the intravenous form of Zofran is clearly covered under Part B, the oral forms of the product can be covered under Part B if it is prescribed for use as an acute anti-emetic used as part of an anti-cancer chemotherapeutic regimen within 48 hours after the time of the administration of the anti-cancer chemotherapeutic agent as a full replacement for the anti-emetic therapy which would otherwise be administered intravenously or under Part D for other uses of the product, including product that is dispensed by the physician for PONV, or as adjunctive therapy to an intravenous anti-emetic. Therefore, if an oncologist uses IV Zofran prior to chemotherapy then the oral product would not be reimbursed for the 48 hour period post chemotherapy for the prevention of delayed nausea and vomiting under the DMERC provisions of the Part B benefit but could be reimbursed under Part D.

---

104 We note that the MMA does not require that Part D benefits be unavailable in these circumstances to Medicare enrollees who have chosen not to enroll in Part B.

105 SSA § 1860D-2(e)(2)(B); Proposed 42 C.F.R. § 423.100.

106 69 Fed.Reg. at 46646.

A second example is hepatitis B vaccine. Part B currently covers hepatitis B vaccine furnished to an individual who is at high or intermediate risk of contracting hepatitis B (as determined by the Secretary under regulations). Those regulations do provide definitions of high or intermediate risk, but also exclude patients who have chronic liver disease and others with a medical need for immunization against hepatitis B. Therefore, Part B would pay for hepatitis B vaccine for a patient who is defined as being at high or intermediate risk of hepatitis B but Part D would pay for hepatitis B vaccine for a patient with chronic liver disease.

Lastly, because immunization traditionally is covered as a medical benefit and not a pharmacy benefit, vaccine delivery even for those vaccines that fall entirely within the Part D benefit must be carefully coordinated to ensure that inclusion of vaccines on a plan formulary translates into a meaningful benefit for enrollees. This will require that vaccine administration be included in the definition of dispensing fee as well as clarification regarding how these claims should be processed, since vaccines tend to be purchased and administered by physicians.

VIII. Subpart C -- Dispensing Fees -- § 423.100

CMS should extend the definition of "dispensing fees" to include the administration costs associated with vaccines

CMS has proposed three possible interpretations of "dispensing fees" that would include alternative methods of accounting for costs associated with certain products. CMS is considering limiting an expanded definition of dispensing fees to home infusion therapies in that home infusion represents "the only circumstance we know of where the additional services associated with administering the drug would not already be covered under Medicare Part A or B and would be necessary to ensure effective delivery of the drug."[107] CMS requests comments on whether the administration of other drugs, specifically vaccines, may pose similar access problems for enrollees absent payment for administration supplies and services.[108] It will be important for CMS to ensure that the costs of vaccine administration are properly incorporated into the dispensing fee.

To best ensure Part D enrollees meaningful access to appropriate therapies, CMS should adopt the third option, which would include the costs of supplies, equipment and professional services necessary to administer home infusion drugs.[109] In proposing the third option, CMS recognizes that, absent payment for the supplies and services necessary for administration, certain pharmaceuticals or biologicals may, as a practical matter, be unavailable to many Part D enrollees, undermining the purpose of the Part D benefit.

CMS should, therefore, extend this definition to include the administration costs associated with vaccines. This policy would be consistent with existing Medicare Part B policy regarding vaccines. Part B covers only a limited number of vaccines, but for these vaccines Part B covers both the cost of the vaccine and the cost of administration. This ensures that enrollees for whom a vaccine is covered under Part B have meaningful access to this benefit. Congress clearly intended for the Part D benefit to include vaccines, specifically including vaccines in the statutory definition of covered Part D drugs. Thus, to provide meaningful coverage for vaccines, payment will need to include administration costs. Inadequate coverage of the administration costs will likely have a negative effect on vaccination rates among Medicare beneficiaries.

IX. Subpart M -- Grievances, Coverage Determinations and Appeals

The exceptions, appeals and grievance processes CMS proposes will not adequately protect Medicare enrollees enrolled in Part D plans and will make it difficult for them to navigate the appeals process to obtain therapies. We urge CMS to redesign its proposed framework to provide Part D enrollees with a clear and reasonable way to obtain the prescription drugs they need. Our specific suggestions are as follows:

1. Reduce the Timeframe for the Appeals Process

CMS must reduce the timeframe in which plans must respond to enrollee appeals or requests for exceptions to provide enrollees with adequate access to the prescription drug benefit.

GSK is concerned that enrollees will experience significant delays in accessing prescription drugs that their treating physician(s) feel are most appropriate because a Part D plan has determined that an appeal must be initiated. The MMA requires that Part D plans follow an appeals process that is consistent with the existing process for appeals of Part C benefits under Medicare Advantage plans.[110] In fact, CMS proposes a process that largely mirrors the Part C appeals process. The MMA does not require, however, that the process for appeals under the Part D benefit incorporate the same timeframes as are set forth for Part C benefits. CMS may shorten the timeframes and still meet the statutory requirement that the appeals process for Part D is consistent with the Part C appeals process.

Reducing the timeframe for appeals would appropriately reflect the difference between prescription medications and other services as well as the manner in which prescription drugs generally are paid. Under Part C, appeals typically relate to payment for physician and hospital benefits after the beneficiary already has received the services. Under Part D, however, an enrollee may be denied a necessary drug at the pharmacy. Thus, under Part D, the enrollee must either go without the drug or pay for the drug out-of-pocket until the appeal is resolved. If an enrollee cannot afford to pay for the drug, the enrollee will need to take a formulary drug that may be less effective or has greater side effects and may not represent the best therapeutic option in the opinion of the treating physician. The enrollee may be forced to go without the therapy altogether while the appeal is resolved. In either case, the enrollee will forgo the therapy that his or her physician deemed most effective.

[110] SSA § 1860D-4(g).

In addition to the therapeutic and financial burdens the length of this process may impose on an enrollee, this process also may require the enrollee to make multiple visits to his or her physician(s) and the pharmacy, thus increasing the burden on frail or elderly patients.[111]

GSK urges CMS to reduce the timeframe of the appeals process to lessen the burden on enrollees and to ensure adequate access to medically necessary drugs. Clearly, the most expedient and beneficial process for the enrollee would be for online, point-of-sale adjudication. Most health plans, or their PBMs, have the ability for online contact with a clinical pharmacist who can make contact with the treating physician to obtain any information necessary to resolve the appeal while the patient is in the pharmacy. Only if a contemporaneous resolution cannot be reached would further appeals processes be implemented.

GSK also recommends that CMS reduce the timeframe for the exceptions process. Given the importance of continuity in how many medications are taken, the timeliness in responding to an exception request is particularly important to the implementation of a meaningful prescription drug benefit. Indeed, Congress recognized the unique challenges that an appeals process may pose for a prescription drug benefit by specifically requiring plans to institute a separate exceptions process. It is not useful to have a separate exceptions process if the timeframe for that process may be as long as for the regular appeals process. *We request that CMS modify the exceptions timeframe to require Part D plans to respond to an exceptions request within 72 hours or at the point-of-sale, if possible. This is consistent with the practice typical in private plans, and will allow enrollees to better access the therapies they need.*

2. Provide Access to an Emergency Supply of Medication

Plans should be required to provide enrollees with an emergency supply of medication while resolving any appeals or exceptions requests.

CMS proposes that a plan be required to provide an emergency supply of medication only for continued coverage of a drug being removed from the plan's formulary, where the plan has failed to act on an exceptions request within a certain timeframe.[112] CMS makes no provision for an emergency supply during the normal course of the exceptions process or during the appeals process.

---

111 The financial burden on enrollees here is increased by the fact that enrollees may not have access to negotiated prices for drugs not on the formulary. Under the Proposed Rule, negotiated prices must be available to enrollees if no benefits are payable due to the application of a deductible or 100% coinsurance requirement. 42 C.F.R. § 423.104(h).

112 Proposed 42 C.F.R. § 423.578(c)(2).

GSK recommends that CMS require plans to make an emergency supply of a drug available anytime an enrollee is already taking the drug and an exceptions request or appeal is underway, not simply when a plan has failed to act in a timely manner.

It is not medically appropriate for a patient to simply discontinue an ongoing therapy or switch therapies during an appeals process. This is particularly true for vulnerable populations, including individuals that have multiple medical conditions or need drugs that require very individualized dosing, such as antidepressants or antipsychotics.

Furthermore, proper drug therapy is a function not only of prescribing the correct drug, but also of titrating to the correct dose, especially with agents that have a very narrow therapeutic window. Failure to maintain the patient at adequate dosing could put the enrollee at an increased medical risk. This requirement will provide the enrollee with continued access to an ongoing necessary therapy, as well as provide plans with an appropriate incentive to respond to exceptions requests and appeals in a timely fashion.

3. Clarify that Denial of a Claim is a Coverage Determination

The denial of a claim at the pharmacy should be considered a coverage determination for purposes of enabling an enrollee to begin the appeals or exceptions process.

Under the Medicare program, a denial of benefits generally is considered an adverse coverage determination that triggers a requirement that a notice and an explanation of appeal rights be sent to the beneficiary. Under the Proposed Rule, however, a Part D enrollee – or his or her authorized representative – would need to initiate and seek a "coverage determination" or "exception" from his or her Part D plan; denial of a claim at the pharmacy would not be sufficient.

GSK is concerned that this is inconsistent with the Medicare program and will impede an enrollee's ability to appeal. Failure to maintain proper drug therapy throughout the appeal process could subject the enrollee to untoward medical outcomes.

We request that CMS clarify in the final rule that the denial of the claim at the pharmacy is a coverage determination. This will allow an enrollee to receive information about the appeals process at the point of the denial. This also will eliminate an extra, unnecessary step by allowing an enrollee whose claim has been denied to seek an appeal without first having to request a coverage determination.

4. Allow Appeals When the Enrollee Has No Payment Liability

Eliminate the prohibition on appeals where an enrollee has no financial liability.

Under the Proposed Rule, an appeal right would not exist when the enrollee bears no payment liability.[113] This provision is inconsistent with the goals of Part D, and *we strongly urge CMS to eliminate this provision in the final rule.*

Under the Proposed Rule, an enrollee's authorized representative or prescribing physician may request a coverage determination[114] or an exception.[115] Yet CMS proposes to disallow an appeal where another party – such as a family member, other health insurance, or a State Pharmaceutical Assistance Program ("SPAP") – has paid for the prescription. The MMA specifically contemplates that at least some enrollees will have access to assistance with their prescription drug costs from sources other than Part D. [116] The MMA also expressly requires Part D plans to coordinate with SPAPs.

Prohibiting appeals where a third party has provided payment for a drug is likely to discourage these third parties from providing such payment until a Part D appeal has been exhausted. This will be particularly detrimental to those low-income enrollees who rely on SPAPs to access prescription drugs. Ultimately, the burden of the appeals process will shift to the enrollees least able to manage such a complex process.

In the meantime, such expenditures for non-formulary drugs will not count as "incurred costs" for purposes of reaching the out-of-pocket limit. This will result in enrollees taking longer to reach their catastrophic coverage, which, in turn, will increase the liability of SPAPs and other charitable organizations that assist low-income enrollees with their prescription drug costs. This prohibition also has the effect of relieving Part D plans from their obligations to enrollees. Part D plans will have a strong incentive to shift costs to an enrollee's other health coverage, because the Part D plan will be protected from appeals.

GSK strongly urges CMS to eliminate this provision and clarify that Part D plans are required to pay for drugs consistent with their agreement with CMS and their obligations under the MMA and implementing regulations, regardless of whether an enrollee has secondary coverage.

---

[113] Proposed C.F.R. § 423.562(c)(1).

[114] Proposed 42 C.F.R. § 423.566.

[115] Proposed 42 C.F.R. § 423.578(a)(3).

[116] *See, e.g.*, Proposed 42 C.F.R. § 423.452 – 42 C.F.R. § 423.464.

5. Provide Access to Therapies After Mid-Year Formulary Changes

Enrollees taking a drug should be granted continued access to that drug at the same cost-sharing level for the duration of the plan year; alternately, an automatic exceptions process should be instituted for these enrollees upon a formulary change as well as for dual eligibles as they switch from Medicaid to Part D.

CMS proposes that Part D plans be required to establish an exceptions process for situations in which an enrollee is using a drug and the formulary or cost-sharing status changes mid-year or at the beginning of a plan year.[117] *GSK urges CMS to prohibit plans from making changes mid-year that result in removal of a drug from a formulary or increases the cost-sharing required of an enrollee. Otherwise, plans can engage in "bait-and-switch" tactics to the detriment of the enrollee.*

If CMS declines to require plans to limit such changes to the beginning of a plan year, we request that CMS provide a mechanism for automatic exceptions request for enrollees already taking a drug for which the formulary or tiered status is changed. For these enrollees, a plan would need to respond to an automatically generated exceptions request. Otherwise, these enrollees will receive notice of the drug's change in status, have to seek a coverage determination, and then have to initiate an exceptions request. This will result in delays in receiving treatment. For many drug therapies, it is not clinically acceptable for an enrollee to stop and then re-start a prescription while the exceptions or appeals process is resolved. As noted above, such changes may require laboratory tests and physician visits.

We also urge CMS to institute such an automatic exceptions process for dual eligibles when they first switch to Part D. Again, this would enable these enrollees to maintain their current therapies while the exceptions process is underway.

6. Standards for Reviewing Exceptions Requests

The final rule should allow plans to require a prescribing physician to certify that a therapy <u>would not be</u> as effective for an individual.

The MMA requires plans to pay for a nonpreferred drug under the same terms applicable to a preferred drug where the prescribing physician has determined that the preferred drug would not be as effective for the individual for treatment of the same condition, would have adverse effects for the individual, or both.[118] In the Proposed Rule, CMS has established several criteria in addition to the physician's certification required by the MMA that plans must consider during

---

117 Proposed 42 C.F.R. § 423.578(a)(1)(i)-(ii); § 423.578(b)(1)(ii).

118 SSA § 1860D-4(g)(2).

review of an exceptions request for a preferred formulary placement. *We urge CMS to remove these additional requirements and revise this regulatory provision to appropriately reflect the intent of the MMA.*

CMS should require a plan to grant an exceptions request where the prescribing physician makes the MMA-required certifications. This would appropriately defer to the prescribing physician as the best determinate of what drug is the safest, most effective, and medically necessary for an individual patient.

GSK also is concerned that CMS has not properly implemented the MMA in implementing the physician certification provision. The MMA permits a Part D plan to require a physician's certification that a preferred drug "*would not be* as effective for the individual or *would have* adverse effects for the individual or both."[119] In the Proposed Rule, CMS allows a plan to require a physician's written certification that a preferred drug "*is* not as effective for the enrollee" as the requested drug.[120] These proposed regulations could be viewed as permitting plans to institute step therapy or "fail first" requirements prior to granting an exceptions request.

We urge CMS to finalize this provision by allowing plans to require the prescribing physician to certify that a therapy would not be as effective for an individual.

7. Therapeutic Equivalence

CMS should not establish a different definition of therapeutic equivalence for the exceptions process than it does for the rest of the Part D benefit, and therapeutic equivalence should be defined in reference to the Orange Book.

The Proposed Rule states that a plan's exceptions criteria should include "[c]onsideration of whether the requested prescription drug that is the subject of the exceptions request is the therapeutic equivalent of any other drug on the sponsor's formulary."[121] Not only has CMS imposed extra criteria on the exceptions process, but in doing so CMS has also inappropriately included a special definition of "therapeutically equivalent" applicable only to this subsection.

For purposes of the exceptions process, the Proposed Rule defines "therapeutically equivalent" as a preferred drug that has "equal effect and no difference when substituted for the requested drug."[122] Yet the definitions section of the Proposed Rule -- § 423.100 -- defines "therapeutically equivalent" as referring to "drugs that are rated as therapeutic equivalent under

the Food and Drug Administration's most recent publication of 'Approved Drug Products with Therapeutic Equivalence Evaluations.'"[123]

GSK supports the definition proposed in § 423.100 as the commonly accepted definition of "therapeutically equivalent." *We urge CMS to avoid establishing a separate definition for exceptions requests.*

X. Subparts C, F, G, K, Q, and R -- Disclosure of Negotiated Price Information

GSK urges CMS to

(1) extend the confidentiality protection of the Medicaid Rebate statute to information obtained by CMS to carry out Medicare payments to Part D plans, data regarding specific drug claims, and other information that CMS deems necessary under various sections of the Proposed Rules, and all negotiated price information submitted to or reviewed by CMS under part D;

(2) make explicit that the Trade Secrets Act[124] applies to pricing or other confidential information that CMS obtains or reviews from plans as it implements Part D;

(3) adopt a regulation mirroring the section of the Federal Acquisition Regulation relating to the protection of confidential and proprietary information; and

(4) provide notice to pharmaceutical manufacturers prior to releasing confidential information under the Freedom of Information Act

1. GSK urges CMS to extend the confidentiality provisions of the Medicaid rebate statute to all of the information that CMS may obtain from plans in the course of administering the Part D benefit.

In the Proposed Rule, CMS specifies the types of information it may require plan sponsors and MA organizations to report. This information includes data on aggregate negotiated price concessions obtained from pharmaceutical manufacturers and passed through to

[123] Proposed 42 C.F.R. § 423.100

[124] 18 U.S.C. § 1905.

Part D enrollees,[125] information necessary to carry out Medicare payments to plan sponsors and MA organizations,[126] data regarding drug claims at an individual level,[127] and other information the agency deems necessary.[128] In addition to these types of information, CMS expects to request detailed pricing information from Part D plans so that it may review the appropriateness of bids, compare bids, and determine allowable costs associated with reinsurance payments, risk corridors and subsidies.[129]

The information that CMS will require from Part D plan sponsors and MA organizations necessarily will include commercially sensitive information that Part D plans obtain from pharmaceutical manufacturers. GSK is concerned that the Proposed Rule does not adequately protect this confidential and proprietary information.

The information that Part D plans will need to submit to CMS is only partially protected under the Proposed Rule. Under Proposed 42 C.F.R. § 423.104(h), the confidentiality protections of the Medicaid rebate statute[130] extend only to the data that plans submit to CMS regarding aggregate negotiated price concessions. The MMA and the Proposed Rule also provide limited protection for the information CMS obtains from plans for the purpose of carrying out payments to plan sponsors and MA organizations.[131] Proposed § 423.322(b) limits the use of this information to purposes consistent with carrying out provisions related to such payments. While this provision does provide some protection against misuse of the information, we are concerned that there is no protection against disclosure of the information. *Extending the confidentiality protections of the Medicaid rebate statute to this information would provide manufacturers with assurances that their confidential and proprietary information will not be inappropriately disclosed.*

CMS also may require plans to submit specific data on drug claims[132] and other detailed data that CMS may deem necessary under § 423.265, § 423.505, §423.863, and § 423.888. The Proposed Rule does not provide any confidentiality protections for any of this information. We are concerned that this lack of protection could result in the inappropriate release of commercially sensitive information that plans obtain from pharmaceutical manufacturers.

---

[125] Proposed 42 C.F.R. § 423.104(h).

[126] Proposed 42 C.F.R.§ 423.322(a).

[127] Proposed 42 C.F.R. § 423.329(b)(3).

[128] *Id.*

[129] *See, e.g.*, Proposed 42 C.F.R. § 423.265; § 423.505; §423.863; § 423.888.

[130] SSA §1927(b)(3)(D).

[131] Proposed 42 C.F.R. § 423.322(b). CMS suggests in the preamble that this information may include "the quantity, type, and costs of pharmaceutical prescriptions filled by enrollees." 69 Fed.Reg. at 46686.

[132] Proposed § 423.329(b)(3).

We urge CMS to extend the confidentiality protections of the Medicaid rebate statute to all negotiated pricing information submitted to or reviewed by CMS under Part D, including information obtained under Subparts F, G, K, Q, and R of the Proposed Rule.

We are concerned that the Proposed Rule construes the confidentiality provisions of the MMA too narrowly in extending the Medicaid rebate protections only to aggregate pricing information. While Congress left it to CMS to determine exactly what types of information it would need to properly implement Part D, it seems likely that Congress intended to provide the Medicaid rebate statute protections more broadly to pricing data reported to CMS, and not solely to aggregated pricing information. In fact, the Medicaid rebate statute applies more generally to "information disclosed by manufacturers or wholesalers,"[133] and in effect prohibits the disclosure of pricing information regarding specific drugs. It is this type of specified, disaggregated information that is the most commercially sensitive.

Extending the Medicaid Rebate statute protections will assure manufacturers that their proprietary information will be protected when it is held by CMS. This is particularly important, because, as discussed below, Part D plans may not have sufficient motivation to protect the commercially sensitive information that they obtain from manufacturers.

2. *We urge CMS to clarify in the final rule that the Trade Secrets Act[134] applies to pricing or other confidential information that CMS obtains or reviews from plans as it implements Part D.*

The Trade Secrets Act precludes agency officials or employees from disclosing commercially sensitive information, including certain pricing information. The disclosure of this type of proprietary information would cause substantial competitive harm to manufacturers, as well as to Part D plans. Such disclosure also would impede negotiations between manufacturers and plans. Making clear that this type of specific pricing information constitutes a trade secret would help to protect against the disclosure of such information that CMS obtains from Part D plans and would facilitate the negotiation between these parties.

3. GSK urges CMS to adopt a regulation mirroring the section of the Federal Acquisition Regulation relating to the protection of confidential and proprietary information.[135]

This regulation would apply to all bids submitted by either a risk-bearing plan or a fallback plan and would help to clearly identify confidential and proprietary information.

---

[133] § 1927(b)(3)(D).

[134] 18 U.S.C. § 1905.

[135] *See* 48 C.F.R. § 52.215-1(e).

4. *Finally, we urge CMS to provide notice to pharmaceutical manufacturers prior to releasing confidential information under the Freedom of Information Act ("FOIA").*

Federal agencies are required to use "good faith efforts to advise submitters of confidential commercial information" regarding requests for the release of confidential information under FOIA.[136] To that end, the Department of Health and Human Services ("HHS") has adopted a "balanced approach in administering FOIA."[137] Specifically, HHS "recognize[s] the legitimate interests of organizations or persons who have submitted records to the Department or *who would otherwise be affected by release of records*."[138]

Given the unique nature of the reporting requirements under Part D, in which plans report the confidential price information of pharmaceutical manufacturers, it is clear that pharmaceutical manufacturers would be affected by the release of the sensitive price information contained in Part D plan's proposals. Thus, GSK respectfully requests that in addition to notifying Part D plans of a FOIA request, that CMS also provide notice to pharmaceutical manufacturers. This additional notice would allow the entity that would be truly affected by the release of the confidential commercial information the opportunity to review the request and provide the appropriate objection, if necessary.

HHS FOIA regulations currently contemplate the provision of notice to a large number of submitters. Specifically, if CMS "must notify a large number of submitters, [it] may do this by posting or publishing a notice in a place where the submitters are reasonably likely to become aware of it."[139] By posting relevant FOIA requests on a central website, with the ability for submitters to receive e-mail notices of new requests, CMS would provide both Part D plans and pharmaceutical manufacturers sufficient notice to meet CMS FOIA response deadlines or request a time extension. We appreciate CMS's consideration of these specific requests designed to ensure the adequate protection of manufacturers' confidential information.

136 Executive Order 12,600, 52 Fed. Reg. 23781.

137 42 C.F.R. § 5.2.

138 *Id.* (emphasis added).

139 42 C.F.R. 5.65(d)(1).

XI. Subpart Q -- Non-Interference with Respect to Fallback Plans

GSK recommends that CMS clearly indicate in the final rule that it will not set price benchmarks, create incentive payments, or otherwise interfere with the price structure for Part D drugs, whether provided through fallback plans or not.

Congress explicitly prohibits the Secretary from interfering in Part D negotiations between pharmaceutical manufacturers and plan sponsors and more generally from instituting a particular "price structure for the reimbursement of covered Part D drugs."[140] The Proposed Rule should be clarified to ensure that this prohibition will be observed in the context of fallback plans. While we appreciate CMS's recognition of the risk of running afoul of this non-interference provision, particularly with respect to fallback plans,[141] *we request that CMS clearly indicate in the final rule that it will not set price benchmarks, create incentive payments, or otherwise interfere with the price structure for Part D drugs, whether or not provided through fallback plans.*

It is possible that there will be regions in which one Part D plan or MA-PD is operating alongside a fallback plan. In these situations, it will be especially important that CMS not interfere with the negotiations between a pharmaceutical manufacturer and the Part D plan, MA-PD, or the fallback plan. The Proposed Rule could be interpreted as CMS suggesting that it may seek to influence a fallback plan's negotiations with pharmaceutical manufacturers by scrutinizing the negotiated prices for drugs available through the fallback plan or otherwise instituting a price structure for these plans.[142] *We urge CMS to carefully observe the requirements of the non-interference provisions with respect to fallback plans and to be particularly aware of the non-interference requirements in situations in which a fallback plan is offered alongside an at-risk plan in the same region.*

---

[140] SSA § 1860D-11(i).

[141] 69 Fed.Reg. at 46734-5.

[142] *See* 69 Fed.Reg. at 46734-5.

XII. Section 423.159 -- Electronic prescription program

In developing standards for electronic prescribing, CMS must keep as their primary objective the preservation of the physician-patient relationship to facilitate medical choices most appropriate for each patient. Electronic prescribing should support all aspects of the prescribing decision, from choosing the most appropriate drug to resolving all appeals or grievances about that choice. CMS must ensure that the final standards are applicable in the real world with a variety of practice sizes and settings and, therefore, should err on the side of requiring a full demonstration project before the final standards are implemented.

GSK supports the policy of the Medicare Modernization Act to encourage the adoption of electronic prescribing. Widespread adoption of electronic prescribing with the appropriate standards has the potential to (i) enhance patient safety and (ii) improve quality of care, while at the same time realizing significant efficiencies in the delivery of care and reducing overall health care costs.

There are literally hundreds of highly technical issues surrounding the development of electronic standards, interoperability, terminology, privacy, etc. If the critical goal of improving quality of care is to be preserved, CMS must not lose sight of the overarching consideration in implementing this new technology: the importance of the physician-patient relationship and the ability of the physician and patient to make the most appropriate medical choices. Those choices relate both to the decision on which drug will most effectively treat the patient's disease and to the patient's options for filling that prescription.

Within the health care system, in addition to appropriate treatment considerations, there are also financial incentives for payors, pharmacies, drug manufacturers, and other participants to encourage or select the use of certain drugs. While the electronic prescribing system must operate within the context of a specific drug benefit plan in which costs are a relevant consideration, its primary focus should be ensuring safety and improving patient quality; it should not be used merely as a cost-savings tool. *The standards must ensure that the ultimate decision on what drug to prescribe – if any – and how to get drugs dispensed remains in the hands of the patient and the physician or other practitioner.*

There are many examples of how electronic prescribing can help save costs while at the same time ensuring quality of care through preservation of physician and patient treatment choice. For example, the electronic prescribing initiative has the potential to greatly simplify the process of satisfying health plan prior authorization, physician "dispense as written" orders, physician attestation regarding appropriate use, drug interaction alerts, step therapy, co-payment appeals, and denial of coverage appeals. These processes are typically performed manually at great cost to the plan and physician and great inconvenience to the patient. In the current system, these well-intentioned efforts actually dissuade patients from filling their prescriptions, thus contributing to poor outcomes and increased health care costs. *The inclusion of electronic*

"Point of Care" fulfillment processes for each of the above mentioned interventions, therefore, should be an essential feature of an electronic prescribing system.

It is easy to get carried away with the prospect of a "perfect" electronic prescribing environment in which physicians will ideally have all of the information they need to prescribe the medicine that is the most clinically effective and cost effective for the patient and in which the prescription will be transmitted quickly and without error to the chosen dispenser, whether that be a physical pharmacy or a mail-order facility. However, CMS must not lose sight of the reality that underlying this electronic communications system are real patients with less–than-perfect memories, who often face obstacles to filling and complying with their prescriptions.

For example, one of the stated advantages of electronic prescribing is doing away with the paper prescription that the patient must deliver to a pharmacy. Paper prescriptions are often the cause of errors, non-compliance, and inefficiencies due to handwriting errors and obstacles to the ability of patients to have their prescriptions filled. The resulting underutilization and non-compliance are major sources of inefficiencies and costs in the system.

However, in many cases it is the prescription – the piece of paper -- that helps patients remember to get their prescriptions filled. In implementing an electronic prescribing system that eventually could obviate the need for paper prescriptions, we must keep in mind the human elements in play and ensure that there are still adequate incentives and tools available to help patients follow through in getting prescriptions filled, either for themselves or those for whom they are responsible.

We encourage CMS to also consider the other real-world factors that will influence the use of electronic prescribing technology. That is, standards for electronic prescribing must be flexible and scalable to be applicable in the wide variety of clinical settings and specialties, from small to large health care organizations, and low to high volume prescribing practices. *The system must be flexible to support varying physician and patient needs.*

For example, a physician may write a prescription for a long-term medication that the patient chooses to receive by mail order. If the mail order medication will take several days to a week to be delivered, the physician may want to split the prescription and write a prescription for one week's worth of medicine so it can be filled locally. The standards must be sufficiently flexible to support situations like this that vary from most common practices.

The standards must be written with the understanding that electronic prescribing is not just a stand-alone application but must become a collective part of a full electronic health record. *Ultimately, it must have interoperability so that each physician can have the full patient medical history and other information he or she needs in a reliable and user-friendly form.*

Finally, the law requires the Secretary to conduct a pilot project once the initial standards have been adopted; the law allows the Secretary to by-pass the pilot project if there is already

adequate industry experience with the standards the Secretary is planning to adopt. We encourage CMS to exercise caution in this regard.

With the introduction of a new technology that is complex and uncertain, yet so critical to patient safety and the delivery of quality care, we encourage the Secretary to exercise the power to forego a pilot project only if there is extremely high confidence level in the industry experience with the proposed standards. The Secretary should err on the side of requiring further demonstrations to ensure the effectiveness and quality of all aspects of the new standards in a variety of real-world settings.

Conclusion

As CMS prepares the final rule and other regulations to implement the MMA, we ask the agency to remain focused on the statute's greater purpose: to provide Medicare enrollees with important drug therapies in clinically appropriate and cost-effective settings. Patients' access to advanced therapies depends upon Medicare's appropriate reimbursement to providers for those therapies. GSK appreciates the opportunity to comment on the issues we have identified in this comment letter, and we look forward to working with CMS to create a Part D prescription drug benefit that ensures Medicare enrollees meaningful access to vital drug therapies. Please feel free to contact me at (215) 751-4557 if you have any questions regarding these comments. Thank you for your attention to this very important matter.

Respectfully submitted,

Dean Hakanson. MD

Re: Comments of GlaxoSmithKline on the Draft Model Guidelines

Dear Ms. Lang:

GlaxoSmithKline ("GSK") appreciates this opportunity to comment on the draft document entitled "Medicare Prescription Drug Benefit Model Guidelines" (the "Draft Guidelines") that the United States Pharmacopeia ("USP") recently released. GSK is a world leading research-based pharmaceutical company with a mission to improve the quality of human life by enabling people to do more, feel better, and live longer.

GSK supports the implementation of the new Medicare prescription drug benefit ("Medicare Part D") and the delivery of that benefit through competing private-sector prescription plans. GSK applauds USP for acting quickly to produce the Draft Guidelines and appreciates the substantial effort invested by the USP Panel in undertaking this complicated task. We believe the final USP model guidelines ("Model Guidelines"), if developed consistent with USP's mission envisioned by Congress in the Medicare Modernization Act ("Statute"), can be an important component in the successful implementation of Medicare Part D.

EXECUTIVE SUMMARY

Medicare Part D prescription drug plans ("PDPs") with formulary structures (categories and pharmacologic classes) consistent with the Model Guidelines are subjected to <u>less review and scrutiny</u> by the Centers for Medicare & Medicaid Services ("CMS"). In our view, this requires USP to be especially vigilant in its development of the Model Guidelines to ensure that the categories and classes in the Guidelines are sufficient to protect vulnerable Medicare beneficiaries from discrimination by PDPs and to ensure access to a meaningful range of safe and effective medicines for all beneficiaries -- a large, diverse population with a wide spectrum of health conditions, comorbidities and treatment needs. Upon a thorough

review of the Draft Guidelines, GSK believes that the Draft Model Guidelines fall far short of this critical role envisioned by Congress.

For example, the USP proposed "Respiratory Tract Medications" Therapeutic Class contradicts the nationally accepted NIH/NHLBI/NAEPP practice guideline. The practice guideline specifically lists three different medication classes patients must have. However the proposed Model Guidelines places all three into a single pharmacologic class, which would have the effect of discriminating against Medicare beneficiaries with asthma, particularly the sicker beneficiaries.

Another example is the model Blood Glucose Regulating Agents therapeutic category where all oral hypoglycemic agents are placed in one class. Practice guidelines, published research and standard of practice recognize the natural progression of Type 2 Diabetes over time, resulting in a decrease in pancreatic beta cell function and reduced secretion of insulin. There may also be an increase in insulin resistance. The result is loss of glycemic control over time regardless of the treatment used (diet, sulfonylureas, metformin or insulin). During the course of diabetes treatment, physicians typically add therapies without dropping current therapies to meet escalating patient needs (from monotherapy to increasing use of oral polytherapy to oral polytherapy plus insulin). Because the proposed Model Guidelines do not assure coverage for polytherapy for diabetes, the sickest diabetic beneficiaries would be discouraged from enrolling in plans that adhere to the Model Guidelines.

Accordingly, in finalizing the Guidelines, we urge USP to ensure that the Model Guidelines accomplish the purpose that Congress intended - to prevent PDPs from discouraging sicker and more costly beneficiaries from enrolling due to the plan's formulary design and to ensure beneficiaries access to the drugs they need. To achieve that result, GSK recommends (i) that the "recommended subdivisions" in the Draft Guidelines be moved into pharmacologic classes and (ii) that various categories, classes and the currently proposed "recommended subdivisions" be modified so that, when final, the Model Guidelines are more closely aligned with currently accepted clinical practice as discussed below. Moreover, based on our assessment of the literature and accepted medical practice, we have identified a need for additional categories or classes for products that USP appears to have overlooked. [1] In addition, we believe that USP should identify how it will react to newly approved drugs and changes in indications for already approved drugs, and how it will review existing categories and classes to ensure that they remain consistent with current clinical practice.

---

1 While we include a discussion below about a number of products that were seemingly overlooked, it would be helpful to see the list of drugs by category or class that USP is supposed to prepare for CMS as soon as possible to further our understanding of how USP believes the categories or classes are populated.

ASSESSMENT OF THE MODEL FORMULARY GUIDELINES

I. Ensuring that the Model Guidelines Serve Their Intended Purpose

The new Medicare prescription drug program holds the potential to greatly increase Medicare beneficiaries' access to prescription drugs not currently covered by Medicare. GSK is concerned, however, that the substantial benefits of Medicare Part D will be jeopardized by how some prescription drug plans ("PDPs") implement the program, particularly with respect to the design of their formularies. Congress shared this concern and included in the statute several significant and independent beneficiary protections regarding formulary structure and development. CMS may approve a PDP only if the PDP satisfies these important requirements. [2]

One such key patient protection provision developed by Congress (and placed among the provisions labeled "Beneficiary Protections for Qualified Prescription Drug Coverage") is the requirement that patients have access to multiple "drugs" (at least two drugs) within each "therapeutic category and class" of the formulary. Given this requirement, the formulary categories and classes that a PDP uses to structure its formulary are critical in determining what types of drugs are available to beneficiaries covered by the formulary. The Statute also requires that upon review of the plan, CMS "does not find that the design of the plan and its benefits (including any formulary and tiered formulary structure) are likely to substantially discourage enrollment by certain part D eligible individuals under the plan." [3] In other words, CMS must determine that the PDP and its benefit ensures access to a meaningful range of drugs necessary for treatment of beneficiaries and that the PDP's therapeutic category and class structure does not discriminates against the sickest and costliest beneficiaries by failing to assure them this access to the types of drugs that they need.

Under the Statute, approval of individual PDPs is generally left to CMS following its careful review of the PDP's application. However, Congress directed CMS to seek the assistance of the USP in the development of a list of categories and classes that may be adopted and used by PDPs (*i.e.*, the Model Guidelines) in structuring their formularies. If a PDP's formulary structure is consistent with the categories and classes in the Model Guidelines, CMS may not find that the design of

---

2 Social Security Act ("SSA") § 1860D-11(e)(2).

3 SSA § 1860D-11(e)(2)(D)(i).

the plan's formulary categories and classes violate the requirement not to "to substantially discourage enrollment" by eligible beneficiaries through its plan design and benefits. This insulates a PDP from some scrutiny of its formulary. On the other hand, the Statute does not require plans to follow the Model Guidelines. PDPs with formularies using categories and classes different from the Model Guidelines may obtain approval from CMS only upon the agency's review of its categories and classes, in addition to all formulary and other requirements required by the Statute and CMS regulations.

This Congressional mandate and role for guidelines from USP has led some to refer to the Model Guidelines as a "safe harbor" for PDPs. While this characterization may be an overstatement in that consistency with the Model Guidelines does not insulate the plan entirely from review of its formulary by CMS, the fact that the Model Guidelines provide even a partial "safe harbor" from CMS' ability to police the effect on patient access of category and class designs in PDP formularies, in our view, bestows a significant responsibility on USP. That is, USP has the responsibility to ensure that the categories and classes in the Model Guidelines ensure access and are not transformed into a means for PDPs to effectively deny access to medications to select groups of Medicare beneficiaries.

Unfortunately, there is evidence that the Draft Guidelines have been shaped by a desire on the part of USP to balance the number of categories and classes against the position of many prospective PDPs that fewer categories or classes are needed to give them flexibility to, among other things, design their plans to ensure "cost effectiveness." [4] The decision to create numerous "recommended subdivisions" rather than having such groupings included as categories or classes likewise illustrates USP's departure from its charge from Congress and its misplaced focus on balancing the protection of beneficiaries with the desires of plans. The result of this focus is a less granular set of categories and classes that would, in effect, allow a PDP to evade review by CMS whether the categories and classes in its formulary would discourage sicker and more costly beneficiaries from enrolling in its plan. At the same time, as illustrated with numerous examples in our analysis below, it is evident that the categories and classes in the Draft Guidelines are structured in a manner that would allow plans not to provide numerous, critically needed drugs to treat the Medicare patient population consistent with accepted medical standards and nationally recognized treatment guidelines.

---

4 *E.g.* Draft Guidelines at 7 (discussing the "challenge of balancing access to needed drugs with the need for the Model Guidelines to be practical for" drug plans).

GSK is also concerned that USP has given insufficient consideration to the unique and distinct drug needs of the elderly and disabled patient population that will enroll in Medicare Part D. The "environmental scan" performed for USP in support of its efforts to develop the Draft Guidelines and on which the USP heavily relied, focused almost exclusively on the employer group health plan population, not the Medicare population. However the Medicare patient population is a very different population from enrollees in employer group health plans with respect to the use of drug therapies. The Medicare population typically has multiple chronic conditions and requires a wider variety of medications. Indeed, elderly Medicare beneficiaries often require drug treatments for chronic conditions such as osteoporosis, hypertension, diabetes, cardiovascular disease or depression – conditions that require simultaneous administration of multiple medications that must be taken for extended periods of time.[5] Elderly patients with chronic diseases are more susceptible to medication adverse events than the general population. Therefore, access to adverse-event reducing drugs is essential for these beneficiaries. Physicians must have access to the wide range of medicines needed to treat appropriately this population's often complex medical conditions, especially in light of the elderly patient's greater sensitivity to drug interactions and side effects.

GSK urges USP to provide a matrix of categories and classes that, if followed by a PDP, would ensure that the plan makes available to enrolled Medicare beneficiaries and their treating physicians all of the drugs that they would need.[6] This matrix must be developed by carefully reviewing the clinical and scientific evidence regarding the set of drugs needed by the Medicare patient population, not by balancing that evidence with the cost concerns of PDPs. Any such balancing will be the job of CMS in implementing the new prescription drug program. Because the Model Guidelines will provide a means for plans to avoid some level review by CMS, it is imperative that there be no room within the Model Guidelines to allow plans to discourage beneficiary enrollment. While this might appear to create a higher burden for plans, they have the option of adopting different categories and classes and having them reviewed by CMS.

---

5 See Report to the President, "Prescription Drug Coverage, Spending, Utilization, and Prices," From Department of Health & Human Services, April 2000, available at http://aspe.hhs.gov/health/reports/drugstudy/.

6 We also request that USP identify how it will perform the congressionally mandated function of updating the Model Guidelines to reflect changes in the uses of drugs and the addition of new drugs. There needs to be a predictable mechanism for doing so in a timely fashion. For newly approved drugs, in particular, GSK believes that there needs to be a prompt mechanism for determining whether a new category or class must be added.

II. Assessment of Current Categories, Classes and Subdivisions

Based on our review of the Draft Model Guidelines, considerable changes need to be made to the list of categories and classes to ensure that plans following the Model Guidelines will not be able to discourage enrollment by certain types of Medicare beneficiaries and that the enrollees have access to the range of medicines needed to appropriately treat their medical conditions. Avoiding adverse events should be a specific consideration in establishing pharmacologic classes. Even drugs in the same therapeutic category and pharmacologic class will have different side-effect and adverse event profiles. This is particularly necessary for patients with chronic conditions because they are more susceptible to medication adverse events than the general population. This means that pharmacologic classifications should include classes that allow avoidance of adverse events and not just traditional chemical class or mechanisms of action. A starting point would be to include all of the currently "recommended subdivisions" in the Draft Guidelines as pharmacologic classes in the final Model Guidelines. However, that alone would not be sufficient, as there would need to be changes to the categories, classes and subdivisions that appear in the Draft Guidelines We address these changes below.

A. Analgesics Therapeutic Category

By offering Opioid Analgesics and Non-opioid Analgesics as the only options in the Analgesics Pharmacological Classification, the proposed Model Guideline conflicts with leading peer-reviewed arthritis treatment guideline recommendations and associated pharmacologic classifications and potentially limits patient access to safe and effective alternatives for pain relief. For this reason, GSK recommends that COX-2 selective inhibitors be added as a Pharmacologic Class in this category.

Key goals of the American College of Rheumatology Osteoarthritis Guideline include control of pain and avoidance of toxic effects from therapy.

> *"The goals of the contemporary management of the patient with OA continue to include control of pain and improvement in function and health-related quality of life, with avoidance, if possible, of toxic effects of therapy."*[1]

When describing the pharmacologic options, the intent of these guidelines clearly is to separate the COX-2 selective inhibitors from the non-selective NSAIDs. As described, COX-2 selective inhibitors are first line therapy for patients who fail to manage their pain with adequate doses of acetaminophen.

> *"Toxicity is the major reason for not recommending the use of NSAIDs as first-line therapy for patients with OA of the hip. Data from epidemiologic studies demonstrate that among persons ages 65 and older, 20-30% of all hospitalizations and deaths due to peptic ulcer disease were attributable to NSAID therapy."*[2]

The importance of this recommendation is highlighted by the incidence of major complications and death from gastrointestinal bleeds due to non-selective COX inhibitors (NSAIDs). This represents a public health problem for patients requiring the management of chronic pain. Hospital admissions arise in 0.25 - 1.58% of users per year and deaths occur in 7,000 US patients annually. [1] In many cases of major GI bleed due to NSAIDs there is no prior warning.

Table 3. Pharmacologic therapy for patients with osteoarthritis*
(Taken from ACR OA Hip & Knee Guideline)

Oral
Acetaminophen
COX-2-specific inhibitor
*Non-selective NSAID plus misoprostol or a proton pump inhibitor***
Nonacetylated salicylate
Other pure analgesics Tramadol

Opioids Intraarticular
Glucocorticoids
Hyaluronan
Topical
Capsaicin
Methylsalicylate

- *The choice of agent(s) should be individualized for each patient as noted in the text. COX-2 = cyclooxygenase 2; NSAID = nonsteroidal anti-inflammatory drug.*

***Misoprostol and proton pump inhibitors are recommended in patients who are at increased risk for upper gastrointestinal adverse events.* [1]

Subsequent to the writing of the guidelines noted above, several large outcome studies have been published confirming that COX-2 selective inhibitors can reduce GI morbidity 50% to 80% vs. non-selective NSAIDs. The VIGOR study [3] showed a 50% reduction in GI risk for patients taking rofecoxib versus an NSAID. The TARGET study shows an even greater reduction of approximately 80% for lumaricoxib. [i] Short-term endoscopy studies for all available COX-2 drugs show substantial risk reductions for endoscopic ulcers. [4]

The American Pain Society (APS) recently released a clinical guideline on the treatment of acute and chronic pain associated with arthritis. This multidisciplinary, evidence-based guideline was developed by a panel of experts in arthritis pain management confirms the use of COX-2 specific inhibitors prior to the use of the non-selective NSAIDs.

> *"For persons with moderate to severe pain from osteoarthritis and rheumatoid arthritis, COX-2 nonsteroidal anti-inflammatory drugs (NSAIDs) are the best choice for their pain-relieving potency and lower incidence of gastrointestinal (GI) side effects. Use of non-selective NSAIDs should be considered only if the patient does not respond to acetaminophen and COX-2 drugs, and is not at risk for NSAID-induced GI side effects. Because of the high cost of COX-2 agents, some patients may benefit from non-selective NSAID therapy combined with a medication to moderate GI distress."* [4]

Early concerns that rofecoxib-specific increases in cardiovascular risk may represent a class effect have been negated by the benign CV profile shown in the TARGET study. [5]

The American College of Rheumatology guidelines for the management of rheumatoid arthritis points out that patients with RA are twice as likely as OA patient to have a

serious complication from non-selective NSAID therapy. Strategies to avoid the GI toxic effects of non-selective NSAIDs, include the use of a highly selective COX-2 inhibitor.[6]

These data, taken together, shows that the COX-2 drugs are sufficiently different in their safety profile from ns-NSAIDS as to represent a distinct class of medications, offering patients a distinct benefit over ns-NSAIDs. These drugs should be considered as separate therapeutic options for patients at risk of serious GI bleeding (advanced age, chronic use and other risk factors).

For these reasons, GSK recommends that the Analgesics Therapeutic Category be revised as follows.

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	*Recommended Subdivisions*
Analgesics	Opioid Analgesics	
	Non-opioid Analgesics	
	COX-2 Inhibitors

B. **Antibacterials Therapeutic Category, All Pharmacologic Classes (Nos. 5 – 13)**

The proposed antibacterials pharmacologic classes are not aligned with accepted medical practice and treatment guidelines. According to the CDC, drug-resistant infections require accurate detection and appropriate treatment as they pose a significant threat to public health[1].

Community-acquired infections and the number of medications to which they are resistant is increasing[2]. Organisms that are resistant to multiple anti-bacterial medications are increasing, therefore access to the most specific and potent antibacterial medications is essential.

The currently defined subdivisions are actually antibacterial classes and should be listed as such. Each formulation and derivation is unique and specific to their antibacterial actions, effectiveness and benefits. These drugs are not interchangeable because they combat different types of bacterial infections (gram negative vs. gram positive, broad spectrum vs. specific). In addition, an individual patient might need more than one agent at a time.

Therefore, GSK proposes that the following classification be used for the Antibacterials Therapeutic Category.

Therapeutic Category	Pharmacologic Class	Recommended Subdivisions
Antibacterials	Beta Lactam, Penicillins	
	• Penicillin G-related Penicillins	
	• Penicillins, Amino Derivative	
	• Penicillinase-resistant Penicillins	
	• Extended Spectrum Penicillins	
	Beta-Lactam, Cephalosporins	
	• Cephalosporins, 1st Generation	
	• Cephalosporins, 2nd Generation	
	• Cephalosporins, 3rd Generation	

	• Cephalosporins, 4th Generation	
	Beta-Lactam, Other	
	• Carbacephems	
	• Carbapenems	
	• Cephamycins	
	• Monobactams	
	Quinolones	
	• Quinolones, Fluorinated	
	• Quinolones, Non-fluorinated	
	Sulfonamide/Related Antibacterials	
	Aminoglycosides	
	Macrolides	
	• Erythromycins	
	• Macrolides, Other	
	Tetracyclines	
	Antibacterials, Other	
	• Antifolates	
	• Glycopeptides	
	• Lincomycins	
	• Nitrofurans	
	• Oxazolidinones	
	• Polymyxins	
	• Streptogramins	
	• Other

C. Anticonvulsants Therapeutic Category (No. 14)

GSK recommends adding four (4) pharmacologic class listings titled "sodium channel blocker", "calcium channel blocker", "GABA systems" and "glutamate receptors" to the therapeutic category titled "anticonvulsants".

Various types of seizures respond differently to anticonvulsant agents with response rate often based on a drug's mechanism of action. Furthermore, selection of an antiepileptic drug depends on if the treatment is for new onset or refractory epilepsy. In accordance with the American Academy of Neurology (AAN)/American Epilepsy Society (AES) treatment guidelines, broad access to anticonvulsant agents is required to treat the multiple forms of epilepsy, to accommodate disease response variability and to account for the vast differences in drug side effects, toxicity, and adverse event profiles among the many agents. [1,1] Access to anticonvulsants with different mechanisms of action is particularly important for patients with refractory epilepsy. According to the AAN/AES treatment guidelines, the average number of failed anticonvulsants in studies involving refractory patients was often eight or more.

The Model Guidelines present potentially serious problems for Medicare part D patients including:

- Placing patients at undue risk by failing to ensure access to newer agents which often have fewer safety concerns, better side effect profiles and a broader therapeutic concentration range
- Not ensuring coverage of medications to treat each type of seizure including partial (focal or local) seizures, generalized seizures and unclassified epileptic seizures
- Reducing the likelihood that patients with refractory disease will find one anticonvulsant or a combination of anticonvulsants that will control their seizures.

The Model Guidelines make it possible for a PDP to cover only older agents, those that can have higher toxicity profiles, those with a high likelihood for a side effect or to cover agents that address just one or two mechanisms of seizure activity. In addition, even if limiting coverage of anticonvulsant medications addressed the goal for seizure control for all types of seizures, even in refractory patients, it would not recognize the additional, but equally important, goals of therapy that impact a patient's quality of life including optimal cognitive, physical and psychological functioning.[2]

Drug therapy selection is based on the seizure type, disease duration, mechanism of drug action and the side effect or adverse event profile. The elderly beneficiaries covered by Medicare part D may be especially vulnerable to drug side effects as are most patients with increasing age. Therefore, limiting drug coverage by narrowly

defining the anticonvulsant therapeutic category could result in excessive adverse event and toxicity burden in this already high risk population.

For these reasons GSK proposes the following change to the Model Guidelines.

Reference Line	Therapeutic Category	Pharmacologic Class	Recommended Subdivisions
14	Anticonvulsants	Sodium Channel Blocker	
15		Calcium Channel Blocker	
16		GABA Systems	
17		Glutamate Receptors

D. Anti-depressants Therapeutic Category, Reuptake Inhibitors and Other, Pharmacologic Classes_ (Nos. 15, 16, 17)

GSK recommends that subdivisions for anti-depressants be made pharmacologic classes, which is consistent with APA Practice Guideline for the Treatment of Patients with Major Depressive Disorder.

Of the nearly 35 million Americans age 65 and older, an estimated 2 million have a depressive illness (major depressive disorder, dysthymic disorder or bipolar disorder.)[1] Chronic medical illness afflicts eighty eight percent of people aged 65 or older, and those with chronic illnesses have a high prevalence of major depressive illness[2]. Depression associated with chronic medical illness may also lead not only to increased health care utilization and morbidity but also to increased mortality[3]. The National Institute of Mental Health considers depression in people age 65 and older to be a major public health problem[1].

The American Psychiatric Association guideline for treatment of patients with major depressive disorder emphasizes the necessity of continuation of medication through acute and maintenance phases. The goal is to treat the symptoms acutely (1-2 months) to achieve response. To reduce the likelihood of relapse, this response should be maintained for an additional 2-6 months[4]. Thus, depressed patients should be treated with an antidepressant for at least 4-9 months. More than 40% of these patients, however, discontinue therapy within the first three months of treatment due to poor tolerability[5].

In order to assure continuous treatment, a range of anti-depressant medication options are needed for initial therapy as well as for replacement medication. CMS will realize medical cost savings as medication adherence improves because total cost of care decreases significantly. Additional drug cost is more than offset by medical cost savings. Patients who stay on therapy for more than 90 days not only have an improved chance of recovery, but their annual medical costs can be reduced by more than $2,000.[6,7]

The proposed pharmacologic classifications under the antidepressant therapeutic category inappropriately link different mechanisms of action under a single heading. It also links medications that have considerable differences in safety as well as side-effect profile.

We recognize that USP will be looking at which specific drugs would fit into each classification/subdivision, but we would like to clarify that buproprion does not fit into the specific categories and would be considered antidepressant, other, or a new pharmacologic classification would need to be added.

Therefore, GSK proposes that the following classification be used for the Antidepressant Therapeutic Category.

Therapeutic Category	Pharmacologic Class	Recommended Subdivisions
Antidepressants	Monoamine Oxidase Inhibitors	
	SNRI	
	SSRI	
	Tricyclics	
	Antidepressants, other

E. Antidotes, Deterrents and Poison Control Therapeutic Category, Antidotes Pharmacologic Classes (No. 18)

The term "opioid antagonist" in the current subdivision of antidotes has become outdated and should be changed to specify "centrally acting opioid antagonists." A new opioid antagonist pharmacologic classification "peripherally acting opioid agonist" should be added to the Gastrointestinal Medications section for differentiation.

The new class of agent is peri registration for the treatment of Post Operative Ileus and under development for other gastrointestinal conditions. The two distinct mechanisms of action and clearly different potential indications should be differentiated in the USP model guidelines.

GSK recommends the following change to the Draft Model Guidelines

Therapeutic Category	Pharmacologic Classification	Recommended Subdivisions
Antidotes, Deterrents, and Poison Control	Antidotes Centrally Acting Opioid Antagonist	
	Antidotes: Antivenins	
	Antidotes: Ion Exchange Resins	
	Antidotes, Other	
	Antidotes:Heavy Metal Antagonists	

F. Antiemetics Therapeutic Class, New Pharmacologic Class for NK1

The National Comprehensive Cancer Network Clinical Practice Guidelines in Oncology: Antiemetics (v.1.2004) guidelines now identify NK1 inhibitors for use as prophylaxis with highly emetogenic chemotherapy regiments in combination with a 5HT3 antagonist.[1] They are also recommended for use as an option for moderately emetogenic chemotherapy in combination with dexamethasone for the prevention of delayed nausea and vomiting.

Therefore, GSK requests that this new class be added to the proposed formulary listing.

Therapeutic Category	Pharmacologic Classification	Recommended Subdivisions
Antiemetics	NK1 inhibitors	
	5-HT3 Antagonists	
	Antiemetics, other

G. Antihistamines Therapeutic Category, H1 Blockers and H2 Blockers Pharmacologic Classes (Nos. 28, 29)

The antihistamine therapeutic category and classes are too narrowly defined and do not incorporate recognized practice guidelines for the treatment and management of allergies, which include a broader range of conditions and recommended treatments.

Of all allergy-related conditions and symptoms, allergic rhinitis is of major concern. Allergic rhinitis affects up to 40 million Americans and is the sixth most prevalent chronic disease in the United States[1]. In 1995, it was estimated that the direct and indirect costs for the management of this condition was 2.7 billion dollars, excluding costs for accompanying asthma and sinusitis. In 1996, Ray et al, estimated that the direct medical costs for allergic rhinitis, as a primary or secondary diagnosis, at 5.9 billion dollars accounting for airway related diseases[2].

Allergic rhinitis is defined as inflammation of the nasal mucosa precipitated by exposure to inhaled allergens producing a specific immunologic response[3]. "Untreated allergic rhinitis develops into a chronic state of inflammation and nasal obstruction that frequently leads to much more serious diseases in both the upper and lower airways. Allergic rhinitis is closely associated with, and may be a causative factor in, asthma, sinusitis, otitis media with effusion (OME), and polyps."[4,5]

Antihistamines work by blocking the H_1-receptor site and inhibiting the effects of histamine. Antihistamines relieve rhinorrhea, sneezing, itching and ocular symptoms; however in general, they do not effectively relieve nasal obstruction[6].

Decongestants constrict blood vessels in the nose and reduce mucosal edema to relieve nasal obstruction. They are less effective for rhinorrhea, sneezing and itching. Decongestants are available in topical and oral formulations. Decongestants are often combined with antihistamines to provide relief of all nasal symptoms[7].

Intranasal corticosteroid preparations relieve all major nasal symptoms of allergic rhinitis, including nasal obstruction, rhinorrhea, sneezing and itching. These preparations are applied directly to the site of inflammation and inhibit the activity of inflammatory cells and their mediators: histamine, leukotrienes and prostaglandins. The Joint Task Force states "…nasally inhaled corticosteroids are the most effective medication class in controlling symptoms of allergic rhinitis."[6]

Leukotriene modifiers are a class of drugs used to treat asthma. Of the three leukotriene modifier agents available, only montelukast is indicated for the relief of symptoms of seasonal allergic rhinitis. It inhibits one of the many classes of

inflammatory mediators, leukotrienes, by binding to leukotriene C_4, D_4, and E_4 receptors[7].

Mast cell stabilizers treat allergies by blocking the release of histamine and preventing mast cells from degranulating. Intranasal cromlyn sodium is used for the prevention and treatment of the nasal symptoms of allergic rhinitis. Although its mechanism is thought to involve degranulation of mast cells, it has not been fully elucidated[8].

Anticholinergic agents such as intranasal ipratropium bromide is indicated for the symptomatic relief of rhinorrhea associated with allergic and non-allergic perennial rhinitis in adults and children 12 years of age and older. It does not relieve nasal congestion, sneezing or post-nasal drip.

GSK recommends that the Therapeutic Category "Antihistamines" be updated and renamed "Anti-allergy." The proposed H1 and H2 blocker pharmacologic classes should be replaced with the new classes, which reflect Joint Task Force guidelines for appropriate treatment of allergy symptoms, including allergic rhinitis:

- antihistamines,
- decongestants
- intranasal corticosteroids
- leukotriene modifiers
- mast cell stabilizers
- anticholinergics

For these reasons GSK recommends the following changes to the Model Guidelines.

<table>
<tr><th>THERAPEUTIC CATEGORY</th><th>PHARMACOLOGIC CLASS</th><th>Recommended Subdivisions</th></tr>
<tr><td rowspan="2">Anti-allergy</td><td rowspan="2">antihistamines,
decongestants
intranasal corticosteroids
leukotriene modifiers
mast cell stabilizers
anticholinergics</td><td></td></tr>
<tr><td></td></tr>
</table>

H. Anti-Inflammatory Therapeutic Category

By combining COX-2 Inhibitors, Salicylates and Other Nonsteroidals as subdivisions of the Nonsteroidal class in the Anti-inflammatories Therapeutic Category, the proposed Model Guildeline conflicts with leading peer-reviewed arthritis treatment guideline recommendations and associated pharmacologic classifications and potentially limits patient access to safe and effective options for pain relief. For this reason, GSK recommends that COX-2 Inhibitors, Salicylates and Other Nonsteroidals be listed as separate Pharmacologic Classes.

Key goals of the American College of Rheumatology Osteoarthritis Guideline include control of pain and avoidance of toxic effects from therapy.

> *"The goals of the contemporary management of the patient with OA continue to include control of pain and improvement in function and health-related quality of life, with avoidance, if possible, of toxic effects of therapy."*[1]

When describing the pharmacologic options, the intent of these guidelines clearly is to separate the COX-2 selective inhibitors from the non-selective NSAIDs. As described, COX-2 selective inhibitors are first line therapy for patients who fail to manage their pain with adequate doses of acetaminophen.

> *"Toxicity is the major reason for not recommending the use of NSAIDs as first-line therapy for patients with OA of the hip. Data from epidemiologic studies demonstrate that among persons ages 65 and older, 20-30% of all hospitalizations and deaths due to peptic ulcer disease were attributable to NSAID therapy."*[2]

The importance of this recommendation is highlighted by the incidence of major complications and death from gastrointestinal bleeds due to non-selective COX inhibitors (NSAIDs). This represents a public health problem for patients requiring the management of chronic pain. Hospital admissions arise in 0.25 - 1.58% of users per year and deaths occur in 7,000 US patients annually. [1] In many cases of major GI bleed due to NSAIDs there is no prior warning.

Table 3. Pharmacologic therapy for patients with osteoarthritis*
(Taken from ACR OA Hip & Knee Guideline)

Oral
Acetaminophen
COX-2-specific inhibitor
*Nonselective NSAID plus misoprostol or a proton pump inhibitor***
Nonacetylated salicylate
Other pure analgesics Tramadol

Opioids Intraarticular
Glucocorticoids
Hyaluronan
Topical
Capsaicin
Methylsalicylate

- *The choice of agent(s) should be individualized for each patient as noted in the text. COX-2 = cyclooxygenase 2; NSAID = nonsteroidal antiinflammatory drug.*

***Misoprostol and proton pump inhibitors are recommended in patients who are at increased risk for upper gastrointestinal adverse events.* [1]

Subsequent to the writing of the guidelines noted above, several large outcome studies have been published confirming that COX-2 selective inhibitors can reduce GI morbidity 50% to 80% vs. non-selective NSAIDs. The VIGOR study [5] showed a 50% reduction in GI risk for patients taking rofecoxib versus an NSAID. The TARGET study shows an even greater reduction of approximately 80% for lumaricoxib. [6] Short-term endoscopy studies for all available COX-2 drugs show substantial risk reductions for endoscopic ulcers. [7]

The American Pain Society (APS) recently released a clinical guideline on the treatment of acute and chronic pain associated with arthritis. This multidisciplinary, evidence-based guideline was developed by a panel of experts in arthritis pain management confirms the use of COX-2 specific inhibitors prior to the use of the non-specific NSAIDs.

> *"For persons with moderate to severe pain from osteoarthritis and rheumatoid arthritis, COX-2 nonsteroidal anti-inflammatory drugs (NSAIDs) are the best choice for their pain-relieving potency and lower incidence of gastrointestinal (GI) side effects. Use of nonselective NSAIDs should be considered only if the patient does not respond to acetaminophen and COX-2 drugs, and is not at risk for NSAID-induced GI side effects. Because of the high cost of COX-2 agents, some patients may benefit from nonspecific NSAID therapy combined with a medication to moderate GI distress."* [6]

Early concerns that rofecoxib-specific increases in cardiovascular risk may represent a class effect have been negated by the benign CV profile shown in the TARGET study. [9]

The American College of Rheumatology guidelines for the management of rheumatoid arthritis points out that patients with RA are twice as likely as OA patient to have a serious complication from non-specific NSAID therapy. Strategies to avoid the GI toxic effects of nonspecific NSAIDs, include the use of a highly selective COX-2 inhibitor.[10]

These data, taken together, shows that the COX-2 drugs are sufficiently different in their safety profile from ns-NSAIDS as to represent a distinct class of medications, offering patients a distinct benefit over ns-NSAIDs. These drugs should be considered as separate therapeutic

options for patients at risk of serious GI bleeding (advanced age, chronic use and other risk factors).

For these reasons, GSK recommends that the Anti-inflammatory Therapeutic Category be revised as follows.

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	*Recommended Subdivisions*
Anti-inflammatory	Corticosteroids (see Hormones)	
	COX-2 Inhibitors	
	Salicylates	
	Nonsteroidals, Other

I. Antineoplastics Therapeutic Category, All Pharmacologic Classes

Current cancer treatment practice creates a unique situation that clearly does not fit well within the proposed draft USP formulary categories and the potential minimum requirement of two drugs per category.

Cancer is not one disease but rather a wide range of diseases, with products from multiple pharmacological classes used based on tumor type, stage of disease, available biomarkers, proven combination regimens and patient tolerability. Included in the pharmacological classes used in the treatment of cancer are antineoplastics, hormone suppressants, immune suppressants and other immunological agents. Current treatment guidelines, such as the NCCN Guidelines in Oncology, often offer a range of options for management based not purely on labeled indications but also on available scientific evidence for all of the product categories outlined above.[1] Therefore, many cancer treatments are used by physicians off label.

As written, many of the proposed categories in the draft USP formulary guide do not contain any self-administered products. As an example, many future self-administered products are likely to fall within the proposed "Targeted Molecular Therapies" section. This section could therefore potentially cover several very distinct classes of targeted molecular therapies, which have very discreet targets, indications, lines of therapy, tumor types, potential combination uses and biomarker requirements for use.

Cancer products that have similar mechanisms of action frequently have very different indications not only by tumor type but also by stage of disease and recommended combination regimens. Unlike many other therapy areas, Oncology is often characterized by initial approvals often being gained as accelerated indications for niche or highly refractory patient groups. Subsequent development then often leads to an expansion to earlier lines of therapy, alternative combination protocols and different tumor types. There are often significant time gaps between this evidence being published and its incorporation into product labeling, compendia and practice and treatment guidelines.

Based on the points above, GSK has significant concerns that, with the currently proposed formulary and the proposed requirement that only two drugs of any one category need be covered by the PDPs, many Medicare beneficiaries who may benefit from cancer therapies will be discriminated against by being denied appropriate treatment options for the management of their Cancer.

GSK therefore recommends that the USP grant an exception for anti-cancer therapies including antineoplastics, hormones suppressants, immune suppressants and other immunological agents and permit an open formulary for all Cancer treatment options.

J. Antiparkinson Agents – Therapeutic Category (No. 47)

GSK recommends expanding the Therapeutic Category defined as "Antiparkinson Agents" to "Antiparkinson and Movement Disorder Agents."

Movement disorders are neurological motor disturbances characterized by either abnormally increased motor activity or by abnormally decreased motor function or mobility. It is believed that Movement Disorders develop from an abnormally functioning basal ganglia, the portion of the brain deep in the cerebral hemispheres most responsible for the body's motor control.[1]

In the current USP draft guidelines, treatments for Parkinson's disease do not fully address Movement Disorders. Movement Disorders include but are not limited to Parkinson's Disease, Dystonia, Restless Legs Syndrome, Essential Tremor, Multiple System Atrophy (MSA), Progressive Supranuclear Palsy (PSP), Huntington's Disease, Tourette Syndrome, Ataxia, Tics, Rett Syndrome, Spasticity and Wilson Disease. This is consistent with Parkinson's Disease & Movement Disorders, Fourth Edition, Editors, Joseph J. Jankovich, M.D., and Eduardo Tolosa, M.D., Lippincott Williams & Wilkins, New York, 2002.

Clinicians who care for those afflicted with Parkinson's disease and other movement disorders need a broad array of pharmacologic agents to address the complexities of these conditions. If this category is not expanded to address movement disorders, Medicare beneficiaries will be disadvantaged from receiving the appropriate medications to treat these conditions.

Therefore, we recommend that USP expand the Antiparkinson Agents Therapeutic Category to "Antiparkinson and Movement Disorder Agents."

K. <u>Therapeutic Category: Antivirals, Pharmacologic Classes (Nos. 58-69):</u>

The proposed HIV pharmacologic classes should be removed from the antivirals therapeutic category. Limiting coverage and restricting access to HIV treatments jeopardizes the lives of HIV patients. This special population should be treated as such under Medicare Part D.

The standard of care in HIV is a minimum of three HIV drugs at any one time. Those three drugs are usually from only one or two pharmacologic classes at a given time[1]. Two drugs each from the proposed pharmacologic classes is contrary to the DHHS guidelines for HIV. In fact, specifying any limited number of agents in these classes is contrary to national treatment guidelines. For example, the vast majority of people on treatment for HIV are taking a "backbone" of two drugs from the nucleoside/nucleotide reverse transcriptase inhibitor category. Even though the drugs are in the same pharmaceutical class and have the same general mechanism of action, a specific mutation in the HIV virus may render some drugs in this class unusable, while others are highly effective. There are several of these specific mutations (or patterns of mutations) so it is not possible to single out two drugs that would be effective in all patients.[2]

Research and practice have shown that adherence to medication regimens is essential in HIV treatment [3]. In order to enable patient adherence to medication, HIV therapy must be individualized for the patient based on a number of issues, including:

- pill burden
- dosing frequency
- toxicities
- drug-drug interactions
- pregnancy
- co-morbid conditions
- level of HIV in the blood[4]

Creating HIV pharmacologic classifications in an effort to reduce costs will have the opposite effect, increasing adverse events for patients and costs for CMS. Reducing the number of classifications further increases CMS cost and put HIV beneficiaries' lives in danger.

Therefore, based on these reasons, GSK proposes that the proposed HIV pharmacologic classes should be removed from the antivirals therapeutic category.

L. Bipolar Agents Therapeutic Category (No. 76)

GSK recommends adding two (2) pharmacologic class listings titled "Mania or Mixed Episodes" and "Bipolar Depression" to the therapeutic category titled "Bipolar Agents". Although not pharmacologic classes per se, the pharmacologic class listings recommended mirror the treatment categories used in the American Psychiatric Association (APA) Practice Guideline for the Treatment of Patients with Bipolar Disorder (April 2002 Revision).[1]

The current Draft Model Guidelines fail to recognize the distinct episodes of bipolar disorder, which include mania, depression and mixed episodes, as well as distinctions between acute and maintenance treatment. As written, the two agents that could be selected by a PDP may or may not provide adequate treatment for all types of bipolar episodes. For instance, the two selected agents may only treat acute mania and not adequately prevent recurrence of bipolar depression. This is recognized in the APA Practice Guideline which makes separate treatment recommendation for the different episodes of bipolar disorder. Accordingly, practitioners require access to a minimum of four therapeutic categories: antipsychotics, anticonvulsants, antidepressants and mood stabilizers (e.g., lithium) to adequately manage both the acute and long-term treatment of bipolar disorder, as well as the types of episodes.

The goal of short term treatment for bipolar disorder is to control acute symptoms and help a patient return to normal function. However, the goal of long term treatment is help prevent future relapse, reduce symptoms, including risk of suicide and improve a patient's general functioning. [2] Furthermore, as bipolar disorder is usually a long term illness, maintenance treatment presents a unique challenge. Agents used in the short term treatment of bipolar disorder are often used long term, despite limited evidence to support their use. Therefore, agents that have demonstrated safety and efficacy in long term treatment are of importance in the overall therapy of a patient with bipolar disorder.

The devastating consequences of bipolar disorder and the failure of a single agent to effectively treat all bipolar episodes require broad access to multiple medications. The current Model Guideline places Medicare part D patients at enormous risk for inadequate access to critical bipolar disorder medications. Furthermore, inappropriate drug selection can contribute to rapid cycling, a difficult to treat condition where patients experience four or more mood disturbances within a single year. In particular, there are suggestions that use of antidepressants in patients with bipolar disorder may contribute to rapid cycling.[1] Therefore, a clear distinction between bipolar depression and unipolar depression, for the purposes of treatment, is required.
[1]

In addition, a recent survey revealed that 69% of patients with bipolar disorder were misdiagnosed with major depression (60%), anxiety disorder (26%), schizophrenia (18%) and borderline personality disorder (17%). [3] The high rate of misdiagnoses, in addition to the reasons noted above, underscores the need to have bipolar agents as a therapeutic category.

Proposed Classification – Bipolar Agents

Reference Line	Therapeutic Category	Pharmacologic Class	Recommended Subdivisions
76	**Bipolar Agents**	**Mania or Mixed Episodes**	
77		**Bipolar Depression**

M. Blood Glucose Regulating Agents Therapeutic Category:, Insulins Pharmacologic Class (No. 77) and Hypoglycemic Agents, Oral Pharmacologic Class (No.78)

The proposed pharmacologic classification "Hypoglycemic Agents, Oral" is inconsistent with appropriate treatment of diabetes recognized in peer-reviewed scientific literature and standard medical practice. Further, compliant formularies would allow discrimination against sicker Medicare beneficiaries. To resolve these problems with the proposed classifications, we strongly support redefining "recommended subdivisions" as "pharmacologic classes", thereby requiring formulary coverage for each class and assuring coverage for appropriate multiple medication use.

Type 2 Diabetes (T2D) is a progressive disease where glycemic control is lost over time regardless of the treatment used (e.g. diet, sulfonylureas, metformin or insulin). Recent studies have shown that approximately 64% of patients with Type 2 Diabetes are not at the American Diabetes Association (ADA) A1C goal of 7% or lower, therefore demonstrating the need for more intensive treatment strategies and broad access to available treatment options.[1] During the course of T2D treatment, physicians typically add therapies without dropping current therapies to meet escalating patient needs (from monotherapy to increasing use of oral polytherapy to oral polytherapy plus insulin).

This standard of practice is supported in the literature as demonstrated in the classic Turner paper from the landmark UK Prospective Diabetes Study (UKPDS), which observed outcomes for more than 4000 patients randomized to 'conventional' versus 'intensive' therapy over a ten year period. The study demonstrated that there is a progressive need for multiple therapies to control hyperglycemia (by 3 years approximately 50% of patients will need more than one agent, and by 9 years 75% of patients will need multiple agents to achieve A1C goals).[2] The amassing of compelling evidence such as this is increasingly challenging the previous slow addition of further hypoglycemic agents in favor of a more intensive stepwise treatment approach involving combination therapy.[3,4] The pathophysiology of T2D reveals complex metabolic defects that cause the disease which may explain the need for multiple medications. The importance of using multiple medications that target these defects (insulin resistance, defective pancreatic insulin secretion, hepatic glucose production etc) is also described by Inzucchi in JAMA.[5] The right combination must be driven by patient-specific criteria such as tolerability, contraindications etc. However, physicians have relatively few treatment options to treat type 2 diabetes, particularly since several therapies are poorly tolerated.[6,7]

Therefore, the proposed oral hypoglycemic classification, within the Draft Model Guidelines does not assure that the necessary variety of medications needed to target the multiple defects would be covered. Participating PDPs limiting the number of

therapies to two could thus discriminate against beneficiaries requiring polytherapy (particularly those unable to tolerate one or more of the covered agents).

This creates significant concerns, not only regarding access to quality care for those who need it most but also regarding potential escalation of costs. Diabetes cost the US an estimated $132 billion in medical expenditures and lost productivity.[8] The significant direct medical costs are driven by the costs of complications of the disease.[9] As demonstrated in two papers from Diabetes Care and JAMA, improved glycemic control is associated with significant cost savings.[10,11] Because the use of appropriate medications can reduce direct costs, limiting medication coverage for diabetes is likely to have a negative impact on total CMS expenditures. The ADA recognizes the staggering costs of direct medical care for diabetes (e.g., hospitalizations for complications) versus the much lower costs of medications (broken out by outpatient meds, insulins/injectables, oral antidiabetics) which could reduce those complications.[8]

Therefore, GSK recommends the following changes to the Model Guidelines.

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	*Recommended Subdivisions*
Blood Glucose Regulating Agents	Insulin: Rapid	
	Insulin: Short	
	Insulin: Intermediate	
	Insulin: Long	
	Alpha Glucosidase Inhibitors	
	Meglitinides	
	Biguanides	
	Sulphonylureas	
	Thiazolidinediones	

We will also be proposing to CMS that diabetes be considered a special population under Medicare Part D regulations.

N. Therapeutic Category: Blood Products/Modifiers/Volume Expanders

Pharmacologic Classes: Blood formation and Anitcoagulants (80-84)

GSK recommends adding three (3) pharmacologic class listings titled "Agent for Anemia", "Agent for Neutropenia", "Agent for Thrombocytopenia and Other" to the Therapeutic Category titled "Blood Products/Modifiers/ Volume Expanders". The current category of Colony Stimulating Factors is too broad and excludes several current products by definition.

In addition, GSK recommends the pharmacologic class of Anticoagulants should be updated to be consistent with The Seventh 2003 ACCP (American College of Chest Physicians) Guidelines on Antithrombotic Therapy and Thrombolytic Therapy scheduled for release on September 24, 2004. At least one covered drug from the six subdivisions of anticoagulants must be included as they cover distinct mechanisms of action.

Proposed Classification

Reference Line	**Therapeutic Category**	**Pharmacologic Class**	**Recommended Subdivisions**
81	Blood Products/Modifiers/ Volume Expanders	Agent for Anemia	
		Agent for Neutropenia	
		Agent for Thrombocytopenia and Other	
Reference Line	**Therapeutic Category**	**Pharmacologic Class**	**Recommended Subdivisions**
82	Blood Products/Modifiers/ Volume Expanders	Anticoagulants	Heparin, Unfractionated
			Heparin, Low Molecular Weight
			Direct Thrombin Inhibitors
			Factor Xa Inhibitors
			Vitamin K Antagonists

			Thrombolytic Agents

O. Cardiovascular Medicines Therapeutic Category, Beta-Blockers/Related Pharmacologic Class with Recommended Subdivisions of Nonselective, Cardioselective, and Alpha-beta Blockers.

Because of the unique properties and clinical benefits of the classes listed in the Beta-blocker "recommended subdivisions," we recommend that the USP Model Guidelines Pharmacologic Classification for Beta-Blockers/Related be changed to list Nonselective, Cardioselective, and Alpha-beta Blockers as unique pharmacologic classifications.

Beta-blockers are currently used for a broad spectrum of cardiovascular diseases (i.e. hypertension, angina pectoris, antiarrhythmics, hypertropic subaortic stenosis, left ventricular dysfunction following myocardial infarction, and mild to severe heart failure of ischemic or cardiomypatic origin, plus other non-cardiovascular applications). The current proposed classification suggests there is no significant difference among the three subdivisions and that there is, in essence, a class effect for all agents for all applications. The UCLA Heart Failure Clinical Practice Guidelines, however, recognize the differences among these classes, as evidenced in the following quote:

> "The ACC/AHA guidelines recommend using only those beta-blockers and those doses that have been proven to reduce mortality (i.e., mortality reduction is not a class effect)." [1]

Not all beta-blockers have been proven to reduce mortality in patients with Class I-IV heart failure, and not all of those have been proven to work across the entire spectrum of disease.

Similar arguments can also be made for use of beta blockers in diabetics. In diabetics, heart disease is a frequent complication with significant mortality and morbidity. Because of the impact on glycemic control, those beta-blockers that have a neutral effect on glycemic control should be explicitly covered. Older beta generation beta blockers, i.e., the non-selective, may have an adverse detrimental effect on glycemic control. The American Diabetes Association (ADA) 2004 Clinical Practice Recommendations reinforces the differences in beta blockers as exemplified in the following :

> "Utilization of β-blockade, ACE inhibitors, or possibly angiotensin receptor blockers is essential in preventing remodeling with its associated decline in ventricular function. Beta-Blockers not only prevent, but may also reverse, cardiac remodeling. Glycemic control may also play an important role in the

> therapy of diabetic HF. The adverse metabolic side effects that have been associated with β-adrenergic inhibitors in the diabetic patient may be circumvented by use of a third-generation β-Blocker. Prophylactic utilization of ACE inhibitors and β-Blockers to avoid rather than await, the need to treat high-risk diabetic patients."[2]

The alpha-beta-blocker subdivision is recognized as a third-generation beta blocker.

Because of the unique properties that alpha-beta-blockers have beyond just beta blocker effect, alpha-beta blockers do not belong in the beta blocker class as a subdivision. The addition of alpha-blockade to beta-blockade creates more complete adrenergic effects and additional ancillary pharmacologic properties which may include antioxidant, antiapoptotic, antiproliferative, electrophysiologic and metabolic effects. These unique effects differentiates alpha-beta-blockers from traditional beta blocker, warranting a separate pharmacologic classification. Although an argument could be made to simply put the alpha-beta blockers in a distinct class without placing the beta blockers in separate classes, we recommend that all three be listed as separate due their uniqueness and the lack of class effect

Therapeutic Category	**Pharmacologic Class**	**Recommended Subdivisions**
Cardiovascular	Nonselective Beta Blocker	
	Cardioselective Beta Blocker	
	Alpha-beta Blockers

P. Gastrointestinal Medications Therapeutic Category, New Pharmacologic Class

The term "opioid antagonist" in the current subdivision of antidotes has become outdated and should be changed to specify "centrally acting opioid antagonists." A new opioid antagonist pharmacologic classification "peripherally acting opioid agonist" should be added to the Gastrointestinal Medications section for differentiation.

The new class of agent is peri registration for the treatment of Post Operative Ileus and under development for other Gastrointestinal conditions. The two distinct mechanisms of action and clearly different potential indications should be differentiated in the USP model guidelines.

Therefore, GSK recommends the following addition to the Draft Model Guidelines.

Therapeutic Category	Pharmacologic Classification	Recommended Subdivisions
Gastrointestinal Medications	Peripherally Acting Opioid Antagonist	

Q. Genitourinary Medicines Therapeutic Category; Benign Prostatic Hyperplasia (BPH) Agents Pharmacologic Class (No. 114)

The proposed BPH Pharmacologic Class is inconsistent with nationally recognized BPH treatment guidelines. The AUA guidelines specify two types of medications with distinct mechanisms of action and recommend using both types of agents for some patients. The proposed classifications do not assure access to appropriate medications for men with BPH because plans could choose any two medications and not at least one from each class.

To be consistent with recognized practice guidelines, GSK recommends changes to the BPH pharmacologic class which include a subdivision for alpha-blockers and a subdivision for 5ARIs. Because the recommended treatment for BPH includes both treatment of the underlying disease along with reduction in urinary retention and BPH related surgery, both of these subdivisions should have at least one covered drug.

Benign prostatic hyperplasia (BPH) is a progressive disease where the prostate continues to enlarge over time. The prevalence is age dependent, beginning usually after age 40; by age 60, prevalence is greater than 50%, and by age 85, as high as 90%[1]. Treatment is based on severity of symptoms and is directed to reduce prostate size through specific drug therapy or surgery (TURP or prostatectomy). The current pharmacological treatment options for lower urinary tract symptoms (LUTS) secondary to BPH include α-blockers and 5α-reductase inhibitors or 5ARIs. Alpha-blockers are recognized as appropriate therapy for prostatic enlargement and are used for relief of symptoms as well as prevention of disease progression. 5ARIs are effective for symptoms associated with prostatic enlargement, prevent disease progression and reduce the risk of acute urinary retention and the need for BPH-related surgery. Combination therapy, utilizing both 5ARIs with an alpha-blocker, appears to be more effective than alpha-blocker monotherapy in reducing the likelihood of acute urinary retention and surgery.[1,2,3,4] The European Urological Association (EUA) 2004 guidelines are consistent with the AUA guidelines[2].

With a higher prevalence of BPH in men over 65, it is especially important to assure access to appropriate medications. Left untreated, 1 in 6 patients with an enlarged prostate and symptoms may experience acute urinary retention or BPH related surgery over a 4-year time period[5].

For these reasons GSK recommends the following changes to the Model Guidelines.

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	Recommended Subdivisions
Genitourinary Medications	BPH Agents	*Alpha-blockers*
		5α-Reductase Inhibitors

R. Immunological Agents Therapeutic Category (No. 125)

The proposed Model Guidelines consider vaccines to be a recommended subdivision of the Immune Stimulants Pharmacologic Class, Immunological Agents Therapeutic Category.

While a plan may choose not to provide immunization to Medicare beneficiaries, it is in the interest of public health and the health of individuals to facilitate the ability of PDPs and MA-PDs to choose to provide immunizations. This would be consistent not only with the health of individuals but also consistent with overall public health objectives.

For this reason, GSK recommends that the USP establish Vaccines as a Therapeutic Category (stating that this category may not need to be populated as part of the Part D "safe harbor" standard) and establish a number of Pharmacological Classes, each with a disease that can be prevented by vaccines. Each disease has a specific vaccine, and these vaccines are not interchangeable in the same way as may be the case with other products with similar mechanisms of action.

Some adult immunizations are already provided under Medicare Part B (e.g., influenza, pneumococcal, hepatitis B to select populations). However, senior adults may need immunizations that are not currently covered by Part B. For example, Healthy People 2010 includes an objective of reducing levels of hepatitis A from the 1997 baseline of 11.3 new cases per 100,000 people to 4.5 new cases per 100,000 by 2010.[1] One of the strategies is to target high risk adults over age 40. The availability of hepatitis A vaccine from a plan offering a Part D benefit would make it easier to meet that objective. In addition, Healthy People 2010 contains an objective to reduce cases of Hepatitis B from the 1997 baseline of 15.0 cases per 100,000 to 3.8 cases per 100,000 by 2010.[1] Universal immunization of children will go a long way to reaching that objective, but there are many seniors outside of the traditional high risk groups currently eligible for Medicare covered hepatitis B immunization who have never been immunized. This additional population may still be at risk because hepatitis B is a blood-borne pathogen that may be contracted in a variety of circumstances. In fact, hepatitis B is easier to contract than HIV. Another category of beneficiaries who should be vaccinated, according to the CDC, are travelers to selected countries.

For these reasons, GSK requests that the following Pharmacologic Classes be considered for inclusion in the Immunological Agents Therapeutic Category:

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	*Recommended Subdivisions*
Immunological Agents	Tetanus-Diphtheria Vaccine	
	Influenza (Flu) Vaccine	
	Pneumococcal Vaccine	
	Hepatitis B Vaccine	
	Hepatitis A Vaccine	
	Hepatitis A and B Vaccine	
	Measles-Mumps-Rubella (MMR) Vaccine	
	Varicella (chickenpox) Vaccine	
	Polio Vaccine	
	Yellow Fever Vaccine	
	Typhoid Vaccine

S. Hormones, Stimulant/Replacement – Therapeutic Category (No. 117)

GSK recommends adding one (1) new therapeutic category entitled "Bone Affecting Agents, Bone Resorption Inhibitors/Bone Formation Agents. Such a therapeutic category is consistent with how bisphosphonates are categorized in two of the official pharmaceutical compendia, the USPDI and the American Hospital Formulary Service (AHFS).

In the current draft guidelines, treatments for osteoporosis are lumped into an overly broad category of "Hormones, Stimulants/Replacements" that includes treatments for thyroid disorders, sexual dysfunction, menopausal symptoms, pituitary and other disorders. This therapeutic category is inappropriate for bisphosphonates used for the treatment and prevention of osteoporosis, as bisphosphonates are neither hormone stimulants nor hormone replacements.

Osteoporosis, which means "porous bones," is a condition of excessive skeletal fragility resulting in bones that break easily. According to the National Osteoporosis Foundation (NOF), osteoporosis and osteopenia (low bone mass) affect an estimated 44 million American women and men age 50 and over. This number is expected to rise to more than 52 million by 2010.

Osteoporosis is the primary cause of hip fracture, which can lead to permanent disability, loss of independence and sometimes even death. Collapsing spinal vertebrae can produce stooped posture and a "dowager's hump," resulting in loss of height and severe back pain. Osteoporosis leads to 1.5 million fractures per year, mostly in the hip, spine and wrist. According to the National Institutes of Health (NIH), one in two women and one in four men older than 50 will suffer a vertebral fracture, and the annual cost of treatment is estimated at $17 billion and rising. These numbers are only expected to rise as the U.S. population ages.

Osteoporosis, if not prevented or appropriately treated, is costly to the Medicare program. According to one estimate, Medicare pays for about 75% of hospital costs associated with osteoporosis-related admissions among adults age 45 and older. [1]

Although some bone loss is expected as people age, osteoporosis is no longer viewed as inevitable. Diagnosis and treatment may begin before bones break, delaying the disease's onset and diminishing its severity. Most important, early intervention can prevent devastating fractures.

Given the importance of this disease to the Medicare population, and the need for flexibility in addressing the needs of both the healthy and frail elderly in terms of co-morbidities, drug-drug interactions and other parameters of patient care, we recommend that USP create a separate therapeutic category for these agents

designated as "Bone Affecting Agents, Bone Resorption Inhibitors/Bone Formation Agents."

Such a therapeutic category is consistent with how bisphosphonates are categorized in two of the official pharmaceutical compendia, the USPDI and the American Hospital Formulary Service (AHFS). The USPDI lists bisphosphonates (and raloxifene) as "category: bone resorption inhibitors." Additionally, the AHFS includes bisphosphonates under section 92:00, Unclassified Therapeutic Agents, recognizing that an appropriate pharmacologic-therapeutic category does not exist in their classification system. AHFS *does* have a category for hormones (68:00 Hormones and Synthetic Substitutes, which, like the USP draft guidelines, includes the subcategories of adrenals, pituitary, thyroid, estrogens, and others), but does not include bisphosphonates in the same category.

We further recommend that the pharmacologic classes within the new therapeutic category be designated as follows: Bone Resorption Inhibitors - Bisphosphonates, Bone Resorption Inhibitors – Hormone/Hormone-like, Bone Resorption Agents – Other, Bone Formation Agents – Parathyroid Hormones.

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	Recommended Subdivisions
Bone Affecting Agents, Bone Resorption Inhibitors/Bone Formation Agents	Bone Resorption Inhibitors - Bisphosphonates	
	Bone Resorption Inhibitors – Hormone/Hormone-like	
	Bone Resorption Agents – Other	
	Bone Formation Agents – Parathyroid Hormones	

If USP does not wish to place osteoporosis drugs in their own category, we recommend at a minimum that the category 118 be expanded and renamed "Hormone/Hormone Antagonist/Hormone Substitutes/ Bone Affecting Agents/Bone Resorption Inhibitors/Bone Formation Agents" to account for the broad range of treatments covered in this category and to appropriately characterize the osteoporosis agents as pharmacologic classes within the category. (We note that as a general matter, the term "Hormone, Hormone Antagonist and Hormone Substitutes" is more consistent

with the standard nomenclature used in Medical Subject Headings.) We further recommend that the pharmacologic classes named above be included in such category.

Reference:

1. Testimony before the USP of the National Osteoporosis Foundation, the American Society for Bone and Mineral Research and the International Society for clinical Densitometry, August 27, 2004, citing Max W, Sinnot P, Kao C, Sung HY, Ride DP. The burden of osteoporosis in California, 1998. Osteoporos Int. 2002; 13(6): 493-500.

T. Respiratory Tract Medications Therapeutic Category Pharmacologic Classes: Antiasthma/Antileucotrienes (No. 136) Antiasthma/Bronchodilators (No. 137), Antiasthma Agents, other (No. 138), Mast Cell Stabilizers (No. 139), Mucolytics (No. 140) and Respiratory Tract Medications, Other (No. 141)

As currently constructed, the pharmacologic classes and subdivisions of the Respiratory Tract Medications Category proposed by USP present the available pharmacologic agents in a manner that is inconsistent with their mechanism of action, inconsistent with recommendations of evidence-based, nationally accepted practice guidelines [1,2,3] and inconsistent with accepted clinical practice for treating asthma and COPD.

GSK recommends that the proposed Respiratory Tract Medications Category pharmacologic classifications and subdivisions be replaced with the following classes (no subdivisions; alphabetic order):

- **Anticholinergics**
- **Beta-agonists – long acting**
- **Beta-agonists – short acting**
- **Inhaled Corticosteroids**
- **Leukotriene Modifiers**
- **Mucolytics**
- **Respiratory Tract Medication – other**

The proposed USP classification for Respiratory Tract Medications compresses three different classes of medications, the short acting beta-agonist (SABA), inhaled corticosteroids (ICS) and long-acting beta-agonists (LABA) into a single artificial grouping that doesn't reflect their differing mechanisms of action, guideline recommendations or standard clinical practice. Accordingly, the proposed structure creates potential for therapy for Medicare patients that is both inconsistent with national guidelines and inadequate to control disease.

Note: Because Mast Cell Stabilizers are rarely used in practice, USP should consider dropping them as pharmacologic classifications or consider them part of the "other" classification.

GSK is also concerned that the proposed Respiratory Tract Category and associated pharmacologic classes emphasize "anti-asthma" therapies and do not adequately address the different treatment options necessary for Medicare beneficiaries with COPD.

Revising the Respiratory Tract pharmacologic classes as outlined above creates a close alignment with long-standing treatment guidelines and clinical practice standards and should thus help ensure access to appropriate treatment options for Medicare patients with asthma and COPD.

Regarding asthma, the NIH/NHLBI guidelines indicate that patients with persistent asthma require at least two types of medication. Specifically, the guidelines state:

> "All patients need to have a short acting-inhaled beta2-agonist (SABA) to take as needed for symptoms. Patients with mild, moderate or severe persistent asthma require daily long-term-control medication to control their asthma (page 9)." Further, patients with moderate persistent asthma may need and patients with severe persistent asthma should have a long acting inhaled beta2-agonist in addition to the short acting beta2-agonist and a controller medication (page 11). [4]

Current clinical practice for asthma reflects the guidelines in that most treated asthma patients are managed with multiple medications. Market databases show that while a small portion of asthma patients (~20%) are managed with SABA alone, the vast majority of patients with asthma (~80%) require multiple medications to control their disease. [5]

COPD is a distinct, complex, multi-component disease characterized by airflow limitation that is not fully reversible. There are specific ICD-9 codes, nationally and internationally recognized guidelines [2,3] and treatment recommendations specifically for COPD.

The guidelines indicate that appropriate treatment for COPD often includes simultaneous use of multiple medications. Specifically, Celli B, MacNee W, et al. in *Standards for the Diagnosis and Treatment of Patients with COPD: a Summary of the ATS/ERS Position Paper* [3] state that:

- Combining different therapeutic agents produces a greater change in lung function and symptoms than single agents alone.
- Data from trials combining long-acting inhaled beta-agonists and inhaled corticosteroids show a significant additional effect on pulmonary function and a reduction in symptoms in those receiving combination therapy compared with its components.
- The largest effects in terms of exacerbations and health status are seen in patients with an FEV1<50% predicted, where combining treatment is clearly better than either component alone.

Again, as with asthma, the norm for treatment of COPD in clinical practice includes the use of multiple medications. Market databases show that nearly 90% of patients currently being treated for COPD receive more than one class of medication.

GSK proposes the following changes to the Model Guidelines:

THERAPEUTIC CATEGORY	PHARMACOLOGIC CLASS	*Recommended Subdivisions*
Respiratory Tract Medications	Anticholinergics	none
	Beta-agonists – long acting	
	Beta-agonists – short acting	
	Inhaled Corticosteroids	
	Leukotriene Modifiers	
	Mucolytics	
	Respiratory Tract Medication – other

III. Need for New Categories or Classes

In addition to the above revisions to the groupings in the Draft Guidelines, we believe that a number of products were missed in USP's creation of these groupings. Below we identify these omissions and provide suggested categories or classes for each.

A. Obesity Therapeutic Category

Obesity is associated with diabetes, coronary heart disease and hypertension. Because of the impact of these diseases for the elderly population especially, obesity treatments should be included as a therapeutic class in the Model Guidelines.

Obesity has been shown to increase the risk of developing diabetes, and conversely, interventional data has shown that weight management medications can effectively prevent diabetes.[1] Also, the American Heart Association (AHA) has classified obesity as a modifiable risk factor for coronary heart disease. Risk estimates from population studies suggest that >=75% of hypertension can be directly attributed to obesity. Obesity has a strong effect on lipoprotein metabolism, regardless of ethnic group. Increased weight is a determinant of higher levels of triglycerides, elevated LDL-C and low HDL-C. Conversely, weight loss is associated with a healthier lipoprotein profile in both men and women: triglycerides decrease, HDL-C increases and LDL-C decreases. [2,3,4,5,6]

Therefore, GSK requests that the following changes be made to the Model Guidelines:

THERAPEUTIC CATEGORY	**PHARMACOLOGIC CLASS**	***Recommended Subdivisions***
Obesity	**Centrally Acting**	*Sympathomametic*
		Non –sympathomametic
	Peripherally Acting	*Digestive Inhibitors*
	Hormonal Manipulation	

These proposed classes are drawn from the categories identified for the pharmacotherapy treatment of obesity by the National Institutes of Health (The Practical Guide. Identification, Evaluation, and Treatment of Overweight and Obesity in Adults. Available at http://www.nhlbi.nih.gov/guidelines/obesity/prctgd_b.pdf . Accessed September 15, 2004.) and the American Academy of Family Physicians (Drug Therapy for Obesity. http://www.aafp.org/afp/20000401/2131.html. Accessed September 15, 2004.)

A. **Addition of Future New Therapeutic Categories and Pharmacologic Classes**

Critical to these processes is that the USP remain aware of newly approved drugs, new indications and other clinical developments that would warrant prompt revision to categories and classes in the Model Guidelines, and that all pertinent information is obtained by USP. The Statute assigns USP the function of adding new categories and classes to the Model Guidelines. The preamble to the Part D rules states that "the USP will revise its classification system periodically to reflect changes in therapeutic uses of covered Part D drugs and any additions of new covered Part D drugs." 69 Fed Reg 46660. According to the USP Web site, the Cooperative Agreement provides that the Guidelines will need to be revised over time, based on new information (such as therapeutic uses) about existing drugs and FDA approval of new drugs. In addition to establishing a mechanism for its own review of the Model Guidelines, we also recommend that USP establish a mechanism by which any interested member of the public (*e.g.*, patient groups, physicians, and manufacturers) can submit information to USP to identify a potential need for revision to the Model Guidelines. This mechanism should ensure that information related to newly approved drugs is easily identified so that the expedited process for such requests discussed above can commence immediately. Moreover, consistent with the USP's commitment to an open and public process, we believe that as issues are raised for consideration, the USP should use its Web site to publicize the consideration of such issues so that the public can submit information that it believes relevant to any such issues. In GSK's view, these processes and the involvement of the public will help ensure that the Model Guidelines remain current and thus continue to ensure that beneficiaries have access to a meaningful range of therapies.

CONCLUSION

GSK appreciates the opportunity to comment on the Draft Guidelines, and we recognize the extensive efforts of the USP in the development of the Model Guidelines. Yet, we believe considerable work remains in finalizing the guidelines so that they serve their intended purpose – the identification of categories and classes that, if followed by a PDP plan, will ensure that beneficiaries can enroll in the plan and have access to the drugs they need. While making all of the subdivisions in the Draft Guidelines categories or classes would be a positive step towards reaching this goal, as described above, certain changes also must be made to the categories, classes and subdivisions. Moreover, additional categories or classes must be developed to address products that seemingly were overlooked in the development of the Draft Guidelines. Please feel free to contact Debbie Fritz, PhD., at (919) 483-2191 if you have any questions regarding these comments. Thank you for your attention to this very important matter.

Respectfully submitted,

Dean Hakanson, MD

Issue Areas/Comments

GENERAL

GENERAL

To Whom It May Concern:

I am currently a 3rd year PharmD student at the University of North Carolina at Chapel Hill. I am concerned about the proposed regulation that allows plans to establish preferred and non-preferred pharmacies. If this occurs, my role as a pharmacist will not be what I have spent the past three years working towards. I joined this profession because its core value of being able to help patients. If patients are forced to go to other places to receive their medications, I will not be about to fulfill my duties as a pharmacist. At UNC, our academic focus has been on the patient. If you decide to implement this law, then we will not be able to practice.

Also, patients with two more chronic diseases and two or more drugs should qualify for medication therapy management services. A pharmacist can offer so much knowledge to patients in regards to medication management. Everyday, patients use their medications incorrectly causing harm to them. If pharmacists were there to intervene, we could eliminate such problems. Certain disease states can be very well managed if there was adequate knowledge by the patient.

Thank you for considering my view.

Binita Patel

GENERAL

GENERAL

Part III: Collection of Information Requirements
Recommendations in the area are:
* Where ever possible, use the standards developed and adopted by HIPAA or other regulating entities. Examples are: NCPDP 5.1 transmission, X12 standards (270/271, 834, 835, etc.).
* If the standard record formats do not meet Part D requirements, then the recommendation is to interface with the appropriate sub-groups to begin modifications once data requirements are known.
* Utilize the current Drug Discount Card standards if possible, since many systems have been programmed for these record formats. This includes enrollment application information, Request/Response records to CMS for eligibility verificiation, disenrollment, etc.

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans

Summary: We are required to implement population based drug utilization management and quality assurance programs as well as targeted medication therapy management programs for individual patients. We may already have some of these programs in place, but will need to develop new programs and processes to meet this requirement. We will be required to submit data to an independent Quality Improvement Organization for the purpose of monitoring. Sponsors are encouraged to use electronic prescribing and physician incentives are included. We are required to be accredited as a PDP sponsor.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46667 D.2.	*"Cost & Utilization Management, QA, MTM, Programs to control fraud, abuse, and waste.* "…drug utilization management and quality assurance systems are generally considered to be population based while medication therapy management involves targeted, direct patient care.	

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

46667	*P&T Committee oversight of cost-effective drug utilization management programs* "We believe that a cost-effective drug utilization management program could also employ the use of prior authorization, step therapy, tiered cost-sharing, and other tools to manage utilization" "Although we have not included proposed regulations, we are considering in the final rule a requirement that these tools should be under the direction and oversight of a Pharmacy and Therapeutics Committee to ensure an appropriate balance between clinical efficacy and cost effectiveness."	1. MedImpact's comment speaks to optimizing the use of the noted tools provided by PBMs to supporting MA PD or PDPs in their efforts to provide a quality, affordable, and accessible drug benefit. CMS rules must allow PBMs to exercise and use all available tools at their disposal to help manage the quality and cost of providing drug benefits to large populations. Benefit design strategies allowing actuarially equivalent products need to be considered and modeled with a creative intent based upon a societal mission to serve our elderly population. P & T committees provide quality oversight in the arena of drug therapeutics and selection based upon scientific evidence. It is our belief that P & T selects the best available clinical products and then supports the efforts of the PBM team to effectively design the benefit structures to administer affordability and accessibility. The fundamental guiding principle in the regulation is to provide actuarial equivalence to assure equivalent financial value to the beneficiary. The primary role of P & T remains to assure QUALITY while the AFFORDABILITY and ACCESSIBILITY of the drug benefit is achieved by a team consisting of pharmacists, actuaries, benefits experts, I.T. designers, and many others. We do not believe that there is a need for language requiring P & T oversight over the broad operations of a PBM. The Chief Medical Officer exercises that critical oversight role in assuring that corporate philosophy balances clinical quality with fiscal responsibility. 2. We would further note that "quality" includes the principles of safety and efficacy. Thus P & T has an expansive role and responsibility in this stead whereas benefits design and systems management to administer a benefits design is clearly in a different arena requiring support from actuaries, I.T. analysts, finance experts, actuaries, and of course pharmacists. We do not see where the limited time resources of a physician led team needs to provide direct oversight in the operations and technology arena.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
	P&T Committee oversight of cost-effective drug utilization management programs *(Continued)*	I would recommend that we emphasis that the P&T Committee focus not only on Quality, but the evaluation of the Safety and Efficacy of the drug products available under a defined program. The benefit strategies are uniquely different from P&T activities of product review and recommendations and your point carries this message out. If this is helpful, attached are some excerpts from the current P&T charter: Committee description: A committee shall exist at MedImpact Healthcare Systems that will be the policy recommending body to MedImpact administration and the Health Services staff and the administration, pharmacy and related benefit administration departments of client health care organizations and plans on matters related to the therapeutic use of drugs. This committee shall be called the Pharmacy & Therapeutics Committee ("Committee"). To serve in an advisory capacity to MedImpact administration and to the medical, health care and related benefit professionals of MedImpact clients on matters pertaining to the use of drugs, including recommendations on the coverage for specific drug therapies.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
	P&T Committee oversight of cost-effective drug utilization management programs *(Continued)*	Committee scope: • To recommend therapeutic designations and appropriate prescribing guidelines to assist with the placement of products on Drug Formulary(ies) acceptable for use in the ambulatory care setting and provide for ongoing constant revision. • To initiate or direct recommended Drug Use Review (DUR) and Drug Use Evaluation (DUE) programs. • To advise MedImpact Healthcare Systems on suitable educational programs and make recommendations in the implementation of effective drug control procedures. • To document such formulary or drug use functions that are used by MedImpact or delegated to it by clients.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46667	*Notice to members about cost-effective drug utilization management programs* "In addition, appropriate drug utilization management programs would have policies and systems in place to assist in preventing overutilization and underutilization of prescribed medications. PDP sponsors and MA Organizations offering MA-PD plans must inform enrollees of program requirements and procedures in order to prevent unintended interruptions in drug therapy. For example, enrollees would be made aware of how to proceed if special circumstances require their prescriptions be refilled before the targeted refill date."	1. PBM systems can detect and prevent early refills based upon protocols established by MCO, MA plans. We are not clear as to what special circumstance would require prescriptions to be filled BEFORE the targeted refill date. Patients have access to a vast network of over 50,000 pharmacies and can have refills completed on virtually any given day. Our sophisticated systems in combination with that of the chain retail pharmacies provide virtual access. Patients on specialty or unique prescription items definitely have to plan their prescription needs more carefully. We believe that enrollees and their care givers have accountability to manage their care and to plan accordingly .
46667 D.2.b	*Quality assurance requirements and the Omnibus Reconciliation Act of 1990* "We are proposing the quality assurance programs include requirements for drug utilization review, patient counseling, and patient information record keeping. We believe that these requirements would generally need to comply with section 4401 of the Omnibus Reconciliation Act of 1990 as codified in 42 CFR 456.705 and section 1927(g)(2)(A) of the At, and we are considering such specific requirements for the final rule…….We solicit comments on whether the Medicaid standards are in fact industry standards, whether they are appropriate standards for part D, and if they are, how they should be adapted for use in part D."	1. DUR review and patient information record keeping are done in compliance with OBRA 90 at the MCO, MA and contracted provider levels. Patient counseling at the pharmacy point of service is mandated by State law and is a cornerstone of retail pharmacy practice. Pharmacy consultation is provided to all patients, not just Medicaid. Quality Assurance in an integrated health care delivery system has advantages which are not as readily achieved in a network provider model. Within integrated deliver systems, electronic medical records and electronic prescribing to staff type pharmacies is emerging. Access to powerful information systems such as this is not yet available to the network models utilizing contracted providers in medicine and pharmacy. Thus, record keeping and quality assurance program regulation evolution needs to be mindful of this reality. .

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46667	*Elements of a quality assurance program* "The elements that are currently viewed as desirable for quality assurance programs are – (1) electronic prescribing (which will become a requirement in the future as discussed later in this preamble); (2) clinical decision support systems; (3) educational interventions, which could be provided by QIO or could rely on other mechanisms; (4) bar codes; (5) adverse event reporting systems; and (6) provider and patient education. We do not expect PDPs and MA-PD plans to adopt all of these elements. However, we expect substantial innovation and rapid development of improved quality assurance systems in the new competitive and transparent market being created by the new Part D benefit.	1. Unclear about what type of policies and systems CMS refers to in this section. The implementation of HealthConnect over the next several years should enhance current quality assurance programs. 2. Electronic prescribing: MedImpact supports the evolution of this technology and will engage in furthering its development as required with MA, PDP clients. While this technology appears readily available, there are many challenges to be overcome to assure physician adoption and broad industry utilization. 3. Bar code technology for prescription dispensing is a standard of practice within the mail fulfillment industry and is just beginning to emerge in progressive retail pharmacy outlets using varying levels of automated dispensing technology. Retail stores with high prescription volume and pharmacist staffing shortages are beginning to invest in this technology. It will be many years before this technology will be implemented across all retail practice settings.
46667	*Definition of medication error* "…the Food and Drug Administration adopted the following definition of a medication error: > Any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the healthcare professional, patient, or consumer. Such events may be related to professional practice; healthcare products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use (see 687 FR 12500 (March 14, 2003)). …We are citing this definition in this preamble as one that we would use initially in interpretive guidance."	1. This definition is broad and MA-PD plans may interpret reporting requirements differently, thus leading to different reporting rates. 2. "Medication error" reduction and management is a risk management process which is the accountability of the participating network pharmacy. PBMs are not engaged in the risk management process dealing with prescription dispensing errors at the retail pharmacy POS. The data within the PBM database is utilized for adjudication purposes and population management processes. The data within the participating network pharmacy system is utilized for direct patient care and prescription fulfillment. Any rules promulgated for QA involving medication error management needs to consider how separate and distinct information systems and organizations can work together to integrate and support broad QA mandates.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
	Evaluation of quality assurance programs " Therefore, we particularly invite comments on how we could evaluate PDPs and MA-PDs based on the types of quality assurance measures and systems they have in place, how error rates can be used to compare and evaluate plans, and how this information could be best provided to beneficiaries to assist them in making their choices among plans"	1. CMS needs to be aware that integrated systems may effectively document and track errors or occurrences within a uniform overarching infrastructure. Network systems lacking such an overarching framework will be following separate guidelines and processes without a singular reporting point. It is reasonable to assume that data capture and reporting rates may be less within the network process and is not necessarily an accurate reflection of quality. A fair and scientific comparison would be based upon uniformly accepted standards. 2. MA PDs and PDPs are different organizational structures newly established to provide access to the new MMA with Medicare Part D. There are no current standards of comparison for this new entity. MAs may possibly be compared via current NCQA or HEDIS benchmarks for how they served their commercial populations. The contracted hospitals may be compared via their JCAHO ratings. State regulatory agencies will have incidents of complaints or citations. There are other not for profit organizations providing quality and service ratings which may be used, but none are focused specifically on the management of the pharmacy benefit. Comparison of pharmacy chains have been provided by various consumer based organizations. We would note that MMA is a broad modernization act which goes beyond just Part D. PBMs which may be PDPs or PDs for MA-PDs have been compared on service issues. This is a very complex issue and there are no simple and accurate ratings or processes which would serve consumers best. Consumers are focused on the cost of the premium and the value of the corresponding drug benefit which is provided via a network pharmacy. The fact that a chain pharmacy will probably serve MULTIPLE PDPs or MA-PDs will complicate targeted comparison even further. Are you comparing the retail POS outlet or the MA-PD or PDP plan? The benefit is defined by law and all variations are required to be actuarial equivalents. Comparison processes will need to wait until there is adequate experience and industry consensus as to what will be appropriate and fair quality benchmarks.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46668 - 69	*Medication therapy management services reimbursable* "Medication management services would be reimbursable when adopted by a plan only when provided to targeted beneficiaries as defined in §423.153(2) of our proposed rule and later in this preamble." "…services could include, but not be limited to, performing patient health status assessments, formulating prescription drug treatment plans, managing high cost "specialty" medications, evaluating and monitoring patient response to drug therapy, providing education and training , coordinating medication therapy with other care management services, and participating in State-approved collaborative drug therapy management." "We will ask a PDP sponsor or MA organization to disclose the fees it pays to pharmacists or others, including an explanation of those fees attributable to MTMP services."	1. We are not clear yet as to how MTMP services will be reimbursed and how that reimbursement will be provided to pharmacies at the POS. If such service is to be provided at the pharmacy POS, contractual negotiations will need to be undertaken to establish an appropriate fee schedule. Credentialing or evidence of competency in selected disease states will need to be provided. The shortage of pharmacists at the POS in the retail sector needs to be considered. Likewise, retail pharmacies in general do NOT have truly confidential areas for detailed consultations envisioned for MTMPs. Such services are most effectively provided in clinical environments such as integrated delivery systems, clinic offices, or by appointment in certain retail pharmacy facilities with adequate consultation facilities. 2. MA-PDs and PDPs will need to develop estimates of costs to submit with their solicitations under what we assume will be administrative costs incident to appropriate drug therapy. Enrollees will not pay for these services, thus the cost with appropriate margin must be built into the premiums for an adjusted or separate administrative costs line. There are no established models for this service and we will be evolving reasonable business assumptions and modeling to support a proposal. 3. Targeted enrollees who may benefit from this service are described as "taking multiple Part D covered drugs, and are likely to incur annual costs that exceed a certain level that we can determine." We believe that this may require forecasts to be done for 2006 but will require CMS to allow accrual of costs to be reconciled in the following year based on lack of present data. PDPs of MA PDs must develop forecasts by early 2005 to submit with their solicitation or to adjust their proposed cost structures to CMS at subsequent quarters. CMS must allow flexibility in this regard prior to formulation of firm and fast rules.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46668 – 69	*Medication therapy management services targeted individuals* "Second, section 1860D4(c)(2)(A)(ii) of the Act requires that MTMP services be provided only for targeted individuals. In other words, not all members of a plan would be entitled to receive these services. As provided under §423.153(d)(2), "targeted beneficiaries" would be plan enrollees who have multiple chronic diseases, are taking multiple Part D drugs, and are likely to incur annual costs that exceed a certain level that we determine. We would invite comments on how we should provide comments to drug plans in defining "multiple chronic diseases" and "multiple covered Part D drugs" for the purposes of determining which Part D enrollees would qualify for MTMP services, or whether such determinations are left to the plans as part of their benefit design." "In addition, we are concerned about the method that plans should use to determine that plans should use to determine the costs that enrollees are "likely to incur" to ascertain whether they qualify as targeted beneficiaries." "Active beneficiary participation and consistent delivery of quality MTMP services will require developing and maintaining on-going beneficiary-provider relationships."	1. Existing Disease Management programs manages patients with diabetes, asthma, CAD, CKD, CVD, CHF, hypertension, osteoporosis and depression. These would most likely be the type of disease states that CMS will be targeting. We will be dependent on ICD-9 coding and inferential data (e.g. prescription data, hospital discharge diagnosis, Encounter Coding System) to identify patients with these disease states. This methodology employed by the Disease Management programs results in a positive predictive value of 85-95% (=5%-15% false positives). We will need to determine how to identify patients with specific chronic diseases. 2. If eligibility for MTMP participation depends upon incurred costs, what are the criteria for ineligibility? Will patients transition in and out of MTMP? For example, suppose a member qualifies in year 1 based upon achieving a certain threshold for drug costs. Assume the program is successful and the member reduces their drug costs in year 2. Would the member still be eligible to enroll for year 3 or would they be disqualified? Such inconsistency may be confusing for members and may result in dissatisfaction with their health care.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46669	*Pharmacists as MTMP providers* "Section 1860D-4(c)(2)(A)(i) of the Act specifically states that a pharmacist may furnish MTMP services. While we believe that pharmacists will be the primary providers of these services, MTMPs could also include other qualified health care professionals as providers of services."	1. How will we separate and bill non-pharmacists services in order to receive reimbursement? 2. Our comments above touch upon pharmacists in the retail network environment as providers of this service. We again reiterate the concern regarding the national shortage of pharmacists. Without a doubt, segments of the retail pharmacist industry lobbied successfully for this language. However, to effectively serve large populations, a supportive clinical, financial and operations infrastructure will be critical to the success of the program. We believe that the oversight for this process begins with the physician referring and guiding patients to MTMP based upon established protocols. MA-PDs, PDPs, PPOs will need to develop such protocols and guidelines with corresponding assumptions leading to cost forecast for premium adjustments. It would be difficult for self directed enrollment unless the patient is identified as a targeted individual enrollee. Some MA-PDs, PDPs may wish to contract with a subcontractor to provide such services. Pharmaceutical companies may wish to provide, support, or sponsor programs which could be of great value to enrollees utilizing their products. No doubt, the pharmacists will play a key role, but the scope and nature of intended MTMP is much more expansive and requires coordinated efforts which engage physicians, patient educators, laboratory data, medical records, and a long term care treatment plan for patients who have a variety of clinical conditions which broadly impact appropriate therapy beyond the prescription. While the notion of call centers seems impersonal, a pharmacist at a call center with the required medical data may be THE most effective facilitator and coordinator of the MTMP. 3. Cost effectiveness for such programs will require long term research involving all aspects of the continuum of care. We would suggest that models for implementation be provided research grant funding as well as operations funding to evolve the optimal models going forward. It would be a good investment to bring together an expert panel to envision various models and to solicit participants willing to commit to execution with a defined statistically significant population. In this way, we may evolve the best practice courses to optimize the use of Medicare and thus taxpayer dollars.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans

FR Page #	*Excerpt*	*Comment/Question*
46670 D.2.d.	*Additional fraud, abuse, and waste standards* "We would also like comments on the value added from requiring plans to develop comprehensive performance standards for use in evaluating internal processes that would appropriately and efficiency research, identify, monitor, and take immediate action to mitigate fraud, abuse, and waste" "For instance, PDPs and MA-PDs need to determine whether or not physicians are illegally prescribing narcotics. In addition to available appropriate data that might be supplied by us, the plans could develop and utilize methods such as data analysis , record audit of PBMSs, pharmacies, physicians, and other providers, DUR….."	1. Will CMS develop uniform standards for all MA-PD plans or will each MA-PD plan develop their own criteria? Will this data be used to compare against other MA-PD plans? How will CMS account for differences in internal processes? 2. CMS has demonstrated a strong interest in identifying physicians who are illegally prescribing narcotics. This was clear in the DDC rules as well. This type of reporting and tracking is not something PBMs have done as routine reporting to health plans or to law enforcement agencies. We would suggest that CMS keep this type of fraud and abuse detection separate from the clinical, financial, and business requirements needed to effectively administer the MMA Part D drug benefit. If such tracking is desirable to obtain prosecutorial evidence, CMS may wish to develop a proposal soliciting bids from PBMs or other claims processing firms to undertake this as a separate project in conjunction with appropriate state and federal law enforcement agencies. Compensation to the successful bidder would be provided to cover administrative as well as operations costs, materials, and start up investment. Successful identification of such illicit prescribing will require coordination with the dispensing pharmacies, federal and state law enforcement, and the appropriate medical and pharmacy licensing agencies. Generation of reports of possible illicit prescribing serves no value unless there is an action plan and infrastructure established to act upon the data. Data from the PBM will need to be reinforced with actual copies of prescriptions and identification of patients. Prosecutorial success requires significant investment in the data analysis at all levels of the fulfillment system. These are law enforcement processes which seem distinct from our clinical and drug benefit management core competencies. Should MA-PD and PDPs forecast costs for such endeavors in their solicitations? Who will pay for these services?

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46670	*Monitoring fraud, abuse, and waste* "One area of concern is inappropriate switching of prescriptions by a PDP or MA-PD plan without consulting a prescribing physician."	1. Pharmacists have been identified by national polls as one of the most trusted professionals in America. Also, the practice of pharmacy is highly regulated and pharmacists are trained and ingrained to practice within the scope of the law. Pharmacists will not put their licenses on the line to switch prescriptions illegally without consulting with and getting physician approval. Pharmacists licensed and registered in the state of practice should ALWAYS have responsibility and accountability for any switching programs instituted by that organization. CMS may wish to focus on developing rules that state as such. In no instance, should non-pharmacist managers supervise or over see such programs. Development of policies and procedures governing a switching program need to be reviewed and approved by the responsible pharmacy executive and manager who should assume accountability for compliance to governing federal and state laws. The practice of pharmacy by a pharmacist is regulated by the governing State Board of Pharmacy.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46670	*Testing integrity analytical tools for effectiveness* "We also seek comments on the appropriateness, value and need for requiring the plans to test program integrity analytic tools for effectiveness, efficiency, and adaptability to the Medicare Benefit environment. For example, one approach could require the plans to provide any of the following in periodic reports; (1) Summary of data analysis activities, (2) resources, (3) tools, or (4) trend analysis. Alternatively, the plans could be required to develop their strategy and propose what each plan determines to be the best approach for detecting and deterring fraud and abuse. Furthermore, the plans could be asked to demonstrate that the agreed upon activities and outcomes that the plans achieve are in relation to the priorities established by us."	1. What would be the purpose of providing the noted periodic reports? PBMs consistently monitor drug trends to allow clients to make key decisions on how to manage their population of beneficiaries. In the competitive Medicare market place where margins are narrow and pricing is on a cost plus basis, what is the value of providing reports for which there is no defined actionable outcome? Rest assured that the MA-PD and PDP will be doing everything reasonable to manage drug spend as required by CMS and to achieve a reasonable profit within the allowable risk corridors. Development of additional reports requires IT investments and analyst support which adds to costs. We would rather invest all available dollars for appropriate drug spend. 2. The continuing note "Alternatively, the plans could be required to develop their strategy and propose what each plan determines to be the best approach for detecting and deterring fraud and abuse. Furthermore, the plans could be asked to demonstrate that the agreed upon activities …are in relation to priorities established by us." We believe that the drug benefit is one of the areas most easily monitored and analyzed due to the sophistication of the systems and establishment of NCPDP standard data formats. The pharmacy system is such that every transaction may be tracked back to a patient, a prescriber, a pharmacy and ultimately the prescription and the inventory of the dispensing pharmacy. If there is collusion between a local physician and a pharmacist, that may be detected most effectively at the local level and not by a population focused data base. Criminal fraud surely exists, but relative to prescription fraud and abuse in the Medicare population in particular with Controlled Substances, we are not knowing of the data which supports that assumption. We are confident that reports may be generated to identify prescribing outliers. We refer to our prior comments: Who wants this data and for what purpose? Who is willing to pay for such data gathering and analysis? And, should such costs be forecasted into any solicitation proposal to be a PDP or MA-PD?

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46670	*Consumer satisfaction surveys* Under §423.156 we would conduct consumer satisfaction surveys among enrollees of PDPs and MA Organizations offering MA-PD plans in order to provide comparative information about qualified prescription drug coverage to enrollees as part of our information dissemination efforts."	1. We would suggest that CMS and CAHPS provide straw man models of survey instruments to the MA-PDs and PDPs for input prior to final draft and distribution. 2. How will CAHPS/AHRQ differentiate satisfaction with the benefit versus the service provided by the network pharmacy? 3. If all plans are actuarially equivalent as approved by CMS, how will CMS differentiate consumer satisfaction?

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46670 D.4.	*Electronic prescribing program* "Section 1860D-4(e) of the Act contains provisions for electronic prescription programs. The statute contains specific provisions on when voluntary initial standards may be adopted (not later than September 1, 2005) and when final standards should be published (not later than April 1, 2008) and then effective (not later than 1 year after the date of promulgation of the final standards)."	1. 423.159(a) would require that PDP sponsors and MA PD PLANS must have the capacity to support e-prescribing programs. We would await the development of the final standards to ascertain how we could support such. 2. The statutory language is specific in that e-prescribing will also transmit data to the pharmacy such as: prescription, formulary information, medical history, possibility of any ADR, availability of lower priced alternative. Please note that "medical history" needs to be defined such that it may be transmitted in a NCPDP field. All the information to be provided to the pharmacy needs to fit a NCPDP approved field. This statute may require significant investment by all stakeholders in IT SYSTEMS. The discussion suggests that only the MA-PD and PDPs have the capability and capacity to undertake compliance to serve the pharmacies. We are supportive of e-Prescribing, but recognize that there will be significant investments required. Pharmacies will benefit by having a clean and almost pristine prescription readily adjudicated and easily entered into their internal pharmacy system. There may be costs associated with the provision of such data elements which will need to be shared across the entire provider continuum.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
	Electronic prescribing program (Continued)	3. There is NO REQUIREMENT THAT PHYSICIANS WRITE PRSCRIPTIOINS ELECTRONICALLY. This is the limiting adoption factor. The language allows differential payment to physicians who elect use e-Prescribing and comply with the forthcoming standards. MA PDs and MCOs will require time to revise their contracts with physicians within their network. Incentives will need to be designed and in place in the contract period prior to CMS implementation of the standard. Physicians will need to invest in the I.T. systems within their practice management systems to comply. Many physicians are appropriately concerned about the investment costs and the impact upon their office efficiency. There is not uniform agreement among physicians and other prescribers that the quality gains offset the lost efficiency and cost investments. The Medicare population is probably about 10-20% of any given physicians practice. Adoption of e-Prescribing will require a process that covers at least 66 to 75% of the physician's panel. The system will need to be able to serve almost his/her entire patient commercial panel as well. Physicians need ONE system that covers all. If the e-Prescribing is geared only for Medicare, adoption will be minimal as the investment ROI will be questioned.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46671-72	*Physician incentives to use electronic prescribing* "We have added regulations at §423.159(b) of this proposed rule that would allow an MA-PD plan to provide a separate or differential payment to a participating physician who prescribed covered part D drugs in accordance with electronic prescription standards (Note that this provision only applies to MA-PD plans and not to PDPs). "Differential payments, at the MA organization's discretion, could take into consideration the cost to the physician in implementing the program and could be increased for participating physicians who use e-prescribing to significantly increase – (1) Formulary compliance where medically appropriate; (2) Use of lower cost, therapeutically equivalent alternatives; (3) Reductions in adverse drug interactions as evidenced by appropriate use of drug interaction checking functions in electronic prescribing; and (4) Efficiencies in filling and refilling prescriptions through reduced administrative costs." "We note that any payment must be in compliance with other Federal and State laws…"	1. Would we still be in compliance with California's Knox-Keene Health Care Service Plan Act? Would it apply in this situation since it involves Medicare patients only? **§ 1348.6. Contracts between health care service plans and licensed health care practitioners; prohibition on certain incentive plans** (a) No contract between a health care service plan and a physician, physician group, or other licensed health care practitioner shall contain any incentive plan that includes specific payment made directly, in any type or form, to a physician, physician group, or other licensed health care practitioner as an inducement to deny, reduce, limit, or delay specific, medically necessary, and appropriate services provided with respect to a specific enrollee or groups of enrollees with similar medical conditions. 2. Incentives for physician adoption need to take into account applicable state and other governing regulations. We would reiterate that adoption rate will be higher if the e-prescribing is applicable to at least 67-75% of the physicians entire panel. Unless the physician's office and treatment rooms are set up with the needed equipment (desk top or hand held) to assure optimal efficiency in serving patients, the actual e-prescribing may be done by a clerk or medical assistant on behalf of the physician. The pharmacy receives only what is inputted from the providers office whether it comes from the provider or his staff.

Subpart D: Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans		
FR Page #	***Excerpt***	***Comment/Question***
46672	*Quality Improvement Organizations data requirements* "To fulfill this responsibility, QIOs would need access to data from the transactions between pharmacies and PDPs and MA-PD plans providing the Part D benefit" "The data would include payment related information (that is, plan identification, beneficiary HIC, date prescription filled, NDC, quantity dispensed, ingredient cost, dispensing fee, and pharmacy zip code) and additional items such as prescriber identifiers, dose, days supply, and other dispensing information. Potentially, the information gathered would be aggregated in our data warehouse, and then distributed to QIOs to fulfill their requirements for quality improvement as specified in their contracts and in response to requests."	1. Please provide data and examples as to the type of assistance that QIOs may provide to MA-PDs, PDPs. 2. QIOs are required to offer providers, practioners, MA organizations, and PDP sponsors QI assistance pertaining to health care services, including those related to prescriptions. Please provide list of some of the current QIO vendors approved by CMS. 3. Are the QIO costs to be included in the solicitation we submit, or are these costs already within the CMS forecast and resources are made available to the stakeholders? 4. How are QIOs assigned to stakeholders or do we solicit and hire our own?
46673 D.6	*Accreditation* "Section 1860D-4(j) of the Act requires that the provisions of section 1852(e)(4) of the Act relating to the treatment of accreditation will apply to PDP sponsors with respect to – (1) access to covered Part D drugs including the pharmacy access requirements and the use of standardized technology and formulary requirements; (2) quality assurance, drug utilization review, medication therapy management, and a program to control fraud, abuse, and waste; and (3) confidentiality and accuracy of enrollee records." "A PDP sponsor may be demed to meet the requirements that relate to access….quality assurance…DUR, MTM, and a program to control fraud, waste, and abuse……if it is accredited and periodically reaccredited by a private national accrediting organization under a process that we have determined meets a process and standards that are no less stringent than our applicable requirements. National accreditation organizations are those entities that offer accreditation services that are available in every State to every organization wishing to obtain accreditation status."	1. Please cite specific examples of accrediting organizations that would meet your standards. 2. PBMs are not usually accredited by JCAHO, NCQA-HEDIS. Would affiliation with a disease management organization who has met those accreditation standards for QA, DUR, suffice? 3. Would having disease state management programs within a PBM accredited by national accrediting agencies meet the CMS pending requirement?

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Part J: Coordination Under Part D Plans with Other Prescription Drug Coverage

Summary: CMS intends to implement section 1860D-11(J) OF THE Act at 423.464(a) of the proposed rule and require sponsors of Part D plans to coordinate with State Pharmaceutical Assistance Programs and other drug plans. In this section, CMS specifies the other plans with which Part D plans must coordinate benefits

Part J: Coordination Under Part D Plans with Other Prescription Drug Coverage		
FR Page #	***Excerpt***	***Comment/Question***
46696 J. 1.	"Whenever we mention or reference Part D Plans, we mean any or all of MA-PD plans, PDPs, and fallback prescription plans. Likewise th term Part D plan sponsor refers to MA organizations offering MA-PD plan, PDP sponsors, and eligble fall back entities offering fallback plans. "We propose to implement sections…of the act….of proposed rule and REQUIRE sponsors of Part D plans to coordinate with State pharmaceutical assistance programs and other prescription drug plans…..we specify the other plans with which Part D plans must coordinate benefits in accordance with section 1860D-24(b) of the Act and define SPAP in accordance with….	Coordination of Benefits will pose a unique challenge to PBMs functioning as contractors or subcontractors at risk or with MA-PDs. The scope of the proposed COB providers contributions to the TrOOP is daunting and will require significant IT investments by CMS or its contractor to support the process. We strongly recommend that CMS pursue Option 2 to provide a single point of contact option and requiring primary and secondary payers send required data to this source.
466697 J.2.	We will waive the pharmacy network access requirements described at 423.120(a)(3) of the proposed rule in the case of an MA-PD plan that provides access (other than through mail pharmacies) to qualified prescription drug coverage through pharmacies owned and operated by the MA organization if we determine that the organization's pharmacy network is sufficient to provide comparable access for enrollees under the plan.	We have clients who own and operate their network of pharmacies who would qualify for the waiver. We encourage provision of such waivers where ever and whenever applicable to qualified MAs.
466698 J.4.a	**"** a. Employer Group Waivers**….**extends the waiver authority that is provided for MA organizations related to part C…of the Act and implemented at 422.106(c) to prescription drug plans related to Part D.	We will need to work closely with our MA plans as well as our direct employer group clients to assure that the appropriate waivers are captured and that the coordination of wrap around benefits are appropriately designed and reviewed for 2006. We will need to develop IT systems and reporting to provide needed data to allow employers to capture tax subsidies for enhanced and wrap around programs. We will need to examine every aspect of Part D to assure that employers optimize their retiree Part D investments.

Part J: Coordination Under Part D Plans with Other Prescription Drug Coverage

FR Page #	*Excerpt*	*Comment/Question*
46699 J.5.	5. Medicare Secondary payer Procedures. ..provides that an MAS organization may charge or authorize a provider to seek reimbursement for services from a beneficiary or third parties to the extent that Medicare is made secondary payer under section… 6. Coordination of Benefits with Other Providers of Prescription Drug Coverage "c. Pharmacy dispensed drugs covered by Part B…are NOT reimbursed unless the pharmacy has a Medicare supplier number; thus a beneficiary could lose Part B coverage by filling a prescription at the wrong pharmacy. 1. Encourage Part D plans to enroll pharmacies with Medicare supplier numbers. 2. Encourage part D plans to inform beneficiaries whether their network pharmacies have Medicare supplier numbers… 3. Develop educational materials reminding pharmacies without Medicare supplier numbers that they must refund any payments collect from beneficiaries enrolled in Part B for part B drugs unless they first notify the beneficiary (through an advanced beneficiary notice (ABN) that Medicare will likely deny the claim."	Network pharmacies have no way of knowing whether beneficiaries are receiving Part B drugs incidental to an office visit unless advised as such by the patient. Education materials from Medicare should provide this information. Likewise, network pharmacy staff will need to inquire of their patients when DME drugs, immunosuppressive drugs, and oral anti cancer drugs are prescribed for Medicare beneficiaries. This is a major area of concern for coordination of benefits. PBMs planning to be Part D contractors or subcontractors will need to begin communicating with their participating pharmacies months in advance to urge filing for Medicare supplier numbers. Network contracts may need to be revised to require having such to be a participating pharmacy in the forthcoming Medicare Part D networks.

Part J: Coordination Under Part D Plans with Other Prescription Drug Coverage

FR Page #	*Excerpt*	*Comment/Question*
46701 J.6	User fees for data transmission	Recommendation on User fees for the transmission of COB information: • Need to determine this for accurate Administration expenses. If the determination of the transmission fees is after the submission of Applications, then allowances should be considered once this is finalized. • For more accurate Administration expense calculation, a flat fee would be the best alternative. If transmission volume is used, it will be a variable expense, and adversely affect those entities that service large utilizing populations. It will also entail more accounting and administrative effort for verification and auditing. • Recommendation for fee billing is quarterly to reduce administrative overhead. • Payment method should be the discretion of the entity that performs this service (see Comment below for the recommendation on Option 2 for TROOP coordination).
46705 J.6.e.	Tracking True Out of Pocket (TrOOP) Costs	We support the notion of Option 2 where CMS would procure a TrOOP facilitation contractor to establish a single point of contact between payers, primary or secondary. We believe that PBMs do not have the IT systems nor corresponding NCPDP standards in place to coordinate benefits from the wide range of entities offering some degree of prescription drug coverage which count as incurred costs to reach the annual limit. The law requires the system to be in effect January 1, 2006. We urge CMS to proceed in developing the business requirements and seeking bids from contractors to provide the single point of contact services essential to the success at the POS as well as for CMS financial process requirements. Advantages of Option 2 are: • TROOP information can be sent from all entities involved to a single point of contact using one standard record transmission format. The alternative is an administration impossibility. • Facilitator can manage all information to be available to all Part D entities (one single data repository). Facilitator can manage billing for transmission fees effectively. The alternative would be difficult to manage if information transmission fees were imposed.

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Part M: Grievances, Coverage Determinations, and Appeals

Summary: We are required to have grievance procedures in place. We are also required to have an exception process for non-formulary drugs and tiering of drugs. The non-formulary process appears to be consistent with our current non-formulary exception process, but the exception process for tiers may be more complicated. We are also required to have an appeals process.

Part M: Grievances, Coverage Determinations, and Appeals		
FR Page #	***Excerpt***	***Comment/Question***
46718	*Appeals process for non-formulary drugs* "In addition, section 1860D-4(h)(2) of the Act specifies that appeals, involving coverage of a covered Part D drug that is not on a PDP's formulary, are permissible only if the prescribing physician determines that all covered Part D drugs, on any tier of the formulary for treatment of the same condition, would not be as effective for the individual as the nonformulary drug, would have adverse effects on the individual, or both"	1. PRIOR AUTHORIZATION processes currently in place would allow the review of denied claims. The PA process assures that the MCO MA will have final approval authority. Existing policies and procedures should suffice or have minor changes to adapt to the rules. Physicians may request PA at this time if only a non formulary drug meets the clinical requirements.
46720	*Exceptions to tiered-cost sharing structure* "…a PDP sponsor must establish an exceptions process that addresses each of the following sets of circumstances: (1) The enrollee is using a drug and the applicable tiered cost-sharing structure changes during the year; (2) the enrollee is using a drug and the applicable cost sharing structure changes at the beginning of the year; and (3) there is no preexisting use of this drug by the enrollee." "…Thus, in §423.578(a)(2) we have proposed a limited number of elements that must be included in any sponsor's exception criteria: (1) A description of the process used by the PDP to evaluate the physician's certification; (2) consideration of the cost of the requested drug compared to that of the preferred drug (3) consideration of whether the formulary includes a drug that is the therapeutic equivalent of the requested drug; and (4) consideration of the number of drugs on the plan's formulary that are in the same class and category as the requested drug. We are also considering requiring a number of other exceptions criteria such as – (1) requiring PDP sponsors to establish a blanket rule permitting continued access to a drug at a given price when there is a mid-year change in the tiering structure;(2)	1. From a broad perspective, efforts to protect the beneficiary from tier changes may or may not be in the best interests of the patient or the program. If P & T makes a decision predicated on scientific evidence that an alternative drug is clinical equivalent and change is without risk, and there are significant cost savings, why would it not be permissible to change the patient through a well organized and managed process? If such a change is possible in the first quarter, the savings to the program achieved from a large volume of prescriptions are denied to the program for 9 months. Exceptions, of course, will be provided pursuant to physician data submittal. However, the tone of the proposed rules suggests that patients may be grandfathered or guaranteed a benefit irrespective of the clinical and scientific evidence supporting the change. We should likewise focus on assuring that the switch may be done legally and with sensitivity. 2. PDPs and MA-PD plans can adjust to the proposed CMS rules. It does not make good sense to negate the effectiveness of acquired discounts that were acquired after P & T approval. Any negotiated discounts will need to be adjusted for limited savings during any given year. For large populations, this could result in significant costs to the program. Cost forecasts submitted to CMS will need to be very conservative and adjusted for these restrictions. 3. The proposal to require patients to try a preferred drug and experience adverse effects before being permitted to resume use of an original drug will

Part M: Grievances, Coverage Determinations, and Appeals

FR Page #	*Excerpt*	*Comment/Question*
	requiring an enrollee who is using a drug that is subsequently removed from the sponsor's formulary or is no longer considered a preferred drug(s) to try a preferred drug(s), and experience adverse effects, before being permitted to resume using the original drug; (3) requiring a sponsor to establish exceptions criteria that are specific to particular classes of covered Part D drugs, such as cholesterol-lowering drugs; and (4) requiring sponsors to give enrollees an opportunity to request exceptions to a plan's tiered cost-sharing structure other than on a case-by-case basis. Additionally, we contemplated the possibility of establishing criteria for the review process used to evaluate plan formularies and tiering structures, and developing exceptions criteria are specific to classes of covered Part D drugs." "Like for tiering exceptions we are proposing that enrollees be required to request reconsideration by an independent review entity (IRE), as opposed to having these cases automatically forwarded to the IRE."	be very instrumental in helping our drug use management efforts. However, I have concerns that such a requirement diminishes physician judgment in determining the best medication for a given patient. In many cases, administratively requiring a patient who is taking a certain medication to try an alternative for the purposes of eliciting an adverse drug effect does not seem to be in the best interest of the patient. In addition to adverse effects, a particular drug may be ineffective for a given patient, which would be another appropriate reason to use an alternative drug 4. We can develop class specific exception rules. However, it seems to make more sense to have broad rules that are applicable across all drug classes. Please also consider that the Medicare book of business will be approximately 10-20% of our entire business as we still enjoy a large commercial segment of lives. We would like to keep singular policies and procedures to the degree possible. If we find that the CMS proposals make better sense across the board, we would certainly have no reluctance to propose them to our commercial clients. 5. The notion of an IRE is unique to PBMs who work closely with the Plan Sponsor to assure appropriate accessibility and reconsideration. We concur that it is not needed to automatically send all appeals to an IRE, BUT to have the enrollee request as such. However, we are likewise unfamiliar with the impact of an IRE process on the relationship between the enrollee, its health plan (MA) and the physician. Also, a work flow path would need to be developed such that the decision of the IRE is transmitted to the MA-PD, PDP, PBM in a timely manner. The appeal of tiers as well as drugs is an interesting notion that seems founded upon the assumption that all switches are predicated purely on cost without due consideration for quality. The draft of the CMS rules suggests that PBMS need to be able to utilize all its tools and technology to achieve best possible prices and cost management. Conversely, there are rules designed to offset those gains in an effort to protect the beneficiary. We suggest that CMS may safely assume that PBMs are focused on serving the needs of large populations and are sensitive to the potential negative impact of population based decisions on a very small percentage of individuals within that population. Please do not promulgate rules that compromise the value of the contribution to the vast majority of beneficiaries and to the overall program. 6. For the purposes of tiered cost sharing, we should clearly define the tier for single-source generic drugs (i.e. brand vs. generic copays?). Older generic

Part M: Grievances, Coverage Determinations, and Appeals		
FR Page #	***Excerpt***	***Comment/Question***
		drugs may become single-source if all other manufacturers elect to discontinue production due to low use.

Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Subpart Q: Guaranteeing Access to A Choice of Coverage (Qualifying Plans & Fallback Plans)

Summary: This section discusses the beneficiary's right to have access to a choice of at least two plans; the requirements and limitations on the bid submission; review and approval of fallback prescription drug plans; contract requirements specific to fallback plans; and the determination of enrollee premium and our payments for these plans.

MedImpact Healthcare Systems Inc, Comments for
Medicare Prescription Drug Benefit Proposed Rules Review: File Code CMS-4068 P

Subpart Q: Guaranteeing Access to A Choice of Coverage (Qualifying Plans & Fallback Plans)		
FR Page #	***Excerpt***	***Comment/Question***
46732 528	"…eligible fallback entity….meets all the requirements to be a PDP sponsor (except that it does not have to be capable of withstanding potential financial losses as a licensed risk bearing entity) and does not submit a bid under the risk bidding process for any PDP region for the first year of that contract period. An entity would be treated as submitting a bid under the competitive bidding process, and thus not be an EFE, if the entity was acting as a subcontractor for an integral part of the drug benefit management activities of a PDP sponsor that is submitting a bid for a prescription drug plan. An entity would NOT, however, be treated as a submitting a bid if it is a subcontractor of an MA organization, unless that organization is acting as a PDP sponsor with respect to a prescription drug plan, rather than offering an MA-PD plan. We anticipate that some eligible fallback entities may contrct with other entities for the performance of some required pharmacy benefit management functions…. As the result of this restriction, in bidding, eligible f allback entities would have decided not to submit either a full risk or limited risk bid in any region (either as a direct contractor, or as a subcontractor for a PDP sponsor) in order to be eligible to submit a fallback prescription drug bid in any region. …applies this restriction in the first year of a contract period.	Please validate and clarify the following: An organization may bid for Fall Back if: (1) No risk or limited risk bid submitted in any region as contractor or subcontractor to PDP. (2) PBM has no risk with MA partner to do MA-PD and NOT a PDP An organization is BARRED from bidding as Fall Back if: (1) Submitted bid to be PDP at risk in any region. (2) Submitted bid to be at risk with MA for MA-PD (3) Submitted bid as PDP subcontractor BARRED AS FALLBACK FOR: (1) 2^{ND} & 3^{RD} Year of contract cycle if bid for 1^{st} year. BARRED FROM RISK BID IF: (1) Wins Fall back in that region, barred for 4 years as risk bidder in that region. (2) Wins Fallback , barred everywhere for 3 year contract (3) Submitted a bid to be fallback plan in 2009, where 2009 is 1^{st} year of multi year fall back contract (4) Already approved as fallback in any PDP region for 2009. (5) Offers a fallback in 2008 for same region for which they would be submitting a 2009 risk bid. (6) Entity acts or will act as subcontractor for fallback plan of another entity. We would encourage CMS to have a most liberal interpretation of the law to encourage competition in the fallback bidding. Risk assumption is not something most PBMs would consider. However, PBMS have many MCO and MA clients who are considering entering the market as MA-PDs. Some MAs may request the PBM subcontracted to provide PD services to undertake some degree of risk. Thus, it would appear that this would preclude that PBM from being a fallback even in a different region. While the bidding process is geared to prevent the need for fallback, it may be wise to keep options open-especially since the number of Regions for Part D has not yet been determined.

Issue Areas/Comments

GENERAL

GENERAL

Pls see attached comments

CMS-4068-P-1221-Attach-1.doc

Dear Sir or Madam:

Vital Care Home Infusion Services is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Vital Care is a system of individually owned and operated infusion pharmacies specializing in providing high-tech services to rural and urban patients throughout the United States. With over 120 locations in 14 states, Vital Care can provide fast, efficient, and personalized to patients across the nation. Vital Care is based in Meridian, Mississippi and has been treating infusion patients since 1986. To date, Vital Care has treated approximately tens of thousands of patients. Vital Care was established for the purpose of providing a comprehensive scope of high-quality infusion therapies for stabilized patients in the home setting.

Vital Care appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home

administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B *has not resulted in additional access to home IVIG under Medicare*. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS "S" codes, already used by commercial and Medicare managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payer sector. We recommend that CMS reference the National Home Infusion Association National Definition of Per Diem for a list of the products and services included in the home infusion per diem, available at http://www.nhianet.org/perdiemfinal.htm.

CMS should establish **specific requirements for prescription drug plans to contract with sufficient numbers of infusion pharmacies** to ensure adequate enrollee access to home infusion therapy under Part D.

CMS should require **specific standards for home infusion pharmacies** under Part D. The national accreditation organizations' standards for infusion therapy reflect the community standard of care for the provision of home infusion therapy, which far exceed the OBRA 1990 standards established for retail pharmacies.

CMS should adopt the **X12N 837 P billing format** for home infusion claims under Part D so as to be consistent with the format that private sector health plans use for infusion claims.

CMS should **mandate that prescription drug plans maintain open formularies for infusion drugs** to ensure that this population of vulnerable patients has appropriate access to necessary medications.

Thank you in advance for your consideration of these important issues.

Sincerely,

Johnny Bell
President/ Owner

CMS-4068-P-1222-Attach-1.doc

Toledo IV Care is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Toledo IV Care is an independent home infusion company based in Toledo, Ohio. We have been providing quality home infusion to patients for over a decade. Our patient/customer satisfaction scores for 2003 averaged 96.5%. Our services include a wide range of infusion medications that are acceptable to administer in the home care setting.

Toledo IV Care appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). Issue Areas/Comments

GENERAL

GENERAL

CLINICAL SPECIALTIES, INC (CSI) is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

CSI is in our 17th year of operation, with two locations in Ohio, Cleveland and Columbus, both of which are JCAHO accredited. We are a statewide independent provider of infusion therapy services, and a Medicare provider since 1988. We have access to payor contracts representing 7 million lives in Ohio. In addition to Medicare, Medicare Managed Plans, Ohio Medicaid, Pennsylvania Medicaid, Kentucky Medicaid, Michigan Medicaid, Indiana Medicaid, and the Ohio Bureaus of Workers Compensation representing over 90% of all lives in Ohio. We maintain an overall patient satisfaction of 99%, whereby written survey 99% of our patients say they would use our service again. CSI is currently providing over 4,000 courses of infusion therapy annually.

As President of CSI, and as a pharmacist practicing in infusion therapy field for the last 21 years I would like this opportunity to present my concerns regarding compensation for our services under the new Medicare Part D benefit. The dilemma is that while it is significantly more cost effective to treat infusion therapy patients in the home rather than in the hospital, what is the level of care needed to insure a safe and effective course of treatment, and how to compensate for it. Today an infusion therapy pharmacy bridges the care from the acute care setting to the home and there are many challenges that can be associated in the transition.

HISTORICAL PERSPECTIVE

During the 1980?s many of the commercial payors provided compensation for these services at a relatively high level, justifying the ?savings? as compared to a hospital stay. As providers became more experienced in providing these services, and as more providers entered this market, rates for services dropped dramatically, primarily due to competition. Accordingly, many providers exited from this market.

LEVEL OF CARE AND PATIENT OVERSIGHT NEEDED

In evaluating any compensation schedule, there is a need to look all components. In as such, home infusion unique because it does involve home nursing services (already compensated for under Medicare Part A, thus not necessary to be included), Home Medical Equipment, in the form of IV poles and infusion devices, generally covered as a Medicare Part B benefit, provided it is an `approved? therapy (and as such does not need to be compensated for under Medicare Part D. Also included in the services are various supplies, dispensing services, clinical monitoring services, care coordination services and numerous other pharmaceutical/patient `need? services to assure a safe and uneventful (adverse events can range from under or overdosing of therapy to re-hospitalization or treatment failure?it is rare for patients to report suffering extensively due to rather close monitoring that does occur in this field) course of treatment! In addition, there needs to be:

1) Tight coordination between all professionals to ensure a successful start of therapy,
2) On-call services, 24 hours, 7 days a week by all clinicians,
3) Patient initial instruction and on-going interviews to assure appropriate progress in the treatment regimen and in assuring patient involvement and compliance, once again to prevent treatment failure, identify adverse reactions early or to prevent re-hospitalization!

While simply stated above, these services are not easily performed at home, as you no longer have a controlled environment, such as a hospital or skilled nursing facility! As one would imagine, other administrative and support costs need to be considered.

Issues 1-10

COST AND UTILIZATION MANAGEMENT, QUALITY IMPROVEMENT, AND MEDICATION THERAPY MANAGEMENT

OVERSIGHT OF PROVIDERS

? JCAHO, CHAPS, AAHCA or other accreditating body
? State Boards of Pharmacy. In our case, Ohio, Michigan, Indiana, Kentucky and Pennsylvania
? The Drug Enforcement Agency (DEA)
? OSHA
? CMS
? State Medicaid Programs
? USP 797 Standards, which may dramatically affect our ability to maintain our cost structure we currently operate under

CSI appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both MMA itself and CMS?s proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggest an interpretation of the Part D benefit to include not only the drugs that can be administered in patients? homes but the essential services, supplies and equipment that are integral to the provision of home infusion therapy (?dispensing fee option 3? as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage (?MA?) plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important ?demonstration project? of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

? Dispensing fee options 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS ?S? codes, already used by commercial and Medicate managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payor sector.
Thank you for your time and consideration!

Issue Areas/Comments

GENERAL

GENERAL

Dear Review Committee,

This letter is from a concerned indivdiual living with HIV. I am fortunate to work full-time and have insurance that covers the medical care and needed prescriptions to manage living with HIV disease. However as a previous member of the St. Louis Ryan White Title I Planning Council, I was made aware of the potential changes to Medicare Prescription Drug Benefits and found myself extremely worried. Worried that individuals living with HIV/AIDS who qualify for Medicare or Medicaid are among the sickest and poorest of people living with HIV/AIDS, may no longer receive the quality of treatment previously afforded them. For many Medicare/Medicaid represented the last best option for their survival. Being among the sickest and poorest also means that they may be more susceptible to opportunistic infections and viral mutations. This puts them in a great need for various treatments. Not allowing such an indivdiual full access to avaialble treatments would be disappointing, especially in an error when many believe that more attention is being payed toward the Third World, than people in need treatment access right in the United States. Insuring that US citizens have access to needed treatment does not negate our responsibility to the world, but lets make sure we take care of our own. Please make whatever adjustments to this Prescription Drug Benefit Plan that are needed to insure that individuals currently receiving Medicare/Medicaid do not receive less benefits than they currently do and that new enrollees may have access to the best treatment option available for them. Shouldn't the treatment option best for the client be left to the client and the treating physician?

Respectfully,

Lawrence Lewis

Submitted to http://www.cms.hhs.gov/regulations/ecomments

Re: CMS-4068-P (Proposed 42 C.F.R. parts 403, 411, 417 & 423). 69 Fed. Reg. 46632, 8/3/2004.

Dear Sir or Madam:

This letter constitutes our comments on the Medicare Modernization Act and the proposed rules cited above. Also attached are three other papers which have been previously distributed that elaborate on some points addressed in this letter. This letter with attachments is being submitted electronically to www.cms.hhs.gov/regulations/ecomments as a Microsoft Word document. The submission was made before the deadline of 5pm on October 4, 2004.

1. **II.B. Eligibility and Enrollment, Paragraph 6 "Disenrollment by the PDP (§ 423.44)" 69 Fed. Reg. 46641-42**

Comment: Can you tell if the same individual is enrolled in more than one plan (either PDPs and/or MA-PDs). If you cannot make this determination, the potential for fraud or abuse arises.

The legal concept of 'residence" depends in large part on where the individual "intends" to reside. Perhaps other agencies, e.g., the IRS, already have a definition of "residence" that could be adopted by CMS.

2. **II. B. Eligiblility and Enrollment, Paragraphs 9 "Approval of Marketing Materials and Enrollment Forms (§ 423.50)" 69 Fed. Reg. 46643.-44**

Comment: The taxpayer is paying for drugs and drug management, not marketing of other services. Permitting PDP sponsors to mix prescription drug services and other business ventures targeted to enrollees could be asking for trouble. Additionally, it could confuse enrollees. The new drug benefit is confusing enough. The PDP sponsor should focus on one thing – drug management – and make that efficient and economical.

3. II.D.2.a & b. Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans. 69 Fed. Reg. 46666-67

Comment: Minimum Utilization Standards

You asked whether there were "industry standards" and whether CMS should adopt them for all utilization management programs. We think you are the responsible entity for setting minimum standards for all plans. It bears repeating that regardless of "industry standards" heath care costs, and particularly drug costs, continue to escalate to record highs. At the same time, the quality of American health care is lower than that enjoyed by Canadians or Europeans and at a cost much less than ours. The reality is that the government is going to pay billions of dollars for drugs. Relying on "transparency" and information on price discounts to motivate plans to "innovate and adopt the best techniques available" is uncertain at best. We suggest you can do better. On behalf of taxpayers, exercise responsible leadership and impose minimum standards that foster cost-effective utilization management programs.

Section 1860D-(c)(1)(A) provides that utilization programs must include incentives to reduce costs such as use of multiple source drugs, but does not preclude the Secretary from imposing other standard elements of utilization management. The regulation should mandate certain *minimum* utilization standards that must be implemented by all plans.

Specifically, we urge you to mandate one basic requirement for all utilization programs; namely, that the *prescription must include the diagnosis or diagnoses for which the drug is prescribed; the directions for use (i.e., the "sig" information), the quantity and strength dispensed and, in the case of certain drugs used in complex cases, require prior approval by an individual with special training or specialty certification.*[1]

It is assumed that this information will be electronically managed and available at the time of dispensing the drug.

Imposing this basic requirement is the corner stone for all other edits and reviews that support cost control, quality improvement, medication therapy management, and fraud and abuse detection. Among other things, it will:

- Allow smart drug utilization review (DUR) before the script is filled
- Allow screening for age appropriateness, etc.
- Create a drug record for each patient which can be used for therapeutic evaluation and to target disease management, wellness programs, etc.
- Create a drug record that can be screened for fraud and abuse. *Id.*

[1] See May 2002 *Statement on the National Action Plan to Assure the Appropriate Use of Therapeutic Agents in the Elderly Part 1* by Patricia L. Wilson and Loren G. Lipson, M.D.(submitted to DHHS/OS/OPHS/ODPHP) (copy attached).

Additionally, you could by regulation also impose a few other *minimum* requirements that should be included in all utilization programs[2]. These edits address both safety and fraud issues. Suggested edits include those that:

- Identify the prescribed dosage as more or less than the recommended dosage for a diagnosed condition.
- Correlate the daily or other frequency of dose for the specified period to a specific number of pills/agent, etc. to be covered. (e.g., four pills for a once a week use constitutes 30 day supply).
- Compare the above two (e.g., if one pill a day for 30 days is prescribed, but the recommended dose is two pills a day, the prescription must be checked). These edits will preclude stockpiling or other fraud.
- Identify prescriptions for initial dose versus maintenance doses (to assure that the correct dosage recommendation is followed).
- Identify off- label use such as edits that identify prescriptions for adjunctive agents,
- Identify prescriptions that preclude use of a generic.
- Identify whether the prescriber is licensed in the U.S.
- Are derived from evidence-based guidelines (e.g. "step therapy' or guidelines on clinically preferred drugs) that set either a dollar threshold and/or particular drugs for which prior approval must be obtained and/or utilization monitored.

The regulation should also mandate that utilization programs must identify the specific steps to be taken in the event that the edit is tripped, particularly steps for obtaining justification from the prescribing physician for the prescription. Under current practice for many PBMs, nothing more than a pharmacy override obtained by inputting several computer key strokes allows claims to process at two times the maximum recommended daily dose. This is not an adequate safeguard – nor is it an eligible claim.

The regulation should also require utilization programs to establish specific guidelines for:

- Determining if a drug requiring prior approval or specialist review is a Medicare Part B covered supply and medically appropriate in a particular case. This review should also establish the covered quantity for a specific period of time (i.e., weekly, 30 days, 90 days, etc.)
- Overriding any concurrent drug utilization review edit.

CMS should include in the regulation a provision that it will from time to time publish in the Federal Register a list of drugs susceptible to overutilization or abuse. You can rely on your own Office of the Actuary to identify drug candidates or take input from others who observe questionable utilization. Neurontin[3] is an example of a drug, FDA approved for adjunctive

[2] See October 2003 *Prescription Drug Benefit Management: Improving Quality, Promoting Better Access and Reducing Cost* by Patricia L. Wilson, prepared on behalf of the American Association of Health Plan's (AAHP) (copy attached).

[3] See November 2002 *Statement on the National Action Plan to Assure the Appropriate Use of Therapeutic Agents in the Elderly Part 2 – An Example - Neurontin* by Patricia L. Wilson and Loren G. Lipson, M.D.(submitted to DHHS/OS/OPHS/ODPHP) (copy attached).

therapy for epileptic seizures and postherpetic neuralgia, with excessive utilization. It was prescribed for almost a dozen unapproved off-label uses as a result of questionable non-peer reviewed "clinical" studies and financial incentives to hundreds of prescribing doctors, both paid for by the manufacturer.

Pharmacy and Therapeutics Committees have not been universally effective in setting up cost-effective coverage and utilization management programs. Often they view their job at the population management level. In this instance their guidance must be applied to individual enrollee circumstances. They should be involved, but the payer (you) should have the last word; that means, the authority to review the claims being paid, question any inaccurate or inappropriate payment, and impose specific remedies as appropriate. The regulation should thus specifically reserve CMS' authority to review, assess, and remedy utilization errors.

Comment: Quality Assurance 69 Fed. Reg. 46667

You asked for comments of what elements should be required for a quality improvement program. The proposed regulation fails to mandate minimum quality assurance standards. You should require at a minimum all of the desirable elements discussed at 46667 (electronic prescribing, clinical support, education interventions, bar codes, adverse event reporting, provider/patient education). To state that you do not expect the plans to adopt all of these elements is inexplicable.

Comment: Medication Therapy Management Programs 69 Fed. Reg. 4668-69

Targeted beneficiaries are those who:

- Have multiple chronic diseases
- Take multiple drugs, and
- Are likely to incur annual Part D costs that "exceed a level specified by the Secretary."

You propose not to set the amount of annual costs that qualify for receipt of MTMP services. You state that you do not have sufficient evidence, and assert that the plans would have better knowledge of the patients and therefore should set the amount.

We suggest that if it was intended that plans set varying amounts based on their unique populations, Congress would have said so. Given that this is an eligibility criterion in a national program, we submit that you, as the plan sponsor/financier, should establish the criterion on an even-handed basis that is not dependent on where an individual happens to live. We suggest it is doubtful that you have the authority to delegate the establishment of an eligibility criterion to private entities.

Upon consideration, should you agree with our observations, the question remains as to what you should do. You could review case management data from the Medicaid programs (or other sources) for guidance, and revise the amount as more data is reviewed. However, merely because the plans may have a more direct relationship with enrollees does not assure that they are in any better position to determine what the annual amount should be.

4. II.C.a. Covered Part D Drug, 69 Fed. Reg. 46646-47 (Proposed section 423.100 on Definitions at 69 Fed. Reg. 46815)

Comment: In defining covered drugs, the proposed regulatory definition first begins with the requirement that the supply is used by the enrollee for a medically accepted indication (proposed section 423.100 on Definitions at 69 Fed. Reg. 46815). The term "medically accepted indication" means "any use for a covered outpatient drug approved under the Federal Food, Drug and Cosmetic Act, or the use of which is supported by one or more citations included or approved for inclusion in any of the compendia described in subsection (g)(1)(B)(i)." What this all means is that the enrollee must have an illness or injury and that the use of the drug to treat that illness or injury must be an FDA approved use or a use supported by peer-reviewed, evidence-based literature and referenced as such by an authoritative group that can not be unduly influenced. Past references to sources not meeting these criteria have been removed.

A cornerstone therefore of efficient administration is to have the intended use (diagnosis or Dx) on the script (Rx). We refer to this as Dx on Rx.

An important corollary for efficient administration is to understand clearly what is not covered. For example, just because US Pharmacopoeia has a drug class or category for erectile dysfunction medication does not mean that they are covered. What we know from the exemplary work of the Institute of Medicine (IOM) on the quality of care in America, is that it is not where it needs to be. It urges improvements in systems of care that help physicians' help their patients. At its heart, the functioning of this Medicare Part D benefit can move us forward with a quantum leap or move us backward. Without guidance from those charged with regulatory authority on coverage criteria derived in part by defining what you don't cover (the exclusions), you run the risk of creating a monster that will do less than both seniors and tax payers deserve. Money will be wasted and care compromised. We urge CMS to be more definitive concerning coverage or more specifically exclusions. Let me use Periostat to explain the comments. The Medicare benefit is not a dental benefit. Periodontal treatments are not covered. And, Periostat is used for periodontal treatment. The largest PBMs who will function in this new marketplace (Medco, Caremark, Express Scripts) do not think as insurance companies or at-risk providers. As such, without guidance, a Periostat drug claim submitted will be a paid claim. Other functionaries such as Aetna and Prescription Solutions have background as both insurers and at-risk providers and as such are likely to do as inferred by failing to cover dental benefits under Part A and B and exclude Periostat under Part D. Beneficiaries in different parts of the country should receive the same treatment with respect to statuary exclusions. Without guidance from you, it will not happen.

The US taxpayer will pay much of the bill and guidance on coverage (meaning an eligible *and* ineligible claim) should be given by CMS as the plan sponsor/financier. It should not be left solely to a PDP or MA-PD.

Under a recent settlement involving Medicaid fraud between Pfizer and the US Attorney of Massachusetts, Neurontin claims for other than seizures (as adjunctive therapy) or for the pain associated with shingles were deemed fraudulent claims. In a Pharma Audioconference on June

23, 2004 (*Lessons of the Pfizer Settlement for Off Label Promotion – Compliance Issues and Practices*), referenced under comments with number 3 above, the Assistant United States Attorney for Massachusetts confirmed that the only legitimate Medicaid claims were for the 2 FDA approved uses - not the 80% of off-label use. While this case is an egregious one, it is not all that uncommon.

5. II.C.4.b Formulary Requirements, 69 Fed. Reg. 46659-60 (proposed section 423.120(b), 46 Fed. Reg. 46818-19) and Section 1860 D-4 (b)(3)(c)(ii) Beneficiary Protections for Qualified Prescription Drug Coverage

Comment: A formulary (a.k.a. preferred drug list) can serve several purposes:

1. It can address plan design in two ways:
    - To limit plan coverage to drugs on the list, unless a patient has gone through a review process to determine coverage eligibility,
    - To provide lower patient co-payments for formulary, and correspondingly, a higher patient share for non-formulary drugs.

    The first approach is what is commonly referred to as a "closed formulary" - limiting prescription coverage to only formulary medications – with the exception that if the listed drugs are not effective for the patient, a non-listed drug becomes preferred. The "preferred' approach (second alternative) differentiates the patient's share of prescription costs - with patients responsible for a higher share of covered, but non-formulary medications.

2. It can be a tool to help both physicians and patients select appropriate and cost-effective medications when there are multiple similar ("me too") medications available

As required by the statute, you have asked US Pharmacopoeia to develop categories and classes of prescription drugs that constitute a model guideline for formulary development. Their proposed guideline is now in the comment phase. However the charge and the model formulary guideline only addresses plan design (item 1 above). It does nothing to address item 2 above, the concept of which is implied under the "protection" title heading.

We encourage you to extend the concept of a model guideline for formularies to include, as a minimum, the following additional information:

- Notations about inappropriate use if a senior, a child or pregnant
- Notations when dose reductions should occur for seniors
- Notations where prior authorization is required to receive coverage since not all drugs on the formulary are covered for all individuals in all circumstances
- Notations about cost typically done currently by a relative ranking notation system.

A PDP or MA-PD could vary what notations apply to which drugs just as it changes which drugs are on or off the formulary. The PDP or MA-PD could also choose to use no notations, but would not be subject to the safeharbor treatment. What CMS does however is to encourage your intermediaries to give useful information to beneficiaries and physicians.

In addition, a truly useful formulary - one that helps both physicians and beneficiaries with care options - may also contain additional information including the best practice guidelines recommended by the body of experts for a specific condition such as hypertension, elevated cholesterol, mild, or moderate or severe asthma. For example, for hypertension, the 'preferred' drug list might show treatment recommendations from The Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC7). The explanations could be detailed including various degrees of hypertension (mild to severe), and with or without other conditions (diabetic, previous heart attack, etc.).

The rules as they are now proposed are strict for modification to a formulary. But the concept of formulary envisioned included the list of drugs covered under the formulary and not the expanded notion of appropriate use parameters that should be contained in the formulary. Therefore the proposed requirement that a formulary can only change once a year and then only with proper notice should be limited only to the drugs named on it. Changes about appropriate use can and should be made more frequently as evidence-based information presents itself. As an aside the requirements for an annual event change in the formulary must be modified to accommodate changes such as the removal of Vioxx from the marketplace because of increased health concerns. This could be either and FDA mandated withdraw, or a manufacturer-directed recall.

While time has not permitted us to fully review your proposed regulations, we hope these initial comments are both intelligible and useful. Should you have any questions, please call (610-519-0602).

Sincerely,

Patricia L. Wilson

Executive Summary

As the Medicare conferees work towards a Medicare prescription drug benefit proposal for Medicare-eligible beneficiaries, it is important to reemphasize the tools that can improve the quality of care while protecting seniors from the high cost of prescription drugs. In this report, we focus on past and current programs to highlight pharmacy benefit management techniques that accomplish these important goals.

- ***Escalating prescription costs are particularly problematic in programs that do not utilize benefit management techniques. This is especially true for and in senior populations.*** It is important to understand the value of management of prescription drug benefit plans. This report uses data from the recently released Families USA study – *Out-of-Bounds: Rising Prescription Drug Prices for Seniors.* The study is based on the experience of the Pennsylvania Pharmaceutical Assistance Contract for the Elderly (PACE), a program that does not fully utilize prescription drug benefit management techniques. And specifically, we use PACE data to show how the use of a variety of management tools can reduce costs substantially while improving quality of care.

- ***Pharmacy management tools lower costs and improve access and improve quality of care.*** To illustrate the value of these management tools, prescription drug examples were chosen based on drug utilization data for the top 50 drugs under the PACE program and practices prevalent with marketplace innovators. Examples include:

  - *Step-therapy*. Step-therapy is used to ensure patient safety and reduce cost by placing the focus on drug value. This tool promotes use of proven therapies first before moving to newer, but not necessarily better and almost always more costly treatments. It aids doctors in focusing on what others recognize as appropriate, first-line care, rather than the drugs most recently advertised and promoted through pharmaceutical company sales efforts.

    Plavix, an anti-platelet agent, is an example. Common aspirin has been shown to be clinically equivalent to Plavix. Extensive marketing has made Plavix the fourth most utilized drug on PACE list, with annual charges of over $1,500 per user. If Plavix is made a non-formulary drug subject to prior authorization, patients are protected from the risk of potentially dangerous side effects and significant cost savings are achieved.

  - *Competitive pricing and care enhancements*. By negotiating dispensing rates and prices at retail pharmacies and limiting coverage to prescriptions filled at preferred network pharmacies, managed prescription drug benefit plans have generated significant savings. Consequently, any willing provider mandates will decrease the ability to develop a high-quality network at the lowest cost.

  - *Promotion of clinically preferred drugs*. New practice guidelines released by the National Institute of Health/National Heart Lung Blood Institute's Joint National Committee on Prevention, Detection, Evaluation and Treatment of High Blood Pressure (JNC7) indicate diuretics (at less than $100 per year) as the preferred treatment for those

with uncomplicated hypertension – producing better outcomes than new medications. Yet diuretics are at the bottom of the PACE/Families list in terms of utilization. ACE inhibitors are not even on the list, and they are first-line therapy for those patients recovering from heart attacks. Using the PACE data, the use of these alternative drugs could produce potential savings ranging from $95 to $308 per person per year.

- ***Pharmacy management tools are critical to reducing medication errors.*** Pharmacy management tools and technology can and should be used to reduce errors and support health care practitioners.

- ***Pharmacy management tools are necessary to increase use of equally effective but lower cost products such as generics.*** With the advent of direct-to-consumer advertising of prescription drugs and more sophisticated pharmaceutical marketing to physicians, plan design and tools are necessary to provide incentives to use equally effective, but lower cost products.

- ***Pharmacy management tools include an integrated mail service pharmacy that reduce costs through greater efficiency.*** Mail service prescriptions are an integral part of the managed pharmacy system. The patient benefits from 90-day prescriptions for maintenance (long-term) medication delivered directly to their home. Beneficiaries appreciate the cost savings and the enhanced quality resulting from efficient delivery systems. Under PacifiCare's Prescription Solutions program, costs savings of approximately 14%, or an average of $146, per year using mail service instead of retail pharmacies for a brand-name drug were realized. The General Accounting Office (GAO) has also confirmed the cost savings due to pharmacy benefit management techniques. In the January 2003 study of the Federal Employees' Health Benefits Program, the GAO concluded that the average mail-order price was 27% lower for brand-name drugs and 53% lower for generic drugs than the average cash-paying customer price. The PACE Program could reduce drug cost by 10% if using competitively priced mail service pricing - and dispensing fees with only 60% of brand-name drugs switching from retail.

- ***Expanding Pharmacy management technological tools are key to the management of health care.*** Pharmacy benefit managers are proficient in developing, installing, communicating, and maintaining complex prescription drug benefit structures for large groups of beneficiaries. While capabilities are expanding, costs are declining.

  As shown above, by effectively managing the drug benefit, the government can spend less and improve integrated health care for Medicare beneficiaries. If PACE used all of the marketplace innovator tools, it could cut costs by 40%. Additionally, better management of prescription drugs can help reduce medical expenditures, including hospitalizations and emergency care due to adverse drug events. Proven management tools will help the federal government provide a more valuable prescription drug benefit and improve the quality of life for Medicare beneficiaries.

Acknowledgments

Associates & Wilson wishes to acknowledge the many people and organizations that made this report possible. First and foremost we thank the American Association of Health Plans (AAHP) and its members for giving us the opportunity to present ideas to important decision makers at a time when the United States is moving forward on healthcare policies. What happens this fall, as Congress works to reconcile differences in the bills passed by the House and Senate, will have far-reaching effects on both the national economy and the healthcare of older Americans.

Special thanks goes to marketplace innovators listed in this report as well as all those who are committed to improving care quality. To complete this report we drew upon their ideas and the words they wrote. We encourage all to read the thoughts of others referenced in the "For more information" sections that appear throughout the report.

In addition, we would like to acknowledge Loren Lipson, M.D. for generously contributing his time and expertise during our lifetime collaboration on retiree healthcare improvements.

Introduction

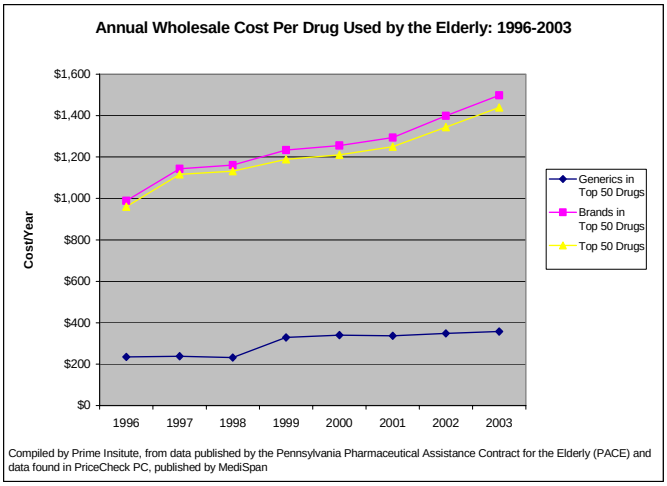
In July 2003, Families USA published a report entitled *Out-of-Bounds: Rising Prescription Drug Prices for Seniors* using data from the Pennsylvania Pharmaceutical Assistance Contract for the Elderly (PACE) program. Focusing on the 50 drugs most frequently used by this elderly population (See Exhibit 1), the findings include:

- Prices rose 3.4 times the rate of inflation in 2002.
- On average, prices for generics rose less rapidly than brand-name drugs while generics also cost significantly less. It is important to note that there is significant variability in price increases between drugs.
- Only 15 of the 50 most frequently used drugs were generics.

The PACE program has been suggested as a model for a Medicare drug benefit, but the program does not use most pharmacy benefit management techniques. This paper focuses on the drugs highlighted in the Families USA report to show how the use of prescription drug benefit management tools developed by marketplace innovators can reduce cost substantially while improving the quality of care and safety for beneficiaries.

The PACE Program as an Example

The *Out-of-Bounds: Rising Prescription Drug Prices for Seniors* report recently published by Families USA provides useful information about the cost of medications taken most frequently by seniors.
The report is based on the drug market basket for the Pennsylvania Pharmaceutical Assistance Contract for the Elderly (PACE) with information compiled by the PRIME Institute at the University of Minnesota.



- PACE has been a leader in many pilot and research projects, yet it uses few of the pharmacy benefit management tools used by a variety of other organizations to manage health care quality and cost.

If PACE used all of the marketplace innovator tools, it could cut costs by 40%.

- The outlook for increased use of pharmacy benefit management tools is promising. On May 29, 2003, the Pennsylvania Governor's Office of Health Care Reform and the Management and Productivity Council announced several changes to the PACE program that will focus on negotiating more competitive drug prices.

For more information:
- Visit www.familiesusa.org for a copy of publication No.03-106.
- Visit www.aging.state.pa.us/aging/lib/aging/pace_01annl.pdf for a copy of the Annual Reports to the Pennsylvania General Assembly for the PACE program.

The PACE program provides limited prescription coverage for low to moderate income older Pennsylvanians. Its sister program PACENET (Pharmaceutical Assistance Contract for the Elderly Needs Enhancement Tier) extends coverage to a higher income levels with somewhat different copays but subject to the same management features. Established in 1984, with an on-line claims adjudication system implemented in 1991 and the addition of PACENET in 1996, PACE is the largest public pharmaceutical program for seniors. Some key design features include:

- Predominately uses independent and chain pharmacies. Pharmacies who deliver by mail including retail stores who register as mail service providers must enroll and meet special requirements
- Supplies limited to 30 days or 100 pills - whichever is less.
- $6 copay per script for PACE and $8 for generics and $15 for brand-named medications for PACENET.
- Generic substitution for multi-source brands is required wherever there is an FDA A-rated generic.
- Specific prospective drug utilization review criteria are used for the maximum initial dose, the maximum daily dose, and the duration of therapy or duplicate therapy. In order for reimbursement to occur under the program for any claim subject to a prospective drug utilization message, the physician or the pharmacist must document the medical necessity.

Important Factors in Healthcare Delivery

Disease Management Programs

Education, compliance programs, and the avoidance of drug interactions contribute to improved quality of care. Pharmacy Benefit Managers (PBMs) have been involved in many successful disease management programs designed to improve compliance with specific pharmaceutical regimens, such as treatments for beta-blocker therapy post acute myocardial infarction, and depression treatment. For example, asthma education programs can improve care by fostering the use of effective anti-inflammatory drugs and other long acting medications. A recent study by Merck-Medco found that overall health care costs were decreased, mainly due to decreased use of asthma inhalers (short-acting beta-agonists)[1]. Other studies confirm this and document the reduction in emergency visits and hospitalizations after appropriate interventions[2].

Verizon, together with a pharmacy service organization, has developed a program to identify members at risk of hip fracture or diagnosis of osteoporosis. These patients are then screened for medications that are known to increase the risks of fall, such as painkillers, sleeping aids, and antidepressant drugs. Communications including information on prevention of falls and alternative drug therapies are sent to both the member and physician for consideration. This type of program reduces health care expenditures while improving quality of life for seniors[3].

PBMs can use pharmacy claims data to identify patients as risk for noncompliance and share this information with treating physicians who can use the data to improve care of their patients[4]. Centralized data collection for pharmacy claims can also help prevent potentially harmful drug interactions; AdvancePCS was able to avoid three million potential adverse drug interactions through the use of their on-line process with immediate drug utilization review[5].

Healthcare Quality

Each year, an estimated 44,000 to 98,000 people die from medical errors. That's more than the number of people who die from car accidents (43,458), AIDS (16,516), or breast cancer (42,297). The statistics in recent studies are concerning – 25% of outpatients had an adverse drug event, 13% were serious and 20% were preventable (See Exhibit 2). Seniors are particularly at high-risk. The Institute of Medicine (IOM) suggests a systems-driven solution: "Human beings, in all lines of work, make errors. Errors can be prevented by designing systems that make it hard for people to do the wrong thing and easy for people to do the right thing. In healthcare, building a safer system means designing processes of care to ensure that patients are safe from accidental injury."

Generics
Generics have chemically identical active ingredients, are available from multiple manufacturers, cost less, and are equally effective as brand-name drugs. Marketplace innovators use generics whenever they can and make them the cornerstone of drug classes to deliver cost-effective, quality care. Many employers and state Medicaid plans encourage generic drug use as a part of their fiduciary and management responsibilities. With significant numbers of brand-name patents due to expire in the near future, we expect more plans to get even more aggressive in encouraging use of generics.

Increased Direct-to-Consumer Advertising
The pharmaceutical industry spends billions of dollars each year to market its products. Studies show pharmaceutical advertising is working: the 25 most advertised drugs account for 40% of recent increased spending on drugs. Increased attention to direct-to-consumer advertising encourages employers, states, and health plans to seek value for their money.

Health Plan Focus on Patient Safety and Quality of Care
There has been a significant increase in attention to patient safety since the Institute of Medicine (IOM) released its report, To Err Is Human: Building a Safer Health System, in 1999, highlighting the magnitude of this problem. The IOM report estimates that medication errors account for over 7,000 deaths annually. Incidence rates of adverse drug reactions vary from 2 per 100 admissions to 7 per 100 admissions among hospitals that have conducted such studies according to the Agency for Healthcare Research and Quality.

Health plans believe that patient safety is a critical component of quality of care and actively address patient safety concerns as part of their efforts to improve health care quality. By design, health plans have an infrastructure that can support patient safety. As part of this infrastructure, health plans employ tools that support physicians and other caregivers and systematically identify patients at risk for medication errors, contraindications and pharmacy recall—at the time when the patient goes to the pharmacy and fills the prescription to help to prevent potential problems before patients begin taking the medications. These activities have been purposely created to reach one of the many IOM safety recommendations: implementing proven medication safety practices that include systematic tracking of drug interactions and dosing.

Management Tools – Their Effect

While the PACE program uses some unique concurrent drug utilization review screening techniques, it employs few of the cost and quality management tools used by health plans and other States in their prescription drug programs. Those tools include formularies with designs that either encourage use of a preferred drug or require a preferred drug as first-line treatment unless care would be compromised. Additionally, PACE does not utilize step-therapy or prior authorization, which are both key management tools in health plans. PACE uses retail pharmacies almost exclusively, and the prices it pays to retail pharmacies are substantially higher than payments made by other entities, including employer-sponsored programs or health plans. Another potential opportunity is the substantial savings from mail service efficiencies.

To address the impact of some of these management tools, we have reviewed the drug utilization data for the top 50 drugs under the PACE program and have attempted to quantify, where appropriate, the potential cost savings on a per user basis for:

- the use of an alternative, but equally effective drug
- lower negotiated prices through dispensing pharmacies
- mail service efficiencies

.

The following treatment examples illustrate potential savings using the management tools: cholesterol-lowering statin agents; proton pump inhibitors that are used to treat various digestive disorders; cardiac medications to treat hypertension; Plavix, used to prevent heart attacks; and drugs used to increase bone mass and prevent/mitigate osteoporosis.

A Word about Calculations

Pace/Families USA Reported Annual Cost:
This represents the annual cost of the drug as documented in the July 2003 "Out-of-Bounds" report that was produced by Families USA.

Alternative Annual Cost:
This number was calculated for a drug viewed as an effective therapeutic alternative to the drug used under the PACE program. We used the drug's per pill/capsule Average Wholesale Price (AWP) as reported in the July 2003 Drug Topics Red Book. The per pill AWP was multiplied by either 365 (one pill once a day) or 730 (one pill twice a day). The result was reduced by 13% for a brand or 55% for a generic drug to produce a conservative proxy for a negotiated annual ingredient cost for a retail purchase in a managed health plan for a maintenance medication. $36.00 was added to this discounted ingredient cost to account for pharmacy dispensing and administrative fees.

Negotiated Cost:
This number was calculated for the drug utilized under the PACE program using the drug's per pill/capsule AWP as reported in the July 2003 Drug Topics Red Book. The per pill AWP was multiplied by either 365 (one pill once a day) or 730 (one pill twice a day). The result was reduced by 13% for a brand or 55% for a generic drug to produce a conservative proxy for a negotiated annual ingredient cost for a retail purchase in a managed health plan for a maintenance medication. $36.00 was added to this discounted ingredient cost to account for pharmacy dispensing and administrative fees.

Cholesterol Drugs

The cholesterol-lowering drugs of the statin class are the most prescribed medication for any age group. They are also among the most expensive. The accompanying chart illustrates the PACE usage ranking for the statins. It is important to note that the generic lovastatin (Mevacor) is not on the list of the 50 most prescribed drugs.

Families USA	
Drug Ranking (by claims)	**Drug Name**
1	Lipitor 10mg
8	Zocor 20mg
11	Lipitor 20mg
31	Zocor 40mg
34	Zocor 10mg
38	Pravachol 20mg

Drug management is especially important for this class of drugs, as often, these very powerful cholesterol lowering drugs are prescribed when the patient only needs a 10%-20% drop in LDL cholesterol. Additionally, every cholesterol-lowering statin drug has the potential for serious side effects on liver and kidney function and muscles, and the potential side effects are of great concern for elderly beneficiaries.

This class of drugs represents an exceptional opportunity for step therapy. Since the lowest dose possible presents the lowest risk, step therapy suggests that the patient start with a low dose. After inspecting the results and monitoring any side effects, the physician and the pharmacy benefit manager can move the patient up to a higher dose if necessary. This procedure protects patient health and saves money.

Drug Name	Pace/ Families USA Reported Annual Cost	Alternative Drug	Alternative Annual Cost	Annual Savings Per User
Lipitor 10mg	$871.00	lovastatin 20mg	$425.00	$446.00
Lipitor 20mg	$1,330.00	Lipitor 20mg	N/A	N/A
Pravachol 20mg	$1,124.00	lovastatin 20mg	$425.00	$699.00
Zocor 10mg	$959.00	lovastatin 20mg	$425.00	$534.00
Zocor 20mg	$1,674.00	lovastatin 40mg	$737.00	$937.00
Zocor 40mg	$1,674.00	Zocor 40mg	N/A	N/A

The chart to the left illustrates the cost savings if an alternative drug is used. Conservative savings estimates range from $446 to $937. Lovastatin was not subject to competitive market forces at the time of this data collection; however, it is presently a multi-sourced drug and additional savings can be realized.

Drug Name	PACE/Families USA Reported Annual Cost	Negotiated Cost	Annual Savings Per User
Lipitor 10mg	$871.00	$794.00	$77.00
Lipitor 20mg	$1,330.00	$1,193.00	$137.00
Pravachol 20mg	$1,124.00	$1,014.00	$110.00
Zocor 10mg	$959.00	$871.00	$88.00
Zocor 20mg	$1,674.00	$1,492.00	$182.00
Zocor 40mg	$1,674.00	$1,492.00	$182.00

The annual savings shown to the left are conservative estimates of savings obtained by negotiating rates for retail pharmacy dispensing. Taking advantage of the efficiencies of mail service would reduce costs further.

Proton Pump Inhibitors (PPIs)

Proton Pump Inhibitors (PPIs) reduce acid formation in the stomach, and this therapy is FDA approved for up to eight weeks for the treatment of Gastroesophageal Reflux Disease (GERD) (For more serious but relatively infrequent conditions, use is continuous). However, if the patient is still experiencing GERD symptoms after eight weeks, it may be a sign of a more serious disease. Step therapy programs help identify patients' needs and focus appropriate care based on symptoms and previous experience. A PPI step-therapy program can also be used to recognize and cure stomach problems caused by the bacteria H. pylori.

Families USA	
Drug Ranking (by claims)	**Drug Name**
5	Prilosec
9	Prevacid
26	Protonix
33	Nexium

Actively managed prescription drug benefit plans who utilize step therapy recommend OTC products for occasional heartburn. More severe cases warrant the use of a generic like ranitidine (Zantac) in prescription strength.

Drug Name	PACE/Families USE Reported Annual Cost	Alternative Drug	Alternative Annual Cost	Annual Savings Per User
Nexium 40mg	$1,614.00	Protonix 40mg	$1,282.00	$332.00
Prevacid 30mg	$1,690.00	omeprazole 20mg	$718.00	$972.00
Prilosec 20mg	$1,684.00	omeprazole 20mg	$718.00	$966.00
Protonix 40mg	$1,282.00	omeprazole 20mg	$718.00	$564.00

Step therapy programs can reduce drug spending between 15% and 25% for most classes of drugs while increasing patient safety and reducing potentially harmful side effects.

Omeprazole shown in the table above as a formulary preferred drug choice is the newly approved generic for Prilosec – once the gold standard in the PPI class. As more generic manufacturers are approved, prices will fall. This will produce even larger savings than those shown above, ranging from $500 to more than $900 per patient.

Drug Name	PACE/Families USA Reported Annual Cost	Negotiated Cost	Annual Savings Per User
Nexium 40mg	$1,614.00	$1,430.00	$184.00
Prevacid 30mg	$1,690.00	$1,522.00	$168.00
Prilosec 20mg	$1,684.00	$1,501.00	$183.00
Protonix 40mg	$1,282.00	$1,141.00	$141.00

An additional tool is negotiating more competitive pricing at retail. These are conservative estimates, and actual experience in the competitive market will vary.

Plavix

Plavix is the fourth highest utilized drug on the PACE/Families USA list, with an annual cost of $1,539 per beneficiary. The drug is an anti-platelet agent used for the secondary prevention of an atherosclerotic event. Common aspirin has been shown to be clinically equivalent to Plavix. See Exhibit 5 on page 31 for more information on the drug.

Families USA	
Drug Ranking (by claims)	**Drug Name**
4	Plavix 75mg

Management tools in PACE could reduce cost of Plavix by about $8 million – or 2% of its *total* program drug costs.

Plavix use in actively managed prescription drug plans is typically limited to patients who have pre-existing cardiovascular problems such as stent placement, heart attack or stroke, or patients who are allergic to aspirin.

Typically, in a plan that utilizes benefit management techniques would classify Plavix as a non-formulary drug that requires prior authorization. This system protects patients who do could achieve equal health benefits with aspirin from the risk of potentially dangerous side effects.

Additionally, lower negotiated prices at retail pharmacies would save the taxpayers and beneficiaries an additional $214 annually, if Plavix is taken continuously. Mail service efficiencies could decrease annual drug costs by an additional $100.

Drug Name	PACE/Families USA Reported Annual Cost	Negotiated Cost	Annual Savings Per User
Plavix	$1,539.00	$1,325.00	$214.00

Bone Building Drugs

Families USA Drug Ranking	Drug Name	Pace/Families USA Reported Annual Cost	Negotiated Cost	Annual Savings Per User
3	Fosamax 70mg	$894.00	$859.00	$35.00
32	Evista 60mg	$895.00	$858.00	$37.00

For many health conditions, there is definitive drug treatment with a presumptive diagnosis. This is often the case with bone loss. In many health plans, these drugs are prescribed even though less than 50% of the time there is no definitive need as evidenced by a bone density test. Additionally, if these drugs are not taken properly, the individual will often take a PPI to counter stomach irritation. Effective marketplace innovators utilize alternative, effective treatments, including:

- Preventing bone loss through lifestyle changes, and
- Minimizing the risk of broken bones by reducing the risk of a fall. Often this involves eliminating drugs that cause dizziness or instability of gait.

Hypertension Treatment

Drugs used to treat hypertension are the most common types of medication prescribed for the elderly population. The PACE/Families list is interesting because it does not contain any ACE inhibitors, and diuretics are at the bottom of this list. With the new practice guidelines just released by JNC7, diuretics whose cost is less than $100 per year still are the preferred treatment for those with uncomplicated situations – producing better outcomes than new medications.

Families USA	
Drug Ranking (by claims)	**Drug Name**
2	Norvasc 5mg
7	furosemide 40mg (Mylan)
10	Norvasc 10mg
13	Toprol XL 50mg
19	metoprolol tartrate 50mg (Mylan)
23	metoprolol tartrate 50mg (Teva)
27	Cozaar 50mg
28	atenolol 25mg
30	furosemide 20mg
37	atenolol 50mg
40	Toprol XL 100mg
42	hydrochlorothiazide 25mg
45	furosemide 40mg (Geneva)
49	Diovan 80mg

Norvasc, in positions 2 and 10 in magnitude of utilization, is a calcium channel blocking agent that causes arteries to expand and drops blood pressure. Other drug categories are preferred over calcium channel blocking agents because they produce better outcomes. Geisinger, a Pennsylvania health plan identified as a marketplace innovator, has a preferred drug list that does not contain calcium channel blockers, and most of the other drugs used to treat hypertension are generic. What makes this so compelling is that Geisinger has such a low rate of hospital admissions (.8 per 10,000 members) for hypertensive patients. Geisinger, and many health plans that use prescription drug management tools, review the use of Angiotensin II inhibitors like Cozaar and Diovan, and coverage is granted in circumstances where an improved outcome is likely to be produced.

This point about some drug classes like calcium channel blockers having no preferred drugs on formulary is an important one regarding management control. For example, if the final bill reported out of the Medicare conference committee requires one drug in each class, there will be never ending pressure to further subdivide therapeutic classes in ways that will not provide added value to beneficiaries. The arguments could be endless – is a Cox II really a different class with different outcomes than non-steroidal anti-inflammatory drugs (NSAID)? If judged yes, it will get 100% of the market and its advertising budget will promote its exclusive position.

While these drugs are not as expensive as newer drugs in other categories, money can still be saved while improving outcomes (see chart below). These savings are on an order of magnitude of $100 to $300 per patient with hypertension. Given the prevalence of hypertension in the PACE population, this could translate to billions.

If we saved *only* $100 annually per patient through better management of hypertension drugs, that's $1.2 billion to spend on other beneficiaries who need prescription drug coverage.

Drug Name	PACE/Families USA Reported Annual Cost	Alternative Drug	Alternative Annual Cost	Annual Savings
Angiotensin II Inhibitors				
Cozaar 50mg	$553.00	enalapril 20mg	$286.00	$ 267.00
		lisinopril 40mg	$294.00	259.00
Diovan 80mg	$567.00	enalapril 20mg	$286.00	281.00
		lisinopril 40mg	$258.00	309.00
Beta Blockers				
Toprol XL 50mg	$277.00	metoprolol tartrate 50mg	$128.00	149.00
Toprol XL 100mg	$416.00	metoprolol tartrate 100mg	$167.00	$ 249.00
Calcium Channel Blockers				
Norvasc 5mg	$549.00	Sular 20mg	$417.00	132.00
Norvasc 10mg	$794.00	Sular 40mg	$417.00	377.00

For drugs treating hypertension, there is less opportunity to reduce costs through pricing negotiation since the initial cost of the drug is less. However, the total savings are significant because of the number of people treated for hypertension. Since about 70% are not treated to an acceptable blood pressure goal, these savings can be spent on treating more people and treating them more effectively.

Drug Name	PACE/Families USA Reported Annual Cost	Negotiated Cost	Annual Savings
Angiotensin II Inhibitors			
Cozaar 50mg	$553.00	$541.00	$12.00
Diovan 80mg	$567.00	$528.00	$39.00
Beta Blockers			
atenolol 25mg	$298.00	$172.00	$126.00
atenolol 50mg	$304.00	$241.00	$ 63.00
metoprolol tartrate 50mg	$405.00	$128.00	$277.00
Toprol XL 50mg	$277.00	$277.00	$ ----
Toprol XL 100mg	$416.00	$398.00	$18.00
Calcium Channel Blockers			
Norvasc 5mg	$549.00	$512.00	$37.00
Norvasc 10mg	$794.00	$725.00	$69.00
Diuretics (loop)			
furosemide 20mg (Mylan)	$52.00	$47.00	$5.00
furosemide 40mg (Mylan)	$59.00	$51.00	$8.00
furosemide 40mg (Geneva)	$57.00	$51.00	$6.00
Diuretics (Thiazide)			
hydrochlorothiazide 25mg	$29.00	$28.00	$1.00

Additional Cost Savings from Mail Order

Throughout this section, we have mentioned that marketplace innovators have negotiated contracts with retail drug stores – or buy and distribute using their own pharmacies – producing costs even lower than the conservative estimate of "negotiated cost." Further, most experience even greater savings when utilizing the efficiencies of mail service dispensing. Costs are significantly lower than retail costs even if retail can dispense a 90-day supply through plan design.

In the PACE example, they could reduce drug cost by 10% if using competitively priced mail service pricing - and dispensing fees with only 60% of brand-name drugs switching from retail.

Prescription cost of ten drugs commonly prescribed for seniors (Retail vs. Mail)[6]

The average savings is 14% or $146 per year on a branded drug

Drug	30 day Retail	90 day Retail	90 day Mail	Savings per 90 days	Annual Savings	Percentage Savings
Pravachol	$121	$365	$325	$40	$160	11%
Lipitor	98	293	261	33	130	11
Lisinopril (g)	22	67	60	7	28	10
Lotensin	33	99	85	14	56	14
Plavix	112	336	302	34	142	10
Metformin (g)	31	92	86	6	24	6
Protonix	104	313	253	60	240	19
Fosamax	76	229	180	49	196	21
Premarin	26	79	57	22	88	28
Zocor	123	368	328	40	160	11

The General Accounting Office (GAO) has also confirmed the cost savings due to pharmacy benefit management techniques. In the January 2003 study of the Federal Employees' Health Benefits Program, the GAO concluded that the average mail-order price was 27% lower for brand-name drugs and 53% lower for generic drugs than the average cash-paying customer price.[7]

Some Conclusions

If PACE had utilized all of the management tools used by marketplace innovators, its costs could have been reduced by as much as 40%. Since the program is funded largely by the state, this would reduce the cost to taxpayers and it could be used to expand the program. On May 29, 2003, Pennsylvania announced plans to expand the groups covered by the PACE program and to negotiate changes in drug purchasing contracts. This is one of many steps that will allow PACE to save money through smarter purchasing. Other steps may focus on eliminating waste and change the mix of what is delivered through the program – not just the price they pay for it. Assuring the use of prescription drug management tools in the Medicare prescription drug benefit will reduce the cost to the government and directly help beneficiaries through higher quality care.

[6] Data derived from PacifiCare of California pharmacy claims January – March 2003.

[7] United States General Accounting Office, Federal Employees' Health Benefits: Effects of Using Pharmacy Benefit Managers on Health Plans, Enrollees, and Pharmacies. January 2003.

Marketplace Innovators

In this section, we briefly highlight entities that address health management and delivery using all of the tools available within the sophisticated pharmacy management arena to improve quality. Since health plans usually integrate prescription drug benefits and medical care, they actively work to promote appropriate drug use to reduce medical costs, including hospitalizations and emergency care.

Health Plans

Below are two health plans (PacifiCare and Geisinger), selected because of their unique characteristics. However, they use many common practices concerning pharmacy benefit management. These plans, whether serving their own health plan, or providing management services to other health plans or employers, provide a host of management services delivered through their pharmacy management unit including:

- Targeted disease intervention programs from Attention Deficit Hyperactivity Disorder (ADHD) to Syndrome X (the insulin resistant state)
- Focused initiatives and education for improved Health Plan Employer Data and Information Set (HEDIS) measurements from asthma to post heart attack
- Specialty pharmacy disease therapy management
- Formulary development and management including the groups that support their Pharmacy and Therapeutics Committees having members with varied specialized training and expertise to insure clinically-sound and cost-effective options
- Prior authorization based upon evidence-based guidelines to insure safe, appropriate, and cost-effective use of prescription medications
- Health outcomes research, epidemiological studies, predictive modeling, decision analysis, and a host of other services that look to future improvements.

PacifiCare Health Systems serves more than 3 million health plan members. The Secure Horizons division of PacifiCare is one of the nation's largest Medicare risk programs, with more than 700,000 members enrolled in its Medicare + Choice plan.

PacifiCare's pharmacy program is managed by Prescription Solutions, a wholly-owned PacifiCare subsidiary. Prescription Solutions serves 5 million beneficiaries, about 55% are from PacifiCare's health plans and 45% represent external clients. Prescription Solutions uses a contracted network of retail pharmacies along with company owned and operated mail service facilities to supply members with their required drugs. Prescription Solutions uses in-house developed coverage management systems and techniques to minimize member risk, utilization and cost. Its generic utilization rate is approximately 55% for its commercial business and almost 60% for its senior products. Additional information on PacifiCare can be found at their website: www.pacificare.com. Information on its pharmacy benefit manager, Prescription Solutions is at www.RxSolutions.com.

Geisinger Health Plan is among the largest rural health care plans in the nation and covers a 20,000 square mile area in northern and central Pennsylvania. Many of the residents in the area participate in the PACE Program reported in the Families USA Study. Geisinger Health Plan serves residents in 40 of Pennsylvania's 67 counties with a variety of health plan options.

Geisinger Health Plan created its own Pharmacy and Therapeutics committee to develop and maintain a specific list of preferred drugs. After using the services of an outside pharmacy benefit manager, it decided to develop its own capabilities, buying support services on an as-needed basis. Its current generic utilization rate is now 57%. Additionally, it has the enviable position of producing some of the best outcomes in the Pennsylvania Healthcare Cost Containment Council report, having the lowest hospital admission rate for hypertension of 0.8 per 10,000 members. More information on Geisinger can be found at: www.thehealthplan.com.

Employers

Health plans are not the only driving force behind the healthcare management tools that are being used to manage rising costs and improve quality of care. As the financier of the majority of Americans' health benefits, employers have a critical role. With double digit annual healthcare cost increases and drug cost trends in excess of 20%, employers need to maintain their ability to continue offering affordable, quality healthcare benefits. Successful and innovative employers develop tools that encourage cost effective and appropriate healthcare use and encourage employees to be smart healthcare consumers (see Exhibit 3 for one company's explanation of "What is a Preferred Drug List?").

Verizon Communications is the largest providers of wireline and wireless communications in the United States. A Fortune 10 company with approximately 190,000 employees, and 900,000 individuals covered by its health care programs, Verizon's global presence extends to 45 countries in the Americas, Europe, Asia and the Pacific.

In 2002, Verizon spent more than $2.4 billion on direct healthcare costs – slightly more than 3.5% of annual revenue. Spending for prescription drugs is over $600 million. Verizon's team is constantly evaluating and implementing new ways to provide quality healthcare that is cost effective for both employees and shareholders. Initiatives include:

- **The Leapfrog Group -** Verizon is a founding member of this group of large healthcare purchasers committed to improving healthcare. Leapfrog initiatives include paying incentive bonuses to hospitals that implement the following changes:
  - ➔ Computerized prescription orders in hospitals to avoid adverse drug events. Requiring hospital doctors to use a computerized order entry system would reduce the errors from hard-to-read handwriting.
  - ➔ Evidence-based hospital referrals.
  - ➔ Attention to critical care.

- **The Dx on Rx Initiative –** This initiative was drafted by Verizon's healthcare team and endorsed by the Pharmacy Council of the Washington Business Group on Health (WBGH). *Dx on Rx* is a proposal to place the diagnosis on a prescription. This can prevent medical errors by making sure that the dose matches the diagnosis and by eliminating the confusion caused by drugs with similar names and different uses. Medical plans won't pay medical claims without this information, and prescription drugs should be treated in a similar manner.

- **HEDIS and Beyond –** The Health Plan Employer Data & Information Set (HEDIS) is a data reporting system that has become an industry standard. And Verizon was one of 3 pilot cases to refine its original work. In the coming years, Verizon plan members will receive data on health plan quality ratings that can help inform their purchasing decisions.

- **The Pennsylvania Project –** This program, run in conjunction with Omnicare, Inc, a geriatrics healthcare company, addresses appropriate drug use and safety through pilot pharmaceutical case management projects. These include:
  - ➔ **Cisapride –** integrated pharmacy data identified patients and reduced the use of cisapride linked to adverse events in seniors, including death. The analysis of Verizon data found the odds of cisapride users dying was nearly 62% higher than for non-cisapride users, and cisapride users had 85% higher total medical and prescription drug costs (see Exhibit 4 for a description). This project produced fact-based information to share with physicians necessary to facilitate a change in drug treatment. It raised awareness that many of the current review protocols are not sufficient and/or appropriate for many individuals (in this case, seniors). Specifically, it raised awareness about cisapride and subsequently the FDA severely restricted use of this product.
  - ➔ **Heart Failure –** a project to increase physician prescribing of ACE inhibitors to retirees with a history of heart failure. It was based on analysis that showed two-thirds of Verizon's retirees and dependents with heart failure were *not* receiving these drugs, which are considered the standard of care under the Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation and Treatment of High Blood Pressure (JNC7). The analysis also found that the odds of an ACE inhibitor user with congestive heart failure dying are 25% lower than they are for non-users.
  - ➔ **Falls and Fractures –** Approximately 350,000 hip fractures occur annually in seniors, and the mortality rate of these hip fractures is 25%. Long-term disability, including depression, occurs for an even greater percentage. The Verizon program aims to prevent falls and fractures in seniors by reducing the use of specific drugs linked as contributors to these events, often due to side effects such as dizziness or instability of gait. The specific drugs identified through this project were based on patient data.

States' Initiatives

Innovation is not limited to health plans and leading edge employer initiatives. States, either individually or collectively, are using proven techniques to make evidence-based decisions in selecting drugs covered under their programs with or without the need for more information. Many of the initiatives are driven by Medicaid, but all focus on spending money wisely so that programs can continue to serve the greatest number of beneficiaries with the highest quality of care. Managing drugs better also reduces other health care costs.

Drug Effectiveness Review Project – a Multi-state Initiative - States are leading the way among governments in finding ways to maintain and improve quality while purchasing drugs more economically.

In order to control costs and maintain quality, states are showing a growing interest in head to head comparisons of effectiveness in drugs within classes (e.g. between the various cholesterol lowering drugs known as statins or between the various anti-inflammatory drugs know as non-steroidal anti-inflammatories).

To obtain accurate information, the Institute for Evidence-based Policy at Oregon Health and Science University is leading a collaboration among interested states to commission evidence-based systematic reviews of worldwide research to find which drugs within a given class are most effective. The reviews are conducted by Evidence-based Practice Centers (EPCs). EPCs are research organizations designated by the U.S. Agency for Healthcare Research and Quality as fully qualified to perform evidence-based reviews for the U.S. Government. These reports are then used by the participating states to determine which drugs to cover for first line treatment. Since evaluation and selection is based on the facts presented in peer-reviewed studies, states using the information in the drug management process can be confident about the quality of the drugs selected. They can then encourage price competition among drug companies with similar products.

Among the top 50 drugs listed in the Families USA article, in classes already reviewed under the state-driven initiative the states found that:

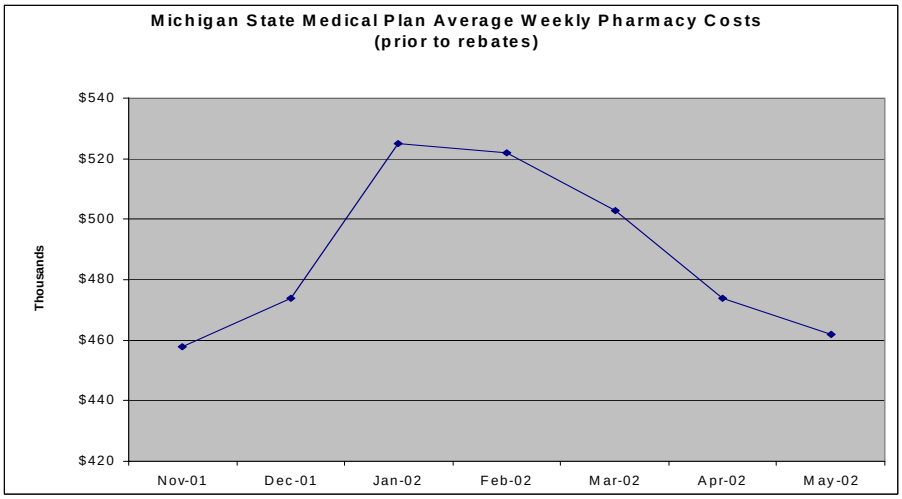
- Among cholesterol-lowering statin drugs lovastatin, a generic, was found to have equal to or better outcome data for the vast majority of individuals than all brand-name drugs in the same class at a fraction of the cost.
- Among proton pump inhibitors to prevent stomach acid formation, all agents had similar outcomes so states could confidently buy the least expensive of the class.
- Non-steroidal anti-inflammatory drugs—far more expensive brand-name medications showed virtually no significant additional benefit in reducing pain and inflammation than over-the-counter medications costing one-tenth as much.

For more information:

- On the results of the evidence-based reviews of therapeutic classes visit www.OregonRx.org and click on the "Reports" hyperlink in the middle of the page. There is also a hyperlink from www.AARP.org to the same material.

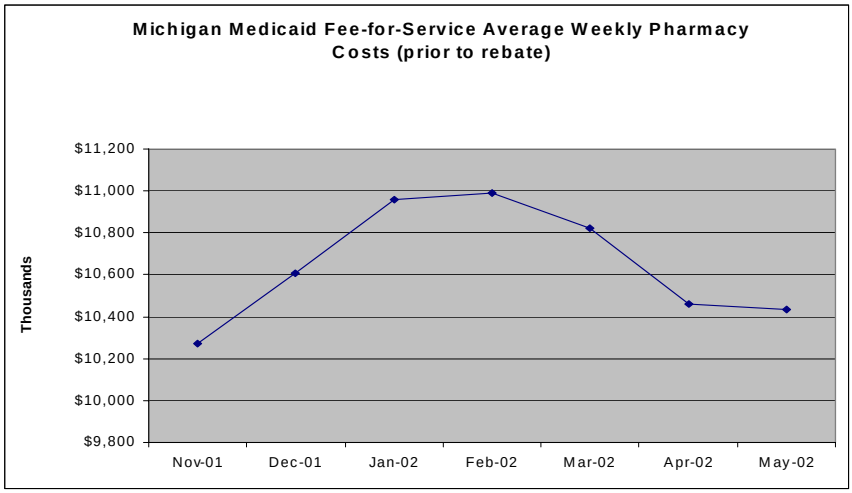
Michigan Pharmaceutical Best Practices Initiative

In 2001, Michigan was spending $1.1 billion in annual drug expenditures for beneficiaries covered under the Michigan Department of Community Health Program. Additionally, Medicaid recipients were growing at a rate of 10,000 per month.



The State decided to implement a "Pharmaceutical Product List" as a statewide drug program management tool to: maintain clinical efficacy in State drug program, improve health outcomes and patient quality of life, increase the number of recipients served and improve cost efficiency and overall healthcare cost management**.**

It accomplished this task by creating a Pharmacy & Therapeutic (P&T) committee, establishing and maintaining a pharmaceutical product list, managing start-up activities and prior authorization volumes and criteria.



Since the implementation of the Michigan Pharmaceutical Product List, the weekly pharmacy expenditure for the Medicaid fee-for-service and the State Medical Program has declined steadily and are over $620,000 below the average weekly expenditures of January 2002. Additionally, the average claim cost has been reduced by over $3.60 per claim.

For more information:

- For information presented by James K. Haverman, Jr. – Director, Michigan Department of Community Health at the October 26,2002 meeting of the National Conference of State Legislators see: www.kaisernetwork.org/health_cast/uploaded_files/MI-Rx-Viele-02Jul.pdf
- See www.michigan.gov for the Michigan Pharmaceutical Product List (MPPL)

Summary

When the federal government begins providing prescription drug coverage for Medicare beneficiaries, the government will have the power to influence the delivery system to provide the most appropriate care. By effectively managing the drug benefit, the government can spend less and improve integrated health care for Medicare beneficiaries. Additionally, better management of prescription drugs can help reduce medical expenditures, including hospitalizations and emergency care due to adverse drug events. Proven management tools will help the federal government provide a more valuable prescription drug benefit and improve the quality of life for Medicare beneficiaries.

Exhibit 1 – Cumulative price change of the top 50 drugs (by number of claims) used by the elderly (PACE program)

Rank by # of claims	Drug Name	Strength	Therapeutic Category	Cumulative Change 1998-2003	Multiple of CPI 1998-2003	2003 Cost/Year
1	Lipitor	10 mg	Lipid-Lowering Agent	30.80%	2.6	$ 871.00
2	Norvasc	5 mg	Calcium Channel Blocker	16.50%	1.4	$ 549.00
3	Fosamax	70 mg	Osteoporosis Treatment	nm	nm	$ 894.00
4	Plavix	75 mg	Anti-Platelet Agent	nm	nm	$ 1,539.00
5	Prilosec	20 mg	Gastrointestinal Agents	22.50%	1.9	$ 1,684.00

Exhibit 2 – Adverse Drug Events

Medication Errors
Evidence from three recent medical journal articles suggests patients, insurers and plan administrators should give a careful consideration to the issue of medication errors.

- Seniors are especially likely to suffer from medication errors. According to the April 2, 2003 issue of the *Journal of the American Medical Association*, elderly patients hospitalized for drug toxicity, such as hypoglycemia, digoxin toxicity, or hyperkalemia were up to 20 times more likely to have been prescribed an interacting drug in the week before hospitalization.
- Outpatients are at an even higher risk then hospitalized patients of some kind of medication error, says a study in the April 17, 2003 issue of the *New England Journal of Medicine*. 25% of the patients in the study had adverse drug events; 13% of these events were serious and 20% were preventable. Beneficiaries who are prescribed drugs outside of the hospital are not under constant supervision, they see their doctors sporadically, and they may not report all of their symptoms, side effects, and other medications. This is especially problematic when the patients are seniors, on several medications at once, and fill their prescriptions at different pharmacies or have memory problems.
- According to an editorial in the same issue of the *New England Journal of Medicine*, preexisting conditions such as Parkinson's or diabetes may increase the likelihood of medication errors.

In 1994, nearly 5% of all hospital admissions (for individuals of all ages) were attributable to drug reactions and interactions. Studies show at least 20% (some show almost 30%) of hospital admissions for Medicare-eligible patients are due to a medication error.
Causes are varied and include:

- Taking too many of one drug
- Taking too few or none of a prescribed drug
- Taking them inappropriately (before or after meals, with alcohol, etc.)
- Allergic reactions
- Drug-to-drug reactions
- The wrong product for the individual's health status

Seniors are more likely to have complications from taking medications. Complications may be minor or they may be severe and may result in death (see *Exhibit 4 - Propulsid*). The more drugs seniors take, the more complications they have. Many seniors take 1,000 pills a year. Repeated studies have identified drugs that should never be used by those 65 or over because of their side effects. Yet more than 15% of all prescriptions for seniors are for inappropriate drugs.
For seniors it is especially important to screen for duplicate therapy, adverse interactions with other prescription drugs, and contraindications of health conditions being treated by different doctors. OTCs, herbs and home remedies create additional complexities

Because of the imperfections of the medical system, patients must be smart healthcare consumers. They must:

- Monitor themselves carefully and report all symptoms to their doctors
- Disclose all medications that they are currently on, both prescribed and over-the-counter
- Help their doctors communicate with each other
- Realize that the drugs contained in their medicine cabinets can both save and cost lives.

What Can Help

One way of remedying human mistakes is to increase the use of technology in medical settings. An article in the same issue of the *New England Journal of Medicine* states that "computer-based decision support can improve physicians' performance and, in some cases, patient outcomes." The IOM also urges a "paperless" healthcare system. Technology can monitor patients, analyze the data, compile it, and even suggest a course of action to the doctor. It can identify potential problems before a medical professional notices them. With technology, there can be fewer problems from calculation errors, patient mix-ups, drug interactions, doctors' infamous illegible handwriting, and more. However, this technology isn't perfect yet, so other problems in the system must be addressed too. Yet the one area which grew up in the technology age is outpatient pharmacy management. Here eligibility, coverage management and claim payment plus tens of thousands of edits on drug interactions and dosing are all handled electronically.

Exhibit 3 – Verizon Formulary Description

What is a Preferred Drug List? (a.k.a. "Formulary")

Background

The "sustainability" of comprehensive prescription drug coverage requires the integration of multiple plan components designed to align the clinical and financial interests of patients and plan resources. In brief – to encourage patient utilization of prescription medications on the same basis as if they were spending their own money while, at the same time, providing patients:

- Clinical support – about treatment options that (a) they may not be familiar with, and/or (b) that might be harmful to them, and
- Economic support – especially for an increasing number of high cost medications that patients might otherwise forego if drug coverage was not available.

The multiple plan components include:

- A commitment of coverage for safe, appropriate, and cost-effective prescription medications;
- Effective use of Retail and Mail Order resources – to balance both acute care and maintenance medication needs cost-effectively, and
- Effective use of (a) preferred, and (b) generic drugs when appropriate for the patient.

This supplement provides supporting information regarding **What is a Preferred Drug List (a.k.a. "Formulary")** as part of "sustainable" prescription drug coverage.

Preferred Drug List

The purpose of the proposed 'preferred' drug concept is to focus both prescribers and patients on the most clinically appropriate and cost-effective medication when there are multiple similar ("me too") medications available. Given a preferred drug list, plan design can work in two ways:

- to limit plan coverage to drugs on the list, unless a patient has gone through a review process to determine coverage eligibility, or,
- to provide lower patient co-payments for 'preferred drugs', and correspondingly, a higher patient share for 'non-preferred' drugs.

The first approach is what is commonly referred to as a "closed formulary" –limiting prescription coverage to only 'preferred' medications – with the exception that if the listed drugs are not effective for the patient, a non-listed drug becomes preferred. The "preferred' approach (second alternative) differentiates the patient's share of prescription costs – with patients responsible for a higher share of covered, but 'non-preferred' medications.

Exhibit 3 – Verizon Formulary Description

Preferred Drugs: The List

Any 'preferred' drug list does not limit patients to a single drug, a single manufacturer, or just a few options for each drug type. The list usually indicates a variety of 'preferred' drugs – often with considerable cost variance.

- Additions to the list of 'preferred' drugs are made as new branded products (or limited-use-generics that treat rare conditions) are approved by the Food and Drug Administration (FDA). Following FDA approval, drugs are evaluated for coverage and management in accordance with best-practice clinical guidelines, the plan's coverage criteria, etc. and may be selected for addition to the 'preferred' drug list.
- Deletions can also occur – drugs previously designated as 'preferred' can be moved to a 'non-preferred basis' – frequently when a new medication is found to be more effective or offer a higher value.

The 'preferred' or 'non-preferred' status will influence the patient's share of the prescription expense – but does *not* exclude coverage for 'non-preferred' drugs for those for whom it is deemed medically necessary on a "closed formulary," or for anyone on an increased cost formulary.

Preferred for Some Patients

Notations concerning appropriateness of use can also change from time-to-time as information about use for the broad population becomes available. In addition, as problems are identified with use in a particular population, a product that is generally 'preferred' could be footnoted as *not* preferred for children or seniors. For example, a footnote might indicate: *"Use by people 65 and older is generally not recommended. The side effects may not be obvious, but may be serious. Safer medication may be available. If used, lower dosages are recommended."*

Sometimes there may be other references footnoted in the 'preferred' drug list – to aid prescribers such as to caution a reduction in dose below the usual guidelines printed in the FDA-approved labeling. This type of footnote often results from experience concerning a drug's use after the clinical trial phase done to secure FDA approval. Pharmacy managers also use reports and clinical findings based on broad, population-based experience. In this case a footnoted text might be something such as *"The recommended dose for children under age 12 – or weighing less than 60 pounds – is often lower than the manufacturers' usual dosing guidelines."*

'Preferred' drug lists may also contain additional information including the best practice guidelines recommended by the body of experts for a specific condition such as hypertension, elevated cholesterol, mild, or moderate or severe asthma. For example, for hypertension, the 'preferred' drug list might show treatment recommendations from The Seventh Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC7). The explanations could be detailed including various degrees of hypertension (mild to severe), and with or without other conditions (diabetic, previous heart attack, etc.).

Costs such as indicators of relative costs of specific drugs or actual costs for a typical supply (such as $ or $$$$) are included in some preferred drug lists to assist physicians and plan members in making cost-effective choices appropriate for their condition.

Exhibit 4 – Pharmacy Intervention to Reduce Medication Risk

Reducing Cisapride Use Through a Targeted, Evidence-Based Intervention in At Risk Retirees of a Telecommunications Company.

W. Gary Erwin[1], Patricia L. Wilson[2], James A. Astuto[3]; [1]Omnicare, Inc., [2]Associates & Wilson, [3]Verizon Communications, Inc.

Purpose. This initiative was conducted to reduce risks of cisapride (Propulsid®)-associated arrhythmias in a telecommunications company's Medicare-eligible plan members with medical and/or drug risk factors. The telecommunications company, a founding member of The Leapfrog Group, undertook this initiative to improve the safety and overall value of its healthcare benefit for retirees. **Methods**. Cisapride was chosen because of its Unacceptable rating for treatment of GERD by Omnicare's *Geriatric Pharmaceutical Care Guidelines®*. An analysis of death rates between Medicare-eligible indemnity plan members who used cisapride (N=445) and members who did not (N=17,732) demonstrated that for those with both a medical and drug risk factor, the odds of a cisapride user (N=163) dying were 62% higher than for a non-cisapride user (N=4202) ($p<0.09$). Intervention "cases" were selected based upon presence of a medical risk factor (ICD9) and drug risk factor (NDC). Cases were forwarded to Omnicare pharmacists, who called targeted prescribers to request discontinuation of cisapride. If the prescriber could not be identified, the retiree was called directly. If the prescriber refused without sound clinical justification, a geriatrician then called. Drug therapy changes resulting from the intervention were forwarded to Verizon's pharmacy benefit manager. **Results**. 144 retiree cisapride users were identified with both medical and drug risk factors. Cisapride was discontinued in 112 (77.8%). At the close of the intervention, 15 (10.4%) prescribers had been contacted but had yet to make a change, 3 (2.1%) refused to discontinue without providing clinical justification, and 2 (1.4%) chose to continue the drug providing informed clinical justification. In 5 (3.5%) cases, no prescriber could ever be identified. **Conclusions**. A targeted, evidenced-based intervention by Omnicare pharmacists changed prescriber behavior by reducing the use of cisapride in at-risk retirees, thus improving the safety of a telecommunications company's drug benefit. The at-risk retirees, when called directly, were fully supportive of the intervention, forthcoming in their discussions, and thankful for the telecommunications company's efforts.

PRESENTED: 2001 AMERICAN GERIATRICS SOCIETY MEETING

Exhibit 5 – Plavix drug summary

How it works	FDA approved uses	FDA recommended dosing/PDR
• Keeps blood platelets from sticking together and forming clots • Shown to work only somewhat better than Aspirin	• The reduction of atherosclerotic events (myocardial infarction, stroke, and vascular death) in patients with atherosclerosis documented by: - recent stroke - recent myocardial infarction or - established peripheral arterial disease	• Recommended dose is 75 mg once daily with or without food • No optimal length of dosage provided in PDR • Only strength approved for manufacture is 75 mg • Average wholesale price (AWP) for 30 pills of 75 mg each is $114

Some FDA precautions (see attachment for full FDA labeling insert)

- While clinical trial data was deemed statistically significant, the results were marginal when compared with aspirin. Trial data is:

Outcome Events

	Plavix	Aspirin
Ischemic stroke*	438	461
Myocardial infarction*	275	333
Other vascular deaths	226	226

*fatal or not

Note: The event is the time to first occurrence of the new event

- For clinical trial "recent" was deemed to be:
  - within 6 months for stroke (with at least a week of residual neurological signs)
  - 35 days for myocardial infarction
- For clinical trials, peripheral arterial disease was objectively established
- Should be discontinued 7 days prior to surgery
- Should not be used when the patient has a tendency toward conditions that cause bleeding such as peptic ulcers or intercranial hemorrhage
- Patients should be notified that it takes longer than usual to stop bleeding and that they should report any unusual bleeding to their physician

Exhibit 5 – Plavix facts and experience

Facts	Experience
Aspirin has been shown effective in reducing the recurrence of heart attack and stroke if taken daily	• Studies suggest aspirin alone has been shown to limit the formation of blood clots, reducing the risk of heart attack, stroke, or death by 30% in people with heart disease
Effectiveness of Plavix in preventing heart attack and stroke has been tested against over-the-counter aspirin (CAPRIE Study – Clopidogrel vs. Aspirin in Patients at Risk of Ischemic Events)	• Patients with recent history of heart attack, stroke, or arterial disease were separated into two groups – one given Plavix (75 mg/day), the other aspirin (375 mg/day) Patients received randomized treatment averaging 1.6 years • The overall incidence rate of heart attack and stroke for these patients was 10.6% for the aspirin group and 9.8% for those on Plavix. In other words, of these patients, 10.6% of those who took aspirin had recurrences to only 9.8% of those on Plavix. • Statistical significance of the relative reduction in risk by using Plavix vs. Aspirin was borderline, however (p=.045)
Researchers in the New England Journal of Medicine have recently conducted a study of the cost-effectiveness of aspirin and Plavix as a preventative measure in patients with coronary heart disease	• Plavix costs $3.22 per pill while aspirin is roughly $0.04 • Using a computer simulation of the United States population with relevant coronary heart disease rates, researchers found the following: - Extending aspirin therapy from its current level to all eligible patients (those for which aspirin isn't contra-indicated, or about 95% of the population) would cost about $11,000 per quality adjusted year of life gained - Giving clopidogrel to that 5% of the population that can't take aspirin would cost about $31,000 per quality adjusted year of life gained - If, however, you were to give clopidogrel to everyone, the tremendous additional cost combined with the relatively minimal positive outcome would cost more than $130,000 per quality adjusted year of life gained • These researchers therefore suggest, on the basis of relative cost effectiveness, the prescription of clopidogrel only in cases where the patient cannot take aspirin for some reason

National Action Plan to Assure the Appropriate Use of Therapeutic Agents in the Elderly

Statement by:

Patricia L. Wilson
Consultant
Associates & Wilson
1084 E. Lancaster Avenue
Rosemont, PA 19010
610-519-0602

Loren G. Lipson, M.D.
Chief, Division of Geriatric Medicine
Keck School of Medicine at the
University of Southern California
1355 San Pablo Street
Los Angeles, CA 90033

May 2002

Part 1

You have asked for comments identifying the most important priorities to be considered in the development of a national action plan to assure the appropriate use of therapeutic agents by elderly Americans. We regret that many competing priorities precluded us from submitting comments earlier. However, we subscribe to "better late than never." We are now pleased to contribute our thoughts developed based on full careers as individuals (Loren Lipson as a patient-caregiver, researcher and teacher and Pat Wilson as a consultant to employers and health plans) and in our more than 15 years of collaboration on aging issues. Since drug overuse, underuse and misuse contribute to or impairs the health status of seniors, much of our work involves managing pharmacy to manage health.

Introductory Comments

When looking at large populations, use of healthcare services increases with age and services change from acute health episodes to continuous treatment of chronic conditions. Medicare beneficiaries tend to have more chronic health conditions, resulting in more physician visits and prescriptions, than younger individuals. Drugs are the primary treatment for most chronic conditions –hypertension, heart conditions, diabetes, etc. While drugs can be beneficial, they can also harm if they are not appropriate for a specific individual. Interactions, overmedication, doses too high, side effects like instability of gait, confusion– all of these endanger health and raise overall healthcare costs. And because the side effects of a particular drug, or combination of drugs, begets more side effects, more drugs are prescribed. It is a never-ending cycle. And those that suffer most are seniors.

Any Federally sponsored program has a significant effect- both positive and negative- on the economy and on health status. By providing the money, the financier dictates what will be delivered. Providing too much money for whatever the healthcare system and its myriad of practitioners want to deliver, is a formula for disaster. The disaster is both in terms of care and in terms of cost to taxpayers and beneficiaries.

Most of us have our own experiences with the effect of too many or the wrong drugs for our aging relatives. Unfortunately, many of these misadventures ended in death. If you have no experience, just go read the first paragraph of the Executive Summary of The Institute of Medicine's report *To Err is Human*. That report deals with a healthcare system that needs fixing. Two of the three medical misadventures used to make its points real to all of us, deal with drugs. And while this report focuses on problems in hospitals, drug "management" outside is no better. Various reports, including HHS-sponsored studies, document that for the Medicare-eligible population, between 20% and 30% of all hospital admissions result from a drug misadventure. The wrong drug, too high a dose, failure to take a needed medication are some examples, but the list goes on.

No one intends harm. They just don't know what they don't know. Additionally, the healthcare practitioners are not supported by *systems* that have as their goal helping them do their jobs better. Sometimes that means preventing errors. Sometimes that means helping pick products appropriate for Aunt Sophie, given her various medical conditions and the current mix of drugs deemed necessary by her various caregivers. Other times that means picking the least costly drug that will be effective for Cousin Ed.

In the design of a new Medicare program, we believe that money should be treated as a precious resource. Spending money on healthcare services and supplies that deliver value to the patient is a worthwhile goal. Spending money on healthcare services and supplies that do harm to patients is just dumb! And doing it in a program that at its core is based on electronic patient- and drug-specific data that is instantaneously accessible and usable, is the dumbest of all. A *smart system* can know all about Aunt Sophie and can know all about the side effects of different drugs, as they are likely to pertain to *her*. A *smart system* can support caregivers in choosing cost-effective products that work for Aunt Sophie. The choices made for her can be quite different than for Uncle Jim. The result is that care is better, value is delivered and money is not wasted on needless and harmful services.

With the graying of America, more services are needed. Few physicians specialize in geriatric medicine. As recent reports have so well documented, there aren't enough of these specialists to provide adequate service to seniors today much less to the aging baby boomers. And of those who specialize in geriatrics, only some specialize in managing drugs. However, most retirees go to general practitioners that may be not as well equipped to monitor prescription drug use and are currently not incented by Medicare to coordinate care with others attending to patient needs. Retirees tend to see multiple doctors and often no one has all of the important facts – not even the patient or a family member. *Smart systems* can help. And a Medicare-sponsored program can either lead or impede their development. For the benefit of all, we hope you will lead.

Important Priorities

You have asked that those contributing to the debate be selective in making suggestions about the most important priorities for a national program. We suggest the following five:

- Design for an electronic infrastructure
- Look at the service or supply you cover – you should set the rules
- Develop your own formulary. Close it. And develop rules that allow appropriate expansions of coverage in individual circumstances
- Use generics whenever you can and make them the cornerstone of drug classes wherever you can
- Be creative, flexible and take nothing for granted.

1. Design for an electronic infrastructure - When card and mail plans were first introduced, plan sponsors were looking for discounts on drugs and lower administrative fees than were paid for the paper claim approach. That's all. Nothing more. Few understood the value of data and what is at the heart of every PBM- electronic networks, infrastructures and computer-driven data manipulation. Remember that what now goes under the name of Medco Health Solutions started as a small division of CSC (Computer Sciences Corporation). The speed with which data is captured and used is mind boggling.

Today, PBMs are not all the same in how they view their job. Some view their job as being efficient claims processors, but do little to judge whether claims are eligible for coverage. A script written is a claim paid, albeit one that is tracked electronically. Some view themselves as drug managers. And some as health managers who help physicians select products that are

effective for their patients within the context of coverage rules. The coverage rules would include effective for the condition, supported by evidence and practice guidelines, safe, least costly etc.

The technology that PBMs use captures important data that can easily be transformed into useful information. Current uses vary from: determining eligibility for benefits, to what are the covered benefits, to prices to be paid to pharmacies and fees to be collected from plan members. But with more data, more is possible. For these reasons some employers and PBMs are looking to use the existing and new information in creative ways to manage their drug and medical plan and to improve the quality of care for patients. HHS should understand the possibilities and expand on them as the basis of coverage decisions. Some easy requirements that would benefit HHS management, improve efficiency and the likelihood that supplies meet the coverage rules to be established are to require:

- The diagnosis on the script
- The directions for use (e.g. *bid*, short for *bis in die* and meaning for us non-Latin scholars twice a day) be included as part of the electronic claim, along with the quantity and strength dispensed
- Special training or certification in a specialty for certain drugs treating complex conditions (whether as a consultant or as the script writer).

Electronic processing costs less than the antiquated paper claims approach and it allows drug utilization review (DUR) to occur before the script is filled – screening for allergies, interaction with other drugs the patient may be taking, age appropriateness, etc. It also creates a drug record for each patient which can be used to target disease management, wellness programs, and for additional DUR after the script is filled – screening for fraud, abuse and therapeutic evaluation. Coupled with patient-specific data even more important screenings can occur to identify and eliminate potential problems.

The relationship between prescription drug programs and medical plans and the data that each has is important for managing costs and care. The goal of integrating all components of the healthcare system is to decrease costs for a disease and improve care and quality outcomes. The development of electronic data interchange creates the ability to integrate medical and pharmacy data. Integrated plans can have one vendor who manages the medical and drug components, or they can have different vendors who share data. The number of vendors is not the issue, but rather how sophisticated their systems are and how well the vendors perform. HHS as a design sponsor can influence the development of *smarter systems*.

2. Look at the service or supply you cover- you should set the rules - To manage anything well, you must go beyond both the price for any service or supply and how much, if any, of it gets delivered (utilization). To get at the heart of the health cost problem requires managing not only *who pays*, but *how much* and *for what*. Management doesn't really exist unless you know exactly what you are purchasing. And care is compromised if the unit of service or supply is not what the patient needs. This focusing on the unit of service provided - a factor most overlook - we believe is the essence of an effective healthcare plan. A unit of service could be a lab test, a surgical procedure, a drug etc. Most efforts to reduce price and utilization have assumed that the

unit of service remains constant; in reality, it is continually changing. Those that focus on price and utilization are not asking questions like:

- Is the service or supply necessary for Aunt Sophie?
- Will she benefit and if so, in what way?
- Is it a generally accepted practice?
- Is it a new approach, but well grounded in science and likely to provide significant benefit?
- Is it elective, cosmetic or a custodial treatment not treating an illness or injury and not an eligible charge covered under the plan? etc.

In the case of drugs, the unit of service is constantly changing. From an H2RA to lifetime therapy with PPIs. From ibuprofen to COX 2s. From ACE inhibitors to angiotensin II receptor blockers. In many cases, the patient is no better off. But, because of dynamic pressures, exerted by those with an interest in influencing providers and patients, care changes because someone – the plan sponsor or funder of services – allows it to change. They are not exercising an appropriate but different pressure on the dynamic marketplace. This failure to anticipate dynamics and respond appropriately leaves the marketplace subject to special-interest pressures.

We approach healthcare with a few simple premises. Whenever evidence indicates that the newer therapy delivers value, it should be covered. Wherever there is no evidence and it costs more, as most new things do, it should not. Congress and the federal government are the funders of the Medicare program in that they collect dollars from various taxpayers and funnel it to various providers for covered services. State legislatures and administrations are sponsors of the Medicaid programs. As such, all should have a say in establishing coverage rules, if they simply have the resolve to set them.

Analyzing the unit of service goes beyond defining physical parameters or looking for unbundling, etc. It raises issues of quality and appropriateness of care. Both affect the rate of growth in health benefit costs. So as we consider expansion of drugs under the Medicare program, it is important to define what you cover and establish the rules for how you will determine if the rules are satisfied. Fortunately you have an electronic and data-driven system so this can be done efficiently *if you* set the rules.

Do not assume that a PBM will do it for you. You must tell them. Focus on what you mean by "medically necessary" or skip the term altogether and go to the elements of coverage. Things like "must treat an illness that the individual has" are made easy because you now have the diagnosis on the script. One rule that should be important for a plan administered by HHS is that the individual should have a condition for which the FDA has approved the use of the drug. Off label use should only be covered when there is sufficient evidence to indicate that it is effective. The evidence should be such that those who are tied to the pharmaceutical manufacturers do not unduly influence it.

Just as it is important to set the rules for what you cover, you should set the rules for what you don't. Listed below are the most common exclusions from employer and managed care plans.

Most common plan exclusion:

- Drugs that don't meet the coverage criteria (e.g. appropriate and effective for the individual etc.)
- Drugs used for experimental purposes
- Drugs for cosmetic purposes including Rogaine, Vaniqua, Solage and Retin-A when used for age spots and as a wrinkle cream
- Weight loss aids
- Drugs that don't treat an illness or injury
- Prescription and OTC vitamins
- Nicotine gum and other smoking deterrents whether OTC or prescription
- Drugs that are highly elective. This could include Viagra, Lamisil for toenail fungus, etc.
- Fertility drugs
- Biologicals unless they are a named inclusion

But the devil is the details. There is significant discrepancy between *how* plans are actually administered by the various administrators- in this case a PBM. For example, you could exclude either experimental drugs or drugs used for experimental purposes, and cover growth hormones for dwarfism but deny coverage to increase muscle mass in the bedridden elderly. Similarly plans might cover Botox for cervical dystonia because it would generally fall under the definition of an illness but deny claims for galbellar lines. No to wrinkles!

There are important distinctions between *exclusions* where a particular drug or type of drug is not covered at all and *restrictions* where use of a drug is limited in some way. It is often hard to enforce these rules in an indemnity plan because information about the use of the drug is often not captured. For example, in many plans, prescription vitamins are only covered during pregnancy, but information about whether or not the patient is pregnant is not captured during drug claim processing. Or, a drug may be FDA approved for a certain use, but experimental for treatment of another condition and the claims processor doesn't know which is applicable. By having the diagnosis on the script, it will be mush easier to efficiently process claims and to deny those that should not be covered under the program. That gets us back to Priority 1 and the importance of a data-driven system. - **Dx on Rx** is the mantra**.**

3. Develop your own formulary. Close it. And develop rules that allow appropriate expansions of coverage in individual circumstances. - A formulary is described by most folks as a list of preferred drugs for use in a specific plan. If properly developed, it is useful in managing both care and its cost. Negotiated manufacturer rebates may also lower cost but may not be a factor in a national plan. If a factor, the rebate should only be an issue in determining the cost of a drug to compare to another choice to determine where the most value is delivered. Formularies – whether or not manufacturer rebates continue or are dealt a fatal blow - are important management tools for drug plans and influence drug selection by doctors and patients.

Any formulary as currently conceived and established only addresses the issue of treatments that are *generally* safe and effective. On a patient by patient basis, this is an irrelevant concept. The only important issue is what is safe and effective for me, or for Cousin Jim or Uncle Bruce. So

while the most cost-effective treatment for most cases will come from Formulary Drugs X, Y and Z, if there is evidence that another treatment is necessary, it should be covered. But to quote a client, the reasons can't be based on "might as well healthcare".

Drug manufacturer marketing both to physicians and to patients makes the closed formulary an important design tool. But given the clout of the pharmaceutical industry, it may be difficult to implement. Yet without it, we believe you doom a national program to failure. We cannot afford a program that simply allows patients to fill prescriptions for whatever a physician chooses to prescribe. Just turn on the television or flip through a magazine and you'll find pharmaceutical companies advertising their drugs directly to the public. The ads direct patients to ask their doctor about their product and may even include a list of doctors or a monetary incentive to see a doctor. The ads never mention costs and often the information about side effects, effectiveness and when using the drug would be inadvisable is in small print and may not even appear on the same page as the advertisement. This advertising is causing patients to ask their doctors for the miracle drugs they've read about or ask why they prescribed one medicine and not the other they saw advertised. The problem is that many of these drugs are no better than older alternatives. Switching to them means we can't gain the advantage of a competitive marketplace with multiple manufacturers.

As you contemplate the design of a national program, you may assume that patients may find the answer "it's not on your formulary" unacceptable. While patient resistance is an issue, it's only one factor. An equally important factor is the continued sustainability of the plan itself. Without controls inherent in the initial plan, you doom it to failure.

4. Use generics whenever you can and make them the cornerstone of drug classes wherever you can - Generics have chemically identical active ingredients, are available from multiple manufacturers, are not patent-protected, and cost less – in many cases, significantly less. Given our premise that money is a precious resource, paying more than you have to for something that is no better - or even marginally better - is imprudent.

Employers and state Medicaid plans have learned the lesson. Plans who only gently encourage generics are a dying breed. More forceful tactics are required. Dying are the days where plan sponsors are reluctant to influence a doctor's decision in any way. While resolve to tackle the issues has been slow in coming, many are exercising their fiduciary and management responsibilities and duties. With significant numbers of brand name products' patents due to expire, we expect even more plans to get even more aggressive in encouraging use of generics in the future.

Some employers' plans call for generic substitution unless the prescription is marked DAW (Dispense As Written). In some states this is permissible, in other states the physician must actually prescribe a generic for it to be dispensed. But all too often the physician just writes DAW for the brand with only a belief, based largely on drug company marketing, that the generic is inferior. But you already have some effective tools to use to counter the ill founded beliefs. We particularly like the one from the inside back cover of the September-October issue of FDA Consumer.

"If you're experiencing anxiety about taking your

generic drug,

read this ad and repeat as needed.

The FDA ensures that your generic drug is safe and effective. All generic drugs are put through a rigorous, multi-step approval process. From quality and performance to manufacturing and labeling, everything must meet the FDA's high standards. We make it tough to become a generic drug in America so it's easy for you to rest assured.
Visit www.fda.gov/cder/ or call 1-888-INFO-FDA to learn more.

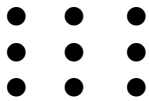
Generic Drugs: Safe. Effective. FDA Approved."

The following chart shows the methods managed plans most typically use to encourage generics.

How plans encourage generics:

- Copay/coinsurance is less for generics
- Closed formulary that is based on generics only in many classes(H2RAs, Ace Inhibitors)
- Charges for branded drugs limited to cost of generic- member pays the full difference in cost even if the physician indicates that the Brand is to be Dispensed as Written(DAW)
- Communicate about price differences- to both patients and physicians
- Communicate about quality control of generic manufacturing process
- Establish a *short* list of drugs that are available as Brands and as generics for which the patient will not be penalized by having to pay more for the Brand. Publish the list and describe why these drugs are treated differently
- Establish procedures to handle the exception for the patient who can't take the generic – when a nonformulary brand is the preferred agent for Aunt Sophie
- Pay pharmacist a higher dispensing fee for generics

5. Be Creative, Flexible And Take Nothing For Granted - Here's a problem we've seen used many times: How do you connect all these dots with just four lines – without lifting your pencil from the paper?



If you're like us, you may forget the solution. You'll have trouble finding it if you're constrained by what you think are the rules of the game or if your focus is too narrow. The key to this puzzle lies in looking outside the grid of nine dots. There's a lesson here for those of us grappling with rising healthcare costs- particularly for those 65 and over. The healthcare system is dynamic, and the rules are constantly changing. To be effective, our thinking must be creative and flexible.

A creative approach to benefit cost management is looking for ways to buy better medical services for less money. There's much room for improvement in the quality of retiree healthcare. The elderly tend to be over-medicated, over-dosed, and over-scalpeled – and their care tends to be under-coordinated. Improving quality of care – and reducing the price you pay for it – takes the resolve to deal with providers – including drug manufacturers, physicians, pharmacists, etc. - not as adversaries but as cooperative business partners, like any other supplier of goods and services.

Healthcare has become big business, and plan financiers who drive the system – governments, employers, etc. - can gain advantages by following sound business practices in dealing with providers. They must use their purchasing power, negotiate, and shop for the best value and exercise their responsibility to say what the plan covers. Retirees can also play a role in improving the quality of care they receive – if all help them become better healthcare buyers.

One way to control retiree healthcare liability is to give more of the financial responsibility to retirees. Another way is to broaden focus beyond the dollars which finance care to the care itself. By managing the type, number and quality of services delivered to retirees or purchased by them, plan financiers – including the U.S. Government can create a win-win situation for themselves and plan beneficiaries.

Closing Comments

In providing financing of drug coverage for Medicare beneficiaries, the government also has the power to influence the delivery system to provide more appropriate care to covered groups. He who has the gold makes the rules! By spending *smarter*, we can spend less – and improve quality of life. Better management of prescription drug benefits can help eliminate other expenditures; for example, hospitalizations due to inappropriate medications, or extended hospital stays from overuse of sedatives. If you fail to exert your power – some would say your responsibility – and you simply expand coverage without addressing what's wrong with how care is now delivered, we all assuredly will spend more. And older Americans will continue to lose out in a healthcare system that doesn't serve their needs as well as it should.

The health and security of our retired American's should be assured through thoughtful, informed change to our current system. This call for ideas before you finalize plans represents but a first step in that process – a process in which we all should become involved.

An Example - Neurontin (gabapentin)

on

National Action Plan to Assure the Appropriate Use of Therapeutic Agents in the Elderly

Part 2

Earlier this year, we responded to Health and Human Service's call for ideas on the most important priorities to consider in developing a national action plan to assure the appropriate use of medications by seniors. In our previous statement, we suggested the following top five priorities for a national program:

- *Design for an electronic infrastructure*
- *Look at the service or supply you cover – you should set the rules*
- *Develop your own formulary. Close it. And develop rules that allow appropriate expansions of coverage in individual circumstances.*
- *Use generics whenever you can and make them the cornerstone of drug classes wherever you can*
- *Be creative, flexible and take nothing for granted*.

We selected those ideas formulated during a lifetime of work involving identifying and solving problems. We tried hard to choose words to make the concepts real to readers. As is usually the case, *the linkage* between ideas is as important as each idea is as a unique concept. In other words, what is possible manifests itself when the ideas are linked together and put into practice.

The national debate to develop a sustainable expansion to Medicare's existing comprehensive physician and hospital benefits was center stage in the recent 2002 elections. The specific initiative has yet to be developed in sufficient detail so that a sustainable drug benefit becomes a reality. In part that program would deliver medications appropriate for covered individuals.

Examples make concepts clearer. This paper is an example of how the 5 selected priorities come into play using just one drug- Neurontin (gabapentin). It is intended to illustrate how our suggestions promote better healthcare and appropriate coverage and could be used in an environment where pharmacy is managed in a systematic way to deliver benefits appropriate for a covered individual. In part that means we will point out how things work now in the "managed" pharmacy environment. And to provide additional clarity, we will mention how some could think things work, but don't.

We do not presume in this paper to cover all of the details concerning the drug's specifics. Nor do we presume that the readers of this paper have, or should have, a medical background - in fact one of its authors has no medical school, nursing or pharmaceutical training. Yet it is important to look at some information about a drug and its coverage under any plan of benefits (whether Medicare, Medicaid or an employer or union-sponsored program) if the goal is to provide coverage for care appropriate for the individual and an expense appropriate for coverage under any benefit plan. We have created summaries to help readers become familiar with background on the drug, with additional references for those who want to read more. We welcome edits and improvements and other thoughts that contribute to the goal of appropriate coverage of medications for all.

Neurontin

Background on the Drug

Under the standards established to safeguard Americans, the Food and Drug Administration (FDA) is responsible for determining if medications (whether drugs or biologicals) are generally safe and effective for use. As part of the initial investigation, whenever a medication is found to be unsafe for use for any subset of the population, information is presented in the labeling approved by FDA. This might relate to use:

- During pregnancy
- By someone with another condition (like kidney problems)
- While taking another medication where a severe interaction has been identified, etc.

Doctors can (and do) prescribe drugs in any way they believe will best help their patient. The prescribing may be for conditions that have not been approved by the FDA as both safe and effective. This is called off-label prescribing. The hope is that there is:

- Fact-based evidence readily available to the prescriber of the benefits of a non-FDA approved use
- Time for the prescriber to review it
- No undue influence by those who benefit from use
- Value delivered to patients for the treatment selected by the physician
- No harm done to the patient.

While it is legal for the prescriber to write scripts for off-label uses, it is, however, illegal for a drug maker to actively promote a medicine for conditions where it has not been demonstrated to the FDA that it is safe and effective for that purpose.

Until recently the only FDA approved use of Neurontin was as adjunctive (add-on or in addition to) therapy in the treatment of partial seizures for patients with epilepsy. Recently (June 2002) the FDA approved Neurontin for postherpetic neuralgia (the treatment of pain after herpes). According to a lawsuit, Warner-Lambert (which has since been acquired by Pfizer) has been actively marketing Neurontin for 11 specific off-label uses. The FDA has now approved one of those 11 uses. There are reports that the off-label marketing was often supported with nothing but anecdotal evidence often sponsored or created by the drug company, with little or no hard data. For some conditions they also promoted dosages that exceeded FDA-approved guidelines. See the next section for more on the misconduct allegations and the attached documents with more drug specifics.

Why we chose it as our example

1. It's in the news - It's topical. In part that means that some readers can relate to the information presented here because it is not new. Others who have not read recent articles about Neurontin can easily search out information for themselves. Here are some of the actions reported in articles in *The New York Times*[1], the *Wall Street Journal*[2] and in *Worst Pills Best*

[1] The New York Times. Melody Petersen: March 14, 2002, May 15,2002 and October 29, 2002
[2] The Wall Street Journal. Rachel Zimmerman: November 8, 2002

Pills News[3], a publication of the Public Citizen Health Research Group. Reports were based on interviews, basic legwork and court documents in the lawsuit brought by Dr. David P. Franklin, a former Warner-Lambert employee. The allegations are:

- In exchange for money, physicians allowed pharmaceutical sales reps into their examining rooms to meet with patients, review medical charts and recommend off-label use.
- Marketing executives at Warner-Lambert urged their superiors to let them promote Neurontin for unapproved uses rather than perform the clinical studies needed to prove the medicine was safe for such patients. They recommended against doing studies because of the short time that they expected the company to be able to sell the drug exclusively before the patent expired. They recommended that Neurontin be promoted for the unapproved condition through educational courses.
- Warner-Lambert tried to influence doctors who wrote medical journal articles about Neurontin by paying them, sometimes secretly, and hiring a marketing company to write first drafts. Warner-Lambert hired two marketing firms to write articles about the unapproved uses of Neurontin and to find doctors willing to sign their name to them as authors. According to an invoice from one of the marketing firms, Warner-Lambert agreed to pay the firm $12,000 for each article and $1,000 for each doctor willing to serve as author. Internal memos detail how the marketing firm often wrote a first draft, but sometimes had problems finding an author. The articles were then reviewed and approved by Warner-Lambert before they were sent to journals for publication.
- Warner-Lambert gave financial incentives to hundreds of doctors to prescribe Neurontin for unapproved uses by inviting them to dinners and weekend trips to resorts. They also paid doctors to speak about Neurontin and to prescribe it to patients who were enrolled in the company's clinical trials.
- Warner-Lambert tracked prescriptions written by doctors after they attended dinner meetings paid for by the drug company at which Neurontin was discussed. Doctors attending the dinners wrote 70% more prescriptions for Neurontin than doctors who did not attend.
- Although Neurontin is approved as adjunct therapy for epilepsy, a marketing executive at Warner-Lambert in a recorded voice-mail message that is part of the lawsuit told sales reps to promote monotherapy.

In a public interview, Dr. Franklin, a former research fellow at Harvard Medical School said he was most troubled by the company's insistence that he press doctors to prescribe Neurontin in much higher doses than had been approved. Several marketing executives had told him that because Neurontin appeared to be safe in high doses it was reasonable to encourage doctors to try it for almost any neurological condition "just to see what happened."

The list of reported questionable tactics goes on and the drug manufacturer will answer charges in court. At the very worst, much of the evidence of effectiveness is tainted. That in turn may have resulted in harm being done to those who used the drug. At the very best, individuals and firms who often appeal to us as working to improve patient care and reduce suffering, come off as a Ron Popeil competitor for the marketing genius award for the year. But marketing pills is not the same as marketing chicken rotisseries.

2. We got snookered (a technical term). Making a mistake should always be a learning experience. This time perhaps others can learn by seeing where we went wrong. What we did

[3] Worst Pills, Best Pills News. May and September 2002

was to violate one of our work standards - take nothing for granted when it comes to managing pharmacy to manage health. It is so important that we selected it as one of only five for your consideration.

Here is what we did. Several years ago we looked at use of Neurontin because it moved into the top 20 for drug spend. Seeing that at that time its only approved use was for epilepsy, we *presumed* that further management should not be a high priority. Reasoning went like this. Most patients were under the care of neurologists. Neurologists were managing use so that it was both standard- and fact- based and the resulting care was appropriate with costs being an eligible expense under either employer-sponsored and self-insured ERISA medical plans or health plans where we provide consulting services.

What should we have done? Some simple calculations to determine if experience is reasonable! According to the U.S. Bureau of Vital Statistics there are about 5.1 epileptics per 1,000 Americans. One client has 537,000 lives in all 50 states covered under several plans but managed by one PBM. That means we could expect about 2,738 epileptics. If we wanted to cross check the number based on the age characteristics of the group, we would expect about 2,937. And then not all of the epileptics would use Neurontin as part of their therapy. If the number is even as high as 50%, that would mean that we should expect about 1,400 users. We could further refine the process for sexes and geographic characteristics but all are in the same ballpark.

So how many Neurontin users are there in this population? 8500! It is interesting to note that this is right in line with the quoted off- label use-83% here vs 78% referenced in articles and court documents. Having identified inconsistencies, we would then have looked further to explain the experience. We did not because **we took for granted** that all users were epileptics and that treatment is evidence-based and appropriate. Had we not violated an important principle (Take nothing for granted) we should not have had to rely on the testimony from the court case now pending to determine that use was off by many multiples of what was reasonable. We believe that experience under any plan is a result of what many do or fail to do. By checking the experience, we can determine the factors driving it and whether the experience is reasonable given current plan provisions and the goal of appropriate care under a sustainable plan of benefits.

Medicaid got snookered too! Since epilepsy prevalence is not linear and is most prevalent in young children and in older seniors (the two groups who make up the largest numbers of covered lives under any Medicaid program), their reasonable estimate would be based on age bands– perhaps with some adjustment for economic variables. Then they too would have known that use was out of kilter and they should look further to explain the experience. They would not just now be trying to recoup inappropriately billed charges.

3. It's a big number and it matters. In 2000, Neurontin earned $1.3 billion. Media reports that as much as 78% of these sales were for non-FDA approved uses without evidence that the drug was safe and effective. *Drug Topics*, a magazine for pharmacists, and based on statistics from Scott-Levin, lists 2001 Neurontin sales in retail drugstores:

- $1,485,674,000(ranked 16th for $s)
- 13,261,000 scripts(ranked 31st for scripts)
- Average price per Rx of $112.

4. It's not just about money and whether it is wasted. It's about care appropriate for all, including Aunt Sophie.

Given the side effects of this product, use by some is likely to cause problems that may continue if not linked back to the drug. Those side effects may be attributed to other things including depression. The prevalence of both dizziness and drowsiness are significant. It would appear that it is this side effect that takes the edge off, that may cause it to have been promoted for these off-label uses like ADD, pain, and bipolar disorder. Yet for seniors, both of these side effects are more significant since they can lead to a slip and a fall with a resulting fracture.

While the labeling suggests that dosing should be carefully selected in seniors, the maximum dose edit in pharmacy benefit manager (PBM) systems are set at what we refer to "as kill a horse" levels-3600 mg per day. Anything less than this and no edit is triggered even if the member is age 80. Further there is no distinction between dosing appropriate for epilepsy or postherpetic neuralgia. Why? Because the PBM does not routinely know the diagnosis. And even if they did also have the medical claims with its codes, the PBMs have not refined their systems to make smart edits that go beyond the general rules. Nor have they demanded that the vendors from whom they buy their basic screening modules, do it differently. Nor is there any edit for an initial script where the starting dose is at maintenance level rather than at the recommended starting dose. It would be reasonable to assume that many of these edits are built in as system safeguards. They are not and because they are not, Aunt Sophie may get more than she should.

Applying our 5 priorities to Neurontin

Here is how the Neurontin example applies to each of the 5 important priorities we previously submitted.

1. ***Plan for an electronic infrastructure***: An electronic infrastructure provides many tools for checking for appropriate and safe use of medications. Using a smart systems' approach, here are some ways to identify appropriate use of Neurontin that should be covered as an expense under a plan:

- Identify all patients taking the drug who are on other epilepsy (Neurontin is recommended as add -on treatment) or herpes drugs. Those scripts could process without further inquiry - whether done by the system or involving physician outreach. For other scripts, establish procedures to ask questions about its intended use.
- If you planned ahead and required the diagnosis on the script (**Dx on Rx**) check the diagnosis against one or two tables input in the claims adjudication software. One table could contain only the FDA approved uses. Another could contain uses that might be approved by various groups as appropriate treatment. For example, if you accepted *Facts and Comparisons* as a source for generally accepted off-label uses, your table for acceptable off label use would contain the following:
  - tremors associated with multiple sclerosis
  - neuropathic pain
  - bipolar disorder
  - migraine prophylaxis.
- Identify the patient's age and determine if the dose is within guidelines. This might require multiple dosing tables for different conditions and for other circumstances-with age being the

most prevalent. Effectively the smart system would have a 3 dimensional array of tables containing dosing information and the patient's characteristics would pick the appropriate one.

- Periodically review the drug data against other significant medical events. For example, look at the Part A data for frequency of slips and falls with a resulting broken bone. We suspect you would find more than you expect. Why? Because the dose may be too high for seniors and the side effect profile, much like sleeping pills, is such that it contributes to the fall and the resulting broken bone.
- Identify the prescriber as an individual licensed to write scripts in the U.S. If not licensed, the claim is denied.
- Identify the *sig* and correlate the quantity dispensed for a specific duration of time (say 30 days) to the number of pills being dispensed. Further check this against the drugs dosing recommendations to determine if it is reasonable. For example, if 30 pills are being requested for 30 days of treatment, yet dosing guidelines are for multiple pills a day, there is a disconnect. Too much product is just as much an issue as too little. Yet this is a simple edit, made possible by the *sig* if the goal is appropriate care. Further if the ultimate sharing of costs between beneficiaries and CMS is a flat dollar copay design instead of a percentage coinsurance, this is an important edit to preclude stockpiling and other fraud.

The list goes on. The important point is that if the system planned for an electronic infrastructure, it could provide a diagnosis code, *sig* code and other important data that could be used to screen for appropriate use, inappropriate off-label use, etc. Systems/programs (coverage review, denial/appeal process, etc.) could then be designed to determine when and under what circumstances coverage of a drug is acceptable in a Federally sponsored program when that drug has not been sanctioned by the FDA as safe and effective for that use. The end result is data connected in an on-line, real time system, creates improvements in care.

A second important point is that drug choices are expanding (with both new chemical compounds and DNA derivatives) at a time when there is significant time pressure on physicians. Many physicians are not able to stay current with these rapid changes. The electronic infrastructure supports them in getting the information they need to make the best choice for each of their patients.

2. *Look at the service or supply you cover – you should set the rules:* The FDA is the primary resource for determining coverage criteria in terms of approved uses and dosage. Off-label use may be appropriate when endorsed by sub-specialties or a broad or common consensus. One example is DESI drugs. They are still currently used by many and should be considered as covered drugs under a federally sponsored plan, even though they may not have been approved by the FDA.

Off-label use should only be covered when there is sufficient evidence to indicate that it is effective. And the evidence should be such that those who are tied to the pharmaceutical manufacturers do not unduly influence it. In the Neurontin case currently pending, allegedly the drug manufacturer illegally and falsely represented the drug's benefits to doctors and patients who then use it so that it becomes an accepted off-label use. The current evidence for off-label use for Neurontin does not pass the sniff test.

CMS should set the rules for coverage. Those rules should also address the strength, step dosing and administrative rules for routine follow-up. For example, Neurontin is recommended to start at a low dose and then be titrated up. These rules can all be easily built into the electronic infrastructure that adjudicates claims. The design of a Medicare-sponsored drug program can make it happen. Alternatively, Medicaid can set requirements for PMBs who process their claims.

In setting rules you can look to the literature to determine where value is delivered and for which subsets of the population it becomes a covered product. The litmus test is that it is appropriate, treats the illness or injury, evidence-based, in accordance with generally accepted guidelines, least costly effective therapy, etc. These become the general coverage criteria used to guide all future decisions about coverage rules in specific circumstances. The point is that Neurontin - as an example of any product - is not always covered or always excluded. The rules will determine that. But you should set the rules that are administered by any PBM. This also ensures that coverage will be the same based on similar facts and circumstances and the rule you establish rather than the vagaries of one administrator who may administer your program in a specific geographic area.

3. ***Develop your own formulary. Close it. And develop rules that allow appropriate expansions of coverage in individual circumstances:*** A thorough review by a national P&T committee set up for this purpose would be necessary to determine whether Neurontin would be on a formulary for a senior population. Currently the drug is being used off-label as a chemical restraint in nursing homes. While with proper dosing and monitoring this may be beneficial to a select population, there have been reports of egregious abuse of this drug in nursing homes. One case alleges that high dose (off-label) usage contributed to lethargy, loss of appetite and dehydration, which lead to immobility, bedsores, and eventually amputation of both legs.

Neurontin also has significant side effects that can lead to serious complications for seniors. See the attached *Neurontin – facts and experience* for more information on side effects. It's likely that inclusion of Neurontin on a formulary for seniors would be limited to a select population, low dosages and require proper monitoring-including creatinine levels. Currently many PBMs set a single *kill a horse dose* for Neurontin that applies for all uses and for all groups, including the elderly. An edit is not triggered unless this maximum dosage is exceeded. Dosing edits need to be customized so that each individual gets the right amount. The system knows lots about covered individuals. That information can be used in improved systems of care that make it appropriate for Aunt Sophie.

Purepac Pharmaceuticals, a subsidiary of Alphapharm, is in approvable status to manufacture a generic. Once the generic is available, you need to decide whether Neurontin™ would then continue to be covered or whether it would be considered non-formulary and then either excluded (if a closed formulary as we suggest) or subject to a different copayment structure. If it continued to be on formulary, would it affect the price the covered individual would pay if they chose the brand over the generic. You might conclude that even in a closed formulary when the drug is used currently by a Medicare beneficiary to treat epilepsy or another seizure disorder that you judge as appropriate, you would cover the brand for existing patients. All new patients would however start on the generic. Price is an issue because it contributes to the sustainability of the program. But appropriateness is the overriding issue.

Drug development and sales is a business, and the product pipeline is important. The pipeline includes both new innovative products with lifesaving benefits as well as marginally different products with few, if any benefits. These new drugs are sold with highly-effective marketing to physicians and users. Most often these new products are brought to market just in time to precede loss of exclusivity for a marginally different drug. Pfizer has been working on pregabalin, the replacement for Neurontin (gabapentin). In 2000 press releases, Pfizer anticipated filing in 2001 in the US for 7 major indications. Some are for the 10 off-label uses of Neurontin. Clinical trials are also under way for today's big money making "illnesses" – generalized or social anxiety disorders. According to Pfizer's September 6, 2002 press release, pregabalin will now not be submitted to both the FDA and European regulators until 2003. CMS's coverage decision about the new drug when available, should be made in light of the then existing brand Neurontin and its generic gabapentin. Cost is one issue, since there is no money to waste. But equally important is the rules under which each product becomes the covered preferred agent.

4. ***Use generics whenever you can and make them the cornerstone of drug classes wherever you can.*** Currently this priority doesn't directly impact the Neurontin example. The patent is due to expire in 2003. However our guess is that now that it is a blockbuster drug (number 16 on the top 200 brand-name drugs by retail sales in 2001 with total retail sales exceeding 1.4 billion dollars), Pfizer will employ the usual drug manufacturer machinations to extend the patent and delay the generic. A 30-month extension could get them beyond an anticipated approval date for pregabalin, the presumed pipeline replacement drug. But when in consort with priorities 2 and 3 you could determine that gabapentin is the preferred drug, with both the brands (Neurontin and the to be determined trademarked name for pregabalin) generally not covered. You could also set a HCFA (when will the name change to CMS MAC?) MAC sooner rather than later, so that you benefit from a competitive price even though there may be only one generic manufacturer.

Coverage exceptions could be made where evidence exists that either brands are the preferred agent for subsets of the population. In all cases, system-edits should be put in place in the electronic infrastructure (priority 1) to check for a dose appropriate for Cousins Jim and Bruce or Aunt Sophie.

5. ***Be creative, flexible and take nothing for granted.*** The healthcare system is dynamic and the rules are constantly changing. As drug companies change the rules, health plans must be prepared to identify the behind the scene moves and refine the plan to adapt. As claims for Neurontin rose well beyond the incidence of epilepsy, alarms should have gone off and set in motion a review procedure and actions to adapt to the change. We got snookered and failed to identify the significant off label use that should have been subject to further scrutiny.

Neurontin is a perfect example of *take nothing for granted* and the consequences of not adhering to this principle.

- Do not take for granted that you know what it is used for, and that its uses will be appropriate for any one individual.
- Do not assume that the off-label use has been or should have been approved by a physician specialty group as acceptable therapy.

- Do not assume that dosing will be checked in any PBM system so that someone is checking for excessive dosing for seniors.
- Do not take for granted that any PBM system will check dosing for children even though the label contains specific recommendations.

Closing Comments

While drugs provide safe and effective treatment options that improve well being for those in specific circumstances, they are not necessarily safe and effective for any one individual. Drug manufacturers are doing what any business should do. They develop a product and market it as well as they can to generate sales. Financiers- whether it is Medicare, Medicaid, an insured health plan or a self- insured employer or union ERISA plan- need to decide when the product meets its coverage rules. Doing that effectively is the challenge. But it can be done in a way that supports physicians in the care they deliver to their patients. And failure to do it dooms any drug benefit – even one sponsored by Medicare. Besides seniors deserve better.

A post script about capture and use of patient data

The Health Insurance Portability and Accountability Act (HIPAA) and its implementing regulations are causing both head scratching and some steps backward in the managed pharmacy area. PBMs and retail pharmacies are at odds about what data they can and should capture as part of the electronic claim submission in light of HIPAA. Some are posturing under the guise of outright prohibition of even the most basic data. It may however represent a desire to spend less time on entering data. But data specific to the individual is necessary not only to determine if the drug for Aunt Sophie is an eligible claim under the health plan, but also to determine if it is safe and appropriate. We presume that clarification is needed since it was never your intent to force coverage of ineligible charges (an ERISA violation) or to process claims that may do harm. We assume that the Institute of Medicine's (IOM) ideas as outlined in its reports (To Err is Human and Crossing the Quality Chasm) will proceed unimpeded by HIPAA. Their thrust, like ours, is for data-driven systems, supporting physicians, to improve quality of care.

Neurontin (gabapentin)

How it works	FDA approved uses	FDA recommended dosing/PDR
• How it works in unknown – either to manage nerve pain after herpes or as a supplemental epilepsy treatment • Not metabolized by the body therefore it is not likely to have a negative effect on the liver • Excreted unchanged by kidneys	• Epilepsy as an add on therapy to other epilepsy drugs * * * • Pain after herpes (postherpetic neuralgia)[1]	• Epilepsy - Pediatric patients (3-12 years): 10-15 mg/day in 3 divided doses. Maximum interval time between doses should not exceed 12 hours - Adult patients (>12): 900 – 1800 mg /day given in divided doses (3x a day) using 300 or 400 mg capsules or 600 or 800 mg tablets. Starting dose is 300 mg 3x/day • Postherpetic neuralgia - 300 mg on day 1 – single - 600 mg on day 2 – divided in 2 doses - 900 mg on day 3 – divided in 3 doses - Can be increased as needed for pain relief to a daily dose of 1800 mg • Neurontin is given orally with or without food

Some FDA precautions (see attachment for full FDA labeling insert)

- Due to decreased kidney function, take care in dose selection for the elderly. Creatinine clearance values should be routinely checked
- Neurontin may cause dizziness, somnolence and other symptoms and signs of CNS depression. Accordingly patients should be advised not to drive a car or operate other complex machinery until they have gained sufficient experience on Neurontin to gauge whether or not it affects their mental and/or motor performance adversely
- Should be used in pregnancy *only if* the potential benefit justifies the risk to the fetus
- Should be used in nursing mothers *only if* the benefits clearly outweigh the risks

Notes:

[1]From www.pfizer.com, under *Health, Medicines & Lifestyles*, and then under US Prescribing Information, its posted labeling for Neurontin also lists this condition. Note: this has not yet been listed in the Physicians Desk Reference (PDR) or on the Food and Drug Administrations website (www.FDA.gov) because it has just been approved for this use.

Neurontin – facts and experience

Facts	Experience
Actions by representatives of Warner Lambert (the drug company who developed the drug) and its new owner (Pfizer) are now the subject of litigation for illegally marketing the uses of the drug to physicians. 11 non-FDA approved uses have been cited in newspapers and court documents	The uses being promoted by the drug company but for which there is not FDA approved use indication include: • Bipolar disorder • Pain syndrome peripheral diabetic neuropathy • Stand alone treatment for epilepsy (FDA approved use of Neurontin in addition to other primary epilepsy drugs) • Reflex sympathetic dystrophy – pain or tenderness following a traumatic injury to an arm or leg • Attention Deficit Disorder • Restless leg syndrome • Trigeminal neuralgia • Essential tremor periodic limb movement • Migraine • Drug and alcohol withdraw Severe pain following herpes virus infection was cited in the court case as inappropriately promoted but a FDA indication has just been granted. New studies (and therefore not listed in the court cases) are now appearing to sing the praises of Neurontin as a treatment for hot flashes. This is a lucrative market because of concerns raised about Premarin.

CMS-4068-P-1227-Attach-1.doc

Horizon Healthcare Services is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Horizon Healthcare services the home infusion needs of thousands of patients in south central Pennsylvania every year including many Medicare recipients. Founded in 1984, our highly trained healthcare professionals have the experience and skills necessary to create positive clinical outcomes for the patients we serve while at the same time conserving scarce healthcare dollars by treating patients at home and avoiding costly hospitalizations.

Horizon Healthcare Services appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

* Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS "S" codes, already used by commercial and Medicare managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payer sector. We recommend that CMS reference the National Home Infusion Association National Definition of Per Diem for a list of the products and services included in the home infusion per diem, available at http://www.nhianet.org/perdiemfinal.htm <http://www.nhianet.org/perdiemfinal.htm> .

* CMS should establish specific requirements for prescription drug plans to contract with sufficient numbers of infusion pharmacies to ensure adequate enrollee access to home infusion therapy under Part D.

* CMS should require specific standards for home infusion pharmacies under Part D. The national accreditation organizations' standards for infusion therapy reflect the community standard of care for the provision of home infusion therapy, which far exceed the OBRA 1990 standards established for retail pharmacies.

* CMS should adopt the X12N 837 P billing format for home infusion claims under Part D so as to be consistent with the format that private sector health plans use for infusion claims.

* CMS should mandate that prescription drug plans maintain open formularies for infusion drugs to ensure that this population of vulnerable patients has appropriate access to necessary medications.

Thank you in advance for your consideration of these important issues.

Sincerely,

Margaret F. Thomas RN

GENERAL

GENERAL

I support increased utilization of generic prescriptions, when available. I would also like to see a "universal" card for Medicare (drug benefits) recipients. With this universal card, the customer could go to any pharmacy and receive the same benefit. Give pharmacist "Provider" status, so that when performing DURs (drug utilization review) of patients prescriptions, the pharmacist will have some real power to act on duplicate therapy and make therapy changes, instead of just making or noting meaningless comments in the patient's profiles.

Many other health care professionals have been given provider status, and I feel that pharmacist should also be given this same status because the pharmacist is the one "Provider" that a patient has easy access to w/r/t other healthcare professionals (i.e physician, nurse, etc.) and pharmacists receive numerous calls/questions from patients on a daily basis..much more so than many other "providers".

October 4, 2004

Centers for Medicare and Medicaid Services
Department of Health and Human Services
P.O. Box 8014
Baltimore, MD 21244-8014

Dear Sir or Madam:

I am writing today on behalf of the Arkansas Pharmacists Association concerning the proposed rules for Medicare Part B. I have several serious concerns about the rules as currently written.

Any Willing Provider/Access to Community Pharmacies

While the bill includes "any willing provider" language to explicitly address Congress' intent for access, the proposed rules pose problems in accomplishing this intent. TriCare Access standards will be circumvented if PDPs and MA-PDs are allowed to "average" the standards across a region. Many Medicare beneficiaries will have unequal access in all three designated areas: urban, suburban, and rural. By averaging the standard, Congress' intent for access is by-passed.

TriCare Access standards and any willing provider intent will also be avoided if plans are allowed to create "preferred" and "non-preferred" networks. Spreading the total savings across the whole network can maximize plan savings. PDPs and MA-PDs will attempt to meet TriCare Access standards with the network as a whole yet proceed to build a "preferred" network that may not meet those standards at all. Medicare beneficiaries in rural areas would be severely limited in their ability to receive the greatest possible savings.

In determining travel distances involved in meeting TriCare Access standards, "commercially traveled routes" should be applied, not the shortest distance between two points.

Level Playing Field for Mail Order Pharmacies and Community Pharmacies

Based on the medication received, rebates from drug manufacturers should be applied and passed on to the Medicare beneficiary equally in both mail-order and community pharmacy. In no case should the mail-order pharmacy employed by the plan be allowed to reallocate rebates received based on community pharmacy prescriptions in a way that would make the mail-order pharmacy seem less expensive. Many PDPs will be pharmacy benefit managers (PBMs), which own their own mail-order houses and will have a vested interest in routing prescriptions to them. Also, PBMs will employ numerous "games" to make discounts appear larger than they really are.

Conflict of Interest in the Use of Mail-Order Pharmacies

Plan sponsors who own mail-order houses SHOULD NOT be allowed to use their own mail-order pharmacies. This practice causes sponsors to attempt to unfairly disadvantage community pharmacies in order to move the prescriptions to their mail-order pharmacies (i.e. self-dealing).

Medication Therapy Management (MTM)

A minimum standard should be defined in the rules so that any Medicare beneficiary can be assured of the same care in the implementation of these services.

Minimum eligibility standards for MTM should be established (i.e. the number of medications and chronic conditions diagnosed for the patient). Without these minimum standards, eligibility could vary greatly between regions.

Payment for these services should be defined so that payment levels are not so low that pharmacies would not be able to afford to supply them. Lack of definition would force patients to receive their MTM services by telephone or some other method inferior to face-to-face care. Again, face-to-face care seemed to be the intent of Congress.

I thank you for allowing comment on these regulations and for your careful consideration of my concerns. Medicare beneficiaries should be allowed freedom of choice for their pharmacy providers. Survey after survey supports that senior patients want and expect that freedom.

Sincerely,

Mark S. Riley, Pharm.D.
Executive Vice President

attached are our comments related to this proposed regulation.

CMS-4068-P-1230-Attach-1.doc

October 4, 2004

Dr. Mark McClellan
Administrator
Centers for Medicare and Medicaid
Department of Health and Human Services
Attention CMS-4068-P
P.O. Box 8041
Baltimore, MD 21244-8014

Re: Medicare Prescription Drug Benefit – Comments to Proposed Rules

Dear Dr. McClellan:

The State of Idaho, Department of Health and Welfare respectfully submits the following comments regarding the proposed Medicare Prescription Drug Benefit Regulations, published in the Federal Register on August 3, 2004. Idaho recognizes CMS efforts to bring prescription coverage to our Medicare population and appreciates the opportunity to comment on these proposed regulations. Idaho's overriding concern is that the proposed regulations have the potential to increase administrative and financial burdens on the State.

Phase-Down Provision:

1. Section 423.910 (d) requires the States to submit an electronic file to CMS identifying each full benefit dual eligible enrolled in the State for each month with Part D coverage that is also determined to be full benefit eligible by the State for full Medicaid benefit.

   Issues related to this section:

   A. The process for submission has yet to be identified. The submission process is identified in the proposed rule as "a manner specified by the Secretary". Without knowing the manner or process that will be used the States cannot estimate what if any additional costs are going to be associated with this requirement and cannot determine how and when they can comply with this

requirement. The process needs to be identified and communicated as soon as possible so that States can meet the implementation timeline and identify new costs associated with this new process.

B. MSIS data is being used to establish the baseline however this process that will be identified by the Secretary will presumably not be from the MSIS reports. There is concern that once operational, the data used to determine phase down payments will not be consistent with the data used to develop the baseline.
C. In the preamble to the proposed rule it is estimated that this new process will place an additional burden on the States which is estimated to be 100 hours per State for start up and an ongoing burden of 122 hours per State per year. Since the manner/process is yet to be defined the actual burden on the States is really unknown. In fact Idaho has spent this amount of time preparing the baseline data – which has yet to be completed. This estimation appears to be exceedingly low.

2. Section 423.902 of the proposed rule states that the growth factor will be based on the most recent National Health Expenditure (NHE) projections for the years involved.

   Issues related to this section:
   A. The overall NHE projections do not reflect the inflation rate experience by Idaho or any specific Medicaid agencies.
   B. Using a national number, even if specific to Medicaid programs, is insensitive to the growth rates that have actually been experienced in each State. In affect, States that have made little or no effort to control the rate of growth of drug costs will be rewarded while States that have worked diligently to control drug costs will be punished.

      Using the Calculation of Phase-down Monthly Contribution for 2006 as described in the proposed regulations, best available data and the cumulative growth factor that we have experienced over the past 3 years we would estimate a monthly payment in 2006 of about $720,000. Each additional percent increase/year above our actual inflation experience represents an additional cost to Idaho of over $21,000 per month. For example, and estimated 11% inflation rate would cost Idaho an additional $65,416 per month or a total of $785,000 for calendar 2006.

3. Section 423 of the proposed rule states that 2003 calendar year is the base year upon which the monthly phase down payments will be based. There will be no adjustments made once this base year calculation is determined.

   Issues related to this section:
   A. Having a complete list of included and excluded costs are paramount for the States to determine the correct baseline rates. Without an approved list of

included and excluded drugs, as just one example, there is no way to determine an accurate baseline.

B. Since drug costs have experienced wide swings over the past few years – using a single year as the baseline and not allowing for any adjustments does not appear to be a fair approach for the States. See comments related to the rebate adjustment factor.

4. Section 423.910 (f) states that the Secretary establishes the rebate adjustment factor using total drug expenditures made and drug rebates received during calendar year 2003 as reported on CMS 64 Medicaid expenditure reports for the four quarters of calendar year 2003 that were received by CMS on or before March 31, 2004.

   Issues with this section:

   A. The assumption is that all of the rebates received during calendar year 2003 and prior to March 31, 2004 are related to the drug expenditure in calendar year 2003. This is an erroneous assumption as rebates can and are collected well after the actual drug expenditure. Baseline year calculation will not be accurate.
   B. The assumption is that the amount of rebates that States receive as a percentage of drug expenditures is a static number. This again is an erroneous assumption as the amount of rebates received by our State has continued to increase. Idaho has experienced over a 2.2% increase in rebates as a percentage of total drug expenditure between CY 2002 and CY 2003. This is not atypical for Idaho as the cumulative increase is over 8% from 1998 through 2003. Each percent difference in the rebate adjustment factor represents additional costs to Idaho of approximately $118,000 for the first year of the phase-down contribution.
   C. The rebate adjustment factor is figured on the total drug expenditure for the State – not just the dual eligible population. This population traditionally has higher drug utilization and presumably would represent a higher percentage of the rebates that the State receives, comparatively speaking. We request that an adjustment be made so that the rebate adjustment factor is more representative of the population in question.

Eligibility/Enrollment

1. Section 423.772 discusses family size. It is unclear what degree of relationship to the applicant is required to include an individual in family size.

2. Section 423.782 refers to cost sharing subsidy. Are individuals eligible for Medicaid HCBS considered “institutionalized individuals” for purposes of no cost sharing? This is not clear in the proposed regulations.

3. In section 423.904 – should the reference to the notice requirements be to 423.34(c) instead of 423.34(d)? Reference appears to be in error.

4. Section 423.904 states that the State agency must make eligibility determinations and redeterminations for low-income premium and cost-sharing subsidies. Section 423.906(a) specifies that regular Federal matching applies to eligibility determinations and notification activities for this Federal program. The State believes that an enhanced federal match should accompany the State's activity that supports this Federal program.

5. Section 423.42 (d) of the proposed rules provides that PDPs may disenroll participants for various reasons. Additionally and individual who is disenrolled for failure to pay monthly PDP premiums, disruptive behavior, or misrepresentation of third party reimbursement will not be provided a Special Enrollment Period permitting him/her in another PDP. Idaho encourages a thoughtful review of this section of the rule for the following reasons:

    A. Because Medicaid can no longer receive federal financial participation for paying for prescription drugs, dual eligible individual beneficiaries who are involuntarily disenrolled would face a significant hardship.
    B. The proposed rule creates a significant opportunity for a very vulnerable population to be denied access to needed medications. Without needed medications the participants, in particular those with mental health issues, have the potential to become unstable and may end up utilizing additional public funds to deal with crisis situations, institutional care, or imprisonment.
    C. Disruptive behavior is not defined in the proposed regulation. Disruptive behavior that is related to the participant's underlying diagnosis should not be a reason for disenrollment. Language used in 42 CFR 438.56(b)(2) that refers to managed care arrangements would also be appropriate in this setting. Without the addition of more defining language too much latitude will be given to the PDPs and there will be the potential that participants will be denied the medications they require to stabilize their condition.

Auto Enrollment

Section 423.34(d) states that full benefit dual eligible individuals who fail to enroll in a PDP or MA-PD plan during their initial enrollment period or special enrollment period under section 423.36(c)(4) will be automatically enrolled. The initial enrollment period is identified as November 15, 2005 through May 15, 2006.

Issues related to this section:

1. The actual process for auto enrollment is not identified in these regulations. The relationship between Federal and State responsibilities is not identified. Process,

roles and responsibilities for the State and Federal government must be defined as soon as possible.

2. Because Medicaid can no longer receive federal financial participation for paying for prescription drugs that are included in Part D, full benefit dual eligible individuals must be enrolled in a PDP by January 1, 2006. This provides a more limited period of the time for these beneficiaries to select a PDP of their choice. This seems to be in some conflict with section 423.859 "Assuring access to a choice of coverage."
3. Only a 45 day window exists for selection of a PDP or auto enrollment and the process is yet to be defined. Given the large volume of enrollment activity, there is significant opportunity for a number of full benefit dual eligible individuals, a vulnerable population, to have not be enrolled for part D benefits. Most importantly lack of prescription coverage for this vulnerable population could have a negative impact on their health. This could result in higher utilization of more expensive resources at additional costs to both the Medicare and Medicaid programs.
4. Not only will full-benefit dual eligibles not qualify for part D benefits if not enrolled, but also federal matching funds would no longer be available to the states for prescription drug coverage under Medicaid. As a result, this can have a significant financial impact on the states. It is imperative that the auto-enrollment process for full-benefit dual eligible individuals by completed by December 31, 2005.

Formulary

Section 423.120 of the proposed regulations covers access to covered Part D drugs. PDP or MA organization formulary must include at least two Part D drugs within each therapeutic category and class of covered Part D drugs. The covered Part D drug list is not included in these regulations.

Issues related to this section:

1. There will not be a single formulary for covered Part D drugs; rather each PDP will have their own formulary that need only include at least two Part D drugs within each therapeutic class of covered Part D drugs.
    A. A single formulary required of all PDPs would be an enormous aide to the States that desire to develop a wrap around drug program for dual eligible individuals.
    B. This approach is insensitive to a significant population of full benefit dual eligibles who are on multiple medications.

2. Recent correspondence from CMS (letter to Medicaid administrator dated September 9, 2004) has proposed a drug list for covered Part D drugs to be used only for the development of the program's baseline. It is explicitly stated in this correspondence that this is not the list that is to be used when the program is operational.

A. To coordinate drug benefits and assure adequate care for the dual eligible population the States need to know what drugs will be included and excluded in Part D as soon as possible. The coordination of State and Federal benefits will require system development and coordination that will take a significant amount of time. This cannot begin until the States have the included and excluded drug lists.
B. It is unclear to the State how having one list of included drugs for the development of the baseline year and a different list of included drugs for the actual Part D program can result in accurate calculation of Phase Down payments.

The State of Idaho appreciates the opportunity to comment on the Medicare Part D program proposed regulations. We are concerned that the proposed regulations have a significant opportunity to reduce the current drug benefit that is being experienced by full benefit dual eligible participants through State Medicaid programs. The proposed regulations do not define processes that will be an integral part of the Medicare Part D program and without this definition the cost to the States cannot be projected. It is our concern that the additional burden placed on the States may result in increased costs to the States and, in some cases, decreased benefit to the Medicare dual eligible population.

Sincerely,

DAVID A. ROGERS
Administrator

Re: Proposed Rule—Medicare Program; Medicare Prescription Drug Benefit (CMS-4068-P)

To Whom It May Concern:

On behalf of the National Community Pharmacists Association (NCPA), I would like to submit the following comments regarding CMS-4068-P.

We support the use of a facilitator (FAC) in the processing of TrOOP and COB claims. Without a FAC, the burden placed on PDPs and claims processors could be exponential due to the complex nature of these claims (i.e., from reversals, resubmissions, etc.).

While we favor the FAC model, we also have some concerns with respect to using a prominent switch company (e.g., NDCHealth or another single entity) as a FAC. Our concerns primarily revolve around the net effect on pricing and freedom of choice with regards to switch companies.

1) Pricing - Today, the majority of pharmacy transactions are single switch transactions (provider - payer - provider). A small percentage of transactions require multiple switches (e.g., COB). The FAC model inherently involves a multitude of multiple switches to various payers, thus theoretically increasing the cost associated with full processing of a claim. Our concern for pharmacy, in general, is the fees associated with these complex processes. One common concern in the industry with respect to the Medicare Drug Program is the decreasing margins at the pharmacy level. While this logic is debatable, adding a higher switching fee for these types of complex claims would only add more fuel to the fire and continue to further decrease pharmacy margins.

2) Switch Providers - The fact that NDC is eyeing the opportunity to serve as a FAC concerns us as well. NDC is well known in the industry as the leader in claims switching (however, competitors such as eRx and WebMD continue to gain ground in this area). Our concern with placing a prominent switch company in the role as a FAC is the potential for an unfair advantage in the switch marketplace. This could result in decreased competition and create an environment susceptible to price increases for general claims switching services. Provisions would need to be made to allow equal access to the FAC by all switching companies so that no one switch provider would be placed at an economic disadvantage. In addition, measures should be taken to prevent any switch company serving as a FAC from creating a monopolistic environment.

The National Community Pharmacists Association (NCPA) represents the nation's community pharmacists, including the owners of 24,000 pharmacies. The nation's independent pharmacies, independent pharmacy franchises, and independent chains represent a $78 billion marketplace, dispensing nearly half of the nation's retail prescription medicines.

Thank you for the opportunity to provide these comments. Please feel free to contact me if I can provide you with any further assistance concerning this issue.

Sincerely,

Kathryn F. Kuhn, R.Ph.
Senior Vice President, Pharmacy Programs

Re: Comments on CMS-4068-P
The Proposed Rule for the Medicare Prescription Drug Benefit

Dear Dr. McClellan:

On behalf of Apria Healthcare Inc., I am pleased to submit these comments regarding the proposed rule to implement the new Medicare Part D prescription drug benefit. Specifically, these comments pertain to the recent notice published in the *Federal Register* on August 3, 2004.[1]

Apria is a leading provider of integrated home care services and products. Apria offers a full range of home infusion drug therapy, as well as home medical equipment and home respiratory therapy. Through 30 wholly-owned, licensed and JCAHO-accredited infusion pharmacies, Apria serves adult and pediatric patients with a wide range of infectious diseases, nutritional disorders, cancer and chronic illnesses such as Lou Gehrig's Disease and multiple sclerosis. Aside from the thousands of people covered by private managed care organizations who benefit from Apria's home infusion services, the company also cares for a significant number of elderly patients throughout the United States who have complex medical problems and multiple co-morbidities who require home infusion therapy and are covered by Medicare Advantage (MA. formerly Medicare+Choice) plans.

These comments are divided into the following sections:

I. General
II. Dispensing Fees for Home Infusion Drug Therapy
III. Contracting with Home Infusion Drug Pharmacies
IV. Formulary Development

[1] Medicare Program; Medicare Prescription Drug Benefit; 69 *Fed. Reg.* 46632 (Aug. 3, 2004).

I. General

We wish to commend CMS for engaging in the research necessary to understand many of the unique characteristics of home infusion drug therapy. These findings are reflected in the preamble of the proposed rule, which summarizes the various services and functions that are required to provide home infusion drug therapy safely and effectively in the home care setting.

We applaud CMS for recognizing in the proposed rule the clinical and cost benefits of home infusion drug therapy, as well as the essential role this area of therapy plays in the private sector health system and under Medicare managed care programs. The proposed regulation describes an interpretation of the Part D benefit that would include the essential services, supplies and equipment that are integral to the provision of infusion drug therapy provided in the home (see discussion of "Dispensing Fee Option 3" below).

If Dispensing Fee Option 3 is adopted in the final regulation, as we recommend, then the Medicare fee-for-service program can offer coverage of home infusion drug therapy comparable to what private sector health plans and Medicare Advantage plans have offered for years. In doing so, Medicare would realize the significant system-wide savings that come from the provision of infusion drug therapy in the most cost-effective setting.

A. Home infusion drug therapy provides an opportunity for Medicare Part D to replicate the success achieved by private sector health plans and Medicare Advantage plans.

Currently, many of the infusion drug therapies used commonly in the private sector, such as antibiotic therapy used in the treatment of severe infections, are not covered under the Medicare Part B durable medical equipment (DME) benefit. Coverage under the DME benefit is based on the use of an item of DME – in this case, an infusion pump − and extends only to a few designated drugs, most of which are used in the treatment of cancer and intractable pain. As a result, Medicare beneficiaries who could have received infusion drug therapy at home have been forced into far more costly settings, such as acute care hospitals, hospital outpatient departments, hospital emergency rooms and long term care facilities.

In contrast to the limited coverage that exists under Medicare Part B, Medicare coverage of home infusion therapy has worked well under Part C with the Medicare Advantage plans. Many if not most Medicare Advantage plans provide coverage for a broad range of home infusion therapies and related services as a <u>medical</u> benefit. Examples include Aetna US Healthcare, Humana Health Plans, PacifiCare's Secure Horizons plans and Presbyterian Salud in New Mexico. Clearly, these plans would not provide this optional coverage unless they were convinced that coverage of home infusion therapy in the home setting is cost-effective.

For Medicare Advantage plans, home infusion has provided significant system-wide savings by enabling beneficiaries to receive infusion therapy without incurring hospital or nursing facility costs. Medicare Advantage plans cover the homecare pharmacy, nursing and other in-home services, supplies, equipment and same-day, in-home delivery/patient teaching necessary for the provision of home infusion therapy. The effectiveness of home infusion therapy under Part C, and the manner in which Medicare Advantage plans define and cover this therapy, can be a model for infusion coverage under Part D.

B. Specific requirements must be established by CMS to ensure that Medicare Part D makes use of home infusion drug therapy in the same fashion as private sector and Medicare Advantage plans.

Stand-alone Part D prescription drug plans (PDPs), in the absence of specific requirements or direction from CMS, will not embrace drug therapies such as home infusion drug therapy because the PDPs will be rewarded for contributing to system-wide savings on the drugs alone. As a result, the financial incentives that have driven private payer acceptance and use of home infusion drug therapy will not exist for stand-alone PDPs.

As a result, specific requirements and direction from CMS are necessary for the coverage of home infusion drugs to work properly. We urge CMS to ensure that the Final Rule contains provisions relating to home infusion drug therapy on the issues discussed in the remainder of these comments, including such issues as dispensing fees, pharmacy access, formulary provisions and the formatting of claims.

II. Dispensing Fees for Home Infusion Drug Therapy

A. CMS should adopt Dispensing Fee Option 3, which is the only proposed option that would adequately recognize the services and items that are necessary to provide home infusion drug therapy.

Congress' definition of prescription drugs under the statute clearly includes infusion drugs provided in the home, and the proposed rule likewise reinforces the fact that infusion drugs (other than the few drugs currently covered under Part B) are included in the Part D benefit.

However, for the coverage of home infusion drugs to be meaningful for Medicare beneficiaries, CMS also must cover the services, supplies and equipment related to the provision of these drugs. Limiting coverage to the drugs only without the services, supplies and equipment will not produce meaningful coverage of infusion drugs in outpatient settings. This is because infusion pharmacies will be unable to provide infusion drugs without adequate payment for the services, supplies and equipment.

The most appropriate mechanism for such coverage of infusion services, supplies and equipment provided under the proposed rule is the dispensing fee. In the preamble, CMS sets out three options for defining dispensing fees under the new benefit and invites comment on each.

- Option 3 comes closest to accurately recognizing the fundamental elements – including the services, supplies and equipment – that are essential for the provision of home infusion drug therapy. Option 3 is the only option that reflects the fundamental elements of home infusion drug therapy (see additional discussion in subsequent sections of these comments).

- In contrast, Option 1 only provides the perspective of retail pharmacies and does not meet the needs of Medicare beneficiaries requiring home infusion drug therapy.

- Although Option 2 captures the supplies and equipment used in the provision of home infusion drug therapy, this option falls far short of recognizing the essential professional services required to provide home infusion drug therapy because it does not recognize the professional services that are required to provide safe and effective infusion therapy in the home.

B. CMS should adopt Dispensing Fee Option 3 because it is consistent with the well-established standards of practice for home infusion drug therapy.

The major independent accreditation organizations, including the Joint Commission on Accreditation of Healthcare Organizations (JCAHO), have established extensive, detailed standards regarding the patient management, support services, facilities, patient safety, policies, procedures and functions that must be provided by home infusion pharmacies. These standards, which address issues ranging from the requirements for sterile preparation of infusion drugs to the oversight of patient therapy, are significantly different from the standards governing traditional retail pharmacies.

Option 3 is the only dispensing fee option that adequately reflects the content of these national accreditation standards. For example, one major difference between retail pharmacies and home infusion pharmacies is the urgency surrounding the initial referral from a physician or hospital and the resulting home delivery/patient education requirements. Due to the severity of the patient's illness (such as a serious infection which has not responded to oral medications), pressures on hospitals to discharge patients as soon as possible, and stability/refrigeration requirements for many medications, home infusion pharmacy staff frequently have to deliver directly to patients' homes the same day as the referral. This is considerably more expensive than a retail pharmacy model where the patient or caregiver visits the pharmacy in person to pick up the drug. All of this must take place in conjunction with insurance verification, coordination with the nurse who will teach the patient, compounding by a home infusion pharmacist, and eventually, billing third party payors and collecting patient co-pays – all activities that are not applicable to the retail setting.

The well-established understanding of the professional services involved in providing in home infusion drug therapy is not merely an industry definition. Payers, clinicians, clinical societies, providers and accrediting organizations share a common understanding of what is involved in providing these therapies in outpatient settings.

C. CMS should adopt accreditation requirements under Dispensing Fee Option 3 as a straightforward means to protect Part D enrollees.

As the first homecare provider to seek and obtain JCAHO accreditation in the 1980s, Apria has a longstanding commitment to ensuring that the professional services and functions we provide meet a demanding set of quality standards. Apria recently completed its latest triennial survey cycle, with a successful outcome in all infusion pharmacies, respiratory and medical equipment locations. Our company has served as a pilot for innovative survey techniques developed by the JCAHO, and our management has formally served on advisory committees of the organization. Today, our quality standards meet or exceed JCAHO's requirements, which is a requirement of the over 2500 private sector managed care plans with which we contract to provide home infusion services.

In the final rule, CMS should address the qualifications of the infusion pharmacies that may provide the elements of care described under Dispensing Fee Option 3. We recommend that CMS require every pharmacy providing infusion services to be accredited as a home care pharmacy by a recognized national accrediting organization. We also recommend that every entity that provides nursing services to Part D infusion patients be either accredited as a nursing agency as an extension of their existing home infusion accreditation, or be a Medicare-certified home health agency.

Private sector plans require accreditation as a basic assurance that the pharmacists and nurses are experienced and the pharmacies are staffed properly to provide the necessary care. The quality standards required of home infusion pharmacies and nursing agencies by the accreditation organizations have become the community standard for the provision of home infusion therapy.

D. CMS should use a refined version of Dispensing Fee Option 3 to define the full scope of necessary professional infusion pharmacy services.

All infusion patients, whether or not they qualify for the home health benefit, require professional pharmacy services that again differ from those found in the retail setting. The general categories of such services are:

- Compounding medications in a sterile environment
- Dispensing
- Ongoing Clinical Monitoring
- Care Coordination with other agencies involved in patient care

- Provision of Supplies and Equipment
- Multiple Categories of Pharmacy Professional Services, such as pharmacokinetic drug monitoring or parenteral nutrition formula development
- Administrative Services
- In-home delivery, patient and caregiver education
- Third party billing
- Other Support Costs

These services are described in greater detail in a number of accreditation materials and other forums, including a document on the website of the National Home Infusion Association describing the "per diem" model.[2]

We propose a modification to Dispensing Fee Option 3 to more explicitly describe the pharmacy professional services that are needed for home drug infusion therapy. The pharmacy services referenced above in the model per diem definition (and generally described in Dispensing Fee Option 3) should be included in the dispensing fee for all Part D infusion patients. Most of these functions would be captured in the Option 3 definition of dispensing fees.

Both private payers and Medicare Advantage plans use per diem payments that are tied to the intensity level of the particular infusion therapy. For over 20 years, these plans have essentially developed resource-based relative value scales to capture the intensity, in terms of time and resources involved in providing each infusion therapy safely and effectively. Thus, the plans do not use a single per diem amount for all infusion therapies. We recommend that the PDPs follow this approach under Medicare Part D.

E. CMS can establish easily-administered safeguards to avoid any duplicate payments for nursing services

CMS raises a question in the proposed rule regarding how to ensure that the services captured in Dispensing Fee Option 3 are not reimbursed under the home health benefit or otherwise.

The potential area of concern involves the infusion patients who also qualify for the Medicare home health benefit. For this subset of infusion patients who also qualify for the home health benefit, it would be a simple matter to first determine whether a beneficiary qualifies for the home health benefit before reimbursing Part D funds for nursing services. The majority of beneficiaries who require infusion drug therapy do not qualify for the home health benefit, and their nursing services should be paid under the Part D benefit as part of the dispensing fee.

---

[2] National Home Infusion Association. National Definition of Per Diem. June 2003. *Available at* www.nhianet.org/perdiemfinal.htm.

Importantly, the home health benefit does not cover any of the pharmacy services described in the preceding subsection of these comments.

By first identifying beneficiaries who qualify for the home health benefit, the nursing component, when medically necessary, should be reflected in the dispensing fee but only for beneficiaries who do not qualify under the home health benefit for nursing services. Importantly, nursing care is not included in the model per diem definition (discussed above) nor in the HCPCS "S" coding structure (discussed below) used by private payers.

Private payers typically separate out nursing from the pharmacy-related costs represented by the per diem. They share the Medicare program's natural concern about nursing costs, and these plans have concluded the best means of tracking and controlling nursing costs is to use a separate payment mechanism for nursing.

F. CMS can establish easily-administered safeguards to avoid duplicate payments under Medication Therapy Management Programs.

CMS asks for comments regarding how to ensure that the Medicare program avoids making duplicate payments if the PDPs pay for infusion-related dispensing fees as well as medication therapy management services.

Generally, the dispensing fee as defined in Dispensing Fee Option 3 will capture most of the services and functions described in our per diem model plus the nursing component, and there will not be a clear need for a separate payment to infusion pharmacies for additional medication therapy management services. We believe that the primary situation where medication therapy management services may be indicated is where an infusion pharmacy has to coordinate the activities of another pharmacy.

However, if CMS does not choose Dispensing Fee Option 3 for defining dispensing fees, then CMS should not consider the medication therapy management program as a substitute for covering the services, supplies and equipment required to provide infusion drug therapy. The limitations on the applicability of the medication therapy management program (*i.e.*, it is limited to patients with chronic conditions and multiple medications) make it a poor vehicle for capturing the clinical monitoring functions required of infusion pharmacies for all infusion patients.

III. Contracting with Home Infusion Pharmacies

A. CMS should establish separate and distinct requirements for PDPs to contract with sufficient numbers of home infusion pharmacies to ensure adequate enrollee access to home infusion drug therapy under Medicare Part D.

CMS should establish specific safeguards for home infusion pharmacies to ensure meaningful enrollee access to home infusion drug therapies. A number of important differences exist between home infusion pharmacies and traditional retail pharmacies that highlight the need to create separate requirements for the two types of pharmacies. For example–

- Home infusion pharmacies provide specific essential services that are not provided by the vast majority of retail pharmacies or mail order pharmacies.

- Home infusion pharmacies must maintain facilities, equipment and safeguards for compounding and storing sterile parenteral drug solutions, which is not common among retail pharmacies.

- Home infusion pharmacies are responsible for the care of their patients 24 hours a day, seven days a week, while retail pharmacies are not.

- Home infusion pharmacies are subject to separate state licensure, regulations and accreditation standards from retail pharmacies.

- The contracts used by private health plans for home infusion pharmacies are structured differently from the contracts used for retail pharmacies.

- The total number of traditional retail pharmacies in the United States far outweighs the total number of home infusion pharmacies.

These differences are echoed in the preamble of the proposed rule, where CMS discusses its findings regarding important distinctions between home infusion pharmacies and retail pharmacies.[3]

To ensure that Part D enrollees have sufficient access to home infusion drug therapy, CMS should adopt its proposal to establish distinct access standards for home infusion pharmacies in the Final Rule. This would be consistent with Congress' general mandate that CMS must ensure enrollees have convenient access to pharmacies, as access to a retail pharmacy does not by itself meet the needs of a beneficiary who requires infusion therapy.

B. CMS should require use of the ASC X12N 837 claims format for infusion drug therapy, consistent with CMS' recent determination, because infusion claims formats are different from retail pharmacy claims.

CMS' Office of HIPAA Standards has carefully reviewed how home infusion therapy is provided, and recently issued a Program Memorandum[4] and a Frequently Asked Question (FAQ)[5] document on the CMS website summarizing its conclusion.

[3] 69 *Federal Register* at 46648 and 46658.

For example, the FAQ document states:

> …Home infusion therapy typically has components of professional services and products that include ongoing clinical monitoring, care coordination, supplies and equipment, and the drugs and biologics administered – all provided by the home infusion therapy provider.

In a letter dated April 8, 2003, Jared Adair, director of the CMS Office of HIPAA Standards, wrote:

> …we have determined that home drug infusion therapy services are different from services provided by retail pharmacies, and that the business model for home drug infusion therapy providers is fundamentally different from a retail pharmacy for dispensing drugs…. We also acknowledge that a requirement to bill home infusion drugs using the NCPDP format would fail to meet the administrative, clinical, coordination of care, and medical necessity requirements for home drug infusion therapy claims." (emphasis added)

As a result, CMS determined that the National Council for Prescription Drugs Program (NCPDP) claim format, which is the HIPAA standard for the processing of retail pharmacy drug claims, is not appropriate for the filing of home infusion drug therapy claims. Instead, CMS instructed that home infusion claims, to be compliant with HIPAA, must be filed under the ASC X12N 837 claims format.

Please note that the description of infusion therapy as described in the FAQ tracks very closely with the language of Dispensing Option 3 in the proposed rule. We recommend that the specific wording already posted on CMS's FAQ be included as the infusion claiming requirement in Part D regulations. To do so will increase the level of administrative standardization in infusion claims transactions per the objectives of HIPAA, while also ensuring that home infusion providers and Part D payers comply with the HIPAA regulation when implementing Part D claiming transactions. If CMS does not require that Part D home infusion therapy claims be submitted on the 837, then it would open up the possibility for some Part D payers to ignore the fundamental differences of home infusion therapy from retail pharmacy and implement only NCPDP claiming—forcing infusion pharmacies to be out of compliance with HIPAA.

---

[4] Centers for Medicare & Medicaid Services, Program Memorandum, Carriers, Transmittal B-03-024 (4/11/03), *available at* http://cms.hhs.gov/manuals/pm_trans/B03024.pdf.

[5] Centers for Medicare & Medicaid Services, Frequently Asked Questions (FAQs), "Are Drug Transactions Conducted by HIT Providers Retail Pharmacy Drug Claim Transactions Billed Using NCPDP Formats?" (Answer ID 1880) (3/31/03), *available at* http://questions.cms.hhs.gov.

This would deprive the PDPs and CMS of a valuable tool for tracking important patient-specific data. Consolidated 837 claiming would facilitate the consolidation of all drugs along with the professional pharmacy "per diem" services, equipment and supplies into single claims billed for infusion therapies, easily mapped into patient services utilization data bases for analysis—whereas the possibility of billing infusion drugs separately via the retail NCPDP claim format results in loss of this consolidated data for analysis.

C. CMS should recognize that infusion coding is different from retail pharmacy drug coding.

Since 2002 the Healthcare Common Procedure Coding System (HCPCS) provides approximately 80 "S" codes for home infusion therapy services. Most codes reflect a "bundled" per diem approach in which most or all of the supplies and services provided to a home infusion patient are billed under a single code. This complete system of "S" codes for home infusion therapy services is specifically designed for use by private payers, and are available for use by government payers that adopt this widely used private sector methodology for infusion coding and payment. These codes are not used in coding of retail pharmacy drug claims and are not permitted for HIPAA-compliant use on the NCPDP transaction).

Although CMS does not have a single HIPAA coding standard for drugs, we believe that the PDPs and CMS will find requiring NDC drug coding for Part D claims will provide best opportunity for patient utilization analysis and tracking of total Part D drug costs for CMS's program administration. We believe the Part D regulations should require that all claims for drugs be coded with NDC numbers.

D. Coordination of benefits.

In addition to these reasons for infusion claiming and coding consistency, the COB portion of the Part D program is also best implemented by CMS's establishing a requirement for 837 claiming and use of the established coding systems. The majority of COB will occur with commercial payers such as the Blues and other private health plans. As the private sector has already widely adopted the established coding systems described above, it will be important for CMS to require consistent coding adoption to make COB work, ensuring that the allocation of payment for services between Part D plans and other primary or secondary plans works well.

Since the private payer sector accepts home infusion therapy claims using the HIPAA-compliant X12 N 837 format, for COB to work effectively is another reason that CMS should require PDPs to use the 837 claim format for infusion claims. Because a very large majority of private infusion payers use the HIPAA-complaint *professional* 837 (837P) claim format, to make COB work we believe that CMS's Part D regulations should require PDPs to adopt the HIPAA-compliant 837P format only, excluding both the *institutional* 837 and NCPDP transaction from use.

E. CMS should clarify the any willing provider requirements with respect to home infusion drug therapy.

CMS should clarify that this access safeguard is to be applied to any willing provider of home infusion therapy meeting the infusion-specific quality standards (see below), as distinct from retail pharmacies. Such a requirement is consistent with the statutory language.[6]

In addition, for the purpose of the any willing provider requirements, CMS should clarify that prescription drug plans should have a standard contract for home infusion pharmacies.

These recommendations for the network access standards will help safeguard enrollee access by ensuring that the Medicare Part D benefit reflects common private sector practices for home infusion drug therapy. In addition, the recommended clarifications will not impose significant burdens on PDPs.

F. CMS should recognize that OBRA 1990 standards do not represent the standard of care for infusion pharmacies.

In the preamble, CMS refers to Section 54401 of the Omnibus Reconciliation Act of 1990, stating that the regulations issued pursuant to that section in 42 CFR 456.705 "describe currently accepted standards for contemporary pharmacy practice and our intent is to require plans to continue to comply with contemporary standards." CMS seeks comments on whether these standards are industry standards and whether they are appropriate for Part D.

The OBRA 1990 standards were written for retail pharmacies. The drafters of these standards did not attempt to address the standard of care for infusion pharmacies. Infusion pharmacies that are in compliance with the infusion-specific standards established by accrediting organizations meet the OBRA 1990 standards, but the OBRA 1990 standards do not reflect "contemporary pharmacy practice" for infusion pharmacies. The community standard of care for infusion pharmacies is found in the accreditation standards that are required by virtually every private health plan, as well as numerous MA plans, to participate in their provider networks.

The quality assurance standards followed by home infusion pharmacies—and as required for accreditation--far exceed the OBRA 1990 standards. Due to advances in newly-approved drugs and technology and additional laws and regulations established in the intervening years (such as HIPAA), and development of knowledge surrounding patient safety and medication management at home, the level of patient data collection, assessment and intervention in the infusion clinical model goes far above and beyond the quality standards currently used for Medicaid. Again we respectfully direct your attention to Jared Adair's April 8, 2003 comments concerning the key differences between retail and home infusion pharmacies.

[6] Social Security Act, Section 1860D-4(b)(1)(A).

IV. Formulary Development

A. CMS should mandate that PDP and MA-PD plan sponsors maintain an open formulary for infusion drugs to ensure this population of vulnerable patients has appropriate access to necessary medications.

Much of the MMA is based on the premise that Medicare can take advantage of cost-savings techniques commonly used in the private sector and still deliver quality services to Medicare beneficiaries. CMS should note that although private health plans commonly use restricted or preferred formularies for drugs delivered orally, via patch or other non-invasive methods, private plans rarely apply these formulary restrictions to infusion drugs.

As discussed in greater detail below, there are numerous clinical and operational barriers to establishing formularies for infusion drugs. As a result, with respect to infusion drugs, formularies should remain open.

B. CMS should recognize that PDPs and pharmacy and therapeutics committees are not well situated to evaluate infusion drugs.

It will be difficult for PDPs and traditional pharmacy and therapeutics committees (P&T committees) to evaluate infusion drugs in the same manner that they evaluate orally administered drugs.

P&T committees generally evaluate the relative safety, efficacy, and effectiveness of prescription drugs within a class of prescriptions drugs and make recommendations to a health plan for the development of a formulary or preferred drug list. Frequently, P&T committees focus on the "therapeutic equivalence" of different multisource drugs (*i.e.*, whether one drug will have the same desired clinical impact as another). However, such evaluations are performed in a context where the method of administering the drug is not significant.

In contrast to oral drugs, the method of administration for an infusion drug may have separate and significant clinical and cost implications. All infusion drugs require a device of some type to deliver the drug into the body, including various catheters temporarily or semi-permanently implanted in each patient depending on the anticipated duration of therapy, potential side effects of the drug and the patient's diagnosis itself. Various methods of drug delivery also exist, from IV bags hung on poles to sophisticated external or internal infusion pumps. A patient's clinical condition may determine not only what device is selected for delivery, but also what drug should be used. For instance, many patients receiving infusion therapy are at high risk of infection or complications from infection. Consequently, a physician may need to choose a medication that can be prepared in advance in a pharmacy clean room and administered once a day to reduce the risk of infection from preparation in the home or multiple intravenous access device manipulations.

Similarly, in selecting a medication for a patient, a physician often needs to consider administration access type and what delivery technology will be best suited for use in a particular patient's home. If the patient is capable of managing a portable infusion pump, drugs requiring longer infusion times may become more clinically appropriate. If other technologies are used, such as IV bags hung on poles, the patient may require more frequent nursing visits to monitor the risk of infection.

The typical P&T Committee would usually not have the experience to evaluate the administration technology or professional support requirements, such as nursing visits, in reviewing infusion drugs. Furthermore, such committees do not typically make decisions considering all available treatment options throughout the continuum. Drugs considered ideal in an inpatient setting are often not desirable in the home setting and visa versa, especially where the first dose of the drug is concerned. Examples include Taxol® for ovarian cancer, Lovenox® for deep vein thromboses and certain immune globulins.

In addition, most infusion drugs must be compounded by the pharmacy. Once compounded, these drugs lose stability over time or be impacted by changes in temperature. For oral drugs, the frequency of administration or stability issues usually do not pose challenges for a P&T Committees as they try to determine therapeutic equivalence.

Ultimately, the infrastructure for protecting patient interests in formulary decisions—the traditional P&T Committee—does not have the ability to evaluate the extra-pharmacological considerations that must be taken into account for infusion treatment, including the administration device, drug stability, proximity to a compounding pharmacy, available administration access site and infection risk. Typically, these factors would be addressed by a physician or pharmacist knowledgeable about an individual's patient's circumstances and history when selecting a drug and delivery device.

C. CMS should recognize home infusion patients as a particularly vulnerable population that requires additional protection.

Patients receiving home infusion therapy are one of the truly vulnerable populations of the Medicare population, and as CMS acknowledged in the Proposed Rule,[7] the medical needs of such populations necessitate that they receive special protection under Medicare Part D. Infusion drugs are used to treat some of the most severe illnesses, including cancer, severe infections, pain and loss of gastrointestinal integrity.

Although the Medicare Part D regulations do create an appeals process for patients if their physician's choice of medication is not on formulary, patients with these compromising illnesses are the least capable of exercising an appeals right. If a patient does not have a family member or physician willing to take on the burden of being an advocate, then the patient's care could be compromised.

[7] 69 Fed. Reg. at 46661.

* * * *

We commend CMS for its initial efforts to understand and accurately define home infusion drug therapy under Medicare Part D. There is an important opportunity for the program to replicate the successes achieved by private health plans and Medicare managed care plans. There is also a risk that in the absence of sufficient direction from CMS and some targeted safeguards, the benefits of home infusion drug therapy will be lost for both beneficiaries and the overall Medicare program.

We would be pleased to provide additional assistance regarding these important issues. Please contact Lisa Getson, Apria's executive vice president, at 949-639- 2021 if you have any questions or comments.

Sincerely,

Lawrence M. Higby
President and Chief Executive Officer

JANET SCHALANSKY, SECRETARY

SOCIAL AND REHABILITATION SERVICES

October 4, 2004

Centers for Medicare and Medicaid Services
Department of Health & Human Services
Attention: CMS-4068-P
P.O. Box 8014
Baltimore, Maryland 21244-8014

Dear Sir or Madam:

The Kansas Department of Social and Rehabilitation Services respectfully submits the following comments regarding the proposed rule on the Medicare Prescription Drug Benefit published Tuesday, August 3, 2004. Comments are grouped under section identifiers as requested in the proposed rule.

One general comment needs to be made. Because of the statutory and regulatory requirements regarding states' responsibilities in implementing and administering activities related to Part D, it is absolutely critical that access to federal data be provided in a timely and thorough manner. Specifically Kansas requests access to online real time entitlement and enrollment information for not only Part D and subsidy eligibility but also Part A and B. This should occur through access to the Common Working File.

Subpart B - Eligibility & Enrollment

Section 423.34 - <u>Enrollment Process</u>

Because of the level of information required for the auto enrollment process and the resources needed to carry it out, the State would recommend that the Centers for Medicare & Medicaid Services (CMS) take the lead for this process. Information will need to be obtained in order to better guarantee that the person is enrolled in an appropriate plan taking into consideration their living arrangement, specific drug needs, and available participating pharmacies. CMS is in the best position to accomplish this task with information provided from the states and SSA.

Section 423.36 - <u>Initial Enrollment Period</u>

The State is concerned regarding the impact of the initial enrollment period for persons who are fully dually eligible at the time of this enrollment process. Per section 423.906, a person who is eligible for Part D and also is a full benefit dual eligible, medical assistance under Medicaid is not available for drugs that could be covered under Part D. It appears that in order to protect drug coverage from lapsing as of January 1, 2006 for current Medicaid eligibles, the individual would need to enroll by the

end of December 2005. If this is correct, the period of time to accomplish such enrollment (November 15 through December 31) is not sufficient for the number of beneficiaries who will be impacted. The State strongly recommends that an additional period of 90 days or more following January 1 be provided for Medicaid to continue paying drug claims for consumers who have not yet been able to complete the Part D enrollment process.

This same approach will likely be necessary for consumers who newly apply for full Medicaid coverage during this initial enrollment period for Part D. For example, a person who has not yet enrolled for Part D applies for Medicaid on December 20, 2005 and would qualify as a fully dual eligible. If the Medicaid application is not processed until January 15 but Part D enrollment does not take effect until February, the person would again appear to be left without drug coverage for the month of January.

On an ongoing basis, this additional Medicaid coverage period may need to be applied in certain instances involving the individual's own initial enrollment period for Part D. Persons may apply and qualify for full Medicaid coverage and be not only currently eligible but also eligible for Medicaid coverage in the three prior months. If not enrolled in Part D during this period, again the person would be left without drug coverage until that enrollment is completed.

Lastly such an extended Medicaid coverage period may need to be applied in situations where retroactive Medicare entitlement is established. Per section 423.4, a Part D eligible is defined as a person who is entitled to or enrolled in Part A and/or Part B. There will be instances in which an individual is retroactively enrolled in Parts A or B because of a delayed approval for disability benefits. Such persons may have received Medicaid during this time and had their drug costs covered. Once approved for retroactive enrollment in Parts A or B, the person would now become a retroactive full dual eligible. As the person was not enrolled in Part D during this time, any retroactive drug coverage would potentially be in violation of these regulations. The regulations would appear to require the State to fully reimburse CMS for the coverage provided, yet do not allow the beneficiary to enroll in Part D retroactively.

Because of these and similar instances, the State strongly encourages CMS to provide for either retroactive Part D enrollment and coverage or permit an interim period of Medicaid drug coverage to account for such situations.

Subpart C - Benefits & Beneficiary Protections

Section 423.100 - <u>Definitions</u>

Prescription drug coverage under Part D has been limited for institutionalized consumers so that only

those residing in skilled nursing facilities are eligible. The State disagrees with this limitation and believes that all institutional settings including ICF-MR's should be included. In addition, persons accessing long term care services through home and community based services waivers should also be included. Individuals in these living arrangements should be assured access to coverage of all drugs through Part D.

Subpart P - Premiums & Cost Sharing Subsidies for Low Income Individuals

Section 423.772 - Definitions

The definition of full benefit dual eligibles includes persons who meet a medically needy spenddown in a month. Such definition is extremely problematic as the person will go in and out of full benefit classification on an ongoing basis making continuity of drug coverage next to impossible. There is also an issue with persons who meet spenddown in a prior period but who are back in spenddown status in the current month of application. The State proposes that medically needy individuals who meet spenddown be viewed as meeting the full benefit dual definition for a continuous period of up to 12 months even though going back into spenddown status during this time.

Section 423.773 - Requirements for Eligibility

The State strongly concurs with the inclusion of QMB, SLMB, and QI 1's as full subsidy eligible without the requirement for a separate determination.

Section 423.774 - Eligibility Determinations, Redeterminations, and Applications

The regulations provide for a duplicative application and determination process in which persons may apply for low income subsidies with either the State or Social Security Administration. As the subsidy is directly tied to Medicare coverage, this process is best handled as an SSA function. However, it is understood that many low income subsidy applicants may qualify for the Medicaid Savings Programs (QMB, SLMB, QI1) and thus automatically qualify for a subsidy. The State recommends that where an application is filed with the State and the person does not qualify for a Medicaid category that would result in automatic qualification for a subsidy, the information be provided to Social Security for a determination of subsidy eligibility. This can best be done by permitting SSA to use the State's application to make the subsidy determination. This would prevent the State from expending substantial funds and resources on modifying eligibility systems to handle the subsidy determination. That determination uses income and resource rules as well as family size definitions that differ substantially from Medicaid rules applied is in most states. SSA should also handle the redetermination and appeal process for all subsidy-only consumers. Information systems also need to be developed to better share information gathered between the two entities.

There do not appear to be any provisions regarding treatment of individuals who lose subsidy eligibility, particularly those who are deemed eligible by virtue of Medicaid eligibility. Processes need to be put into place for SSA to redetermine subsidy eligibility before the subsidy is eliminated. This may occur in instances where the individual has failed to return a Medical redetermination form or in which they have moved to another state and not contacted the new state agency for continued

Medicaid coverage. Proper and timely notification is critical before the subsidy is withdrawn.

Subpart S - Special Rules for States

Section 423.910 - <u>Requirements</u>

The baseline for determining the state's contribution doesn't take into consideration deductions for recoveries received as a result of such activities as estate recovery, medical subrogation, consumer overpayment recoveries, and third party collections. The State requests such activities be included in the baseline calculation.

We appreciate the opportunity to provide comments regarding these regulations.

Sincerely,

Janet Schalansky
Secretary

Issue Areas/Comments

Issues 1-10

BENEFITS AND BENEFICIARY PROTECTIONS

With the use of formularies, Medicaid recipients who are currently stable on medication therapies may not have continuity of care should they be switched to MA-PD or PDP preferred drug therapies.
A Medicare Part D beneficiary who is a Medicaid dual eligible should not be disenrolled from a MA-PD or PDP plan for any reason. This group of individuals in most cases do not have an alternative drug plan.

COORDINATION WITH PLANS AND PROGRAMS THAT PROVIDE PRESCRIPTION DRUG COVERAGE

Part B drug claims which are denied covergae due to therapeutic inappropriateness, drug-disease contraindication, incorrect drug dosage, duration of drug treatment or for similar reasons related to meidal necessity should not be considered a Part D drug. Consideration should be given for coverage of drugs which are denied coverage under Part B as there may be clinical reasons for the coverage of these products.

Also, while there is much interface between drug coverage under Part B and Part D, use of the NDC number should be require in Part B billing to ensure rebate collections from drug manufacturers on federal and state supplemental rebates. Continuing the use of HCPCS codes makes it difficult to invoice drug manufacturers accurately for all drugs.

ELIGIBILITY, ELECTION, AND ENROLLMENT

Should the auto-enrollment of dual eligibles end prior to 1/1/06? The dual eligibles should have an opportunity to choose the MA-PD or PDP plan prior to an auto-enrollment period.

Mark B. McClellan
Administrator
Centers for Medicare & Medicaid Services
Department of Health and Human Services
Attention: CMS-4068-P
PO Box 8014
Baltimore, MD 21244-8014

File Code: CMS-4068-P

Dear Dr. McClellan:

On behalf of the National Coordinating Council for Medication Error Reporting and Prevention (NCC MERP), I would like to take this opportunity to respond to the proposed rule for Title 1 of the Medicare Prescription Drug, Improvement and Modernization Act under Section 423.153(c) that requires providers of qualified prescription drug coverage to implement a quality assurance program. This includes quality assurance measures and systems for reducing medication errors, reducing adverse drug reactions, and improving medication use.

At its September 24, 2004, meeting, the Council had the opportunity to carefully review and discuss these sections of the proposed rule and offers the following comments:

? The Council supports the inclusion of drug utilization review, patient counseling, and patient information record-keeping as part of the quality assurance program.

? The Council supports inclusion of the proposed elements for quality assurance systems including electronic prescribing, clinical decision support systems, educational interventions, use of barcodes, adverse event reporting systems, and provider/patient education.

? The Council strongly cautions the Agency against the inclusion of error rates or the comparison of error rates in future quality reporting systems. In June 2002, the Council issued a statement against the use of medication error rates as a basis for comparing health care organizations noting that medication error rates for this purpose are of no value because of differences in culture, interpretation of error definition, differences in patient populations, and methods of reporting and detection. This document may be found in Attachment A. The Council suggests that there is

more value in encouraging the reporting of errors to a central location (e.g., national databases such as USP MEDMARX SM and FDA MedWatch). When errors are reported to an objective third party, these data can be broadly disseminated to help avoid recurrence. It is the Council?s contention that using these data for comparisons is a step backward that will resurrect the punitive ?culture of blame? identified by IOM as a major obstacle to safer patient care. Such comparisons also foster under-reporting and less than full disclosure about events which prevent the understanding of the causes of error.

Finally, the Council would like to point out that the definition of medication error that is quoted in the proposal was originally developed by the Council (see Attachment B) and later adopted by the Food and Drug Administration. It is important to note, however, that medication errors are preventable adverse events; but not all adverse events are preventable. All drugs have intrinsic toxicities that are unavoidable in some patients. Also, some patients have unanticipated allergic or idiosyncratic reactions to drugs that cannot be prevented.

A roster of NCC MERP member organizations and individuals is included as Attachment C. These comments reflect the collective opinion of the Council, but not necessarily of its individual members.

Thank you for this opportunity to provide input on this important issue. If you require additional information, please do not hesitate to contact me at 630-792-5916 or lhanold@jcaho.org.

Sincerely,

Linda S. Hanold
Chair, NCC MERP, c/o USP, 12601 Twinbrook Parkway, Rockivlle, MD 20852

Centers for Medicare & Medicaid Services
U.S. Department of Health and Human Services
Attention: CMS-4068-P
P.O. Box 8014
Baltimore, Maryland 21244-8014
http://www.cms.hhs.gov/regulations/ecomments

Dear Sirs/Madams:

These comments are filed by the National Coordinating Committee for Multiemployer Plans (NCCMP) in response to the request for public comments by the Centers for Medicare and Medicaid Services (CMS) on the proposed rule to implement the new Medicare Prescription Drug Benefit authorized in section 101 of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (MMA). This proposed rule was published in the Federal Register of August 3, 2004 (69 Fed. Reg. 46632).

The NCCMP is the only national organization devoted exclusively to protecting the interests of the approximately ten million workers, retirees, and their families who rely on multiemployer plans for retirement, health and other benefits. Our purpose is to assure an environment in which multiemployer plans can continue their vital role in providing benefits to working men and women. The NCCMP is a nonprofit organization, with members, plans and plan sponsors in every major segment of the multiemployer plan universe, including in the building and construction, retail food and service, and entertainment industries.

Most multiemployer plans today provide for retiree health benefits and many of those plans include some type of coverage for prescription drugs. As is well documented, the number of retirees covered by employer-sponsored health benefit plans today and in the future has continued to shrink, primarily because of the combination of accounting rule changes that force private sector employers to recognize the long-term liability of the retiree medical benefits and the rapidly escalating cost of providing that retiree health coverage.

Although facing the same marketplace cost pressures as other plan sponsors, employers and unions who have come together through collective bargaining to establish multiemployer plans have been less likely to drastically reduce or eliminate retiree coverage, in part because active workers in those industries where multiemployer plan coverage is prevalent have been willing to forgo some portion of their compensation to continue to subsidize the health benefits of their brothers and sisters who have retired. Even so, some multiemployer plans have been forced to alter the way benefits are financed in order to remain fiscally solvent. For some multiemployer plans, the rapidly escalating costs, the demographic trends, and the contraction of

the unionized workforce have required them to seriously rethink plan design and financing issues and to take steps to reduce or eliminate retiree benefits in ways that would have been unthinkable just a few years ago.

During the legislative process surrounding the passage of the MMA, the NCCMP urged Congress to consider carefully the structure of the new prescription drug program so as to avoid creating additional burdens on employer-sponsored plans and further incentives for them to reduce or drop prescription drug coverage for Medicare-eligible retirees. Although Congress incorporated an employer subsidy provision in the final legislation for plans that provided prescription drug benefits that were at least actuarially equivalent to the standard Part D drug benefit to encourage employers to continue providing retiree drug coverage, the overall structure of the new Medicare Part D benefit seriously disadvantages retirees with employer-sponsored coverage. This is particularly true with respect to the ability of retirees to meet the out-of-pocket limits that would trigger Medicare's catastrophic coverage. We recognize that CMS cannot through regulation remedy such a serious structural flaw in the statutory framework of the MMA, but we urge CMS to use its interpretive authority to ameliorate wherever possible the disadvantageous treatment of retirees with employer-sponsored coverage.

The statutory provisions of the MMA relating to employer-sponsored retiree prescription drug coverage are largely fashioned with a corporate health plan model in mind. Under this model, the plan sponsor is the employer who controls both plan design and financing decisions with little or no input from employees, unions or retirees. As you know, the world of multiemployer plans is quite different. Under applicable labor law, these collectively bargained plans are administered by a Board of Trustees consisting of equal numbers of representatives of labor and management. Under the Employee Retirement Income Security Act of 1974 (ERISA), the Board functions as both plan sponsor and the named fiduciary of the plan (and often the plan administrator as well) and therefore no individual employer can influence the operation or design of the plan because those decisions are reserved for the Board.

We appreciate the obvious effort that CMS has made in crafting its proposed rule to recognize that not all employer-sponsored plans are the same. We share your goals of maximizing the number of retirees retaining existing drug coverage, avoiding windfalls in which retirees receive a smaller subsidy from plan sponsors than Medicare would pay on their behalf, minimizing administrative burdens on beneficiaries, employers, unions, and plans, minimizing costs to the government of providing retiree drug subsidies and staying within the budget estimates. However, we believe that some of the rules that are being considered, particularly those directed at avoiding employer windfalls, may not be as relevant to multiemployer plans as they might be in a corporate plan setting, since it is the joint Board of Trustees that controls the design and financing of the retiree health plan, not any individual employer. This provides a degree of protection against potential manipulation that may be missing in other circumstances.

We have focused our comments on a handful of key issues raised in Subpart R of the proposed rule but we hope to open a dialogue with CMS staff on these and other issues of concern. Our detailed comments follow.

Comments Related to Subpart R – Payments to Sponsors of Retiree Prescription Drug Plans:

Section 423.882 Definitions

"Group health plan"

We support the use of the same definition of group health plan as found in section 607(1) of ERISA, 29 U.S.C. 1167(1). To further clarify the ability of multiemployer plans to qualify for the subsidy, we suggest also incorporating the definition of "multiemployer plan" found in section 3(37) of ERISA, 29 U.S.C. 1002(3)(37).

"Sponsor"

Although the proposed rule refers back to the definition of plan sponsor found in section 3(16)(B) of ERISA, we suggest that CMS confirm that in the case of a multiemployer plan (i.e., a plan established or maintained jointly by more than one employer and one or more employee associations), the plan sponsor is the board of trustees.

It would also be helpful for CMS to confirm how the employer subsidy provisions for prescription drug coverage operate in the context of a multiemployer health plan.

As we understand the statutory structure and legislative history of MMA regarding the employer subsidy for retiree prescription drug coverage, Congress intended for the Board of Trustees of the multiemployer plan to be the recipient of the employer subsidy since it is the plan that finances the retiree drug benefits (i.e., employer contributions and retiree contributions are placed in trust and those amounts, together with interest accumulated in the trust, are used to pay retiree prescription drug benefits). Therefore, as the entity claiming the subsidy, the multiemployer plan, not each contributing employer, will be responsible for meeting the procedural requirements to claim the subsidy, including providing the required disclosures to the Secretary and all eligible individuals (e.g., the notice of creditable coverage). The plan will apply for the subsidy (including furnishing the actuarial attestation and the list of qualified retirees covered under the multiemployer retiree prescription drug plan who are not enrolled in Medicare Part D). Once CMS has processed the application and verified the status of qualified retirees of all contributing employers, the subsidy would be paid to the multiemployer retiree prescription drug plan and these amounts would be credited toward future contributions to prescription drug coverage, by providing funds to cover costs that would otherwise have to be met through additional contributions. This approach eases burdens on CMS and individual contributing employers, while allowing the entity that pays the retiree prescription drug benefits (the multiemployer plan) to receive the subsidy and use it to cover retiree drug costs without incurring necessary administrative costs.

We would be happy to review with you the way that multiemployer plans operate and to furnish further detail why it is essential that the plan be treated as the plan sponsor for purposes of the subsidy, rather than individual contributing employers.

Section 423.884 Requirements for qualified retiree prescription drug plans

(a) Actuarial Attestation

Under the proposed rule, plan sponsors seeking to claim a subsidy for their prescription drug coverage must annually apply for the subsidy, no later than 90 days before the beginning of the calendar or plan year for which the subsidy is sought.

Although the proposed rule requires an actuarial attestation that the prescription drug benefits provided under the retiree prescription drug plan is at least actuarial equivalent to the standard Medicare Part D benefit, little guidance is given regarding the content of this attestation. CMS should consider developing a model form for this attestation, in which the plan's actuary could describe in simple terms how the determination of actuarial equivalency was made and what assumptions were used. A useful example of this type of standardized actuarial reporting for CMS to consider is the Schedule B to the Form 5500, the annual financial report that certain ERISA-covered pension plans must file with the U.S. Department of Labor. Of course, if CMS decides to promulgate a model form, its use should be considered a safe harbor for satisfaction of the attestation requirement and plan sponsors should be free to submit their own attestations in any other format as long as the required information has been included.

We think that CMS's proposal to require that an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

Establishing actuarial equivalency

Under the MMA, the federal government will pay a cash subsidy to employers and other plan sponsors (including multiemployer plans) that provide retiree prescription drug coverage that is at least equal in value to the new Medicare Part D prescription drug coverage. The subsidy would be 28 percent of a retiree's total covered drug costs between $250 and $5,000 per year, which translates to a maximum subsidy payment to a plan sponsor of $1,330 per retiree. The subsidy would be payable for each retiree covered under the employer-sponsored plan who is not enrolled in Medicare Part D.

Although the cost of providing the new drug coverage under Medicare is partially financed by the Federal government, retirees enrolled in the new Medicare Part D benefit program will still be paying a substantial amount themselves for the coverage.

The standard Medicare Part D benefit design which will be offered through stand-alone prescription drug plans (PDPs) is as follows:

- Retirees will pay a monthly premium set by the PDP (estimated to be $35 per month in 2006 when the program begins, but expected to increase as costs increase);
- The PDP decides which prescription drugs to cover, as long as the PDP's formulary meets certain statutory requirements;
- Retirees must pay the first $250 in covered drug costs out of their own pocket (the standard deductible);
- Retirees pay 25% of covered drug costs between $250 and $2,250 during the year;
- Retirees pay 100% of covered drug costs between $2,225 and $5,100 during the year;
- Retirees pay no more than 5% of covered drug costs to the extent that those costs exceed $5,100. But to be eligible for this "catastrophic" coverage, an individual retiree must pay $3,600 (in 2006) in covered drug costs. Costs covered by a third-party, such as insurance or a group health plan, would not count toward this so-called "true out-of-pocket" amount (TrOOP).

To qualify for the 28% Federal subsidy, coverage provided by the employer-sponsored retiree medical plan does not have to be identical to the standard Part D drug benefit described above; it must be at least equal in value on an actuarial basis to the Part D coverage.

The MMA defines this measurement and comparison of the values of the two benefit design "actuarial equivalence." This test makes it possible to compare the value of different benefit designs. Actuarial equivalence looks at the expected cost of a benefit for a typical person, not how much it will actually cost for any given individual. This is important because a person who has greater health care needs obviously will cost more than one who is healthier.

The term "actuarial equivalence" is not defined in the proposed rule itself. CMS will have to create a standard for determining whether an employer retiree drug benefit is actuarially equivalent to the standard Part D benefit. However, in the preamble to the proposed rule, CMS has suggested a variety of differing approaches or tests to determine whether the employer-sponsored retiree drug plan is actuarially equivalent to the standard Medicare Part D prescription drug plan. CMS has asked for public comments on which, if any, of these standards is the right one and which may not be suitable. The standard CMS ultimately chooses will determine how generous a benefit employers have to offer retirees and how big a share of the benefit employers can require retirees to pay and still qualify for the federal subsidy.

Below is a brief description of each of the standards for which CMS seeks public comment:

- Single Prong Test: Under this test, also known as the "gross value test," an employer's benefit is good enough to qualify for a federal subsidy if, on average, the total value of

the benefit is at least equal to the total value of the standard Part D benefit. It does not matter what share of the benefit, if any, the employer pays. Under this test, the employer could contribute nothing and require the retiree to pay the full cost of the plan, yet the employer would still be paid the federal subsidy.

- Single Prong/No Windfall Test: As with the test above, an employer's benefit is good enough for a subsidy if on average the total value of the benefit is at least equal to the total value of the standard Part D benefit. However, the dollar amount of the subsidy paid to the employer cannot be greater than the dollar amount the employer pays toward the retiree coverage. The employer could design the plan so that it pays nothing towards retiree drug coverage after taking the federal subsidies into account.

- Two-Prong Test: This test begins with the single prong test but applies a second test (or "prong") in which the employer would also have to show it is paying for at least a specific minimum share of the total benefit. CMS offers several examples of the level at which it could set the minimum share or amount the employer must pay under the Two-Prong Test. These include:
    - The average per person amount Medicare would expect to pay as a subsidy to employers during the year, estimated by CMS to be $611 in 2006 when the program begins.
    - The expected amount of paid claims under the standard Part D prescription drug plan minus the monthly part D premiums paid by the retiree, estimated by the Congressional Budget Office to be approximately $1,200 in 2006.
    - The after-tax value of the average per person amount Medicare would expect to pay as a subsidy to employers during the year. For employers subject to the federal corporate income tax, this would be higher than the $611 estimated subsidy payment and will vary depending on the employer's tax rate.

One of Congress's policy goals under MMA is to ensure that the subsidy is used to preserve retiree benefits and not used simply to improve the employer's bottom line or for other non-health care uses. The preamble to the proposed regulation endorses the principle that the subsidy should be passed through to the retirees to pay for retiree prescription drug benefits. In particular, the proposed regulation states:

> "The intent of the MMA retiree prescription drug subsidy provisions is to slow the decline in employer-sponsored retiree insurance. By providing a special subsidy payment to sponsors of qualifying plans, the MMA provides employers with extra incentives and flexibility to maintain prescription drug coverage for their retirees. Our intention is to make these subsidy payments as reasonably available to plan sponsors as possible. We wish to take into account as much as possible the needs and concerns of plan sponsors, consistent with necessary assurances that Federal payments are accurate and in accordance with statutory requirements, that the interests of retiree-beneficiaries are protected, and that employers do not receive ''windfalls'' consisting of subsidy payments that are not passed on to beneficiaries."[1]

[1] 69 Fed. Reg. 46737 (August 3, 2004).

The structure of multiemployer plans assures that this policy goal is met.

After carefully considering each of the proposed standards, we have the following recommendations regarding the actuarial equivalence test that we believe are consistent with CMS's goals.

- CMS should adopt the Two-Prong Test for actuarial equivalence, which requires the portion of the prescription drug plan financed by the employer to be at least equal to the portion of the Part D benefit that is financed by Medicare. Only this test is consistent with the letter and intent of the MMA to provide for alternative drug coverage that is actuarially equivalent to the standard Part D benefit. In considering the portion of the plan that is financed by the employer, earnings on employer contributions held in trust as plan assets should be included. The comparison of the employer plan to the Part D benefit should be based on the benefits provided, not the cost.

- All of the other standards described by CMS in the preamble to the proposed rules could penalize retirees covered under a retiree drug plan and should be rejected. The Single Prong Test, the Single Prong/No Windfall Test, and the two versions of the Two-Prong Test that permit the employer to limit its contribution to the average subsidy amount it would expect to be paid from Medicare could all require a retiree to pay more for drug coverage than the retiree would if he or she were covered under a Medicare Part D prescription drug plan.

- Other tests being considered by CMS would allow for even greater windfalls to an employer. The Single Prong (or Gross Value) Test would allow for enormous windfalls to employers since it would permit an employer to pay nothing toward the drug benefit and still collect federal subsidies. This option has been roundly criticized in the press, is inconsistent with the intent of Congress, and would undermine the integrity of the Medicare drug program and therefore endanger the future of the program.

- In those cases in which a plan sponsor would be prohibited from claiming the largest possible retiree drug subsidy payable under the law due to the anti-windfall protections, CMS should provide a mechanism permitting the plan sponsor to claim the larger subsidy, so long as it passes through the value of the subsidy exceeding the windfall protections to the retirees. This is very important from a multiemployer perspective.

- Where a plan is fully insured, the regulations should require the insurance carrier to provide to the plan sponsor the information necessary to apply for the subsidy.

What is a "plan"?

As CMS acknowledges, many plan sponsors provide different levels and packages of benefits to different groups of retirees. In determining whether the coverage meets the actuarial equivalency test, one must first determine what the plan is that is being compared to the standard Medicare Part D prescription drug coverage. In its proposed rule, CMS indicates that it intends

to adopt a definition of "plan" that mirrors the current approach found in the Treasury regulations regarding the health insurance continuation requirements of the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA). Under those regulations, all health benefits provided by the plan sponsor are presumed to be under a single plan unless plan documents indicate otherwise.

As a result, actuarial equivalence would be determined by evaluating the plan as a whole, not on a benefit structure by benefit structure basis, and if, on average the actuarial value of the drug coverage equals or exceeds the value of the standard Part D coverage, the plan would satisfy the actuarial equivalency test.

We support the use of such an approach because it is one that is already familiar to plan sponsors and it provides flexibility without sacrificing retiree protections.

(b) Sponsor application for the subsidy payment

In general we support the approach taken by CMS that requires the plan sponsor to apply for the subsidy annually. As previously noted above, in the case of a multiemployer prescription drug plan, it is the plan itself, not each contributing employer that will file the application for the subsidy payment.

Under the proposed rule, plan sponsors must submit their subsidy applications no later than 90 days prior to the beginning of the calendar year for which the subsidy is requested. In order to receive the subsidy for 2006, applications with accompanying documentations must be submitted by September 30, 2005. For plans that begin coverage in the middle of a year, the plan sponsor must submit an actuarial attestation no later than 90 days prior to the date that coverage begins. For new plans that begin prescription drug coverage after September 30, 2005, the plan sponsor must submit an actuarial attestation no later than 150 days prior to the start of the program.

CMS also proposes to require that a plan sponsor submit a new actuarial attestation no later than 90 days before the implementation of a material change to the plan's drug coverage that impacts the actuarial value of the plan. A material change is defined as "any change that potentially causes the plan to no longer meet the actuarial equivalence test."

Although we generally support the proposed structure, we have concerns about the need to apply for a subsidy in the first year of the program by September 30, 2005. We are not sure whether the Boards of Trustees of multiemployer plans or other plan sponsors will be able to determine with certainty what alternatives there may be for retiree coverage other than simply continuing to provide benefits in the same way as in the past. For instance, some multiemployer plans may want to contract with qualified prescription drug plans (PDPs) to offer a coordinated or supplemental benefit. There is no guarantee that all the PDPs that might ultimately be offered in the region will be up and running by September 30, 2005. CMS should consider allowing plan sponsors who think they will be claiming the subsidy to file their application by September

30, 2005, but allow some flexibility in revising that application during a somewhat more extended period.

In addition, as previously noted in our comments on actuarial attestations generally, we think that CMS's proposal to require an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

(c) Disclosure of creditable coverage

The proposed rule requires plan sponsors to disclose to retirees (and their Medicare-eligible spouses and dependents) whether the retiree prescription drug plan is actuarially equivalent to the standard Medicare Part D drug plan and therefore whether their coverage under the employer plan is creditable coverage. CMS has asked for input on a number of issues related to this requirement.

We encourage CMS to develop a model disclosure form that plan sponsors might use. We agree with CMS that it would be useful to consider as a model the approach taken by CMS, the Department of Labor and the Department of Treasury in their joint regulations regarding notices of creditable coverage under the Health Insurance Portability and Accountability Act of 1996, although the notice must be provided in a more timely fashion that would enable retirees to enroll in Part D if their plan is not actuarially equivalent.

CMS has also asked for comments regarding whether this disclosure could be incorporated into existing disclosures made to retirees in the normal course of plan operation or whether a separate notice should be required. In particular, CMS notes:

> We are soliciting comments regarding the types of materials that could provide an appropriate vehicle for this purpose, as well as ways to ensure that the notice is conspicuous and readily identified by recipients, particularly in those instances where the coverage is not creditable. 69 Fed. Reg. 46744.

Although we normally would oppose additional separate notices as unduly burdensome and would typically encourage CMS to allow plan sponsors to incorporate disclosure into existing types of dissemination, given the importance of the choice facing retirees, the need for timely disclosure of whether or not the plan's drug coverage is actuarially equivalent, and the

potential late enrollment penalties that retirees will face if they do not enroll in Part D when they are first eligible, we support requiring a separate notice regarding creditable coverage, unless the retiree prescription drug plan finds an alternative method of incorporating the notice with existing mailings or other forms of disclosure that assures that the notice will be conspicuous and readily identified by the recipients as important.

(d) HSAs, FSAs, HRAs, and MSAs

In the Preamble to the proposed rule, CMS requests input on whether the amounts used for prescription drug expenses under health savings accounts (HSAs) and other types of individual savings arrangements, including flexible spending accounts (FSAs), health reimbursement arrangements (HRAs) and medical savings accounts (MSAs) should be treated as group health payments for purposes of counting as incurred costs for purposes of meeting the Part D out-of-pocket threshold. 69 Fed. Reg. 46650. The general rule under Section 1860D-2(b)(4)(C)(ii) of the MMA is that any costs for which the individual is reimbursed by insurance or otherwise, a group health plan, or another third-party payment arrangement do not count toward incurred costs.

CMS indicates that its "strong preference" is to treat HSA amounts differently so as to allow amounts reimbursed through an HSA to count towards incurred costs. Under this interpretation, a Medicare beneficiary could withdraw funds from his or her HSA, pay Part D drug expenses, and allow these expenses to count toward the beneficiary's out-of-pocket payments. Medicare catastrophic coverage would consequently begin sooner than if these payments were not counted toward TrOOP.

We strongly oppose creating a special exception for these payments. Although the Department of Labor has established a regulatory safe harbor for certain HSAs so that they may not be treated as group health plans under the Employee Retirement Income Security Act of 1974 (ERISA),[2] not all HSAs will fall into that safe harbor and some may, in fact, be group health plans. Even under the Department's guidance this question is ultimately decided by the individual facts and circumstances of each case. There is no statutory authority for CMS to create a special rule for HSAs and it would be both illegal and inappropriate to do so. Moreover, if HHS were to create a special exception from TrOOP only for those HSAs that were not employer plans would create an enforcement problem and an administrative nightmare. Who would determine whether the HSA in question was an ERISA plan? The Department of Labor? HHS? The plan sponsor? The individual who established the HSA himself or herself? The structure of the MMA and the proposed rule places a great deal of confidence in the plan sponsor to self-police compliance. Determining whether or not an arrangement constitutes an ERISA plan has always been the purview of the Department of Labor or, ultimately, the courts through actions brought under ERISA section 502. This would create a level of complexity and administrative burden that seems unjustified and unsupportable, given CMS' goals of

[2] Department of Labor Field Assistance Bulletin 2004-1 (April 7, 2004). This can be found at: http://www.dol.gov/ebsa/regs/fab_2004-1.html.

minimizing administrative burdens on employers, unions, plans and beneficiaries and minimizing costs to the government of providing retiree prescription drug coverage.

We believe that HSA amounts should be treated as other tax-favored forms of health coverage and excluded from incurred costs. They are not "essentially analogous to a beneficiary's bank account" because individuals who establish these accounts have been given extraordinarily generous tax preferences to use this form of tax-favored savings. Individuals can deduct amounts placed in HSAs when the contributions are made "above-the-line," contributions can be made by others on behalf of an individual and deducted by the individual, even though he or she didn't make the contribution, and withdrawals from HSAs for qualified medical expenses (including prescription drug costs) are tax free. In contrast, individuals who place money in a bank account are given no special tax preferences.

CMS' desire to give HSAs special treatment is simply another example of discrimination against retirees with employer-sponsored prescription drug coverage, since HSAs can be set up by individuals without any employer involvement, although employer contributions to HSAs on behalf of employees are permitted. HSAs should be treated as all other tax-favored savings mechanisms – whether individual or employer-sponsored (including FSAs, HRAs and MSAs). In other words, payments from all four of these vehicles should be excluded from incurred costs. To do otherwise would create a substantial windfall and an unjustified double taxpayer subsidy for individuals who establish HSAs. Not only would they receive a tax subsidy for establishing such an arrangement, they would be treated more favorably than individuals who pay prescription drug expenses through salary reduction programs that are employer-sponsored. To allow HSA amounts to count toward incurred costs while barring other forms of subsidized employer coverage from doing so is just another example of the bias against retiree drug coverage provided under employer-sponsored plans that is an integral part of the structure of the MMA, notwithstanding Congress' attempt to ameliorate that bias somewhat through the offering of an employer subsidy for continuing to provide coverage.

Waivers for Plan Sponsors to contract with or become Part D Prescription Drug Plans (PDPs) or Medicare Advantage (MA-PD) plans

Plan sponsors that do not choose to provide coverage that qualifies for the subsidy or provide coverage that supplements or wraps around the Part D benefit can instead contract with or become a PDP or Medicare Advantage (MA) plan. CMS indicates that an MA-PD plan or a PDP plan may request, in writing from CMS, a waiver or modification of the Medicare Advantage or Part D requirements that hinder the design of, the offering of, or the enrollment in Medicare Advantage plans by employees or former employees receiving benefits from plans sponsored by employers, labor organizations, or multiemployer plans. MA and PDP plans that receive a waiver may restrict the enrollment to participants and beneficiaries in an employer-sponsored plan. Waivers might include restricting enrollment to the plan sponsor's retirees and offer a benefit that resembles existing active coverage. A waiver might also include authorizing the establishment of separate premium amounts for enrollees of the employer-sponsored group.

A waiver process should be established for employers and other plan sponsors to contract with or otherwise create Medicare Part D PDPs and MA-PD plans that serve employment-based populations. Waivers should be published and made easily available online. Existing waivers that were made available to Medicare+Choice plans should be catalogued and placed online so that plan sponsors can determine what requirements have already been considered for waiver.

CMS recognizes that one option available to employers under the MMA is to provide retiree prescription coverage that supplements coverage offered under a PDP or MA-PD plan. For this option to work smoothly for plan sponsors, particularly those with retirees living across the PDP and MA-PD regions to be established, CMS should take appropriate steps to encourage the development of supplemental plans by PDP and MA-PD providers. If both the Part D plan and the supplemental plan are offered a single provider, it may be easier to coordinate benefits.

In addition, a number of multiemployer plans have joined together to establish purchasing coalitions to improve their purchasing leverage for prescription drugs with pharmacy benefit managers (PBMs). We strongly urge CMS to extend waiver authority to purchasing coalitions involved with employer-sponsored plans. It is quite likely that these purchasing coalitions may be potential PDP plan sponsors, so CMS should not preclude waivers for such entities.

Conclusion

Again we appreciate your willingness to seek input from the plan sponsor community and other stakeholders in the fight to preserve employer-sponsored retiree health programs. We are especially grateful for your willingness to consider the special administrative problems of multiemployer plans because of their structural differences from plans sponsored by individual employers. Please feel free to contact me for further information. We would be pleased to meet with you to discuss these comments and any other issues on which you are seeking input. We look forward to working with you in the future.

Yours truly,

Randy DeFrehn
Executive Director

Attention: CMS-4068-P
P.O. Box 8014
Baltimore, Maryland 21244-8014
http://www.cms.hhs.gov/regulations/ecomments

Dear Sirs/Madams:

These comments are filed by the National Coordinating Committee for Multiemployer Plans (NCCMP) in response to the request for public comments by the Centers for Medicare and Medicaid Services (CMS) on the proposed rule to implement the new Medicare Prescription Drug Benefit authorized in section 101 of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (MMA). This proposed rule was published in the Federal Register of August 3, 2004 (69 Fed. Reg. 46632).

The NCCMP is the only national organization devoted exclusively to protecting the interests of the approximately ten million workers, retirees, and their families who rely on multiemployer plans for retirement, health and other benefits. Our purpose is to assure an environment in which multiemployer plans can continue their vital role in providing benefits to working men and women. The NCCMP is a nonprofit organization, with members, plans and plan sponsors in every major segment of the multiemployer plan universe, including in the building and construction, retail food and service, and entertainment industries.

Most multiemployer plans today provide for retiree health benefits and many of those plans include some type of coverage for prescription drugs. As is well documented, the number of retirees covered by employer-sponsored health benefit plans today and in the future has continued to shrink, primarily because of the combination of accounting rule changes that force private sector employers to recognize the long-term liability of the retiree medical benefits and the rapidly escalating cost of providing that retiree health coverage.

Although facing the same marketplace cost pressures as other plan sponsors, employers and unions who have come together through collective bargaining to establish multiemployer plans have been less likely to drastically reduce or eliminate retiree coverage, in part because active workers in those industries where multiemployer plan coverage is prevalent have been willing to forgo some portion of their compensation to continue to subsidize the health benefits of their brothers and sisters who have retired. Even so, some multiemployer plans have been forced to alter the way benefits are financed in order to remain fiscally solvent. For some multiemployer plans, the rapidly escalating costs, the demographic trends, and the contraction of

the unionized workforce have required them to seriously rethink plan design and financing issues and to take steps to reduce or eliminate retiree benefits in ways that would have been unthinkable just a few years ago.

During the legislative process surrounding the passage of the MMA, the NCCMP urged Congress to consider carefully the structure of the new prescription drug program so as to avoid creating additional burdens on employer-sponsored plans and further incentives for them to reduce or drop prescription drug coverage for Medicare-eligible retirees. Although Congress incorporated an employer subsidy provision in the final legislation for plans that provided prescription drug benefits that were at least actuarially equivalent to the standard Part D drug benefit to encourage employers to continue providing retiree drug coverage, the overall structure of the new Medicare Part D benefit seriously disadvantages retirees with employer-sponsored coverage. This is particularly true with respect to the ability of retirees to meet the out-of-pocket limits that would trigger Medicare's catastrophic coverage. We recognize that CMS cannot through regulation remedy such a serious structural flaw in the statutory framework of the MMA, but we urge CMS to use its interpretive authority to ameliorate wherever possible the disadvantageous treatment of retirees with employer-sponsored coverage.

The statutory provisions of the MMA relating to employer-sponsored retiree prescription drug coverage are largely fashioned with a corporate health plan model in mind. Under this model, the plan sponsor is the employer who controls both plan design and financing decisions with little or no input from employees, unions or retirees. As you know, the world of multiemployer plans is quite different. Under applicable labor law, these collectively bargained plans are administered by a Board of Trustees consisting of equal numbers of representatives of labor and management. Under the Employee Retirement Income Security Act of 1974 (ERISA), the Board functions as both plan sponsor and the named fiduciary of the plan (and often the plan administrator as well) and therefore no individual employer can influence the operation or design of the plan because those decisions are reserved for the Board.

We appreciate the obvious effort that CMS has made in crafting its proposed rule to recognize that not all employer-sponsored plans are the same. We share your goals of maximizing the number of retirees retaining existing drug coverage, avoiding windfalls in which retirees receive a smaller subsidy from plan sponsors than Medicare would pay on their behalf, minimizing administrative burdens on beneficiaries, employers, unions, and plans, minimizing costs to the government of providing retiree drug subsidies and staying within the budget estimates. However, we believe that some of the rules that are being considered, particularly those directed at avoiding employer windfalls, may not be as relevant to multiemployer plans as they might be in a corporate plan setting, since it is the joint Board of Trustees that controls the design and financing of the retiree health plan, not any individual employer. This provides a degree of protection against potential manipulation that may be missing in other circumstances.

We have focused our comments on a handful of key issues raised in Subpart R of the proposed rule but we hope to open a dialogue with CMS staff on these and other issues of concern. Our detailed comments follow.

Comments Related to Subpart R – Payments to Sponsors of Retiree Prescription Drug Plans:

Section 423.882 Definitions

"Group health plan"

We support the use of the same definition of group health plan as found in section 607(1) of ERISA, 29 U.S.C. 1167(1). To further clarify the ability of multiemployer plans to qualify for the subsidy, we suggest also incorporating the definition of "multiemployer plan" found in section 3(37) of ERISA, 29 U.S.C. 1002(3)(37).

"Sponsor"

Although the proposed rule refers back to the definition of plan sponsor found in section 3(16)(B) of ERISA, we suggest that CMS confirm that in the case of a multiemployer plan (i.e., a plan established or maintained jointly by more than one employer and one or more employee associations), the plan sponsor is the board of trustees.

It would also be helpful for CMS to confirm how the employer subsidy provisions for prescription drug coverage operate in the context of a multiemployer health plan.

As we understand the statutory structure and legislative history of MMA regarding the employer subsidy for retiree prescription drug coverage, Congress intended for the Board of Trustees of the multiemployer plan to be the recipient of the employer subsidy since it is the plan that finances the retiree drug benefits (i.e., employer contributions and retiree contributions are placed in trust and those amounts, together with interest accumulated in the trust, are used to pay retiree prescription drug benefits). Therefore, as the entity claiming the subsidy, the multiemployer plan, not each contributing employer, will be responsible for meeting the procedural requirements to claim the subsidy, including providing the required disclosures to the Secretary and all eligible individuals (e.g., the notice of creditable coverage). The plan will apply for the subsidy (including furnishing the actuarial attestation and the list of qualified retirees covered under the multiemployer retiree prescription drug plan who are not enrolled in Medicare Part D). Once CMS has processed the application and verified the status of qualified retirees of all contributing employers, the subsidy would be paid to the multiemployer retiree prescription drug plan and these amounts would be credited toward future contributions to prescription drug coverage, by providing funds to cover costs that would otherwise have to be met through additional contributions. This approach eases burdens on CMS and individual contributing employers, while allowing the entity that pays the retiree prescription drug benefits (the multiemployer plan) to receive the subsidy and use it to cover retiree drug costs without incurring necessary administrative costs.

We would be happy to review with you the way that multiemployer plans operate and to furnish further detail why it is essential that the plan be treated as the plan sponsor for purposes of the subsidy, rather than individual contributing employers.

Section 423.884 Requirements for qualified retiree prescription drug plans

(a) Actuarial Attestation

Under the proposed rule, plan sponsors seeking to claim a subsidy for their prescription drug coverage must annually apply for the subsidy, no later than 90 days before the beginning of the calendar or plan year for which the subsidy is sought.

Although the proposed rule requires an actuarial attestation that the prescription drug benefits provided under the retiree prescription drug plan is at least actuarial equivalent to the standard Medicare Part D benefit, little guidance is given regarding the content of this attestation. CMS should consider developing a model form for this attestation, in which the plan's actuary could describe in simple terms how the determination of actuarial equivalency was made and what assumptions were used. A useful example of this type of standardized actuarial reporting for CMS to consider is the Schedule B to the Form 5500, the annual financial report that certain ERISA-covered pension plans must file with the U.S. Department of Labor. Of course, if CMS decides to promulgate a model form, its use should be considered a safe harbor for satisfaction of the attestation requirement and plan sponsors should be free to submit their own attestations in any other format as long as the required information has been included.

We think that CMS's proposal to require that an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

Establishing actuarial equivalency

Under the MMA, the federal government will pay a cash subsidy to employers and other plan sponsors (including multiemployer plans) that provide retiree prescription drug coverage that is at least equal in value to the new Medicare Part D prescription drug coverage. The subsidy would be 28 percent of a retiree's total covered drug costs between $250 and $5,000 per year, which translates to a maximum subsidy payment to a plan sponsor of $1,330 per retiree. The subsidy would be payable for each retiree covered under the employer-sponsored plan who is not enrolled in Medicare Part D.

Although the cost of providing the new drug coverage under Medicare is partially financed by the Federal government, retirees enrolled in the new Medicare Part D benefit program will still be paying a substantial amount themselves for the coverage.

The standard Medicare Part D benefit design which will be offered through stand-alone prescription drug plans (PDPs) is as follows:

- Retirees will pay a monthly premium set by the PDP (estimated to be $35 per month in 2006 when the program begins, but expected to increase as costs increase);
- The PDP decides which prescription drugs to cover, as long as the PDP's formulary meets certain statutory requirements;
- Retirees must pay the first $250 in covered drug costs out of their own pocket (the standard deductible);
- Retirees pay 25% of covered drug costs between $250 and $2,250 during the year;
- Retirees pay 100% of covered drug costs between $2,225 and $5,100 during the year;
- Retirees pay no more than 5% of covered drug costs to the extent that those costs exceed $5,100. But to be eligible for this "catastrophic" coverage, an individual retiree must pay $3,600 (in 2006) in covered drug costs. Costs covered by a third-party, such as insurance or a group health plan, would not count toward this so-called "true out-of-pocket" amount (TrOOP).

To qualify for the 28% Federal subsidy, coverage provided by the employer-sponsored retiree medical plan does not have to be identical to the standard Part D drug benefit described above; it must be at least equal in value on an actuarial basis to the Part D coverage.

The MMA defines this measurement and comparison of the values of the two benefit design "actuarial equivalence." This test makes it possible to compare the value of different benefit designs. Actuarial equivalence looks at the expected cost of a benefit for a typical person, not how much it will actually cost for any given individual. This is important because a person who has greater health care needs obviously will cost more than one who is healthier.

The term "actuarial equivalence" is not defined in the proposed rule itself. CMS will have to create a standard for determining whether an employer retiree drug benefit is actuarially equivalent to the standard Part D benefit. However, in the preamble to the proposed rule, CMS has suggested a variety of differing approaches or tests to determine whether the employer-sponsored retiree drug plan is actuarially equivalent to the standard Medicare Part D prescription drug plan. CMS has asked for public comments on which, if any, of these standards is the right one and which may not be suitable. The standard CMS ultimately chooses will determine how generous a benefit employers have to offer retirees and how big a share of the benefit employers can require retirees to pay and still qualify for the federal subsidy.

Below is a brief description of each of the standards for which CMS seeks public comment:

- Single Prong Test: Under this test, also known as the "gross value test," an employer's benefit is good enough to qualify for a federal subsidy if, on average, the total value of

the benefit is at least equal to the total value of the standard Part D benefit. It does not matter what share of the benefit, if any, the employer pays. Under this test, the employer could contribute nothing and require the retiree to pay the full cost of the plan, yet the employer would still be paid the federal subsidy.

- Single Prong/No Windfall Test: As with the test above, an employer's benefit is good enough for a subsidy if on average the total value of the benefit is at least equal to the total value of the standard Part D benefit. However, the dollar amount of the subsidy paid to the employer cannot be greater than the dollar amount the employer pays toward the retiree coverage. The employer could design the plan so that it pays nothing towards retiree drug coverage after taking the federal subsidies into account.

- Two-Prong Test: This test begins with the single prong test but applies a second test (or "prong") in which the employer would also have to show it is paying for at least a specific minimum share of the total benefit. CMS offers several examples of the level at which it could set the minimum share or amount the employer must pay under the Two-Prong Test. These include:
    - The average per person amount Medicare would expect to pay as a subsidy to employers during the year, estimated by CMS to be $611 in 2006 when the program begins.
    - The expected amount of paid claims under the standard Part D prescription drug plan minus the monthly part D premiums paid by the retiree, estimated by the Congressional Budget Office to be approximately $1,200 in 2006.
    - The after-tax value of the average per person amount Medicare would expect to pay as a subsidy to employers during the year. For employers subject to the federal corporate income tax, this would be higher than the $611 estimated subsidy payment and will vary depending on the employer's tax rate.

One of Congress's policy goals under MMA is to ensure that the subsidy is used to preserve retiree benefits and not used simply to improve the employer's bottom line or for other non-health care uses. The preamble to the proposed regulation endorses the principle that the subsidy should be passed through to the retirees to pay for retiree prescription drug benefits. In particular, the proposed regulation states:

> "The intent of the MMA retiree prescription drug subsidy provisions is to slow the decline in employer-sponsored retiree insurance. By providing a special subsidy payment to sponsors of qualifying plans, the MMA provides employers with extra incentives and flexibility to maintain prescription drug coverage for their retirees. Our intention is to make these subsidy payments as reasonably available to plan sponsors as possible. We wish to take into account as much as possible the needs and concerns of plan sponsors, consistent with necessary assurances that Federal payments are accurate and in accordance with statutory requirements, that the interests of retiree-beneficiaries are protected, and that employers do not receive ''windfalls'' consisting of subsidy payments that are not passed on to beneficiaries."[1]

[1] 69 Fed. Reg. 46737 (August 3, 2004).

The structure of multiemployer plans assures that this policy goal is met.

After carefully considering each of the proposed standards, we have the following recommendations regarding the actuarial equivalence test that we believe are consistent with CMS's goals.

- CMS should adopt the Two-Prong Test for actuarial equivalence, which requires the portion of the prescription drug plan financed by the employer to be at least equal to the portion of the Part D benefit that is financed by Medicare. Only this test is consistent with the letter and intent of the MMA to provide for alternative drug coverage that is actuarially equivalent to the standard Part D benefit. In considering the portion of the plan that is financed by the employer, earnings on employer contributions held in trust as plan assets should be included. The comparison of the employer plan to the Part D benefit should be based on the benefits provided, not the cost.

- All of the other standards described by CMS in the preamble to the proposed rules could penalize retirees covered under a retiree drug plan and should be rejected. The Single Prong Test, the Single Prong/No Windfall Test, and the two versions of the Two-Prong Test that permit the employer to limit its contribution to the average subsidy amount it would expect to be paid from Medicare could all require a retiree to pay more for drug coverage than the retiree would if he or she were covered under a Medicare Part D prescription drug plan.

- Other tests being considered by CMS would allow for even greater windfalls to an employer. The Single Prong (or Gross Value) Test would allow for enormous windfalls to employers since it would permit an employer to pay nothing toward the drug benefit and still collect federal subsidies. This option has been roundly criticized in the press, is inconsistent with the intent of Congress, and would undermine the integrity of the Medicare drug program and therefore endanger the future of the program.

- In those cases in which a plan sponsor would be prohibited from claiming the largest possible retiree drug subsidy payable under the law due to the anti-windfall protections, CMS should provide a mechanism permitting the plan sponsor to claim the larger subsidy, so long as it passes through the value of the subsidy exceeding the windfall protections to the retirees. This is very important from a multiemployer perspective.

- Where a plan is fully insured, the regulations should require the insurance carrier to provide to the plan sponsor the information necessary to apply for the subsidy.

What is a "plan"?

As CMS acknowledges, many plan sponsors provide different levels and packages of benefits to different groups of retirees. In determining whether the coverage meets the actuarial equivalency test, one must first determine what the plan is that is being compared to the standard Medicare Part D prescription drug coverage. In its proposed rule, CMS indicates that it intends

to adopt a definition of "plan" that mirrors the current approach found in the Treasury regulations regarding the health insurance continuation requirements of the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA). Under those regulations, all health benefits provided by the plan sponsor are presumed to be under a single plan unless plan documents indicate otherwise.

As a result, actuarial equivalence would be determined by evaluating the plan as a whole, not on a benefit structure by benefit structure basis, and if, on average the actuarial value of the drug coverage equals or exceeds the value of the standard Part D coverage, the plan would satisfy the actuarial equivalency test.

We support the use of such an approach because it is one that is already familiar to plan sponsors and it provides flexibility without sacrificing retiree protections.

(b) Sponsor application for the subsidy payment

In general we support the approach taken by CMS that requires the plan sponsor to apply for the subsidy annually. As previously noted above, in the case of a multiemployer prescription drug plan, it is the plan itself, not each contributing employer that will file the application for the subsidy payment.

Under the proposed rule, plan sponsors must submit their subsidy applications no later than 90 days prior to the beginning of the calendar year for which the subsidy is requested. In order to receive the subsidy for 2006, applications with accompanying documentations must be submitted by September 30, 2005. For plans that begin coverage in the middle of a year, the plan sponsor must submit an actuarial attestation no later than 90 days prior to the date that coverage begins. For new plans that begin prescription drug coverage after September 30, 2005, the plan sponsor must submit an actuarial attestation no later than 150 days prior to the start of the program.

CMS also proposes to require that a plan sponsor submit a new actuarial attestation no later than 90 days before the implementation of a material change to the plan's drug coverage that impacts the actuarial value of the plan. A material change is defined as "any change that potentially causes the plan to no longer meet the actuarial equivalence test."

Although we generally support the proposed structure, we have concerns about the need to apply for a subsidy in the first year of the program by September 30, 2005. We are not sure whether the Boards of Trustees of multiemployer plans or other plan sponsors will be able to determine with certainty what alternatives there may be for retiree coverage other than simply continuing to provide benefits in the same way as in the past. For instance, some multiemployer plans may want to contract with qualified prescription drug plans (PDPs) to offer a coordinated or supplemental benefit. There is no guarantee that all the PDPs that might ultimately be offered in the region will be up and running by September 30, 2005. CMS should consider allowing plan sponsors who think they will be claiming the subsidy to file their application by September

30, 2005, but allow some flexibility in revising that application during a somewhat more extended period.

In addition, as previously noted in our comments on actuarial attestations generally, we think that CMS's proposal to require an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

(c) Disclosure of creditable coverage

The proposed rule requires plan sponsors to disclose to retirees (and their Medicare-eligible spouses and dependents) whether the retiree prescription drug plan is actuarially equivalent to the standard Medicare Part D drug plan and therefore whether their coverage under the employer plan is creditable coverage. CMS has asked for input on a number of issues related to this requirement.

We encourage CMS to develop a model disclosure form that plan sponsors might use. We agree with CMS that it would be useful to consider as a model the approach taken by CMS, the Department of Labor and the Department of Treasury in their joint regulations regarding notices of creditable coverage under the Health Insurance Portability and Accountability Act of 1996, although the notice must be provided in a more timely fashion that would enable retirees to enroll in Part D if their plan is not actuarially equivalent.

CMS has also asked for comments regarding whether this disclosure could be incorporated into existing disclosures made to retirees in the normal course of plan operation or whether a separate notice should be required. In particular, CMS notes:

> We are soliciting comments regarding the types of materials that could provide an appropriate vehicle for this purpose, as well as ways to ensure that the notice is conspicuous and readily identified by recipients, particularly in those instances where the coverage is not creditable. 69 Fed. Reg. 46744.

Although we normally would oppose additional separate notices as unduly burdensome and would typically encourage CMS to allow plan sponsors to incorporate disclosure into existing types of dissemination, given the importance of the choice facing retirees, the need for timely disclosure of whether or not the plan's drug coverage is actuarially equivalent, and the

potential late enrollment penalties that retirees will face if they do not enroll in Part D when they are first eligible, we support requiring a separate notice regarding creditable coverage, unless the retiree prescription drug plan finds an alternative method of incorporating the notice with existing mailings or other forms of disclosure that assures that the notice will be conspicuous and readily identified by the recipients as important.

(d) HSAs, FSAs, HRAs, and MSAs

In the Preamble to the proposed rule, CMS requests input on whether the amounts used for prescription drug expenses under health savings accounts (HSAs) and other types of individual savings arrangements, including flexible spending accounts (FSAs), health reimbursement arrangements (HRAs) and medical savings accounts (MSAs) should be treated as group health payments for purposes of counting as incurred costs for purposes of meeting the Part D out-of-pocket threshold. 69 Fed. Reg. 46650. The general rule under Section 1860D-2(b)(4)(C)(ii) of the MMA is that any costs for which the individual is reimbursed by insurance or otherwise, a group health plan, or another third-party payment arrangement do not count toward incurred costs.

CMS indicates that its "strong preference" is to treat HSA amounts differently so as to allow amounts reimbursed through an HSA to count towards incurred costs. Under this interpretation, a Medicare beneficiary could withdraw funds from his or her HSA, pay Part D drug expenses, and allow these expenses to count toward the beneficiary's out-of-pocket payments. Medicare catastrophic coverage would consequently begin sooner than if these payments were not counted toward TrOOP.

We strongly oppose creating a special exception for these payments. Although the Department of Labor has established a regulatory safe harbor for certain HSAs so that they may not be treated as group health plans under the Employee Retirement Income Security Act of 1974 (ERISA),[2] not all HSAs will fall into that safe harbor and some may, in fact, be group health plans. Even under the Department's guidance this question is ultimately decided by the individual facts and circumstances of each case. There is no statutory authority for CMS to create a special rule for HSAs and it would be both illegal and inappropriate to do so. Moreover, if HHS were to create a special exception from TrOOP only for those HSAs that were not employer plans would create an enforcement problem and an administrative nightmare. Who would determine whether the HSA in question was an ERISA plan? The Department of Labor? HHS? The plan sponsor? The individual who established the HSA himself or herself? The structure of the MMA and the proposed rule places a great deal of confidence in the plan sponsor to self-police compliance. Determining whether or not an arrangement constitutes an ERISA plan has always been the purview of the Department of Labor or, ultimately, the courts through actions brought under ERISA section 502. This would create a level of complexity and administrative burden that seems unjustified and unsupportable, given CMS' goals of

[2] Department of Labor Field Assistance Bulletin 2004-1 (April 7, 2004). This can be found at: http://www.dol.gov/ebsa/regs/fab_2004-1.html.

minimizing administrative burdens on employers, unions, plans and beneficiaries and minimizing costs to the government of providing retiree prescription drug coverage.

We believe that HSA amounts should be treated as other tax-favored forms of health coverage and excluded from incurred costs. They are not "essentially analogous to a beneficiary's bank account" because individuals who establish these accounts have been given extraordinarily generous tax preferences to use this form of tax-favored savings. Individuals can deduct amounts placed in HSAs when the contributions are made "above-the-line," contributions can be made by others on behalf of an individual and deducted by the individual, even though he or she didn't make the contribution, and withdrawals from HSAs for qualified medical expenses (including prescription drug costs) are tax free. In contrast, individuals who place money in a bank account are given no special tax preferences.

CMS' desire to give HSAs special treatment is simply another example of discrimination against retirees with employer-sponsored prescription drug coverage, since HSAs can be set up by individuals without any employer involvement, although employer contributions to HSAs on behalf of employees are permitted. HSAs should be treated as all other tax-favored savings mechanisms – whether individual or employer-sponsored (including FSAs, HRAs and MSAs). In other words, payments from all four of these vehicles should be excluded from incurred costs. To do otherwise would create a substantial windfall and an unjustified double taxpayer subsidy for individuals who establish HSAs. Not only would they receive a tax subsidy for establishing such an arrangement, they would be treated more favorably than individuals who pay prescription drug expenses through salary reduction programs that are employer-sponsored. To allow HSA amounts to count toward incurred costs while barring other forms of subsidized employer coverage from doing so is just another example of the bias against retiree drug coverage provided under employer-sponsored plans that is an integral part of the structure of the MMA, notwithstanding Congress' attempt to ameliorate that bias somewhat through the offering of an employer subsidy for continuing to provide coverage.

Waivers for Plan Sponsors to contract with or become Part D Prescription Drug Plans (PDPs) or Medicare Advantage (MA-PD) plans

Plan sponsors that do not choose to provide coverage that qualifies for the subsidy or provide coverage that supplements or wraps around the Part D benefit can instead contract with or become a PDP or Medicare Advantage (MA) plan. CMS indicates that an MA-PD plan or a PDP plan may request, in writing from CMS, a waiver or modification of the Medicare Advantage or Part D requirements that hinder the design of, the offering of, or the enrollment in Medicare Advantage plans by employees or former employees receiving benefits from plans sponsored by employers, labor organizations, or multiemployer plans. MA and PDP plans that receive a waiver may restrict the enrollment to participants and beneficiaries in an employer-sponsored plan. Waivers might include restricting enrollment to the plan sponsor's retirees and offer a benefit that resembles existing active coverage. A waiver might also include authorizing the establishment of separate premium amounts for enrollees of the employer-sponsored group.

A waiver process should be established for employers and other plan sponsors to contract with or otherwise create Medicare Part D PDPs and MA-PD plans that serve employment-based populations. Waivers should be published and made easily available online. Existing waivers that were made available to Medicare+Choice plans should be catalogued and placed online so that plan sponsors can determine what requirements have already been considered for waiver.

CMS recognizes that one option available to employers under the MMA is to provide retiree prescription coverage that supplements coverage offered under a PDP or MA-PD plan. For this option to work smoothly for plan sponsors, particularly those with retirees living across the PDP and MA-PD regions to be established, CMS should take appropriate steps to encourage the development of supplemental plans by PDP and MA-PD providers. If both the Part D plan and the supplemental plan are offered a single provider, it may be easier to coordinate benefits.

In addition, a number of multiemployer plans have joined together to establish purchasing coalitions to improve their purchasing leverage for prescription drugs with pharmacy benefit managers (PBMs). We strongly urge CMS to extend waiver authority to purchasing coalitions involved with employer-sponsored plans. It is quite likely that these purchasing coalitions may be potential PDP plan sponsors, so CMS should not preclude waivers for such entities.

Conclusion

Again we appreciate your willingness to seek input from the plan sponsor community and other stakeholders in the fight to preserve employer-sponsored retiree health programs. We are especially grateful for your willingness to consider the special administrative problems of multiemployer plans because of their structural differences from plans sponsored by individual employers. Please feel free to contact me for further information. We would be pleased to meet with you to discuss these comments and any other issues on which you are seeking input. We look forward to working with you in the future.

Yours truly,

Randy DeFrehn

P.O. Box 8014
Baltimore, MD 21244-8014

Subject: Medicare Program: Medicare Prescription Drug Benefit, CMS 4068-P, RIN-0938-AN08

To Whom It May Concern:

CVS/Pharmacy is providing comments with regard to the proposed rule published August 3, 2004. This rule would implement Title I of the Medicare Modernization Act of 2003 that establishes the voluntary Medicare Part D prescription drug benefit.

CVS operates over 5,300 pharmacies in 36 states and the District of Columbia. CVS is the largest provider of out-patient prescription drugs in the United States. As such, our expectation is that CVS will be a major provider of pharmacy services to Medicare recipients under the Part D program.

Section 423.30-423.50 – Issues Relating to Eligibility and Enrollment (Subpart A)

The confusion that has surrounded the Medicare discount card demonstrates the need for clear and understandable materials for Medicare recipients. CVS would also encourage CMS to recognize the role of the pharmacist in helping recipients to understand this benefit. Some of the components of these materials would include:

- The network status of a pharmacy and whether the pharmacy is a preferred or non-preferred pharmacy.
- The eligibility status of the recipient, whether they have met their front end deductible, and whether they have reached a gap in coverage (ie. the donut hole).
- This information must be provided to the pharmacist via an on-line real time basis.
- The experience with Medicare recipients, who were eligible for the $600 Transitional Assistance and failed to enroll, shows a definite need for special attention to be directed to the Medicare/Medicaid dual eligible. CVS would encourage CMS to allow for a transitional period for these dual eligible beneficiaries. We would also encourage an automatic enrollment process for these individuals.

Section 423.100 – Definition of Covered Part D Drugs

Options for Dispensing Fees – 69 Federal Register 46647-48

Most Medicare recipients will receive their Part D benefits from private insurers or prescription benefit managers (PBMs). CVS is concerned that these entities will attempt to utilize dispensing fees usually reserved for private insurers for this program. The complexity of providing services to this population, because of issues such as coordination of benefits, gaps in coverage, determination of front end deductibles, product and patient eligibility, etc. makes this program considerably more difficult. Recent studies, including the newly enacted California Medicaid dispensing fee, showing that the dispensing fee has to be in excess of $7 to adequately reimburse pharmacies for providing these services.

Section 423.104 – Requirements relating to Qualified Precription Drug Coverage

Access to negotiated prices

Subsection(h) of this section requires pharmacies to pass through negotiated prices during coverage gaps and for non-covered formulary drugs. This requirement amounts to nothing less than price controls on retail pharmacies. While this burden is extended to retail pharmacies, no such burdens are required of pharmaceutical manufacturers, or plan sponsors. Plan sponsors should not be able to keep any "pharmacy spreads" on prescriptions. Thus, they should not be able to reimburse pharmacies at a lower rate than they are charging the plan for filling the prescription.

Section 423.120 – Access to Covered Part D Drugs

Section 423.120(a)(1)-(5) – Issues relating to access to pharmacies

The legislative history demonstrates that it was the intent of Congress to require plans to comply, at a minimum, with the Department of Defense TriCare access standards. These standards require that 90% of Medicare beneficiaries must live within 2 miles of a participating pharmacy in an urban area, 90% of recipients in a suburban area must live within a 5 mile radius of a participating pharmacy, and 70% of recipients living in rural areas they must live within a 15 mile radius of a participating pharmacy. The proposed rule should also clearly define whether these distances are geographic or driving distances.

Averaging Access Standards

The proposed rules allow plans to meet these standards by averaging. CVS believes that each plan must meet these standards in each state and in region in which they operate. Allowing them to average the access standards could create areas where Medicare recipients lack adequate accessibility to a participating pharmacy. For

example, in Pennsylvania, averaging could result in a situation where Philadelphia is more than adequately served while Pittsburgh is not.

Creating "Preferred Pharmacy" Network

The proposed rule also allows plans to use this averaging methodology when creating networks of "preferred pharmacies" and "non-preferred pharmacies". By utilizing this method, the plan could create a higher cost non-preferred network that meets the TriCare access standards and at the same time create a lower cost preferred network that does not meet the standard. The proposed rule should be changed to require that all networks meet the TriCare access standard.

Section 423.120(a)(4) – Contracting Terms with Pharmacies and Prohibition of Transferring Insurance Risk

This section and Congress clearly prohibited plans from requiring pharmacies to accept insurance risk as a condition of participation. The proposed rule defines insurance risk as "risk that is commonly assumed by insured licensed by a state". It further states that it should not include payment variations due to performance based measures. Although these performance based incentives are common in the market place, they are usually in addition to the basic reimbursement. They represent additional payments for meeting certain objectives and there are no deductions from the basic payment, if these objectives are not met.

The final rule should prohibit plans from utilizing a variation of the system detailed above to require pharmacies to accept any contractual terms that would require them to accept lower payment rates if a plan experiences cost over runs. The plans should also cleanly identify to the pharmacy the pricing source that they will use for payment.

Section 423.120(a)(6) – Level playing field between mail order and network pharmacies

The Legislative Record shows that it was the intent of Congress to allow community pharmacies to provide a 90-day supply with no artificial cost sharing that would "coerce" recipients to obtain their maintenance medication from a mail order entity. Thus, the only additional cost to the recipient should be the difference in the negotiated price for the covered drug at the network pharmacy and the mail order pharmacy. With this in mind, the definition of "negotiated price" should reflect the price to the plan net any rebates, discounts or other price concessions paid to the plan for a similar drug quantity obtained from either the retail pharmacy or the mail order pharmacy. These price concessions should be applied directly to reducing the cost of the prescription. The plan should not be allowed to use the price concessions to artificially lower the cost of mail order prescriptions.

Section 423.153(b)) – Quality Assurance Programs

The preamble of the proposed rule contains extensive discussion of quality assurance programs the plans should incorporate. CVS fully supports the incorporation of quality assurance programs. However, rather than requiring the prescription drug plans to establish their own quality assurance programs, the role of the plans should be to develop a system that ensures that the provider has established a quality assurance program and measures the value of such programs. The preamble also states that future reporting of error rates may be required to allow recipients to compare the quality of service in choosing a plan. All studies involved in accessing quality assurance plans have shown that the most effective quality assurance programs allow for an anonymous and confidential reporting structure with legal protection from discovery.

Section 423.851-.875 – Subpart Q – Guaranteeing Access to Choice of Coverage (fall back plans)

These sections contain the requirements that the government establish a fall back plan in the event there is a region where there are not two choices of either a risk bearing PDP or MA-PD. The final rule should make clear that these fall back plans must comply with all the access and quality standards that PDP and MA-PD must adhere to. Additionally, the fall back plan should also be required to adequately reimburse pharmacies with regard to a dispensing fee and an appropriate product cost reimbursement.

In conclusion, CVS appreciates this opportunity to comment with regard to the proposed regulations regarding the Medicare Part D portion of the Medicare Modernization Act. We would urge CMS to use its discretionary power to amend the proposed rule to address our concerns with regard to adequate reimbursement for pharmacies, access standards, quality assurance issues, and education of recipients and pharmacies.

Sincerely,

Carlos R. Ortiz, R.Ph
Vice President of Government Affairs

Medicare Drug Benefit; Comments to The Proposed Rule

Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA)

Contents

Background, Intent and Acknowledgement

Founded in 1994, PharmaCare is a wholly owned subsidiary of CVS Corporation, the nations largest operator of retail pharmacies with annual sales in excess of $33 billion. PharmaCare has more than 3,000 employees and is the most diversified pharmaceutical care management company in the country. PharmaCare holds leading positions in pharmacy benefit management services, mail-service pharmacy, specialty drug pharmacy and clinic pharmacy services. PharmaCare is also a Medicare approved national drug discount card sponsor. By the conclusion of 2004, over 140,000 Medicare beneficiaries will have enrolled in ***myPharmaCare***.

Through this document PharmaCare offers comment to the proposed rule (42 CFR Parts 403, 411, 417 and 423; Medicare program; Medicare Drug Benefit). The creation of Prescription Drug Plans (PDP's), Limited Risk Plans and Fallback Plans through the Act are of potential interest to PharmaCare. However, some aspects of the proposed rule, which we address herein, raise concerns that should be addressed by CMS. These concerns are not unique to PharmaCare as they are, in many respects, shared by our competitors. We are sure that should CMS publish a final rule that satisfactorily addresses these issues that all Medicare beneficiaries will be better served.

Finally, PharmaCare appreciates the opportunity to make comment to this proposed rule. Today PBM's are providing millions of Medicare beneficiaries drug benefits through employer sponsored plans and Medicare Choice contractor plans. Consultation between PBM's and CMS is the right course of action. Accordingly, PharmaCare offers our services freely to CMS now, and throughout the process ahead that will conclude with the successful implementation of Medicare Part-D in 2006.

The Proposed PDP Regions

Introduction. PharmaCare attended the open forum held in Chicago, IL (Rosemont) regarding the formation of regions for MA-PD and PDP's. The presentations made indicated that serious study and analysis had been given to each option under consideration. In the broader context the issue of fewer versus many regions clearly dominates the debate at hand.

Discussion. PharmaCare offers the following comments.

Comments About Fewer Regions. Of the two options being considered (10 regions or 11) we believe that the option for 11 regions has greater merit. It is our view that this option represents a better distribution of markets, or concentrations of beneficiaries, over the 10-region option. However, while fewer regions create larger pools of beneficiaries for PDP's to market to, they also offer unique barriers that also inhibit the scale value of such large multi-state regions. State insurance regulations are the most noteworthy barrier. State licensure and oversight would will prove burdensome for PDP's. As the proposed rule offers PDP's no safe-harbor in this regard, PDP's will not freely enjoy the scale inherent in multi-state regions, but will instead be forced to operate as multiple state based entities within a region. This will increase cost and hamper the ability of PDP's to effectively capitalize on the larger pools of beneficiaries offered through multi-state regions.

Comments About Many Regions. Of the four regions being considered (32, 34, 37 and 50) we believe that the option of 50 regions is most appealing and the option for 37 regions has merit as well. In summary the 50-region option simplifies many regulatory and operational considerations by equating region with state. Of the remaining regional considerations, we believe the option for 37 regions does the better job of joining several states to form the few multi-state regions. In these cases the 37 region option does the best job of preserving the

integrity of traditional regional markets; e.g. Northern New England, Pacific Northwest, etc. While not by any means uniform, insurance considerations should vary less among the states joined to form these few multi-state regions.

Recommendation. For the reasons discussed above, PharmaCare recommends many regions versus few, with 50 regions being recommended above all other considerations. We appreciate the goals and intent of CMS through the concept of larger multi-state regions. However, given the pace of this program, the challenges posed by such an approach would be too numerous and prove a barrier to program implementation. The issue of multi-state regions is always a consideration CMS could revisit in the future.

Issues Related to TROOP

Introduction. PharmaCare has studied the proposed rule regarding TROOP (True Out Of Pocket) and has participated in CMS special open door forums regarding TROOP as well. Of all of the topics worthy of comment, TROOP represents a topic in need of serious comment by industry and re-consideration by CMS.

Discussion. At the heart of the issue with TROOP is the requirement to coordinate benefits with the beneficiary's Other Health Insurance (OHI) on a real time basis. While there are several issues that make TROOP coordination problematic, it is the issue of real time coordination that is most serious.

Under the proposed rule PDP's would be required to assure TROOP through coordination with OHI as self-identified by the beneficiary upon their application. While the intent of TROOP can easily be appreciated, the practicality of coordinating OHI on a real time basis for pharmacy benefits is very problematic. In summary, with respect to pharmacy claims, the activity of claims adjudication corresponds to the actual time of service; a process that takes less than 5 seconds. This differs significantly from the process used for medical billing. Under medical claims management, claims adjudication is not associated real time with the performance of service, but instead occurs days, weeks even months later, and this lag time makes OHI coordination possible under a medical claims approach. The rule, as written, approaches TROOP coordination in the context of a medical claims management model, not the existing pharmacy model. And, it assumes this model is transferable to pharmacy, when it is not. The approach to TROOP in the proposed rule is inconsistent with pharmacy claims management standards and practice, and should be changed in the final rule. We offer amplification below to support this recommendation.

Are pharmacies the answer? Pharmacies are not the solution to accomplish TROOP. Pharmacies do not and cannot split claims. The point of sale (POS) systems used universally by pharmacies direct each claim to a designated single payor; not multiple payors. The transaction is processed in 2 to 3 seconds with a response as either paid or denied, but only from the one payor. With respect to the relationship between the patient and the pharmacy, the pharmacy is only a provider. It has no way of knowing what the beneficiary disclosed regarding OHI when the beneficiary made their application to the PDP. The pharmacy will only know to submit a beneficiaries claim to a PDP when beneficiary presents a prescription and their PDP program card.

Are PBM's the answer? Given that pharmacies are not the solution for TROOP, the question is rightfully directed to PBM systems for consideration. As the PBM system receives claims from pharmacy systems, is it possible that that the PBM system can coordinate TROOP on a real time basis? The answer is, no. The adjudication process is bi-directional only: e.g. between the pharmacy, where the claim is originated, and the PBM. PBM systems do not systematically redirect claims to other health insurance providers in real time before responding to the claims originator, the pharmacy. Coordination of benefits is most often accomplished by PBM systems by denying claims for plan members where the plan sponsor has indicated the existence of other health insurance through the eligibility file. Under these conditions a beneficiary would be denied until the plan sponsor indicated they were satisfied that the member's OHI had been exhausted. Such a determination would occur directly between the beneficiary and the plan sponsor, and outside of the claims adjudication process.

The PBM's role in coordinating TROOP is further complicated by other considerations. Today, PBM's contract almost entirely with group payers (e.g. self-insured employer plans, managed care plans, etc.), and not individuals. Should a group payer have just one source of OHI, it ***may*** be possible for the PBM to coordinate with that singular source in real-time under unique conditions;

(e.g. the PBM already had a contractual relationship with the other health insurance payer). However, as Part-D is not a group product, enrolling beneficiaries may have OHI from any number of sources (e.g. an employer wrap-plan; a Med-Sup plan; a drug manufacturer plan; etc.). As written, the proposed rule would require that TROOP be coordinated real-time with each and every OHI source identified by the beneficiary. This would require the PBM to establish contracts and real-time electronic claims processing procedures with an open-ended number of OHI sources. This is unrealistic. First, as discussed previously, PBM systems are not configured to redirect claims to OHI providers in real-time. Second, assuming the first problem could be overcome, it is unrealistic to assume that a PBM could successfully conclude contract terms and on-line claims transaction coordination with every source of OHI. Many of these sources would not even be capable of on-line claims transactions. In conclusion, PBM's and their systems are not the solution for assuring accurate coordination of TROOP.

Recommendation. PharmaCare recommends that CMS confer with the National Council for Prescription Drug Programs (NCPDP). NCPDP serves an important role for all industries associated with pharmacy programs. Most importantly they establish the electronic claims standards necessary to accomplish prescription drug program management. Together, NCPDP and CMS can coordinate a workable solution for TROOP.

Also, CMS should give serious consideration to allowing PDP's to simply deny acceptance for any applicant who indicates they have OHI. The approach to TROOP under the proposed rule is a source of unacceptable risk to potential PDP's in terms of investment and accountability. As PDP's are risk based providers they should be asked to only assume risk for beneficiaries where accurate risk accountability can be assured. Beneficiaries with OHI are perfectly suited for Limited Risk Plans or Fallback Plans, and we recommend that PDP's should not be required to enroll such beneficiaries.

The Proposed Data Set

Introduction. PharmaCare participated in a CMS sponsored Open Door Forum (ODF) on September 9, 2004 regarding the Bidders' Data Set for Prescription Drug Plans. The forum's intent was for the American Academy of Actuaries Working Group to identify the high-priority data needs for bidders, to summarize their discussions with CMS on developing a bidders data set, and to present a plan for making essential data available in a timely manner. A summary of the ODF went on to describe the need for a data set as follows: *A data set including detailed information on drug utilization is an essential element in facilitating bids by insurers to provide prescription drug coverage.*

Discussion. PharmaCare concurs that an accurate and comprehensive data set is an essential element to facilitate bidding. The ODF, however, pointed to significant problems with the approaches being pursued by the Academy's Working Group.

The data sources available to the Working Group are of little value as they are incomplete and dated. The Medicare Current Beneficiary Survey (MCBS) has significant limitations and shortcomings as an instrument for producing the necessary drug utilization information needed by potential PDP bidders. The 2001 FEP retirees' data does not reflect the many new drugs that have come to market since that time nor the changes in drug prices. In summary, these sources are inadequate and incomplete.

Recommendation. To gain the confidence of PDP's, CMS should endeavor to secure credible sources of data for the Academy's Working Group to analyze. Such sources are readily available. Three excellent sources are discussed below.

1. TRICARE. The TRICARE pharmacy benefit program includes a program unique to over 1.5 million retirees. CMS should coordinate the transfer of both a historical drug utilization file from the Department of Defense's TRICARE Management Activity (TMA) and update files as necessary. The TRICARE TMA subscribes to the standards established by NCPDP. The creation of file reflecting the data fields and layout standards of NCPDP is a task that can be easily accomplished by TMA or its contractor. PharmaCare recommends CMS act quickly as this approach to securing valuable and relevant data represents a low or no cost activity that can be accomplished in days.

2. Pharmacy Benefits Managers. Today PBM's administer pharmacy benefit programs for millions of Medicare beneficiaries through employer sponsored plans and Medicare Choice contractor plans. No better source of data is available than that which can be provided by PBM's. PharmaCare recommends that CMS ask PBM's to voluntarily offer the Working Group data files reflecting the utilization of Medicare age beneficiaries. The process would result in the largest, most robust data set possible and provide the Working Group the information they need to produce quality results.

3. Chain Drug Stores. The National Association of Chain Drug Stores (NACDS) is an excellent source of data. Pharmacies are stakeholders in this endeavor and desire a well-developed program. Their membership, if approached, would freely cooperate with CMS by sharing data.

Issues Related to PDP's and Risk

Introduction. It will be the PBM industry that makes administration of the Medicare Drug Benefit possible. However, their role as PDP's or in association with PDP's is questionable unless the proposed rule is modified. Since the enactment of MMA in December 2003, some in the PBM industry have made public comment to the issues of PDP's being treated as insurers and of the requirement to assume risk. These requirements are in inconsistent with commercial practices where PBM's are not insurers and do not assume risk. Consequently, we recommend that CMS appreciate that unless the final rule satisfactorily addresses these issues PBM's may not view Medicare as such an important new market opportunity, which in turn could place the implementation of the Medicare Drug Benefit in jeopardy.

Discussion. Risk posses many new considerations for PBM's. Several of these considerations are discussed below, and illustrate why some PBM's have indicated they may be required to forgo the opportunities presented by MMA unless the final rule is modified.

In the context of an insurer risk is defined as "the danger or probability of loss". Auto insurers, for example, know that not every policyholder will file a claim, making the probability of loss low among most policyholders and high only among a few at one time. It is the excess premium secured from non-claimant policyholders that pay for the excess costs of the few claimant policyholders. With respect to prescription drugs, however, the opposite is true. The probability of loss in never low because it can be assumed that most policyholders will be claimants and few will not. Even worse, in the case of the elderly it can be assumed that substantially ALL elderly beneficiaries will be claimants. And, as drug therapy is the primary form of treatment today for almost all chronic medical conditions that afflict the elderly, the possibility of radically curtailing drug use is unrealistic, especially given the overwhelming efficacy offered by most drug

therapies today. In summary the elderly are a very bad risk because there is almost certainty of loss.

The issue of adverse selection is also very problematic for PBM's. As the Medicare Drug Benefit will be voluntary, only the sickest beneficiaries can be expected migrate to the new Part-D leaving the premium payments for lower utilizing healthier beneficiaries unavailable to supplement the excess costs of the adverse membership. This is not conjecture, but reality. Medicare Choice contractors struggled under the weight of adverse selection for years resulting in withdrawal from numerous counties across the country. Adverse selection is assured for a PDP under the Medicare Drug Benefit.

And finally, PBM's are not insurers. Requiring PDP's to be insurance companies creates a significant new burden for PBM's and creates unintended business risk. In the precious little time available to prepare for this program a PBM faces many costly hurdles associated with state licensures. This is unknown territory for PBM's and States alike. One concern PBM's have that licensing actions may in fact trigger an unintended response from states whereby they attempt to bring substantially all PBM operations under state insurance authority. This would be a costly struggle to defend against. And, should the states succeed, it would prove very problematic to the PBM industry as it would add significant cost and seriously hamper the evolution of business practices, benefit design and even quality management programs.

Recommendation. PharmaCare recommends CMS publish a final rule that lowers the barriers posed by insurance and risk. The final rule should set out a safe harbor for PDP's with respect to state insurance regulations. And, in order to lower the adverse risk associated with Medicare aged beneficiaries, the government should consider adopting a final rule that limits the risk faced by PDP's. One example includes creating risk-free sources of revenue for PDP's such as separate program management fees rather than all-inclusive premiums.

In another example CMS could offer to cap the PDP's risk to a maximum loss. Changes such as these are important as they will serve to attract prospective PDP's. A final rule that does not mitigate the implications of insurance and risk may not attract PBM's to this program as PDP's.

Risk and The Issue of Any Willing Provider

Introduction. The issue of Any Willing Provider (AWP) is problematic for PDP's as risk bearing entities. Also, the proposed rule offers guidance that is impracticable to potential PDP's. PharmaCare believes the proposed rule should be modified to reposition the intended role of AWP to what we believe was intended by the authors of MMA.

Discussion. The MMA and the proposed rule make reference to both Any Willing Provider and pharmacy network access standards. In the context of commercial practices, the two are in some ways redundant. Prescription plan sponsors seeking pharmacy network services from a PBM, for example, specify access standards to ensure a PBM contracts with sufficient providers, but not all providers. In the process of assembling a network a PBM uses the leverage offered by the access standards to negotiate price knowing that more aggressive prices can be secured if there is no requirement to allow the participation of any willing provider. Under a requirement to assemble a network where any willing provider may participate, no such leverage exists and no access standard may be assured as providers participate at will.

It is the opinion of PharmaCare that the authors of the Act included access standards as a means for prospective PDP's to establish network contracting leverage while protecting the interests of beneficiaries. This is fundamentally consistent with any entity bearing risk and assures the government of the best possible basis of cost. And, the Federal Government also shares this opinion. The Federal Trade Commission has concluded that Any Willing Provider requirements are fundamentally in conflict with the ability of any network assembler to secure best price. Please refer to the FTC's web site at http://www.ftc.gov/opa/2004/04/ribills.htm for an example of a recent example of the Commission's position on AWP.

PharmaCare also believes the issue of Any Willing Provider has also been misinterpreted as presented in the proposed rule. The proposed rule infers that Any Willing Provider is a requirement of a PDP, which we believe incorrectly interprets the intent of the Act. PharmaCare believes the Act discusses Any Willing Provider in the context of a right of the beneficiary, not a requirement of a plan sponsor or PDP. It is common for States to extend the privilege of pharmacy Freedom of Choice (FOC) to the membership of health insurance carriers; the terms Freedom of Choice and Any Willing Provider are often used interchangeably in the context of a member or beneficiary. But this privilege offered by States to members does not necessarily flow by extesnion to health insurers as a requirement. In summary, such laws are intended to reinforce and support the freedom of individuals to secure service from providers of their choice, but not by extension require health insurers to contract with them.

Recommendation. PharmaCare recommends that the final rule clarify the intent of the Act by specifying that the law protects the right of each beneficiary to choose their own provider, but does not require the PDP to include any willing provider in their network. And, it is not sufficient enough for CMS to allow PDP's to designate such providers as "non-preferred" or "out of network" if it still requires they contract with them. In-network providers will not negotiate best price if they know other providers can participate through circuitous means. The rule should clearly state that while beneficiaries may use providers of their choice, benefits will not be payable unless they use a contracted in-network provider of the PDP. The final rule should also clarify that the access standards set out in the Act are the principle methodology for assuring adequate access and drop any reference to AWP with respect to the establishment of networks.

Medication Therapy Management (MTM)

Introduction. The final rule should make clarification with respect to Medication Therapy Management (MTM) and the role of PDP's and providers. The proposed rule raises concerns that PDP's may be required to fund MTM by themselves.

Discussion. Considerable attention has been paid to the topic of MTM. However, the proposed rule should make clarifications in several regards. First, the proposed rule leaves questions unanswered as to the source of funding for MTM services. One could interpret the proposed rule as inferring that MTM services will be paid for by PDP's. This raises concerns. Assume a provider (e.g. a pharmacy) performs an MTM service. If the obligation to pay for that service falls on the PDP then where will those funds come from? If the answer is, from the fixed premium's paid by the beneficiary and Medicare, then this poses significant risk to PDP's. Such services would represent an open checkbook to providers who could perform them at will and make payment demands on a PDP, who in turn must pay from a fixed pool of premium revenue. Even worse the MTM activity could actually cause increased drug use, which is in conflict with a fixed price risk-based program.

The proposed rule should also clarify the MTM is an activity that can be performed by the PDP itself and is not the exclusive domain of others like pharmacists, nurses and physicians. PDP's will be in the best position to perform MTM themselves as they will have all available utilization data available. The final rule should clarify that MTM is a service that may be performed by providers as exclusively determined by the PDP. Otherwise the PDP will lose control of where and how these services are performed.

And, finally, the final rule should make it clear that MTM is not an exercise or activity that is exclusively performed in person between a health care provider

and the beneficiary, but may also be performed remotely by phone, internet and by paper. These recommended approaches are very cost effective and can reach more beneficiaries than in-person approaches. And, many quality programs already exist that employ these approaches.

Recommendation. The final rule must clarify the issue of MTM. MTM cannot be an at will activity of any willing provider. PDP's must hold the authority to establish who may provide MTM to their program membership. The final rule must also clarify from what source of funds the services of MTM will be paid. PharmaCare recommends that CMS pay for MTM separately and not include MTM funding as part of an inclusive premium calculation. MTM payments should also not be subject to risk as the activity of MTM will, in many cases, cause increases in drug use (e.g. under-utilization, therapy initiation, etc.).

Beneficiary Late Enrollment Penalty

Introduction. The formula for imposing beneficiary late enrollment fees, as discussed in the proposed rule, is not aggressive enough to promote rapid beneficiary enrollment in PDP's.

Discussion. Underlying the intent of the MMA is the belief that the government's best interest is served when industry participates on a risk basis to share the financial management challenge posed by Medicare beneficiaries. To attract the most qualified entities to serve as PDP's CMS should make every effort to ensure fast and rapid adoption of Medicare Part-D through PDP's. To this end, the proposed late enrollment fee is insufficient. PharmaCare does not believe $0.36 per month is enough of a fee to motivate beneficiaries to rapidly adopt Medicare Part-D.

Recommendation. PharmaCare recommends that CMS consider a black-out period where enrollment is not authorized rather than a late penalty. For example, offering beneficiaries the right to enroll only in November and December of each year for proceeding calendar year, with January through October being closed to enrollment (e.g. the black-out). Such an approach would create a sense of urgency among beneficiaries. The late enrollment penalty, as proposed, will only promote a "wait and see" attitude. If CMS is to attract prospective PDP's, then the final rule should include an approach that creates a sense of urgency for beneficiaries to enroll in Medicare Part-D through a PDP.

Conclusive Comments & Contact Information

PharmaCare again extends our thanks to CMS for the opportunity to make comment to this proposed rule. The Medicare Drug Benefit can only be viewed as a sea change event. As such PharmaCare very much desires to take part in this exciting program. We recognize that CMS has precious little time to implement this program, however, if prospective PDP's are to value the opportunity created by the Act then CMS should give serious consideration to our recommended modifications of the proposed rule. The modifications recommended by PharmaCare are, in our opinion, modest yet essential to assuring a workable program. PharmaCare offers our service freely to CMS for the purpose of concluding a final rule.

Should CMS desire to contact PharmaCare regarding these topics, all inquiries may be made to the following individual:

Dear Dr. McClellan:

The National Association of Social Workers (NASW) welcomes the opportunity to provide comments on the proposed rule "Medicare Program; Medicare Prescription Drug Benefit," 69 FR 46632. NASW is the largest professional social work organization with more than 153,000 members nationwide. NASW promotes, develops, and protects the practice of social work and social workers, while enhancing the well being of individuals, families, and communities through its work, service, and advocacy. We are concerned that the proposed rule does not provide sufficient protections for the 13 million Medicare beneficiaries with disabilities and chronic health conditions. The following are critical recommendations:

Coverage of Dual Eligibles (§ 423.34)

Of grave concern is the impact of the new Medicare drug benefit on those beneficiaries who currently have drug coverage through their state Medicaid programs, i.e. the dual eligibles. CMS must ensure that these very vulnerable beneficiaries receive coverage for the medications they need under the new drug benefit and are not harmed or made worse off when their drug coverage is switched from Medicaid to Medicare.

Based on social workers experience with this group of beneficiaries, we are gravely concerned that the proposed regulations would cause harmful disruption in care and inadequate drug coverage for dual eligibles. In particular, the proposed regulations do not address how access to needed medications by dual eligibles will be maintained when their drug coverage is switched from Medicaid to Medicare.

We urge CMS to take account of the unique circumstances and needs of this population, and delay transfer of drug coverage from Medicaid to Medicare for the dual eligibles for at least six months to allow adequate time to educate and enroll these vulnerable and often hard-to-reach individuals and to ensure they receive the drug coverage to which they are entitled.

CMS must also address the real threat of adverse health outcomes facing dual eligibles. Under the proposed rule, dual eligibles would effectively be forced to enroll in the lowest cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans (and automatic enrollment would require placement in a low-cost plan). While it is critical that the transfer from Medicaid to Medicare drug coverage maintain continuity of care, the proposed regulations provide no such protection. To the contrary, the formularies for these low-cost drug plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Without access to the coverage they need, dual eligibles would have no real choice but to switch medications. Yet changing medications is for those with complex conditions is both very difficult and potentially dangerous. For example, abrupt changes in psychiatric medications bring the risk of serious adverse drug reactions and interactions and the potential for a severe loss of functioning.

With respect to beneficiaries with mental illness, these regulations must give meaningful effect to the concern Congress itself voiced, stating in the conference report on the Act that: "[i]f a plan chooses not to offer or restrict access to a particular medication to treat the mentally ill, the disabled will have the freedom to choose a plan that has appropriate access to the medicine needed. The Conferees believe this is critical as the severely mentally ill are a unique population with unique prescription drug needs as individual responses to mental health medications are different." [Report No. 108-391, pp. 769-770] Unfortunately, the proposed rule does not adequately provide the protection for people with mental illness that Congress called for. We urge that the regulations be revised to provide for "grandfathering" coverage of psychiatric medications for dual eligibles into the new Part D benefit, as a number of states have done in implementing preferred drug lists for their Medicaid programs.

Lastly, for the dual eligibles in particular, CMS must fund collaborative partnerships with organizations representing people with disabilities and other vulnerable populations. Such partnerships will be critical to an effective outreach and enrollment process. Targeted and hands-on outreach to vulnerable Medicare beneficiaries, especially those with low-incomes, is vitally important in the enrollment process. We strongly urge CMS to develop a specific plan for facilitating enrollment of beneficiaries with disabilities and complex medical conditions in each region that incorporates collaborative partnerships with the state and local agencies and advocacy organizations that serve them.

Alternative, Flexible Formularies for Beneficiaries for Vulnerable Populations (§ 423.120(b))

For people with serious and complex medical conditions, access to the right medications can make the difference between living in the community, being employed and leading a healthy and productive life on the one hand; and facing deteriorating health, unnecessary hospitalizations and even death, on the other. Often, people with disabilities and complex medical conditions need access to the newest medications, because they have fewer side effects and may represent a better treatment option than older less expensive drugs. Many individuals have multiple disabilities and health conditions making drug

interactions a common problem. Frequently, extended release versions of medications are needed to effectively manage these conditions. In other cases, specific drugs are needed to support adherence to a treatment regimen. Individuals with cognitive impairments may be less able to articulate problems with side effects making it more important for the doctor to be able to prescribe the best medication for the individual. Often that pharmacological process takes time since many people with significant disabilities must try multiple medications and only after much experimentation find the medication that is most effective for their circumstance. The consequences of denying the appropriate medication for an individual with a disability or chronic health condition are serious and can include injury or debilitating side effects, even hospitalization or other types of costly medical interventions.

We strongly support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs, and the enormous potential for serious harm (including death) if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must have access to all medically necessary prescription drugs at a plan's preferred level of cost-sharing. We recommend that this treatment apply to the following overlapping special populations who:

- are dually eligible for Medicare and Medicaid;
- live in nursing homes, ICF-MRs and other residential facilities;
- have life threatening conditions; or
- have pharmacologically complex condition such as mental illness, Alzheimer's disease, multiple sclerosis, HIV/AIDS, and epilepsy.

Furthermore, new limits on cost management tools must be imposed for these vulnerable populations. We urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. For example we strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We urge CMS to prohibit or place limits on the use of certain cost containment policies, such as unlimited tiered cost sharing, dispensing limits, therapeutic substitution, mandatory generic substitution for narrow therapeutic index drugs, or prior authorization. We are also concerned that regulations will create barriers to having the doctor prescribe the best medication for the individual including off-label uses of medications that are common for many conditions. We strongly recommend that the final rule prohibit plans from placing limits on the amount, duration and scope of coverage for covered part D drugs.

Involuntary Disenrollment for Disruptive Behavior (§ 423.44)

The proposed regulation raises grave concerns in allowing Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" (§ 423.44(d)(2)). These provisions create enormous

opportunities for discrimination against individuals with mental illness and cognitive impairments. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and as a result they could also be subject to a late enrollment penalty increasing their premiums for the rest of their lives. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage.

As a matter of principle, for a critical safety net program such as Medicare prescription drugs for dual eligibles, NASW cannot support automatic disenrollment of this population under any circumstances. We are therefore alarmed that CMS has proposed an expedited disenrollment process that would undermine the minimal standards and protections included in the proposed rule. This expedited process proposal must not be included in the final rule. In addition, CMS must provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior and must waive the late enrollment penalty for these individuals as well. The final rule must include the following protections:

- drug plans must be prohibited from disenrolling a beneficiary because he/she exercises the option to make treatment decisions with which the plan disagrees, including the option of no treatment and/or no diagnostic testing;
- drug plans may not disenroll a beneficiary because he/she chooses not to comply with any treatment regimen developed by the plan or any health care professionals associated with the plan;
- documentation provided to CMS arguing for approval of a plan's proposal to involuntarily disenroll an individual must include:
  - documentation of the plan's effort to provide reasonable accommodations for individuals with disabilities in accordance with the Americans with Disabilities Act; and
  - documentation that the plan provided the beneficiary with appropriate written notice of the consequences of continued disruptive behavior or written notice of its intent to request involuntary disenrollment; and
- drug plans must provide beneficiaries subject to involuntary disenrollment with the following notices:
  - advance notice to inform the individual that the consequences of continued disruptive behavior will be disenrollment;
  - notice of intent to request CMS' permission to disenroll the individual; and
  - A planned action notice advising that CMS has approved the plan's request for approval of involuntary disenrollment.

Appeals Procedures (§§ 423.562-423.604)

The appeals processes outlined in the proposed regulations are overly complex, drawn-out, and inaccessible to beneficiaries. Under these proposed rules, there are too many levels of internal appeal that a beneficiary must request from the drug plan before receiving a truly independent review by an administrative law judge (ALJ) and the

timeframes for plan decisions are unreasonably long. In order to qualify for a hearing by an ALJ, beneficiaries must first request a coverage determination or exception from a tiered cost-sharing scheme or formulary which can take between 14 and 30 days, unless a plan honors a beneficiary's request that the determination or exception be expedited in which case it could still take up to 14 days. To appeal adverse determinations or exception decisions, beneficiaries must request plans to review their decision again and make a redetermination within 30 days unless the beneficiary paid out-of-pocket for the medication at issue, in which case the plan has 60 days to decide. Even if a plan honors a request to expedite a redetermination, the deadline for plans to make a decision could be as long as 14 days. Following a redetermination, beneficiaries may appeal to a so-called independent review entity for a reconsideration of their case, but these entities will not be authorized to review or question the criteria plans use to evaluate exceptions requests. The proposed rules do not even set deadlines for reconsideration decisions. After receiving a reconsideration decision, beneficiaries are only allowed to appeal to an administrative law judge if the amount in controversy meets a threshold level of $100 and it is unclear how CMS will calculate whether a beneficiary has met this threshold.

In addition to imposing unreasonable delays and burdens on beneficiaries, these appeal processes are far from transparent. Drug plans would be authorized to establish their own criteria for reviewing determination, exceptions, and redetermination requests and these criteria will vary from plan to plan. Plans would also be authorized to establish varying degrees of paperwork requirements for beneficiaries and their prescribing physicians who wish to request exceptions from tiered cost-sharing schemes or formularies. Far from ensuring that beneficiaries' rights are protected, which should be their primary function, these procedures would actually impede the right of beneficiaries to a fair hearing.

Beneficiaries with disabilities and complex health needs often have an extremely limited capacity to navigate grievance and appeals procedures. To accommodate the special needs of these beneficiaries and others who are vulnerable or with low income, CMS must establish a simpler process that puts a priority on ensuring ease of access and rapid results for beneficiaries and their doctors and includes a truly expedited exceptions process for individuals with immediate needs, including individuals facing health care crises, which should be modeled after the federal Medicaid requirement that states respond to prior authorization requests within 24 hours.

We also urge CMS to require plans to dispense a temporary supply of drugs in emergencies. The proposed system does not ensure that beneficiaries' rights are protected and does not guarantee beneficiaries have access to needed medications. For many individuals with disabilities such as epilepsy, mental illness or HIV, treatment interruptions can lead to serious short-term and long-term consequences. For this reasons the final rule must provide for dispensing an emergency supply of drugs pending the resolution of an exception request or pending resolution of an appeal.

Outreach and Enrollment (§ 423.34)

The proposed regulations do not adequately address the need for collaboration with state and local agencies and community-based organizations on outreach and enrollment of beneficiaries with disabilities and complex health conditions. In the conference report for the Medicare Modernization Act, Congress directed that "the Administrator of the Center for Medicare Choices [sic] shall take the appropriate steps before the first open enrollment period to ensure that Medicare beneficiaries have clinically appropriated [sic] access to pharmaceutical treatments for mental illness" (Report No. 108-391, pp. 769-770).

To respond to Congress's concern with ensuring enrollment and comprehensive coverage for beneficiaries, CMS must partner with community-based organizations focused on addressing the needs of vulnerable beneficiaries and the state and local agencies that coordinate benefits for them. Beneficiaries with special needs will most likely turn to organizations that they know and trust with questions and concerns regarding the new Part D drug benefit. Making information and educational materials available at these sites will help inform beneficiaries with mental illness about the new benefit, but providing community-based organizations with pamphlets and brochures alone is not adequate. To answer the many difficult, detailed, and time-consuming questions that beneficiaries will have about the new program, extensive face-to-face counseling services will be needed. Social workers and community-based organizations can provide the kind of detailed help needed, but they will need additional resources.

CMS must develop a specific plan for facilitating enrollment of beneficiaries with special needs, in each region that incorporates collaborative partnerships with and additional funding for state and local public and nonprofit agencies and organizations focused on these needs. In addition, in their bids, drug plans should include specific plans for encouraging enrollment of often hard-to-reach populations.

NASW strongly urges that the concerns discussed above be addressed in order to ensure access to psychiatric medications under the Part D drug benefit for the many Medicare beneficiaries who need them.

Thank you for your consideration of our comments.

Sincerely,

Toby Weismiller, ASCW
Director, Professional Development and Advocacy

Dear Dr. McClellan:

The National Association of Social Workers (NASW) welcomes the opportunity to provide comments on the proposed rule "Medicare Program; Medicare Prescription Drug Benefit," 69 FR 46632. NASW is the largest professional social work organization with more than 153,000 members nationwide. NASW promotes, develops, and protects the practice of social work and social workers, while enhancing the well being of individuals, families, and communities through its work, service, and advocacy. We are concerned that the proposed rule does not provide sufficient protections for the 13 million Medicare beneficiaries with disabilities and chronic health conditions. The following are critical recommendations:

Coverage of Dual Eligibles (§ 423.34)

Of grave concern is the impact of the new Medicare drug benefit on those beneficiaries who currently have drug coverage through their state Medicaid programs, i.e. the dual eligibles. CMS must ensure that these very vulnerable beneficiaries receive coverage for the medications they need under the new drug benefit and are not harmed or made worse off when their drug coverage is switched from Medicaid to Medicare.

Based on social workers experience with this group of beneficiaries, we are gravely concerned that the proposed regulations would cause harmful disruption in care and inadequate drug coverage for dual eligibles. In particular, the proposed regulations do not address how access to needed medications by dual eligibles will be maintained when their drug coverage is switched from Medicaid to Medicare.

We urge CMS to take account of the unique circumstances and needs of this population, and delay transfer of drug coverage from Medicaid to Medicare for the dual eligibles for at least six months to allow adequate time to educate and enroll these vulnerable and often hard-to-reach individuals and to ensure they receive the drug coverage to which they are entitled.

CMS must also address the real threat of adverse health outcomes facing dual eligibles. Under the proposed rule, dual eligibles would effectively be forced to enroll in the lowest cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans (and automatic enrollment would require placement in a low-cost plan). While it is critical that the transfer from Medicaid to Medicare drug coverage maintain continuity of care, the proposed regulations provide no such protection. To the contrary, the formularies for these low-cost drug plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Without access to the coverage they need, dual eligibles would have no real choice but to switch medications. Yet changing medications is for those with complex conditions is both very difficult and potentially dangerous. For example, abrupt changes in psychiatric medications bring the risk of serious adverse drug reactions and interactions and the potential for a severe loss of functioning.

With respect to beneficiaries with mental illness, these regulations must give meaningful effect to the concern Congress itself voiced, stating in the conference report on the Act that: "[i]f a plan chooses not to offer or restrict access to a particular medication to treat the mentally ill, the disabled will have the freedom to choose a plan that has appropriate access to the medicine needed. The Conferees believe this is critical as the severely mentally ill are a unique population with unique prescription drug needs as individual responses to mental health medications are different." [Report No. 108-391, pp. 769-770] Unfortunately, the proposed rule does not adequately provide the protection for people with mental illness that Congress called for. We urge that the regulations be revised to provide for "grandfathering" coverage of psychiatric medications for dual eligibles into the new Part D benefit, as a number of states have done in implementing preferred drug lists for their Medicaid programs.

Lastly, for the dual eligibles in particular, CMS must fund collaborative partnerships with organizations representing people with disabilities and other vulnerable populations. Such partnerships will be critical to an effective outreach and enrollment process. Targeted and hands-on outreach to vulnerable Medicare beneficiaries, especially those with low-incomes, is vitally important in the enrollment process. We strongly urge CMS to develop a specific plan for facilitating enrollment of beneficiaries with disabilities and complex medical conditions in each region that incorporates collaborative partnerships with the state and local agencies and advocacy organizations that serve them.

Alternative, Flexible Formularies for Beneficiaries for Vulnerable Populations (§ 423.120(b))

For people with serious and complex medical conditions, access to the right medications can make the difference between living in the community, being employed and leading a healthy and productive life on the one hand; and facing deteriorating health, unnecessary hospitalizations and even death, on the other. Often, people with disabilities and complex medical conditions need access to the newest medications, because they have fewer side effects and may represent a better treatment option than older less expensive drugs. Many individuals have multiple disabilities and health conditions making drug

interactions a common problem. Frequently, extended release versions of medications are needed to effectively manage these conditions. In other cases, specific drugs are needed to support adherence to a treatment regimen. Individuals with cognitive impairments may be less able to articulate problems with side effects making it more important for the doctor to be able to prescribe the best medication for the individual. Often that pharmacological process takes time since many people with significant disabilities must try multiple medications and only after much experimentation find the medication that is most effective for their circumstance. The consequences of denying the appropriate medication for an individual with a disability or chronic health condition are serious and can include injury or debilitating side effects, even hospitalization or other types of costly medical interventions.

We strongly support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs, and the enormous potential for serious harm (including death) if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must have access to all medically necessary prescription drugs at a plan's preferred level of cost-sharing. We recommend that this treatment apply to the following overlapping special populations who:

- are dually eligible for Medicare and Medicaid;
- live in nursing homes, ICF-MRs and other residential facilities;
- have life threatening conditions; or
- have pharmacologically complex condition such as mental illness, Alzheimer's disease, multiple sclerosis, HIV/AIDS, and epilepsy.

Furthermore, new limits on cost management tools must be imposed for these vulnerable populations. We urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. For example we strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We urge CMS to prohibit or place limits on the use of certain cost containment policies, such as unlimited tiered cost sharing, dispensing limits, therapeutic substitution, mandatory generic substitution for narrow therapeutic index drugs, or prior authorization. We are also concerned that regulations will create barriers to having the doctor prescribe the best medication for the individual including off-label uses of medications that are common for many conditions. We strongly recommend that the final rule prohibit plans from placing limits on the amount, duration and scope of coverage for covered part D drugs.

Involuntary Disenrollment for Disruptive Behavior (§ 423.44)

The proposed regulation raises grave concerns in allowing Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" (§ 423.44(d)(2)). These provisions create enormous

opportunities for discrimination against individuals with mental illness and cognitive impairments. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and as a result they could also be subject to a late enrollment penalty increasing their premiums for the rest of their lives. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage.

As a matter of principle, for a critical safety net program such as Medicare prescription drugs for dual eligibles, NASW cannot support automatic disenrollment of this population under any circumstances. We are therefore alarmed that CMS has proposed an expedited disenrollment process that would undermine the minimal standards and protections included in the proposed rule. This expedited process proposal must not be included in the final rule. In addition, CMS must provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior and must waive the late enrollment penalty for these individuals as well. The final rule must include the following protections:

- drug plans must be prohibited from disenrolling a beneficiary because he/she exercises the option to make treatment decisions with which the plan disagrees, including the option of no treatment and/or no diagnostic testing;
- drug plans may not disenroll a beneficiary because he/she chooses not to comply with any treatment regimen developed by the plan or any health care professionals associated with the plan;
- documentation provided to CMS arguing for approval of a plan's proposal to involuntarily disenroll an individual must include:
  - documentation of the plan's effort to provide reasonable accommodations for individuals with disabilities in accordance with the Americans with Disabilities Act; and
  - documentation that the plan provided the beneficiary with appropriate written notice of the consequences of continued disruptive behavior or written notice of its intent to request involuntary disenrollment; and
- drug plans must provide beneficiaries subject to involuntary disenrollment with the following notices:
  - advance notice to inform the individual that the consequences of continued disruptive behavior will be disenrollment;
  - notice of intent to request CMS' permission to disenroll the individual; and
  - A planned action notice advising that CMS has approved the plan's request for approval of involuntary disenrollment.

Appeals Procedures (§§ 423.562-423.604)

The appeals processes outlined in the proposed regulations are overly complex, drawn-out, and inaccessible to beneficiaries. Under these proposed rules, there are too many levels of internal appeal that a beneficiary must request from the drug plan before receiving a truly independent review by an administrative law judge (ALJ) and the

timeframes for plan decisions are unreasonably long. In order to qualify for a hearing by an ALJ, beneficiaries must first request a coverage determination or exception from a tiered cost-sharing scheme or formulary which can take between 14 and 30 days, unless a plan honors a beneficiary's request that the determination or exception be expedited in which case it could still take up to 14 days. To appeal adverse determinations or exception decisions, beneficiaries must request plans to review their decision again and make a redetermination within 30 days unless the beneficiary paid out-of-pocket for the medication at issue, in which case the plan has 60 days to decide. Even if a plan honors a request to expedite a redetermination, the deadline for plans to make a decision could be as long as 14 days. Following a redetermination, beneficiaries may appeal to a so-called independent review entity for a reconsideration of their case, but these entities will not be authorized to review or question the criteria plans use to evaluate exceptions requests. The proposed rules do not even set deadlines for reconsideration decisions. After receiving a reconsideration decision, beneficiaries are only allowed to appeal to an administrative law judge if the amount in controversy meets a threshold level of $100 and it is unclear how CMS will calculate whether a beneficiary has met this threshold.

In addition to imposing unreasonable delays and burdens on beneficiaries, these appeal processes are far from transparent. Drug plans would be authorized to establish their own criteria for reviewing determination, exceptions, and redetermination requests and these criteria will vary from plan to plan. Plans would also be authorized to establish varying degrees of paperwork requirements for beneficiaries and their prescribing physicians who wish to request exceptions from tiered cost-sharing schemes or formularies. Far from ensuring that beneficiaries' rights are protected, which should be their primary function, these procedures would actually impede the right of beneficiaries to a fair hearing.

Beneficiaries with disabilities and complex health needs often have an extremely limited capacity to navigate grievance and appeals procedures. To accommodate the special needs of these beneficiaries and others who are vulnerable or with low income, CMS must establish a simpler process that puts a priority on ensuring ease of access and rapid results for beneficiaries and their doctors and includes a truly expedited exceptions process for individuals with immediate needs, including individuals facing health care crises, which should be modeled after the federal Medicaid requirement that states respond to prior authorization requests within 24 hours.

We also urge CMS to require plans to dispense a temporary supply of drugs in emergencies. The proposed system does not ensure that beneficiaries' rights are protected and does not guarantee beneficiaries have access to needed medications. For many individuals with disabilities such as epilepsy, mental illness or HIV, treatment interruptions can lead to serious short-term and long-term consequences. For this reasons the final rule must provide for dispensing an emergency supply of drugs pending the resolution of an exception request or pending resolution of an appeal.

Outreach and Enrollment (§ 423.34)

The proposed regulations do not adequately address the need for collaboration with state and local agencies and community-based organizations on outreach and enrollment of beneficiaries with disabilities and complex health conditions. In the conference report for the Medicare Modernization Act, Congress directed that "the Administrator of the Center for Medicare Choices [sic] shall take the appropriate steps before the first open enrollment period to ensure that Medicare beneficiaries have clinically appropriated [sic] access to pharmaceutical treatments for mental illness" (Report No. 108-391, pp. 769-770).

To respond to Congress's concern with ensuring enrollment and comprehensive coverage for beneficiaries, CMS must partner with community-based organizations focused on addressing the needs of vulnerable beneficiaries and the state and local agencies that coordinate benefits for them. Beneficiaries with special needs will most likely turn to organizations that they know and trust with questions and concerns regarding the new Part D drug benefit. Making information and educational materials available at these sites will help inform beneficiaries with mental illness about the new benefit, but providing community-based organizations with pamphlets and brochures alone is not adequate. To answer the many difficult, detailed, and time-consuming questions that beneficiaries will have about the new program, extensive face-to-face counseling services will be needed. Social workers and community-based organizations can provide the kind of detailed help needed, but they will need additional resources.

CMS must develop a specific plan for facilitating enrollment of beneficiaries with special needs, in each region that incorporates collaborative partnerships with and additional funding for state and local public and nonprofit agencies and organizations focused on these needs. In addition, in their bids, drug plans should include specific plans for encouraging enrollment of often hard-to-reach populations.

NASW strongly urges that the concerns discussed above be addressed in order to ensure access to psychiatric medications under the Part D drug benefit for the many Medicare beneficiaries who need them.

Thank you for your consideration of our comments.

Sincerely,

Toby Weismiller, ASCW
Director, Professional Development and Advocacy

To Whom It May Concern:

The National Spinal Cord Injury Association is pleased to submit comments on the proposed rule "Medicare Program;
Medicare Prescription Drug Benefit," 69 FR 46632. The National Spinal Cord Injury Association (NSCIA), founded in 1948, is the nation's oldest and largest civilian organization dedicated to improving the quality of life for hundreds of thousands of Americans living with the results of spinal cord injury and disease (SCI/D) and their families. This number grows by thirty newly-injured people each day.

Tens of thousands of individuals with spinal cord injury or disease (sci/d) are Medicare beneficiaries. NSCIA has grave concerns because the proposed rule does not provide critical protections for people with sci/d and almost 13 million other Medicare beneficiaries with disabilities and chronic health conditions. We offer the following essential recommendations:

DESIGNATE SPECIAL POPULATIONS WHO WILL RECEIVE AFFORDABLE ACCESS TO AN ALTERNATIVE, FLEXIBLE FORMULARY:

Individuals who have sci/d or other with serious and complex health issues must have access to the right medications. Such medications are critical to leading healthy, functioning, productive lives in the community as opposed to being institutionalized in nursing homes. Not having access to the correct medications can cause expensive hospital stays and life threatening events. People with sci/d and other disabilities may need the latest medications because they have fewer side effects.
Denying the suitable medication for an individual with a disability or chronic health condition can cause serious side effects, create unnecessary health problems, and lead to costly medical interventions. We strongly support the suggestion in the proposed rule that people with disabilities and other chronic conditions require special treatment due to unique medical needs, and the enormous potential for serious harm or death if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program.

We recommend the following groups be among those included in these exempt populations:

- people who are dually eligible for Medicare and Medicaid
- people with sci/
- people who live in nursing homes and other residential facilities
- people who have life threatening conditions
- people who have pharmacologically complex conditions

POSTPONE THE IMPLEMENTATION OF THE PART D PROGRAM FOR DUAL ELIGIBLES:

Dual eligibles (i.e. Medicare beneficiaries who also have Medicaid coverage) have more extensive needs and lower incomes than the rest of the Medicare population. Among these are many with sci/d. They rely extensively on prescription drug coverage to sustain their basic health. Because of low income, they are the most vulnerable beneficiaries. NSCIA believes there is not enough time allowed to address how drug coverage for these health and fiscally exposed beneficiaries will be transferred to Medicare on Jan. 1, 2006.

CMS and the private Part D plans giving drug coverage do not have enough time to implement a prescription drug benefit staring on January 1, 2006. These time constraints may well lead to plans that jeopardize the lives of people with sci/d and

other disabilities who fall into the dual eligible population. It is highly improbable that 6.4 million dual-eligibles could be identified, educated, and enrolled in six weeks (from November 15th the beginning of the enrollment period to January 1, 2006),

Therefore, **NSCIA urges that transfer of drug coverage from Medicaid to Medicare be delayed a minimum of six months even if legislative mandate is required.**
We further urge CMS to actively support such legislation in the current session of Congress.

FUND COLLABORATIVE PARTNERSHIPS WITH ORGANIZATIONS REPRESENTING PEOPLE WITH DISABILITIES THAT ARE CRITICAL TO AN EFFECTIVE OUTREACH AND ENROLLMENT PROCESS:

Organizations representing people with disabilities and other targeted populations of Medicare beneficiaries should be funded to collaborate with CMS in the outreach and enrollment process. These advocacy and service groups are one of the most effective inroads to disseminate outreach and enrollment information. **NSCIA strongly recommends that CMS develop national and regional partnerships with disability service and advocacy groups and local and state agencies.**

COST MANAGEMENT LIMITS AND CONSUMER PROTECTION:

NSCIA recommends that CMS make major enhancement to its provisions for consumer protection. One key example is not allowing any plan to require 100% cost sharing for any medication. These and other proposed cost burdens on the consumer could threaten and adversely effect people with sci/d and other disabilities. In addition to providing for special treatment for certain special populations, we urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. For example we strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We oppose any regulations that allow cost containment practices that would limit a physician from prescribing the best medication for an individual. This elimination of said cost containment practices is especially critical for the lives of people with sci/d and other disabilities.

ENHANCE AND STRENGTHEN INADEQUATE EXCEPTIONS AND APPEALS PROCESSES:

NSCIA believes the appeals processes in the proposed rule are not accessible, too complex and will have a major adverse and deleterious impact on beneficiaries with disabilities. We
urge that CMS develop an understandable process that allows simplicity of access and fast results for beneficiaries and their doctors. NSCIA also urges an expedited appeals process. Along with many other disability organizations, NSCIA believes that the proposed rule **fails to meet Constitutional due process requirements and fails to satisfy the requirements of the statute**. The proposed rule has so many levels of cumbersome internal appeals to the drug plan that it makes unbiased appeal nearly impossible. The appeals process itself could preclude critical medications over a duration of time so as to be life threatening to people with disabilities.

The parts of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (MMA) that call for design and implementation of an exception process are vital consumer protections that must include regulations that are enforced. Such procedures could assure that individuals with sci/d and other disabilities would receive timely coverage determination for on and off formulary medications in a manner unique to their complex needs.

NSCIA joins other disability organizations in asking that CMS revamp the exceptions process to: establish clear standards by which prescription drug plans must evaluate all exceptions requests; to minimize the time and evidence burdens on treating physicians; and to ensure that all drugs provided through the exceptions process are made available at the preferred level of cost-sharing.

REQUIRE PLANS TO DISPENSE A TEMPORARY SUPPLY OF DRUGS IN EMERGENCIES:

Persons with sci/d, other disabilities, and chronic health conditions must have access to prescribed medications at all times. The proposed system does not ensure beneficiary
access to needed medications. Said drugs are vital to the continued, productive functioning of persons with sci/d and other disabilities. Interruption of medication regimes can cause serious health complications and may even be life threatening. Consequently, the final rule must ensure that an emergency supply of drugs be made available for dispensing while pending the resolution of an exception request or an appeal.

NSCIA appreciates your consideration of these public comments.

Re: CMS-4068-P Comments on Part D, Medicare, Proposed Outpatient Drug Program Rules

Dear Dr. McClellan:

On behalf of the California Medical Association, we wish to join the American Medical Association in seeking further clarification regarding a range of patient safeguards that should be more explicitly addressed in your proposed rules. We believe it is imperative that these regulations clearly prohibit manipulations of a physician's prescribing authority that could subsequently result in disruptions in both the quality and continuity of medical care.

We strongly agree with your comments recently in the Wall Street Journal that "the choice of drugs should reflect current medical practice." In that spirit, we respectfully urge that CMS consider the following:

Benefit Design: As noted in AMA's testimony, we are concerned by 'serious deficiencies' in the USP's proposed model classification system. We find numerous circumstances whereby entire classes of vital drugs could be excluded by an HMO, PBM or other plan administrator. While some may believe this could help produce short term savings in the drug benefit program, it is inevitable that such limitations on coverage will shift the ensuing costs resulting from therapeutic failure to other parts of the Medicare program.

P&T Committee Coverage Decisions: We join the AMA in expressing our concern that absent further clarification, P&T Committees may be allowed to meet in secret, limit clinical and public input, and be stacked to favor the plan administrator's drug class preferences. It is not clear that the scope of the P&T Committees would include other coverage restriction strategies, such as prior authorization procedures or tiered/step formularies, nor if the committee's decisions would be binding on the PDP. We feel very strongly that the rule should be modified to make it clear that P&T committees must be responsible for the development of all coverage policies, and that their decisions should be made and explained openly through a transparent process that allows for public input.

Patient Protections: We are also very concerned that the plans could change formularies with only 30 days notice. You are aware that the Medicare population in general, and the dual eligible population in particular, commonly have multiple chronic conditions that require multiple ongoing drug therapies. In a majority of these patients their conditions are medically fragile and the dosages and drug products have been carefully titrated. Other than adding drug products, we believe formularies should only be modified, with adequate notice and P&T Committee approval, between plan years/contracts.

Drug Switching, Federal Preemption of State Pharmacy and Patient Protection Laws. While the preamble states that drug switching should require explicit approval by the treating physician, the rules themselves fail to expressly preserve this vital principle. Similarly, nowhere in the rule is the likely effect of the MMA on state pharmacy laws – which currently regulate the practice of therapeutic interchange – or drug switching – discussed. Switching prescriptions without the consent of the treating physician is the practice of medicine by non-physicians. Health plan or PBM employees who have virtually no history or contact with affected patients should not be permitted to override the treating physician's expert judgment. Again, Medicare is essentially a closed system—short-term savings which result in higher costs overall do not serve Medicare patients or the public well. To ensure that the final rules are not interpreted as permitting drug switching without the explicit consent of the treating physician, we urge you make it clear in the text of the regulations that state laws regulating therapeutic interchange must continue to be respected.

Office-Based Injectible Drugs for Oncology and Other Specialties: The MMA will drastically reduce the payment amount for drugs and drug administration services compared to the 2004 amounts. In addition, it appears likely that the payment methodology for drugs (106% of the manufacturer's average sales price) will result in payment amounts for many drugs that are lower than the prices at which physicians can purchase them, yet there is no mechanism in the MMA for adjustments in such circumstances. These changes have the potential to create substantial impairment of patient access to cancer and other essential treatments. Therefore, Congress should create exceptions under which CMS would be required to ensure that the payment amounts for in 2005 and later years are sufficient to cover the cost that physicians incur in purchasing the drugs. In addition, Congress should revise the MMA's transitional adjustment payment for drug administration services to an amount that will maintain the net revenue available to physicians from drugs and drug administration services in 2005 and 2006 at the same level as in 2004.

We readily acknowledge the daunting, complex nature of this new and promising program. And we applaud your efforts to implement it in a fair and responsible fashion. As you work to refine the implementing rules, we ask that the agency anticipate the consequences of arbitrarily limiting access to medically necessary drug products and work diligently to ensure that the standards and requirements that you ultimately set out for the program first and foremost do no harm.

Thank you for your consideration of these important medical principles and our mutual support of the patients we all serve.

Sincerely,

Comments from AmeriHealth Mercy Health Plan

CMS-4068-P-1244-Attach-1.doc

October 4, 2004

Mark B. McClelland, M.D., Ph.D.
Administrator
Centers for Medicare & Medicaid Services
Department of Health and Human Services
Attention: CMS-4068-P
P.O. Box 8018
Baltimore, MD 21244-8018

Dear Dr. McClellan:

AmeriHealth Mercy Health Plan is pleased to have the opportunity to submit comments in response to the notice of proposed rulemaking by the Centers for Medicare & Medicaid Services (CMS) to establish the program for the Medicare Prescription Drug Benefit under Part D. AmeriHealth Mercy Health Plan is submitting separate comments to the Medicare Advantage (MA) regulations that relate to some of the same issues discussed here.

Background

AmeriHealth Mercy Health Plan is a subsidiary jointly owned by Independence Blue Cross and Mercy Health System. AmeriHealth Mercy Health Plan is a leading provider of Medicaid managed care programs and services. Together with its affiliate Keystone Mercy Health Plan and *PerformRx*, its pharmacy benefits management division, AmeriHealth Mercy Health Plan touches the lives of more than one million Medicaid members in seven states. AmeriHealth Mercy Health Plan and its affiliates (collectively, AmeriHealth Mercy Health Plan) are very interested in the opportunities provided by the Medicare Modernization Act (MMA) to participate both in the MA program through the offering of specialized MA plans for dual eligibles and in the offering of pharmacy benefit services on behalf of specialized MA plans serving dual eligibles.

The need to effectively manage prescription drug benefits for our large mandatory enrollment Medicaid populations led AmeriHealth Mercy Health Plan to develop *Perform Rx,* a Medicaid pharmacy care management program that meets financial objectives while improving the quality of health care for members. *PerformRx* manages drug benefits and services for almost 900,000 Medicaid beneficiaries in six states.

As further background, AmeriHealth Mercy has significant experience in serving dual eligible populations. AmeriHealth Mercy Health Plan furnishes services to about 50,000 full benefit dual eligibles in the following three health plans:

- Keystone Mercy Health Plan, Southeastern Pennsylvania's largest Medicaid managed care health plan serving more than 280,000 Medical Assistance recipients, including 31,000 dual eligibles, in Bucks, Chester, Delaware, Montgomery and Philadelphia counties**.** Keystone Mercy Health Plan operates this plan under a license held by Vista Health Plan, a subsidiary of Independence Blue Cross.
- AmeriHealth Mercy Health Plan serves about 76,000 Medical Assistance recipients, including about 6, 000 dual eligibles, in fifteen counties in Central and Northeastern Pennsylvania. AmeriHealth Mercy Health Plan operates this plan under a license held by Vista Health Plan, a subsidiary of Independence Blue Cross.
- Passport Health Plan[1] is a Medicaid managed care plan that serves over 130,000 members in Louisville and 15 surrounding counties in Kentucky. Its membership includes 12,000 dual eligibles. Passport was formed in 1997 by a group of safety net Medicaid providers. AmeriHealth Mercy provides complete health plan management and administrative support services under the governance of the Passport Health Plan board. Passport Health Plan is currently in the process of completing an application to participate in the Medicare Advantage program as a specialized MA plan for dual eligibles.

Discussion

1. Introduction

As an overall comment, AmeriHealth Mercy's experience in managing comprehensive prescription drug benefits for high risk Medicaid populations is that the management of the prescription drug benefit and medical benefits (hospital, physician, ancillary, etc.) are inherently interrelated because the quality outcomes and total costs are interdependent. Good disease management programs incorporate prescription drug data and management as integral components to clinical quality improvement and utilization/cost management efforts. Successful disease and case management programs serving high risk, low income populations focus on removing barriers to services. While total medical costs can be stabilized/reduced, an individual's prescription drug utilization may actually increase with appropriate use and adherence to medication plans. Thus, from the perspective of an MA-PD plan that is managing medical and pharmaceutical services, the sponsoring MA organization has strong motivation to ensure that the Part D drug benefit is designed and administered in a manner that serves the best interests of its enrollees. Over the years, health plans have developed effective programs to appropriately manage their drug benefits. AmeriHealth Mercy Health Plan urges CMS to develop the Part D regulations in a manner that gives health plans the discretion to continue these programs.

2. Subpart B – Eligibility and Enrollment

[1] Passport Health Plan is the trade name for University Health Care, a section 501(c)(3) tax exempt organization.

In this section of our letter, we provide our rationale for requesting that CMS adopt a policy that would allow the auto-assignment of full benefit dual eligibles into an MA-PD that is offered by a health plan in which the full benefit dual eligibles are enrolled or a health plan under common ownership and control of the health plan in which the full benefit dual eligibles are enrolled. Because of the importance of these comments, AmeriHealth Mercy Health Plan has repeated these recommendations in its comments to the MA proposed rule.

The MMA establishes a mechanism for full benefit dual eligibles who will be losing their outpatient drug coverage under Medicaid to select enrollment in an MA-PD plan or a PDP. The statute allows for default enrollment into a PDP in the event that a full benefit dual eligible fails to select a PDP or an MA-PDP Plan. Based on information provided at an open door forum, our understanding is that CMS intends to have this default enrollment occur effective January 1, 2006.

In the preamble to the PDP proposed rule (page 46638), CMS explains that there are conflicting statutory provisions related to default enrollments. To address these conflicts, CMS is proposing to default full benefit dual eligibles into an MA-PD if the full benefit dual eligible was enrolled in the MA organization previously. In the preamble, CMS articulates its policy justification for this decision as follows:

> To the extent that the MA-only portion of the MA-PD plan parallels the coverage under a full benefit dual eligible individual's MA plan, enrolling the individual in the MA-PD plan would be similar to permitting the individual to remain enrolled in the MA plan while simultaneously enrolling the individual in a PDP. In other words, enrolling the individual in a MA-PD plan offered by the same MA organization is, in effect, simply adding qualified prescription drug coverage to the individual's MA benefits. For this reason, we believe the reference to ``prescription drug plans'' in section 1860D-1(b)(1)(C) of the Act should be interpreted as requiring enrollment of a full benefit dual-eligible into a plan that will provide the individual with Part D drug benefits in addition to any other benefits the individual receives under Medicare, whether through Medicare Part A and/or Part B, or through enrollment in the Medicare Advantage program under Part C. We believe this interpretation promotes the policies underlying sections 1860D-1(b)(1)(C) and 1860D-1(a)(1)(B)(ii) of the Act, giving full effect to both statutory provisions.

AmeriHealth Mercy Health Plan fully supports CMS proposed policy, but requests that CMS expand this policy to allow for default enrollments in two additional, related circumstances illustrated below. First, Passport Health Plan currently enrolls 12,000 dual eligibles and is in the process of applying for an MA-SNP to serve dual eligibles. AmeriHealth Mercy Health Plan is recommending that CMS expand its policy to allow for the current full benefit dual eligible enrollees of Passport Health Plan's Medicaid MCO who do not otherwise select an MA-PD or PDP to default into Passport Health Plan's MA-PD. Because virtually all Medicare services are covered under Medicaid, allowing such a default enrollment would permit these full benefit enrollees to continue to receive the full range of A/B services and drug benefits from the same

health plan. Moreover, AmeriHealth Mercy Health Plan believes that allowing dual eligibles to retain their prescription drug providers and the existing pharmacy management structure is fully consistent with the objectives stated above.

AmeriHealth Mercy Health Plan believes there is legal precedence to support our interpretation that would permit members of another health plan offered by the same organization to be viewed as members of the Medicare managed care organization. Section 1851(a)(3)(B) includes the provision that prohibits beneficiaries with end-stage renal disease (ESRD) to enroll in an MA plan. This paragraph includes an exception that permits the enrollment of "an individual who develops end-stage renal disease while enrolled in an MA plan may continue to be enrolled in that plan." As part of the BBA regulations, CMS was confronted with the issue of whether a Medicare beneficiary who was enrolled in a non-Medicare+Choice plan and who developed ESRD could enroll in a Medicare+Choice plan offered by the same organization. In answering this question, CMS appropriately asserted its authority to depart from the literal reading of the statute and took the following position:

> For purposes of this provision only we are considering individuals who are enrolled in a private health plan offered by the M+C organization to have been enrollees of the M+C plan when they developed ESRD. (63 FR 34976, June 26, 1998)

While this ESRD enrollment issue is in a different context from the default enrollment issue under the MMA, it illustrates the clear willingness of CMS to depart from the literal reading of the statute to reach an important and desirable policy result. In this case, that departure entailed treating a non-MA enrollee of an organization as an MA enrollee of that same organization for purposes of enrollment into an MA plan. Consistent with CMS' willingness to extend a reference to M+C organizations to a non-Medicare health plan offered by the same entity, we believe that CMS has the corresponding legal authority to make an analogous legal interpretation. AmeriHealth Mercy Health Plan believes that strong policy reasons also support this result because this interpretation would allow a single organization to coordinate the services and be responsible for the full range of Medicare and Medicaid benefits for the full benefit dual eligibles. In making this recommendation, we emphasize that these full benefit dual eligibles would have the right to disenroll from the MA-SNP, if they want.

We also believe our recommendation has policy support under the statutory provision in Section 1851(c)(3)(a)(II), which address seamless continuation of coverage. Under that provision, CMS has the authority to establish procedures under which an individual who is enrolled in a health plan (other than an MA plan) offered by an MA organization at the time of the initial election period and who fails to elect to receive coverage other than through the organization is deemed to have elected the MA plan offered by the organization. While this provision applies to initial election period when a person is first eligible for Medicare coverage, the provision demonstrates Congressional support for arrangements that facilitate enrollment into an MA plan of an enrollee covered by a non-MA plan sponsored by the same organization. In addition, this provision offers clear authority for CMS to provide for this default enrollment in the future when an

enrollee of a Medicaid MCO first becomes eligible for Medicare and the same entity also offers an MA plan.

Our second policy recommendation related to how CMS interprets the default enrollment provision is an extension of our initial request and relates to the two Pennsylvania Medicaid managed care plans: Keystone Mercy Health Plan in Southeastern Pennsylvania, and AmeriHealth Mercy Health Plan in Central and Northeastern Pennsylvania. As noted above, AmeriHealth Mercy Health Plan and its affiliate, Keystone Mercy Health Plan, are owned by Independence Blue Cross and Mercy Health System. Both of these Medicaid plans are operated under an HMO license held by Vista Health Plan, a wholly owned subsidiary of Independence Blue Cross.

Independence Blue Cross itself and through its subsidiaries has three separate MA contracts. One contract is a PPO sponsored by Independence Blue Cross itself. The second contract is held by a wholly owned subsidiary of Independence Blue Cross, Keystone Health Plan East, Inc., and is offered in Southeastern Pennsylvania. The third contract is held by AmeriHealth HMO, Inc. AmeriHealth Mercy Health Plan is requesting that CMS adopt a policy that would allow the full benefit dual eligible enrollees of AmeriHealth Mercy Health Plan and Keystone Mercy Health Plan and who do not otherwise select another MA-PD or PDP to default on January 1, 2006, into the MA-SNP sponsored by AmeriHealth HMO, Inc, and Keystone Health Plan East, Inc., respectively. In making this request, we want to be clear that substantial efforts will be made in advance of the default date to have these Medicaid enrollees either select a MA-PD plan or a drug plan. Keystone Health Plan East and AmeriHealth HMO, Inc. will be actively marketing the dual eligibles enrolled in their affiliated Medicaid managed care organizations in a manner consistent with CMS rules. However, as CMS is aware from its experience in the drug discount card program and the challenges associated with enrolling dual eligibles in the Medicare savings programs, many dual eligibles will take no action prior to January 1, 2006. AmeriHealth Mercy Health Plan strongly believes it is in the best interests of their enrollees and the Medicare program to default these enrollees into Keystone Health Plan East's MA-SNP.

AmeriHealth Mercy Health Plan also believes there is a legal precedent for allowing affiliates of organizations to avail themselves of statutory rights under the Medicare or Medicaid program. Prior to enactment of the BBA, Medicaid MCOs were prohibited from having more than 75 percent of their enrollment comprised of persons eligible for Medicare and Medicaid. Certain community health centers, migrant health centers, and Appalachian health centers were exempt from this requirement. When CMS implemented this statutory provision, CMS departed from the literal reading of the statute and extended this exemption to HMOs owned by these health centers. CMS discussed this issue in the following manner:

> As noted in the previous section, we are proposing to amend the regulations to recognize the statutory exemption from the composition of enrollment standard for certain Community, Migrant, and Appalachian Health Centers. It has come to our attention that some of these exempt centers have joined to form larger organization in order to operate an HMO of adequate size. Under simple arrangements, several community health centers have established an HMO that

> enrolls members who are then provided primary care services through the same community health centers. The HMO serves simply as the corporate vehicle allowing the centers to combine their efforts. In this circumstance, we believe that, consistent with Congressional intent, the HMO formed by centers that are exempt from the composition of enrollment standard should itself be exempt from the standard. (53 FR 746, January 12, 1988)

This discussion illustrates CMS willingness to extend statutory rights from an organization to an affiliate of that organization in appropriate circumstances. In the context of the issues being raised to CMS here, it is important to note that the complexity arising from these different organizational structures derives both from the limitations that Independence Blue Cross has to use the Blue Cross mark outside of its designated area and Medicaid managed care program requirements. Notwithstanding this complexity, it is clear that all of the entities that hold the MA contracts and Medicaid contracts with the Pennsylvania Department of Public Welfare are wholly owned subsidiaries of Independence Blue Cross. Therefore, for purposes of developing public policy interpreting the default enrollment provisions, we believe it is reasonable and appropriate for CMS to treat these affiliated companies as a single entity.

AmeriHealth Mercy Health Plan recognizes that CMS' consideration of AmeriHealth Mercy Health Plan's requests needs to be considered in the context of a broader policy that is consistent with the objectives of the MMA and serves the best interests of full benefit dual eligibles. To achieve this end, AmeriHealth Mercy Health Plan recommends that CMS adopt the following policy:

> That CMS approve default enrollment of a full benefit dual eligible who has not otherwise selected an MA-PD or PDP into an MA-PD that is administered by an MA organization (1) that operates the Medicaid MCO in which the dual eligible is enrolled or (2) that is affiliated by common ownership or control with an organization that operates the Medicaid MCO in which the dual eligible is enrolled. As a condition of CMS approving this policy, the MA organization would be obligated to meet the following conditions:
>
> 1. The MA organization would have to assure that the full benefit dual eligibles are given notice of the default enrollment and their opportunity to select other options in advance of the default enrollment as well as their continued ability to disenroll from the specialized MA-PD plan following their enrollment.
>
> 2. The bid for A/B benefits would not include beneficiary premiums or cost sharing that would be paid by the full benefit dual eligible enrollees. If the Part D premium is determined to be in excess of the low income premium subsidy, the MA-PD plan would reallocate rebate dollars to the amount of the low income premium subsidy (if permitted by CMS).
>
> 3. The MA organization must represent that substantially all of the Medicaid providers currently furnishing services to the full benefit dual eligibles are either

part of the MA-SNP's delivery system or would have the opportunity to participate in that delivery system provided that the MA organization's credentialing requirements could be met.

4. The same pharmacy benefits manager that will administer the Part D benefit on behalf of the MA-SNP must also have previously managed the pharmacy benefit for the dual eligible enrollees of the Medicaid MCO.

AmeriHealth Mercy Health Plan would welcome the opportunity to discuss with CMS its proposal. As implicitly reflected in the above conditions, AmeriHealth Mercy Health Plan is recommending that CMS allow default enrollments into an MA-PD even if the Part D premium exceeds the low income premium subsidy. We believe the enrollees' best interests will be met by enrolling them in the MA plan under the above conditions rather than forcing them into a PDP.

3. Subpart C – Benefits and Beneficiary Protections

a. USP Classification structure

AmeriHealth Mercy Health Plan supports the proposed USP classification structure. We believe that the skeletal structure does exactly what it was primarily intended to do -- prevent enrollee discrimination through non-inclusion of certain medication types and categories. This skeletal structure provides a good basis from which to create a workable formulary that will ultimately be reviewed by CMS for appropriateness. AmeriHealth Mercy Health Plan reiterates its earlier point that it is very important for CMS to give MA organizations the flexibility to administer their drug benefit in a manner that serves the best interest of their beneficiaries. AmeriHealth Mercy Health Plan has substantial experience developing and managing formularies under Medicaid programs in a number of states. These formularies make available to enrollees in a cost effective manner the pharmaceuticals they need. AmeriHealth Mercy Health Plan urges CMS not to develop requirements that impair the ability of health plans like AmeriHealth Mercy Health Plan to continue the effective pharmaceutical programs that they currently offer to their enrollees.

b. Formulary development

AmeriHealth Mercy Health Plan supports the formulary development requirements and believes that the statutory and proposed regulatory requirements are generally consistent with industry practices in the development of formularies. Under the proposed rule, the majority of members comprising the P&T committee would be required to be practicing physicians and/or practicing pharmacists. In addition, at least one practicing pharmacist and one practicing physician member would have to be an expert in the care of elderly and disabled individuals and free of conflict with respect to the PDP sponsor and PDP or MA organization and MA-PD. AmeriHealth Mercy Health Plan believes this standard, in general, is reasonable and consistent with standard industry practice. However, AmeriHealth Mercy Health Plan has one concern with regard to how CMS is

interpreting "independent." In the preamble discussion, it appears that CMS would preclude a pharmacist from being viewed as "independent" if the pharmacist was part of the pharmacy network of the MA-PD plan. AmeriHealth Mercy Health Plan believes that many health plans attempt to create their P & T Committees composed of the "best and brightest" physicians within their geographic area. They also have this same goal for their provider networks. As a result, we have concerns that it may not be possible to obtain a physician or pharmacist who meets the requisite qualifications but is not part of the health plan's network. The health plan would be forced to find a pharmacist or physician who is located outside their service area to participate on their P & T Committee. Consequently, the selected P & T Committee member would lack a good understanding of local health care issues and concerns.

c. Use of rebates to reduce cost sharing

Under §423.100 in the definition of "required prescription drug coverage" an MA-PD plan may offer enhanced alternative coverage if there is no supplementary beneficiary premium as a result of the use of rebate dollars from A/B savings. In the preamble, CMS notes that an MA-SNP may use rebate dollars to reduce the nominal copayments that apply to low-income subsidy individuals who have incomes below 135 percent of FPL. We are seeking CMS confirmation on an issue related to this position. These dual eligibles may have copayments of $1/$3 or $2/$5. Our understanding is that an MA organization offering an MA-SNP for dual eligibles may use rebate dollars to remove both levels of copayments. AmeriHealth Mercy Health Plan is requesting that CMS confirm this interpretation in the preamble to the final regulation.

d. Drugs covered under Part B and Part D

CMS sets forth a lengthy discussion in the preamble concerning issues arising from drugs that may be provided under Part B and Part D. Based on our experience in the Medicaid program, AmeriHealth Mercy Health Plan has found that enormous issues can arise regarding the appropriate classification of drugs when the classifications dictate different financial obligations. AmeriHealth Mercy Health Plan urges CMS to the fullest extent possible to provide clear guidance regarding which drugs fall under Part B and those that fall under Part D. This guidance should also explain the rules determining treatment of newly approved drugs. This guidance should also delineate clearly the circumstances in which a drug may fall under either Part B or Part D depending on the manner in which it is administered.

4. Subpart D – Cost Control and Quality Improvement

As proposed under §423.153(b), CMS is requiring MA-PD plans and PDPs to have a cost-effective drug utilization management program. This program must:

(1) Include incentives to reduce costs when medically appropriate; and
(2) Maintain policies and systems to assist in preventing over-utilization and under-utilization of prescribed medications.

AmeriHealth Mercy Health Plan believes an effective drug utilization program is integral to the success of the Part D program. To this end, AmeriHealth Mercy Health Plan urges CMS to convey in the preamble its support for current practices that are commonly used by health plans and pharmacy benefit managers to manage utilization and control costs.

While unfortunate, the reality in today's health care environment is that a significant amount of beneficiary fraud and abuse occurs. This type of activity occurs in spite of significant efforts on the part of both pharmacists and the majority of practicing physicians to prevent this type of behavior. AmeriHealth Mercy Health Plan asks CMS to consider providing options, policies and processes that would allow health care payers/providers to investigate potential beneficiary fraud and misuse, and when verifiable, to attempt to control the activity in question. A large number of States already have beneficiary fraud and misuse programs in place for their Medicaid programs, and, in our opinion, these programs can be extremely successful in reducing the unwanted behavior.

AmeriHealth Mercy Health Plan, through its working relationship with the Commonwealth of Pennsylvania, has designed, developed, and implemented a program that attempts to eliminate/reduce fraud and misuse of drug products within our specific member population. Our particular program is referred to as "Recipient Restriction."

The pharmacy services department for the health plan constantly monitors drug claim data, looking for potential fraud and misuse. There are a number of algorithms that exist or could be developed by CMS to give guidance on what would, or would not, be considered fraud and/or misuse. The focus of these programs is typically on drugs and drug products that have "street" or "abuse" potential, with the primary products being the therapeutic class – opiate/narcotic pain medications. A number of other products have been included and are monitored as research and practice dictate.

The current process requires that once the health plan identifies a member misusing either products or services, a request to "restrict" that member is submitted to the Commonwealth's Department of Public Welfare "Recipient Restriction" oversight committee for a review and final determination. If the committee feels that there is enough data/information to support the restriction, based on the restriction criteria that has been approved and is in place, the member is restricted to using a single provider or group of providers and/or a single retail pharmacy vendor for a period of five years. What is also important is that this restriction attaches to the recipient and follows that recipient as they move from health plan to health plan. This is an extremely important component of the program as it precludes the recipient from re-initiating the unwanted behavior simply by changing health plans.

There appears to be little comment given in the MMA to programs/processes geared toward beneficiary fraud and misuse, the ability of MA-PD plans PDPs to initiate these types of programs, or CMS's willingness/ability to support this type of program.

AmeriHealth Mercy Health Plan's experience with this type of restriction program has been very positive. Once identified and "restricted," our research shows a significant decrease in the detrimental practices and behavior of the restricted recipients.

AmeriHealth Mercy Health Plan would encourage CMS to address and clarify the types of programs and support for these programs that might be forthcoming. The ability of a health plan to take limited action against a recipient that is misusing the system, with only the slightest impact of that recipient's access to the health care system, is an extremely valuable tool to improve appropriate utilization of medications and reduce unnecessary financial expenditures. While it may not be possible to establish a program under Medicare that parallels exactly the Medicaid programs, AmeriHealth Mercy Health Plan urges CMS to consider these issues and convey in the preamble to the final rule or the rule itself the manner in which these programs may be administered as well as alternative practices that may be followed by PDPs and MA-PD plans to accomplish the same objectives.

AmeriHealth Mercy Health Plan is also seeking confirmation from CMS with regard to the ability of MA-PDs and PDPs to require that certain drugs receive prior approval before a prescription is filled. Prior approval is a common practice and CMS repeats a number of times in the preamble the ability of health plans to continue their existing programs to manage costs. We also note that the Federal Medicaid law expressly provides:

> A State may subject to prior authorization *any* covered outpatient drug. Any such prior authorization program shall comply with the requirements of paragraph (5)." § 1396r- 8(d)(1)(A) (emphasis added).

Paragraph (5), entitled "Requirements of prior authorization programs," reads as follows:

> A State plan under this subchapter may require, *as a condition of coverage or payment* for a covered outpatient drug for which Federal financial participation is available in accordance with this section, ... the approval of the drug before its dispensing for any medically accepted indication (as defined in subsection (k)(6) of this section) only if the system providing for such approval-
> (A) provides response by telephone or other telecommunication device within 24 hours of a request for prior authorization; and
> (B) except with respect to the drugs on the list referred to in paragraph (2), provides for the dispensing of at least 72-hour supply of a covered outpatient prescription drug in an emergency situation (as defined by the Secretary).

42 U.S.C. § 1396r-8(d)(5) (emphasis added)

AmeriHealth Mercy Health Plan believes the process we currently use, follows the federal Medicaid guidelines. This guideline has worked well for years in the Medicaid environment, and AmeriHealth Mercy Health Plan recommends that CMS approve a comparable policy for the Part D program.

5. Subpart F Submission of Bids and Monthly Beneficiary Premiums; Plan Approval

In the preamble discussion, CMS is clear that it expects PDP sponsors and MA organizations to identify the additional costs that may arise as a result of supplemental benefits. CMS states that a portion of these costs will be associated with increased utilization of the Part D basic benefit. CMS expects that the costs associated with this increased utilization will be included in the component of the bid attributable to the supplemental benefits, not the basic benefits.

This position raises a number of very significant and troubling issues for AmeriHealth Mercy Health Plan. If AmeriHealth Mercy Health Plan were to offer a MA-SNP for dual eligibles, its enrollees would have substantial "supplemental" coverage through the payment by CMS of the low-income subsidies. Our actuaries estimate that the utilization associated with an MA-SNP is well above that associated with the basic plan -- potentially 20 percent higher. This increased utilization is for the same population; it does not reflect populations choosing the plan or the value of the cost sharing itself. It is in addition to any risk adjustment needed due to diagnosis or medical conditions of a given population. Of the total allowed costs due to the increased utilization, a portion is reimbursed through increased cost sharing subsidies or increased reinsurance subsidies. The remaining portion is not reimbursed through any of the Part D direct subsidy, the reinsurance subsidy, the low-income premium subsidy, or the low-income cost sharing subsidy. Most importantly, the additional costs associated with this additional utilization cannot be reallocated outside of the basic drug benefit because AmeriHealth Mercy Health Plan will not be offering supplemental benefits.

As a result, AmeriHealth Mercy Health Plan and other MA-SNPs will be placed at a significant competitive disadvantage to MA-PDs and PDPs that will not have these additional costs included in their basic bid. More importantly, this inequity increases the likelihood that the premium of an MA-SNP will be greater than the low-income premium subsidy in its region. If this should occur, full benefit dual eligibles, who might otherwise have no premium, will be forced to pay a premium to the MA-SNP. This occurrence could create an incentive for the full benefit dual eligibles of the MA-SNP to disenroll and enroll in another plan that may be less expensive, but may not offer the special services needed by the dual eligible population.

For this reason, AmeriHealth Mercy Health Plan opposes CMS' proposed decision to require the costs associated with increased Part D basic services that arise when supplemental benefits are provided to be removed from the basic bid.

6. Subpart G Payments to PDP Sponsors and MA Organizations Offering MA-PD plans for all Medicare Beneficiaries for Qualified Prescription Drug Coverage

On page 46688 of the preamble, CMS included the following discussion conveying its concerns that plans serving large portions of low-income subsidy beneficiaries may not be paid adequately under the new Part D risk adjustment system:

> Any risk adjustment methodology we adopt should adequately account for low-income subsidy (LIS) individuals (and whether such individuals incur higher or lower-than average drug costs). Our risk adjustment methodology should provide neither an incentive nor a disincentive to enrolling LIS individuals, and we request comments on this concern and suggestions on how we might address this issue.
>
> Our particular concern is that a risk adjustment methodology, coupled with the statutory limitation restricting low-income subsidy (LIS) payments for premiums to amounts at or below the average, could systematically underpay plans with many LIS enrollees (assuming LIS enrollees have higher costs than average enrollees). If the risk-adjustor fails to fully compensate for the higher costs associated with LIS recipients, an efficient plan that attracts a disproportionate share of LIS eligible individuals would experience higher costs to the extent the actual costs of the LIS beneficiaries are greater than the risk-adjustment compensation. Failing to discourage enrollment by LIS beneficiaries in 2006, the plan would experience higher than expected costs in that year and presumably be driven to reflect these higher costs (due to adverse selection, not efficiency) in its bid for 2007. In this hypothetical, plans would have a disincentive to attracting a disproportionate share of LIS beneficiaries. One possible solution would be to assure that the initial risk-adjustment system, which will be budget neutral across all Part D enrollees, does not undercompensate plans for enrolling LIS beneficiaries. In fact, to the extent that an initial risk-adjustor might at the margin tend to overcompensate for LIS beneficiaries, plans would have a strong incentive to disproportionately attract such beneficiaries. Plans could attract LIS beneficiaries both by designing features that would be attractive to such beneficiaries but also by bidding low. We would appreciate comments on this concern and suggestions on how we might address this potential problem.

AmeriHealth Mercy Health Plan shares the concern that the risk adjustment methodology could systematically underpay plans with many low-income subsidy enrollees. As noted above, of the total allowed costs due to the increased utilization, a portion is reimbursed though increased cost sharing subsidies or increased reinsurance subsidies. The remaining portion is not reimbursed through any of the Part D direct subsidy, the reinsurance subsidy, the low-income premium subsidy, or the low income cost sharing subsidy. Because these costs are not reimbursed, MA-SNPs will need to build them into member premium. As a result, MA-SNPs like AmeriHealth Mercy Health Plan will be less competitive than plans without such low-income eligibles.

To address this issue, CMS could include in the risk adjuster a component that reflects both the extra utilization the dually eligible Medicare/Medicaid population reflects due to its inherent risk (if it bought the basic Part D plan) and the extra utilization because it will effectively receive a much richer $1/$3 copay plan. AmeriHealth Mercy Health Plan believes that this incremental adjustment would be beyond that reflected in the standard (to be determined) diagnosis-based risk adjuster. We believe that this solution would protect both MA-SNPs and other PDP or MA-PD plans that happen to enroll low-income members.

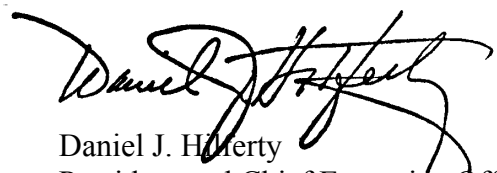
In addition to the increased costs associated with the greater utilization of services, we believe that the additional administrative expense involved in the increased utilization and the administration of the cost sharing subsidy is also unlikely to be included in:

- Standard PDP bids
- Reinsurance subsidies
- Low income premium subsidy
- Cost sharing subsidy

If so, it again would be in the member premium and put plans with LIS enrollees at a competitive disadvantage. This cost could be either a) added to a Medicaid/low income risk adjustment (as above), or b) added as a load onto the actual cost sharing reimbursement.

AmeriHealth Mercy Health Plan appreciates the opportunity to comment on these regulations. If you would like to discuss any of our comments, feel free to call me at (215) 937-8200.

Sincerely,



Daniel J. Hilferty
President and Chief Executive Officer

Issue Areas/Comments

GENERAL

GENERAL

To Whom It May Concern:

I am writing today in regards to the proposed Medicare Part D rules. As a pharmacist of the Medicine Shoppe Pharmacy located in LaCrosse, WI, I am greatly concerned about these proposed rules and the impact they will have on pharmacy services for our patients.

Please know that myself and all pharmacists want to see this Medicare Part D benefit work for all those involved. Unfortunately as past history will show, the private sector health plans have and continue to target pharmacies and pharmacy reimbursement in cost containment measures rather than teaming with pharmacy providers to enhance the quality and accessability to important health care services. We cannot continue to follow this path.

As a community pharmacist, I am concerned with three aspects of the Medicare Part D proposed rule and recommend that Centers for Medicare and Medicaid Services enable the following three policies:

1) Medicare recipients must be able to choose their own pharmacies.
It is critical that plan sponsors make every effort to include as many pharmacy providers as possible in the Part D benefit. Accessibility should be applied at a level no broader than a county to ensure all patients have ready access to the pharmacies in their community. Furthermore, plan sponsors must be required to provide pharmacy payment such that it at a minimum covers the average costs associated with dispensing prescription drugs. Private health plans often use their market force to drive down pharmacy reimbursement rates below a pharmacy's operational costs, thereby forcing pharmacy providers to shift costs to other business sectors. Medicare must now allow plan sponsors to continue this practice.

2) Implement measures to prohibit incentives designed to coerce recipients into choosing plans that exclude pharmacies.
Medicare patients should not be economically coerced into using one pharmacy over another unless the plan sponsor can justify quality reasons for a preferential pharmacy. Plan sponsors should be prohibited from providing economic incentives to recipients for using mail order pharmacies. Plan sponsors should also be prohibited from promoting pharmacies in which they have ownership interest.

3) Plan sponsors should be required to establish specified Medication Therapy Management services.
The Center for Medicare and Medicaid Services should require all plan sponsors to provide at least a specified set of medication therapy management services. Plan sponsors could provide additional MTM services, beyond the minimum required, but each must meet the CMS miminum requirements. Likewise, all plan sponsors should be directed to allow any pharmacist who receives an order for an MTM service to be able to provide that service.

All medicare eligible prescribers shoud be allowed to refer their patients in need of MTM services to a provider of such. At a minimum, each plan should be required to pay for MTM services ordered by such prescribers.

Plan sponsors should also have a plan in place to direct specifed patients, such as those with multiple chronic diseases and/or drug therapies, to MTM service providers. In turn, MTM service payment must be adequate to warrant provision of the necessary services provided by a pharmacist. As well, all pharmacists practicing within a region should be afforded the opportunity to provide MTM services.

In closing, I would like to express my appreciation for this opportunity to offer CMS my opinion of the rules being proposed for Medicare Part D benefit. I hope that my concerns and the concerns expressed by pharmacists locally and nationally are being considered.

Thank you for your time and consideration.

Sincerely,

Stephanie Belling, RPH

GENERAL

GENERAL

Please see comments in attached Word document.

CMS-4068-P-1246-Attach-1.doc

Option Care of East and Central Iowa is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Option Care of East and Central Iowa is a member of the national network of the Option Care home infusion companies and is located in Cedar Rapids, Iowa. We are an employee-owned company that has been specializing in this type of home care services for over 20 years. We are a member of the largest network of home infusion companies in the country. We are accredited by the Joint Commission and have earned a rather large market share in this state through clinical excellence and the resulting high patient satisfaction. We serve several hundred infusion patients on an on-going basis and have relationships with all government payers and most managed care organizations.

Option Care of East and Central Iowa appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

* Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS "S" codes, already used by commercial and Medicare managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payer sector. We recommend that CMS reference the National Home Infusion Association National Definition of Per Diem for a list of the products and services included in the home infusion per diem, available at http://www.nhianet.org/perdiemfinal.htm <http://www.nhianet.org/perdiemfinal.htm> .

* CMS should establish specific requirements for prescription drug plans to contract with sufficient numbers of infusion pharmacies to ensure adequate enrollee access to home infusion therapy under Part D.

* CMS should require specific standards for home infusion pharmacies under Part D. The national accreditation organizations' standards for infusion therapy reflect the community standard of care for the provision of home infusion therapy, which far exceed the OBRA 1990 standards established for retail pharmacies.

* CMS should adopt the X12N 837 P billing format for home infusion claims under Part D so as to be consistent with the format that private sector health plans use for infusion claims.

* CMS should mandate that prescription drug plans maintain open formularies for infusion drugs to ensure that this population of vulnerable

patients has appropriate access to necessary medications.

Thank you in advance for your consideration of these important issues.

Sincerely,

Subject: Comments on Medicare Prescription Drug Benefit Proposed Rule
(*69 Fed. Reg. 46632-46863,* August 3, 2004)

Dear Sir or Madam:

Thank you for the opportunity to comment on the proposed regulations that implement the new Medicare Prescription Drug Benefit enacted in last year's Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA). The Center on Budget and Policy Priorities is a non-profit policy organization that works at the federal and state levels on fiscal policy and public programs that affect low- and moderate-income families and individuals. Our comments here focus on the new Part D benefit as it will apply to low-income Medicare beneficiaries including those who are dually eligible for both Medicare and Medicaid.

One key issue that we believe has not received appropriate attention in the proposed regulations is the historic opportunity the new drug benefit offers in improving enrollment in various public programs such as food stamps for which many low-income elderly and disabled beneficiaries are eligible. We believe that it is important that the regulation ensures that eligible beneficiaries are connected to other benefits for which they are likely to be eligible. We recognize that one agency, the Centers for Medicare & Medicaid Services (CMS) is promulgating this regulation and that the regulation relates to programs under its purview. But, in addition to Medicare, full Medicaid, and the Medicare Savings Programs for which CMS is responsible, other programs like food stamps, SSI and Social Security are the linchpins of federal support for the members of our society who are aging or experience a disability. This low-income Medicare population cannot be expected to navigate overly complicated enrollment procedures. To the extent that the government as a whole fails to coordinate these benefits, it is failing a very vulnerable population.

In addition, as noted by numerous other groups concerned with the dual eligibles and low-income Medicare beneficiaries, we find that the regulation falls short in many other areas especially in transitioning the dual eligibles from Medicaid drug coverage to the new Medicare drug benefit, ensuring that dual eligibles have access to the drugs they need, and in the processes that are envisioned for enrolling low-income beneficiaries in the low-income subsidies.

Please find below our general comments to the proposed regulations on these issues. Please note that we have also submitted more comprehensive comments along with other groups. These comments were submitted by Families USA.

Sincerely,

Robert Greenstein Executive Director	Edwin Park Senior Health Policy Analyst	Dorothy Rosenbaum Senior Policy Analyst

Jo Anne B. Barnhart, Commissioner, Social Security Administration

I. General Comments on Improved Coordination with Other Programs Like Food Stamps

A. Background

Many Medicare beneficiaries who are eligible for a low-income subsidy under the Medicare Part D benefit will also be eligible for food stamps. The MMA and the proposed rule provide that applications for the Part D low-income subsidy may be filed with either a State's Medicaid program or with the Social Security Administration (SSA). The proposed rule has very little detail, however, about how the application process is likely to work. Because so many people who are eligible for but not participating in food stamps are likely to apply for the Part D subsidy, this application process presents an historic opportunity to connect eligible seniors and people with disabilities to the Food Stamp Program.

Many Medicare Beneficiaries Who Are Eligible for Part D Subsidies Also Are Eligible for Food Stamps

Many of the low-income Medicare beneficiaries who will be eligible for — and apply for — the new low-income drug subsidies that the prescription drug law provides are eligible for food stamps but not enrolled. A Medicare beneficiary will be eligible for some additional subsidy under Part D if his or her income, together with the income of any spouse who is present, is below 135 percent of the federal poverty level. The asset limit for the Part D low-income subsidy will be $6,000 for single beneficiaries and $9,000 for married couples. (Those with incomes below 150 percent of the poverty line with assets below $10,000 for individuals and $20,000 for couples receive a smaller low-income subsidy).

Food stamp eligibility rules are very similar — the universe of food stamp-eligible Medicare beneficiaries is a subset of the Part D-eligible population. Specifically, to be eligible for food stamps a household must have *net* income, after all available deductions are taken into account, below the federal poverty level and assets, not including a primary residence, personal items, and an automobile in most states, must be below $3,000.

Deductions play an important role in food stamp eligibility and benefit levels by taking into account certain household expenses in determining the amount of income that is available to purchase food. In practice, this means that a Medicare beneficiary could have gross income somewhat above the poverty level and still be eligible for food stamps. For the elderly and people with disabilities, the most important deductions are: a *medical expense deduction* for out-of-pocket medical expenses greater than $35 a month; a *dependent care deduction*, for expenses of up to $175 a month for adults who need care; and a *shelter deduction*, for households that have high shelter costs (including mortgage, rent, taxes, insurance, and utility expenses) in relation to their income.

The primary difference between the Part D subsidy eligibility and food stamp eligibility is the definition of who is considered in the family unit. For the Part D subsidy, only the Medicare beneficiary and his or her spouse, if present, will be considered unless there are related dependents who rely on the individual or his or her spouse for at least one-half of their financial support. For food stamps a household consists of individuals who live together and who purchase and prepare meals together. So in some instances where Medicare beneficiaries live

with others, the food stamp unit will include more people than the Part D family unit. USDA finds, however, that about half of elderly people who are eligible for food stamps but do not participate live alone, so in many cases there will be no difference.

Seniors and People With Disabilities Have Low Food Stamp Participation Rates, Despite Being Eligible for Sizable Benefits

Very low-income elderly and individuals with disabilities — those with annual incomes below about 75 percent of the poverty line (which is $6,788 for an individual and $8,554 for a couple) — are fairly well connected to the safety net; they are generally eligible for cash assistance under the Supplemental Security Income (SSI) Program and health coverage under Medicaid. The majority of these very low-income individuals do participate in food stamps.

But low-income elderly and individuals with disabilities with incomes above this level — including many such people who live below the poverty line — generally do not qualify for SSI or Medicaid, and although they are eligible for food stamps, they often are not enrolled. Overall, the program serves only about a quarter of eligible elderly people and just under half of the population of eligible adults with disabilities. In total, USDA estimates that there are over 6 million seniors and adults with disabilities who are eligible for food stamps but do not receive them.[1] Of course, Medicare beneficiaries who are not receiving SSI or Medicaid are the people who will be applying for the Part D benefit through SSA or state or local offices.

For many low-income Medicare beneficiaries, Social Security benefits bring them close to or modestly above the poverty line. For such households who do not have high expenses — for example, because they live in public housing and have no out-of-pocket medical costs — the food stamp benefit for which they qualify can be relatively low, perhaps only $10 a month. If, however, such a household has high shelter expenses, out-of-pocket medical expenses, or dependent care expenses, its monthly food stamp benefit will be significantly higher. The average Social Security recipient who has medical expenses and receives food stamps qualifies for about $50 a month in benefits. A typical household with members who are elderly or disabled and very high deductions can receive close to $90 a month or more in food stamps. Outreach messages that SSA or states use may be more useful if they explain that households with high expenses will qualify for more food stamps.

Current Responsibilities of SSA and States Make Them Appropriate to Play a Role in Enrolling Medicare Beneficiaries in Food Stamps

The states and SSA each currently have responsibilities related to the Food Stamp Program. Although food stamp benefits are 100 percent federally-funded and many of the program's eligibility and benefit rules are set by federal rules, the states have primary responsibility for virtually all aspects of the administration of the program (as they do with Medicaid), including outreach, certification and enrollment, issuance, and on-going case management. States receive a 50 percent federal match for administrative costs related to food

[1] For the Food Stamp Program an individual is considered to be elderly upon turning 60. So this figure somewhat overstates the number who would also be Medicare beneficiaries.

stamps. With only a handful of exceptions, the same local agency or local office that processes Medicaid applications also determines food stamp eligibility.

The Food Stamp Act envisions that SSA will play an important role in informing seniors and people with disabilities about food stamps. Under section 11(j)(1) of the Food Stamp Act, Social Security and SSI applicants and recipients are to be "informed of the availability of a simple application to participate in [the food stamp] program at the social security office." Section 11(j)(2) of the Food Stamp Act further requires SSA to "forward immediately" to state agencies food stamp applications from households where all members are applicants for or receive SSI. Finally, section 11(j)(2)(C) provides that the Secretary of Agriculture will reimburse the Commissioner of Social Security for any costs associated with these activities. To be clear, this means that food stamps, an entitlement with open-ended funding, can fully reimburse SSA for these food stamp-related activities without Congress needing to appropriate additional funds. (See 7 U.S.C. § 2020(j) — attached.)

Unfortunately, to our knowledge, SSA and USDA are largely out of compliance with Section 11(j)(2) of the Food Stamp Act. There is no uniform simple application currently available at social security offices for applicants or recipients to use to apply for food stamps. Not many social security offices make much effort to inform Social Security or SSI applicants about the availability of food stamps. Nationwide, the total amount that SSA received from USDA for these activities was less than $10 million in fiscal year 2003.

One promising exception is the "Combined Application Projects," or CAPs, that have been implemented in four states (Mississippi, New York, South Carolina, and Washington) in the past decade. In the CAP states, for SSI applicants who live alone, SSA provides a shortened food stamp application form with just a couple of additional questions to what the SSI application gathers. Data from the SSA application and interview are transferred to the food stamp agency, and food stamp benefits are determined without the applicant having to take any further action. (See http://www.fns.usda.gov/fsp/government/caps.pdf.) SSA has agreed to allow three additional states (Florida, Massachusetts, and Pennsylvania) to adopt this model but has declined to make the option available nationwide.

B. Comments on Subpart P Section 423.774 and Subpart S Section 423.904

The Part D enrollment process offers an historic opportunity to connect Medicare beneficiaries to food stamps and other assistance programs that might help them make ends meet. We urge you in the final regulation, and through other implementation decisions, to set up an eligibility process for the Part D low-income subsidy that allows low-income Medicare beneficiaries to be enrolled as seamlessly as possible in food stamps, as well as other state- or SSA-administered benefits for which they may qualify. This will require CMS to work collaboratively with SSA, USDA, and state agencies. Below are some specific opportunities that we see.

- **Provide information about food stamps and other major benefits for which applicants may be eligible in any outreach materials that CMS, SSA, and state Medicaid programs design and distribute.** CMS and SSA are planning

large-scale information and outreach efforts in the lead-up to the Medicare drug benefit going into effect. Mailings, on-line resources, and other materials that are made available to low-income Medicare beneficiaries and to groups that work with such beneficiaries could easily include information about the availability of food stamps and how to apply. USDA has developed an on-line prescreening tool at http://209.48.219.49/fns/.

- **Design procedures that allow applications that are filed and other information that applicants provide to be shared between SSA, state agencies, and CMS so that it is available to all agencies.** Such data sharing would allow states to target follow-up outreach to applicants who appear to be eligible for other programs, such as food stamps. For example, states could use the information that applicants provide to them or SSA for the drug benefit to automatically fill out significant sections of a food stamp application. The state could then mail the application to the elderly individual asking him or her simply to fill in the remaining questions and mail the application back, without having to come to the food stamp office.

- **Collaborate with other federal agencies, primarily USDA and SSA, on ways to enroll eligible applicants in all benefit programs.** The three agencies should seek to simplify federal program rules so that low-income Medicare beneficiaries can readily access all programs for which they qualify. A model may be the SSA Combined Application Projects that now operate in a handful of states, where SSI applicants are asked only a couple of additional questions and are certified automatically for food stamps based on their SSI applications. The standardized federal rules under these projects have allowed SSI applicants who live alone to apply for food stamps with significantly less burden than would otherwise be required.

- **Develop coordinated redetermination processes that are as simple as possible for Medicare beneficiaries.** Under the regulation, CMS seems to envision that once the Part D benefit is underway, Medicare beneficiaries will have their eligibility redetermined annually. It appears that a beneficiary who receives a Part D subsidy, is a QMB, and also receives food stamps would have to reapply separately for these three benefits at different times and would potentially have to provide virtually all of the same information to three different entities. This is an unreasonable burden for a poor senior or individual with a disability who may find it difficult and confusing to navigate three separate processes. In addition, this population tends to have relatively stable income and other circumstances. One option would be for SSA and state agencies to renew Part D eligibility based on information the beneficiary has provided for other programs, such as food stamps, if it is current. Many states have successfully used this type of “passive renewal” procedure in their Medicaid and State Children’s Health Insurance Programs (SCHIP).

- **USDA can reimburse SSA for the food stamp program's share of any costs associated with efforts to inform Social Security recipients of the availability of food stamps and other programs.** This could include, for example, outreach mailings to Medicare beneficiaries or costs associated with making computerized information available to states.

II. General Comments on Other Proposed Regulations

A. Comments on Subpart B — Eligibility and Enrollment

Enrollment of Dual Eligibles in Medicare Part D Plans

The proposed regulations fail to address adequately how responsibility for providing drug coverage for the 6.4 million Medicare beneficiaries with full Medicaid coverage (i.e., the full dual eligibles) will be appropriately transferred from Medicaid to Medicare on January 1, 2006. There are issues both of timing and of the mechanics of instituting the enrollment process. The proposed regulations do not adequately address these issues in a way that would ensure that these 6.4 million dually eligible beneficiaries avoid a potential loss of drug benefits or a gap in drug coverage, either of which could have unfortunate health consequences for these individuals.

According to the preamble, automatic enrollment of dual eligibles as required under section 423.34(d) will not begin until the end of the initial enrollment period on May 15, 2006. However, the Medicaid drug benefit for dual eligibles will no longer be available on January 1, 2006. (Federal Medicaid matching funds will no longer be available for providing outpatient drug coverage to the dual eligibles after January 1, 2006.) Given the difficulty of appropriately educating this population about Part D plan choices, it is a near certainty that a substantial number of dual eligibles will face a several month gap in coverage between the end of Medicaid's drug benefit and the scheduled automatic enrollment. This likely scenario would directly contravene Members of Congress' and the Administration's commitment that dual eligibles will be better off under Medicare Part D (or at least not be made worse off). The most appropriate solution would be to delay the cut-off of federal Medicaid matching funds to allow more adequate time to ensure an effective transition of the dual eligibles from Medicaid to the new Medicare Part D benefit. However, that would likely require statutory changes to the MMA. At the very least, CMS needs to encourage large-scale education efforts targeted to the dual eligibles by states and other organizations and allow for an earlier auto-enrollment deadline prior to January 1, 2006 to avoid gaps in coverage for the dual eligibles.

In the preamble, CMS requests comments on whether CMS or the states should perform automatic enrollment of dual eligibles. State officials are familiar with the needs of their dual eligible populations and have more data readily available on the dual eligibles in their state. They also will already be involved in the enrollment process because they are required to perform low-income subsidy enrollment; therefore, we recommend that states have the option of performing automatic enrollment. (We are concerned that under section 1860D-1(b)(1)(C) of the MMA and section 423.34(d)((2) of the proposed regulations, the auto enrollment must be conducted on a random basis, which may limit the ability of states that are conducting this auto

enrollment from moving dual eligibles to the plan that provides the greatest access to drugs. This too may require further statutory changes)

We are also extremely concerned with ensuring continuity of care for dual eligibles who have substantial drug needs. As discussed below in our comments on the need for special open formularies for the dual eligible population, for example, a disproportionate number of dual eligibles struggle with mental illness and need access to a wide variety of medications.

As outlined in the proposed regulations, dual eligibles would be forced to enroll (or be automatically enrolled) in the "benchmark" or average cost plans in their areas because, under the low-income subsidy, they will receive only a premium subsidy up to the cost of the premium for these plans. They will not receive additional premium subsidies for plans with premiums higher than the premium cost of a benchmark plan. The formularies for these plans, however, may not be as comprehensive as the drug coverage that these individuals currently have through Medicaid.

Without access to the coverage they need, dual eligibles may be forced to switch medications. In the treatment of HIV/AIDS, for example, such switches can be highly problematic and potentially deadly. We believe the same is true for a number of other illnesses and categories. Not ensuring continuity of care for prescription drugs for the dual eligibles could increase the costs of their care; dual eligibles with restricted access to drugs could end up requiring expensive services like hospitalization.

The regulations do provide a special enrollment period for full dual eligibles to use "at any time" (section 423.36). However, this provision of the regulations does not adequately address the needs of dual eligibles. There may not be adequate choice of low-cost drug plans in each region, particularly in rural areas which have not had much luck attracting Medicare managed care plans in the past. In addition, the dual eligibles are unlikely to have income or resources to pay the additional premiums (in addition to the low-income subsidy) necessary to enroll in higher cost plans that may have more comprehensive drug coverage and greater access to drugs. Moreover, the special enrollment provisions under section 423.36 do not specify that dual eligibles would not be subject to a late enrollment fee if this complex process of disenrollment and reenrollment results in a gap in coverage of more than 63 days.

In addition, full benefit dual eligibles (and their personal representatives) should receive a notice explaining their right to a special enrollment period both when they enroll in a plan and each time the prescription drug plan changes its coverage in a way that directly affects them, such as removing a drug from its formulary, changing the co-payment tier for a drug, or denying their appeal concerning a non-formulary drug or an effort to change the co-payment tier.

In the preamble to the proposed regulations, CMS points to the exceptions process as a means of securing coverage of off-formulary medications. But the process proposed is extremely complex and will likely be impossible to navigate for people having a psychiatric crisis, facing cognitive impairments, or in the midst of aggressive chemotherapy, to list just a few examples. Moreover, the timelines established are drawn out; an expedited determination could

take as long as two weeks. Drug plans are not required to provide an emergency supply of medications until at least two weeks following a request.

Congress and the Administration have promised that dual eligible beneficiaries would be better off with this new Part D drug benefit (or at least no worse off) than they were receiving drug coverage through Medicaid. To honor this commitment, coverage of medications currently available to dual eligibles and other special populations under Medicaid must be grandfathered into the new Part D benefit just as a number of states (such as Wisconsin, Oregon, Kentucky, Texas and California) have done in implementing preferred drug lists under their Medicaid programs. For dual eligibles (and for others with life-threatening diseases such as HIV/AIDS, mental illness, cancers, and other extreme conditions), Part D plans should be required to cover their existing medications. At a minimum, this protection should be given to dual eligibles, because it is likely to be impossible for dual eligibles to enroll in more generous drug plans by paying supplemental premiums or paying for off-formulary drugs on an out-of-pocket basis.

B. Comments on Subpart C —Benefits and Beneficiary Protections

Special Formulary Protections for Dual Eligibles

Section 423.120(b) outlines the requirements on Part D prescription drug plans and on Medicare Advantage plans for their drug formularies. We strongly support the suggestion in the preamble to the proposed rule that certain populations require special treatment due to their unique medical needs. Such populations include full dual eligibles as well as institutionalized populations, persons with life-threatening conditions, and persons with pharmacologically complex conditions. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and must be protected from tiered cost-sharing that could create insurmountable access barriers. We recommend that the final rule provide for alternative, flexible formularies for special populations that include coverage for all FDA-approved covered Part D drugs with a valid prescription. Furthermore, because of the clinical importance of providing access to the specific drugs prescribed, drugs prescribed to these defined populations ought to be made available at the preferred level of cost-sharing for each drug.

In enacting the MMA, Members of Congress and the Administration committed to the principle that dual eligibles (persons eligible both for Medicare and Medicaid) would be better off (or at least not be made worse off) when their coverage for prescription drugs shifted from Medicaid to the new Medicare Part D coverage. Historically, the Medicaid prescription drug benefit has been closely tailored to the poor and generally sicker population it serves, providing beneficiaries with a range of drugs that they need with little or no co-payment. Under section 1927 of the Social Security Act, states that elect to provide prescription drug coverage under their Medicaid programs must cover all FDA-approved drugs from every manufacturer that has entered into an agreement with the Secretary of Health and Human Services to pay rebates to states for the products that the states cover. All drug manufacturers currently participate in the Medicaid rebate program.

Dual eligibles are the most vulnerable Medicare beneficiaries. Dual eligibles are people with disabilities and other serious conditions who tend to need a wide variety of prescription drugs. They are more than twice as likely to be in fair or poor health as other Medicare beneficiaries; they are three times more likely to have problems with Activities of Daily Living (ADLs) as other beneficiaries; and they are ten times more likely to be in a long-term care facility than other beneficiaries. In serving dual eligibles, Medicare prescription drug plans must be able to respond to a range of disabilities and conditions, such as physical impairments and limitations like blindness and spinal cord injury, debilitating psychiatric conditions, and other serious and disabling conditions such as Parkinson's disease and HIV/AIDS. If dual eligibles are not to be worse off when Part D prescription drug coverage begins, then they must have continued access to an alternative and flexible formulary that permits treating physicians to prescribe the full range of FDA-approved medications.

This will particularly be the case for many of the dual eligibles who reside in nursing facilities and other residential facilities. Such institutionalized beneficiaries require access to flexible formularies on the basis of their complex and multiple prescription drug needs.

Moreover, although we recommend that any alternative formulary include access to all FDA-approved medications, if the final rule permits a more restrictive alternative formulary, it should ensure that all drugs included on the formulary of participating Long-Term Care (LTC) pharmacies are included in the plan's formulary, and drugs that are preferred by the LTC pharmacies' formularies should be treated by the plan as a preferred drug. Institutionalized individuals also have little or no capacity to pay cost-sharing for non-preferred drugs or to purchase drugs for which coverage has been denied. It is imperative that any alternative formulary provide strong protections that prevent such individuals from being charged cost-sharing. For dual eligibles who reside in institutions, a condition of eligibility requires them to pledge all but a nominal personal needs allowance, usually $30 per month, to the cost of the institutional care. (We note that individuals who require an institutional level of care but live in the community under home- and community-based Medicaid waivers should have the same special protections as institutionalized beneficiaries because of their similar substantial need for prescription drugs. Otherwise, providing greater access to drugs for institutionalized individuals than to those living in the community would have the adverse effect of reversing the continued progress states have made in moving people from nursing homes to the community setting.)

C. Comments on Subpart P — Premiums and Cost-Sharing Subsidies for Low-Income Individuals

Automatic Eligibility and Enrollment of Dual Eligibles for Low-Income Subsidy

Section 423.773 of the proposed regulations states that both full benefit dual eligibles (as well as Medicare Savings Program beneficiaries, as discussed below) are *eligible* for the additional low income subsidies, but it does not explicitly state that these beneficiaries are to be automatically *enrolled* in the subsidy program. The regulations should clarify that an individual treated as a full subsidy individual (such as a dual eligible or a MSP beneficiary) does not have to take any further action with respect to the subsidy (i.e., to make application or in any other to way verify their status), except to the extent that they need to enroll in a Part D plan. This will

help smooth the transition from Medicaid drug coverage for dual eligibles and should improve participation for others.

Treatment of Resources

Under section 423.772, we support the proposed regulation's limitation of countable resources to liquid assets only. However, the definitions of liquid assets and what it means for an asset to be able to be converted into cash in 20 days need to be clarified. The final rule should enumerate the list of countable resources that constitute liquid assets to promote clarity for states and beneficiaries. The scope of countable liquid assets should be construed narrowly, as experience under the MSP programs shows that assets tests tend to discourage enrollment and raise administrative costs for states. Experience among the states with MSPs has shown that when states waive the assets test or make it more reasonable by excluding, for example, burial plots, burial funds and life insurance from the list of countable assets, enrollment in MSP increases, with the additional costs of enrollment at least partly offset by administrative savings.

Moreover, it is harsh and inappropriate to deny an applicant the low-income drug benefit because the applicant will not liquidate a life insurance policy or burial fund. We are especially troubled by an SSA draft of the application for the low-income subsidy that asks whether an applicant has life insurance with a face value of $1,500 or more. Such a policy should not be acceptable; low-income elderly people and people with disabilities should not be disqualified from the low-income drug benefit because they have a modest life insurance policy that is intended to cover their funeral and burial costs when they die. The Food Stamp Program, for example, entirely excludes the value of a life insurance policy from its asset test. At most, the only part of a life insurance policy that should be considered is the cash surrender value to the extent that the value exceeds some much more reasonable amount, such as $20,000.

In addition, retirement accounts such as a 401(k) plan or IRA should either be fully exempt for all beneficiaries, or fully exempt for disabled Medicare beneficiaries up to age 65, with an assumed annuity value, based on the account, considered as income for all beneficiaries aged 65 and over. If calculating an annuity value would be too complicated, a simplified approach could be used, under which a fixed percentage of such an account is treated as income each year, based on Census (or other official) life expectancy tables. In other words, if a person aged 65 is assumed to live 20 years based on the life expectancy tables, five percent of the amount in the individual's 401 (k) or IRA would be counted as income each year. These accounts would *not* be counted as assets.

This is a much fairer and more rational approach. To count such accounts as assets and disqualify people with modest account balances would undercut efforts to encourage low- and moderate-income people to build some savings that can ease their poverty throughout their old age. Counting these accounts as assets for disabled beneficiaries who are below retirement age also may reduce work incentives. If such accounts are counted as assets, such individuals may be forced to liquidate modest retirement accounts. It would be far better to preserve such accounts so that the prospect of enlarging them if an individual with a disability can return to work may operate as a work incentive.

Counting the amounts in such accounts as assets is inappropriate. Such accounts are supposed to help support these people throughout their old age. Counting such accounts as assets implies that the accounts should be emptied out now to help pay for prescriptions, with the individual then left deeper in poverty for the rest of his or her life.

(Finally, we would note that the draft SSA application contains a problematic and confusing treatment of "annuities," which the application says should be treated as an asset rather than as income. The term "annuity" is popularly used for a range of financial instruments, including "life-time annuities." And an individual with a life-time annuity *no longer owns the underlying assets*. Such an individual has essentially sold the assets to the annuity company in return for a stream of income in the form of a guaranteed monthly payment for the rest of the individual's life. In these cases, it is wholly inappropriate to count the value of the underlying assets against the asset test; the individual no longer owns the assets and has no legal access to them. Furthermore, in these cases, the monthly payments that such an individual receives from the annuity company clearly ought to be counted as income. The draft SSA application is likely to lead to confusion and erroneous determinations in this area.)

Treatment of MSP Beneficiaries by SSA

We strongly support the decision reflected in section 423.773(c) to deem Medicare Savings Program ("MSP") beneficiaries automatically eligible for the low-income subsidy. This would greatly ease the administrative burden on states and SSA while also ensuring that many more MSP beneficiaries enroll in the low-income subsidy.

We are concerned, however, that MSP beneficiaries are likely to be treated differently depending on whether they apply for the low-income subsidy through Medicaid or through a SSA office. Inequities and confusion among beneficiaries may result because SSA would apply its standard for assets which may be less generous than the asset eligibility rules for MSPs in place in some states. For example, Alabama, Arizona, Delaware, and Mississippi have eliminated the assets test under the MSP programs. Eligibility requirements for the low-income subsidy should be as generous at the SSA office for subsidy-eligible individuals as at a Medicaid office, regardless of where and how people apply within the same state. Under the proposed rules, in states that have adopted less restrictive asset methodologies, people whose assets are slightly above the limits set in section 423.773 would likely be enrolled in a less generous subsidy, or have their application rejected entirely, if they apply directly through SSA, because SSA will apply the national guidelines proposed in section 423.773. However, the same people would have their application accepted if they applied through their states' Medicaid offices, were screened and then enrolled in an MSP, and were then automatically eligible for the low-income subsidy.

To resolve this problem, we propose that SSA should apply state-specific asset eligibility rules in determining eligibility for the low-income subsidy when they are more generous than under the national standard, an option discussed, though rejected, in the preamble at page 46,727. This means that for applicants from states that have eliminated the asset test or have more generous disregards under section 1902(r)(2) of the Social Security Act for MSP eligibility, SSA should apply the state's more generous rules to determine eligibility if applicable. This option is

permitted under Section 1860D-14(a)(3)(E)(iv) of the statute. (We note that the statute should be amended to allow SSA to also apply state-specific income eligibility rules when they are more generous as well.)

The regulations should also provide that subsidy applicants who appear to have excess assets *or* incomes either be screened by SSA for eligibility in an MSP program or have their applications forwarded to the state Medicaid agency to be screened for MSP eligibility. States would be precluded from requiring beneficiaries to resubmit information, such as income and asset levels, that they have already provided to SSA. Applicants would be enrolled in the appropriate MSP program, be deemed automatically eligible for the low-income subsidy under section 423.773(c) and then be enrolled in the appropriate low-income subsidy. Adopting this policy, which is not precluded by the statute, will ensure that all subsidy applicants are treated equitably and in a manner most favorable to the applicants, as well as increase participation in MSPs.

As part of this policy, the low-income subsidy application should allow an applicant to opt out of screening and enrollment for an MSP, as it is possible that a few applicants may not wish to participate in an MSP. Under Section 1860D-14(a)(3)(v)(II) of the statute, beneficiaries who are determined eligible for MSPs may be enrolled in the low-income subsidy. There is no requirement that beneficiaries actually enroll in an MSP. Therefore, applicants who meet the eligibility requirements for an MSP but who decline to enroll in the program should still be made automatically eligible for the low-income subsidy.

Because enrollment in an MSP can affect the amount of assistance a beneficiary may receive through other public assistance program, such as Section 8 housing vouchers or food stamps, there will be a profound need for beneficiary counseling during the enrollment process. We recommend that CMS plan for this need by making funds available to local agencies, including state health insurance assistance programs (SHIPs) and other community-based organizations.

In addition, we suggest that states not be permitted to pursue estate recoveries against MSP beneficiaries. Such recoveries are not cost-effective but can deter beneficiaries from enrolling. Any information provided to beneficiaries about MSP enrollment should tell applicants whether they will be subject to estate recovery if they enroll in an MSP. We include the same suggestion in our comments to section 423.904(c) discussed below.

D. Comments on Subpart S — Special Rules for States — Eligibility Determinations for Subsidies and General Payment Provisions

State Medicaid Screening for Medicare Savings Programs

We believe that section 423.904(c) of the proposed regulations regarding states' obligations to screen subsidy applicants and offer them enrollment in MSPs is inadequate. In particular, proposed section 423.904(c)(2) should specify what "offer enrollment" means. We believe an applicant must be offered the opportunity to enroll during the same visit or contact (in office, by phone, or by mail), without providing further documentation or completing additional

forms. Only if enrollment is easy and convenient would Congress's intent of increasing participation in MSPs be accomplished. Furthermore, because enrollment in an MSP may be the only entry into the subsidy for some low-income beneficiaries, a simple and easy application for MSP programs is essential.

As written, section 423.904(c) would permit states to say they have "offered enrollment" if they tell applicants that they might be eligible for an MSP and can return another time to complete another application form if they wish to apply. Such an outcome would defeat the purpose of the screen-and-enroll provision included in the new Section 1935(a)(3) of the Social Security Act that was established in Section 103(a) of the statute. The low-income subsidy application should include an "opt-out" provision, under which qualified applicants would be enrolled in an MSP unless they affirmatively decline to do so. This provision would make enrollment in an MSP another way to qualify for the low-income subsidy.

Moreover, it is critical that state Medicaid offices provide good quality counseling to applicants, including their potential eligibility for other benefits such as MSPs. In addition, to ensure that enrollment requirements between MSPs and the low-income subsidy are aligned, states should not be permitted to pursue estate recoveries against MSP beneficiaries. Such recoveries are not cost-effective and can deter beneficiaries from enrolling. Any information provided to beneficiaries about MSP enrollment should tell applicants whether they will be subject to estate recovery if they enroll in an MSP.

In the interest of further aligning eligibility rules for MSPs and the low-income subsidy and easing administrative burdens, we suggest that CMS should direct states to apply the definitions of resources used in Subpart P, section 423.772, if they are more generous than the MSP standards used in the individual state, in making their resource determinations for MSP applicants.

In addition, should CMS adopt a policy, as has been discussed publicly, under which most subsidy applications to state Medicaid agencies would simply be forwarded to SSA for the actual eligibility determination for the low-income subsidy, the regulations should be clear that screening for MSP eligibility must take place prior to the transmittal of the applications to SSA. Potential beneficiaries should not have to wait to be screened and offered enrollment in MSPs until after SSA processes their low-income subsidy application and provides such information back to the state Medicaid offices (if SSA in fact does so). Furthermore, an individual cannot be told by either SSA or the state that she or he is ineligible for the low-income subsidy until MSP eligibility has been determined (if the individual wishes). It would be highly problematic for an individual to receive a notice from SSA that he or she is ineligible for the low-income subsidy, have her MSP eligibility determined by the state, and then receive a notice from the state that she is eligible for both MSP and the subsidy. Alternatively, the individual may be found ineligible for the low-income subsidy by SSA and subsequently enrolled in a MSP but never redetermined for eligibility for the low-income subsidy. Whatever the mechanics, the individual must be told that MSPs are a route to subsidy eligibility.

Finally, SSA should also screen subsidy applicants for eligibility in MSPs and develop a system with states to enroll eligible beneficiaries. SSA should use the income and resource

disregards used by the state for MSPs, if they are more generous than under the uniform national definition. Applicants should not miss out on the opportunity to enroll in MSPs simply because they apply through SSA rather than state Medicaid offices. The same concerns about beneficiary education and estate recovery discussed above would apply to enrollment through SSA.

State Medicaid Screening and Enrollment for Full Medicaid

We believe that the regulations should also ensure that beneficiaries are screened not only for MSPs but also for eligibility for full Medicaid and offered enrollment if they qualify, consistent with 42 C.F.R. § 435.404. Ideally, all subsidy applicants would be screened for full Medicaid and offered enrollment if they qualify (similar to current screen-and-enroll procedures under the State Children's Health Insurance Program described in 42 C.F.R. § 457.350, and in particular for states that use separate SCHIP applications as described in 42 C.F.R. § 457.350(f)(3)). Because the importance of maintaining a simple application process for the low-income subsidy is paramount, CMS may wish to consider using a simple screening process based on information obtained through the subsidy application. This screening would trigger a follow-up with applicants who appear to be eligible for full Medicaid.

ATTACHMENT
Food Stamp Act [7 U.S.C. § 2020(j)] on SSA's responsibilities

Section 11(j) of the Food Stamp Act:

(1) Any individual who is an applicant for or recipient of supplemental security income or social security benefits (under regulations prescribed by the Secretary in conjunction with the Commissioner of Social Security) shall be informed of the availability of benefits under the food stamp program and informed of the availability of a simple application to participate in such program at the social security office.
(2) The Secretary and the Commissioner of Social Security shall revise the memorandum of understanding in effect on the date of enactment of the Food Security Act of 1985, regarding services to be provided in social security offices under this subsection and subsection (i), in a manner to ensure that—
(A) applicants for and recipients of social security benefits are adequately notified in social security offices that assistance may be available to them under this Act;
(B) applications for assistance under this Act from households in which all members are applicants for or recipients of supplemental security income will be forwarded immediately to the State agency in an efficient and timely manner; and
(C) the Commissioner of Social Security receives from the Secretary reimbursement for costs incurred to provide such services.

Issue Areas/Comments

GENERAL

GENERAL

Thank you for the opportunity to comment on the Medicare Part D proposed rules. The Medicare Drug Program is a very complex program with significant ramifications for a large number of vulnerable Missourians. The Missouri Department of Social Services (DSS) urges the Centers for Medicare and Medicaid Services (CMS) issue the next version of these regulations in a format that will allow one more round of comment, even if it is a shortened comment period. We are concerned that failure to provide for additional public input when the regulation is more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

Attention: CMS–4068–P

Thank you for the opportunity to comment on the Medicare Part D proposed rules. The Medicare Drug Program is a very complex program with significant ramifications for a large number of vulnerable Missourians. The Missouri Department of Social Services (DSS) urges the Centers for Medicare and Medicaid Services (CMS) issue the next version of these regulations in a format that will allow one more round of comment, even if it is a shortened comment period. We are concerned that failure to provide for additional public input when the regulation is more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

Enrollment Process

General

Missouri is concerned that the under the proposed Medicare Part D rule automatic enrollment of full benefit dual eligibles might not occur until May 15, 2006. This would cause dual eligibles active on January 1, 2006 who do not voluntarily enroll in Medicare Part D to go as long as five and a half months without prescription drug coverage. Many of the individuals who have been long time Medicaid recipients may be confused by the voluntary enrollment process and fail to enroll by January 1, 2006. Medicare's experience with the drug discount card has demonstrated that vulnerable populations often will not enroll on their own initiative in a program such as the Part D benefit, despite the advantages of the benefit being offered. Leaving dual eligibles with no coverage seems in conflict with the purpose of the Medicare Modernization Act (MMA). Automatically enrolling the full benefit dual eligibles prior to January 1, 2006 would not allow much opportunity to select a plan; however, this is preferable to having no coverage. Intermittent eligibility in Medicaid programs may further

complicate the transition to Part D and disrupt access to prescription drugs. Unique Medicaid "spenddown" or "medically needy" programs operate in 39 states. These programs allow people with high medical costs, including nursing home residents, to qualify for Medicaid by spending their income and resources down to a state-defined medical assistance eligibility level. In many cases, an individual may begin a month with a pension check or other source of income that makes them ineligible for Medicaid for the first part of the month, but once that income is put toward the cost of their care (that is, spent down), they become eligible for the remainder of the month. Depending on the spenddown period designed by the state, individuals can cycle on and off of Medicaid eligibility on as often as a monthly basis. This intermittent eligibility will significantly complicate the initial education and enrollment process and must be factored into continuing administrative and policy decisions for states, the federal government, and providers of prescription drug benefits.

Accordingly, Missouri seeks amendment to both §423.34(b) and §423.42(a) in order to clarify that a state may assist an individual with completion of the individual's Private Prescription Drug Plan (PDP) application, including executing the application on the individual's behalf, or may otherwise assist an individual in the Part D enrollment process as long as the individual is provided an opportunity to decline this assistance or "opt out" of any available PDP. Another option CMS should consider is allowing full benefit dual eligibles not enrolled in Part D to continue to receive prescription drug coverage under Medicaid with Federal Financial Participation (FFP) until the automatic enrollment date.

B. Eligibility and Enrollment (Federal Register page 46637)

2. Part D Enrollment Process (§423.34) (Federal Register page 46639)

CMS: *In implementing the automatic enrollment process for full benefit dual eligible individuals, we are considering which entity is best suited to perform the automatic and random enrollment function. We invite comment on the most appropriate method of performing automatic assignment of dual eligibles and the appropriate entity to do so.*

DSS Comments: The Missouri Department of Social Services believes automatic enrollment of full benefit dual eligibles can be handled most efficiently by the states if CMS is able to provide up-to-date information on persons currently enrolled in Medicare Part D. Having the states be responsible for performing the automatic enrollment would allow for the shortest period of time between the Medicaid approval and enrollment in Part D. DSS is concerned that the administrative cost of requiring the states to do the automatic enrollment would be an unfunded mandate. The preamble mentions compensating the states through FFP for administrative expenses or through contractual or other arrangements. Since the cost to develop a

system for automatic enrollment may be extensive, DSS feels states should receive more than the current administrative match for assuming this burden to meet this "new national workload of indeterminate size."

4. Effective Dates of Coverage and Change of Coverage (§423.38)

c. Special Enrollment Period (Federal Register page 46641)

CMS: *The rule states that for special enrollment periods, the effective date of the enrollment will be determined by CMS.*

DSS Comments: CMS should make the effective date of enrollment in Part D retroactive to the date the person's Medicaid was effective and they became a full benefit dual eligible. If the enrollment in Part D is not retroactive to the date Medicaid eligibility began, full benefit dual eligibles will have no prescription drug benefit during the prior quarter coverage. Longstanding Missouri statute requires that medical assistance (Medicaid) is only paid during such times as grants-in-aid (FFP) is provided or made available to the state.

Subpart P: Premiums and Cost-Sharing Subsidies for Low-Income Individuals (Federal Register page 46725)

2. Eligibility Determinations, Redeterminations and Applications (§423.774) (Federal Register pages 46727-46728)

CMS: *We invite comments on state Medicaid agency procedures how to best implement the determination, redetermination, and appeal process.*

DSS Comments: Section 1860D-14(a)(3)(B)(i) of the Act and the proposed 423.774 both say that determinations of eligibility for the subsidies are made by the state Medicaid agency or Social Security Administration (SSA). Our initial interpretation of this was that both agencies were required to make determinations and the Medicare recipient was free to choose which to apply with. However, it has come to our attention that SSA is proposing that the states can comply by taking applications and submitting them to SSA for the eligibility determination. This appears to conflict with Section 1935 of the Act and the proposed 423.904 that require the state Medicaid agency to make determinations of eligibility for the subsidies. If CMS believes that a state Medicaid agency can meet the requirements of both Sections 1860D-14(a)(3)(B)(i) and 1935 by taking applications and submitting them to SSA, that should be clarified in the regulations. The regulation should be clear on what obligation a state choosing this option has for keeping track of what applications were submitted and what happened to them.

The regulations do not specify the time standards within which an eligibility determination must be completed. Would the state Medicaid agency be required to complete determinations within 45 days as is required for most Medicaid eligibility determinations under 42 CFR 435.911? The regulations should specify a time standard that would apply to determinations made either by the state or SSA.

Subpart S: Special Rules for States – Eligibility Determinations for Low-Income Subsidies and General Payment Provisions (Federal Register page 46861)

CMS: *Each of the 50 states and the District of Columbia is required to provide for payment to the Secretary a phased-down contribution to defray a portion of the Medicare drug expenditures for individuals whose projected Medicaid drug coverage is assumed by Medicare Part D.*

DSS Comments: The regulations in Subpart S provide an overview of the clawback (phased-down state contribution) calculation, but it lacks the specifics for the states to estimate the clawback. The comments provided are based somewhat on information provided in conference calls attended by CMS.

The clawback is based on expenditures in calendar year 2003. The base year expenditures are trended based on National Health Expenditure (NHE) trends. The NHE trends are significantly higher than the actual increase experienced by the state. Therefore, the state will be paying a higher clawback and is further impacted since the state will continue to pay this "higher rate" for the life of the Medicare Modernization Act. Based on the last couple of years, it is also highly likely that the NHE trend will be higher than the trend experienced in Missouri Medicaid. This difference will also result in a higher clawback payment from the state.

The rebate adjustment factor is based on the pharmacy expenditures and rebates collected for the same period of time through the CMS-64 reports. When reporting these quarterly, the rebates will lag six months behind the expenditures due to the rebate process. The rebate adjustment factor artificially reduces the actual percent of rebate that is collected, which, in turn, results in a higher clawback that the state will be paying monthly to eternity. A more appropriate rebate adjustment factor would be the expenditures for calendar year 2003 and rebates collected for July 2003 – June 2004.

The clawback calculation apparently does not allow for adjustments. Missouri is a "Pay and Chase" state for pharmacy claims. Since there are no provisions for these collections in the clawback calculation, the gross per capita spent is artificially high, resulting in a higher clawback payment for Missouri. The clawback calculation also does not take into account that Medicaid recipients in calendar year 2003 were the beneficiaries of a drug

formulary that contained more drugs than they may have access to under a PDP. The clawback calculation does not allow adjustment for the more restrictive drug formulary.

Involuntary Disenrollment of Beneficiary by the PDPs (§423.44) Federal Register page 46641

CMS: *The proposed rule provides that PDPs may disenroll individuals whose behavior is disruptive.*

DSS Comments: The Department of Social Services has concerns regarding provisions in the proposed regulations to allow Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening." These provisions create enormous opportunities for discrimination against individuals with mental illnesses, Alzheimer's, and other cognitive conditions. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and as a result, they could also be subject to a late enrollment penalty, increasing their premiums for the rest of their lives. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage.

Under the MMA, section 1860D-1(b) directs the Secretary to establish a disenrollment process for PDPs using rules similar to a specific list of rules for the MA program. This list does not include reference to section 1851(g)(3)(B) of the Social Security Act which authorizes MA plans to disenroll beneficiaries for disruptive behavior.

Therefore, this provision regarding disenrollment of individuals by the PDP for disruptive behavior should be eliminated entirely or there should be a heightened standard for involuntary disenrollment of dual eligibles with mental health issues. There should also be expansion of the "special enrollment exceptions" for individuals disenrolled by a PDP (such as, for disruptive behavior) so that the individual will have an opportunity to join another PDP and continue with necessary medications. These "special enrollment exceptions" are necessary given the high risk of discrimination presented by the provisions for involuntary disenrollment. CMS should provide a special enrollment period for beneficiaries involuntarily disenrolled. It should include a reasonable time period for plan selection and be exempt from late enrollment penalties. Dual eligible beneficiaries who are involuntary disenrolled will face significant hardship because the Missouri Medicaid program will no longer be able to cover prescription drugs if there is no FFP.

Access to Covered Part D Drugs (§423.120) (Federal Register page 46655)

b. Formulary Requirements (Federal Register page 46659)

CMS: *To the extent that a PDP sponsored or MA organization uses a formulary to provide qualified prescription drug coverage to Part D enrollees, it would be required to meet the requirements of §423.120(b)(1) and section 1860D–4(b)(3)(A) of the Act to use a pharmaceutical and therapeutic (P&T) committee to develop and review that formulary. As a note of clarification, we interpret the requirement at section 1860D–4(b)(3)(A) of the Act that a formulary be ''developed and reviewed'' by a P&T committee as requiring that a P&T committee's decisions regarding the plan's formulary be binding on the plan. However, we request comments on this interpretation. In addition, it is our expectation that P&T committees will be involved in designing formulary tiers and any clinical programs implemented to encourage the use of preferred drugs (e.g., prior authorization, step therapy, generics programs).*

DSS Comments: Continuity of pharmaceutical treatment is of great importance to effective disease management and appropriate healthcare. As the proposed regulations themselves seem to acknowledge, PDP formularies must be developed with appropriate consideration of the point that – especially for older individuals – it is often therapeutically counter-productive, or even dangerous, to abruptly change medications. Accordingly, we believe that coordination of formulary development between State Pharmaceutical Assistance Programs (SPAP) and PDPs is especially important and should be expressly encouraged by the Part D rules.

As we understand the CMS proposal, CMS expects that the model categories and classes developed by United States Pharmacopeia (USP) will be defined so that each includes at least one drug that is approved by the Food and Drug Administration (FDA) for the indication(s) in the category or class. That is, no category or class would be created for which there is no FDA approved drug and which would therefore have to include a drug based on its "off label" indication. While DSS generally approves of the process being utilized by USP we point out an inherent flaw in the decision that, in some cases, only one drug approved in a given therapeutic class will be included in the formulary. In the case of many drugs that require lengthy periods to determine "stable" doses, abruptly changing a beneficiary's medicines in order to ensure reimbursement as a covered Part D drug could have serious consequences to that individual's health and welfare. Such negative outcomes are especially likely in the case of psychotropic compounds.

Moreover, we believe that any established formulary exceptions criteria must be flexible enough to take into account the actual circumstances of a particular beneficiary. The Secretary should provide a guideline to Medicare Advantage Prescription Drug (MA-PD) plans, as well as stand-alone

prescription drug plans, that requires such flexibility. In addition, anything less than a comprehensive formulary should be considered when calculating the state's "phase down/clawback" payment since Missouri had a non-scaled down formulary Missouri does not believe it should pay clawback/phase down for a more restricted drug formulary.

C. Voluntary Prescription Drug Benefit and Beneficiary Protections (Federal Register page 46646)

1. Overview and Definitions (§423.100) (Federal Register page 46646)

c. Long-Term Care Facility (Federal Register page 46648)

CMS: *We request comments regarding our definition of the term long-term care facility in §423.100, which we have interpreted to mean a skilled nursing facility, as defined in section 1819(a) of the Act, or a nursing facility, as defined in section 1919(a) of the Act. We are particularly interested in whether intermediate care facilities for the mentally retarded (ICF/MRs) or related conditions, described in §440.150, should explicitly be included in this definition given Medicare's special coverage related to mentally retarded individuals. It is our understanding that there may be individuals residing in these facilities who are dually eligible for Medicaid and Medicare. Given that payment for covered Part D drugs formerly covered by Medicaid will shift to Part D of Medicare, individuals at these facilities will need to be assured access to covered Part D drugs. Our proposed definition limits our definition to skilled nursing and nursing facilities because it is our understanding that only those facilities are bound to Medicare conditions of participation that result in exclusive contracts between long-term care facilities and long-term care pharmacies. However, to the extent that ICF/MRs and other types of facilities exclusively contract with long-term care pharmacies in a manner similar to skilled nursing and nursing facilities, we would consider modifying this definition.*

DSS Comments: As a result of the Olmstead decision, states have been moving seniors and persons with SSI benefits from institutions into less restrictive placements. These placements include ICF/MR facilities for the disabled, community care, and assisted living facilities for the aged. In addition to these less restrictive institutional settings, states have implemented waiver programs for home and community based care as an alternative to placement in a nursing home. Medicare beneficiaries spend down their assets until they are forced into nursing homes. These alternatives provide Medicare eligible beneficiaries with a choice of placement. Exclusive contracts with a long term care pharmacy should not be the deciding factor on whether or not to extend the definition of long term care facility to other forms of housing other than traditional nursing homes; the beneficiaries' qualification for Medicare and their placement should be the deciding factor. States can identify Medicare eligible individuals who were

institutionalized, and can also identify those individuals that, if it were not for the Olmstead decision or an 1115 waiver, would be institutionalized. These individuals are low income Medicare beneficiaries; having a Medicare prescription benefit at no cost will allow their income to be used for daily living expenses and not on prescriptions.

Therefore, we recommend that the final rule include a definition of "long-term care facility" that explicitly includes intermediate care facilities for persons with mental retardation and related conditions and assisted living facilities. We believe that many mid to large size ICF/MRs and some assisted living facilities operate exclusive contracts with long-term care pharmacies.

3. Establishment of Prescription Drug Plan Service Areas (§423.112) (Federal Register page 46655)

CMS: *We intend to initially designate both PDP and MA regions by January 1, 2005. In accordance with section 1858(a)(2)(C)(i) of the Act, there will be between 10 and 50 PDP regions within the 50 States and the District of Columbia and at least one PDP region covering the United States territories. The PDP regions, like the MA regions, will become operational in January 2006.*

DSS Comments: The State of Missouri believes that the establishment of PDP regions consistent with MA regions (as described in proposed §422.55) is of far less importance than establishing PDP regions that are defined by individual state boundaries. It is critical to a number of operational aspects of Part D benefits administration that each state should be a separate PDP region. As the proposed rule seems to acknowledge, existing SPAPs will play a critical role in coordinating benefits with the PDPs for the most vulnerable populations to be served under the Part D program, as well as in providing "wrap-around" coverage for beneficiaries within these populations. The administrative complexities and burden of effectuating these goals will be enormously – and unnecessarily – increased to the extent that the boundaries of PDP regions are not consistent with the state boundaries defining the relevant SPAP service areas.

6. Coordination of Benefits with Other Providers of Prescription Drug Coverage (Federal Register page 46700)

a. Coordination with SPAPs (State Pharmaceutical Assistance Programs) (Federal Register page 46701)

CMS: Our goal is to make the coordination of benefits process as functional for the beneficiary, pharmacy, and states as possible.

DSS Comments: SPAPs are prohibited from encouraging enrollees to join a particular PDP, and the law and regulatory language prohibits SPAPs

from discriminating based on the PDP in which the beneficiary is enrolled. The federal law does not prohibit a state from providing consumer advice to its citizens as to which plan might work best with a SPAP, which plan offers the best value, etc. Given the intense need for consumer assistance, we urge that the regulation either be silent on the issue or that the regulation actually encourage the states to help their citizens with the many difficult choices and questions they will be facing.

The proposed regulation portrays a much broader and very different non-discrimination rule than is contained in the statute, and is inconsistent with the express statutory language establishing limitations on that rule Under the statute's express language, a qualifying SPAP would quite plainly be permitted to encourage beneficiaries to enroll in a "preferred" PDP by any otherwise legal means that does not constitute disparate treatment of individuals in respect to determinations of eligibility for, or the amount of, assistance. In other words, while a Part D qualifying SPAP would be required to provide the same amount of "wrap-around" coverage to an individual in an alternative plan as would be provided to the individual if enrolled in a "preferred" PDP designated by the SPAP, this would not prevent the SPAP from implementing a preference for a given PDP through other means. CMS, in its proposed regulations, has rewritten this statutory rule so as apparently to prohibit *any* kind of SPAP activity that might grant preference to a given PDP or steer beneficiaries to a particular PDP; the law does not permit this substitution of agency policy for clearly expressed legislative intent.

The final regulations should include a revision of Section 423.464(e)(1)(ii) so that the rule conforms to the express language and intent of Congress in prohibiting qualifying Part D SPAPs from employing determinations of beneficiaries' eligibility or amount of benefits to favor one PDP over another; but the CMS regulations may not validly expand this statutory rule to preclude any preferential treatment of a PDP by an SPAP.

Subpart J: Coordination Under Part D Plans With Other Prescription Drug Coverage (Federal Register page 46696)

6b. Coordination With Other Prescription Drug Coverage (Federal Register page 46702)

CMS: *Comments requested regarding situations that might involve coordination between states and PDPs.*

DSS Comments: Case management services for our elderly and disabled full benefit dual eligible require the identification of prescription drugs being used by the client. We cannot rely on the patient's information, as they might not be capable of recalling all drugs they are currently using. To be effective in providing the best care to these individuals, their adjudicated drug claims data would be vital. We would expect to see these claims "crossover" to the state from CMS just as fee for service Medicare

claims do presently. The state would not want to set up data exchanges with every PDP versus one with CMS.

6c. Coordination of Benefits (Federal Register pages 46702-46703)

1.a. Covered Part D Drug (Federal Register page 46646-46647)

CMS: *Comments requested concerning gaps that may exist in the combined Medicare Part B and D coverage package.*

DSS Comments: Many of Missouri's full benefit dual eligibles do not have Part B coverage. Missouri is a 209b state and has different eligibility guidelines. These individuals would obtain their Part B covered drugs from Medicaid under the current system. Under the MMA, these drugs would not be covered under the Part D program as they are covered under the Part B. However, since the client does not have Part B but does have Part D (dual eligible), these drugs could not be covered by Medicaid. Interpretation of the law in this manner will limit the access to care these individuals should have available to them.

On page 46703 of the Federal Register it states, "We interpret the definition of covered Part D drug to exclude coverage under Part D for drugs otherwise covered and available under Parts A or B for individuals who choose not to enroll in either program. We interpret the words payment is available to mean that payment would be available to any individual who could sign up for A or B, regardless of whether they are actually enrolled." Thus, for all Part D individuals, Part A drugs and Part B drugs are "available" if they choose to pay the appropriate premiums. Consequently, Part D would not be required to pay for drugs covered under Parts A and B on the basis of a Part D eligible individual's status regardless whether the beneficiary is receiving Part A or B." For Medicaid recipients who are not eligible for Part A but could be enrolled in Part B if they choose to do so through the state buy-in program but do not take advantage of this offer, can their prescription drugs be covered by Medicaid with FFP? If not, dual eligibles will be receiving a lesser pharmacy benefit than they do currently. Our full benefit dual eligible population is accustomed to accessing drugs that are necessary to their health. Medicare's criteria for coverage of Part B drugs is much more restrictive than other insurance entities and/or Medicaid. Who would be responsible for payment if a dual eligible obtains a Part B covered drug as part of a recognized treatment plan by sources other than Medicare, the drug is rejected as non-covered by Medicare Part B using Medicare criteria, and it does not become a Part D drug? Will the beneficiary have to assume liability for their drugs? Would this become a non-covered Medicare drug payable by Medicaid at the normal federal match based on Medicaid coverage criteria? How would such a determination be made and relayed to the state and the provider? Could a process in which "exceptions" are processed for these drugs be implemented? An appeals process could be dangerous to the health of an individual who has relied on these drugs for successful treatments.

Those involved in such scenarios may be very physically or mentally ill and may not have the ability or resources to pursue the appeal process.

6.d. Collection of Data on Third Party Coverage (Federal Register page 46704)

CMS: *Comments on collection of third-party data.*

DSS Comments: The status of third party payer can change many times. Pharmacies will contact health insurance companies and Medicaid agencies now if they have discrepancies with eligibility data at the point of sale. To have them contact the disputed coverage entity should be no greater demand on their resources than they have now. This data would then be fed back to the PDPs through the coordination of benefits process who would send it to CMS for updated records.

The original collection of such data should be incorporated into the application process just as it is with the Medicaid eligibility determination process. This would require mandatory release of information by the beneficiary.

C. Voluntary Prescription Drug Benefit and Beneficiary Protections

b. Dispensing Fees (Federal Register page 46647)

CMS: *We invite comments on three different options for the term dispensing fee.*

DSS Comments: The Department of Social Services believes that option 1 is the best interpretation of dispensing fee. Any supplies and equipment needed for the administration of the medication and any cognitive services should be reimbursed separately.

Subpart M: Grievances, Coverage Determinations, Reconsiderations and Appeals (Federal Register, page 46717)

Coverage Determination (§423.566 through §423.576)

CMS: *The PDP sponsor must make its expedited determination and notify the enrollee and the prescribing physician as expeditiously as the enrollee's health condition requires, but no later than 72 hours after receiving the request.*

DSS Comments: Currently Medicaid recipients whose prescription requests are not being honored receive a 72-hour supply of medications pending the initial coverage request. They are entitled to notice, face-to-face

hearings, and aid paid pending an appeal if their request is denied and they file their appeal within a specified time frame. All state Medicaid appeals processes are completed more expeditiously than Medicare appeals. The appeals process as described in Subpart M does not accord dual eligible and other Part D enrollees with adequate notice of the reasons for the denial and their appeal rights, with an adequate opportunity to a face-to-face hearing with an impartial trier of fact, with an adequate opportunity to have access to care pending resolution of the appeal, or with a timely process for resolving disputes.

The Missouri Department of Social Services appreciates the opportunity to submit comments on the Proposed Rule for the Medicare Prescription Drug Benefit. We welcome questions you may have or comments you may wish to discuss. Please contact Christine Rackers, Director, Division of Medical Services, at 573/751-6922.

Sincerely,

Steve Roling
Director

Comments on the Proposed Rule Concerning the Medicare Prescription Drug Benefit

Dear Dr. McClellan,

Thank you for the opportunity to comment on the proposed rules regarding the Medicare Prescription Drug benefit. Within the Ohio Department of Job and Family Services, the Office of Ohio Health Plans administers Ohio Medicaid, the Medicare Premium Assistance Program, and the Ohio Disability Medical Assistance Program. Collectively, these programs cover 1.7 million Ohioans, including more than 200,000 Medicare beneficiaries.

Preserving access to prescription drugs for dual Medicare-Medicaid eligible beneficiaries ("dual eligibles") should be a priority for CMS. In Ohio, as in many states, dual eligibles have access to an open formulary, including many of the "Medicaid-optional" drugs that may not be covered by Medicare Part D (over-the-counter drugs, barbiturates, benzodiazepines, and vitamins). In addition, Ohio Medicaid consumers receive their prescriptions with zero out-of-pocket cost, except when drugs require prior authorization. For our most fragile residents, the benefit proposed in the Medicare Modernization Act (MMA) will replace a comprehensive, zero out-of-pocket plan with a more limited plan which will require out-of-pocket costs that may prohibit indigent Medicare beneficiaries from getting their prescriptions.

Access to prescriptions for Medicare beneficiaries receiving long-term care (LTC) is vitally important. Both patients living in LTC facilities and those receiving services through Medicaid home and community-based waivers should be included in this category. Access to a LTC pharmacy provider through the Prescription Drug Plan (PDP) or Medicare Advantage

Prescription Drug (MA-PD) plan, and appropriate formulary drugs including infusion therapy, are critically important for this population.

MMA requires the states to pay a phased-down state contribution toward the prescription costs of dual eligibles. The calculation of this "clawback" as set out in the proposed rule does not accurately represent the actual costs to either Medicare or to the state in providing this prescription benefit. While CMS staff have indicated that the MMA limits the information used to calculate the payment, Section 1935(c)(3) of the Social Security Act as amended by the MMA states that the Secretary may use "other data" to determine the appropriate amount. Ohio believes that this language allows more information to be used that may more accurately represent the actual costs that states would have incurred for prescription drugs for dual eligibles in the absence of Medicare Part D.

Subpart B: Eligibility and Enrollment

Section II.B.2 of the preamble referring to **Section 423.34(d)** of the proposed regulations discusses the process for auto-enrollment of full-benefit dual eligibles, and solicits comment regarding whether the federal government (CMS or its contractor) or the States (or their contracted entities) should have responsibility for administering the "random" automatic enrollment process for full benefit dual-eligible individuals who do not otherwise enroll in an MA-PD or PDP. Ohio strongly opposes this additional administrative burden, which CMS accurately describes as "a new national workload of indeterminate size," on the States. The governing legislation is clear that this responsibility should fall upon the federal government. Section 1860D-1(b)(1)(C) of the Act directs that, if there is more than one prescription drug plan available to a full-benefit dual eligible individual who has failed to enroll in a PDP or MA-PD plan, "*[t]he Secretary* shall enroll such an individual on a random basis among all such plans in the PDP region" (emphasis added).

Given this express designation of responsibility, neither the Secretary nor CMS has authority to impose responsibility for the auto-enrollment function on the States. The preamble to the proposed rule suggests that administrative costs of auto-enrollment activities by the states might have to be borne, at least in some substantial part, by the States themselves. Moreover, even if administrative costs of carrying out this function were to be 100% federally reimbursed (as would be more appropriate, given that the Part D program falls within the federal Medicare program, not the joint state/federal Medicaid program), it would nevertheless constitute a substantial, additional administrative burden on the States that they are not equipped to perform.

As the preamble to the proposed regulation acknowledges, CMS' assumption of the auto-enrollment responsibility will further the goals of national uniformity in, and facilitate federal oversight over, the process. Auto-enrollment will require accurate and timely information flow between CMS and the States in any event. There is no reason to assume that transmission of accurate Medicaid eligibility data from the States to CMS would be inherently any more problematic than transmission of accurate and timely Part D data from CMS to the States.

Recommendation: CMS should facilitate the auto-enrollment process for dual eligibles, either directly or through a contractor. Ohio believes there is no legitimate rationale for transferring to the States an administrative responsibility that Congress clearly indicated should fall upon the federal government.

Section II.B.2 of the preamble referring to **Section 423.34(d)** of the proposed regulations also discusses the timing of the auto-enrollment for dual eligibles, referring to a process to begin at "the end of the individual's initial enrollment period." We have concerns about the enrollment and the auto-enrollment process as established by this section of the draft regulations in relation to providing adequate communication and assistance in enrolling dual eligibles. First, we are concerned about the timing of the automatic enrollment process for dual eligibles because they will lose Medicaid prescription drug coverage on January 1, 2006. They must enroll, preferably through their own selection, prior to losing their Medicaid prescription drug coverage. The scheduled auto-enrollment process beginning on May 16, 2006, is too late to dovetail with the loss of their Medicaid prescription drug coverage. If this date is to work, CMS must communicate with dual eligibles concerning this change in their prescription drug benefits far in advance of the proposed October 15, 2005, mailing. Second, the proposed rule lists a plethora of concerns around auto-enrolling a full benefit dual eligible in an MA-PD or a PDP, specifying that involuntarily dis-enrolling a dual eligible from one plan in order to auto-enroll them into a plan charging a lower premium is not a viable option under the statute. Though finding a plan and premium that will fit within the low-income subsidy is a concern and further illustrates the need to assist dual eligibles in understanding their options. For this population, the concern is finding a plan which will cover all their medications as previously covered under their Medicaid drug benefit, thereby making the transition to Medicare drug coverage a seamless one.

Recommendation: CMS should change the scheduled auto-enrollment date or change the date that dual eligibles lose their Medicaid coverage, and provide in-person assistance (through federally contracted independent enrollment brokers) in order to adequately educate dual eligibles on their options and minimize the need for the auto-enrollment. In order to provide dual eligibles with the information they need to make an informed choice, PDPs, MA-PDs, CMS and SHIP agencies should not deluge dual eligibles with mailed notices and expect they will understand that they will lose their Medicaid prescription drug coverage, and that they must find a PDP or MA-PD that covers their medications.

Section II.B.10 of the preamble discusses the information that CMS will make available to PDPs and MA-PDs. Divulging beneficiary-specific information to PDPs and MA-PDs could be particularly risky for dual eligible beneficiaries. MA-PD plans have an incentive to enroll dual eligibles because they will receive an additional capitation payment (Medicaid add-on) for these higher risk beneficiaries. The dual eligible population is more vulnerable (due to age, limited English proficiency, limited education, etc.) to the risk of enrolling in a plan that does not meet their needs and having to pay out-of-pocket if their medications are not covered by the plan marketed to them. Some Medicare managed care plans have a reputation for being especially aggressive with regard to enrolling dual eligibles without providing clear information on plan limitations. Dual eligibles will require greater protections and individual assistance to select the plan that most meets their needs.

Recommendation: CMS should establish special protections for the dual eligible population, including prohibitions against direct marketing to dual eligibles by PDPs and MA-PDs.

Subpart C: Voluntary Prescription Drug Benefit and Beneficiary Protections

Section II.C.1.a of the preamble solicits "comments concerning any drugs that may require specific guidance with regard to their coverage under Part D, and any gaps that may exist in the combined 'Part D & B' coverage package." As proposed in MMA, the definition of a Part D drug excludes those drugs which may be excluded under section 1927(d)(2) of the Social Security Act. By excluding these drugs, Medicare beneficiaries may not have access to drugs such as phenobarbital (a barbiturate) or clonazepam (a benzodiazepine) for seizures, or potassium (a mineral) for the heart. For many dual eligible beneficiaries, these drugs are vitally important. The low income subsidies have no provisions for extended coverage to include these drugs. While these drugs are optional for state Medicaid programs, Ohio and most other states do cover these drugs for Medicaid consumers as an important part of the benefit package. Please also see comments below under the heading "Submission of Bids and Monthly Beneficiary Premiums: Determining Actuarial Valuation" information pertaining to Section II.F of the preamble regarding alternative coverage. Ohio believes that basic alternative coverage including the Medicaid-optional drugs is actuarially equivalent to standard coverage.

Clarification of coverage of prescription drugs under Medicare Part B is essential. The rules regarding Part B coverage are confusing, and if left to the interpretation of PDPs and MA-PDs, drugs not covered under Part B may be excluded from Part D plans. If these drugs are excluded from Part D coverage, our fear is that Medicare beneficiaries would be denied coverage.

Recommendation: CMS should include coverage for "Medicaid-optional" drugs in the Part D benefit for dual eligibles, as part of the standard package or a basic alternative plan, or within an extended package available with the low income subsidies. CMS should also clarify coverage of prescription drugs under Medicare Part B to ensure that all appropriate drugs are covered under either Part B or Part D.

Section II.C.1.c of the preamble asks for "comments regarding our definition of the term long-term care facility in **section 423.100**."

Specifically, comments were solicited concerning whether Intermediate Care Facilities for the Mentally Retarded (ICFs/MR) should be considered LTC facilities. These facilities are residential facilities providing long term care to residents, so as such are LTC facilities. Since virtually all residents of ICFs/MR in Ohio are dual eligibles, and therefore eligible for the low-income subsidies, they should be afforded the same benefits as residents of nursing facilities and skilled nursing facilities, along with all other beneficiaries receiving LTC.

As a result of the U.S. Supreme Court decision *Olmstead v. L.C.*, 527 U.S. 581 (1999), Ohio and other states have been moving seniors and persons with disabilities from institutions into less

restrictive placements. Ohio has implemented waiver programs for home and community based care as an alternative to placement in a nursing home. These alternatives provide consumers with a choice of placement, but allow them to receive the same level of care as those who reside in institutions.

Exclusive contracts with a LTC pharmacy should not be the deciding factor on whether or not to extend the definition of LTC facility to forms of housing other than traditional nursing homes; the beneficiaries' qualification for Medicare and their health care needs should be the deciding factors. Rather than defining "long-term care facility," it may be more useful to define "long-term care." States can identify dual eligible individuals who are institutionalized, and can also identify those individuals that, if it were not for the *Olmstead* decision or an 1115 waiver, would be institutionalized. These individuals are low-income Medicare beneficiaries; having a Medicare prescription benefit at zero out-of-pocket cost will allow their income to be used for daily living expenses and not on prescriptions.

Dual eligible residents of LTC facilities in Ohio are required to use all income toward the cost of care, except for a personal needs allowance of $40 per month. This amount is not enough to pay for the cost of medications obtained from out-of-network pharmacies or non-covered drugs. The personal needs allowance for patients under home and community based services waivers is higher, but is still not high enough to pay the added cost of medications that have previously been covered under the Medicaid pharmacy benefit. Parity between institutionalized and waiver serviced beneficiaries must be maintained. These most needy Medicare beneficiaries must be offered a comprehensive benefit plan with zero out-of-pocket costs.

Recommendation: CMS should include ICFs/MR in its definition of LTC facilities. Furthermore, CMS should define "long-term care" to include both patients in residential facilities as well as those who receive a level of care through a home and community based waiver that would be equivalent to care in a residential LTC facility. All Medicare beneficiaries who are either institutionalized or in Medicaid home and community based waivers should be afforded the same prescription benefits including zero copayments.

Section II.C.4.a of the preamble referring to **Section 423.120** of the proposed regulations discusses access to LTC pharmacies, and whether CMS should require, or merely encourage, PDPs and MA-PDs to include LTC pharmacies in their networks. A requirement that PDPs and MA-PDs include one or more LTC pharmacy providers will ensure access to LTC pharmacy services for all Medicare Part D beneficiaries. By merely encouraging this arrangement, Medicare beneficiaries who enter LTC arrangements while enrolled in a PDP or MA-PD without a contracted LTC pharmacy will be left with only potentially expensive out-of-network options. In addition, a PDP or MA-PD could effectively discriminate against patients in LTC by declining to contract with a LTC pharmacy. The rules governing PDPs and MA-PDs must include beneficiary protections against the few PDPs and MA-PDs which may choose to provide less-than-appropriate care. By requiring each PDP and MA-PD to include at least one LTC pharmacy in its network, beneficiaries will retain a measure of protection. In addition to requiring at least one LTC provider, PDPs and MA-PDs should also be required to contract with any LTC pharmacy that agrees to the PDP's or MA-PD's standard contract.

Recommendation: CMS should require each PDP and MA-PD to include at least one LTC pharmacy in its network, and to contract with any LTC pharmacy that agrees to the PDP's or MA-PD's standard contract.

Section II.C.4.a of the preamble referring to **Section 423.120** of the proposed regulations discusses access to federally qualified health centers (FQHCs), and whether CMS should require, or merely encourage, PDPs or MA-PDs to include FQHC pharmacies in their networks. Similar to the LTC pharmacy question, a requirement that PDPs and MA-PDs include FQHC pharmacy providers will ensure access to pharmacy services for all Medicare Part D beneficiaries. Recognizing that FQHC pharmacies would need different contractual terms, PDPs and MA-PDs should be required to approach these pharmacies and attempt to reach agreement about terms.

Recommendation: CMS should require each PDP and MA-PD to approach all FQHCs in its service area to attempt to negotiate a contract.

Section II.C.4.a of the preamble referring to **Section 423.120** of the proposed regulations discusses access to home infusion pharmacies, and whether CMS should require, or merely encourage, PDPs and MA-PDs to include home infusion pharmacies in their networks. Also similar to the LTC pharmacy question, a requirement that PDPs and MA-PDs include home infusion pharmacy providers will ensure access to pharmacy services for all Medicare Part D beneficiaries. By merely encouraging this arrangement, Medicare beneficiaries who require home infusion services while enrolled in a PDP or MA-PD without a contracted home infusion pharmacy will be left with only potentially expensive out-of network options. By requiring each PDP and MA-PD to include at least one home infusion pharmacy in its network, beneficiaries will retain a measure of protection.

Recommendation: CMS should require each PDP and MA-PD to include at least one home infusion pharmacy in its network.

Section II.C.4.b of the preamble referring to **Section 423.120** of the proposed regulations "invite[s] comments regarding standards and criteria that [CMS] could use to determine that a PDP sponsor or MA organization's formulary classification system that is not based on the model classification system does not in fact discriminate against certain classes of Part D eligible beneficiaries." To be sure that an appropriate formulary system is in place, CMS should consider the United States Pharmacopeia (USP) model guidelines to be the minimum acceptable to meet the criteria. This means that the PDP's or MA-PD's proposed classification system must contain at least as many **equivalent** categories and classes of drugs as USP's model. In addition, CMS must verify that a variety of dosage forms are available. Appropriate drug therapy may involve the use of alternate dosage forms such as injectable and easier-to-swallow oral forms (e.g. liquids or rapidly dissolving tablets) for patients unable to swallow tablets or capsules. Drugs for topical, ophthalmic, nasal, otic, vaginal, and rectal administration should also be included in PDP and MA-PD formularies.

Part of the goal of CMS' approval of PDP and MA-PD formulary classifications must be protection from unintended consequences of cost containment. Particularly in an elderly

population such as the one served by Medicare, inappropriate drug therapy may lead to hospitalization, worsening morbidity, and mortality. The added costs of these consequences would be borne by Medicare Parts A and B, rather than by the Part D PDP. This misaligned financial incentive must be mitigated by requirements to provide drugs in appropriate categories.

With the continued trend toward prescription drugs being granted over-the-counter (OTC) status, it is important that PDPs and MA-PDs not be able to exclude a required category or class of drugs because OTC options are available. These required categories and classes should be included in every plan's list of covered drugs.

Recommendation: CMS should use USP's model guidelines as the baseline for what is acceptable. PDP and MA-PD formularies must include a variety of dosage forms in at least as many equivalent categories and classes of drugs as USP's guidelines. The formulary classification must protect both the beneficiary and Medicare Parts A and B from unintended consequences of cost containment.

Subpart F: Submission of Bids and Monthly Beneficiary Premiums: Determining Actuarial Valuation

Section II.F.4 of the preamble referring to **Section 423.265** of the proposed regulations discusses actuarial equivalence of plans. This section considers differences in plan cost sharing that may be considered actuarially equivalent, but gives little information about plans that may choose to provide coverage of optional drugs under basic alternative plans. Section 1860D-2(a)(2)(A)(ii) of the Social Security Act as amended by MMA provides for "[c]overage of any product that would be a covered part D drug but for the application of subsection (e)(2)(A)" regarding Medicaid-optional drugs. By including these drugs, to be used as alternatives to other Part D drugs, PDPs and MA-PDs will provide a more comprehensive benefit without incurring higher costs than the basic plan. This option should be considered in the regulations and Part D plans should be encouraged to provide this coverage. As mentioned above, coverage of drugs such as phenobarbital (a barbiturate) and clonazepam (a benzodiazepine) are necessary for appropriate care of seizure disorders. OTC drugs such as laxatives, aspirin, and antacids provide cost-effective care for common ailments. The availability of drugs for cough and cold symptoms will reduce inappropriate and unnecessary prescribing of antibiotics which may cause antibiotic resistance and increase hospitalizations and other health care costs. While state Medicaid programs have the option to not cover classes of drugs including those listed here, most provide at least limited coverage. Ohio provides a comprehensive benefit including a selection of agents used for the symptomatic relief of cough and colds, prescription vitamins and mineral products, nonprescription drugs, barbiturates, and benzodiazepines.

Recommendation: CMS should issue regulations encouraging basic alternative coverage including optional drugs. A benefit plan providing this alternative coverage is actuarially equivalent to the standard plan, and offers Medicare beneficiaries a more comprehensive benefit package. PDPs and MA-PDs should be encouraged to provide this basic alternative coverage.

Subpart J: Coordination under Part D Plans with Other Prescription Drug Coverage

Section II.J.6.b of the preamble referring to **Section 423.464** of the proposed regulations invites comments regarding coordination of benefits between state Medicaid programs and PDPs and MA-PDs. While this section is specific to coordination after the implementation of Part D, it is also important to consider the transition into Part D. Dual eligible beneficiaries in Ohio and most other states have a comprehensive drug benefit including open formulary and zero out-of-pocket cost for most prescriptions. This benefit will be replaced by a Part D plan which will probably provide a much more limited formulary and will require copayments for each prescription. Medicare must ensure that the transition from Medicaid prescription coverage to Part D is seamless, and no beneficiary will be unable to obtain medications. The transition process needs to ensure that no dual eligible experiences a lapse in coverage for any reason.

This seamless transition will only be accomplished with an organized, easy-to-understand auto-enrollment process. Because Medicaid coverage will end on December 31, 2005, it is imperative that all dual eligibles be enrolled in a PDP or MA-PD before Part D coverage begins. Once enrolled, the PDP or MA-PD should cover the beneficiary's existing medications during a transition period during which the PDP or MA-PD, beneficiary, and beneficiary's physicians work together to change the drug regimen to conform to the plan's formulary or to receive prior authorizations for necessary medications. Appeals and redeterminations need to be done on an accelerated timeline during the transition period, and beneficiaries must be informed of their right to appeal.

During this transition period, dual eligibles should not be subject to higher out-of-pocket costs for out-of-network pharmacies. While beneficiaries may decline the PDP or MA-PD chosen for them in an auto-enrollment process, it will take some time for the beneficiary to choose a more appropriate PDP or MA-PD that includes his or her preferred pharmacy. For dual eligibles in LTC facilities, extra protections during this transition period are even more important because they are generally locked in to a single pharmacy provider which has contracted with the facility.

Recommendation: CMS should ensure a seamless transition period for dual eligible beneficiaries. This transition period should include expedited appeals, an open formulary, and no penalties for out-of-network pharmacy use. This transition period should last for at least six months, to give the beneficiary, physicians, and the PDP or MA-PD enough time to change any drugs that are nonformulary or to appeal the formulary decision.

Section II.J.6.b of the preamble referring to **Section 423.464** of the proposed regulations invites comments regarding coordination between state Medicaid programs and PDPs and MA-PDs. This coordination of benefits must allow states flexibility to either wrap around or not wrap around the Part D benefit. State assistance may take the form of a State Pharmaceutical Assistance Plan (SPAP) as defined in the regulations, a Medicaid state plan, or another state-financed arrangement. **Regardless of the form of assistance, states should have the ability to choose not to wrap around the benefit while being satisfied CMS has assured that the state's Medicare beneficiaries are receiving appropriate drug coverage.** States should also

have the flexibility, if they do choose to wrap around the benefit, to either pay the difference between the low-income premium subsidy and the premium for a basic or extended plan, or to pay on a per-claim basis. Related to states' decision not to wrap around the Part D benefit, CMS should provide a State Plan Amendment option to exclude dual eligibles, or any consumer eligible for Medicare, from any outpatient drug coverage under Medicaid.

Recommendation: CMS should write regulations protecting the states' ability to either wrap around or not wrap around the Part D benefit, and to choose the structure of any wrap around benefit. For states that choose not to wrap around, CMS should provide protection through the state plan to exclude any Medicare-eligible consumer from Medicaid pharmacy services.

Subpart S: Special Rules for States – Eligibility Determinations for Low-Income Subsidies and General Payment Provisions

Section II.S.1 of the preamble referring to **Section 423.904** of the proposed regulations discusses states' obligations for processing applications for the low-income subsidies. States should be able to meet this obligation by simply accepting applications and forwarding them to the Social Security Administration (SSA) for eligibility determinations to be made. Similarly, all redeterminations and appeals should be done by SSA. This approach will encourage consistency to a national standard and provide accountability to all Medicare beneficiaries. Any provision in the law that a state must perform any eligibility determination for a federal program is an unfunded mandate, and as such should be eligible for 100% federal reimbursement for any state resources expended. Staff time for Ohio to implement this program will include creating rules within the Ohio Administrative Code, training of front-line workers, training of supervisory staff, and time for hearings, appeals, and oversight. In order to accomplish this unfunded mandate, information system changes would need to be made in a short amount of time. If states are to be required to begin accepting applications by July 1, 2005, these system changes are not possible. Ohio also needs time to obtain state statutory authority to perform any functions related to the Medicare benefit but unrelated to state programs. In Ohio, we have the authority to administer the Medicaid program, including the Medicare premium assistance program, but not to administer Medicare. The requirement for states to perform any function regarding eligibility for Medicare is unnecessarily burdensome.

Recommendation: CMS should issue regulations which are clear that a state's only obligation in processing applications for low-income subsidies is to accept applications to be forwarded to SSA for processing. Any resources contributed by a state to the Medicare program should be eligible for 100% federal reimbursement.

Section II.S.4 of the preamble referring to **Section 423.908** of the proposed regulations discusses the calculation of the Phased-Down State Contribution. The calculation, as proposed in rule, closely follows the instructions from MMA. However, the authorizing legislation does contain a provision, in its amendment to Section 1935(c)(3) of the Social Security Act, to use "information reported by the State in the medicaid financial management reports (form CMS-64) for the 4 quarters of calendar year 2003 *and such other data as the Secretary may require*" (emphasis

added). Ohio believes that this language allows the Secretary to consider information that does not appear on the forms CMS-64 for calendar year 2003. The intent of the legislation is to approximate the amount that would have been spent by states for Part D drugs for dual eligibles in the absence of Medicare Part D, based on the experience of 2003. Congress clearly recognized that the forms CMS-64 would not contain the full picture of states' experience in 2003. For example, drug rebates are billed approximately two months after the end of the quarter during which they were earned. Thus, rebates for much of 2003 were not billed or received until well into 2004. Federal rebate liabilities have been steadily increasing. By considering only the rebates that were received in 2003, the calculation more closely reflects 2002 experience.

A second issue is that many states, including Ohio, implemented or planned cost-saving measures in 2003 which will reduce pharmacy costs into the future. For example, Ohio implemented a Preferred Drug List (PDL) program in April 2003 which has shown savings of about 5% in overall pharmacy program costs. As with the federal rebates, the supplemental rebates associated with the PDL were not billed until several months later, so most of the revenue was received in 2004 and reported on forms CMS-64 for quarters in 2004. The Ohio PDL has been introduced in phases, with the first phase in April 2003, second phase in October 2003, and the third phase to be implemented in October 2004. Savings projections for calendar year 2005 are close to 8% of overall program costs. These additional savings should be considered by the Secretary under the "other data" provision of MMA, because they would more closely reflect the costs to Ohio for the pharmacy benefit for dual eligibles in the absence of Medicare Part D. Along with the PDL, a copayment of $3 was instituted for drugs requiring prior authorization. This copayment has improved our cost savings by encouraging Medicaid consumers to use less expensive drugs that do not require a copayment. These savings should also be considered.

A third consideration for the calculation of the phased-down payment is the inflation factor used. The legislation directs the Secretary to use the "most recent National Health Expenditure projections" to determine the inflation factor. State Medicaid programs in general, and Ohio Health Plans in particular, have consistently contained growth to a factor lower than the National Health Expenditure projections. Ohio's recommendation is that CMS consider each state's performance relative to the National Health Expenditure data, and to use a factor appropriate to each state, not to exceed the national projection.

Each state should be required to submit data that explains adjustments to be made to the "clawback" calculation. Because there is no provision for the baseline amount to be recalculated in the future, it is imperative that the liability be accurately calculated. To consider only information that was submitted in standard reports will not reflect the full experience of the states in 2003. Because of the significance of the 2003 baseline number, CMS should develop an appeals process for the phased-down state contribution calculation. This process will enable states to have a process through which to resolve any disagreement with CMS' calculations.

Recommendation: CMS should use the statutorily authorized consideration of "other data" provided by the states to determine an accurate, fair representation of the state's cost for

pharmacy benefits for dual eligibles in the absence of Medicare Part D. Each state's calculation should be different based on experience. This one-time calculation to be used in perpetuity must accurately reflect state experience. As such, a process should be developed for states to appeal CMS' determination of the payment amount.

Conclusions

Ohio Health Plans look forward to working with CMS on the implementation of Medicare Part D. Preserving access to prescription drugs for dual eligibles, the most disadvantaged seniors in our state, is a priority. It is imperative that these and all Medicare beneficiaries have access to a comprehensive drug benefit that is affordable. The cost of providing this benefit should not be unfairly shifted to states through an inappropriate Phased-Down State Contribution payment. Please consider these recommendations before issuing final regulations. If you have any questions, please do not hesitate to contact me at (614) 466-4443.

Respectfully Submitted,

Barbara Coulter Edwards

Department of Health and Human Services
Attention: CMS-4068-P
Baltimore, MD 21244-8014
www.cms.hhs.gov/regulations/ecomments

To Whom It May Concern:

The purpose of this letter is to comment on the Medication Prescription Drug Improvement and Modernization Act of 2003 (MMA), specifically the Medication Therapy Management Program (MTMP).

The New Mexico Society of Health-System Pharmacists represents pharmacists that practice in a variety of health care settings (hospitals, federal clinics and health systems, academia, managed-care organizations, etc.). The mission of our organization is to advance the provision of pharmaceutical care and achieve optimal patient outcomes.

Currently, under New Mexico law, pharmacists can have full prescriptive authority under the supervision of a physician to provide medication therapy management limited to the scope of the physician's practice. Additionally, all registered pharmacists in New Mexico can have prescriptive authority for the following: pediatric and adult immunizations, emergency contraception, and tobacco cessation products.

Representing the New Mexico Society of Health-System Pharmacists, we make the following recommendations for successful implementation of the MTMP which will in turn lead to improved patient care.

It is our position that CMS should include in the rules:

1. **That all pharmacists are included as qualified providers of MTMP**. Pharmacists in health systems currently provide MTM services in anticoagulation clinics, cardiovascular risk reduction clinics, congestive heart failure clinics, asthma clinics, etc. These services have been repeatedly associated with improvements in the quality of patient care and reductions in healthcare costs.
2. **Targeted beneficiaries should include all patients with at least one chronic disease**. Current plans to identify beneficiaries qualified to receive MTMP focus on patients having multiple chronic conditions, receiving multiple medications and who are expected to incur high prescription drug costs. Under-use of medications often is as serious a drug-related problem as is over-use and therefore MTM eligibility should ***not*** be based solely on number of medications currently prescribed.
3. **Reimbursement rates must be determined nationally by CMS using any willing provider guidelines and ensuring appropriate coverage areas**. Ensuring standardized rates of reimbursement would inhibit PDPs from contracting with groups purely based on cost at the sacrifice of MTMP quality.

Reimbursement rates should be based upon the complexity of the service provided and commensurate with reimbursement for other healthcare providers.

4. **The patient must have freedom of choice of providers**. This would encourage competition between providers based on quality, ultimately leading to improved patient outcomes.
5. **CMS must ensure that contractors have full coverage for patient and provider access in rural and underserved areas**.

Thank you for allowing us the opportunity to provide comments on the proposed rules.

Sincerely,

RE: Comments on Medicare Modernization Act of Proposed Rule Part 403

To Whom It May Concern:

We are writing to comment on the proposed rules of August 3, 2004, which would amend 42 CFR 403.205. CMS proposes to amend the federal regulatory definition of a "Medicare Supplemental Policy" to include a stand-alone limited health benefit policy or plan. Additionally, CMS proposes a disclosure form to be sent by Medigap carriers regarding Medicare Part D.

Proposed Changes to Medicare Supplemental Definition

CMS should make no changes to the current definition of Medicare Supplemental Policy except to conform to the MMA changes regarding what is not a Medicare Supplement Policy.

The MMA requires that the definition of Medicare Supplemental Policy only change to add a prescription drug plan under Part D as a type of coverage not included in the definition of the Medicare Supplemental Policy and to replace the term Medicare+Choice with Medicare Advantage. Any other changes to the definition of Medicare Supplemental Policy proposed by CMS are not authorized by the MMA. The agency does not have statutory authority to advance any changes above and beyond the two provided pursuant to the MMA.

CMS proposes to amend the definition of Medicare Supplemental Policy by including a rider attached to an individual or group policy, a stand alone limited health benefit plan or policy that supplements Medicare benefits and is sold primarily to Medicare beneficiaries or that otherwise meets the definition of the Medicare supplement policy as defined in the section, and any rider attached to a supplemental policy to become an integral part of the basic policy. This is already addressed as a matter of state law.

Additionally, CMS proposes to delete section 403.205(d)(1 through 5). In the current law these subparts are specifically listed as exclusions from the definition of Medicare Supplemental Policy. CMS has no statutory authority to delete these provisions and therefore may not removed pursuant to the proposed rule.

Notice to Medigap Prescription Policyholders.

We recommend that CMS retain the version of the "notice" required by section 104 of the MMA for Medigap carriers that was adopted by the NAIC and submitted to CMS. The NAIC approved version of the notice meets all of the statutory requirements of the MMA. We should not as Medigap carriers be required to make any assessments regarding the "value" of coverage nor to promote Medicare Advantage. The notice should go no further than to meet such requirements.

We appreciate the opportunity to offer comments on these proposals and thank you for your consideration of these comments.

Sincerely
Paul Latchford
Vice President and Counsel

To Whom It May Concern:

On behalf of the state of Massachusetts, I appreciate the opportunity to comment on the proposed regulations entitled, "42 CFR Parts 403, 411, 417 and 423 Medicare Program; Medicare Prescription Drug Benefit; Proposed Rule," 69 FR 46632. I am extremely concerned that many of the proposed regulations could negatively impact drug coverage for people living with HIV in our state, as well increasing the financial burden on the already strapped Massachusetts AIDS Drug Assistance Program (ADAP).

1.) Explicitly excluding ADAPs from being able to provide wrap-around coverage in a manner that would allow beneficiaries to reach the catastrophic limit seriously undermines the federal government's priority of providing comprehensive health care to people living with HIV/AIDS. ADAPs are an integral component of the safety net for people living with HIV/AIDS in this country and have a long history of filling gaps left by other federal programs, including Medicaid and Medicare. We strongly recommend that the final rule count cost-sharing subsidies from ADAPs as incurred costs for beneficiaries.

Massuchusetts is very concerned that the regulation also disallows state-appropriated dollars spent by ADAPs to be counted as incurred costs. It is discriminatory and unacceptable to single out state dollars used to provide medications to people living with HIV/AIDS while at the same time allowing state dollars to be used for State Pharmaceutical Assistance Programs' (SPAPs) expenditures on behalf of a beneficiary. Under the proposed regulations, SPAPs are allowed to wrap-around in a way that all costs spent on the behalf of a beneficiary count as incurred costs. States should have the flexibility to provide prescription drugs to a variety of populations, including people living with HIV/AIDS, with the state dollars appropriated. It is inexcusable to

exempt people living with HIV/AIDS from receiving this type of assistance from their state, while allowing people with other medical conditions to benefit from the use of state dollars. Ironically, persons with AIDS who live in states with SPAPs and who are eligible for assistance will have SPAP costs count toward incurred costs, while those who rely on ADAP will not.

2.) While we understand that CMS is hopeful that all prescription drug plans (PDPs) will include all necessary HIV-related drugs on their formularies, it is not required. Therefore, even individuals who benefit from the low-income protections included in the benefit may find themselves turning to ADAPs to receive the remaining necessary medications.

Massachusetts strongly supports the CMS recommendation to implement "open formularies" for special populations and strongly recommends that people with HIV/AIDS be defined as a special population. We feel this is critical to ensuring that Medicare beneficiaries with HIV/AIDS have continued and unhindered access to all of the drugs that are medically necessary for treating the disease. Furthermore, an "open formulary" will prove cost effective because it will prevent the use of more intensive and costly health care resources such as inpatient hospitalization that will occur if Medicare beneficiaries with HIV/AIDS are denied access to medically necessary prescription drugs. While the private drug plans are not at risk for this potential cost shifting, the federal government will incur these costs either through higher Medicaid expenditures or higher Medicare Part A and B expenditures.

3.) Strengthening the language regarding coverage of drugs for off-label use. It is imperative that prescription drug plans be required to cover medically accepted uses of drugs for off-label use that are standard practice in the medical community. For HIV disease, as with many complex conditions, clinical practice frequently progresses ahead of label indications as physicians learn what drug combinations best target their patient's symptoms and side effects. As an example, tenofovir (Viread) has proven effective for treating hepatitis B for people with HIV, although treatment for hepatitis B is not yet an indicated use of the drug.

4.) Imposition of co-payments. People with HIV/AIDS depend on a daily regimen of multiple medications (most of which are non-generic). Even minimal co-payments will create a financial burden for individuals who will be left to choose between paying for medications and meeting other needs, like food and housing. Dual eligibles must maintain the protection that they currently have under Medicaid and not be denied a drug for failure to pay cost sharing.

Again, thank you for the opportunity to submit comment on the proposed rule to implement the Medicare Part D prescription drug benefit. Please contact me at kevin.cranston@state.ma.us if you need further information.

Sincerely,

Kevin Cranston, MDiv
Acting Director

BACKGROUND

RE: CMS?4068?P; Medicare Program; Medicare Prescription Drug Benefit; 42 CFR, Part 423, Section 159, Electronic Prescription Program

This letter is in response to the proposed rule that the Centers for Medicare and Medicaid Services (CMS) published in the Federal Register, Volume 69, Number 148, beginning on page 46632 on August 3, 2004. SureScripts appreciates the opportunity to comment on the proposed rule with respect to those provisions that will support the implementation of an electronic prescription program designed to improve the overall prescribing process for millions of Medicare beneficiaries. In fact, SureScripts has already testified before, and offered additional advice and assistance to, the National Committee on Vital and Health Statistics Subcommittee on Standards and Security as it gathered input this past summer on electronic prescribing standards that might be used for the electronic prescribing program for Medicare. We look forward to continuing to work with CMS to implement said standards and these proposed rules in a manner that improves the safety, efficiency, and quality of the overall prescribing process for all essential stakeholders.

Issue Areas/Comments

GENERAL

GENERAL

On behalf of Dey, L.P., we are pleased to provide CMS with comments to CMS-4068-P. We have attached our full comments and an executive summary of the comments.

CMS-4068-P-1256-Attach-2.doc

CMS-4068-P-1256-Attach-1.doc

Executive Summary
Comments on "Medicare Program; Medicare Prescription Dug Benefit; Proposed Rule"
(CMS-4068-P)

Dey, L.P. appreciates the opportunity to comment on the following issues addressed in the above-referenced proposed rule and its preamble:[1]

- Subpart C – Benefits and Beneficiary Protections
  - Section 423.100 (Definition of "Covered Part D Drug")
  - Section 423.120 (Access to Covered Part D Drugs)

- Subpart D – Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans
  - Section 423.153 (Cost and Utilization Management, Quality Assurance, Medication Therapy Management Programs, and Programs to Control Fraud, Abuse, and Waste)

Key Overall Point: CMS acknowledges the statutorily-mandated distinction between Part B and Part D drugs. Our principal concern is that the agency inappropriately suggests that certain Part B drugs with characteristics such as those described in the proposed rule's preamble – i.e., drugs covered as incident to a physician's service or furnished through an item of DME – could be covered under Part D.

"Covered Part D Drug": Dey supports the principle enunciated in the rulemaking that Part D "wraps around" Part B, providing beneficiaries with drug coverage that is seamless. However, portions of the preamble extend this "wrap around" principle beyond reasonable bounds. Specifically, the preamble cites examples that could be interpreted to confer Part D coverage on infusion and injectable drugs in situations that are currently within the Part B claims administration authority of the DMERCs. Similarly, in addressing dispensing fees for Part D drugs, CMS identifies options that, if implemented with respect to infusion drugs, could be applied more broadly – and inappropriately – to other Part B services.

> *Recommendation*: CMS should make clear that DME drugs used in situations now covered under Part B are excluded from coverage under Part D.

Access to Covered Part D Drugs: The rulemaking appropriately addresses means for ensuring that beneficiaries have access to Prescription Drug Plans (PDPs) that include in their networks' long-term care pharmacies and home infusion pharmacy providers. However, because these pharmacies/providers offer drug-related services that are typically covered under Part B, CMS should take special care to ensure that Part D coverage does not substitute for coverage available under Part B. In fact, we read the preamble's language on these points almost to invite such substitution. For example, CMS seeks comments on whether PDPs should receive performance incentives for producing Medicare savings under Parts *A and B* – virtually an open invitation to replace Part B drug coverage with Part D coverage if the PDP believes it will save money.

[1] 69 Fed Reg 46632 (Aug. 3, 2004).

The Medicare Modernization Act (MMA) clearly did not contemplate this type of Part D-Part B substitution. Indeed, the MMA, in establishing a Chronic Care Improvement Program, provided a separate means for CMS (on a demonstration basis) to test methods for identifying clinical and economic synergies among Parts A, B, and D.

> *Recommendation*: CMS should make clear that PDPs may not substitute Part D drug coverage in situations in which Part B drug coverage is available.

Medication Therapy Management: CMS solicits comments on whether the terms "multiple covered Part D drugs" and "multiple chronic diseases" should be defined by the agency itself or by PDPs. Both terms implicate use of disease management tools – tools that Dey supports. However, we are concerned that inappropriately inserting these tools into Medicare Part D, but not into Part B, could exert a counterproductive, asymmetrical effect. That is, by rewarding PDPs for exacting savings on a drug used in a situation that makes it Part D-covered (when, in other situations, it is Part B-covered) could discourage PDPs from considering the clinical factors DMERCs have long taken into account in administering Part B drug claims.

> *Recommendation*: CMS, not PDPs, should define the key terms. In so doing, the agency should maintain a level playing field among Medicare contractors, preventing PDPs from inappropriately reducing utilization for a subset of the situations in which a drug is used.

Drug Utilization Management: The preamble, in addressing industry standards for drug utilization management, suggests incentives to reduce costs "when medically appropriate" – a phrase not defined.

> *Recommendation*: The phrase "medically appropriate" should be defined to include criteria for ensuring that compounding of drugs is performed in a fashion consistent with patient safety and FDA's requirements.

Centers for Medicare and Medicaid Services

Department of Health and Human Services

Attention CMS-1429-P

P.O. Box 8012

Baltimore, Maryland 21244-8012

Re: [CMS--4068-P] Medicare Program; Medicare Program; Medicare Prescription Drug Benefit

Dear Sir or Madam:

Dey, L.P. is pleased to submit the following comments regarding the above-referenced proposed rule (Proposed Rule).[1] Dey, L.P. welcomes the opportunity to work with the Centers for Medicare and Medicaid Services (CMS) as it develops policy for drugs currently covered as a Part B benefit with the potential for coverage as a Part D benefit in 2006.

Dey, L.P. develops, manufactures, and markets prescription pharmaceuticals for the treatment of respiratory illnesses, including chronic obstructive pulmonary disease (COPD), a condition that represents a significant financial burden for the Medicare program and a serious threat to patient longevity and quality of life.

We propose that CMS clarify in the final rule to specifically exclude from Part D those drugs covered under Part B because they are incident to durable medical equipment (DME).

We are providing comments on three sections of the Proposed Rule that hold implications for the availability of drugs provided as a Part B benefit that may, under some circumstances, be provided as a Part D benefit:

1. Section 423.100, regarding the definition of a covered Part D drug;
2. Section 423.120, regarding access to covered Part D drugs; and
3. Section 423.153 in Subpart D Cost Control and Quality Improvement Requirements for Prescription Drug Plans

Various examples in the proposed rule could establish a precedent for changing coverage from an existing benefit (Part B) to a new one (Part D), thereby violating the "wrap around" principle that CMS has enunciated for Part D.

We suggest that CMS specify clearly in the final rule that drugs currently covered under Part B, either incident to a physician service, or incident to the DME benefit, be excluded from Part D coverage until such time as the Secretary issues the report on this subject (required under the Medicare Modernization Act) and the Congress acts to give CMS the authority to implement any recommended changes stemming from the report.[2]

[1] Proposed Rule, 69 Fed Reg 46631 (Aug. 3, 2004).
[2] Medicare Prescription Drug, Improvement, and Modernization Act of 2003, sec. 101(d).

1. **Subpart C. Voluntary Prescription Drug Benefit and Beneficiary Protections**

   a. ***Proposed Section 423.100 Definition***[3]

The proposed rule includes a definition of two terms that would benefit from more specificity:

- "Covered Part D Drug,"[4] and
- "Dispensing fee."[5]

Covered Part D Drug

CMS addresses the complex issue of drugs that can be covered under Part A, B or D, depending on the form of administration and site of service. While the Part D benefit is expected to be a "wrap-around" to the other benefits, the rulemaking contains descriptions of infusion or injectable drugs that have characteristics similar to a nebulized drug, and others that are administered through DME, where the drug product could be picked up at a pharmacy and be self-administered at home.

Our concern is that the examples include situations that are currently within the purview of the DMERCs and are intended to be addressed in subsequent regulations regarding the competitive acquisition programs for Part B drugs, supplies, medical equipment and related services. We recognize that some drug delivery mechanisms are not covered under Part B, and that beneficiaries could benefit from the "wrap-around" nature of the Part D benefit.

[3] 69 Fed Reg 46646.
[4] 69 Fed Reg 46646.

However, a drug administered through DME should remain a Part B covered service when it is used in a setting which is currently covered by the DMERCs; furthermore, we propose that it should be specifically excluded from Part D. Coverage for these products has evolved over many years, and the coverage criteria and decisions reflect the complex issues that need to be considered in order to structure a program that does not disrupt existing services. This consideration is beyond the scope of reform contemplated by Congress, prior to an analysis by the Secretary.

Part D Dispensing Fee

We commend CMS for clearly stating that the definition of a dispensing fee would apply specifically to Part D, and we agree with the agency's preference for the first of the three options described in the proposed rule; i.e., a single fee associated solely with dispensing of the prescription. We recognize the need for CMS to consider Options 2 and 3 (involving the necessary equipment and supplies and the necessary professional services of a nurse or pharmacist) for home infusion drugs.

However, if Options 2 and 3 are part of the final rule, PDPs should be excluded from applying such fees to reimburse for the costs of services currently subject to Part B coverage. Our concern is that permissible instances in which Options 2 and 3 may be needed (e.g., to reimburse for the costs of supplies and services associated with home infusion drugs that may not be covered currently under Part B) could be applied more broadly and inappropriately to other Part B covered services. Our concern is specifically

[5] 69 Fed Reg 46647.

grounded in the reimbursement circumstances surrounding Dey's product, DuoNeb® Inhalation Solution ("DuoNeb"), used in the treatment of COPD. We presented these concerns in our September 17, 2004 letter in response to **[**CMS-1429-P] Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule for Calendar Year 2005. A summary of the rationale is provided in Exhibit A.

b. Proposed Section 423.120 Access to Covered Part D Drug[6]

Our concerns relate to two provisions regarding the ways in which Medicare beneficiary access to pharmacies can be assured. Specifically, we have concerns regarding CMS preamble language pertaining to availability of PDP access to 1) long term care pharmacy, and 2) home infusion pharmacy providers.

1) Long Term Care Pharmacy

While it is appropriate for CMS to consider whether the new Medicare Prescription Drug Plans (PDPs) should be required to include long-term care pharmacies in their plans and to take into account how the PDP might reimburse these pharmacies for services such as infusion therapy and 24 hour medication delivery, our concern is that such services should be excluded from Part D coverage if Part B coverage is available.

2) Home Infusion Pharmacy

The issue is the same for home infusion pharmacies, although we note with some concern that CMS is seeking comments on ways to encourage PDPs, who do not have a medical benefit and therefore cannot realize efficiencies from reduced hospital costs, to establish

contracts with home infusion pharmacies. The potential to offer performance incentives for Part D contractors for savings under Part A or Part B goes beyond the scope of what MMA contemplated. These types of savings could more appropriately be captured under the Chronic Care Improvement Program, which MMA established as a demonstration.

2. Subpart D. Cost Controls and Quality Improvement Requirements for Prescription Drug Benefit Plans

a) Proposed Section 423.153 Cost and Utilization Management, Quality Assurance, Medication Therapy Management Programs and Programs to Control Fraud, Abuse and Waste

Two provisions of this proposed section could be detrimental to Medicare beneficiaries' continued access to Part B covered drugs and related services:

- Cost Effective Drug Utilization Management[7] (relating to the use of compounded drugs); and
- Medication Therapy Management[8] (relating to providing appropriate nebulizer utilization).

Cost Effective Drug Utilization Management

CMS solicits comments on industry standards for cost effective drug utilization management, which includes the use of incentives to reduce costs, "when medically

[6] 69 Fed Reg 46655.
[7] 69 Fed Reg 46666.
[8] 69 Fed Reg 46668.

appropriate," which is not defined. We suggest that the term "medically appropriate" should specify criteria as to when using compounded drugs would be considered a medically appropriate incentive to reduce costs.

Specifically, we believe CMS should ensure that compounding is done on a patient-name prescription basis, and that pharmacies use all compounding and admixing precautions to ensure product sterility and freedom from microbe ingress contamination. Patient safety is crucial, and the quality of the compounded product should be comparable to a commercial drug product.

Another area of concern regarding compounding is that the FDA prohibits pharmacy compounding of two or more separate FDA-approved products when a combination product approved by the FDA is commercially available.[9]

Specifically, in the past six months alone, the FDA has cited and sent warning letters to several pharmacies for the following compounding violations: preparing drug products that are commercially available, and compounding drugs "without the necessary controls to ensure drug product sterility and potency."[10,11,12]

[9] Food and Drug Administration. Compliance Policy Guidance for FDA Staff and Industry. Sec. 460.200 (Pharmacy Compounding). June 7, 2002. Accessed August 10, 2004 at http://www.fda.gov/ora/compliance_ref/cpg/cpgdrg/cpg460-200.html.
[10] FDA warning letter to Axium Healthcare Pharmacy, June 7, 2004, at http://www.fda.gov/cder/warn/2004/AXIUM%20%20wl.pdf.
[11] FDA warning letter to Gentere, Inc., July 13, 2004, at http://www.fda.gov/foi/warning_letters/g4863d.htm.
12 FDA warning letter to delta Pharma, Inc., September 17, 2004, at http://www.fda.gov/foi/warning_letters/g4965d.htm.

Violations of the FDA policy against compounding commercially-available drugs affect DuoNeb, since it is a currently marketed, sterile, non-allergenic, premixed combination drug; these manufacturing processes are designed to lower the risk of drug cross-contamination and to minimize waste. The premixed, unit-dose combination of the two agents within DuoNeb enhances patient safety by minimizing the chance for medication errors, and it eliminates the need for the Medicare patient to nebulize two different solutions, resulting in faster treatment times and improved compliance.

As for the second category of violation – compounding drugs "without the necessary controls to ensure drug product sterility and potency" – quite obviously patient safety is at risk, and a threat to public health is created. We also note that, in 2002, the FDA sampled 29 drugs from compounding pharmacies and found that 10 were subpotent.[12] In all, the compounded drugs sampled by the FDA registered a 34 percent failure rate – far in excess of the comparable two percent rate for commercially-available drugs.[13]

These examples highlight the complexity unique to prescription drugs covered under Part B and the need for greater clarity and precision in the Part D proposed rule.

Medication Therapy Management Program

CMS solicits comments on whether it should define the terms "multiple covered Part D drugs" and "multiple chronic diseases", or allow the PDPs to define the terms as part of their bids to CMS. While we support the use of appropriate disease management tools

---

[12] Report: Limited FDA Survey of Compounded Drug Products. Food and Drug Administration. Accessed August 24, 2004 at http://www.fda.gov/cder/pharmcomp/survey.htm.
[13] *Id.*

such as the Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines, our concern is that CMS maintain a level playing field among its contractors and not create an advantage for PDPs who potentially could be rewarded for reducing nebulizer use among a sub-set of COPD patients, without adequately considering clinical factors such as those included in the DMERC coverage policies.

Conclusion

Dey, L.P. appreciates the opportunity to comment on these three proposed sections that – absent additional clarification – could affect Medicare beneficiaries' access to life-saving and quality-of-life enhancing medications. We base our observation on examples contained in the proposed rule that, while casually presented, belie the underlying complexity that results when coverage could be provided under different benefits, depending on the route of administration and site of service. Coupled with the concerns we raised in our response to the proposed rule on Part B payment, we are compelled to reiterate our recommendation that CMS develop a cohesive strategy for inhalation drug therapy based on clinical guidelines and correct assumptions as to the medical necessity of nebulizer-based therapy by some patients. In addition, including pharmacy compounding as an activity whose costs may be included in the dispensing fee could be troublesome, given that on certain occasions pharmacy compounding is not appropriate and should not be reimbursed by PDPs.

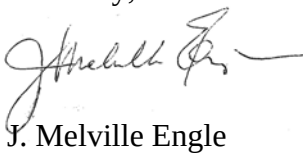
We urge CMS to revisit the proposed changes regarding a revised (or incremental) dispensing fee by conducting a study of the appropriate activities and their costs, and by considering the considerable operating and patient-support expenses borne by pharmacies.

The concept of a "service fee" may be a more appropriate description of the various pharmacy activities and expenses.

Dey, L.P. believes that CMS needs to be more specific in the final regulation about the Part D benefit for those prescription drugs that can be covered under the Part B benefit. The MMA includes several provisions related to the latter that will be implemented over the next few years and also calls for the Secretary to study these issues and report to Congress. We know the complexity of the issues related to inhalation products and support an approach that considers them in the overall context of respiratory disease costs to the Medicare program. It is important to get the right prescriptions to patients using the most appropriate delivery mechanism, be it nebulizers, MDIs, or dry powder inhalers (DPIs), all of which are found in clinical practice guidelines and will be included in Medicare's benefits as of 2006. CMS and its contractors need to strive for consistency with existing Medicare policies and FDA polices to ensure that payment policy changes do not create incentives for activities that are not consistent with the coverage of products under existing benefits and the assurances provided to the public by the FDA.

Thank you for the opportunity to present our views with respect to these selected provisions detailing how the Part D benefit will be implemented.

Sincerely,



J. Melville Engle

President and CEO

Nebulizers versus MDIs

We feel compelled to correct the record regarding the stance CMS has taken regarding the relative and comparative value of nebulizers versus MDIs. In the portion of the Proposed Rule preamble pertaining to MMA Section 305, CMS states that Medicare beneficiaries have a "strong" financial incentive to use nebulizers since the alternative inhalation drug delivery mechanism, metered dose inhalers (MDIs), currently are not covered under Part B, and beneficiaries will have to wait until January 2006 to be covered under the new Part D drug benefit. CMS also states that, based on a literature review, nebulizers are no more effective than MDIs in delivering bronchodilators, and CMS predicts a substantial shift from nebulizers to MDIs once the latter become covered under Part D beginning in 2006.[14] We fear CMS may underestimate the clinical value, patient preference and improved outcomes for nebulized respiratory medication which is based on a reduction of symptoms and improved quality of life, not financial incentives.

While it is true that some studies have shown that nebulizers and inhalers are equally effective, the performance of inhalers was augmented by spacers.[15,16,17] Spacers are designed to deliver MDI-delivered medication more easily and effectively. In common

practice, studies have shown that patients only use spacers to be used with inhalers approximately 50 percent of the time.[18,19] **Without** accessories such as spacers, much of the medication is left in the mouth and throat, thus reducing absorption and efficacy.[20]

In addition, the literature is replete with studies showing that many patients, up to 89%, do not employ proper inhaler technique.[21,22,23] Therapeutic benefit depends on sufficient deposition of drugs in the medium and small airways; this is largely determined by a competent inhaler technique.[24,25] The most recent report of the Global Initiative for Chronic Obstructive Lung Disease (GOLD) states that "COPD patients may have more problems in effective coordination and find it harder to use a simple Metered Dose Inhaler (MDI) than do healthy volunteers or younger asthmatics."[26]

Market research has confirmed the practical superiority of nebulizers to MDIs, as judged from the patients' perspective. One study compared the value of nebulizer systems with MDIs from the patient's perspective, based on an analysis of 1,369 questionnaires.[27] According to the study, nebulizer systems were preferred and considered by patients to be more effective at symptom control than MDIs. Key findings were as follows:

- Fifty-seven percent (57%) of patients surveyed said their symptoms were better controlled with a nebulizer system than with an MDI.
- Eighty-two percent (82%) said the nebulizer system controlled their symptoms for a longer period of time than the MDI.
- Over 80% of patients said the nebulizer system had given them a better quality of life than an MDI alone. Nearly 70% of patients surveyed said the nebulizer system had helped them avoid a trip to the emergency room.
- Fifty-six percent (56%) of these patients said use of a nebulizer system helped to avoid hospitalization.
- Fifty-eight percent (58%) of these patients had avoided unscheduled office visits by using their nebulizer systems.

In short, nebulizers are the preferred method of delivery of bronchodilators for a large proportion of COPD patients, including Medicare beneficiaries. In the preamble, CMS expresses concern that the access of beneficiaries to nebulized bronchodilators in 2005 might be restricted, due to the reduction in Part B payment rates for frequently used

[27] Safian Communications, Inc. Patient Assessment of Efficacy of Nebulizer Systems on Their Respiratory Health. April 1995 (report available on request).

bronchodilators.[28] We agree this is a serious concern, but we submit that it is not a short-term problem that will disappear in 2006. Beneficiaries' continued need for nebulized bronchodilators, even after MDIs become covered under Part D, will make it all the more essential that CMS adequately reimburse providers for these drugs under Part B on an ongoing basis.

[28] Proposed Rule, 69 Fed Reg 47549.

EXHIBIT B

Circumstances Where Compounded Combination Albuterol and Ipratropium Should Not Be Covered Under Medicare

FDA Prohibition of Certain Types of Pharmacy Compounding

Certain types of pharmacy compounding are discouraged by FDA policy, as articulated in Compliance Policy Guide (CPG), Section 460.200, issued on June 7, 2002.[29] The CPG contains factors that the agency considers in deciding whether to exercise its enforcement discretion. One factor is whether a firm **compounds drug products that are commercially available, or which are essentially copies of commercially available FDA-approved products**.[30]

If one or more of the factors identified in CPG section 460.200 are present, such compounding pharmacies may be manufacturing drugs which are subject to the new drug application (NDA) requirements of the Federal Food, Drug, and Cosmetic Act (FFDCA), but for which the FDA has not approved an NDA, or which are misbranded or adulterated. If the FDA has not approved the manufacturing and processing procedures used by these facilities, the FDA has no assurance that the drugs produced are safe and efficacious. Safety and efficacy issues pertain to such factors as chemical stability, purity, strength,

[29] Compliance Policy Guidance for FDA Staff and Industry. Sec. 460.200 (Pharmacy Compounding). Food and Drug Administration. June 7, 2002. Accessed August 10, 2004 at http://www.fda.gov/ora/compliance_ref/cpg/cpgdrg/cpg460-200.html.

[30] Emphasis supplied. In certain circumstances, it may be appropriate for a pharmacist to compound a small quantity of a drug that is only slightly different than an FDA-approved drug that is commercially available. In these circumstances, FDA will consider whether there is documentation of the medical need for the particular variation of the compound for the particular patient.

bioequivalency, and bioavailability. Dey, L.P. is concerned that patients may be receiving unsafe, unsterile drugs of unknown potency and composition, a needless risk when, in the case of pharmacy-compounded albuterol and ipratropium, an FDA-approved inhalation solution is available in DuoNeb® Inhalation Solution.

Based on 1) the NDA requirements of the FFDCA, and 2) CPG §460.200, pharmacy-compounded combinations of albuterol and ipratropium that contain equivalent amounts of the active ingredients in DuoNeb® Inhalation Solution are prohibited by the FDA.

Medicare Denial of Payment for Certain Types of Pharmacy Compounding

If the FDA prohibits pharmacy-compounded combinations of albuterol and ipratropium, then chapter 15, section 50.4.7 of the Medicare Benefit Policy Manual, entitled "Denial of Medicare Payment for Compounded Drugs Produced in Violation of Federal Food, Drug, and Cosmetic Act," should apply. The applicable portion of §50.4.7 reads as follows:

> Section 1862(a)(1)(A) of the Act requires that drugs must be reasonable and necessary in order to be covered under Medicare. This means, in the case of drugs, the FDA must approve them for marketing. Section 50.4.1 instructs carriers and intermediaries to deny coverage for drugs that have not received final marketing approval by the FDA, unless instructed otherwise by CMS. The Medicare Benefit Policy Manual, Chapter 16, "General Exclusions from Coverage," §180, instructs carriers to deny coverage of services related to the use of noncovered drugs as well. Hence, if DME or a prosthetic device is used to administer a noncovered drug, coverage is denied for both the nonapproved drug and the DME or prosthetic device.[31]

[31] Centers for Medicare and Medicaid Services. Medicare Benefit Policy Manual. Chapter 15 (Covered Medical and Other Health Services); §50.4.7 (Denial of Medicare Payment for Compounded Drugs

In order to provide consistency across all benefit categories, all Medicare contractors, including PDPs should adhere to provisions such as those in the Medicare Benefit Policy Manual. This would ensure that any claim for a drug that requires FDA approval but is not FDA-approved would be denied, regardless of the benefit category under which the claim was made. For example, payment for combination products such as albuterol and ipratropium, and the delivery system used to administer the drugs, should be limited to FDA-approved formulations.

Centers for Medicare & Medicaid Services
Department of Health and Human Services

Attention: CMS-4068

Dear Madam or Sir:

On behalf of the clients represented by the undersigned, we wish to submit the following comments on your proposed rule for the Medicare Prescription Drug Benefit. The Medicare Advocacy Project has over 15 years of experience advocating on behalf of Medicare beneficiaries, particularly those with low incomes; the Massachusetts Law Reform Institute is a statewide advocacy organization representing low income individuals, including elders and persons with disabilities; and the Disability Law Center (DLC) is a private, nonprofit protection and advocacy agency that provides free legal assistance to individuals with disabilities throughout Massachusetts. A key mandate of DLC is ensuring that people with disabilities are able to access needed supports to live and work in the community. Because of the limited time allowed and the magnitude of the proposed rule, we are not commenting on CMS-4069, dealing with Establishment of the Medicare Advantage Program. Neither are we commenting on all the sections of the proposed prescription drug rule. Rather, we are focusing on the impact of the rule on low income beneficiaries and persons with disabilities, particularly in the Eligibility and Enrollment and Grievances, Coverage Determination, and Appeals sections. In addition, we support and agree with the more detailed and comprehensive comments submitted on one or both of the proposed rules by the Medicare Consumers Working Group and the Center for Medicare Advocacy, Inc.

We also request that time be provided for another comment period due to the many unaddressed or only vaguely addressed issues. The final regulations could include a number of errors and provisions that result in unintended consequences because so much of the final regulations will not have been seen by the public. We urge CMS to issue the next version of these regulations in a format that will allow one more round of comment, even if a shortened comment period. This is a very complex program with significant ramifications for a large number of citizens. We are concerned that failure to provide for additional public input when the regulations are more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

PART 423-VOLUNTARY MEDICARE PRESCRIPTION DRUG BENEFIT

General comments.

1. Many pro-consumer statements in the preamble do not appear in the proposed rule. These protections bear no weight unless captured in the regulations. More should be done to reflect the Preamble's good intentions in the body of the regulations. For example:

> The Preamble discusses providing affected enrollees, prescribers, pharmacists, and pharmacies with written notice when a drug will be removed from the formulary or moved to a different tier for cost-sharing. The regulatory language does not specify that the notice should be in writing. Requirement for written notice is critical and should be specified.
>
> The Preamble gives examples of situations when a plan will be required to allow an enrollee to use a non-network pharmacy. These include situations such as when an enrollee's plan does not contract with the long-term care pharmacy which an enrollee in a nursing home must use. The regulations should include the examples CMS discusses in the preamble.

2. There are a number of areas where the law is unclear or contradictory and these areas are creating serious problems for the regulation drafters. CMS should take advantage of the law's provision calling for the submission of technical and corrective amendments. While this was supposed to have been done by June 8, 2004, it should still be done, and Congress should address these issues as soon as possible.

3. Simplicity, as well as additional support for information and counseling, is necessary to ensure that beneficiaries are reached in a comprehensible way. The sheer size and complexity of these regulations is a testament to the fact that this new law is incredibly confusing. If beneficiaries are confused, enrollment and use of the new program will be very difficult, particularly for lower income, sicker, and limited English proficiency beneficiaries. Thus whenever it is possible, CMS should seek to simplify the new program.

Addressing some of our specific concerns:

Subpart B-Eligibility and Enrollment

1. The draft regulations addressing enrollment of beneficiaries into private drug plans (PDPs) or Medicare Advantage Prescription Drug Plans (MA-PDPs) do not adequately address the need for hands-on outreach, particularly to low-income beneficiaries, or to beneficiaries with special needs, such as mental illness. More attention must be given to developing materials and education and enrollment campaigns focused on informing beneficiaries with disabilities, including mental illness and cognitive impairments, and those with other special needs about the new drug benefit and helping them to enroll in the best plan available.

2. Of particular concern, is enrollment of the dual eligibles. Beneficiaries covered by both Medicare and Medicaid are by definition poor and cannot afford to pay privately fo fill any gaps in medication. Congress and the Administration promised that dual eligible beneficiaries would be better off with this new Part D drug benefit than they were receiving drug coverage through Medicaid. To honor this promise, coverage of medications for dual eligibles and other special populations must be grandfathered into the new Part D benefit. In addition, CMS must require plans to establish an alternative flexible formulary for dual eligibles as suggested in the preamble to the proposed regulations. This flexible formulary would incorporate utilization management techniques that focus on improving inefficient and ineffective provider prescribing practices but

do not restrict access to medications through prior authorization, fail first, step therapy, or therapeutic substitution requirements.

3. The regulations do not adequately address how drug coverage for the dual eligibles will be transferred to Medicare on January 1, 2006. There are issues both of timing and implementing the enrollment process in a way that will ensure that these beneficiaries do not confront a loss of benefits or a gap in drug coverage, either of which could have disastrous health consequences. Specific comments on enrollment of dual eligibles and our recommendations appear in our comments on §§423.34, 423.36, 423.48 and on Subpart P.

A. We are concerned with ensuring continuity of care for dual eligibles and access to needed prescriptions. These issues and concerns apply equally to all dual eligibles, and particularly to those with special health care needs, as well as to other populations with specific needs (See our comments in Subpart C, §423.120.)

B. The proposed regulations would force dual eligibles to enroll (or be automatically enrolled) in the "benchmark" or average cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans. The formularies for these plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Even though Massachusetts has restricted access to drugs in its Medicaid program with preferred drug lists and prior authorization requirements, Massachusetts has taken many steps to ensure that special populations can readily access medically necessary drugs. For example, individuals who have been stabilized on one antidepressant are not required to try another one.

C. Without access to the coverage they need, dual eligibles will be forced to switch medications, which for certain populations, such as beneficiaries with HIV/AIDS or mental illness can have serious adverse consequences. Also, failing to ensure continuity of care for dual eligibles may benefit the plans, but will undoubtedly lead to Medicare and/or state increased costs for more physician and emergency room visits, and hospitalizations. The regulations do provide a special enrollment period for dual eligibles to use "at any time" (§423.36). However, being able to enroll in a different Part D plan is inadequate to meet the special needs of dual eligibles.

D. In the preamble to the proposed regulations, CMS points to an exceptions process as a means of securing coverage of off-formulary medications (See our comments to **Subpart M-Grievances, Coverage Determination and Appeals**) But the process proposed is extremely complex and cumbersome to navigate for someone having a psychiatric crisis, facing cognitive impairments, or in the midst of aggressive chemotherapy-to list just a few examples. Moreover, the timelines established are inordinately drawn out; for example, an expedited determination could take as long as two weeks. Drug plans are not required to provide an

emergency supply of medications until at least two weeks following a request. Exception, grievance and appeal processes should not be used to substituted for open formulary access to medications.

§423.34 Enrollment Process.

§423.34 (b) Enrollment.
The final rule should provide that an authorized representative may complete the enrollment form on behalf of a Part D eligible individual.

§423.34(c), Notice Requirement.
The notice must be in writing and inform an individual who is denied enrollment of his or her appeal rights, including the right to appeal the imposition of a penalty for late enrollment.

§423.34(d) Enrollment requirement for full benefit dual eligibles.
In the Preamble, CMS requested comments on whether CMS or the states should perform automatic enrollment of dual eligibles. State officials have more readily available data identifying the dual eligibles in their state and they also will be involved in the enrollment process because they are already required to perform low-income subsidy enrollment. In addition, there is an incentive for them to enroll these individuals in Medicare drug plans because without drug coverage they will increase utilization of other Medicaid services. Thus, states should be afforded the ability to conduct auto-enrollment and receive full federal financing for this function. In addition, CMS should develop its own systems for automatic enrollment of dual eligibles in states that do not elect to do so. Also, because the proposed rule leaves unanswered key questions about who will conduct automatic enrollment of dual eligibles and how it will occur, CMS must give the public the opportunity to provide input on any proposal it develops on this issue before publishing a final regulation.

§423.34(d)(1) General Rule.
The draft regulations provide that dual eligibles will be automatically enrolled in a Part D plan if they do not enroll themselves, by the end of the initial enrollment period, which, under §423.36, is May 15, 2006. However, their Medicaid prescriptions drug coverage will end on January 1, 2006. This proposed timeline for automatic enrollment must be changed because it could expose millions of dual eligibles to a four and half month coverage gap that could have serious health consequences for this vulnerable population. Given the difficulty of reaching this population coupled with inadequate provisions for outreach and education, it is almost certain that a substantial number of dual eligibles will face a several month gap in coverage between the end of Medicaid's drug benefit and automatic enrollment. This is untenable, and directly in conflict with Congress' and the Administration's promise that dual eligibles will be better off under Medicare Part D. The transfer of drug coverage from Medicaid to Medicare Part D should be delayed. Absent a delayed transition date for dual eligible drug coverage, however, dual eligibles should be randomly assigned and enrolled in a plan that best suits their needs as early as November 15, 2005 but no later than December 1, 2005. While we would prefer to provide individuals an extended period to make informed choices, it is critical to complete auto-enrollment as early as possible to leave as much time as possible to distribute plan information

and cards to beneficiaries, allow them to switch plans, and educate them about their new drug coverage before January 1, 2006. To make this process work more smoothly, states can begin profiling individual drug histories to prepare for random auto-assignment among plans that are appropriate for the individual even before plan information is released on October 15, 2005. Additionally, CMS should fund a campaign of individualized counseling and assistance both before and after auto-enrollment to explain to individuals their choices and how to enroll in a plan; explain, if applicable, how to get benefits under the plan to which they have been auto-assigned; and explain, if applicable, that they can choose a different plan from the one to which they have been auto-assigned and assist in choosing and enrolling in such a plan.

§423.34(d)(1)(ii)
CMS must develop a solution to the issue of automatic enrollment of dual eligibles who are enrolled in MA plans that have a prescription drug benefit with a premium that is above the low-income benchmark. The solution should be the one least disruptive to medical care and should not force a dual eligible to choose among continued MA enrollment, paying added premiums, or foregoing drug coverage. For institutionalized dual eligibles, the difference between the premium and the premium subsidy should be considered an incurred medical expense and deducted from their monthly "patient paid amount" to the facility. For non-institutionalized dual eligibles, in states with pharmacy assistance programs (SPAPs) which will wrap around Part D coverage and will cover dual eligibles, the SPAPs should be authorized to pay the difference. For medically needy individuals, the cost differential would be an incurred medical expense contributing toward their spenddown, if appropriate. Otherwise, individuals should be counseled about the premium discrepancy and about their right to withdraw from the MA plan and return to original Medicare. Ideally, dual eligibles who want to remain in the MA plan should be allowed to do so and not have to pay any amount by which the MA-PD basic premium exceeds the low-income benchmark amount.

§423.34(d)(2), When there is more than one PDP in a PDP region.
Because not every PDP plan may be appropriate for each dual eligible (for example, due to formulary restrictions), CMS should limit "on a random basis" to "among such plans in the region that meet the beneficiary's particular drug needs." Also, this subsection undermines the §423.859 right of assured access to a choice of at least two qualifying plans, by acknowledging that there may be regions where there is only one PDP in a PDP region with a monthly beneficiary premium at or below the premium subsidy amount.

§423.36 Enrollment Periods.

§423.36(a)(3)(ii) Exception.
It is not clear who these beneficiaries would be.

§423.36(c) Special Enrollment Periods.
This section should be expanded to provide "special enrollment exceptions" for individuals disenrolled by a PDP (such as for disruptive behavior) so that the individual will have an opportunity to join another PDP and continue with necessary medications. These "special enrollment exceptions" are necessary given the high risk of discrimination presented by the

provisions for involuntary disenrollment. CMS should provide a special enrollment period for these beneficiaries. It should include a reasonable time period for plan selection and be exempt from late enrollment penalties. It should also be expanded to make clear that involuntary loss of creditable prescription drug coverage includes loss because the beneficiary, or beneficiary's spouse, stops working; because COBRA coverage ends or because the premiums became unaffordable.

§423.36(c)(4) Special Enrollment Periods and Dual Eligibles.
We support granting dual eligibles special enrollment periods. However, this provision does not adequately address their needs. It is unlikely that there will be much choice of low-cost drug plans in each region, particularly in rural areas which have not historically attracted many Medicare+Choice plans. For example parts of Cape Cod and Western Massachusetts have no Medicare+Choice plans. In addition, these individuals will not have the resources to pay for more comprehensive coverage. Moreover, the special enrollment provisions do not specify that dual eligibles would not be subject to a late enrollment fee if this complex process of disenrollment and reenrollment resulted in a gap in coverage of over 63 days.

In addition, full benefit dual eligibles should receive notice explaining their right to a special enrollment period when they enroll in a plan, and every time their PDP changes its plan in a way that directly affects them, such as removing a drug from its formulary, changing the co-payment tier for a drug, or denying their appeal concerning a non-formulary drug or an effort to change the co-payment tier.

§423.36(c)(8)
The regulations should include a special enrollment period similar to the one for dual eligibles for all beneficiaries eligible for a full or partial-low income subsidy. This is necessary because if coverage for a drug is denied, these low-income beneficiaries will be unable to afford to pay for drugs during a period of appeal, or if their appeal is denied and they are locked into a plan that does not cover a drug they need.

Special enrollment periods should also be provided for all institutionalized individuals, not just institutionalized dual eligibles, since their access to needed drugs may be compromised by the design of the plans and by pharmacy access requirements, such as if their long-term care pharmacy is not required to be included in the network of all PDPs. Individuals with life-threatening situations and individuals whose situations are pharmacologically complex should have the same rights as well.

§423.38 Effective Dates.

§423.38(c) Special Enrollment Periods.
Effective date should be first day of first calendar month following special enrollment in which individual is eligible for Part D.

§423.42 Coordination of enrollment and disenrollment through PDPs

§423.42(c)(2)
Notice of disenrollment should be in writing.

§423.44 Disenrollment by the PDP.

§423.44(b)(2)(I)
CMS requested comments about the requirement to involuntarily disenroll individuals from a PDP if they no longer reside in the service area. This raises the issue of "snowbirds"-the large number of Medicare beneficiaries who move for large parts of the year. This is a problem in Massachusetts where many elders winter in warmer climates. The churning-the enrolling and disenrolling-that plans serving this population will face as they apply this section will be enormous. Because of different formularies between plans and problems of coordination, the regulations should seek to minimize plan changes and maintain continuity of care. This section, as written, could result in a significant number of plan changes, disrupting continuity of care.

Some suggested ways to address this issue better would be to require that plans as a condition of participation have a system of visitor or traveler benefits, consider exempting regional PDPs and PDPs with out-of-network services from the disenrollment requirement, require plans to provide prospective enrollees specific information on traveler benefits and "out-of-plan service policies" and clearly define the time period that a plan could consider an enrollee as "no longer resid(ing) in the PDP's service area." such that it accommodates seasonal travelers who maintain a residence in the service area.. In many cases, 90 day mail order service and arrangements with other plans will make enrolling and disenrolling unnecessary. However, beneficiaries must have a clear understanding of how a plan will serve them while temporarily out of the service area; how when they are traveling and need emergency pharmaceutical services their plan will (or will not) reimburse for those services.

§423.44(d)(2)
Provisions in the proposed regulations to allow Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" create enormous opportunities for discrimination against individuals with mental illnesses, Alzheimer's, and other cognitive conditions. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and accordingly be subject to a late enrollment penalty permanently increasing their premiums. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage. Moreover, CMS lacks statutory authority to authorize PDPs to involuntarily disenroll beneficiaries. Under the MMA, section 1860D-1(b) directs the Secretary to establish a disenrollment process for PDPs using rules similar to a specific list of rules for the Medicare Advantage program. This list does not include reference to section 1851(g)(3)(B) of the Social Security Act which authorizes MA plans to disenroll beneficiaries for disruptive behavior. Thus, these proposed regulations must not be included in the final rule.

Concerns with specific provisions in this section and recommendations for beneficiary protections, which, at a minimum should be provided, are as follows:

§423.44(d)(2)(vi) Reenrollment in the PDP.
In the preamble, CMS appears to be asking for comments on whether a PDP should be allowed to refuse reenrollment of an individual who has been involuntarily disenrolled if there is no other drug plan in the area. As discussed above, it is our position that there is no statutory basis for involuntarily disenrollment. If the regulations allow this for disruptive behavior, then the plans must be required to allow reenrollment. Those individuals most likely to be subject to involuntary disenrollment will not have the resources to pay for their medications out-of-pocket. These individuals are entitled to this benefit. Disruptive behavior does not disqualify you from access to prescription drug coverage and may in fact be an indication that one is in need of medical assistance. Individuals who are involuntarily disenrolled would not have the opportunity to reenroll in a plan until the next annual enrollment period and may therefore be subject to a late penalty and increased premium as a result. This result is unfair in light of the fact that the disruptive behavior may have resulted from denial of access to needed medications. CMS should therefore provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior, must waive the late enrollment penalty for these individuals, and the regulations must include detailed articulated protections to lessen the risks inherent in authorizing sanctions for "disruptive behavior."

§423.44(d)(2)(vii) Expedited Process.
This provision should be deleted from the final rule. The proposal to establish an expedited disenrollment process in cases where an individual's disruptive or threatening behavior has caused harm to others or prevented the plan from providing services is undefined, and provides no standards, requirements or safeguards. It allows plans to employ this mechanism on the basis of behaviors described in the broadest of terms - terms which could easily be mis-applied or applied capriciously or punitively. Thus, it would undermine all the minimal protections that would otherwise apply.

§423.46 Late enrollment penalty.
CMS should delay implementation of this section for two years. The drug benefit is a new and complex program. Many beneficiaries will be confused about their enrollment opportunities and obligations, or not understand that they must choose a plan and enroll. The Medicare-endorsed prescription drug discount card program has shown that, even with significant outreach, the majority of individuals eligible for the $600 low-income subsidy have not yet enrolled. We disagree that healthy beneficiaries will not apply. We believe that the people most at risk of not applying are the most vulnerable beneficiaries, including people with mental illness and cognitive disabilities. Implementation of the late enrollment penalty should be delayed for individuals eligible for the low-income subsidy who may not understand that they have to apply separately for the subsidy and a drug plan, thinking that application for the subsidy is sufficient.

This section should provide that when the late enrollment penalties are implemented, there will be an opportunity for enrollees to appeal late enrollment penalties; that late enrollment penalties will be coordinated with "special enrollment periods" to ensure that individuals who take advantage of the special enrollment periods do not face late penalties; that individuals who are involuntarily disenrolled are exempt from this penalty; and that if an employer or other entity

providing drug coverage to Medicare beneficiaries fails to provide adequate or correct notice of the creditable status of that coverage or a change in status of that coverage, and that coverage is not creditable, there are no late enrollment penalties.

§423.48 Information about Part D.
Medicare beneficiaries can only exercise an informed choice about their drug plan if they have adequate information about drug plan options available to them. The information should be provided annually, in writing, and include details about the plan benefit structure, cost-sharing and tiers, formulary, pharmacy network, and appeals and exception process. In order to assure that beneficiaries have the required information, the standards should be included in regulations that are binding and enforceable, and not in guidance. Minimally, the regulations should require plans to provide premium information, including whether individuals who receive the low-income subsidy will have to pay a part of the premium and, if so, the amount they will have to pay; the benefits structure and comparative value of the plans available to them; the coinsurance or copayment amounts they will need to pay for each covered Part D drug on the formulary; the specific negotiated drug prices upon which coinsurance calculations will be based and that will be available to beneficiaries if they confront the gap in coverage; formulary structure, the actual drugs on the formulary, and how the formulary can change during the plan year; participating pharmacies, mail order options, out-of-service options; and exception, appeals and grievance processes. Plans should be required to provide this information to potential enrollees in a clear manner using a standard format that will allow beneficiaries to easily compare plans. Plans should be required to provide information on negotiated prices in an easily accessible format.

The regulations should also include specific requirements for plans and states, as well as outline activities CMS will undertake, to ensure that every effort will be made to reach dual eligibles. By summer 2005 CMS and the states should launch a concerted outreach and assistance campaign for dual eligibles to alert them about the need to enroll in a Part D plan and to help them make appropriate choices. The outreach campaign would be intended to prevent default enrollment. In addition, as early as possible, and no later than October15, 2005 (assuming information is available), CMS or the states should mail standardized, easy-to-understand notices to dual eligibles that, among other things: inform them of their eligibility to receive the low income drug benefit if they enroll in a PDP or MA-PD; list choices of health plans (clearly denoting those that meet the benefit premium assistance limit) and contact information for each plan; explain that individuals will be randomly enrolled in a prescription drug plan beginning November 15 (or, if different, the appropriate date) if they fail to opt out or enroll in a plan themselves; explain how they may change their drug plans if they wish at any time; and inform them of where in their community they can go to get help with enrollment. These notices should be tested for readability by focus groups and experts. If the states are required to provide this information, CMS should reimburse 100 percent of the states' costs.

§423.50 Approval of marketing material and enrollment forms.
The marketing rules for the PDPs and MA-PDPs should be developed in the historical context of other Medicare programs. From selective marketing to outright fraud, Medicare programs historically have been afflicted with marketing abuses and scams. We urge that CMS be vigilant to identify and prohibit these problematic areas and practices as it develops final regulations.

§423.50 (e) Standards for PDP marketing.
Telemarketing should expressly be prohibited. Door-to-door solicitation is prohibited under this section and telemarketing presents many of the same dangers. The regulations should specifically prohibit prescription drug plans from initiating telephone or e-mail contact with potential enrollees, unless the potential enrollee requests contact through such means in response to a direct mail or other advertisement.

In the Preamble, CMS asked for comments on whether it would be advisable to permit prescription drug plan sponsors to market and provide additional products (such as financial services, long term care insurance, credit cards) in conjunction with Medicare prescription drug plan services. CMS should not allow plans to market other services, nor should it seek to encourage other entities, such as financial institutions, to participate as PDPs. The potential for abuse—both cherry picking of healthier beneficiaries into plans and avoidance of financial services to less healthy individuals—is enormous. CMS also asked for comments on the applicability of MA marketing requirements for PDP marketing. PDP marketing requirements should be at least as restrictive as MA marketing because of the high potential both for confusion and for individuals to be directed to—and locked-into—plans that do not best meet their needs. Beneficiaries look to providers for balanced, unbiased information, and they should be able to rely on the information that these sources provide. However, if providers or pharmacies are allowed to market plans, there is the potential for aggressive marketing of certain PDPs, regardless of whether or not that PDP is the best for the beneficiary. The adverse consequences of making a bad selection based on promotion from a trusted source are high.

§423.56 Procedures to determine and document creditable status of prescription drug coverage.

§423.56 (e) Notification.
It is essential that beneficiaries understand whether they have creditable coverage. Failure to understand the issue of creditable coverage can lead to a lifetime of higher Part D premiums. CMS must set forth specific requirements that plans provide information to Medicare beneficiaries enrolled in those plans clearly stating whether or not the coverage they have is creditable. Minimally, in 2005, information on whether coverage is creditable or not should be provided in more than one mailing, and included in such documents as quarterly retiree income statements, medical billing correspondence, etc. After 2005, CMS should develop standard notices, through its Beneficiary Notice Initiative, to be used. In years after 2006, when creditable status changes, special notification is needed to insure that beneficiaries know as soon as the decision is made to reduce coverage, so they can begin shopping for a PDP and avoid a lifetime of premium penalties. Because this is such important notification, it should be sent by registered mail, or e-mail with proof of receipt. Additionally where beneficiaries are not adequately informed by an employer or other entity that their coverage is not creditable, CMS should take action on behalf of all the individuals of that employer or other entity to provide a special enrollment period (SEP). Each individual adversely impacted by the failure of the employer or other entity to inform adequately should not have to apply or appeal for a SEP.

Subpart C-Benefits and Beneficiary Protections

§423.100 Definitions.
"Dispensing fee" should be broadly framed, in order to permit the payment of costs associated with home infusion therapy. Of the options provided in the preamble to the proposed rule, we support option 3. We do not believe that a narrowly crafted definition of dispensing fee is appropriate because the conference report at § 1860D-2(d)(1)(B) references negotiated prices in a manner that indicates that Congress intends to define negotiated prices in a way that arrives at the most accurate prices when considering a variety of both concessions and fees. Since the antibiotics, chemotherapy, pain management, parenteral nutrition and immune globulin and other drugs that are administered through home infusion are indisputably covered Part D drugs, and equipment, supplies and services are integral to the administration of home infusion therapies, costs associated with such administration should be included in the definition of dispensing fee, in order to arrive at the most accurate determination of the negotiated price. Option 1 makes an arbitrary and inappropriate distinction between costs associated with dispensing a covered Part D drug and associated costs for the delivery and administration of a covered Part D drug, and option 2 does not capture all the true costs associated with dispensing a covered Part D drug.

"Long-term care facility" should explicitly include ICF/MRs and assisted living facilities.
We recommend that the final rule include a definition of "long-term care facility" that explicitly includes intermediate care facilities for persons with mental retardation and related conditions (ICF/MRs) and assisted living facilities. This is important because many mid to large size ICF/MRs and some assisted living facilities operate exclusive contracts with long-term care pharmacies.

§423.104 Requirements related to qualified prescription drug coverage.
The final rule defines "person" so that family members can pay for covered Part D cost-sharing. The law precludes contributions from employer sponsored health plans from being counted as incurred costs and counting toward the deductible or out of pocket limit. Contributions from one employer-sponsored benefit should not receive differential treatment over contributions from another type of employer-sponsored benefit. Contributions from employer-sponsored group health coverage should be counted as an incurred cost, similar to contributions from HSAs, HRAs, and FSAs. The final rule should also count cost-sharing subsidies from AIDS Drug Assistance Programs (ADAPs) as incurred costs. The regulations also specifically state that state-appropriated dollars spent by ADAPs cannot be counted as incurred costs. It is discriminatory and unacceptable to single out state dollars used to provide medications to people living with HIV/AIDS and not allow them to count as incurred costs, while at the same time allowing state dollars paid by State Pharmaceutical Assistance Programs' (SPAPs)to count as incurred costs.

§423.104(e)(2)(ii) Establishing limits on tiered copayments.
The final rule should not allow Part D plans to apply tiered co-payments without limits. Rather, it must place limits on the use of tiered cost-sharing, such as permitting no more than three cost-sharing tiers and requiring Part D plans to use the same tiers for all classes of drugs.

§423.104(h) Negotiated prices.(1) Access to negotiated prices.
No plan should be allowed to impose 100% cost-sharing for any drug. Such cost-sharing should be considered as per se discrimination against the group or groups of individuals who require that prescription.

§423.120 Access to covered Part D drugs.

§423.120(a) Assuring Pharmacy Access.
Pharmacy access standards must be met in each local service area, rather than by permitting plans to apply them across a multi-region or national service area. Permitting plans to meet the access standards across more than one local service area could cause individuals in some local service areas to not have convenient access to a local pharmacy. Also, only retail pharmacies should be counted for the purpose of meeting pharmacy access standards. It would undermine the principle that Medicare beneficiaries will have convenient access to a local pharmacy if the access standards could be met by counting pharmacies that serve only specific populations and which are not available to all parts of the general public. The final rule should require prescription drug plans to offer to contract with Indian Health Service, Indian tribes and tribal organizations, and urban Indian organizations (I/T/U) pharmacies and make available a standard contract. Should the final rule not contain this requirement and in situations where an I/T/U pharmacy is not part of a plan's network, then plan enrollees should be exempted from differential cost-sharing requirements for accessing an out-of-network pharmacy. The final rule should also require prescription drug plans to offer to contract with all LTC pharmacies and make available a standard contract. Over 80% of nursing home beds are in facilities that require the resident to use a long-term care pharmacy. Should the final rule not contain this requirement and in situations where a LTC pharmacy is not part of a plan's network, then plan enrollees should be exempted from differential cost-sharing requirements for accessing an out-of-network pharmacy. Furthermore, CMS must ensure that persons who utilize specialized pharmacies, such as LTC, I/T/U, FQHC, rural, or clinic-based pharmacies are not penalized through higher cost-sharing for non-preferred pharmacies or through higher cost-sharing for out-of-network access.

§1860D-11(e)(2)(D) authority to review plan designs to ensure that they do not substantially discourage enrollment by certain Part D eligible individuals.
CMS should use the authority provided under section 1860D-11(e)(2)(D) to review plan designs, as part of the bid negotiation process, to ensure that they are not likely to substantially discourage enrollment by certain Part D eligible individuals. Previous experience with Medicare+Choice plans shows that private insurers use a variety of techniques to discourage both initial and continued enrollment in a plan by enrollees with more costly health care needs. For example, Medicare+Choice plans have offset reduced cost-sharing for doctors visits with increased cost sharing for services such as skilled nursing facility care, home health care, hospital coinsurance, and cost sharing for covered chemotherapy drugs that are utilized by people with chronic and acute care needs. CMS should thus analyze formularies, cost-sharing tiers and cost-sharing levels, and how cost-sharing (including both tiers and levels) is applied to assure that people with the most costly prescriptions are not required to pay a greater percentage of the cost of those drugs. CMS also needs to assure that a variety of drugs are included in a

formulary at the preferred cost-sharing tier to treat chronic conditions and conditions that require more costly treatments. As stated above, CMS must ensure that persons who utilize specialized pharmacies, such as LTC, I/T/U, FQHC, rural, or clinic-based pharmacies are not penalized through higher cost-sharing for non-preferred pharmacies or through higher cost-sharing for out-of-network access.

§423.120(a)(6) Level playing field between mail-order and network pharmacies.
The final rule should ensure that beneficiary out-of-pocket costs used for the purchase of covered Part D drugs count as incurred costs. A key principle of the MMA is that Medicare beneficiaries have convenient access to a local pharmacy. This principle is undermined by permitting plans to charge beneficiaries the cost differential for receiving an extended supply of a covered Part D drug through a network retail pharmacy versus a network mail-order pharmacy. However, notwithstanding this objection, the final rule should permit the cost differential charged to beneficiaries to count as an incurred cost.

§423.120(b) Formulary requirements.
We do not believe it is appropriate for the final rule to constrain prescribers' capacity to prescribe drugs for off-label uses. By not permitting a class to exist in the USP model guidelines solely because all commonly used medications are being used for off-label indications could lead plans to deny coverage for off-label uses. Off-label prescribing has become a common-and accepted-practice across the field of medicine. For example no drugs that are currently used in the treatment of lupus (a serious, life-threatening auto-immune disorder) have the treatment of lupus as an on-label indication. For the treatment of mania, certain anti-convulsants and calcium channel blockers have proven effective and certain anti-convulsants have proven effective for treatment of bipolar disorder, although these uses are not FDA-approved on-label indications. We thus oppose any provisions in the final rule that place new limits on the ability of prescribers to prescribe drugs for off-label uses-or that legitimize the denial of coverage for covered Part D drugs simply because they are used for an off-label indication.
We support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must be protected from tiered cost-sharing that could to these defined populations must be made available at the preferred level of cost-sharing for each drug. We recommend that this treatment apply to at least the following overlapping special populations: dual eligibles, institutionalized populations, persons with life-threatening conditions, and persons with pharmacologically complex conditions.

We recommend that if the final rule limits the notice requirements to persons directly affected by the change, then plans must be required to provide notice in writing, mailed directly to beneficiary, 90 days prior to the change, and the notice must inform the beneficiary of their right to request an exception and appeal a plan's decision to drop a specific covered Part D drug from their formulary. We also recommend that the final rule place strict limits on mid-year formulary changes, requiring plans to justify a decision to remove drugs from a formulary such as the availability of new clinical evidence indicating that a particular covered Part D drug is unsafe or contraindicated for a specific use or when all manufacturers discontinue supplying a particular

covered Part D drug in the United States. Should the final rule fail to effect such a restriction, plans should be required to continue dispensing all discontinued drugs until the end of the plan year for all persons currently taking a discontinued drug as part of an ongoing treatment regimen.

§423.124 Special rules for access to covered Part D drugs at out of network pharmacies.
The final rule must establish requirements on plans to dispense a temporary supply of a drug (wherever a prescription is presented, irrespective of whether or not it is at a network pharmacy) in cases of emergency. If the emergency situation involves a coverage dispute, the plan must dispense refills until such time as the prescription expires or the coverage dispute is resolved, through either a plan decision to provide coverage for the drug or through completion of the appeal process. This requirement must also specify that a temporary supply must be dispensed even in cases where beneficiaries are unable to pay applicable cost-sharing.

The final rule should also limit out-of-network cost-sharing to no more than the difference between the maximum price charged to any in-network Part D plan in which the pharmacy participates and the in-network price. While we recommend that this limitation apply in all circumstances, at a minimum, it must be applied through the final rule, to the scenarios described in the preamble to the proposed rule.

§423.128 Dissemination of plan information.

§423.128 (d) Provision of specific information.
It is essential that the final rule require all plans to provide 24-hours-a-day/7-days-a-week access to their toll-free customer call center. The management of the Part D prescription drug benefit is a serious issue that necessitates timely assistance and resolution of coverage issues. The implications of delayed access are potentially very serious. For this reason, notwithstanding concerns about the cost of making round-the-clock access available to their enrollees, this must be considered part of the cost of participating in the Part D program.

§423.128(e) Claims Information.
In addition to the required explanation of benefits elements in the proposed regulation, the explanation of benefits should also include information about relevant requirements for accessing the exceptions, grievance and appeals processes.

Subpart J-Coordination Under Part D With Other Prescription Drug Coverage

§423.464(e) Coordination with State Pharmaceutical Assistance Programs (SPAPs).

SPAPs and new SPAPs must be able to help beneficiaries 'fill in the donut,' and we appreciate CMS's efforts to coordinate this assistance. To assure that beneficiaries are receiving seamless coverage and not facing undue out of pocket expenses, an exchange of data between the PDP and the SPAP is necessary. This should include (but not be limited to) an exchange of eligibility files, exchange of claims payment and information about the drugs on the PDPs formulary and any changes to it. Also, AIDS Drug Assistance Programs (ADAPs) should be recognized as

State Pharmacy Assistance Programs and allowed to wrap around the Medicare Part D drug benefit.

Subpart M-Grievances, Coverage Determination, and Appeals

The proposed regulations fail to meet the requirements of the Due Process Clause of the Fifth Amendment to the United States Constitution. As interpreted by the United States Supreme Court, due process requires adequate notice and hearing when public benefits are being terminated. Medicaid recipients whose prescription requests are not being honored currently receive a 72-hour supply of medications pending the initial coverage request. They are entitled to notice, face-to-face hearings, and aid paid pending an appeal if their request is denied and they file their appeal within a specified time frame. All state Medicaid appeals processes are completed more expeditiously than Medicare appeals. The appeals process as described in Subpart M does not accord dual eligibles and other Part D enrollees with adequate notice of the reasons for the denial and their appeal rights, with an adequate opportunity for a face-to-face hearing with an impartial trier of fact, with an adequate opportunity to have access to care pending resolution of the appeal, or with a timely process for resolving disputes. While we recognize that the most efficient means of protecting enrollees, amending MMA to provide for an appeals process similar to Medicaid, is beyond the authority of CMS, CMS can take steps in the final regulations to improve notice and the opportunity for speedy review.

Sections 1860D-4(f), (g), and (h) require that Part D plan sponsors establish grievance, coverage determination and reconsideration, and appeals processes in accordance with Sections 1852(f), (g) of the Social Security Act. As will be discussed in more detail below, CMS has failed to comply with the language of those provisions. Overall, the incredibly onerous exceptions process does not comply with the statutory requirements or meet the basic elements of due process. In addition, CMS, in implementing Section 1852(c) and in settlement of *Grijalva v. Shalala*, 153 F.3d 1115 (9th Cir, 1998), *vacated and remanded*, 526 U.S. 1096 (1999), adopted 42 C.F.R. §422.626, which establishes the right to a fast-track, pre-termination review by an independent review entity. The proposed Subpart M fails to incorporate the same fast-track, pre-termination review for Part D. CMS needs to incorporate a similar process for Part D in order to establish a process in accordance with Section 1852(c). A similar fast-track process would also be more in keeping with due process requirements.

As a general comment, this entire subpart needs to be made much simpler. To have two tracks, depending on (1) whether one personally pays for a drug and files an appeal or (2) does not obtain the drug and files an appeal, is far too complicated. The time frames, paperwork, and processes should be simplified into one course of action that beneficiaries may hope to understand.

§423.560 Definitions.

This section defines "appeal" to exclude grievance and exceptions processes, and defines “authorized representative” as an individual authorized by an enrollee to deal with appeals. The definition of “authorized representative” needs to clarify that a doctor or representative, including a State Prescription Drug Plan (since the SPAP may be at risk in the event of PDP

actions) can be an authorized representative, and that authorized representatives can deal with exceptions and grievances as well as appeals.

§423.562 General provisions.

§423.562(b)(5)(iii)

Reconsideration by an Independent Review Entity (IRE) should be automatic, as in the Medicare+Choice plans

§423.562(c)(1)

This subsection precludes an enrollee who has no further liability to pay for prescription drugs from appealing. However, it is important to be able to appeal formulary changes. A comprehensive change in this limitation is essential to protect the health of beneficiaries. At a minimum, SPAPs should be able to appeal on behalf of an enrollee and the section should clarify that a low-income institutionalized individual can appeal a determination, even if she has no co-payment responsibilities.

§423.566 Coverage determinations.

§423.566(b) Actions that are coverage determinations.

This subsection needs to clarify further what constitutes a coverage determination. The proposed definition does not include in the list of coverage determinations from which an appeal can be taken a determination by the PDP that a drug is not a covered drug under Part D. An enrollee should be entitled to appeal to determine whether, in fact, a drug the plan claims is not covered under Part D is so covered. The definition should also clarify that denials of enrollment in a Part D plan, involuntary disenrollment from a Part D plan, and the imposition of a late enrollment penalty are coverage determinations subject to the appeals process. Finally, the regulation should state that the presentation of a prescription to the pharmacy constitutes a coverage determination. If the pharmacy does not dispense the prescription, then the request for coverage should be deemed denied, and the enrollee should be entitled to notice and to request a re-determination. Without such clarification, enrollees will not be informed of their rights, and the appeals process will become meaningless.

§423.568, Standard timeframes and notice requirements for coverage determinations.

§423.568(a) Timeframe for requests for drug benefits.

The plan should be required to provide oral notice as soon as it determines that it will extend the deadline for considering whether it will cover a drug, including notice of the right to request an expedited grievance. The oral notice should be followed-up in writing.

§423.568(b) Timeframe for requests for payment.

This section should be eliminated. There should be no distinction in time frames when an enrollee requests payment.

§423.568(c), Written notice for PDP sponsor denials.

Who gives notice? The proposed regulations place the responsibility for providing notice of a coverage determination on the plan sponsor. This presumes a situation in which the person presents a prescription, the pharmacy contacts the plan, and then the plan takes 14 days to decide whether or not to cover a drug. In reality, the pharmacy, in most instances, tells the enrollee that the plan will not cover the drug. Without notice provided by the pharmacy, most enrollees will not know to tell the pharmacy to submit the prescription anyway so they can get a notice from which to appeal. They also may not know or understand their right to seek expedited consideration of the initial coverage determination, or an exception if the drug is not on the formulary or on too high a tier. If the enrollee pays out of pocket and then seeks reimbursement from the plan, she will not be eligible for expedited consideration.

The regulations should require the plan sponsor to develop a notice explaining the right to seek a redetermination, and to ask for expedited review. The pharmacy should be required to give the notice to the enrollee. Any potential burden of such a requirement is reduced by the need to maintain electronic communications between the pharmacies and the plans in order to keep up-to-date with formularies, coinsurance, and calculations of an enrollee's out-of-pocket expenses.

The proposed regulations talk about using "approved notice language in a readable and understandable form." The regulations need to be more specific, including information about what is required to use the exceptions process. We suggest that notice should

Include information about exceptions and appeal rights immediately upon denial (including upon determination that a drug is not covered on formulary and including denials issued by the pharmacist), explain why coverage was denied and provide options in addition to the appeal procedures for obtaining necessary medications;

Include clinical or scientific basis for denial; and

Be available in multiple languages and note the availability of language services.

In addition, all notices need to be available in alternate formats to accommodate people with disabilities, and in languages other than English where a portion of the population is not English speaking. The requirements of plans and the rights of beneficiaries in this area must be spelled out in much more detail. There is also an overarching need to consider literacy problems and encourage simplicity.

§423.568(e) Effect of failure to provide timely notice.
It is nowhere spelled out how the beneficiary is apprised of this right.

§423.570 Expediting certain coverage determinations.

§423.570(a) Request for expedited determination.
CMS requests comments on who should be able to request determinations and re-determinations. An authorized representative should be able to request expedited consideration just as the authorized representative may request a coverage determination. In emergency situations, enrollees with mental health concerns and other vulnerable individuals may need someone else to act on their behalf.

§423.570(c) How the PDP sponsor must process requests.
All coverage determinations and appeals concerning drugs, including those in which the enrollee has paid for the drug, should be treated as requests for expedited review. An enrollee would suffer adverse consequences if required to wait for the longer time periods; many people will simply go without prescribed medications pending the outcome of the review. Doubling the timeframes and disallowing expedited review in cases when enrollees pay for their drugs out-of-pocket could adversely affect the health of those who forego other necessities like food and heat in order to pay for their medicine.

At a minimum, all requests for exceptions should be automatically given expedited consideration. Where someone seeks expedited review of a request to continue a drug that is no longer on the formulary, the plan should be required to process the request in 24 hours under the provision that requires an expedited review to be completed as fast as the beneficiary's condition requires. The enrollee should be given a 72-hour supply of the medicine, which is renewable if the plan decides to take longer than 72 hours. The medicine should be treated as an on-formulary drug.

If requests for an exception are not automatically treated as a request for expedited review, the rules should state that the doctor's certificate requesting expedited review and requesting an exception should be one and the same.

§423.570(d)(2)
A beneficiary should not have to wait for a written notice to learn of the right to file an expedited grievance and the right to resubmit a request with prescribing physician support.

§423.572 Timeframes and notice requirements for expedited coverage determinations.

§423.572 (b) Extensions of timeframe.
The timeframe (of 72 hours) can be extended by the plan up to 14 days on showing that an extension is in the interests of the enrollee. The regulations should be modified to read best interest of the enrollee and define interests of the enrollee to include those situations in which the drug plan seeks additional information to substantiate the enrollee's request, or when the enrollee requests additional time to gather supporting information. The regulations should also require the plan to inform the enrollee of the extension immediately, both orally and in writing, rather than "by the expiration of extension." Also, the written notice should include more than just the reasons for the delay.

There should be no extended time period for requests for payment of drugs already received. This imposes extreme hardship on low-income beneficiaries and those with multiple prescriptions who may choose to unnecessarily spend money on their medications because of the uncertainty and length of the appeals process rather than spend the money on other urgent necessities of life.
It is not clear from the proposed regulations what notice a beneficiary will receive when sometime during the year a plan changes its formulary and the drug(s) it covers. The statute says plans must make the change in information available on the internet, the Preamble discusses a

mailed notice, and the draft regulation simply says 'notice.' A change in formulary, or a change in the tiering of a drug on the formulary should be clearly explained to a beneficiary taking that drug which has been changed. That notice should be written notice and the receipt of that notice should serve as a trigger for the beneficiary's legal rights.

§423.572(d) Content of the notice of expedited determination.
See §423.568(c) comments above.

§423.572(e) Effect of failure to provide a timely notice.
How does a beneficiary know s/he can appeal the lack of timely notice?

§423.578 Exceptions process.
The proposed regulations do not explain how an enrollee will get notice about the exceptions process and/or that a drug is not included on the formulary. The only notice requirement is found in §423.120(b), which requires the plan sponsor to provide at least 30 days notice to CMS, affected enrollees, pharmacies, pharmacist and authorized prescribers before removing a drug or changing a drug's preferred or tiered status. Although the preamble talks about written, mailed notice, and the statute requires posting on the Internet, the regulatory language merely says that notice must be given.

To meet basic due process requirements concerning termination of benefits, the notice of the change must be in writing and must include an explanation of how to use the exceptions process, including the requirements for a doctor's certificate, the right to a hearing, and the reasons why a drug is not included on or removed from the formulary, or why the tier is changing, and the evidence required to establish an exception.

Proposed section §423.120(b) provides insufficient time for the notice, given the substantial burden placed on the enrollee to either get a new prescription or to gather the medical evidence. Many beneficiaries will not be able to get a doctor's appointment within 30 days, and many will not be able to change drugs without a medical evaluation. The final regulations should state that notice must be provided 90 days in advance of the change.

In addition, the exception process section should include a subsection on notice that (1) refers to §§423.120(b) and (2) requires plan sponsors to develop a notice that explains the exceptions process, the situations in which someone may seek an exception, and the information that is required to support an exception request, which the pharmacy will give to an enrollee who requests coverage for a non-formulary drug or requests to be assessed a lower cost-sharing amount.

§423.578 (a)(2).
This subsection fails to meet the statutory requirement that the Secretary establish guidelines for an exception process. The plan statutory language is not permissive; it does not say that plans may establish additional criteria if they wish. It says that the Secretary is to establish criteria and the plans are to abide by them. Plans should have no discretion whatsoever. The fact that they may establish differing tiered structures is not relevant to the statutory right to request an

exception to whatever structure they devise. In fact, the flexibility accorded to plans is why beneficiaries need strong guidelines to protect their interests.

Where the proposed regulations include guidance for criteria, the criteria listed exceed the scope of the statute. The proposed regulations list a "limited number of elements that must be included in any sponsor's exception criteria," but this list includes criteria that do not apply based on the statutory provision that states an exception applies if a physician determines that a preferred drug would not be as effective or would have adverse effects or both.

The proposed rules also fail to provide adequate guidance to physicians concerning whether the standard requiring the doctor to certify that a preferred drug would not be as effective or would cause adverse effects has been met.

The final regulation should require that the lowest co-pay that applies should apply to drugs for which an enrollee has won an exception to the tiered cost-sharing structure. That's the whole point of this process - to infuse some equity upon a showing that none of the other medications covered are as effective or may cause harm.

The final rule should also include the following omitted criteria: regulations permitting continued access to a drug at given price when there is a mid-year formulary change, and regulations requiring sponsors to give enrollees an opportunity to request exceptions to a plan's tiered cost-sharing structure other than on a case-by-case basis.

§423.578(b) Request for exceptions involving a nonformulary drug.
This subsection fails to meet the statutory requirement that the Secretary establish guidelines for an exception process. In the preamble, CMS states that "[r]equiring sponsors to use an exceptions process to review requests for coverage of non-formulary drugs will create a more efficient and transparent process and will ensure that enrollees know what standards are to be applied" and will help ensure these formularies "are based on scientific evidence rather than tailored to fit exceptions and appeals rules for formulary drugs ." However, the proposed regulations give drug plans complete discretion in determining the criteria they will use to determine exceptions requests. In addition, independent review entities "would not have any discretion with respect to the validity of the plan's exceptions criteria or formulary." By failing to adequately define the criteria plans may use to consider exceptions requests or provide any meaningful oversight over these criteria, these proposed regulations would not ensure that formularies are based on scientific evidence and would not establish a transparent process. The regulations as written subvert CMS's stated goals.

The proposed rules set an impossibly high bar for receiving an exception by requiring prescribing physicians to produce clinical evidence and medical and scientific evidence to demonstrate that the on-formulary drug is likely to be ineffective or have adverse effects on the beneficiary. Clinical trials generally do not include older people, people with disabilities and people with co-morbidities. While some such evidence does exist, it has not been developed for all drugs and conditions. However, a physician may have extensive experience treating these kinds of patients with the condition or illness at issue and this experience should be given at least

equal weight in making such determinations. In fact, the statutory standard requires deference to the doctor's determination that all on-formulary medications would not be effective or cause adverse consequences. This required deference is not reflected in the proposed rules. It is also important that the final rules recognize the existence of individual differences in reactions to the same drug and that exceptions be available to someone who can not tolerate or who does not benefit from a drug even though that drug is beneficial to most people.

The NPRM proposes to authorize plans to require a long list of information in the written certification from the prescribing physician that an off-formulary drug is needed. This list is overly long and repetitive and may encourage drug plans to establish burdensome paperwork requirements as a hurdle to prevent physicians and consumers from following through on an exceptions request. Moreover, this proposed rule also leaves the required contents entirely up to the plan's discretion by including the catch-all phrase - "any other information reasonably necessary". The requirements for this written certification should be standardized to facilitate use of the exceptions process by providers and consumers. These standards would also help achieve CMS's stated goal of establishing a transparent process.

An important provision was left out of the requirements for receiving a dosing exception. The proposed rule states that in order to receive an exception, the physician must demonstrate that the number of doses available is likely to be ineffective or adversely affect the drug's effectiveness or patient compliance. This rule must also allow exceptions if the prescribing physician demonstrates that the number of doses available would cause an adverse reaction or harm to the enrollee - as provided in the proposed rules for other kinds of exceptions requests.

The final regulation should clarify that formulary use includes not just dose restriction, but the format of the dosage (liquid vs capsule, etc.) and packaging, such as bubble wraps for long-term care facility residents.

§423.578(c)(2) When a sponsor does not make a timely decision.
The regulation provides for a one month's supply of a drug, but only if the plan does not act timely on an exceptions determination. If the request for an exception is not given expedited treatment, the sponsor can take two weeks to issue a decision, meaning the enrollee would wait two weeks before getting the supply of medicine. Even if the exception is treated as a request for expedited review, the enrollee would still have to wait 72 hours (unless s/he could show the decision needed to be made more quickly because of her/his condition.) Most people wait to the last minute to refill a prescription, often because of drug plan and pharmacy restrictions.

It is also unclear how an enrollee knows about these rights when a sponsor does not make a timely decision.

The enrollee should be entitled to a one month's supply upon presenting the request for a refill and upon presenting a new prescription for a non-formulary drug. Plans should be required to make exception determinations and notify the enrollee in 24 hours as required under Medicaid for prior authorization determinations. 42 U.S.C. §1386r-8(d)(5)(A).

We cannot overemphasize the importance of drug coverage and ensuring no gaps in the intake of medication. In mental health and HIV/AIDS, for example, it is essential that medications be available quickly and without interruption. In the HIV/AIDS sector, for example, consistent research proves that the risk of drug resistance and resulting treatment failure significantly increases with each missed dose of therapy.

423.578(c)(3), When an exception request is approved.
The lowest coinsurance amount should apply anytime an enrollee wins an exception through this process because the drug at issues has been determined medically necessary with no on-formulary drug as a suitable alternative. The exception for the non-formulary drug thus meets the criteria for an exception to the tiered cost-sharing structure as well.

The regulation needs to clearly set forth the requirement that notice be provided when a decision is made on an exception request. The notice should explain that the decision is a coverage determination and explain the appeal rights that are available.

We commend CMS for specifying that, once an exception request is granted, a plan sponsor may not require the enrollee to keep requesting exceptions in order to continue receiving the drug. However, we are concerned that the "exception" to this protection which allows the plan to discontinue a drug if safety considerations arise, is too broad. The final regulation should be revised to permit reversal of a previously granted exception only if the FDA determines that the drug is no longer safe for treating the enrollee's disease or medical condition.

We are concerned that the timeframes for exceptions determinations are far too long. Mirroring the timeframes for plan determinations, these proposed provisions raise similar concerns. It is extremely unfair to require longer time frames if a beneficiary has paid out of pocket for a needed medication when their alternative would be to wait two weeks to a month for a determination or an emergency one-month supply of the needed drug. Beneficiaries' health and safety may well be at risk if they are forced to forego other necessities because of the added, and most likely very significant, expense of paying out of pocket for their medicines. Although the proposed regulations include some provisions for an emergency supply of medications while a plan is considering an exceptions request, it is unreasonable and bad health policy to make beneficiaries wait two to four weeks before the drug plan must provide an emergency supply. In addition, plans should be required to demonstrate that an extension of the standard time frame for exceptions determinations is in the best interest of the enrollee and the final rule must charge independent review entities with exercising oversight over these extensions. Plans should be required to make determinations regarding exceptions requests and notify the enrollee of these determinations in 24 hours as required under Medicaid for determinations regarding prior authorization requests (42 U.S.C. 1396r-8(d)(5)(A)).

§423.580 Right to a redetermination
The proposed regulations only authorize an enrollee or an enrollee's prescribing physician (acting on behalf of an enrollee) to request a redetermination or an expedited redetermination. The enrollee's authorized representative must also be allowed to request a redetermination and an expedited redetermination. Since the proposed regulations would allow an enrollee's authorized

representative to file a request for Determinations and Exceptions, it does not make sense to not allow an enrollee's representative to pursue a claim further through the redetermination, reconsideration, and higher levels of appeal. In fact, the proposed regulations define an authorized representative as an individual authorized to act on behalf of an enrollee "in dealing with any of the levels of the appeals process".

§423.584 Expediting certain re-determinations.
The regulations need to describe in detail the notice responsibilities for both standard and expedited re-determinations, including what must be provided in the notice. This is crucial, given that the next level of review to the IRE is not automatic, as it is with Medicare Advantage plans. The notice should explain the reason for the denial, including the medical and scientific evidence relied upon, the right to request review, or expedited review, to the IRE, including timeframes and the right to submit evidence in person and orally.

§423.584(a) Who may request an expedited redetermination.
See §423.580 regarding allowing an individual's authorized representative to request an expedited re-determination.

§423.584(d)(2).
The information in the letter should also be provided orally. The enrollee should not have to wait three days for this information.

§423.586 Opportunity to submit evidence.
The regulations should establish clear criteria for informing the enrollee and the physician that they can submit evidence in person, as well as clear procedures for in-person review.

§423.590 Timeframes and responsibility for making redeterminations.
The regulation should be amended so that a plan can only extend the timeframe for a re-determination if requested to do so by the enrollee, or if the plan can demonstrate that the extension is in the best interest of the enrollee (for example, the plan needs to obtain additional information to support the enrollee's request). As previously stated, all re-determination requests, and particularly those involving exceptions, should be treated as expedited, and plans should not be given more time to resolve re-determination requests involving payment requests.

§§423.590(c) Effect of failure to meet timeframe for standard redetermination and (e) Failure to meet timeframe for expedited redetermination.
Again, how does enrollee know this and know what to do?

§423.600 Reconsideration by an independent review entity (IRE).
CMS needs to clarify in the final regulations that the role of the IRE is to provide independent, de novo review, especially in regard to the exceptions process. The preamble states that "…The IRE's review would focus on whether the PDP had properly applied its formulary exceptions criteria for the individual in question…..the IRE will not have any discretion with respect to the validity of the plan's exceptions criteria or formulary." If the IRE does not review all the

evidence and issue a reconsideration decision based on its own analysis, then enrollees will be denied independent review, and the requirements of due process will not have been met.

Further, because, as noted above, CMS is required by the statute to set standards for the exceptions process, the IRE must have authority to determine whether the PDP's exceptions criteria comply with the statute. Otherwise, enrollees will have no mechanism for review of arbitrary and improper standards.

Since the Part D process is supposed to follow the MA process, the regulations should follow the MA regulations and require that denials automatically be sent to the IRE for reconsideration. The regulations as written create a barrier to the first level of independent review for enrollees who have difficulty following the complicated process. We dispute CMS's statement in the preamble that many of the drug appeals will involve small monetary amounts. Rather, most will involve medications for chronic conditions that enrollees take on an on-going basis; the yearly sum of the cost-sharing will be quite substantial, especially considering the income level of most people with Medicare. In addition, by requiring the enrollee to file a request for ALJ review, the first truly independent review available, CMS can satisfy the statutory requirement that the enrollee files the appeal.

If the final regulations continue to place the burden of requesting a reconsideration on the enrollee, they need to clarify that an authorized representative can act on the enrollee's behalf. Again, without such clarification, enrollees who lack the capacity to file a reconsideration request will be denied their due process rights. In addition, the prescribing doctor should also be permitted to request a reconsideration, especially since the enrollee needs the doctor's statement in order to request IRE review of an unfavorable exception request.

Finally, the enrollee should be allowed to request a reconsideration orally, especially where the request is for an expedited review.

§423.600(b).
We are pleased that CMS is requiring the IRE to solicit the view of the treating physician. We believe the IRE should also be required to solicit the view of the enrollee. However, because in our experience the MA independent contractor is often reluctant and unwilling to accept the views of and evidence from the beneficiary, the final regulation needs to be more specific. The regulation needs to specify how this will occur, including contact by telephone, email, or face-to-face meeting.

§§423.600(d).
The regulations need to establish a set timeframe by which the IRE must issue its decision in order for this process to be transparent. Enrollees will have no knowledge of the contract between CMS and the IRE and thus will not know how long they will have to wait for a reconsideration decision. Also, if contractual, the time frame can change with each new contract, putting enrollees at greater risk of adverse health consequences from being denied needed medicines. The regulation should also state that an enrollee may appeal to an ALJ if the IRE fails to act within the regulatory time frame and how the enrollee will be apprised of this right.

§423.602 Notice of reconsideration determination by the independent review entity.
The language concerning what the notice must entail is ambiguous. The notice must "inform the enrollee of his or her right to an ALJ hearing if the amount in controversy meets the threshold requirement under 423.610." Does this mean that the notice tells you that you can go to an ALJ, but only if your claim is large enough? Or does this mean the IRE only has to tell you about your right to an ALJ hearing if your claim meets the threshold amount? The latter interpretation is problematic for several reasons, including the fact that you can aggregate claims. The final regulation should state that the notice must inform the enrollee of his or her right to an ALJ hearing, and the procedure for requesting such a hearing, including the dollar amount required to request a hearing.

§423.610 Right to an ALJ Hearing.
Congress recognized the special needs of the low income, and how even small copayment amounts can cause many lower income individuals to forgo filling prescriptions. We urge CMS to provide exceptions to the ALJ threshold requirements for those receiving the Medicare subsidy. For example, the amount at controversy for a lower-income individual could be deemed to be the amount that would be at controversy if the individual were a non-subsidy eligible individual receiving the standard benefit.

It is unclear what §423.610(c) intends when it says, "Two or more appeals may be aggregated by the enrollee… if (I) the appeals have previously been reconsidered by an IRE…" Does this mean that an enrollee will have to file a new appeal each month for a prescription to treat an on-going chronic condition? Such a requirement would be unduly burdensome for enrollees, drug plans, the IRE, and the ALJs. The final regulation needs to clarify that when the plan denies coverage, in order to satisfy the jurisdictional amount an enrollee should be able to add up the cost of the medicine for a year, if the medicine treats an on-going chronic condition, or for the number of refills authorized if the underlying condition is not chronic.

Subsection (ii) says the request for the hearing must list all of the appeals to be aggregated and must be filed within 60 days after all of the IRE reconsideration determinations being appealed have been received. If you are consolidating appeals, and the first denial is in April and the last one you need to get to the jurisdictional amount is in August, will you still be timely? Or does it have to be 60 days from the first denial in April?

§423.612 Request for an ALJ Hearing.
The regulation should specify that, if an appeal is filed with the PDP, the PDP must submit the file to the IRE within 24 hours of receipt of the request, and the IRE must transmit the file to the ALJ within 24 hours. Our experience is that, without set time frames, some current reviewing entities take long periods of time, adding to the delay in the processing and resolution of ALJ appeals.

The regulations also need to require the IRE to include all of the information in the file, such as doctor's statements, statements by the enrollee, and any other evidence submitted by the enrollee, including information not relied upon in making its decision. It has been our experience that

contracting entities, including MA plans, often omit evidence submitted by the enrollee when transferring a file to the ALJ or other level of review.

§§423.634, Reopening and revising determinations and decisions and 423.638 How a PDP sponsor must effectuate expedited redeterminations or reconsidered redeterminations.
Subsection (c) in both of these draft regulations allows the PDP to take up to 60 days to implement a reversal by the IRE, an ALJ, or higher. That's totally unacceptable, since further delays may cause increased health consequences to people who have foregone medication pending appeal. Favorable decisions should be implemented in the same 72 hour time period as reversals at earlier levels of review.

Subpart P - Premiums and Cost-Sharing Subsidies for Low-Income Individuals

§432.772 Definitions.
"Family size." We support defining family members as relatives in the household receiving at least half of their support from the applicant or applicant's spouse. In order to minimize burdens on beneficiaries, the regulations should specify that applicants will be able to self-attest to the status of dependents, without providing further documentation.

"Full subsidy eligible individuals." The definition should refer to the language of §§423.773(b) and(c), in order to avoid ambiguity.

"Income." The definition should make clear that income not actually owned by the applicant, even if his or her name is on the check, should not be counted.

"Institutionalized individual." The definition should include those individuals eligible for home and community based services under a Medicaid waiver (see, e.g., definition of "institutionalized spouse" at 42 U.S.C. § 1396r-5(h)(1)(A)), since those individuals must meet the acuity standards for Medicaid coverage in a nursing facility, and should include individuals in ICF-MRs and individuals in any institution in which they are entitled to a personal needs allowance.

The definition should not include the language "for whom payment is made by Medicaid throughout the month" since an individual could conceivably be a full benefit dual eligible recently returned from a hospital stay whose nursing facility stay would be paid for by Medicare Part A for the entire month. Even though in that month all their drugs are likely to be paid for by Medicare Part A, as a practical matter, for continuity and minimum disruption, they should not lose their status as an "institutionalized individual." The same reasoning should apply to a full benefit dual eligible individual who might be hospitalized during an entire month, during which their entire stay would also be paid for by Medicare Part A.

"Personal representative." The portion of the definition that permits an individual "acting responsibly" on behalf of an applicant needs further clarification as to who would determine that the individual is acting responsibly and what circumstances would constitute a per se conflict of interest.

"Resources." We support the limitation of countable resources to liquid assets. However the definitions of liquid assets and what it means to be able to be converted into cash in 20 days need to be clarified. The final rule should include a specific list of countable resources to promote clarity for state and beneficiaries. Resources should not include burial plots, burial funds or life insurance of any value, nor should it include any officially designated retirement account, such as an IRA, 401(k), 403(b) etc. Alternatively, the respective exclusions for the value of life insurance and burial funds should be increased to a reasonable amount, such as $10,000 per asset. Most potential low-income beneficiaries have assets below this level.

Excluding these resources will ease the application process for consumers and eligibility workers, as well as reduce administrative costs by reducing the time and effort required to verify assets. This is consistent with both Congress's and CMS's intent. Resource assessments should not include any consideration of transferred assets, as would otherwise be required under SSI rules.

We note that a current draft of the SSA application for the low-income subsidy inquires whether an applicant has life insurance with a face value of $1,500 or more. CMS must ensure that any proposed SSA application is harmonized with these rules on assets and income. As noted above, life insurance should not count towards assets, and this question should be eliminated.

§423.773 Requirements for eligibility.
We support the proposal to make dual eligibles (both full dual eligibles and those in Medicare Savings Programs (MSPs)) automatically eligible for the low-income subsidy. As we explain below, however, we believe a great deal more specificity is needed in this section. We are particularly concerned that the proposed rule leaves room for ambiguity regarding these beneficiaries' status. We believe that the proposed eligibility rules for partial dual eligibles will result in inequities and confusion. In addition, the draft regulations do not adequately explain how low-income beneficiaries are to be notified about their eligibility, nor do they explain how prescription drug plans are to determine which beneficiaries are enrolled in the low-income subsidy. The proposed rules also do not adequately protect low-income beneficiaries whose enrollment is delayed or is processed erroneously.

§423.773(a) Subsidy eligible individual.
Although the statute defines a subsidy eligible individual as one enrolled in a Part D plan, the requirement in Subpart S that states take applications for the low-income subsidy beginning July 1, 2005, before Part D plans are available to be enrolled in makes it clear that CMS believes people should be able to apply for the low-income subsidy without being enrolled in a Part D plan. This is actually imperative, as otherwise, an individual would be forced to pay a plan premium that the subsidy, in fact, pays for them. The subsidy eligibility determination would be done "conditionally" - conditioned upon the individual enrolling in a Part D plan. The regulations should reflect this reality and clearly direct both SSA and state Medicaid programs determining eligibility that the individual can both apply and be determined subsidy eligible before she or he has enrolled in a plan

§423.773(b) Full subsidy eligible individual.

The indexing of resources should indicate that rounding is always up to the next multiple of $10.

§423.773(c) Individuals treated as full subsidy eligible.
This section should conform to Subpart S § 423.904(c)(3) which requires states to notify all deemed subsidy eligible individuals of their subsidy eligibility. It should specify that the notice must be given by July 1, 2005 for those individuals eligible at that time. For those who subsequently become eligible, notice should be given at the same time the individual is notified of their eligibility for the benefit that qualifies them to be treated as a full subsidy individual. The notice should make clear to individuals what they need to do to use their subsidy, and should direct them to a source for information, counseling and assistance in choosing a Part D plan. For those who will lose Medicaid coverage January 1, 2006, the notice should explain their appeal rights as well. Individuals should also be told of their right to appeal the level of subsidy to which they are entitled.

Section 209(b) states and non-1634 states must coordinate with the Social Security Administration to determine how to provide notice to SSI recipients who are not receiving Medicaid and who therefore do not appear on the state's Medicaid rolls.

§423.773 states that both full benefit dual eligibles and MSP beneficiaries are eligible for the low income subsidy, but it does not explicitly state that these beneficiaries are automatically enrolled in the subsidy program. The regulations should be absolutely clear that an individual treated as full subsidy does not have to take any further action with respect to the subsidy (i.e., make application or in any other way verify their status), but only to enroll in a Part D plan. This will help smooth the transition from Medicaid drug coverage for dual eligibles, and should improve participation for others.

§423.773(c)(3).
We support the decision reflected in this proposed subsection to deem MSP beneficiaries automatically eligible for the low-income subsidy. We are concerned, however, that inequities and confusion among beneficiaries may result because SSA will not apply the more generous income and asset MSP eligibility rules in place in some states (for example, Alabama, Arizona, Delaware, and Mississippi, which have eliminated consideration of assets for MSPs). Eligibility requirements should be the same for all subsidy-eligible individuals in a state, regardless of where and how they apply. Under the proposed regulations, in states that have adopted less restrictive income and asset methodology, people whose assets or income are slightly above the limits set in § 423.773 would be enrolled in a less generous subsidy, or have their application rejected entirely, if they apply directly through SSA, because SSA will apply the national guidelines proposed in §423.773. However, the same people would have their application accepted if they applied through their states' Medicaid offices, were screened and then enrolled in an MSP, and were then automatically eligible for the low-income subsidy.

To resolve this problem, we propose that SSA apply state-specific income and asset eligibility rules in determining eligibility for the low-income subsidy, an option discussed, though rejected, in the preamble. This means that for applicants from states that have eliminated the asset test or

increased disregards under §1902®)(2) for MSP eligibility, SSA should apply the state's rules to determine eligibility. This option is permitted under §1860D-14(a)(3)(E)(iv) of the statute.

Alternatively, the regulations should provide that subsidy applicants who appear to have excess assets or incomes would either be screened by SSA for eligibility in an MSP program, or have their applications forwarded to the state Medicaid agency to be screened for MSP eligibility. States would be precluded from requiring beneficiaries to resubmit information, such as income and asset levels, that they have already provided to SSA. Applicants would be enrolled in the appropriate MSP program, and then be enrolled in the appropriate low-income subsidy under proposed § 423.773(c). Adopting this policy, which is not precluded by statute, will ensure that all subsidy applicants are treated equitably, as well as increase participation in MSPs.

As part of this alternative policy, the low-income subsidy application should allow an applicant to opt out of screening and enrollment for an MSP, as some applicants may not wish to participate in an MSP. Under §1860D-14(a)(3)(v)(II) of the statute, beneficiaries who are determined eligible for MSPs may be enrolled in the low-income subsidy. There is no requirement that beneficiaries actually enroll in an MSP. Therefore, applicants who meet eligibility requirements for an MSP, but who decline to enroll in the program, should still be automatically eligible for the low-income subsidy.

Because enrollment in an MSP can affect the amount of assistance a beneficiary may receive through other public assistance program, such as Section 8 housing vouchers or food stamps, there will be a profound need for beneficiary counseling during the enrollment process. We recommend that CMS plan for this need by making funds available to local agencies, including state health insurance assistance programs (SHIPs), and other community-based organizations.

This draft regulation states that a state Medicaid agency must notify full benefit dual eligibles that they are eligible for the low-income subsidy and should enroll in a Part D plan. The regulations do not state, however, when this notice should be issued, or what the notice should say. Consistent with our comments above and those accompanying 423.904(c)(3), the notification should be sent to beneficiaries on or near July 1, 2005, when states will have made the automatic eligibility determinations.

We also suggest that CMS develop model notices based on input from beneficiaries, which would explain the purpose of new subsidy simply and clearly. The notice should make clear to individuals what they need to do to use their subsidy, and should direct them to a source for information, counseling and assistance in choosing a Part D plan. It should also explain as simply as possible what level of subsidy the beneficiary will receive, and the beneficiary's appeal rights if she believes the subsidy level is in error.

The draft regulation fails to address eligibility issues for Medicaid beneficiaries who become eligible after a spenddown period, either under a medically needy program or in a 209(b) state. These beneficiaries should be informed of their likely eligibility for a low-income Medicare subsidy and given an opportunity to enroll. When they have met their spenddown, they should be informed of their entitlement to a lower co-payment, if applicable, as a deemed subsidy eligible.

Our recommendations for redeterminations of these beneficiaries are discussed below, in §423.774.

§423.773(d) Other subsidy eligible individuals.
The indexing of resources should indicate that rounding is always up to the next multiple of $10.

§423.774 Eligibility determinations, redeterminations, and applications.

§423.774(a) Determinations of whether an individual is a subsidy eligible individual.
This subsection provides that determinations of eligibility for the subsidy are to be made by state Medicaid agencies or by SSA, depending on where an individual applies. We believe that in order to ensure prompt enrollment in both the subsidy and ultimately in a plan, the regulations should specify that a determination notice must be sent to the applicant no later than 30 days after the application is filed. Because determinations for the low-income subsidy should be a simple process, very little time should be required to render a decision. Both SSA and states should be required to notify CMS with 24 hours of a individual being determined eligible for the subsidy.

§423.774(b) Effective date of initial eligibility determination.
In order to avoid delays in the ability of beneficiaries to use their subsidy benefits while their application is pending, the final rule should offer beneficiaries the option of applying through a presumptive eligibility system. Such a system would be especially helpful to beneficiaries who have enrolled in a Part D plan but are not yet receiving the low-income subsidy. Applicants can complete a short form at a provider's office or other location in which they declare their family size, income and assets. If their income and assets are below the relevant eligibility levels, they are found presumptively eligible. Applicants may still be required to complete a full application within a prescribed period of time (typically 30 to 60 days) if additional information is required. In the meantime, however, beneficiaries are given temporary cards that they can present to health care providers and receive services immediately. Experience has shown that the error rate for these enrollment systems is very low. In the rare cases where beneficiaries are later found ineligible, they and their providers are held harmless for the benefits they receive during the presumptive eligibility period.

Applicants for the low-income subsidy could be found presumptively eligible at state Medicaid offices, SSA offices, pharmacies, or other providers. If the low-income subsidy application form is simple enough, applicants could complete the form itself and self-attest to their income and assets. If they appear to be eligible, they would be enrolled in the appropriate subsidy while their application is processed. They would receive some form of temporary certification stating that they have been presumptively enrolled, which their pharmacy would accept while their application is processed. Such a system would encourage beneficiaries to apply, as they would be able to see the benefits of the system immediately.

§423.774(c) Redetermination and appeals of low-income subsidy eligibility.
There should be a provision for prompt reconsideration of a subsidy eligibility determination, for beneficiaries who believe they have either been erroneously denied eligibility or approved for the

wrong subsidy category. The provisions applying the appeal rules of state Medicaid plans or SSA do not provide for a prompt reconsideration process. Because obtaining prescription drugs is so vital, and especially because low-income beneficiaries are unable to pay the costs of their prescription drugs out of their own pockets, a quick reconsideration process is essential.

The draft regulation refers to redeterminations and appeals under the state Medicaid plan. This is inadequate, as frequent redeterminations in place in some states will cause some beneficiaries to drop out of the program. To maximize enrollment, the rule should establish that all determinations are for one year, per the Secretary's authority under the statute. We also urge CMS to adopt an annual, passive, and simple redetermination for all beneficiaries, whether they have enrolled through SSA or states. Should it be necessary, the Secretary should direct the Commissioner of SSA to create such a system. Under a passive redetermination system, beneficiaries would be sent a statement of the relevant information on file and asked to respond only if any of that information had changed over the year. If they do not respond, their coverage would continue unchanged for another year.

If states are not required to adopt passive redeterminations, we urge that redeterminations be made as they are under the state's MSP programs, or under the most passive, simplified redetermination process used for any category of coverage under the state plan.

§423.774(d), Application requirements.
This section should make clear to both states and SSA that no documents should be required of the individual as long as the applicant authorizes the agency to verify information from financial and other institutions. Documentation production should be only the absolute last resort.

Also, as we mentioned in our comments to §423.773 above, the proposed rule does not address eligibility determinations and recertification periods for Medicaid beneficiaries who become eligible after a spenddown period, either under a medically needy program or in a 209(b) state. Once beneficiaries become deemed subsidy eligible individuals by completing their spenddown, they should retain that status for a full year, until their next redetermination for the low-income subsidy, regardless of whether they go off Medicaid. Otherwise, individuals who go in and out of medically needy status, depending on the length of their state's budget period, will have extremely confusing changes regarding their Medicare low-income drug subsidy.

§423.800 Administration of Subsidy.

§423.800(a), Notification of eligibility for low-income subsidy.
We are concerned that there is no provision in §423.800(a) specifying a time period by which CMS must notify a plan that an enrollee is eligible for a subsidy. This is an essential step in the process, because without the subsidy, prohibitive costs will prevent low-income beneficiaries from using their Part D benefits. We propose that CMS be required to inform Part D plans of beneficiaries' enrollment in the subsidy no later than 24 hours after the application for the subsidy is approved. As this will likely be an electronic notification, it should not be burdensome. It is vital that plans know which beneficiaries are enrolled in the subsidy, so that these low-income beneficiaries do not have to pay the full cost of their prescriptions while their subsidy application is process.

§23.800(e), Reimbursement for cost sharing paid before notification of eligibility for low-income subsidy.
The draft reimbursement provisions are inadequate to protect low-income beneficiaries. The proposed regulation would require plans to reimburse low-income beneficiaries for excess copayment and premium amounts made after the effective date of the subsidy application. This is not a realistic solution to the problem facing beneficiaries who have prescription drug needs before their Part D plans are notified that the beneficiaries are subsidy-eligible and need to have their records adjusted accordingly. Low-income beneficiaries will not be able to afford to pay these costs out of their own pockets with the expectation of being reimbursed later. Instead, these beneficiaries will forego prescription drug coverage until their plan processes their subsidy, making the first month or more of their subsidy period meaningless.

Adoption of a presumptive eligibility system recommended above would alleviate this problem. As an additional alternative, the regulations should provide that beneficiaries may present their notice of approval for the subsidy to their pharmacy when they seek prescription drugs. Pharmacies should accept this notice as adequate to relieve the beneficiary from making a co-payment, and instead seek reimbursement for the beneficiary's plan.

Subpart S - Special Rules for States - Eligibility Determinations for Subsidies and General Payment Provisions

§423.904 Eligibility determinations for low-income subsidies.

§423.904(a) General Rule.
This subsection should cross reference the entire Subpart P, or, at a minimum the definitions included in §423.772.

§423.904(b) Notification to CMS.
The rule should direct states to notify CMS of eligibility determinations within 24 hours of making them, as we previously recommended with respect to SSA determinations.

§423.904(c) Screening for eligibility for Medicare cost-sharing and enrollment under the State plan.
The proposed regulation regarding states' obligations to screen subsidy applicants and offer them enrollment in Medicare Savings Programs ("MSPs") are inadequate. In particular, the regulation should specify what "offer enrollment" means. We believe an applicant must be offered the opportunity to enroll during the same visit or contact (in office, by phone, or by mail), without providing any further documentation or completing any additional forms. Only if enrollment is easy and convenient will Congress's intent of increasing participation in MSPs be accomplished. Furthermore, because under the current rules, enrollment in an MSP may be the only entry into the subsidy for some beneficiaries, a quick and easy application for MSP programs is essential. As written, the regulation would permit states to say they have "offered enrollment" simply if they tell applicants that they might be eligible for an MSP and may return another time to complete another application form if they wish to apply. Such an outcome would defeat the

purpose of the screen and enroll provision included in the new §1935(a)(3) established in §103(a) of the statute. Instead, as proposed in our comments to Subpart P, the low-income subsidy application should include an "opt-out" provision, under which qualified applicants would be enrolled in an MSP unless they affirmatively decline to do so. This provision would explain that enrollment in an MSP may be another way to qualify for the low-income subsidy.

As we explained in our comments to Subpart P, because enrollment in an MSP may affect receipt of other public benefits, there is a tremendous need for good quality counseling of beneficiaries. In addition, in order to ensure that enrollment requirements between MSPs and the low-income subsidy are aligned, states should not be permitted to pursue estate recoveries against MSP beneficiaries. Such recoveries are not cost-effective and can deter beneficiaries from enrolling. Any information provided to beneficiaries about MSP enrollment should tell applicants whether they will be subject to estate recovery if they enroll in an MSP.

In the interest of further aligning eligibility rules for MSPs and the low-income subsidy and easing administrative burdens, we suggest that CMS direct states to apply the definitions of resources used in Subpart P, §423.772, in making their resource determinations for MSP applicants.

In addition, should CMS adopt a policy, as has been discussed publicly, under which most subsidy applications to state Medicaid agencies would be forwarded to SSA for the actual eligibility determination, the regulations should be clear that the screening for MSP eligibility must take place prior to the processing of the applications to SSA. Potential beneficiaries should not have to wait to be screened and offered enrollment in MSPs. Furthermore, an individual cannot be told, by either SSA or the state that she or he is ineligible for the low-income subsidy until MSP eligibility has been determined (if the individual wishes). It would be incredibly confusing for an individual to receive a notice from SSA that she is ineligible for a subsidy, have her MSP eligibility determined by the state, then receive a notice from the state that she is eligible for both MSP and the subsidy. Whatever the mechanics, the individual must be told that MSPs are a route to subsidy eligibility.

Finally, as we discussed in our comments to §423.773, SSA should also screen subsidy applicants for eligibility in MSPs as well, and develop a system with states to enroll eligible beneficiaries. Applicants should not miss out on the opportunity to enroll in MSPs because they apply through SSA rather than state Medicaid offices. The same concerns about beneficiary education and estate recovery discussed above apply to enrollment through SSA.

The regulations should also ensure that beneficiaries are screened for eligibility for full Medicaid and offered enrollment if they qualify, consistent with 42 C.F.R. §435.404. Ideally, all subsidy applicants would be screened for Medicaid, and offered enrollment if they qualify. Because the importance of maintaining a simple application process for the subsidy is paramount, CMS may wish to consider using a simple screening process based on information obtained through the subsidy application. This screening would trigger a follow-up with applicants who appear to be eligible for full Medicaid.

Many Medicare beneficiaries who are eligible for a low-income subsidy under the Part D Program will also be eligible for other important benefits. Some of these benefits, such as food stamps, are also administered by states and have eligibility rules that very closely correspond with the new eligibility rules for the Part D subsidies. Historically participation by seniors and people with disabilities in these programs has been low, despite the fact that the benefits that low-income Medicare beneficiaries would be able to receive could help them struggle less to make ends meet every month. The Part D enrollment process offers an historic opportunity to connect Medicare beneficiaries to these other programs.

Beyond saying that applications may be filed either with a State's Medicaid program or with SSA, the proposed rule has very little detail about how the application process is likely to work. We urge CMS to specify that the new eligibility process should dovetail with other programs so that low-income Medicare beneficiaries can be enrolled as seamlessly as possible in all the state- or SSA-administered benefits for which they qualify

423.904(d)(3)(ii), Cost-effectiveness of information verification.
This section should be modified to permit states to use the verification process established by the Social Security Administration to verify the income and assets of people who apply for a Part D subsidy through a state Medicaid agency.

PART 403-SPECIAL PROGRAMS AND PROJECTS

Subpart B-Medicare Supplemental Policies

Disclosure notices advising consumers of their statutory rights must be short, simple, easy to understand, and address as few issues as possible. The proposed disclosure notice concerning Medigap policies H, I, and J included in the Preamble is too long, provides unnecessary information, and includes information that may not be accurate for all beneficiaries. We suggest that the letter be modified as follows:

Delete the information about Medicare Part D at the beginning of the disclosure notice;
Delete statements about the value of Part D benefits, which are irrelevant to the issue of changes to Medigap;
Delete the second statement about the need to notify the Medigap issuer if a person later enrolls in Medicare Part D. This information is repetitive; and

Delete the information concerning enrollment issues about Medicare Part D which is unrelated to whether a Medigap policy provides creditable coverage.

In addition, we encourage CMS to develop a different notice for people who will have creditable coverage as their options will be different from those of people whose Medigap policies are not deemed to provided creditable coverage. The specific information this group of beneficiaries will need about their creditable coverage, and any required action, will vary depending on whether their coverage is employer sponsored retiree coverage, a Medigap Plan J, a pre-standard Medigap plan, or a Medigap with a rider or an innovative benefit.

The discussion in the Preamble to the Regulation beginning with Subpart T 4(c)(iii) references the difficulty of determining creditable coverage and the inability to even make that determination in advance of a final rule to implement Part D. We expect there will be confusion on this issue and that mistakes may be made by issuers in applying an actuarial test to groups of policies issued all over the country. We expect additional confusion due to the proposal to modify the definition of Medicare Supplement (Medigap) policies in §403.205 to include riders and freestanding benefits for prescription drugs. We are requesting two remedies for Medicare beneficiaries who are initially notified of creditable coverage when the coverage is no longer or never was creditable: a Special Enrollment Period in Part D and a guaranteed issue right to a Medigap policy without prescription drug benefits. We are also requesting the extension of the right to a guaranteed issue policy to Dual Eligibles who lose their eligibility to Medicaid benefits.

Thank you for the opportunity to submit comments on the proposed rule. We hope that this will not be the final opportunity to do so.

Very truly yours,

Department of Health and Human Services

Attention: CMS-4068

Dear Madam or Sir:

On behalf of the clients represented by the undersigned, we wish to submit the following comments on your proposed rule for the Medicare Prescription Drug Benefit. The Medicare Advocacy Project has over 15 years of experience advocating on behalf of Medicare beneficiaries, particularly those with low incomes; the Massachusetts Law Reform Institute is a statewide advocacy organization representing low income individuals, including elders and persons with disabilities; and the Disability Law Center (DLC) is a private, nonprofit protection and advocacy agency that provides free legal assistance to individuals with disabilities throughout Massachusetts. A key mandate of DLC is ensuring that people with disabilities are able to access needed supports to live and work in the community. Because of the limited time allowed and the magnitude of the proposed rule, we are not commenting on CMS-4069, dealing with Establishment of the Medicare Advantage Program. Neither are we commenting on all the sections of the proposed prescription drug rule. Rather, we are focusing on the impact of the rule on low income beneficiaries and persons with disabilities, particularly in the Eligibility and Enrollment and Grievances, Coverage Determination, and Appeals sections. In addition, we support and agree with the more detailed and comprehensive comments submitted on one or both of the proposed rules by the Medicare Consumers Working Group and the Center for Medicare Advocacy, Inc.

We also request that time be provided for another comment period due to the many unaddressed or only vaguely addressed issues. The final regulations could include a number of errors and provisions that result in unintended consequences because so much of the final regulations will not have been seen by the public. We urge CMS to issue the next version of these regulations in a format that will allow one more round of comment, even if a shortened comment period. This is a very complex program with significant ramifications for a large number of citizens. We are concerned that failure to provide for additional public input when the regulations are more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

PART 423-VOLUNTARY MEDICARE PRESCRIPTION DRUG BENEFIT

General comments.

1. Many pro-consumer statements in the preamble do not appear in the proposed rule. These protections bear no weight unless captured in the regulations. More should be done to reflect the Preamble's good intentions in the body of the regulations. For example:

> The Preamble discusses providing affected enrollees, prescribers, pharmacists, and pharmacies with written notice when a drug will be removed from the formulary or moved to a different tier for cost-sharing. The regulatory language does not specify that the notice should be in writing. Requirement for written notice is critical and should be specified.
>
> The Preamble gives examples of situations when a plan will be required to allow an enrollee to use a non-network pharmacy. These include situations such as when an enrollee's plan does not contract with the long-term care pharmacy which an enrollee in a nursing home must use. The regulations should include the examples CMS discusses in the preamble.

2. There are a number of areas where the law is unclear or contradictory and these areas are creating serious problems for the regulation drafters. CMS should take advantage of the law's provision calling for the submission of technical and corrective amendments. While this was supposed to have been done by June 8, 2004, it should still be done, and Congress should address these issues as soon as possible.

3. Simplicity, as well as additional support for information and counseling, is necessary to ensure that beneficiaries are reached in a comprehensible way. The sheer size and complexity of these regulations is a testament to the fact that this new law is incredibly confusing. If beneficiaries are confused, enrollment and use of the new program will be very difficult, particularly for lower income, sicker, and limited English proficiency beneficiaries. Thus whenever it is possible, CMS should seek to simplify the new program.

Addressing some of our specific concerns:

Subpart B-Eligibility and Enrollment

1. The draft regulations addressing enrollment of beneficiaries into private drug plans (PDPs) or Medicare Advantage Prescription Drug Plans (MA-PDPs) do not adequately address the need for hands-on outreach, particularly to low-income beneficiaries, or to beneficiaries with special needs, such as mental illness. More attention must be given to developing materials and education and enrollment campaigns focused on informing beneficiaries with disabilities, including mental illness and cognitive impairments, and those with other special needs about the new drug benefit and helping them to enroll in the best plan available.

2. Of particular concern, is enrollment of the dual eligibles. Beneficiaries covered by both Medicare and Medicaid are by definition poor and cannot afford to pay privately fo fill any gaps in medication. Congress and the Administration promised that dual eligible beneficiaries would be better off with this new Part D drug benefit than they were receiving drug coverage through Medicaid. To honor this promise, coverage of medications for dual eligibles and other special populations must be grandfathered into the new Part D benefit. In addition, CMS must require plans to establish an alternative flexible formulary for dual eligibles as suggested in the preamble to the proposed regulations. This flexible formulary would incorporate utilization management techniques that focus on improving inefficient and ineffective provider prescribing practices but

do not restrict access to medications through prior authorization, fail first, step therapy, or therapeutic substitution requirements.

3. The regulations do not adequately address how drug coverage for the dual eligibles will be transferred to Medicare on January 1, 2006. There are issues both of timing and implementing the enrollment process in a way that will ensure that these beneficiaries do not confront a loss of benefits or a gap in drug coverage, either of which could have disastrous health consequences. Specific comments on enrollment of dual eligibles and our recommendations appear in our comments on §§423.34, 423.36, 423.48 and on Subpart P.

A. We are concerned with ensuring continuity of care for dual eligibles and access to needed prescriptions. These issues and concerns apply equally to all dual eligibles, and particularly to those with special health care needs, as well as to other populations with specific needs (See our comments in Subpart C, §423.120.)

B. The proposed regulations would force dual eligibles to enroll (or be automatically enrolled) in the "benchmark" or average cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans. The formularies for these plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Even though Massachusetts has restricted access to drugs in its Medicaid program with preferred drug lists and prior authorization requirements, Massachusetts has taken many steps to ensure that special populations can readily access medically necessary drugs. For example, individuals who have been stabilized on one antidepressant are not required to try another one.

C. Without access to the coverage they need, dual eligibles will be forced to switch medications, which for certain populations, such as beneficiaries with HIV/AIDS or mental illness can have serious adverse consequences. Also, failing to ensure continuity of care for dual eligibles may benefit the plans, but will undoubtedly lead to Medicare and/or state increased costs for more physician and emergency room visits, and hospitalizations. The regulations do provide a special enrollment period for dual eligibles to use "at any time" (§423.36). However, being able to enroll in a different Part D plan is inadequate to meet the special needs of dual eligibles.

D. In the preamble to the proposed regulations, CMS points to an exceptions process as a means of securing coverage of off-formulary medications (See our comments to **Subpart M-Grievances, Coverage Determination and Appeals**) But the process proposed is extremely complex and cumbersome to navigate for someone having a psychiatric crisis, facing cognitive impairments, or in the midst of aggressive chemotherapy-to list just a few examples. Moreover, the timelines established are inordinately drawn out; for example, an expedited determination could take as long as two weeks. Drug plans are not required to provide an

emergency supply of medications until at least two weeks following a request. Exception, grievance and appeal processes should not be used to substituted for open formulary access to medications.

§423.34 Enrollment Process.

§423.34 (b) Enrollment.
The final rule should provide that an authorized representative may complete the enrollment form on behalf of a Part D eligible individual.

§423.34(c), Notice Requirement.
The notice must be in writing and inform an individual who is denied enrollment of his or her appeal rights, including the right to appeal the imposition of a penalty for late enrollment.

§423.34(d) Enrollment requirement for full benefit dual eligibles.
In the Preamble, CMS requested comments on whether CMS or the states should perform automatic enrollment of dual eligibles. State officials have more readily available data identifying the dual eligibles in their state and they also will be involved in the enrollment process because they are already required to perform low-income subsidy enrollment. In addition, there is an incentive for them to enroll these individuals in Medicare drug plans because without drug coverage they will increase utilization of other Medicaid services. Thus, states should be afforded the ability to conduct auto-enrollment and receive full federal financing for this function. In addition, CMS should develop its own systems for automatic enrollment of dual eligibles in states that do not elect to do so. Also, because the proposed rule leaves unanswered key questions about who will conduct automatic enrollment of dual eligibles and how it will occur, CMS must give the public the opportunity to provide input on any proposal it develops on this issue before publishing a final regulation.

§423.34(d)(1) General Rule.
The draft regulations provide that dual eligibles will be automatically enrolled in a Part D plan if they do not enroll themselves, by the end of the initial enrollment period, which, under §423.36, is May 15, 2006. However, their Medicaid prescriptions drug coverage will end on January 1, 2006. This proposed timeline for automatic enrollment must be changed because it could expose millions of dual eligibles to a four and half month coverage gap that could have serious health consequences for this vulnerable population. Given the difficulty of reaching this population coupled with inadequate provisions for outreach and education, it is almost certain that a substantial number of dual eligibles will face a several month gap in coverage between the end of Medicaid's drug benefit and automatic enrollment. This is untenable, and directly in conflict with Congress' and the Administration's promise that dual eligibles will be better off under Medicare Part D. The transfer of drug coverage from Medicaid to Medicare Part D should be delayed. Absent a delayed transition date for dual eligible drug coverage, however, dual eligibles should be randomly assigned and enrolled in a plan that best suits their needs as early as November 15, 2005 but no later than December 1, 2005. While we would prefer to provide individuals an extended period to make informed choices, it is critical to complete auto-enrollment as early as possible to leave as much time as possible to distribute plan information

and cards to beneficiaries, allow them to switch plans, and educate them about their new drug coverage before January 1, 2006. To make this process work more smoothly, states can begin profiling individual drug histories to prepare for random auto-assignment among plans that are appropriate for the individual even before plan information is released on October 15, 2005. Additionally, CMS should fund a campaign of individualized counseling and assistance both before and after auto-enrollment to explain to individuals their choices and how to enroll in a plan; explain, if applicable, how to get benefits under the plan to which they have been auto-assigned; and explain, if applicable, that they can choose a different plan from the one to which they have been auto-assigned and assist in choosing and enrolling in such a plan.

§423.34(d)(1)(ii)
CMS must develop a solution to the issue of automatic enrollment of dual eligibles who are enrolled in MA plans that have a prescription drug benefit with a premium that is above the low-income benchmark. The solution should be the one least disruptive to medical care and should not force a dual eligible to choose among continued MA enrollment, paying added premiums, or foregoing drug coverage. For institutionalized dual eligibles, the difference between the premium and the premium subsidy should be considered an incurred medical expense and deducted from their monthly "patient paid amount" to the facility. For non-institutionalized dual eligibles, in states with pharmacy assistance programs (SPAPs) which will wrap around Part D coverage and will cover dual eligibles, the SPAPs should be authorized to pay the difference. For medically needy individuals, the cost differential would be an incurred medical expense contributing toward their spenddown, if appropriate. Otherwise, individuals should be counseled about the premium discrepancy and about their right to withdraw from the MA plan and return to original Medicare. Ideally, dual eligibles who want to remain in the MA plan should be allowed to do so and not have to pay any amount by which the MA-PD basic premium exceeds the low-income benchmark amount.

§423.34(d)(2), When there is more than one PDP in a PDP region.
Because not every PDP plan may be appropriate for each dual eligible (for example, due to formulary restrictions), CMS should limit "on a random basis" to "among such plans in the region that meet the beneficiary's particular drug needs." Also, this subsection undermines the §423.859 right of assured access to a choice of at least two qualifying plans, by acknowledging that there may be regions where there is only one PDP in a PDP region with a monthly beneficiary premium at or below the premium subsidy amount.

§423.36 Enrollment Periods.

§423.36(a)(3)(ii) Exception.
It is not clear who these beneficiaries would be.

§423.36(c) Special Enrollment Periods.
This section should be expanded to provide "special enrollment exceptions" for individuals disenrolled by a PDP (such as for disruptive behavior) so that the individual will have an opportunity to join another PDP and continue with necessary medications. These "special enrollment exceptions" are necessary given the high risk of discrimination presented by the

provisions for involuntary disenrollment. CMS should provide a special enrollment period for these beneficiaries. It should include a reasonable time period for plan selection and be exempt from late enrollment penalties. It should also be expanded to make clear that involuntary loss of creditable prescription drug coverage includes loss because the beneficiary, or beneficiary's spouse, stops working; because COBRA coverage ends or because the premiums became unaffordable.

§423.36(c)(4) Special Enrollment Periods and Dual Eligibles.
We support granting dual eligibles special enrollment periods. However, this provision does not adequately address their needs. It is unlikely that there will be much choice of low-cost drug plans in each region, particularly in rural areas which have not historically attracted many Medicare+Choice plans. For example parts of Cape Cod and Western Massachusetts have no Medicare+Choice plans. In addition, these individuals will not have the resources to pay for more comprehensive coverage. Moreover, the special enrollment provisions do not specify that dual eligibles would not be subject to a late enrollment fee if this complex process of disenrollment and reenrollment resulted in a gap in coverage of over 63 days.

In addition, full benefit dual eligibles should receive notice explaining their right to a special enrollment period when they enroll in a plan, and every time their PDP changes its plan in a way that directly affects them, such as removing a drug from its formulary, changing the co-payment tier for a drug, or denying their appeal concerning a non-formulary drug or an effort to change the co-payment tier.

§423.36(c)(8)
The regulations should include a special enrollment period similar to the one for dual eligibles for all beneficiaries eligible for a full or partial-low income subsidy. This is necessary because if coverage for a drug is denied, these low-income beneficiaries will be unable to afford to pay for drugs during a period of appeal, or if their appeal is denied and they are locked into a plan that does not cover a drug they need.

Special enrollment periods should also be provided for all institutionalized individuals, not just institutionalized dual eligibles, since their access to needed drugs may be compromised by the design of the plans and by pharmacy access requirements, such as if their long-term care pharmacy is not required to be included in the network of all PDPs. Individuals with life-threatening situations and individuals whose situations are pharmacologically complex should have the same rights as well.

§423.38 Effective Dates.

§423.38(c) Special Enrollment Periods.
Effective date should be first day of first calendar month following special enrollment in which individual is eligible for Part D.

§423.42 Coordination of enrollment and disenrollment through PDPs

§423.42(c)(2)
Notice of disenrollment should be in writing.

§423.44 Disenrollment by the PDP.

§423.44(b)(2)(I)
CMS requested comments about the requirement to involuntarily disenroll individuals from a PDP if they no longer reside in the service area. This raises the issue of "snowbirds"-the large number of Medicare beneficiaries who move for large parts of the year. This is a problem in Massachusetts where many elders winter in warmer climates. The churning-the enrolling and disenrolling-that plans serving this population will face as they apply this section will be enormous. Because of different formularies between plans and problems of coordination, the regulations should seek to minimize plan changes and maintain continuity of care. This section, as written, could result in a significant number of plan changes, disrupting continuity of care.

Some suggested ways to address this issue better would be to require that plans as a condition of participation have a system of visitor or traveler benefits, consider exempting regional PDPs and PDPs with out-of-network services from the disenrollment requirement, require plans to provide prospective enrollees specific information on traveler benefits and "out-of-plan service policies" and clearly define the time period that a plan could consider an enrollee as "no longer resid(ing) in the PDP's service area." such that it accommodates seasonal travelers who maintain a residence in the service area.. In many cases, 90 day mail order service and arrangements with other plans will make enrolling and disenrolling unnecessary. However, beneficiaries must have a clear understanding of how a plan will serve them while temporarily out of the service area; how when they are traveling and need emergency pharmaceutical services their plan will (or will not) reimburse for those services.

§423.44(d)(2)
Provisions in the proposed regulations to allow Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" create enormous opportunities for discrimination against individuals with mental illnesses, Alzheimer's, and other cognitive conditions. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and accordingly be subject to a late enrollment penalty permanently increasing their premiums. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage. Moreover, CMS lacks statutory authority to authorize PDPs to involuntarily disenroll beneficiaries. Under the MMA, section 1860D-1(b) directs the Secretary to establish a disenrollment process for PDPs using rules similar to a specific list of rules for the Medicare Advantage program. This list does not include reference to section 1851(g)(3)(B) of the Social Security Act which authorizes MA plans to disenroll beneficiaries for disruptive behavior. Thus, these proposed regulations must not be included in the final rule.

Concerns with specific provisions in this section and recommendations for beneficiary protections, which, at a minimum should be provided, are as follows:

§423.44(d)(2)(vi) Reenrollment in the PDP.
In the preamble, CMS appears to be asking for comments on whether a PDP should be allowed to refuse reenrollment of an individual who has been involuntarily disenrolled if there is no other drug plan in the area. As discussed above, it is our position that there is no statutory basis for involuntarily disenrollment. If the regulations allow this for disruptive behavior, then the plans must be required to allow reenrollment. Those individuals most likely to be subject to involuntary disenrollment will not have the resources to pay for their medications out-of-pocket. These individuals are entitled to this benefit. Disruptive behavior does not disqualify you from access to prescription drug coverage and may in fact be an indication that one is in need of medical assistance. Individuals who are involuntarily disenrolled would not have the opportunity to reenroll in a plan until the next annual enrollment period and may therefore be subject to a late penalty and increased premium as a result. This result is unfair in light of the fact that the disruptive behavior may have resulted from denial of access to needed medications. CMS should therefore provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior, must waive the late enrollment penalty for these individuals, and the regulations must include detailed articulated protections to lessen the risks inherent in authorizing sanctions for "disruptive behavior."

§423.44(d)(2)(vii) Expedited Process.
This provision should be deleted from the final rule. The proposal to establish an expedited disenrollment process in cases where an individual's disruptive or threatening behavior has caused harm to others or prevented the plan from providing services is undefined, and provides no standards, requirements or safeguards. It allows plans to employ this mechanism on the basis of behaviors described in the broadest of terms - terms which could easily be mis-applied or applied capriciously or punitively. Thus, it would undermine all the minimal protections that would otherwise apply.

§423.46 Late enrollment penalty.
CMS should delay implementation of this section for two years. The drug benefit is a new and complex program. Many beneficiaries will be confused about their enrollment opportunities and obligations, or not understand that they must choose a plan and enroll. The Medicare-endorsed prescription drug discount card program has shown that, even with significant outreach, the majority of individuals eligible for the $600 low-income subsidy have not yet enrolled. We disagree that healthy beneficiaries will not apply. We believe that the people most at risk of not applying are the most vulnerable beneficiaries, including people with mental illness and cognitive disabilities. Implementation of the late enrollment penalty should be delayed for individuals eligible for the low-income subsidy who may not understand that they have to apply separately for the subsidy and a drug plan, thinking that application for the subsidy is sufficient.

This section should provide that when the late enrollment penalties are implemented, there will be an opportunity for enrollees to appeal late enrollment penalties; that late enrollment penalties will be coordinated with "special enrollment periods" to ensure that individuals who take advantage of the special enrollment periods do not face late penalties; that individuals who are involuntarily disenrolled are exempt from this penalty; and that if an employer or other entity

providing drug coverage to Medicare beneficiaries fails to provide adequate or correct notice of the creditable status of that coverage or a change in status of that coverage, and that coverage is not creditable, there are no late enrollment penalties.

§423.48 Information about Part D.
Medicare beneficiaries can only exercise an informed choice about their drug plan if they have adequate information about drug plan options available to them. The information should be provided annually, in writing, and include details about the plan benefit structure, cost-sharing and tiers, formulary, pharmacy network, and appeals and exception process. In order to assure that beneficiaries have the required information, the standards should be included in regulations that are binding and enforceable, and not in guidance. Minimally, the regulations should require plans to provide premium information, including whether individuals who receive the low-income subsidy will have to pay a part of the premium and, if so, the amount they will have to pay; the benefits structure and comparative value of the plans available to them; the coinsurance or copayment amounts they will need to pay for each covered Part D drug on the formulary; the specific negotiated drug prices upon which coinsurance calculations will be based and that will be available to beneficiaries if they confront the gap in coverage; formulary structure, the actual drugs on the formulary, and how the formulary can change during the plan year; participating pharmacies, mail order options, out-of-service options; and exception, appeals and grievance processes. Plans should be required to provide this information to potential enrollees in a clear manner using a standard format that will allow beneficiaries to easily compare plans. Plans should be required to provide information on negotiated prices in an easily accessible format.

The regulations should also include specific requirements for plans and states, as well as outline activities CMS will undertake, to ensure that every effort will be made to reach dual eligibles. By summer 2005 CMS and the states should launch a concerted outreach and assistance campaign for dual eligibles to alert them about the need to enroll in a Part D plan and to help them make appropriate choices. The outreach campaign would be intended to prevent default enrollment. In addition, as early as possible, and no later than October15, 2005 (assuming information is available), CMS or the states should mail standardized, easy-to-understand notices to dual eligibles that, among other things: inform them of their eligibility to receive the low income drug benefit if they enroll in a PDP or MA-PD; list choices of health plans (clearly denoting those that meet the benefit premium assistance limit) and contact information for each plan; explain that individuals will be randomly enrolled in a prescription drug plan beginning November 15 (or, if different, the appropriate date) if they fail to opt out or enroll in a plan themselves; explain how they may change their drug plans if they wish at any time; and inform them of where in their community they can go to get help with enrollment. These notices should be tested for readability by focus groups and experts. If the states are required to provide this information, CMS should reimburse 100 percent of the states' costs.

§423.50 Approval of marketing material and enrollment forms.
The marketing rules for the PDPs and MA-PDPs should be developed in the historical context of other Medicare programs. From selective marketing to outright fraud, Medicare programs historically have been afflicted with marketing abuses and scams. We urge that CMS be vigilant to identify and prohibit these problematic areas and practices as it develops final regulations.

§423.50 (e) Standards for PDP marketing.
Telemarketing should expressly be prohibited. Door-to-door solicitation is prohibited under this section and telemarketing presents many of the same dangers. The regulations should specifically prohibit prescription drug plans from initiating telephone or e-mail contact with potential enrollees, unless the potential enrollee requests contact through such means in response to a direct mail or other advertisement.

In the Preamble, CMS asked for comments on whether it would be advisable to permit prescription drug plan sponsors to market and provide additional products (such as financial services, long term care insurance, credit cards) in conjunction with Medicare prescription drug plan services. CMS should not allow plans to market other services, nor should it seek to encourage other entities, such as financial institutions, to participate as PDPs. The potential for abuse—both cherry picking of healthier beneficiaries into plans and avoidance of financial services to less healthy individuals—is enormous. CMS also asked for comments on the applicability of MA marketing requirements for PDP marketing. PDP marketing requirements should be at least as restrictive as MA marketing because of the high potential both for confusion and for individuals to be directed to—and locked-into—plans that do not best meet their needs. Beneficiaries look to providers for balanced, unbiased information, and they should be able to rely on the information that these sources provide. However, if providers or pharmacies are allowed to market plans, there is the potential for aggressive marketing of certain PDPs, regardless of whether or not that PDP is the best for the beneficiary. The adverse consequences of making a bad selection based on promotion from a trusted source are high.

§423.56 Procedures to determine and document creditable status of prescription drug coverage.

§423.56 (e) Notification.
It is essential that beneficiaries understand whether they have creditable coverage. Failure to understand the issue of creditable coverage can lead to a lifetime of higher Part D premiums. CMS must set forth specific requirements that plans provide information to Medicare beneficiaries enrolled in those plans clearly stating whether or not the coverage they have is creditable. Minimally, in 2005, information on whether coverage is creditable or not should be provided in more than one mailing, and included in such documents as quarterly retiree income statements, medical billing correspondence, etc. After 2005, CMS should develop standard notices, through its Beneficiary Notice Initiative, to be used. In years after 2006, when creditable status changes, special notification is needed to insure that beneficiaries know as soon as the decision is made to reduce coverage, so they can begin shopping for a PDP and avoid a lifetime of premium penalties. Because this is such important notification, it should be sent by registered mail, or e-mail with proof of receipt. Additionally where beneficiaries are not adequately informed by an employer or other entity that their coverage is not creditable, CMS should take action on behalf of all the individuals of that employer or other entity to provide a special enrollment period (SEP). Each individual adversely impacted by the failure of the employer or other entity to inform adequately should not have to apply or appeal for a SEP.

Subpart C-Benefits and Beneficiary Protections

§423.100 Definitions.
"Dispensing fee" should be broadly framed, in order to permit the payment of costs associated with home infusion therapy. Of the options provided in the preamble to the proposed rule, we support option 3. We do not believe that a narrowly crafted definition of dispensing fee is appropriate because the conference report at § 1860D-2(d)(1)(B) references negotiated prices in a manner that indicates that Congress intends to define negotiated prices in a way that arrives at the most accurate prices when considering a variety of both concessions and fees. Since the antibiotics, chemotherapy, pain management, parenteral nutrition and immune globulin and other drugs that are administered through home infusion are indisputably covered Part D drugs, and equipment, supplies and services are integral to the administration of home infusion therapies, costs associated with such administration should be included in the definition of dispensing fee, in order to arrive at the most accurate determination of the negotiated price. Option 1 makes an arbitrary and inappropriate distinction between costs associated with dispensing a covered Part D drug and associated costs for the delivery and administration of a covered Part D drug, and option 2 does not capture all the true costs associated with dispensing a covered Part D drug.

"Long-term care facility" should explicitly include ICF/MRs and assisted living facilities.
We recommend that the final rule include a definition of "long-term care facility" that explicitly includes intermediate care facilities for persons with mental retardation and related conditions (ICF/MRs) and assisted living facilities. This is important because many mid to large size ICF/MRs and some assisted living facilities operate exclusive contracts with long-term care pharmacies.

§423.104 Requirements related to qualified prescription drug coverage.
The final rule defines "person" so that family members can pay for covered Part D cost-sharing. The law precludes contributions from employer sponsored health plans from being counted as incurred costs and counting toward the deductible or out of pocket limit. Contributions from one employer-sponsored benefit should not receive differential treatment over contributions from another type of employer-sponsored benefit. Contributions from employer-sponsored group health coverage should be counted as an incurred cost, similar to contributions from HSAs, HRAs, and FSAs. The final rule should also count cost-sharing subsidies from AIDS Drug Assistance Programs (ADAPs) as incurred costs. The regulations also specifically state that state-appropriated dollars spent by ADAPs cannot be counted as incurred costs. It is discriminatory and unacceptable to single out state dollars used to provide medications to people living with HIV/AIDS and not allow them to count as incurred costs, while at the same time allowing state dollars paid by State Pharmaceutical Assistance Programs' (SPAPs)to count as incurred costs.

§423.104(e)(2)(ii) Establishing limits on tiered copayments.
The final rule should not allow Part D plans to apply tiered co-payments without limits. Rather, it must place limits on the use of tiered cost-sharing, such as permitting no more than three cost-sharing tiers and requiring Part D plans to use the same tiers for all classes of drugs.

§423.104(h) Negotiated prices.(1) Access to negotiated prices.
No plan should be allowed to impose 100% cost-sharing for any drug. Such cost-sharing should be considered as per se discrimination against the group or groups of individuals who require that prescription.

§423.120 Access to covered Part D drugs.

§423.120(a) Assuring Pharmacy Access.
Pharmacy access standards must be met in each local service area, rather than by permitting plans to apply them across a multi-region or national service area. Permitting plans to meet the access standards across more than one local service area could cause individuals in some local service areas to not have convenient access to a local pharmacy. Also, only retail pharmacies should be counted for the purpose of meeting pharmacy access standards. It would undermine the principle that Medicare beneficiaries will have convenient access to a local pharmacy if the access standards could be met by counting pharmacies that serve only specific populations and which are not available to all parts of the general public. The final rule should require prescription drug plans to offer to contract with Indian Health Service, Indian tribes and tribal organizations, and urban Indian organizations (I/T/U) pharmacies and make available a standard contract. Should the final rule not contain this requirement and in situations where an I/T/U pharmacy is not part of a plan's network, then plan enrollees should be exempted from differential cost-sharing requirements for accessing an out-of-network pharmacy. The final rule should also require prescription drug plans to offer to contract with all LTC pharmacies and make available a standard contract. Over 80% of nursing home beds are in facilities that require the resident to use a long-term care pharmacy. Should the final rule not contain this requirement and in situations where a LTC pharmacy is not part of a plan's network, then plan enrollees should be exempted from differential cost-sharing requirements for accessing an out-of-network pharmacy. Furthermore, CMS must ensure that persons who utilize specialized pharmacies, such as LTC, I/T/U, FQHC, rural, or clinic-based pharmacies are not penalized through higher cost-sharing for non-preferred pharmacies or through higher cost-sharing for out-of-network access.

§1860D-11(e)(2)(D) authority to review plan designs to ensure that they do not substantially discourage enrollment by certain Part D eligible individuals.
CMS should use the authority provided under section 1860D-11(e)(2)(D) to review plan designs, as part of the bid negotiation process, to ensure that they are not likely to substantially discourage enrollment by certain Part D eligible individuals. Previous experience with Medicare+Choice plans shows that private insurers use a variety of techniques to discourage both initial and continued enrollment in a plan by enrollees with more costly health care needs. For example, Medicare+Choice plans have offset reduced cost-sharing for doctors visits with increased cost sharing for services such as skilled nursing facility care, home health care, hospital coinsurance, and cost sharing for covered chemotherapy drugs that are utilized by people with chronic and acute care needs. CMS should thus analyze formularies, cost-sharing tiers and cost-sharing levels, and how cost-sharing (including both tiers and levels) is applied to assure that people with the most costly prescriptions are not required to pay a greater percentage of the cost of those drugs. CMS also needs to assure that a variety of drugs are included in a

formulary at the preferred cost-sharing tier to treat chronic conditions and conditions that require more costly treatments. As stated above, CMS must ensure that persons who utilize specialized pharmacies, such as LTC, I/T/U, FQHC, rural, or clinic-based pharmacies are not penalized through higher cost-sharing for non-preferred pharmacies or through higher cost-sharing for out-of-network access.

§423.120(a)(6) Level playing field between mail-order and network pharmacies.
The final rule should ensure that beneficiary out-of-pocket costs used for the purchase of covered Part D drugs count as incurred costs. A key principle of the MMA is that Medicare beneficiaries have convenient access to a local pharmacy. This principle is undermined by permitting plans to charge beneficiaries the cost differential for receiving an extended supply of a covered Part D drug through a network retail pharmacy versus a network mail-order pharmacy. However, notwithstanding this objection, the final rule should permit the cost differential charged to beneficiaries to count as an incurred cost.

§423.120(b) Formulary requirements.
We do not believe it is appropriate for the final rule to constrain prescribers' capacity to prescribe drugs for off-label uses. By not permitting a class to exist in the USP model guidelines solely because all commonly used medications are being used for off-label indications could lead plans to deny coverage for off-label uses. Off-label prescribing has become a common-and accepted-practice across the field of medicine. For example no drugs that are currently used in the treatment of lupus (a serious, life-threatening auto-immune disorder) have the treatment of lupus as an on-label indication. For the treatment of mania, certain anti-convulsants and calcium channel blockers have proven effective and certain anti-convulsants have proven effective for treatment of bipolar disorder, although these uses are not FDA-approved on-label indications. We thus oppose any provisions in the final rule that place new limits on the ability of prescribers to prescribe drugs for off-label uses-or that legitimize the denial of coverage for covered Part D drugs simply because they are used for an off-label indication.
We support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must be protected from tiered cost-sharing that could to these defined populations must be made available at the preferred level of cost-sharing for each drug. We recommend that this treatment apply to at least the following overlapping special populations: dual eligibles, institutionalized populations, persons with life-threatening conditions, and persons with pharmacologically complex conditions.

We recommend that if the final rule limits the notice requirements to persons directly affected by the change, then plans must be required to provide notice in writing, mailed directly to beneficiary, 90 days prior to the change, and the notice must inform the beneficiary of their right to request an exception and appeal a plan's decision to drop a specific covered Part D drug from their formulary. We also recommend that the final rule place strict limits on mid-year formulary changes, requiring plans to justify a decision to remove drugs from a formulary such as the availability of new clinical evidence indicating that a particular covered Part D drug is unsafe or contraindicated for a specific use or when all manufacturers discontinue supplying a particular

covered Part D drug in the United States. Should the final rule fail to effect such a restriction, plans should be required to continue dispensing all discontinued drugs until the end of the plan year for all persons currently taking a discontinued drug as part of an ongoing treatment regimen.

§423.124 Special rules for access to covered Part D drugs at out of network pharmacies.
The final rule must establish requirements on plans to dispense a temporary supply of a drug (wherever a prescription is presented, irrespective of whether or not it is at a network pharmacy) in cases of emergency. If the emergency situation involves a coverage dispute, the plan must dispense refills until such time as the prescription expires or the coverage dispute is resolved, through either a plan decision to provide coverage for the drug or through completion of the appeal process. This requirement must also specify that a temporary supply must be dispensed even in cases where beneficiaries are unable to pay applicable cost-sharing.

The final rule should also limit out-of-network cost-sharing to no more than the difference between the maximum price charged to any in-network Part D plan in which the pharmacy participates and the in-network price. While we recommend that this limitation apply in all circumstances, at a minimum, it must be applied through the final rule, to the scenarios described in the preamble to the proposed rule.

§423.128 Dissemination of plan information.

§423.128 (d) Provision of specific information.
It is essential that the final rule require all plans to provide 24-hours-a-day/7-days-a-week access to their toll-free customer call center. The management of the Part D prescription drug benefit is a serious issue that necessitates timely assistance and resolution of coverage issues. The implications of delayed access are potentially very serious. For this reason, notwithstanding concerns about the cost of making round-the-clock access available to their enrollees, this must be considered part of the cost of participating in the Part D program.

§423.128(e) Claims Information.
In addition to the required explanation of benefits elements in the proposed regulation, the explanation of benefits should also include information about relevant requirements for accessing the exceptions, grievance and appeals processes.

Subpart J-Coordination Under Part D With Other Prescription Drug Coverage

§423.464(e) Coordination with State Pharmaceutical Assistance Programs (SPAPs).

SPAPs and new SPAPs must be able to help beneficiaries 'fill in the donut,' and we appreciate CMS's efforts to coordinate this assistance. To assure that beneficiaries are receiving seamless coverage and not facing undue out of pocket expenses, an exchange of data between the PDP and the SPAP is necessary. This should include (but not be limited to) an exchange of eligibility files, exchange of claims payment and information about the drugs on the PDPs formulary and any changes to it. Also, AIDS Drug Assistance Programs (ADAPs) should be recognized as

State Pharmacy Assistance Programs and allowed to wrap around the Medicare Part D drug benefit.

Subpart M-Grievances, Coverage Determination, and Appeals

The proposed regulations fail to meet the requirements of the Due Process Clause of the Fifth Amendment to the United States Constitution. As interpreted by the United States Supreme Court, due process requires adequate notice and hearing when public benefits are being terminated. Medicaid recipients whose prescription requests are not being honored currently receive a 72-hour supply of medications pending the initial coverage request. They are entitled to notice, face-to-face hearings, and aid paid pending an appeal if their request is denied and they file their appeal within a specified time frame. All state Medicaid appeals processes are completed more expeditiously than Medicare appeals. The appeals process as described in Subpart M does not accord dual eligibles and other Part D enrollees with adequate notice of the reasons for the denial and their appeal rights, with an adequate opportunity for a face-to-face hearing with an impartial trier of fact, with an adequate opportunity to have access to care pending resolution of the appeal, or with a timely process for resolving disputes. While we recognize that the most efficient means of protecting enrollees, amending MMA to provide for an appeals process similar to Medicaid, is beyond the authority of CMS, CMS can take steps in the final regulations to improve notice and the opportunity for speedy review.

Sections 1860D-4(f), (g), and (h) require that Part D plan sponsors establish grievance, coverage determination and reconsideration, and appeals processes in accordance with Sections 1852(f), (g) of the Social Security Act. As will be discussed in more detail below, CMS has failed to comply with the language of those provisions. Overall, the incredibly onerous exceptions process does not comply with the statutory requirements or meet the basic elements of due process. In addition, CMS, in implementing Section 1852(c) and in settlement of *Grijalva v. Shalala*, 153 F.3d 1115 (9th Cir, 1998), *vacated and remanded*, 526 U.S. 1096 (1999), adopted 42 C.F.R. §422.626, which establishes the right to a fast-track, pre-termination review by an independent review entity. The proposed Subpart M fails to incorporate the same fast-track, pre-termination review for Part D. CMS needs to incorporate a similar process for Part D in order to establish a process in accordance with Section 1852(c). A similar fast-track process would also be more in keeping with due process requirements.

As a general comment, this entire subpart needs to be made much simpler. To have two tracks, depending on (1) whether one personally pays for a drug and files an appeal or (2) does not obtain the drug and files an appeal, is far too complicated. The time frames, paperwork, and processes should be simplified into one course of action that beneficiaries may hope to understand.

§423.560 Definitions.

This section defines "appeal" to exclude grievance and exceptions processes, and defines “authorized representative” as an individual authorized by an enrollee to deal with appeals. The definition of “authorized representative” needs to clarify that a doctor or representative, including a State Prescription Drug Plan (since the SPAP may be at risk in the event of PDP

actions) can be an authorized representative, and that authorized representatives can deal with exceptions and grievances as well as appeals.

§423.562 General provisions.

§423.562(b)(5)(iii)

Reconsideration by an Independent Review Entity (IRE) should be automatic, as in the Medicare+Choice plans

§423.562(c)(1)

This subsection precludes an enrollee who has no further liability to pay for prescription drugs from appealing. However, it is important to be able to appeal formulary changes. A comprehensive change in this limitation is essential to protect the health of beneficiaries. At a minimum, SPAPs should be able to appeal on behalf of an enrollee and the section should clarify that a low-income institutionalized individual can appeal a determination, even if she has no co-payment responsibilities.

§423.566 Coverage determinations.

§423.566(b) Actions that are coverage determinations.

This subsection needs to clarify further what constitutes a coverage determination. The proposed definition does not include in the list of coverage determinations from which an appeal can be taken a determination by the PDP that a drug is not a covered drug under Part D. An enrollee should be entitled to appeal to determine whether, in fact, a drug the plan claims is not covered under Part D is so covered. The definition should also clarify that denials of enrollment in a Part D plan, involuntary disenrollment from a Part D plan, and the imposition of a late enrollment penalty are coverage determinations subject to the appeals process. Finally, the regulation should state that the presentation of a prescription to the pharmacy constitutes a coverage determination. If the pharmacy does not dispense the prescription, then the request for coverage should be deemed denied, and the enrollee should be entitled to notice and to request a re-determination. Without such clarification, enrollees will not be informed of their rights, and the appeals process will become meaningless.

§423.568, Standard timeframes and notice requirements for coverage determinations.

§423.568(a) Timeframe for requests for drug benefits.

The plan should be required to provide oral notice as soon as it determines that it will extend the deadline for considering whether it will cover a drug, including notice of the right to request an expedited grievance. The oral notice should be followed-up in writing.

§423.568(b) Timeframe for requests for payment.

This section should be eliminated. There should be no distinction in time frames when an enrollee requests payment.

§423.568(c), Written notice for PDP sponsor denials.

Who gives notice? The proposed regulations place the responsibility for providing notice of a coverage determination on the plan sponsor. This presumes a situation in which the person presents a prescription, the pharmacy contacts the plan, and then the plan takes 14 days to decide whether or not to cover a drug. In reality, the pharmacy, in most instances, tells the enrollee that the plan will not cover the drug. Without notice provided by the pharmacy, most enrollees will not know to tell the pharmacy to submit the prescription anyway so they can get a notice from which to appeal. They also may not know or understand their right to seek expedited consideration of the initial coverage determination, or an exception if the drug is not on the formulary or on too high a tier. If the enrollee pays out of pocket and then seeks reimbursement from the plan, she will not be eligible for expedited consideration.

The regulations should require the plan sponsor to develop a notice explaining the right to seek a redetermination, and to ask for expedited review. The pharmacy should be required to give the notice to the enrollee. Any potential burden of such a requirement is reduced by the need to maintain electronic communications between the pharmacies and the plans in order to keep up-to-date with formularies, coinsurance, and calculations of an enrollee's out-of-pocket expenses.

The proposed regulations talk about using "approved notice language in a readable and understandable form." The regulations need to be more specific, including information about what is required to use the exceptions process. We suggest that notice should

Include information about exceptions and appeal rights immediately upon denial (including upon determination that a drug is not covered on formulary and including denials issued by the pharmacist), explain why coverage was denied and provide options in addition to the appeal procedures for obtaining necessary medications;

Include clinical or scientific basis for denial; and

Be available in multiple languages and note the availability of language services.

In addition, all notices need to be available in alternate formats to accommodate people with disabilities, and in languages other than English where a portion of the population is not English speaking. The requirements of plans and the rights of beneficiaries in this area must be spelled out in much more detail. There is also an overarching need to consider literacy problems and encourage simplicity.

§423.568(e) Effect of failure to provide timely notice.
It is nowhere spelled out how the beneficiary is apprised of this right.

§423.570 Expediting certain coverage determinations.

§423.570(a) Request for expedited determination.
CMS requests comments on who should be able to request determinations and re-determinations. An authorized representative should be able to request expedited consideration just as the authorized representative may request a coverage determination. In emergency situations, enrollees with mental health concerns and other vulnerable individuals may need someone else to act on their behalf.

§423.570(c) How the PDP sponsor must process requests.
All coverage determinations and appeals concerning drugs, including those in which the enrollee has paid for the drug, should be treated as requests for expedited review. An enrollee would suffer adverse consequences if required to wait for the longer time periods; many people will simply go without prescribed medications pending the outcome of the review. Doubling the timeframes and disallowing expedited review in cases when enrollees pay for their drugs out-of-pocket could adversely affect the health of those who forego other necessities like food and heat in order to pay for their medicine.

At a minimum, all requests for exceptions should be automatically given expedited consideration. Where someone seeks expedited review of a request to continue a drug that is no longer on the formulary, the plan should be required to process the request in 24 hours under the provision that requires an expedited review to be completed as fast as the beneficiary's condition requires. The enrollee should be given a 72-hour supply of the medicine, which is renewable if the plan decides to take longer than 72 hours. The medicine should be treated as an on-formulary drug.

If requests for an exception are not automatically treated as a request for expedited review, the rules should state that the doctor's certificate requesting expedited review and requesting an exception should be one and the same.

§423.570(d)(2)
A beneficiary should not have to wait for a written notice to learn of the right to file an expedited grievance and the right to resubmit a request with prescribing physician support.

§423.572 Timeframes and notice requirements for expedited coverage determinations.

§423.572 (b) Extensions of timeframe.
The timeframe (of 72 hours) can be extended by the plan up to 14 days on showing that an extension is in the interests of the enrollee. The regulations should be modified to read best interest of the enrollee and define interests of the enrollee to include those situations in which the drug plan seeks additional information to substantiate the enrollee's request, or when the enrollee requests additional time to gather supporting information. The regulations should also require the plan to inform the enrollee of the extension immediately, both orally and in writing, rather than "by the expiration of extension." Also, the written notice should include more than just the reasons for the delay.

There should be no extended time period for requests for payment of drugs already received. This imposes extreme hardship on low-income beneficiaries and those with multiple prescriptions who may choose to unnecessarily spend money on their medications because of the uncertainty and length of the appeals process rather than spend the money on other urgent necessities of life.
It is not clear from the proposed regulations what notice a beneficiary will receive when sometime during the year a plan changes its formulary and the drug(s) it covers. The statute says plans must make the change in information available on the internet, the Preamble discusses a

mailed notice, and the draft regulation simply says 'notice.' A change in formulary, or a change in the tiering of a drug on the formulary should be clearly explained to a beneficiary taking that drug which has been changed. That notice should be written notice and the receipt of that notice should serve as a trigger for the beneficiary's legal rights.

§423.572(d) Content of the notice of expedited determination.
See §423.568(c) comments above.

§423.572(e) Effect of failure to provide a timely notice.
How does a beneficiary know s/he can appeal the lack of timely notice?

§423.578 Exceptions process.
The proposed regulations do not explain how an enrollee will get notice about the exceptions process and/or that a drug is not included on the formulary. The only notice requirement is found in §423.120(b), which requires the plan sponsor to provide at least 30 days notice to CMS, affected enrollees, pharmacies, pharmacist and authorized prescribers before removing a drug or changing a drug's preferred or tiered status. Although the preamble talks about written, mailed notice, and the statute requires posting on the Internet, the regulatory language merely says that notice must be given.

To meet basic due process requirements concerning termination of benefits, the notice of the change must be in writing and must include an explanation of how to use the exceptions process, including the requirements for a doctor's certificate, the right to a hearing, and the reasons why a drug is not included on or removed from the formulary, or why the tier is changing, and the evidence required to establish an exception.

Proposed section §423.120(b) provides insufficient time for the notice, given the substantial burden placed on the enrollee to either get a new prescription or to gather the medical evidence. Many beneficiaries will not be able to get a doctor's appointment within 30 days, and many will not be able to change drugs without a medical evaluation. The final regulations should state that notice must be provided 90 days in advance of the change.

In addition, the exception process section should include a subsection on notice that (1) refers to §§423.120(b) and (2) requires plan sponsors to develop a notice that explains the exceptions process, the situations in which someone may seek an exception, and the information that is required to support an exception request, which the pharmacy will give to an enrollee who requests coverage for a non-formulary drug or requests to be assessed a lower cost-sharing amount.

§423.578 (a)(2).
This subsection fails to meet the statutory requirement that the Secretary establish guidelines for an exception process. The plan statutory language is not permissive; it does not say that plans may establish additional criteria if they wish. It says that the Secretary is to establish criteria and the plans are to abide by them. Plans should have no discretion whatsoever. The fact that they may establish differing tiered structures is not relevant to the statutory right to request an

exception to whatever structure they devise. In fact, the flexibility accorded to plans is why beneficiaries need strong guidelines to protect their interests.

Where the proposed regulations include guidance for criteria, the criteria listed exceed the scope of the statute. The proposed regulations list a "limited number of elements that must be included in any sponsor's exception criteria," but this list includes criteria that do not apply based on the statutory provision that states an exception applies if a physician determines that a preferred drug would not be as effective or would have adverse effects or both.

The proposed rules also fail to provide adequate guidance to physicians concerning whether the standard requiring the doctor to certify that a preferred drug would not be as effective or would cause adverse effects has been met.

The final regulation should require that the lowest co-pay that applies should apply to drugs for which an enrollee has won an exception to the tiered cost-sharing structure. That's the whole point of this process - to infuse some equity upon a showing that none of the other medications covered are as effective or may cause harm.

The final rule should also include the following omitted criteria: regulations permitting continued access to a drug at given price when there is a mid-year formulary change, and regulations requiring sponsors to give enrollees an opportunity to request exceptions to a plan's tiered cost-sharing structure other than on a case-by-case basis.

§423.578(b) Request for exceptions involving a nonformulary drug.
This subsection fails to meet the statutory requirement that the Secretary establish guidelines for an exception process. In the preamble, CMS states that "[r]equiring sponsors to use an exceptions process to review requests for coverage of non-formulary drugs will create a more efficient and transparent process and will ensure that enrollees know what standards are to be applied" and will help ensure these formularies "are based on scientific evidence rather than tailored to fit exceptions and appeals rules for formulary drugs ." However, the proposed regulations give drug plans complete discretion in determining the criteria they will use to determine exceptions requests. In addition, independent review entities "would not have any discretion with respect to the validity of the plan's exceptions criteria or formulary." By failing to adequately define the criteria plans may use to consider exceptions requests or provide any meaningful oversight over these criteria, these proposed regulations would not ensure that formularies are based on scientific evidence and would not establish a transparent process. The regulations as written subvert CMS's stated goals.

The proposed rules set an impossibly high bar for receiving an exception by requiring prescribing physicians to produce clinical evidence and medical and scientific evidence to demonstrate that the on-formulary drug is likely to be ineffective or have adverse effects on the beneficiary. Clinical trials generally do not include older people, people with disabilities and people with co-morbidities. While some such evidence does exist, it has not been developed for all drugs and conditions. However, a physician may have extensive experience treating these kinds of patients with the condition or illness at issue and this experience should be given at least

equal weight in making such determinations. In fact, the statutory standard requires deference to the doctor's determination that all on-formulary medications would not be effective or cause adverse consequences. This required deference is not reflected in the proposed rules. It is also important that the final rules recognize the existence of individual differences in reactions to the same drug and that exceptions be available to someone who can not tolerate or who does not benefit from a drug even though that drug is beneficial to most people.

The NPRM proposes to authorize plans to require a long list of information in the written certification from the prescribing physician that an off-formulary drug is needed. This list is overly long and repetitive and may encourage drug plans to establish burdensome paperwork requirements as a hurdle to prevent physicians and consumers from following through on an exceptions request. Moreover, this proposed rule also leaves the required contents entirely up to the plan's discretion by including the catch-all phrase - "any other information reasonably necessary". The requirements for this written certification should be standardized to facilitate use of the exceptions process by providers and consumers. These standards would also help achieve CMS's stated goal of establishing a transparent process.

An important provision was left out of the requirements for receiving a dosing exception. The proposed rule states that in order to receive an exception, the physician must demonstrate that the number of doses available is likely to be ineffective or adversely affect the drug's effectiveness or patient compliance. This rule must also allow exceptions if the prescribing physician demonstrates that the number of doses available would cause an adverse reaction or harm to the enrollee - as provided in the proposed rules for other kinds of exceptions requests.

The final regulation should clarify that formulary use includes not just dose restriction, but the format of the dosage (liquid vs capsule, etc.) and packaging, such as bubble wraps for long-term care facility residents.

§423.578(c)(2) When a sponsor does not make a timely decision.
The regulation provides for a one month's supply of a drug, but only if the plan does not act timely on an exceptions determination. If the request for an exception is not given expedited treatment, the sponsor can take two weeks to issue a decision, meaning the enrollee would wait two weeks before getting the supply of medicine. Even if the exception is treated as a request for expedited review, the enrollee would still have to wait 72 hours (unless s/he could show the decision needed to be made more quickly because of her/his condition.) Most people wait to the last minute to refill a prescription, often because of drug plan and pharmacy restrictions.

It is also unclear how an enrollee knows about these rights when a sponsor does not make a timely decision.

The enrollee should be entitled to a one month's supply upon presenting the request for a refill and upon presenting a new prescription for a non-formulary drug. Plans should be required to make exception determinations and notify the enrollee in 24 hours as required under Medicaid for prior authorization determinations. 42 U.S.C. §1386r-8(d)(5)(A).

We cannot overemphasize the importance of drug coverage and ensuring no gaps in the intake of medication. In mental health and HIV/AIDS, for example, it is essential that medications be available quickly and without interruption. In the HIV/AIDS sector, for example, consistent research proves that the risk of drug resistance and resulting treatment failure significantly increases with each missed dose of therapy.

423.578(c)(3), When an exception request is approved.
The lowest coinsurance amount should apply anytime an enrollee wins an exception through this process because the drug at issues has been determined medically necessary with no on-formulary drug as a suitable alternative. The exception for the non-formulary drug thus meets the criteria for an exception to the tiered cost-sharing structure as well.

The regulation needs to clearly set forth the requirement that notice be provided when a decision is made on an exception request. The notice should explain that the decision is a coverage determination and explain the appeal rights that are available.

We commend CMS for specifying that, once an exception request is granted, a plan sponsor may not require the enrollee to keep requesting exceptions in order to continue receiving the drug. However, we are concerned that the "exception" to this protection which allows the plan to discontinue a drug if safety considerations arise, is too broad. The final regulation should be revised to permit reversal of a previously granted exception only if the FDA determines that the drug is no longer safe for treating the enrollee's disease or medical condition.

We are concerned that the timeframes for exceptions determinations are far too long. Mirroring the timeframes for plan determinations, these proposed provisions raise similar concerns. It is extremely unfair to require longer time frames if a beneficiary has paid out of pocket for a needed medication when their alternative would be to wait two weeks to a month for a determination or an emergency one-month supply of the needed drug. Beneficiaries' health and safety may well be at risk if they are forced to forego other necessities because of the added, and most likely very significant, expense of paying out of pocket for their medicines. Although the proposed regulations include some provisions for an emergency supply of medications while a plan is considering an exceptions request, it is unreasonable and bad health policy to make beneficiaries wait two to four weeks before the drug plan must provide an emergency supply. In addition, plans should be required to demonstrate that an extension of the standard time frame for exceptions determinations is in the best interest of the enrollee and the final rule must charge independent review entities with exercising oversight over these extensions. Plans should be required to make determinations regarding exceptions requests and notify the enrollee of these determinations in 24 hours as required under Medicaid for determinations regarding prior authorization requests (42 U.S.C. 1396r-8(d)(5)(A)).

§423.580 Right to a redetermination
The proposed regulations only authorize an enrollee or an enrollee's prescribing physician (acting on behalf of an enrollee) to request a redetermination or an expedited redetermination. The enrollee's authorized representative must also be allowed to request a redetermination and an expedited redetermination. Since the proposed regulations would allow an enrollee's authorized

representative to file a request for Determinations and Exceptions, it does not make sense to not allow an enrollee's representative to pursue a claim further through the redetermination, reconsideration, and higher levels of appeal. In fact, the proposed regulations define an authorized representative as an individual authorized to act on behalf of an enrollee "in dealing with any of the levels of the appeals process".

§423.584 Expediting certain re-determinations.
The regulations need to describe in detail the notice responsibilities for both standard and expedited re-determinations, including what must be provided in the notice. This is crucial, given that the next level of review to the IRE is not automatic, as it is with Medicare Advantage plans. The notice should explain the reason for the denial, including the medical and scientific evidence relied upon, the right to request review, or expedited review, to the IRE, including timeframes and the right to submit evidence in person and orally.

§423.584(a) Who may request an expedited redetermination.
See §423.580 regarding allowing an individual's authorized representative to request an expedited re-determination.

§423.584(d)(2).
The information in the letter should also be provided orally. The enrollee should not have to wait three days for this information.

§423.586 Opportunity to submit evidence.
The regulations should establish clear criteria for informing the enrollee and the physician that they can submit evidence in person, as well as clear procedures for in-person review.

§423.590 Timeframes and responsibility for making redeterminations.
The regulation should be amended so that a plan can only extend the timeframe for a re-determination if requested to do so by the enrollee, or if the plan can demonstrate that the extension is in the best interest of the enrollee (for example, the plan needs to obtain additional information to support the enrollee's request). As previously stated, all re-determination requests, and particularly those involving exceptions, should be treated as expedited, and plans should not be given more time to resolve re-determination requests involving payment requests.

§§423.590(c) Effect of failure to meet timeframe for standard redetermination and (e) Failure to meet timeframe for expedited redetermination.
Again, how does enrollee know this and know what to do?

§423.600 Reconsideration by an independent review entity (IRE).
CMS needs to clarify in the final regulations that the role of the IRE is to provide independent, de novo review, especially in regard to the exceptions process. The preamble states that "…The IRE's review would focus on whether the PDP had properly applied its formulary exceptions criteria for the individual in question…..the IRE will not have any discretion with respect to the validity of the plan's exceptions criteria or formulary." If the IRE does not review all the

evidence and issue a reconsideration decision based on its own analysis, then enrollees will be denied independent review, and the requirements of due process will not have been met.

Further, because, as noted above, CMS is required by the statute to set standards for the exceptions process, the IRE must have authority to determine whether the PDP's exceptions criteria comply with the statute. Otherwise, enrollees will have no mechanism for review of arbitrary and improper standards.

Since the Part D process is supposed to follow the MA process, the regulations should follow the MA regulations and require that denials automatically be sent to the IRE for reconsideration. The regulations as written create a barrier to the first level of independent review for enrollees who have difficulty following the complicated process. We dispute CMS's statement in the preamble that many of the drug appeals will involve small monetary amounts. Rather, most will involve medications for chronic conditions that enrollees take on an on-going basis; the yearly sum of the cost-sharing will be quite substantial, especially considering the income level of most people with Medicare. In addition, by requiring the enrollee to file a request for ALJ review, the first truly independent review available, CMS can satisfy the statutory requirement that the enrollee files the appeal.

If the final regulations continue to place the burden of requesting a reconsideration on the enrollee, they need to clarify that an authorized representative can act on the enrollee's behalf. Again, without such clarification, enrollees who lack the capacity to file a reconsideration request will be denied their due process rights. In addition, the prescribing doctor should also be permitted to request a reconsideration, especially since the enrollee needs the doctor's statement in order to request IRE review of an unfavorable exception request.

Finally, the enrollee should be allowed to request a reconsideration orally, especially where the request is for an expedited review.

§423.600(b).
We are pleased that CMS is requiring the IRE to solicit the view of the treating physician. We believe the IRE should also be required to solicit the view of the enrollee. However, because in our experience the MA independent contractor is often reluctant and unwilling to accept the views of and evidence from the beneficiary, the final regulation needs to be more specific. The regulation needs to specify how this will occur, including contact by telephone, email, or face-to-face meeting.

§§423.600(d).
The regulations need to establish a set timeframe by which the IRE must issue its decision in order for this process to be transparent. Enrollees will have no knowledge of the contract between CMS and the IRE and thus will not know how long they will have to wait for a reconsideration decision. Also, if contractual, the time frame can change with each new contract, putting enrollees at greater risk of adverse health consequences from being denied needed medicines. The regulation should also state that an enrollee may appeal to an ALJ if the IRE fails to act within the regulatory time frame and how the enrollee will be apprised of this right.

§423.602 Notice of reconsideration determination by the independent review entity.
The language concerning what the notice must entail is ambiguous. The notice must "inform the enrollee of his or her right to an ALJ hearing if the amount in controversy meets the threshold requirement under 423.610." Does this mean that the notice tells you that you can go to an ALJ, but only if your claim is large enough? Or does this mean the IRE only has to tell you about your right to an ALJ hearing if your claim meets the threshold amount? The latter interpretation is problematic for several reasons, including the fact that you can aggregate claims. The final regulation should state that the notice must inform the enrollee of his or her right to an ALJ hearing, and the procedure for requesting such a hearing, including the dollar amount required to request a hearing.

§423.610 Right to an ALJ Hearing.
Congress recognized the special needs of the low income, and how even small copayment amounts can cause many lower income individuals to forgo filling prescriptions. We urge CMS to provide exceptions to the ALJ threshold requirements for those receiving the Medicare subsidy. For example, the amount at controversy for a lower-income individual could be deemed to be the amount that would be at controversy if the individual were a non-subsidy eligible individual receiving the standard benefit.

It is unclear what §423.610(c) intends when it says, "Two or more appeals may be aggregated by the enrollee… if (I) the appeals have previously been reconsidered by an IRE…" Does this mean that an enrollee will have to file a new appeal each month for a prescription to treat an on-going chronic condition? Such a requirement would be unduly burdensome for enrollees, drug plans, the IRE, and the ALJs. The final regulation needs to clarify that when the plan denies coverage, in order to satisfy the jurisdictional amount an enrollee should be able to add up the cost of the medicine for a year, if the medicine treats an on-going chronic condition, or for the number of refills authorized if the underlying condition is not chronic.

Subsection (ii) says the request for the hearing must list all of the appeals to be aggregated and must be filed within 60 days after all of the IRE reconsideration determinations being appealed have been received. If you are consolidating appeals, and the first denial is in April and the last one you need to get to the jurisdictional amount is in August, will you still be timely? Or does it have to be 60 days from the first denial in April?

§423.612 Request for an ALJ Hearing.
The regulation should specify that, if an appeal is filed with the PDP, the PDP must submit the file to the IRE within 24 hours of receipt of the request, and the IRE must transmit the file to the ALJ within 24 hours. Our experience is that, without set time frames, some current reviewing entities take long periods of time, adding to the delay in the processing and resolution of ALJ appeals.

The regulations also need to require the IRE to include all of the information in the file, such as doctor's statements, statements by the enrollee, and any other evidence submitted by the enrollee, including information not relied upon in making its decision. It has been our experience that

contracting entities, including MA plans, often omit evidence submitted by the enrollee when transferring a file to the ALJ or other level of review.

§§423.634, Reopening and revising determinations and decisions and 423.638 How a PDP sponsor must effectuate expedited redeterminations or reconsidered redeterminations.
Subsection (c) in both of these draft regulations allows the PDP to take up to 60 days to implement a reversal by the IRE, an ALJ, or higher. That's totally unacceptable, since further delays may cause increased health consequences to people who have foregone medication pending appeal. Favorable decisions should be implemented in the same 72 hour time period as reversals at earlier levels of review.

Subpart P - Premiums and Cost-Sharing Subsidies for Low-Income Individuals

§432.772 Definitions.
"Family size." We support defining family members as relatives in the household receiving at least half of their support from the applicant or applicant's spouse. In order to minimize burdens on beneficiaries, the regulations should specify that applicants will be able to self-attest to the status of dependents, without providing further documentation.

"Full subsidy eligible individuals." The definition should refer to the language of §§423.773(b) and(c), in order to avoid ambiguity.

"Income." The definition should make clear that income not actually owned by the applicant, even if his or her name is on the check, should not be counted.

"Institutionalized individual." The definition should include those individuals eligible for home and community based services under a Medicaid waiver (see, e.g., definition of "institutionalized spouse" at 42 U.S.C. § 1396r-5(h)(1)(A)), since those individuals must meet the acuity standards for Medicaid coverage in a nursing facility, and should include individuals in ICF-MRs and individuals in any institution in which they are entitled to a personal needs allowance.

The definition should not include the language "for whom payment is made by Medicaid throughout the month" since an individual could conceivably be a full benefit dual eligible recently returned from a hospital stay whose nursing facility stay would be paid for by Medicare Part A for the entire month. Even though in that month all their drugs are likely to be paid for by Medicare Part A, as a practical matter, for continuity and minimum disruption, they should not lose their status as an "institutionalized individual." The same reasoning should apply to a full benefit dual eligible individual who might be hospitalized during an entire month, during which their entire stay would also be paid for by Medicare Part A.

"Personal representative." The portion of the definition that permits an individual "acting responsibly" on behalf of an applicant needs further clarification as to who would determine that the individual is acting responsibly and what circumstances would constitute a per se conflict of interest.

"Resources." We support the limitation of countable resources to liquid assets. However the definitions of liquid assets and what it means to be able to be converted into cash in 20 days need to be clarified. The final rule should include a specific list of countable resources to promote clarity for state and beneficiaries. Resources should not include burial plots, burial funds or life insurance of any value, nor should it include any officially designated retirement account, such as an IRA, 401(k), 403(b) etc. Alternatively, the respective exclusions for the value of life insurance and burial funds should be increased to a reasonable amount, such as $10,000 per asset. Most potential low-income beneficiaries have assets below this level.

Excluding these resources will ease the application process for consumers and eligibility workers, as well as reduce administrative costs by reducing the time and effort required to verify assets. This is consistent with both Congress's and CMS's intent. Resource assessments should not include any consideration of transferred assets, as would otherwise be required under SSI rules.

We note that a current draft of the SSA application for the low-income subsidy inquires whether an applicant has life insurance with a face value of $1,500 or more. CMS must ensure that any proposed SSA application is harmonized with these rules on assets and income. As noted above, life insurance should not count towards assets, and this question should be eliminated.

§423.773 Requirements for eligibility.
We support the proposal to make dual eligibles (both full dual eligibles and those in Medicare Savings Programs (MSPs)) automatically eligible for the low-income subsidy. As we explain below, however, we believe a great deal more specificity is needed in this section. We are particularly concerned that the proposed rule leaves room for ambiguity regarding these beneficiaries' status. We believe that the proposed eligibility rules for partial dual eligibles will result in inequities and confusion. In addition, the draft regulations do not adequately explain how low-income beneficiaries are to be notified about their eligibility, nor do they explain how prescription drug plans are to determine which beneficiaries are enrolled in the low-income subsidy. The proposed rules also do not adequately protect low-income beneficiaries whose enrollment is delayed or is processed erroneously.

§423.773(a) Subsidy eligible individual.
Although the statute defines a subsidy eligible individual as one enrolled in a Part D plan, the requirement in Subpart S that states take applications for the low-income subsidy beginning July 1, 2005, before Part D plans are available to be enrolled in makes it clear that CMS believes people should be able to apply for the low-income subsidy without being enrolled in a Part D plan. This is actually imperative, as otherwise, an individual would be forced to pay a plan premium that the subsidy, in fact, pays for them. The subsidy eligibility determination would be done "conditionally" - conditioned upon the individual enrolling in a Part D plan. The regulations should reflect this reality and clearly direct both SSA and state Medicaid programs determining eligibility that the individual can both apply and be determined subsidy eligible before she or he has enrolled in a plan

§423.773(b) Full subsidy eligible individual.

The indexing of resources should indicate that rounding is always up to the next multiple of $10.

§423.773(c) Individuals treated as full subsidy eligible.
This section should conform to Subpart S § 423.904(c)(3) which requires states to notify all deemed subsidy eligible individuals of their subsidy eligibility. It should specify that the notice must be given by July 1, 2005 for those individuals eligible at that time. For those who subsequently become eligible, notice should be given at the same time the individual is notified of their eligibility for the benefit that qualifies them to be treated as a full subsidy individual. The notice should make clear to individuals what they need to do to use their subsidy, and should direct them to a source for information, counseling and assistance in choosing a Part D plan. For those who will lose Medicaid coverage January 1, 2006, the notice should explain their appeal rights as well. Individuals should also be told of their right to appeal the level of subsidy to which they are entitled.

Section 209(b) states and non-1634 states must coordinate with the Social Security Administration to determine how to provide notice to SSI recipients who are not receiving Medicaid and who therefore do not appear on the state's Medicaid rolls.

§423.773 states that both full benefit dual eligibles and MSP beneficiaries are eligible for the low income subsidy, but it does not explicitly state that these beneficiaries are automatically enrolled in the subsidy program. The regulations should be absolutely clear that an individual treated as full subsidy does not have to take any further action with respect to the subsidy (i.e., make application or in any other way verify their status), but only to enroll in a Part D plan. This will help smooth the transition from Medicaid drug coverage for dual eligibles, and should improve participation for others.

§423.773(c)(3).
We support the decision reflected in this proposed subsection to deem MSP beneficiaries automatically eligible for the low-income subsidy. We are concerned, however, that inequities and confusion among beneficiaries may result because SSA will not apply the more generous income and asset MSP eligibility rules in place in some states (for example, Alabama, Arizona, Delaware, and Mississippi, which have eliminated consideration of assets for MSPs). Eligibility requirements should be the same for all subsidy-eligible individuals in a state, regardless of where and how they apply. Under the proposed regulations, in states that have adopted less restrictive income and asset methodology, people whose assets or income are slightly above the limits set in § 423.773 would be enrolled in a less generous subsidy, or have their application rejected entirely, if they apply directly through SSA, because SSA will apply the national guidelines proposed in §423.773. However, the same people would have their application accepted if they applied through their states' Medicaid offices, were screened and then enrolled in an MSP, and were then automatically eligible for the low-income subsidy.

To resolve this problem, we propose that SSA apply state-specific income and asset eligibility rules in determining eligibility for the low-income subsidy, an option discussed, though rejected, in the preamble. This means that for applicants from states that have eliminated the asset test or

increased disregards under §1902®)(2) for MSP eligibility, SSA should apply the state's rules to determine eligibility. This option is permitted under §1860D-14(a)(3)(E)(iv) of the statute.

Alternatively, the regulations should provide that subsidy applicants who appear to have excess assets or incomes would either be screened by SSA for eligibility in an MSP program, or have their applications forwarded to the state Medicaid agency to be screened for MSP eligibility. States would be precluded from requiring beneficiaries to resubmit information, such as income and asset levels, that they have already provided to SSA. Applicants would be enrolled in the appropriate MSP program, and then be enrolled in the appropriate low-income subsidy under proposed § 423.773(c). Adopting this policy, which is not precluded by statute, will ensure that all subsidy applicants are treated equitably, as well as increase participation in MSPs.

As part of this alternative policy, the low-income subsidy application should allow an applicant to opt out of screening and enrollment for an MSP, as some applicants may not wish to participate in an MSP. Under §1860D-14(a)(3)(v)(II) of the statute, beneficiaries who are determined eligible for MSPs may be enrolled in the low-income subsidy. There is no requirement that beneficiaries actually enroll in an MSP. Therefore, applicants who meet eligibility requirements for an MSP, but who decline to enroll in the program, should still be automatically eligible for the low-income subsidy.

Because enrollment in an MSP can affect the amount of assistance a beneficiary may receive through other public assistance program, such as Section 8 housing vouchers or food stamps, there will be a profound need for beneficiary counseling during the enrollment process. We recommend that CMS plan for this need by making funds available to local agencies, including state health insurance assistance programs (SHIPs), and other community-based organizations.

This draft regulation states that a state Medicaid agency must notify full benefit dual eligibles that they are eligible for the low-income subsidy and should enroll in a Part D plan. The regulations do not state, however, when this notice should be issued, or what the notice should say. Consistent with our comments above and those accompanying 423.904(c)(3), the notification should be sent to beneficiaries on or near July 1, 2005, when states will have made the automatic eligibility determinations.

We also suggest that CMS develop model notices based on input from beneficiaries, which would explain the purpose of new subsidy simply and clearly. The notice should make clear to individuals what they need to do to use their subsidy, and should direct them to a source for information, counseling and assistance in choosing a Part D plan. It should also explain as simply as possible what level of subsidy the beneficiary will receive, and the beneficiary's appeal rights if she believes the subsidy level is in error.

The draft regulation fails to address eligibility issues for Medicaid beneficiaries who become eligible after a spenddown period, either under a medically needy program or in a 209(b) state. These beneficiaries should be informed of their likely eligibility for a low-income Medicare subsidy and given an opportunity to enroll. When they have met their spenddown, they should be informed of their entitlement to a lower co-payment, if applicable, as a deemed subsidy eligible.

Our recommendations for redeterminations of these beneficiaries are discussed below, in §423.774.

§423.773(d) Other subsidy eligible individuals.
The indexing of resources should indicate that rounding is always up to the next multiple of $10.

§423.774 Eligibility determinations, redeterminations, and applications.

§423.774(a) Determinations of whether an individual is a subsidy eligible individual.
This subsection provides that determinations of eligibility for the subsidy are to be made by state Medicaid agencies or by SSA, depending on where an individual applies. We believe that in order to ensure prompt enrollment in both the subsidy and ultimately in a plan, the regulations should specify that a determination notice must be sent to the applicant no later than 30 days after the application is filed. Because determinations for the low-income subsidy should be a simple process, very little time should be required to render a decision. Both SSA and states should be required to notify CMS with 24 hours of a individual being determined eligible for the subsidy.

§423.774(b) Effective date of initial eligibility determination.
In order to avoid delays in the ability of beneficiaries to use their subsidy benefits while their application is pending, the final rule should offer beneficiaries the option of applying through a presumptive eligibility system. Such a system would be especially helpful to beneficiaries who have enrolled in a Part D plan but are not yet receiving the low-income subsidy. Applicants can complete a short form at a provider's office or other location in which they declare their family size, income and assets. If their income and assets are below the relevant eligibility levels, they are found presumptively eligible. Applicants may still be required to complete a full application within a prescribed period of time (typically 30 to 60 days) if additional information is required. In the meantime, however, beneficiaries are given temporary cards that they can present to health care providers and receive services immediately. Experience has shown that the error rate for these enrollment systems is very low. In the rare cases where beneficiaries are later found ineligible, they and their providers are held harmless for the benefits they receive during the presumptive eligibility period.

Applicants for the low-income subsidy could be found presumptively eligible at state Medicaid offices, SSA offices, pharmacies, or other providers. If the low-income subsidy application form is simple enough, applicants could complete the form itself and self-attest to their income and assets. If they appear to be eligible, they would be enrolled in the appropriate subsidy while their application is processed. They would receive some form of temporary certification stating that they have been presumptively enrolled, which their pharmacy would accept while their application is processed. Such a system would encourage beneficiaries to apply, as they would be able to see the benefits of the system immediately.

§423.774(c) Redetermination and appeals of low-income subsidy eligibility.
There should be a provision for prompt reconsideration of a subsidy eligibility determination, for beneficiaries who believe they have either been erroneously denied eligibility or approved for the

wrong subsidy category. The provisions applying the appeal rules of state Medicaid plans or SSA do not provide for a prompt reconsideration process. Because obtaining prescription drugs is so vital, and especially because low-income beneficiaries are unable to pay the costs of their prescription drugs out of their own pockets, a quick reconsideration process is essential.

The draft regulation refers to redeterminations and appeals under the state Medicaid plan. This is inadequate, as frequent redeterminations in place in some states will cause some beneficiaries to drop out of the program. To maximize enrollment, the rule should establish that all determinations are for one year, per the Secretary's authority under the statute. We also urge CMS to adopt an annual, passive, and simple redetermination for all beneficiaries, whether they have enrolled through SSA or states. Should it be necessary, the Secretary should direct the Commissioner of SSA to create such a system. Under a passive redetermination system, beneficiaries would be sent a statement of the relevant information on file and asked to respond only if any of that information had changed over the year. If they do not respond, their coverage would continue unchanged for another year.

If states are not required to adopt passive redeterminations, we urge that redeterminations be made as they are under the state's MSP programs, or under the most passive, simplified redetermination process used for any category of coverage under the state plan.

§423.774(d), Application requirements.
This section should make clear to both states and SSA that no documents should be required of the individual as long as the applicant authorizes the agency to verify information from financial and other institutions. Documentation production should be only the absolute last resort.

Also, as we mentioned in our comments to §423.773 above, the proposed rule does not address eligibility determinations and recertification periods for Medicaid beneficiaries who become eligible after a spenddown period, either under a medically needy program or in a 209(b) state. Once beneficiaries become deemed subsidy eligible individuals by completing their spenddown, they should retain that status for a full year, until their next redetermination for the low-income subsidy, regardless of whether they go off Medicaid. Otherwise, individuals who go in and out of medically needy status, depending on the length of their state's budget period, will have extremely confusing changes regarding their Medicare low-income drug subsidy.

§423.800 Administration of Subsidy.

§423.800(a), Notification of eligibility for low-income subsidy.
We are concerned that there is no provision in §423.800(a) specifying a time period by which CMS must notify a plan that an enrollee is eligible for a subsidy. This is an essential step in the process, because without the subsidy, prohibitive costs will prevent low-income beneficiaries from using their Part D benefits. We propose that CMS be required to inform Part D plans of beneficiaries' enrollment in the subsidy no later than 24 hours after the application for the subsidy is approved. As this will likely be an electronic notification, it should not be burdensome. It is vital that plans know which beneficiaries are enrolled in the subsidy, so that these low-income beneficiaries do not have to pay the full cost of their prescriptions while their subsidy application is process.

§23.800(e), Reimbursement for cost sharing paid before notification of eligibility for low-income subsidy.
The draft reimbursement provisions are inadequate to protect low-income beneficiaries. The proposed regulation would require plans to reimburse low-income beneficiaries for excess copayment and premium amounts made after the effective date of the subsidy application. This is not a realistic solution to the problem facing beneficiaries who have prescription drug needs before their Part D plans are notified that the beneficiaries are subsidy-eligible and need to have their records adjusted accordingly. Low-income beneficiaries will not be able to afford to pay these costs out of their own pockets with the expectation of being reimbursed later. Instead, these beneficiaries will forego prescription drug coverage until their plan processes their subsidy, making the first month or more of their subsidy period meaningless.

Adoption of a presumptive eligibility system recommended above would alleviate this problem. As an additional alternative, the regulations should provide that beneficiaries may present their notice of approval for the subsidy to their pharmacy when they seek prescription drugs. Pharmacies should accept this notice as adequate to relieve the beneficiary from making a co-payment, and instead seek reimbursement for the beneficiary's plan.

Subpart S - Special Rules for States - Eligibility Determinations for Subsidies and General Payment Provisions

§423.904 Eligibility determinations for low-income subsidies.

§423.904(a) General Rule.
This subsection should cross reference the entire Subpart P, or, at a minimum the definitions included in §423.772.

§423.904(b) Notification to CMS.
The rule should direct states to notify CMS of eligibility determinations within 24 hours of making them, as we previously recommended with respect to SSA determinations.

§423.904(c) Screening for eligibility for Medicare cost-sharing and enrollment under the State plan.
The proposed regulation regarding states' obligations to screen subsidy applicants and offer them enrollment in Medicare Savings Programs ("MSPs") are inadequate. In particular, the regulation should specify what "offer enrollment" means. We believe an applicant must be offered the opportunity to enroll during the same visit or contact (in office, by phone, or by mail), without providing any further documentation or completing any additional forms. Only if enrollment is easy and convenient will Congress's intent of increasing participation in MSPs be accomplished. Furthermore, because under the current rules, enrollment in an MSP may be the only entry into the subsidy for some beneficiaries, a quick and easy application for MSP programs is essential. As written, the regulation would permit states to say they have "offered enrollment" simply if they tell applicants that they might be eligible for an MSP and may return another time to complete another application form if they wish to apply. Such an outcome would defeat the

purpose of the screen and enroll provision included in the new §1935(a)(3) established in §103(a) of the statute. Instead, as proposed in our comments to Subpart P, the low-income subsidy application should include an "opt-out" provision, under which qualified applicants would be enrolled in an MSP unless they affirmatively decline to do so. This provision would explain that enrollment in an MSP may be another way to qualify for the low-income subsidy.

As we explained in our comments to Subpart P, because enrollment in an MSP may affect receipt of other public benefits, there is a tremendous need for good quality counseling of beneficiaries. In addition, in order to ensure that enrollment requirements between MSPs and the low-income subsidy are aligned, states should not be permitted to pursue estate recoveries against MSP beneficiaries. Such recoveries are not cost-effective and can deter beneficiaries from enrolling. Any information provided to beneficiaries about MSP enrollment should tell applicants whether they will be subject to estate recovery if they enroll in an MSP.

In the interest of further aligning eligibility rules for MSPs and the low-income subsidy and easing administrative burdens, we suggest that CMS direct states to apply the definitions of resources used in Subpart P, §423.772, in making their resource determinations for MSP applicants.

In addition, should CMS adopt a policy, as has been discussed publicly, under which most subsidy applications to state Medicaid agencies would be forwarded to SSA for the actual eligibility determination, the regulations should be clear that the screening for MSP eligibility must take place prior to the processing of the applications to SSA. Potential beneficiaries should not have to wait to be screened and offered enrollment in MSPs. Furthermore, an individual cannot be told, by either SSA or the state that she or he is ineligible for the low-income subsidy until MSP eligibility has been determined (if the individual wishes). It would be incredibly confusing for an individual to receive a notice from SSA that she is ineligible for a subsidy, have her MSP eligibility determined by the state, then receive a notice from the state that she is eligible for both MSP and the subsidy. Whatever the mechanics, the individual must be told that MSPs are a route to subsidy eligibility.

Finally, as we discussed in our comments to §423.773, SSA should also screen subsidy applicants for eligibility in MSPs as well, and develop a system with states to enroll eligible beneficiaries. Applicants should not miss out on the opportunity to enroll in MSPs because they apply through SSA rather than state Medicaid offices. The same concerns about beneficiary education and estate recovery discussed above apply to enrollment through SSA.

The regulations should also ensure that beneficiaries are screened for eligibility for full Medicaid and offered enrollment if they qualify, consistent with 42 C.F.R. §435.404. Ideally, all subsidy applicants would be screened for Medicaid, and offered enrollment if they qualify. Because the importance of maintaining a simple application process for the subsidy is paramount, CMS may wish to consider using a simple screening process based on information obtained through the subsidy application. This screening would trigger a follow-up with applicants who appear to be eligible for full Medicaid.

Many Medicare beneficiaries who are eligible for a low-income subsidy under the Part D Program will also be eligible for other important benefits. Some of these benefits, such as food stamps, are also administered by states and have eligibility rules that very closely correspond with the new eligibility rules for the Part D subsidies. Historically participation by seniors and people with disabilities in these programs has been low, despite the fact that the benefits that low-income Medicare beneficiaries would be able to receive could help them struggle less to make ends meet every month. The Part D enrollment process offers an historic opportunity to connect Medicare beneficiaries to these other programs.

Beyond saying that applications may be filed either with a State's Medicaid program or with SSA, the proposed rule has very little detail about how the application process is likely to work. We urge CMS to specify that the new eligibility process should dovetail with other programs so that low-income Medicare beneficiaries can be enrolled as seamlessly as possible in all the state- or SSA-administered benefits for which they qualify

423.904(d)(3)(ii), Cost-effectiveness of information verification.
This section should be modified to permit states to use the verification process established by the Social Security Administration to verify the income and assets of people who apply for a Part D subsidy through a state Medicaid agency.

PART 403-SPECIAL PROGRAMS AND PROJECTS

Subpart B-Medicare Supplemental Policies

Disclosure notices advising consumers of their statutory rights must be short, simple, easy to understand, and address as few issues as possible. The proposed disclosure notice concerning Medigap policies H, I, and J included in the Preamble is too long, provides unnecessary information, and includes information that may not be accurate for all beneficiaries. We suggest that the letter be modified as follows:

Delete the information about Medicare Part D at the beginning of the disclosure notice;
Delete statements about the value of Part D benefits, which are irrelevant to the issue of changes to Medigap;
Delete the second statement about the need to notify the Medigap issuer if a person later enrolls in Medicare Part D. This information is repetitive; and

Delete the information concerning enrollment issues about Medicare Part D which is unrelated to whether a Medigap policy provides creditable coverage.

In addition, we encourage CMS to develop a different notice for people who will have creditable coverage as their options will be different from those of people whose Medigap policies are not deemed to provided creditable coverage. The specific information this group of beneficiaries will need about their creditable coverage, and any required action, will vary depending on whether their coverage is employer sponsored retiree coverage, a Medigap Plan J, a pre-standard Medigap plan, or a Medigap with a rider or an innovative benefit.

The discussion in the Preamble to the Regulation beginning with Subpart T 4(c)(iii) references the difficulty of determining creditable coverage and the inability to even make that determination in advance of a final rule to implement Part D. We expect there will be confusion on this issue and that mistakes may be made by issuers in applying an actuarial test to groups of policies issued all over the country. We expect additional confusion due to the proposal to modify the definition of Medicare Supplement (Medigap) policies in §403.205 to include riders and freestanding benefits for prescription drugs. We are requesting two remedies for Medicare beneficiaries who are initially notified of creditable coverage when the coverage is no longer or never was creditable: a Special Enrollment Period in Part D and a guaranteed issue right to a Medigap policy without prescription drug benefits. We are also requesting the extension of the right to a guaranteed issue policy to Dual Eligibles who lose their eligibility to Medicaid benefits.

Thank you for the opportunity to submit comments on the proposed rule. We hope that this will not be the final opportunity to do so.

Very truly yours,

Issue Areas/Comments

GENERAL

GENERAL

Thank you for the opportunity to comment on the proposed regulation to implement the Medicare prescription drug benefit. I offer the following comments for consideration as CMS develops the final regulation.

BENEFICIARY ACCESS TO COMMUNITY RETAIL PHARMACIES:
I am concerned about the proposed rul regarding the pharmacy access standard. Under the proposed regulation, each prescription drug benefit plan is allowed to apply the Department of Defense's TRICARE standards on the local (37664)level rather than 'on average' in a regional service area.

To address the situation where it is impossible to meet the TRICARE standard for a particular zip code because access does not exist at that level (no pharmacy in the zip code), the regulation should require that the access standard be the greater of the TRICARE standard or the access equal to that available to a member of the general public living in that zip code.

Requiring plans to meet the standard on a local level is the only way to ensure patients equal and convenient access to their chosen pharmacies.

PROPOSED REGULATION CREATES NETWORKS SMALLER THAN TRICARE:
The proposed regulation also allows plans to create 'preferred' pharmacies and 'non-preferred' pharmacies, with no requirements on the number of preferred pharmacies a plan must have in its network. Plans could identify only one 'preferred' pharmacy and drive patients to use it through lower co-payments, negating the intended benefit of the access standards. Only 'preferred ' pharmacies shoud count when evaluation whether a plan has met the required TRICARE access standards. The Dept. of Defense network of pharmacies meets the Tricare access standards and has uniform cost sharing for all these network pharmacies. CMS shoould require plans to offer a standard contract to all pharmacies. Any pharmacy willing to meet the plan's standards terms should be allowed to provide the same copays to the patient population.

EQUAL ACCESS TO RETAIL AND MAIL ORDER PHARMACIES FOR MEDICARE BENEFICIARIES:
I believe it was the intent of Congress to assure Medicare beneficiaries are able to obtain covered prescriptions drugs and medication therapy management services from the pharmacy provider of their coice. As such, plans must permit beneficiaries to obtain covered outpatient drugs and medication therapy management services at any community retail pharmacy in the plan's network, in the same amount, scope, and duration that the plan offers through mail order pharmacies. According to the proposed regulation, the only difference a beneficiary would have to pay between retail and mail order prescriptions should be directly related to the difference in the service costs, not the cost of the drug product. Under Medicare Part D, all rebates, discounts or other price concessions shoould be credited equally to reduce the cost of prescription drugs no matter where they are dispensed. The benefits from these arrangements shoould be required to be used to directly benefit the Medicare beneficiary in terms of lower cost prescriptions.

Pharmacists are also the ideal health care professionals to provide Medication Therapy Management Program and determine which services each beneficiary needs.

I, also, know that the local pharmacist is the most accessible healthcare provider a Medicare beneficiary has. I have even gone to patients homes to help them with their medications because they couldn't understand the physician's instructions, so how could they possibly understand a mail-order pharmacist on the telephone.

In conclusion, I urge CMS to make the needed revisions to the Medicare prescription drug benefit regulations to better serve Medicare beneficiaries.

Thank you for considering my comments.

Sincerely,
Eddie Rowe, DPh.

STATE OF CONNECTICUT

File Code: CMS-4068-P

October 4, 2004

Dr. Mark B. McClellan
Administrator
Centers for Medicare and Medicaid Services
Department of Health and Human Services
ATTN: CMS-4068-P
P.O. Box 8014
Baltimore, MD 21244-8014

Dear Dr. McClellan:

The Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (Public Law 108-173) is historic legislation that presents opportunities and challenges for Connecticut. As a state with representation on the State Pharmaceutical Assistance Transition Commission (SPATC) authorized by that law, we are pleased to have been a part of the communication process between the Centers for Medicare and Medicaid Services and certain states that will be impacted by the new Medicare pharmaceutical benefit. We have not repeated all of the recommendations made by the Commission in these comments. However, we want to note that the State of Connecticut supports all of the recommendations outlined by the Commission.

While the SPATC process was certainly a helpful forum for presenting comments of importance to Connecticut, the impact of the Medicare Modernization Act extends beyond the interests of state pharmaceutical assistance programs to include issues relevant to the Medicaid program and to state retirees. The State of Connecticut believes that there are important threshold issues in the rule related to SPAPs. Therefore, we have repeated some of the SPATC comments here to underline the critical nature of these areas.

Accordingly, attached please find comments from the State of Connecticut regarding CMS's proposed rule for implementing the Medicare prescription drug benefit. If you have any questions about our comments, please contact Paul Potamianos at 860-418-6272 (paul.potamianos@po.state.ct.us) or David Parrella at 860-424-5116 (david.parrella@po.state.ct.us).

Sincerely,

Marc S. Ryan
Secretary

A. General Provisions

Section 423.4. Definitions. *PDP Sponsor.* Section 1860D-41(13) of the Act defines a PDP sponsor as a "nongovernmental entity," which is operationalized at Section 423.4 of the proposed rule (p. 46810). We ask that CMS be flexible in its interpretation of the Act and its definition of nongovernmental entity so that states can comply with the law while at the same time allowing for creation of state-sponsored nongovernmental entities or selection of one entity as PDP sponsor for our Medicaid dual-eligible and SPAP populations. Not only would this approach minimize client confusion and ensure continuity of care (since we are familiar with both the medical and pharmaceutical histories of our clients), but it would resolve issues of data-sharing, client notification and client enrollment.

Section 423.6 (p. 46636 of the preamble). Cost-Sharing in beneficiary education and enrollment. It is unclear whether PDPs or MA-PD plans can pass along education and information costs in the form of user fees to states. To the extent that there are education and information costs, these should be borne by CMS and/or PDPs or MA-PD plans, not states.

Section 423.112 (p. 46636 of the preamble). Establishment of prescription drug plan service areas. Because the MMA allows for up to 50 state regions, and because Connecticut is an SPAP state, we believe that CMS should establish PDP regions in a way that allows Connecticut to be its own region. This is of importance to Connecticut because of the need to coordinate between our SPAP and the PDP or MA-PD plans. The needs and concerns of smaller states (especially states with SPAPs) could be subsumed by larger states with different integration needs. Allowing Connecticut to be its own region will help ensure that all PDPs or MA-PD plans will be responsive to meeting Connecticut's needs, and will help maintain continuity of care for Connecticut's vulnerable populations.

Section 423.34(d) (pp. 46638-46640 of the preamble). Enrollment process. *Enrollment requirement for full benefit dual eligibles.* The preamble proposes that full benefit dual eligibles be given until May 15, 2006, to establish initial enrollment before the auto-enrollment process begins. Under this proposal, some full benefit dual eligibles will not be covered by Part D until after May 15, 2006, which would mean either that those individuals have no prescription coverage or that states will be forced to continue coverage through their Medicaid programs for that time period, but without receiving FFP for those Medicaid costs. Indeed, states will incur costs for full benefit duals who do not enroll until May 15, 2006, even beyond that date, since we do not have the administrative and programmatic ability to ensure that those individuals are immediately enrolled in a Part D plan and are accessing Part D prescription drug benefits. States should not be penalized by the fact that many full benefit dual eligibles will likely not be enrolled prior to January 1, 2006; rather, states should be able to receive FFP for prescription costs for duals until initial enrollment is accomplished and individuals are able to access their Part D benefits.

To best address this situation, we believe CMS should implement an auto-enrollment process whereby full benefit dual eligibles are automatically enrolled in a default plan effective January

1, 2006, unless the individual elects to enroll in a different plan prior to that date. In addition, in order for states to implement the most effective, best integrated wrap around program, and to minimize disruption to clients, states should be able to auto-enroll dual eligibles into a preferred PDP (similar to the drug discount card).

Under the rule, a full benefit dual who fails to enroll would be automatically enrolled in a PDP that has a monthly beneficiary premium equal to or below the subsidy amount for low income beneficiaries. While the regulation is clear that states can wrap around for beneficiaries, it is not clear whether a state can elect to enroll a dual (or perhaps SPAP recipient) in a higher premium plan if the state paid the difference and determined it to be cost effective compared to what the state's wrap around cost would otherwise be. In contrast, if a dual elects a higher premium plan as the regulation allows, the beneficiary would cover the cost of the difference (see page 46639 of the preamble). CMS should clarify that there is no obligation for states to cover the differential for duals who enroll in a plan with a premium higher than the premium subsidy benchmark level.

The proposed regulation provides for auto-enrollment for any dual eligible who has not enrolled in a Part D PDP by the end of the individual's enrollment period or upon becoming dual eligible after an initial enrollment period. While the preamble states that full benefit dual eligibles may choose to change enrollment, we believe that they should not be able to disenroll from one plan and enroll in another in a way that would create a break in coverage since this could potentially result in no prescription coverage at all or, for those states that choose to wrap around, it could force states to cover prescription costs through Medicaid at 100% state cost. Such scenarios conflict with CMS's stated rationale for auto-enrollment, which is to ensure that full-benefit dual eligibles receive outpatient drug coverage under Part D (see p. 46638 of the preamble).

If CMS does allow for a break in Part D coverage, protocols need to be in place for the coordination of and payment for drug benefits for any time period that a Medicaid dual eligible is not actually enrolled in a PDP or MA-PD plan. In addition, states need to be notified whenever a dual eligible disenrolls so that state Medicaid programs will know that the individual is no longer covered under Part D. The exposure to state Medicaid programs and SPAPs is significant as many states that choose to wrap around dual eligibles' Part D coverage will find themselves covering 100% of the prescription costs for those dual eligibles that decline enrollment or disenroll from a Part D plan.

Section 423.34 (p. 46639 of the preamble). Enrollment process. CMS is requesting comments on the most appropriate method and entity to perform auto-enrollment of dual eligibles. If the state assumes responsibility for the auto-enrollment of dual eligibles, then the rule should be amended to include an FFP provision. Since Medicare is a federal benefit, we believe that states should be fully reimbursed at 100% of their costs.

B. Eligibility and Enrollment

Section 423.36(a) (p. 46639 of the preamble). Enrollment periods. *Initial Enrollment Period for Part D—Basic Rule*. States with large SPAPs need time to develop and implement a

wraparound. Indeed efforts in this regard are complicated by the fact that many states with SPAPs will also be seeking to integrate their dual eligible populations into their programs to wraparound a dual eligible's minimal Part D costs. In effect, this creates a need to administer two wraparounds. To the degree that CMS will not announce PDP and MA-PD plans until late 2005 and with enrollment not expected until the beginning of November 2005, it is unlikely that all SPAPs will be ready to integrate their programs with the new Part D benefit. In addition, with the late rollout of Part D, there will be little time to educate consumers and help them understand the Part D benefit and its impact on them. If individual SPAPs are not ready to wrap around the federally subsidized drug benefits, SPAP states should have the option to obtain a lump sum transitional payment in FFY 2006 for SPAP recipients or elect to continue under the drug discount card program for SPAP recipients. It is assumed that non-SPAP residents would be enrolled in the nationwide program.

Left open in the preamble (see page 46727) is who will enroll beneficiaries into the Part D benefit. Section 423.774 (page 46855) of the regulation indicates that states may play a role in determining subsidy eligibility for Medicaid duals, but it is unclear if states will be required to or have the flexibility to assume the eligibility and enrollment for both Medicaid duals and SPAP beneficiaries in Part D. Many states would argue that this is the most efficacious way of enrolling beneficiaries. The regulation also leaves open the prospect that states may be the best entities to handle auto enrollment issues for duals that do not enroll in Part D voluntarily. It is noted that states could provide the best and most timely and accurate Medicaid data for determination in these instances.

But, if states are to assume the exclusive role or part of the role in the eligibility and enrollment process, states should be compensated for that cost. States should be offered the opportunity to count all administrative costs, including the costs of determining eligibility and enrollment in Part D plans as eligible Medicaid expenses, whether the beneficiary is enrolled in Medicaid or an SPAP. Consideration should be given to an enhanced reimbursement rate common to all states.

Section 423.48 (p. 46642 of the preamble). Information about Part D. CMS intends to provide information to beneficiaries in advance of initial and annual enrollment periods that would help promote informed beneficiary decisions. However, it could be very confusing for beneficiaries to receive a notice from CMS about monthly premiums and cost sharing requirements, for example, if the beneficiary is also covered by an SPAP or an employer sponsored plan that elects to wrap around the Part D coverage. Connecticut's intention is to ensure that there is no change in benefits or costs to clients of our SPAP or state retirees as a result of Part D, so a notice from CMS about cost-sharing or premiums that the state intends to cover will generate a great deal of confusion on the part of this elderly and disabled population. As an alternative, we believe that notices to beneficiaries covered by SPAPs or covered by a state employee health plan should be coordinated with states so that beneficiary confusion is minimized.

C. Voluntary Prescription Drug Benefit and Beneficiary Protections

Section 423.100 (p. 46646 of the preamble). Definitions. *Covered Part D drug.* It is unclear whether an over-the-counter (OTC) drug currently covered under Medicaid is still subject to FFP

once Part D is implemented. The rule suggests that covered Part D drugs are prescription-only with minor exceptions and must be Medicaid-covered. We believe that dual eligibles should still be able to get non-prescription drug coverage through Medicaid (with associated FFP to the state) because these items are not covered under Part D. It is not a good use of public dollars to have Medicare pay for a more expensive product plus a dispensing fee when a cheaper product is available and is something the client wants. Such a policy could result in doctors prescribing a prescription medication instead of an OTC product so that the client can have it paid for by Medicare.

Section 423.100 (pp. 46648 – 46649 of the preamble). Definitions. *Long-term care facility.* CMS requests comments on how long-term care facilities should be defined in this section and, specifically, whether intermediate care facilities for the mentally retarded should be designated as long-term care facilities. Currently, the rule suggests that the only entities to be defined as long-term care facilities would be skilled nursing or nursing facilities. The CMS justification is that only those facilities are bound to Medicare conditions of participation that result in exclusive contracts with long-term care pharmacies. CMS appears to be willing to reconsider its position on ICF/MRs if evidence is provided that such facilities have pharmacy contracts like long-term care facilities. While ICF/MRs generally may not contract with long-term care pharmacies, it is the case that many state-run ICF/MRs tend to have separate and distinct contracts with pharmacies that are sensitive to the unique needs of these residents. As well, the preamble notes that Medicare does have special coverage related to mentally retarded individuals and that these individuals will need to be assured access to Part D drugs.

We believe ICF/MRs should be designated long-term care facilities for the following reasons:

- Many of these clients have similar health conditions as those in skilled nursing facilities.
- Contracting arrangements are similar to long-term care facilities to respond to residents' unique needs.
- The special coverage in Medicare for the mentally retarded may be better protected through this designation.
- CMS has indicated that it may exempt special needs populations from cost-sharing and formulary restrictions. Residence in a designated long-term care facility would be an appropriate criterion for inclusion in a special needs group, as discussed elsewhere in our comments. Therefore, it is important to define long-term care facilities to include all facilities where individuals live due to health related reasons and also face barriers to their access to pharmacies and drugs due to their living circumstances.

In addition to ICF/MRs, we believe that the regulation should also include group homes under a 1915(c) home and community-based waiver as long-term care facilities for the reasons outlined above. The populations in these facilities are substantially similar to those in ICF/MRs and often are included in state contracts for pharmacy services for ICF/MRs.

Section 423.100 (p. 46651 of the preamble). Definitions. *Incurred costs.* For persons eligible for both ADAP and Medicare, we believe that ADAP expenditures or, alternatively, at least state expenditures for prescription assistance to persons with HIV/AIDS, should count as "creditable"

coverage and should be added to the list of forms of "creditable" coverage under Section 423.56 of the proposed rule (p. 46644 of the preamble). Contrary to the assertion by CMS in the preamble at pages 46650-46651, state funds used to provide prescription assistance to individuals with HIV/AIDS are no different from SPAP expenditures and should count toward that beneficiary's out of pocket costs. We believe that 1860D-24 of the Act gives the Secretary the discretion to define "insurance or otherwise" as described in 1860D-2 in a way that is consistent with our recommendation. The definition of "incurred costs" in Section 423.100 of the proposed rule should therefore be revised accordingly.

Section 423.100. Definitions, or Section 423.104. Requirements related to qualified prescription drug coverage. Since plans can define a one month supply differently (e.g., 30, 31 or 32 days), the proposed rule should establish a consistent definition of supply limits. Without such a definition, one payor may reject a claim saying the refill is too soon, when another would pay. Ensuring a consistent definition will minimize the impact on SPAPs and employer sponsored wrap-around plans, which are likely at risk for covering any charges for early refills.

Section 423.104(h)(1) (p. 46654 of the preamble). Requirements related to qualified prescription drug coverage. *Access to negotiated prices.* The general understanding, based on the language in this section, is that, for a formulary drug, the negotiated PDP or MA-PD plan price will hold through the "donut hole" period and for a non-formulary drug, the SPAP will pay under their pricing structure. Thus, even though it is the SPAP not the PDP or MA-PD plan covering the expense of a formulary drug, the rebate would go to the PDP or MA-PD plan since it is their negotiated rate that is being used and which was most likely developed based on a claims volume that includes the "donut hole" period. By forcing the SPAPs to integrate their programs with all of the plans (see page 46697 of the preamble), there is a disincentive for the states to wraparound. In addition, states lose any bargaining power with manufacturers with regard to rebates if states can no longer guarantee a certain volume or as large a volume. In effect, SPAP costs could now increase during the "donut hole" for a given client as the state no longer has the ability to reduce ultimate costs through significant rebates from a drug manufacturer as the rebate is already being paid to a PDP or MA-PD plan even though the PDP or MA-PD plan is not covering the actual costs of the drugs during the "donut hole." The law and regulation are clear that PDPs and MA-PD plans have to make the discounted price available to beneficiaries even during the "donut hole" period. We recommend that, for states that need the volume to maintain rebates, they be allowed the option of covering prescription costs under their own arrangements (i.e., under existing reimbursement policies and manufacturer rebate agreements), during the "donut hole" period. While a PDP or MA-PD plan may lose some volume discount, states need the leverage.

Section 423.104(h)(3) (p. 46654 of the preamble). Requirements related to qualified prescription drug coverage. *Negotiated prices. Disclosure.* States must have access to the price concession data that CMS says will be required reporting from the PDPs and MA-PD plans despite confidentiality issues. Because states are at risk of losing discounts in both Medicaid and SPAPs, this data will help states determine the financial impact of wrapping around Part D for these populations.

Section 423.112 (p. 46655 of the preamble). Establishment of prescription drug plan service areas. Because the MMA allows for up to 50 state regions, and because Connecticut is an SPAP state, we believe that CMS should establish PDP regions in a way that allows Connecticut to be its own region. This is of importance to Connecticut because of the need to coordinate between our SPAP and the PDP or MA-PD plans. The needs and concerns of smaller states (especially states with SPAPs) could be subsumed by larger states with different integration needs. Allowing Connecticut to be its own region will help ensure that any PDP or MA-PD plans will be responsive to meeting Connecticut's needs, and maintaining continuity of care for Connecticut's vulnerable populations.

Section 423.120(a) (pp. 46658 - 46659 of the preamble). Access to covered Part D drugs. *Assuring pharmacy access.* The proposed rule distinguishes between preferred and non-preferred network pharmacies, where a non-preferred pharmacy is a network pharmacy that offers Part D enrollees higher cost-sharing for covered Part D drugs than a preferred pharmacy. As noted in the preamble, cost sharing can vary not only based on the type of drug or formulary tier, but also on a particular pharmacy's status within the plan's pharmacy network. This adds yet another level of complexity to the plan, especially as SPAPs or employer sponsored plans try to wrap around and coordinate with multiple PDPs and MA-PD plans. Further, while the proposed rule appears to guarantee beneficiaries wide access to pharmacies, a PDP or MA-PD plan could still meet these access requirements but in effect have a very small preferred network that discourages enrollment of certain populations as well as enrollment from certain geographic areas. On page 46659 of the preamble, CMS says it will review the design of proposed plans to ensure that such plans do not "substantially discourage" enrollment. This is important as the current rule does not ensure adequate access to preferred pharmacies and could be used by PDPs or MA-PD plans to shift certain costs back to SPAPs or employer sponsored plans that choose to wrap around the Part D benefit. To maximize access, CMS should establish clear guidelines to ensure the broadest network of preferred pharmacies throughout a PDP's or MA-PD plan's coverage area. We believe this could best be achieved by requiring plans to meet network access standards using preferred pharmacies. In addition, the rule should mandate that CMS approve changes to a PDP's or MA-PD plan's network annually, as well as any substantive midyear changes in plan networks.

Section 423.120. Access to covered Part D drugs. The MMA does not appear to address the issue of continuity of benefits with respect to dual eligibles. Since the existing provisions in Title XIX have not been repealed, CMS will need to clarify whether state Medicaid programs continue to be bound by the requirement to provide non-formulary drugs as dual eligibles transition to Medicare Part D. Similarly, if there is an appeal of a formulary decision, we believe that Medicare should pay for the cost of the requested prescription pending resolution of the appeal, so that Medicaid is not responsible for continuing coverage at 100% state cost.

Section 423.120 (p. 46661 of the preamble). Access to covered Part D drugs. CMS is requesting comments on special needs populations and any special treatment needed for such populations as it relates to flexibility and cost containment in the program. The preamble recognizes the unique health needs of such populations and notes that open formularies are the norm for clients in long-term care facilities. Section 423.782(a)(2)(ii) also exempts individuals in long-term care facilities from cost-sharing.

Skilled nursing facility residents and residents of ICF/MRs appear to be deemed institutionalized under the Act and would be free of cost-sharing requirements. That may not be the case for residents of 1915(c) waiver group homes and other similar facilities for persons with mental illness or mental retardation. Because these special needs populations have substantially similar financial status and health needs as residents of skilled nursing facilities and ICF/MRs, we believe that all of these populations should be treated equally.

While residents of ICF/MRs and group homes and other facilities may have some income disregarded (those in nursing homes do not), their income is still extremely limited. The personal needs allowances (PNAs) in skilled nursing facilities are generally well below $100 in most states, and need only be $30 per month according to federal Medicaid law. These PNAs must cover personal incidentals as well as co-pays and non-formulary drugs. If not deemed institutionalized or otherwise freed of cost-sharing, a medically fragile individual subject to cost-sharing and with multiple prescriptions could not afford even the minor cost-sharing under Part D.

The financial wherewithal of all special needs populations, including those in skilled nursing facilities and ICF/MRs otherwise free of cost-sharing, may not be able to afford their medications or have true access to them if formulary restrictions apply. Formulary restrictions could force such special needs individuals to utilize the majority or all of their monthly income on medications if a needed drug is not on a formulary, and must be purchased out-of-pocket while pursuing an appeal. Indeed, in some cases, their PNA would not be adequate to cover the out-of-pocket cost, resulting in a break in therapy. Furthermore, few of these individuals have the cognitive abilities to deal with appealing a formulary denial and it would be an enormous burden for their group home or case manager to have to navigate the appeals process on behalf of numerous clients.

CMS clearly recognizes in the preamble that such populations may need special treatment because they are more sensitive to and less tolerant of many medications. Also noted is that most long-term care pharmacies have open formularies to respond to this fact. In general, the existence of any formulary restrictions and cost-sharing could easily lead to greater medical costs for non-drug benefits for these exceedingly medically fragile populations. Research published by the Center for Health System Change has documented that barriers to access for drugs for the Medicaid population, including co-payments and prior authorization, have led to reduced adherence to medically necessary drug regimens. Failure to properly comply with medication therapy results in exacerbations of chronic and acute illnesses that, at a minimum, bring these patients back to the physician and, at worst, puts them in a hospital or other institutional setting.

We believe strongly that all special needs populations must be exempt from formulary restrictions and cost-sharing. Formulary exceptions and exemptions from cost-sharing are important for the following groups:

- Residents of skilled nursing facilities and other like entities.
- Residents of ICF/MR facilities.
- Residents of 1915(c) waiver group homes.

- Residents of state-run group homes that operate similarly to 1915(c) waiver group homes but have not technically met federal Medicaid qualifications.
- Those with chronic mental illness, whether they qualified for federal SSI or not. These individuals often are required to have less-than-30-day supplies of prescription drugs because of suicidal tendencies or the need for close monitoring. Formularies and cost-sharing for this population would complicate the already major challenge of drug adherence for many of these individuals, whose very illnesses make it difficult to adapt to change. Furthermore, paying out of pocket for denied drugs would force these individuals to exhaust the vast majority of their income each month. States that have implemented even nominal co-pays on Medicaid recipients have at least anecdotally found that such co-pays have dissuaded the mentally ill from filling prescriptions. This was the case even when Medicaid beneficiaries were told that federal law dictated that the drug could not be withheld due to lack of payment of co-pays. Thus, we know that financial barriers for this population result in under-treatment and consequently larger costs for non-drug services.
- Those with other chronic health conditions, such as HIV/AIDS. These beneficiaries often have multiple prescriptions due to the complex nature of their conditions. As such, they would be unable to afford cost-sharing or the additional financial implications of being subjected to a restrictive formulary.
- Beneficiaries who are otherwise on Medicaid community-based waivers (to avoid institutionalization) and therefore have very limited incomes should also be considered to be free of cost-sharing and certain formulary restrictions. This would apply to individuals on home and community-based waivers for the elderly and disabled or those on Katie Beckett waivers.

Section 423.120 (see also section 423.124) (p. 46657 of the preamble). Access to covered Part D drugs. CMS is seeking comments regarding whether plans should be required to contract with long-term care pharmacies. Section 1860D-4(b)(1)(C)(iv) of the law gives the Secretary discretion to require plans to contract with long-term care pharmacies. We would recommend that section 423.120 of the rule be modified to include access to all long-term care pharmacies.

Section 423.120 (p. 46659 of the preamble). Access to covered Part D drugs. The proposed regulation provides for fairly stringent rules to ensure that beneficiaries have access to medically necessary drugs. While section 1860D-4(b)(3)(A) of the Act requires that the formulary be "developed and reviewed" by a P&T committee, it is CMS' interpretation that the P&T committee may establish and change drugs on a formulary and that the committee's decision is binding on the plan. Section 423.120 of the regulation, however, requires only that a PDP's and MA-PD plan's formulary be reviewed by a P&T committee. The regulation should be amended to adopt CMS' intent about the binding nature of the P&T committee's decisions.

Section 423.120(a)(6) (p. 46649 of the preamble). Access to covered Part D drugs. *Level playing field between mail-order, and network pharmacies.* The proposed rule provides that those who choose an extended supply of a Part D drug through a retail pharmacy would be responsible for the differential between the retail pharmacy's negotiated price and the network's mail-order

negotiated price. We are concerned about this policy because, if that amount is greater than the amount the SPAPs or employer sponsored wrap-around plans would have paid for the extended supply, then costs are being shifted to the states.

CMS is seeking comments on their proposal that this price differential be counted as an incurred cost against the annual out-of-pocket threshold. We support this position and recommend that the rule clearly state that this differential counts towards out-of-pocket expenditures.

Section 423.120(b)(2) (p. 46660 of the preamble). Access to covered Part D drugs. *Inclusion of drugs in all therapeutic categories and classes.* There is a requirement that PDPs and MA-PD plans have at least two drugs in each class as well as have generics available. The regulations are not clear, however, whether generics can be one of the two drugs. We believe two brands plus a generic (when available) should be the minimum requirement.

Section 423.120(b)(5) (p. 46819 of the preamble). Access to covered Part D drugs. *Provision of notice regarding formulary changes.* Section 1860D-4(b)(3)(E) of the Act states: "Any removal of a covered Part D drug from a formulary and any change in the preferred or tiered cost-sharing status of such a drug shall take effect only after appropriate notice is made available (such as under subsection (a)(3)) to the Secretary, affected enrollees, physicians, pharmacies, and pharmacists." Of concern is that CMS has interpreted "appropriate notice" to mean 30 days. Specifically, section 423.120 (page 46819) of the proposed rule reads: "A PDP sponsor or MA organization offering an MA–PD plan must provide at least 30 days notice to CMS, affected enrollees, authorized prescribers, pharmacies, and pharmacists prior to removing a covered Part D drug from its plan's formulary, or making any change in the preferred or tiered cost-sharing status of a covered Part D drug." CMS may maintain that any arbitrary change is unlikely as it has a requirement for all formulary changes to go through a P&T committee that meets specifications and the approval of CMS. The issue is not that changes might be made arbitrarily, but it simply does not allow enough time for the SPAPs to respond to or integrate the formulary change in their programs. Therefore we recommend that, at a minimum, PDPs be required to grandfather-in coverage of a deleted drug for anyone who was taking the medication prior to the deletion, unless the deletion is due to the new availability of a generic substitute or due to the FDA's removal of the drug from the market due to safety reasons. This should not be construed as prohibiting a PDP from asking physicians to voluntarily switch their patients to less costly drugs, in a therapeutic substitution initiative. In the alternative, we believe that any formulary change should require 90 day notice to all beneficiaries as well as SPAPs and state retiree plans.

Section 423.120(b)(5) (p. 46661 of the preamble). Access to covered Part D drugs. *Provision of notice regarding formulary changes.* CMS proposes that PDPs and MA-PD plans only inform those taking a drug affected by a formulary change of such a change. We believe that all beneficiaries and all parties, including SPAPs and state retiree plans, should be notified of formulary changes.

Section 423.124 (p. 46662 of the preamble). Special rules for access to covered Part D drugs at out-of-network pharmacies. In the preamble, CMS details four scenarios where out of network access would be guaranteed. A fifth scenario for out-of-network access should be added that specifically identifies those retirees who reside in different parts of the country during the year

("snowbirds") and are outside of the service area, (e.g., they reside for several months at a time in Connecticut and in Florida). Regional plans may not be sufficient for snowbirds. Even if a plan's service area does cover both areas of the country where the snowbird resides, the plan may not use the same contracting pharmacies in the dual locations, thereby subjecting the retiree to pay higher costs from out-of-network pharmacies during a portion of the year. This is an important consideration for employers who currently have (or are required to have per union agreements or otherwise) prescription drug coverage that is nationwide or covers entire regions of the country and are deciding whether to switch to a plan that has Medicare Part D as the primary payer for prescription coverage.

D. Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans

Section 423.153 (p. 46667 of the preamble). Cost and utilization management, quality assurance, medication therapy management programs, and programs to control fraud, abuse, and waste. CMS requests comments regarding a proposed requirement that cost-savings strategies be under the direction and oversight of a Pharmacy and Therapeutics Committee. We support this proposal.

Section 423.153 (p. 46670 of the preamble). Cost and utilization management, quality assurance, medication therapy management programs, and programs to control fraud, abuse, and waste. For states to run successful disease management programs, it is important that they retain the ability to access prescription history for dual eligibles. In addition, in order to minimize prescription abuse by clients who are in lock-in status, states need the ability to continue to track a client's prescription history. The exchange of data between PDPs / MA-PD plans and states is critical. Limiting the number of plans (see our comments in Subpart J) would facilitate integration and allow the state to better coordinate care.

Section 423.153(c). Cost and utilization management, quality assurance, medication therapy management programs, and programs to control fraud, abuse, and waste. *Data Sharing/ Quality Assurance.* To ensure an effective drug benefit program, quality assurance and evaluation are essential. In particular, SPAPs and state retiree plans must have access to data to evaluate program performance. As a result, we believe CMS should share Medicare evaluation data with SPAPs and state retiree plans to allow states to make decisions regarding ongoing quality improvements. We also believe CMS should issue an annual report assessing the effectiveness of the Part D drug benefit program. The report should include detailed information on claim denials; exceptions and appeals and their outcomes; the turnaround times for PDP processing of prior authorization requests, exception requests, and re-determination requests; and, the percent of the total negotiated drug costs paid by the PDP versus the beneficiary, SPAP, or state retiree plan.

F. Submission of Bids and Monthly Beneficiary Premiums: Determining Actuarial Valuation

Sections 423.104 and 423.272 (p. 46681 of the preamble). Review and negotiation of bid and approval of plans submitted by potential PDP sponsors or MA organizations planning to offer MA–PD plans. The general understanding, based on section 423.104 of the proposed rule and page 46654 of the preamble, is that, for a formulary drug, the negotiated PDP or MA-PD plan price will hold through the "donut hole" period and for a non-formulary drug, the SPAP will pay under their pricing structure. Thus, even though it is the SPAP not the PDP or MA-PD plan covering the expense of a formulary drug, the rebate would go to the PDP or MA-PD plan since it is their negotiated rate that is being used and which was most likely developed based on a claims volume that includes the "donut hole" period. By forcing the SPAPs to integrate their programs with all of the plans (see page 46697 of the preamble), there is a disincentive for the states to wraparound. In addition, states lose any bargaining power with manufacturers with regard to rebates if states can no longer guarantee a certain volume or as large a volume. In effect, SPAP costs could now increase during the "donut hole" for a given client as the state no longer has the ability to reduce ultimate costs through significant rebates from a drug manufacturer as the rebate is already being paid to a PDP or MA-PD plan even though the PDP or MA-PD plan is not covering the actual costs of the drugs during the "donut hole." The law and regulation are clear that PDPs and MA-PD plans have to make the discounted price available to beneficiaries even during the "donut hole" period. We recommend that, for states that need the volume to maintain rebates, they be allowed the option of covering prescription costs under their own arrangements (i.e., under existing reimbursement policies and manufacturer rebate agreements), during the "donut hole" period. While a PDP or MA-PD plan may lose some volume discount, states need the leverage.

Section 423.272 (p. 46681 of the preamble). Review and negotiation of bid and approval of plans submitted by potential PDP sponsors or MA organizations planning to offer MA–PD plans. This section allows CMS to reject any bid if it finds that it will "substantially discourage enrollment by certain Part D eligible individuals." In the preamble, CMS asks for comments on how to evaluate the proposed formularies in bid proposals. We believe a reasonable formulary should assure that 90% of patients with any particular diagnosis could find their medication on the formulary. CMS should therefore establish a formulary evaluation criterion that would trigger a much more detailed evaluation of the adequacy of the formulary if a drug plan failed to offer enough medication choices to assure that 90% of the beneficiaries will be able to continue on their current therapies. A formulary that requires vast numbers of elderly to switch or appeal will result in the potential for numerous interruptions in drug therapy that result in other medical cost and quality problems. It will also result in significant costs for SPAPs that will wrap around Part D by picking up the costs of drugs that are denied as non-formulary drugs.

Section 423.293(a) (p. 46685 of the preamble). Collection of monthly beneficiary premiums. *General rule.* The regulation allows for payment of premiums directly to PDPs or MA-PD plans. Because CMS will have the most up-to-date information about which plan a beneficiary is enrolled in, SPAPs should pay premiums directly to CMS. One mechanism that could be used is to parallel the existing programs whereby states pay QMB and SLMB cost-sharing to the federal government through Medicaid reimbursement withholds.

The regulation also allows for the collection of beneficiary premiums through withholding from Social Security checks. However, in the case where an SPAP state wishes to wrap its SPAP

benefit around the Part D benefit, such withholding is inappropriate. Once again, we want the option of paying premiums directly to CMS. Such payments could be made similar to the way Medicare buy-in payments are made for dual eligibles. With state payment of premiums, we would want to ensure that there are beneficiary protections to prevent disenrollment of the beneficiary if a federal-state payment dispute arises.

G. Payments to PDP Sponsors and MA Organizations Offering MA-PD Plans for All Medicare Beneficiaries for Qualifies Prescription Drug Coverage

Section 423.336 (p. 46693 of the preamble). Risk-sharing Arrangements. *Plan spending below target*. In the preamble, CMS writes "if plan spending fell below the target, plans would share the savings with the government." Because states are contributing toward the cost of running the Part D program through the clawback, any savings that accrue to "the government" should be shared with states.

I. Organization Compliance With State Law and Preemption by Federal Law

No comments.

J. Coordination Under Part D Plans With Other Prescription Drug Coverage

Section 423.464(a) (p. 46700 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *General rule*. This section addresses the data sharing that should occur with SPAPs as to coordination of benefits, calculation of out-of-pocket requirements, etc. In our view, the regulation is weak with respect to safeguarding states' needs for coordination because it says that PDPs "must permit" SPAPs to coordinate with PDPs. We believe that the rule should be modified to read that PDPs and MA-PD plans "are required to coordinate with SPAPs." We also believe that, once the initial coordination is in place, language requiring ongoing coordination needs to be added to the rule. In addition, we believe explicit language in the contracts of PDPs and MA-PD plans (see section 423.505 of the rule) must be included to ensure the proper data sharing and coordination, especially if PDPs and MA-PD plans are responsible for TrOOP calculation, as opposed to a separate vendor contracted by CMS. We have offered additional comments under Subpart K, below, regarding contractual language that would help effectuate the requirement for PDPs and MA-PD plans to coordinate with SPAPs.

Section 423.464(a). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *General rule*. While this section of the regulation requires PDPs and MA-PD plans to permit SPAPs to coordinate with plans, the detail is insufficient to address the significant continuity of care concerns raised by SPAP plans on behalf of their beneficiaries. The regulation needs to be stronger on the requirements of PDPs and MA-PD plans to share data and enter into agreements regarding continuity of care and coordination of such things as prior authorization, generic substitution and formulary changes. The regulation should make clear that PDPs and MA-PD plans are required to work with SPAPs and give some deference to the controls,

processes, and limitations (e.g., preferred drug list, prior authorization and generic substitution decisions) already established by SPAPs. We recommend that state rules addressing patient access to drugs should govern PDPs and MA-PD plans. To protect continuity of care, procedures should be put in place before the January 2006 start date to mandate dialogue concerning SPAP clients that have already been prior authorized for certain brand drugs.

Section 423.464(e)(ii) (p. 46697 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *Non-discrimination.* Section 1860D-3 of the Act requires the Secretary to ensure that each Part D eligible individual has a choice of at least two qualifying plans or, if necessary, the opportunity to enroll in a fallback prescription drug plan. Section 1860D-23(b)(2) prohibits SPAPs from working with a subset of plans available in the region (the so-called "anti-discrimination" requirement), which means that SPAPs must coordinate with multiple plans. Section 426.464(e)(1)(ii) operationalizes the Act by requiring SPAPs to provide assistance "to Part D eligible individuals in all Part D plans without discriminating based upon the Part D plan in which an individual enrolls." Section J of the preamble (page 46697) states:

> "We are interpreting the nondiscrimination language to mean that SPAPs, if they offer premium assistance or supplemental assistance on Part D cost sharing, must offer equal assistance by all PDPs or MA–PD plans available in the State and may not steer beneficiaries to one plan or another through benefit design or otherwise. State programs cannot, for example, use the threat of withholding SPAP enrollees to negotiate coverage, premium or formulary changes with PDPs or MA–PD plans. Violations of the non-discrimination rule will jeopardize the program's special status with respect to true out-of-pocket costs. That is, a State program that discriminates does not qualify under the definition of an SPAP, and consequently, its contributions to cost sharing do not count toward the out-of-pocket limit."

CMS indicated in an 8/4/04 conference call that the actual operational details were not yet defined. For administrative ease, efficiency and cost effectiveness, states need the ability to limit the number of PDPs with which they need to coordinate to one or two. The states need to have ways to ratchet down their costs, especially in light of no guarantee of reimbursement for ongoing administrative costs, the strong likelihood of a loss of drug rebate dollars in SPAP and Medicaid programs, and the ongoing "donut hole" costs to states. More to the point, continuity of care can be maximized (and costs to the state and federal governments minimized) if states have the ability to work with one or two preferred PDPs. Further, many SPAPs will be providing some form of wrap around coverage or will be subsidizing a plan's premiums. As a result, it is essential that SPAPs be given the opportunity to steer their beneficiaries away from those PDPs requiring disproportionately high premiums without providing any clear benefits to their enrollees. The language in section 423.464 of the regulations should be broadened to allow states to contract with one or two PDPs as long as the contracts are competitively bid and limiting the number of PDPs would be in the best interest of state SPAP clients because the state clearly defined what it was looking for during the bidding process. We believe that states would still be able to meet the anti-discrimination test with this process. As an alternative, states should be allowed to design a wrap around and limit enrollment of its SPAP and dual-eligible clients in those plans that agree to the state's contractual requirements. As a further alternative, states should have the right to auto-enroll any SPAP clients who are required as a condition of enrollment in an SPAP to enroll in Part D but fail to do so (or duals that either refuse to enroll voluntarily or disenroll from Part D) in a state's preferred PDP vendor(s). Indeed, section 423.34

of the regulation refers to states potentially doing an automatic and random enrollment function with regard to duals that do not voluntarily enroll. We believe that allowing states to enroll SPAP clients and dual eligibles in default plans, but then allowing those enrollees to choose another PDP if they do not want to be in the default plan, will meet the test of anti-discrimination.

Section 423.464(f)(3) (pp. 46696-46700 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *Imposition of fees.* While SPAPs are not required to coordinate with PDPs (see page 46701 of the preamble), section 423.464(a) of the regulation says PDPs "must permit" SPAPs to coordinate with PDPs and MA-PD plans. The rule allows Part D plans to impose fees on SPAPs for required coordination, including enrollment, claims processing, payment of premiums, and administrative processes (see page 46700 of the preamble). Because no funding is provided to states for this coordination, such fees should not be imposed on the states. While 1860D-11(j) of the Act says that fees unrelated to the cost of coordination are not to be imposed, we believe that CMS has the authority to interpret this language to prevent unnecessary and unreasonable fees from being charged at all. Instead, CMS should establish a baseline requirement of coordination that is applicable nationwide, with any costs related to that coordination factored into a plan's bid and paid by CMS. Only extraordinary costs related to a state's unique situation that are beyond the scope of normal, reasonable national-standard coordination requirements should be borne by the state, and even then we seek the ability to negotiate such costs in concert with CMS before plan contracts are executed. Additionally, it is important that the regulations and the PDP and MA-PD plan contracts signed with CMS be clear and specific on the level of coordination that PDPs and MA-PD plans must have with SPAPs, and that any state-specific requirements be included in the contracts executed by CMS and the plans. Without these protections, there is absolutely no incentive for plans to negotiate in good faith with states, and states could be subjected to unreasonable and excessive fees as a result of needing to coordinate SPAP and retiree coverage with the plans. (We have made related comments on contract protections in Subpart K.)

Section 423.464(f)(ii) (pp. 46698 – 46699 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *Employer Options*. If employers pick an option that requires their retirees to enroll in Part D with Medicare as the primary payer, the final rule should contain special access and financial protections to safeguard those employers with significant numbers of "snowbird" retirees. As discussed in our comments on Subpart C, above, this segment of the retiree population has access issues that must be addressed. This is particularly important because there is still uncertainty over how many plans that currently offer nationwide drug discount cards will participate in Part D due to the notion of presumed risk.

Section 423.464(d) (p. 46701 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *Cost Management Tools.* Section 423.464(d) of the proposed rule and section 1860D-24(c)(1) of the Act allow PDPs and MA-PD plans to continue to use cost-containment strategies even as they relate to SPAPs or other drug plans providing wrap-around or supplemental coverage. CMS seeks comments in the preamble on how CMS "can ensure that wrap-around coverage offered by SPAPs and other insurers does not undermine or eliminate the cost management tools established by Part D plans." The greater concern may be how to ensure that Part D plans are not incentivized to cost shift to SPAPs and state retiree plans. If states are

paying for coverage for SPAP enrollees who are also Medicare Part D beneficiaries (regardless of whether the PDP or MA-PD plan is directly providing the additional benefits under contract with the SPAP or whether the SPAP is coordinating such wrap around coverage with the PDP or MA-PD plan), we believe CMS should help support state laws and policies regarding SPAP coverage. States are as interested in cost management as CMS—but we are also mindful of the impact on vulnerable populations and the need to ensure continuity of care. The rule makes no attempt to prevent PDPs and MA-PD plans from controlling or overruling SPAP decision-making when coverage is paid for by SPAPs, particularly in the "donut hole." Section 423.464(d) of the rule should be modified to require that PDPs and MA-PD plans accede to SPAP rules where SPAPs are paying for beneficiary coverage.

Section 423.464(e)(2) (p. 46702 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *Special treatment under out of pocket rule*. CMS indicates it is interested in comments on whether SPAPs should be required to provide feedback on how much TrOOP they have paid. Because PDPs know how much of the claim they have paid and because beneficiary and SPAP expenditures both count as TrOOP costs, it is irrelevant how much of that claim is SPAP related. There are enough administrative and coordination requirements in MMA without imposing more. The rule should be modified by deleting the phrase "collect information on and" from Section 423.464(e)(2). PDPs should count any non-PDP costs for SPAP enrollees as out of pocket for purposes of TrOOP calculation.

Section 423.464(e)(2) (pp. 46706 and 46789 of the preamble). Coordination of Benefits With Other Providers of Prescription Drug Coverage. *Tracking TrOOP*. CMS seeks comments on whether a single, central entity or multiple PDPs are best suited to tracking TrOOP. Because of coordination requirements with SPAPs, we recommend that one central entity (CMS) maintain a data system rather than having multiple PDPs maintaining separate systems.

K. Proposed Application Procedures and Contracts With PDP Sponsors

Section 423.505. Contract Provisions. (cross reference Section 423.464. Coordination of Benefits). Section 423.464 of the rule and page 46700 of the preamble address the data sharing that will occur with SPAPs as to coordination of benefits, calculation of out-of-pocket requirements, etc. See our comments under Subpart J, above, regarding strengthening the rule by requiring PDPs to coordinate with SPAPs. CMS has proposed no specific contractual language for PDPs and MA-PD plans that would describe the required coordination. Section 423.505 of the proposed regulation only states that PDPs would need to "comply with the coordination requirements…in subpart J". In order to implement this requirement, we believe explicit language in section 423.505 of the rule as well as in the contracts of PDPs and MA-PD plans must be included to ensure the proper data sharing and coordination, especially if PDPs and MA-PD plans are responsible as opposed to a separate vendor contracted by CMS.

Section 423.505. Contract Provisions. (cross reference Section 423.464. Coordination of Benefits). *Fees*. CMS has proposed no specific contractual language for PDPs and MA-PD plans that would prevent unreasonable or excessive fees from being imposed (see comments to Section 423.464 under Subpart J). Section 423.505 of the proposed regulation only states that

PDPs would need to "comply with the coordination requirements…in subpart J". Because no funding is provided to states for coordination, such fees should not be imposed on the states. While 1860D-11(j) of the Act says that fees unrelated to the cost of coordination are not to be imposed, we believe that CMS has the authority to interpret this language to prevent fees from being charged at all, or at a minimum the imposition of unnecessary and unreasonable fees. Instead, CMS should establish a baseline requirement of coordination that is applicable nationwide, with any costs related to that coordination factored into a plan's bid and paid by CMS. Only extraordinary costs related to a state's unique situation that are beyond the scope of normal, reasonable, national-standard coordination requirements should be borne by the state, and even then we seek the ability to negotiate such costs in concert with CMS before plan contracts are executed. Additionally, it is important that the regulations and the PDP and MA-PD plan contracts signed with CMS be clear and specific on the level of coordination that PDPs and MA-PD plans must have with SPAPs, and that any state-specific requirements be included in the contracts executed by CMS and the plans. Without these protections, there is absolutely no incentive for plans to negotiate in good faith with states, and states could be subjected to unreasonable and excessive fees as a result of needing to coordinate SPAP and retiree coverage with the plans. (We have made related comments on contract protections in Subpart J.)

Sections 423.509 and 423.510. Termination of contract by PDP or CMS. Currently, SPAPs are not among the parties specifically delineated as requiring notification by either PDPs or CMS. Given the significant impact Part D plans will have on SPAPs and state retirees, states must be included as parties to be notified of the termination of PDP contracts. At a minimum, SPAPs should be allowed greater notice than to the public in order to coordinate coverage as well as current and future enrollment. Sections 423.507 through 423.510 of the proposed rule should be amended to include timely notification to SPAPs and state retiree plans of termination of a PDP contract. (Similar notification requirements should be imposed by CMS on MA-PD plans.)

L. Effect of Change of Ownership or Leasing of Facilities During Term of Contract

Sections 423.551(c) and 423.552(a)(1) (pp. 46716-46717 of the preamble). Advance Notice Requirement. Currently, states are not among the parties specifically delineated as requiring notification by either PDPs or CMS. Given the significant impact Part D plans will have on SPAPs and state retirees, states must be included as parties to be notified of changes in ownership. To ensure continuity of care and minimize disruption of coordinated benefits, the advanced notification requirements in sections 423.551 and 423.552 of the proposed rule should be amended to include states, especially SPAP states.

M. Grievances, Coverage, Reconsiderations, and Appeals

Section 423.562. General Provisions. (cross-reference Section 423.44 (p, 46641 of the preamble). Disenrollment by the PDP). Section 423.44 of the proposed rule allows for the disenrollment of beneficiaries whose behavior is "disruptive, unruly, abusive, uncooperative or threatening." Because of the special needs of the dual eligibles, as well as the elderly and disabled served under our SPAP, an adequate appeals process needs to be established as well as

provisions to ensure that there will be no lapse in coverage since lack of coverage would threaten their health needs.

Sections 423.560 to 423.638. To protect continuity of care, procedures should be put in place before the January 2006 start date to mandate dialogue between states and PDPs and MA-PD plans concerning SPAP clients that have already been prior authorized for certain brand drugs. In Connecticut, atypical antipsychotic drugs are exempt from prior authorization for clients currently on them – only newly prescribed atypical antipsychotics that have at least three A-rated generics available for substitution are required to get prior authorization, and then for initial scripts only. The regulation should be modified to ensure that PDPs honor the existing prior authorization and generic substitution decisions made by SPAPs. This will help maintain continuity of care.

Section 423.560. Definitions, and Section 423.562. General Provisions. *SPAPs as Authorized Representatives, and Data Sharing*. While the definition of an authorized representative under section 423.560 could be interpreted to include an SPAP acting on behalf of an SPAP client, the regulation should be clarified. For both administrative and programmatic reasons, it is important that SPAPs be allowed to be the authorized representatives for SPAP clients.

For example, regarding step therapy, SPAPs may have claims history to show that the PDPs and MA-PD plans preferred drug was previously tried. PDPs and MA-PD plans should be required to coordinate with SPAPs and share claims history because SPAPs may have the longest and most complete clinical history. This is especially important because people may change PDPs and MA-PD plans every year, but the SPAP will remain consistent.

SPAPs and PDPs / MA-PD plans need to coordinate or at least share clinical criteria for prior authorization and also generic substitution. It is important both to avoid having two entities undertake prior authorization but also to protect continuity of care.

It will be confusing for SPAPs that have full benefit plans to know whether they should pay under their wrap-around when a PDP or MA-PD plan denies coverage. For example, when denials occur for a DUR reason, how will an SPAP know not to pay for a contraindicated drug? Certainly, SPAPs will want to continue with their own DUR programs to both protect their clients as well as prevent unnecessary costs. This will be challenging if the PDP or MA-PD plan and SPAP DUR programs don't have the same system edits.

Again, the rule must be clarified to ensure that the definition of "authorized representative" includes SPAPs and retiree plans acting on behalf of a beneficiary. We also recommend that CMS add requirements to Section 423.562 to ensure that PDPs are required to share data with SPAPs, at no cost to SPAPs, to ensure coverage is coordinated to promote continuity of care.

Section 423.566 (pp. 46718-46721 of the preamble). Coverage determinations. A phase-in period for formulary denials by PDPs and MA-PD plans for new enrollees is needed. This would ensure that new enrollees don't first discover that they aren't covered for a drug when they have run out and are seeking a refill – leaving them no time to pursue a switch or to appeal. This is especially important for individuals taking multiple drugs who may discover that more

than one medication needs to be switched. Good clinical practice calls for not switching multiple drugs at once, but rather doing them one at a time, so that it is clear which drug is causing side effects, if any show up. An exception should automatically be granted any time an individual is running into more than one denial for non-formulary drugs. Otherwise, SPAPs and employer sponsored wrap-around plans will wind up paying for all of these denials.

Section 423.568(a). Standard timeframe and notice requirements for coverage determinations. The proposed rule allows PDPs up to 14 days to issue a decision on the request for an exception. This timeframe, however, is far too lengthy and is inconsistent with current industry practice as well as Medicaid standards. If adopted, this standard could put vulnerable populations, particularly those with chronic illnesses, at significant risk. PDPs should be required to render a decision on a request for an exception within 48 to 72 hours. While an exception request is pending, the beneficiary should receive the requested prescription (at a minimum, a 3-day supply if a 48-72 hour timeframe for PDP review of exception requests is adopted).

Section 423.578. Exceptions process. We have a number of recommendations regarding the proposed exceptions process. First, the final regulation must ensure that exceptions processes dovetail with SPAP prior authorization processes. Second, SPAPs must be allowed to be authorized representatives for the individual during the exception appeal. Third, while an exception is pending for dual eligibles, Medicare should pick up the full cost of the requested prescription until a decision is rendered so that states are not forced to pick up the costs as a potential Medicaid and SPAP continuity of care issue. This is particularly important because of restrictions on limiting Medicaid state plan services for the dual eligible population. Fourth, PDPs should be required to grandfather-in coverage of a deleted drug for anyone who was taking the medication prior to the deletion, unless the deletion is due to the new availability of a generic substitute or due to the FDA's removal of the drug from the market due to safety reasons. This should not be construed, however, as prohibiting a PDP from asking physicians to voluntarily switch their patients to less costly drugs as part of a therapeutic substitution initiative. Finally, we urge inclusion of language to guarantee access to lower co-pays when midyear increases are made by the PDPs.

Section 423.600 (p. 46722 of the preamble). Reconsideration by an Independent review entity (IRE). Connecticut supports the proposal for establishing an independent review entity for reconsideration of PDP redeterminations.

Sections 423.560 to 423.638. Grievances, Coverage Determinations, and Appeals. As an alternative to the dispute resolution framework presented in the proposed rule, we offer a potential retrospective dispute settlement framework. Under this alternative, a drug is authorized in favor of continuity of care while the dispute resolution process takes place. The system could be modeled after several Medicare demonstration programs operating in states dealing with home care coverage in the Medicare and Medicaid programs.

P. Premiums and Cost-Sharing Subsidies for Low-Income Individuals

Section 423.772 (pp. 46725-46726 of the preamble). Definitions. *Family Size.* In addition to applicant and his/her spouse, the household includes "individuals who are related to the applicant or applicants…and who are dependent on the applicant or the applicant's spouse for at least one-half of their financial support." As the preamble indicates, this rule is dissimilar to the SSI as well as eligibility determination rules for Transitional Assistance under the current drug discount card program. By requiring the consideration of a household member other than a spouse, complexity is added to the process, increasing the administrative burden on states performing eligibility determinations for low income subsidy individuals. It is also very different than how eligibility is determined for our SPAP, and as such, it increases the administrative burden involved in wrapping around the Part D benefit. The rule should be changed to have greater consistency with existing government programs.

Section 423.772. Definitions. *Resources*. The proposed rule at Section 423.773 includes resource limits (also known commonly as "asset limits") for "full subsidy eligible" and "other low-income subsidy" eligible individuals. The definition for resources under Section 423.772 of "other resources that can be readily converted to cash within 20 days, that are not excluded from resources in section 1613 of the Act" is problematic because it is vague. It is not clear how this 20-day liquidation rule should be interpreted. The regulation should provide a specific list of instruments and asset types that are excluded. For example, cash surrender value of life insurance should be totally excluded. Providing a clear list of excluded "non-liquid" resources will foster uniform eligibility determination and ease the administrative burden for SPAPs.

Section 423.772. Definitions. *Institutionalized individual.* (cross reference Section 423.782. Cost-sharing subsidy.) While institutionalized persons have no cost sharing for covered Part D drugs covered under their PDP or MA-PD plans, the definition of "institutionalized" is problematic. Individuals in residential care homes, group homes, etc. are vulnerable populations and their care is typically paid for or subsidized by states and the federal government. The imposition of cost-sharing on these individuals could have the unintended effect of encouraging institutionalization in order to provide prescription coverage under Part D. The incentive should be for the client to choose the community option, not the institutional option. Community settings such as residential care homes and group homes should be included in the definition of "institutionalized individual."

Section 423.782(a)(2)(ii) (p. 46729). Cost-sharing subsidy. *Full subsidy eligible individuals.* Consistent with the MMA statute, this section rules out any cost-sharing for institutionalized beneficiaries, although page 46729 of the preamble may not completely comport with the outlined section. The preamble refers to 1902(q)(1)(B) of the Social Security Act:

(B) In this subsection, the term "institutionalized individual or couple" means an individual or married couple—

(i) who is an inpatient (or who are inpatients) in a medical institution or nursing facility for which payments are made under this title throughout a month, and

(ii) who is or are determined to be eligible for medical assistance under the State plan.

It would appear that the SSA section above does define ICF/MRs as institutions, so those clients would not be subject to cost sharing. It is less clear whether individuals in 1915(c) waiver group homes, assisted living facilities, residential care homes, boarding homes and other such entities would be defined also as "medical institutions." For the reasons outlined in our comments on special needs populations (section 423.120), we strongly believe that all of these individuals need to be exempt from cost-sharing. Thus, the proposed rule should be clarified to include in the definition of "institutionalized beneficiary" all individuals in 1915(c) waiver group homes, assisted living facilities, residential care homes, boarding homes and other such therapeutic residential facilities.

Q. Guaranteeing Access to a Choice of Coverage (Qualifying Plans and Fallback Plans)

See our comments under Subpart J regarding nondiscrimination and use of preferred plans.

Section 423.855 (p. 46638 of the preamble). Definitions. *Eligible Fallback Entity or Fallback Entity*. If the fallback option must be implemented because not enough PDPs or MA-PD plans express interest in serving in a state, the definition of an eligible fallback entity should be modified so that an SPAP can serve as the fallback plan for SPAP clients (and all others would go to the Part D fallback provider).

R. Payments to Sponsors of Retiree Prescription Drug Plans

Section 423.884 (pp. 46741 – 46743 of the preamble). Requirements for qualified retiree prescription drug plans. *Definition of Actuarial Equivalence.* CMS' concern over windfalls, though justifiable, could drive sponsors from participating in the subsidy or worse yet drive them to drop their employer-sponsored drug coverage completely. CMS is so concerned that employers could impose the full cost of the benefit package on employees through employee premiums or contribute a smaller amount toward the financing of the package and still be eligible for subsidy, that they don't realize their proposed requirements to qualify for the subsidy are too stringent for most employers.

Three tests for actuarial equivalency have been proposed. Option 1 is the creditable coverage gross test or one prong approach. Option 2 proposes to limit the amount of the retiree drug subsidy so that it could not exceed the amount paid by plan sponsors on behalf of their retirees. Option 3 proposes a two- prong gross and net test that employers must satisfy. We do not support the proposals under Options 2 and 3 as they contradict the intent of the MMA to slow the decline in employer-sponsored retiree insurance. In addition, CMS stated in the preamble that, "we have questions about the adequacy of the legal basis" for the proposed policies in Options 2 and 3. If

a limit on the subsidy is imposed, there is no incentive for employers that offer a retiree drug benefit that exceeds the proposed Part D coverage to continue to provide high-quality prescription drug coverage to their Medicare eligible retirees. The two-prong approach under Option 3 places an undue burden on employers by requiring them to meet both tests in order to qualify for the subsidy. The unnecessary burden of meeting the net test may force employers to not apply for the subsidy, discontinue its coverage and make Medicare Part D the primary payer for its retiree drug costs.

For all these reasons stated above, we believe the gross test for actuarial equivalency proposed as Option 1 is more than sufficient. It meets the policy goal established by Congress in that it will minimize the administrative burdens on employers. By minimizing the administrative burdens, more employers will retain their sponsored drug coverage for its retirees and thereby fulfill two other goals of Congress to maximize the number of retirees retaining employer-sponsored drug coverage and minimize the costs to the government of providing retiree drug subsidies.

Section 423.888 (pp. 46745 – 46746 of the preamble). Payment methods, including provision of necessary information. *Plan Year versus Coverage Year Issues.* Cost threshold and cost limits are calculated for plan years that end in 2006 yet the subsidy amount for a qualifying covered retiree is based on coverage year (calendar year). Connecticut is a state that has a July 1 through June 30 plan year. As such we would encounter the situation identified where for the plan year July 1, 2006 through June 30, 2007, our actuarial attestation would be due on April 1, 2006. However, the cost threshold and cost limit for 2007 would most likely not be calculated. This is a major issue for employers. How can employers provide evidence of actuarial equivalency without knowing the cost limit and cost threshold that will be in place during the plan year? It is unreasonable and unrealistic to expect that this can be done.

A second aspect of this issue is specific to the first year of implementation. How should CMS handle plan years that begin in 2005 with respect to the subsidy payment? The options are to: 1) start counting gross costs for prescriptions filled after January 1, 2006; 2) determine a subsidy amount as if the sponsor were authorized to receive subsidy payments for the entire plan year and then prorate this amount based on the number of plan year months that fall in 2006; or 3) determine subsidy amounts on a monthly basis as if the sponsor were authorized to receive subsidy payments for the entire plan year but would then pay only the amounts for the plan year months that fall in 2006. Of the three options presented the preference is for either Option 1 or Option 3. Because our plan year begins July 1, 2005, the same results would be achieved under either scenario.

Section 423.888 (pp. 46746 – 46748 of the preamble). Payment methods, including provision of necessary information. *Payment Methodology.* The proposal is for CMS to make monthly payments with adjustments for over/under payments to subsequent periodic payments and a final reconciliation 45 days after the end of the calendar year. This requires plan sponsors to certify by the 15th of the following month the total amount by which actual drug spending exceeds the cost threshold and yet remains below the cost limit. CMS based this method on the assumption that plan sponsors use PBMs and PBMs routinely adjudicate claims on a real-time basis with very limited claims or payment lags. This may be true, but what does a sponsor do if it can't get the data in a timely fashion from the plan? The State of Connecticut utilizes the services of one PBM

for the collection of prescription claims data for all employees, including retirees. The prescription benefits are on a fully insured basis with employees contributing a set dollar amount for a co-payment. The state has encountered problems with respect to receiving timely information from the PBM. The expectation to require sponsors to certify the prior month's amounts by the 15th is idealistic and is a goal that the state would be unlikely to meet. A more realistic goal would be to allow sponsors to certify within the range of 45 – 60 days after the end of the month.

Section 423.888 (p. 46748 of the preamble). Payment methods, including provision of necessary information. *Data Collection*. Of the options proposed, we recommend the first option that requires the sponsor (or group health plan designated by the sponsor) to submit the aggregate total of all allowable drug costs of all of the qualifying covered retirees in the plan for the time period in question. This choice does not place excessive burdens on the employer and is the most protective of the retiree's privacy. CMS states that this option may be the most problematic in terms of assuring the accuracy of the subsidy payment but we disagree. Even though the aggregate cost submitted to CMS would not be broken down to each qualifying retiree, the sponsor (or group health plan) must maintain the claims data to support and verify its submission for audit purposes for at least six years after the end of the plan year.

The remaining options require a sponsor (or group health plan) to submit the aggregate allowable costs for each qualifying covered retiree. Even if this data is required for only the first two years as proposed in one option, there are still privacy issues. Therefore the remaining options are not recommended as they impinge on a retiree's privacy. This infringement is to the point where the submission of costs broken down to each retiree does not appear to comply with the government's own HIPAA requirements.

S. Special Rules for States—Eligibility Determinations for Low-Income Subsidies, and General Payment Provisions

Section 423.904 (p. 46751 of the preamble). Eligibility determinations for low-income subsidies. (See also Section 423.744 (p. 46727 of the preamble)). We request clarification of the language on page 46751 of the preamble regarding eligibility determinations for low-income subsidies being conducted "consistent with the manner and frequency" that Medicaid determinations and redeterminations are conducted. While Section 1860D-14(a)(3) of the Act and the proposed rule at Section 423.774(a) say that eligibility determinations for low-income subsidies are made "by the State under its State plan under title XIX if the individual applies with the Medicaid agency," this is inconsistent with the language on page 46751 of the preamble. Also, if a state were to consider using a contractor for the eligibility determination and redetermination process, we would want costs associated with the contractor to be eligible for FFP.

The state is seeking clarification as to whether CMS would approve a State Plan Amendment that eliminates prescription drugs as a covered benefit for full duals (because of the availability of the Part D benefit), without violating equal amount, scope and duration requirements. In other words, can states limit pharmaceutical coverage in Medicaid to non-duals? Without this ability, states will be faced with providing prescription drug coverage for dual eligible Medicaid

recipients who decline enrollment or disenroll at 100% state cost. If CMS will not approve such an amendment, the state will be open to coverage at 100% state cost of Part D non-formulary drugs pending the outcome of an appeal.

Section 423.906(a) (p. 46751 of the preamble). General payment provisions. *Regular Federal matching*. The proposed rule indicates that states could receive the regular federal match for administrative costs in determining subsidy eligibility and for notification. However, the preamble also indicates that states would be responsible for periodic redeterminations. We therefore believe that the rule should be modified to clarify that FFP for redeterminations is permitted.

In addition, ongoing financial support should be provided for states' operational and administrative costs once transitional grants end in/after FFY 06. Specifically, in addition to the provision that allows states to gain federal financial participation on their administrative costs associated with determining a dual eligible's subsidy, states and SPAPs should be eligible to count the following as eligible reimbursement costs in the Medicaid program: costs of enrolling dual eligibles in the Part D program; enrollment and eligibility costs of SPAP recipients in the part D program; and all administrative costs associated with administering a wraparound for both dual eligible and SPAP recipients.

Section 423.910. Requirements. If Connecticut determines that it is in their best interest – from both a financial and continuity of care standpoint – to run their own prescription drug program for their dual eligibles at 100% state cost (e.g., through our SPAP), can we waive the auto-enrollment process for dual eligibles? It appears that under this scenario, the state would not be subject to the phase-down state contributions provisions.

Section 423.910(b)(1) (p. 46752 of the preamble). Requirements. *State contribution payment. Calculation of payment*. The 2003 base year is artificially high because it fails to account for changes in utilization and pricing that were implemented through Connecticut law to bring down pharmacy costs in the Medicaid program for dual eligibles (e.g., MAC pricing, prior authorization, generic substitution, dispensing fee changes, preferred drug list and supplemental rebates). We believe that the law (Section 1935(b), page 2157 of MMA) gives the Secretary the discretion to make adjustments to the 2003 base. In determining the gross per capita Medicaid expenditures for prescription drugs, the Secretary shall "use data from the Medicaid Statistical Information System (MSIS) and other available data" (emphasis added). We believe the Secretary could use actuarial analyses or other data to evaluate the changes to state drug expenditures (as described above) to consider adjustments to the 2003 baseline. We ask that you consider this and adjust the proposed rule accordingly.

Section 423.910(b)(2) (p. 46752 of the preamble). Requirements. *State contribution payment. Method of payment.* The rule specifies that state payments for the "phased-down state contribution" would be made in a manner similar to the mechanism by which states pay Medicare Part B premiums for dual eligibles. If Connecticut can make its contribution in the same manner as we are currently doing for our dual eligibles, this methodology is acceptable. If the Secretary were to require that we submit a check or make an electronic transfer payment,

there would be significant implications for Connecticut's constitutional and statutory expenditure cap.

Re: Proposed Rule—Medicare Program; Medicare Prescription Drug Benefit (CMS-4068-P)

To Whom It May Concern:

On behalf of the National Community Pharmacists Association (NCPA), I would like to submit the following comments regarding CMS-4068-P.

We support the use of a facilitator (FAC) in the processing of TrOOP and COB claims. Without a FAC, the burden placed on PDPs and claims processors could be exponential due to the complex nature of these claims (i.e., from reversals, resubmissions, etc.).

While we favor the FAC model, we also have some concerns with respect to using a prominent switch company (e.g., NDCHealth or another single entity) as a FAC. Our concerns primarily revolve around the net effect on pricing and freedom of choice with regards to switch companies.

1) Pricing - Today, the majority of pharmacy transactions are single switch transactions (provider - payer - provider). A small percentage of transactions require multiple switches (e.g., COB). The FAC model inherently involves a multitude of multiple switches to various payers, thus theoretically increasing the cost associated with full processing of a claim. Our concern for pharmacy, in general, is the fees associated with these complex processes. One common concern in the industry with respect to the Medicare Drug Program is the decreasing margins at the pharmacy level. While this logic is debatable, adding a higher switching fee for these types of complex claims would only add more fuel to the fire and continue to further decrease pharmacy margins.

2) Switch Providers - The fact that NDC is eyeing the opportunity to serve as a FAC concerns us as well. NDC is well known in the industry as the leader in claims switching (however, competitors such as eRx and WebMD continue to gain ground in this area). Our concern with placing a prominent switch company in the role as a FAC is the potential for an unfair advantage in the switch marketplace. This could result in decreased competition and create an environment susceptible to price increases for general claims switching services. Provisions would need to be made to allow equal access to the FAC by all switching companies so that no one switch provider would be placed at an economic disadvantage. In addition, measures should be taken to prevent any switch company serving as a FAC from creating a monopolistic environment.

The National Community Pharmacists Association (NCPA) represents the nation's community pharmacists, including the owners of 24,000 pharmacies. The nation's independent pharmacies, independent pharmacy franchises, and independent chains represent a $78 billion marketplace, dispensing nearly half of the nation's retail prescription medicines.

Thank you for the opportunity to provide these comments. Please feel free to contact me if I can provide you with any further assistance concerning this issue.

Sincerely,

Kathryn F. Kuhn, R.Ph.
Senior Vice President, Pharmacy Programs

Re: Comments on CMS-4068-P
The Proposed Rule for the Medicare Prescription Drug Benefit

Dear Dr. McClellan:

On behalf of Apria Healthcare Inc., I am pleased to submit these comments regarding the proposed rule to implement the new Medicare Part D prescription drug benefit. Specifically, these comments pertain to the recent notice published in the *Federal Register* on August 3, 2004.[1]

Apria is a leading provider of integrated home care services and products. Apria offers a full range of home infusion drug therapy, as well as home medical equipment and home respiratory therapy. Through 30 wholly-owned, licensed and JCAHO-accredited infusion pharmacies, Apria serves adult and pediatric patients with a wide range of infectious diseases, nutritional disorders, cancer and chronic illnesses such as Lou Gehrig's Disease and multiple sclerosis. Aside from the thousands of people covered by private managed care organizations who benefit from Apria's home infusion services, the company also cares for a significant number of elderly patients throughout the United States who have complex medical problems and multiple co-morbidities who require home infusion therapy and are covered by Medicare Advantage (MA. formerly Medicare+Choice) plans.

These comments are divided into the following sections:

I. General
II. Dispensing Fees for Home Infusion Drug Therapy
III. Contracting with Home Infusion Drug Pharmacies
IV. Formulary Development

[1] Medicare Program; Medicare Prescription Drug Benefit; 69 *Fed. Reg.* 46632 (Aug. 3, 2004).

I. General

We wish to commend CMS for engaging in the research necessary to understand many of the unique characteristics of home infusion drug therapy. These findings are reflected in the preamble of the proposed rule, which summarizes the various services and functions that are required to provide home infusion drug therapy safely and effectively in the home care setting.

We applaud CMS for recognizing in the proposed rule the clinical and cost benefits of home infusion drug therapy, as well as the essential role this area of therapy plays in the private sector health system and under Medicare managed care programs. The proposed regulation describes an interpretation of the Part D benefit that would include the essential services, supplies and equipment that are integral to the provision of infusion drug therapy provided in the home (see discussion of "Dispensing Fee Option 3" below).

If Dispensing Fee Option 3 is adopted in the final regulation, as we recommend, then the Medicare fee-for-service program can offer coverage of home infusion drug therapy comparable to what private sector health plans and Medicare Advantage plans have offered for years. In doing so, Medicare would realize the significant system-wide savings that come from the provision of infusion drug therapy in the most cost-effective setting.

A. Home infusion drug therapy provides an opportunity for Medicare Part D to replicate the success achieved by private sector health plans and Medicare Advantage plans.

Currently, many of the infusion drug therapies used commonly in the private sector, such as antibiotic therapy used in the treatment of severe infections, are not covered under the Medicare Part B durable medical equipment (DME) benefit. Coverage under the DME benefit is based on the use of an item of DME – in this case, an infusion pump − and extends only to a few designated drugs, most of which are used in the treatment of cancer and intractable pain. As a result, Medicare beneficiaries who could have received infusion drug therapy at home have been forced into far more costly settings, such as acute care hospitals, hospital outpatient departments, hospital emergency rooms and long term care facilities.

In contrast to the limited coverage that exists under Medicare Part B, Medicare coverage of home infusion therapy has worked well under Part C with the Medicare Advantage plans. Many if not most Medicare Advantage plans provide coverage for a broad range of home infusion therapies and related services as a <u>medical</u> benefit. Examples include Aetna US Healthcare, Humana Health Plans, PacifiCare's Secure Horizons plans and Presbyterian Salud in New Mexico. Clearly, these plans would not provide this optional coverage unless they were convinced that coverage of home infusion therapy in the home setting is cost-effective.

For Medicare Advantage plans, home infusion has provided significant system-wide savings by enabling beneficiaries to receive infusion therapy without incurring hospital or nursing facility costs. Medicare Advantage plans cover the homecare pharmacy, nursing and other in-home services, supplies, equipment and same-day, in-home delivery/patient teaching necessary for the provision of home infusion therapy. The effectiveness of home infusion therapy under Part C, and the manner in which Medicare Advantage plans define and cover this therapy, can be a model for infusion coverage under Part D.

B. Specific requirements must be established by CMS to ensure that Medicare Part D makes use of home infusion drug therapy in the same fashion as private sector and Medicare Advantage plans.

Stand-alone Part D prescription drug plans (PDPs), in the absence of specific requirements or direction from CMS, will not embrace drug therapies such as home infusion drug therapy because the PDPs will be rewarded for contributing to system-wide savings on the drugs alone. As a result, the financial incentives that have driven private payer acceptance and use of home infusion drug therapy will not exist for stand-alone PDPs.

As a result, specific requirements and direction from CMS are necessary for the coverage of home infusion drugs to work properly. We urge CMS to ensure that the Final Rule contains provisions relating to home infusion drug therapy on the issues discussed in the remainder of these comments, including such issues as dispensing fees, pharmacy access, formulary provisions and the formatting of claims.

II. Dispensing Fees for Home Infusion Drug Therapy

A. CMS should adopt Dispensing Fee Option 3, which is the only proposed option that would adequately recognize the services and items that are necessary to provide home infusion drug therapy.

Congress' definition of prescription drugs under the statute clearly includes infusion drugs provided in the home, and the proposed rule likewise reinforces the fact that infusion drugs (other than the few drugs currently covered under Part B) are included in the Part D benefit.

However, for the coverage of home infusion drugs to be meaningful for Medicare beneficiaries, CMS also must cover the services, supplies and equipment related to the provision of these drugs. Limiting coverage to the drugs only without the services, supplies and equipment will not produce meaningful coverage of infusion drugs in outpatient settings. This is because infusion pharmacies will be unable to provide infusion drugs without adequate payment for the services, supplies and equipment.

The most appropriate mechanism for such coverage of infusion services, supplies and equipment provided under the proposed rule is the dispensing fee. In the preamble, CMS sets out three options for defining dispensing fees under the new benefit and invites comment on each.

- Option 3 comes closest to accurately recognizing the fundamental elements – including the services, supplies and equipment – that are essential for the provision of home infusion drug therapy. Option 3 is the only option that reflects the fundamental elements of home infusion drug therapy (see additional discussion in subsequent sections of these comments).

- In contrast, Option 1 only provides the perspective of retail pharmacies and does not meet the needs of Medicare beneficiaries requiring home infusion drug therapy.

- Although Option 2 captures the supplies and equipment used in the provision of home infusion drug therapy, this option falls far short of recognizing the essential professional services required to provide home infusion drug therapy because it does not recognize the professional services that are required to provide safe and effective infusion therapy in the home.

B. CMS should adopt Dispensing Fee Option 3 because it is consistent with the well-established standards of practice for home infusion drug therapy.

The major independent accreditation organizations, including the Joint Commission on Accreditation of Healthcare Organizations (JCAHO), have established extensive, detailed standards regarding the patient management, support services, facilities, patient safety, policies, procedures and functions that must be provided by home infusion pharmacies. These standards, which address issues ranging from the requirements for sterile preparation of infusion drugs to the oversight of patient therapy, are significantly different from the standards governing traditional retail pharmacies.

Option 3 is the only dispensing fee option that adequately reflects the content of these national accreditation standards. For example, one major difference between retail pharmacies and home infusion pharmacies is the urgency surrounding the initial referral from a physician or hospital and the resulting home delivery/patient education requirements. Due to the severity of the patient's illness (such as a serious infection which has not responded to oral medications), pressures on hospitals to discharge patients as soon as possible, and stability/refrigeration requirements for many medications, home infusion pharmacy staff frequently have to deliver directly to patients' homes the same day as the referral. This is considerably more expensive than a retail pharmacy model where the patient or caregiver visits the pharmacy in person to pick up the drug. All of this must take place in conjunction with insurance verification, coordination with the nurse who will teach the patient, compounding by a home infusion pharmacist, and eventually, billing third party payors and collecting patient co-pays – all activities that are not applicable to the retail setting.

The well-established understanding of the professional services involved in providing in home infusion drug therapy is not merely an industry definition. Payers, clinicians, clinical societies, providers and accrediting organizations share a common understanding of what is involved in providing these therapies in outpatient settings.

C. CMS should adopt accreditation requirements under Dispensing Fee Option 3 as a straightforward means to protect Part D enrollees.

As the first homecare provider to seek and obtain JCAHO accreditation in the 1980s, Apria has a longstanding commitment to ensuring that the professional services and functions we provide meet a demanding set of quality standards. Apria recently completed its latest triennial survey cycle, with a successful outcome in all infusion pharmacies, respiratory and medical equipment locations. Our company has served as a pilot for innovative survey techniques developed by the JCAHO, and our management has formally served on advisory committees of the organization. Today, our quality standards meet or exceed JCAHO's requirements, which is a requirement of the over 2500 private sector managed care plans with which we contract to provide home infusion services.

In the final rule, CMS should address the qualifications of the infusion pharmacies that may provide the elements of care described under Dispensing Fee Option 3. We recommend that CMS require every pharmacy providing infusion services to be accredited as a home care pharmacy by a recognized national accrediting organization. We also recommend that every entity that provides nursing services to Part D infusion patients be either accredited as a nursing agency as an extension of their existing home infusion accreditation, or be a Medicare-certified home health agency.

Private sector plans require accreditation as a basic assurance that the pharmacists and nurses are experienced and the pharmacies are staffed properly to provide the necessary care. The quality standards required of home infusion pharmacies and nursing agencies by the accreditation organizations have become the community standard for the provision of home infusion therapy.

D. CMS should use a refined version of Dispensing Fee Option 3 to define the full scope of necessary professional infusion pharmacy services.

All infusion patients, whether or not they qualify for the home health benefit, require professional pharmacy services that again differ from those found in the retail setting. The general categories of such services are:

- Compounding medications in a sterile environment
- Dispensing
- Ongoing Clinical Monitoring
- Care Coordination with other agencies involved in patient care

- Provision of Supplies and Equipment
- Multiple Categories of Pharmacy Professional Services, such as pharmacokinetic drug monitoring or parenteral nutrition formula development
- Administrative Services
- In-home delivery, patient and caregiver education
- Third party billing
- Other Support Costs

These services are described in greater detail in a number of accreditation materials and other forums, including a document on the website of the National Home Infusion Association describing the "per diem" model.[2]

We propose a modification to Dispensing Fee Option 3 to more explicitly describe the pharmacy professional services that are needed for home drug infusion therapy. The pharmacy services referenced above in the model per diem definition (and generally described in Dispensing Fee Option 3) should be included in the dispensing fee for all Part D infusion patients. Most of these functions would be captured in the Option 3 definition of dispensing fees.

Both private payers and Medicare Advantage plans use per diem payments that are tied to the intensity level of the particular infusion therapy. For over 20 years, these plans have essentially developed resource-based relative value scales to capture the intensity, in terms of time and resources involved in providing each infusion therapy safely and effectively. Thus, the plans do not use a single per diem amount for all infusion therapies. We recommend that the PDPs follow this approach under Medicare Part D.

E. CMS can establish easily-administered safeguards to avoid any duplicate payments for nursing services

CMS raises a question in the proposed rule regarding how to ensure that the services captured in Dispensing Fee Option 3 are not reimbursed under the home health benefit or otherwise.

The potential area of concern involves the infusion patients who also qualify for the Medicare home health benefit. For this subset of infusion patients who also qualify for the home health benefit, it would be a simple matter to first determine whether a beneficiary qualifies for the home health benefit before reimbursing Part D funds for nursing services. The majority of beneficiaries who require infusion drug therapy do not qualify for the home health benefit, and their nursing services should be paid under the Part D benefit as part of the dispensing fee.

---

[2] National Home Infusion Association. National Definition of Per Diem. June 2003. *Available at* www.nhianet.org/perdiemfinal.htm.

Importantly, the home health benefit does not cover any of the pharmacy services described in the preceding subsection of these comments.

By first identifying beneficiaries who qualify for the home health benefit, the nursing component, when medically necessary, should be reflected in the dispensing fee but only for beneficiaries who do not qualify under the home health benefit for nursing services. Importantly, nursing care is not included in the model per diem definition (discussed above) nor in the HCPCS "S" coding structure (discussed below) used by private payers.

Private payers typically separate out nursing from the pharmacy-related costs represented by the per diem. They share the Medicare program's natural concern about nursing costs, and these plans have concluded the best means of tracking and controlling nursing costs is to use a separate payment mechanism for nursing.

F. CMS can establish easily-administered safeguards to avoid duplicate payments under Medication Therapy Management Programs.

CMS asks for comments regarding how to ensure that the Medicare program avoids making duplicate payments if the PDPs pay for infusion-related dispensing fees as well as medication therapy management services.

Generally, the dispensing fee as defined in Dispensing Fee Option 3 will capture most of the services and functions described in our per diem model plus the nursing component, and there will not be a clear need for a separate payment to infusion pharmacies for additional medication therapy management services. We believe that the primary situation where medication therapy management services may be indicated is where an infusion pharmacy has to coordinate the activities of another pharmacy.

However, if CMS does not choose Dispensing Fee Option 3 for defining dispensing fees, then CMS should not consider the medication therapy management program as a substitute for covering the services, supplies and equipment required to provide infusion drug therapy. The limitations on the applicability of the medication therapy management program (*i.e.*, it is limited to patients with chronic conditions and multiple medications) make it a poor vehicle for capturing the clinical monitoring functions required of infusion pharmacies for all infusion patients.

III. Contracting with Home Infusion Pharmacies

A. CMS should establish separate and distinct requirements for PDPs to contract with sufficient numbers of home infusion pharmacies to ensure adequate enrollee access to home infusion drug therapy under Medicare Part D.

CMS should establish specific safeguards for home infusion pharmacies to ensure meaningful enrollee access to home infusion drug therapies. A number of important differences exist between home infusion pharmacies and traditional retail pharmacies that highlight the need to create separate requirements for the two types of pharmacies. For example–

- Home infusion pharmacies provide specific essential services that are not provided by the vast majority of retail pharmacies or mail order pharmacies.

- Home infusion pharmacies must maintain facilities, equipment and safeguards for compounding and storing sterile parenteral drug solutions, which is not common among retail pharmacies.

- Home infusion pharmacies are responsible for the care of their patients 24 hours a day, seven days a week, while retail pharmacies are not.

- Home infusion pharmacies are subject to separate state licensure, regulations and accreditation standards from retail pharmacies.

- The contracts used by private health plans for home infusion pharmacies are structured differently from the contracts used for retail pharmacies.

- The total number of traditional retail pharmacies in the United States far outweighs the total number of home infusion pharmacies.

These differences are echoed in the preamble of the proposed rule, where CMS discusses its findings regarding important distinctions between home infusion pharmacies and retail pharmacies.[3]

To ensure that Part D enrollees have sufficient access to home infusion drug therapy, CMS should adopt its proposal to establish distinct access standards for home infusion pharmacies in the Final Rule. This would be consistent with Congress' general mandate that CMS must ensure enrollees have convenient access to pharmacies, as access to a retail pharmacy does not by itself meet the needs of a beneficiary who requires infusion therapy.

B. CMS should require use of the ASC X12N 837 claims format for infusion drug therapy, consistent with CMS' recent determination, because infusion claims formats are different from retail pharmacy claims.

CMS' Office of HIPAA Standards has carefully reviewed how home infusion therapy is provided, and recently issued a Program Memorandum[4] and a Frequently Asked Question (FAQ)[5] document on the CMS website summarizing its conclusion.

[3] 69 *Federal Register* at 46648 and 46658.

For example, the FAQ document states:

> …Home infusion therapy typically has components of professional services and products that include ongoing clinical monitoring, care coordination, supplies and equipment, and the drugs and biologics administered – all provided by the home infusion therapy provider.

In a letter dated April 8, 2003, Jared Adair, director of the CMS Office of HIPAA Standards, wrote:

> …we have determined that home drug infusion therapy services are different from services provided by retail pharmacies, and that the business model for home drug infusion therapy providers is fundamentally different from a retail pharmacy for dispensing drugs…. We also acknowledge that a requirement to bill home infusion drugs using the NCPDP format would fail to meet the administrative, clinical, coordination of care, and medical necessity requirements for home drug infusion therapy claims." (emphasis added)

As a result, CMS determined that the National Council for Prescription Drugs Program (NCPDP) claim format, which is the HIPAA standard for the processing of retail pharmacy drug claims, is not appropriate for the filing of home infusion drug therapy claims. Instead, CMS instructed that home infusion claims, to be compliant with HIPAA, must be filed under the ASC X12N 837 claims format.

Please note that the description of infusion therapy as described in the FAQ tracks very closely with the language of Dispensing Option 3 in the proposed rule. We recommend that the specific wording already posted on CMS's FAQ be included as the infusion claiming requirement in Part D regulations. To do so will increase the level of administrative standardization in infusion claims transactions per the objectives of HIPAA, while also ensuring that home infusion providers and Part D payers comply with the HIPAA regulation when implementing Part D claiming transactions. If CMS does not require that Part D home infusion therapy claims be submitted on the 837, then it would open up the possibility for some Part D payers to ignore the fundamental differences of home infusion therapy from retail pharmacy and implement only NCPDP claiming—forcing infusion pharmacies to be out of compliance with HIPAA.

---

[4] Centers for Medicare & Medicaid Services, Program Memorandum, Carriers, Transmittal B-03-024 (4/11/03), *available at* http://cms.hhs.gov/manuals/pm_trans/B03024.pdf.

[5] Centers for Medicare & Medicaid Services, Frequently Asked Questions (FAQs), "Are Drug Transactions Conducted by HIT Providers Retail Pharmacy Drug Claim Transactions Billed Using NCPDP Formats?" (Answer ID 1880) (3/31/03), *available at* http://questions.cms.hhs.gov.

This would deprive the PDPs and CMS of a valuable tool for tracking important patient-specific data. Consolidated 837 claiming would facilitate the consolidation of all drugs along with the professional pharmacy "per diem" services, equipment and supplies into single claims billed for infusion therapies, easily mapped into patient services utilization data bases for analysis—whereas the possibility of billing infusion drugs separately via the retail NCPDP claim format results in loss of this consolidated data for analysis.

C. CMS should recognize that infusion coding is different from retail pharmacy drug coding.

Since 2002 the Healthcare Common Procedure Coding System (HCPCS) provides approximately 80 "S" codes for home infusion therapy services. Most codes reflect a "bundled" per diem approach in which most or all of the supplies and services provided to a home infusion patient are billed under a single code. This complete system of "S" codes for home infusion therapy services is specifically designed for use by private payers, and are available for use by government payers that adopt this widely used private sector methodology for infusion coding and payment. These codes are not used in coding of retail pharmacy drug claims and are not permitted for HIPAA-compliant use on the NCPDP transaction).

Although CMS does not have a single HIPAA coding standard for drugs, we believe that the PDPs and CMS will find requiring NDC drug coding for Part D claims will provide best opportunity for patient utilization analysis and tracking of total Part D drug costs for CMS's program administration. We believe the Part D regulations should require that all claims for drugs be coded with NDC numbers.

D. Coordination of benefits.

In addition to these reasons for infusion claiming and coding consistency, the COB portion of the Part D program is also best implemented by CMS's establishing a requirement for 837 claiming and use of the established coding systems. The majority of COB will occur with commercial payers such as the Blues and other private health plans. As the private sector has already widely adopted the established coding systems described above, it will be important for CMS to require consistent coding adoption to make COB work, ensuring that the allocation of payment for services between Part D plans and other primary or secondary plans works well.

Since the private payer sector accepts home infusion therapy claims using the HIPAA-compliant X12 N 837 format, for COB to work effectively is another reason that CMS should require PDPs to use the 837 claim format for infusion claims. Because a very large majority of private infusion payers use the HIPAA-complaint *professional* 837 (837P) claim format, to make COB work we believe that CMS's Part D regulations should require PDPs to adopt the HIPAA-compliant 837P format only, excluding both the *institutional* 837 and NCPDP transaction from use.

E. CMS should clarify the any willing provider requirements with respect to home infusion drug therapy.

CMS should clarify that this access safeguard is to be applied to any willing provider of home infusion therapy meeting the infusion-specific quality standards (see below), as distinct from retail pharmacies. Such a requirement is consistent with the statutory language.[6]

In addition, for the purpose of the any willing provider requirements, CMS should clarify that prescription drug plans should have a standard contract for home infusion pharmacies.

These recommendations for the network access standards will help safeguard enrollee access by ensuring that the Medicare Part D benefit reflects common private sector practices for home infusion drug therapy. In addition, the recommended clarifications will not impose significant burdens on PDPs.

F. CMS should recognize that OBRA 1990 standards do not represent the standard of care for infusion pharmacies.

In the preamble, CMS refers to Section 54401 of the Omnibus Reconciliation Act of 1990, stating that the regulations issued pursuant to that section in 42 CFR 456.705 "describe currently accepted standards for contemporary pharmacy practice and our intent is to require plans to continue to comply with contemporary standards." CMS seeks comments on whether these standards are industry standards and whether they are appropriate for Part D.

The OBRA 1990 standards were written for retail pharmacies. The drafters of these standards did not attempt to address the standard of care for infusion pharmacies. Infusion pharmacies that are in compliance with the infusion-specific standards established by accrediting organizations meet the OBRA 1990 standards, but the OBRA 1990 standards do not reflect "contemporary pharmacy practice" for infusion pharmacies. The community standard of care for infusion pharmacies is found in the accreditation standards that are required by virtually every private health plan, as well as numerous MA plans, to participate in their provider networks.

The quality assurance standards followed by home infusion pharmacies—and as required for accreditation--far exceed the OBRA 1990 standards. Due to advances in newly-approved drugs and technology and additional laws and regulations established in the intervening years (such as HIPAA), and development of knowledge surrounding patient safety and medication management at home, the level of patient data collection, assessment and intervention in the infusion clinical model goes far above and beyond the quality standards currently used for Medicaid. Again we respectfully direct your attention to Jared Adair's April 8, 2003 comments concerning the key differences between retail and home infusion pharmacies.

[6] Social Security Act, Section 1860D-4(b)(1)(A).

IV. Formulary Development

A. CMS should mandate that PDP and MA-PD plan sponsors maintain an open formulary for infusion drugs to ensure this population of vulnerable patients has appropriate access to necessary medications.

Much of the MMA is based on the premise that Medicare can take advantage of cost-savings techniques commonly used in the private sector and still deliver quality services to Medicare beneficiaries. CMS should note that although private health plans commonly use restricted or preferred formularies for drugs delivered orally, via patch or other non-invasive methods, private plans rarely apply these formulary restrictions to infusion drugs.

As discussed in greater detail below, there are numerous clinical and operational barriers to establishing formularies for infusion drugs. As a result, with respect to infusion drugs, formularies should remain open.

B. CMS should recognize that PDPs and pharmacy and therapeutics committees are not well situated to evaluate infusion drugs.

It will be difficult for PDPs and traditional pharmacy and therapeutics committees (P&T committees) to evaluate infusion drugs in the same manner that they evaluate orally administered drugs.

P&T committees generally evaluate the relative safety, efficacy, and effectiveness of prescription drugs within a class of prescriptions drugs and make recommendations to a health plan for the development of a formulary or preferred drug list. Frequently, P&T committees focus on the "therapeutic equivalence" of different multisource drugs (*i.e.*, whether one drug will have the same desired clinical impact as another). However, such evaluations are performed in a context where the method of administering the drug is not significant.

In contrast to oral drugs, the method of administration for an infusion drug may have separate and significant clinical and cost implications. All infusion drugs require a device of some type to deliver the drug into the body, including various catheters temporarily or semi-permanently implanted in each patient depending on the anticipated duration of therapy, potential side effects of the drug and the patient's diagnosis itself. Various methods of drug delivery also exist, from IV bags hung on poles to sophisticated external or internal infusion pumps. A patient's clinical condition may determine not only what device is selected for delivery, but also what drug should be used. For instance, many patients receiving infusion therapy are at high risk of infection or complications from infection. Consequently, a physician may need to choose a medication that can be prepared in advance in a pharmacy clean room and administered once a day to reduce the risk of infection from preparation in the home or multiple intravenous access device manipulations.

Similarly, in selecting a medication for a patient, a physician often needs to consider administration access type and what delivery technology will be best suited for use in a particular patient's home. If the patient is capable of managing a portable infusion pump, drugs requiring longer infusion times may become more clinically appropriate. If other technologies are used, such as IV bags hung on poles, the patient may require more frequent nursing visits to monitor the risk of infection.

The typical P&T Committee would usually not have the experience to evaluate the administration technology or professional support requirements, such as nursing visits, in reviewing infusion drugs. Furthermore, such committees do not typically make decisions considering all available treatment options throughout the continuum. Drugs considered ideal in an inpatient setting are often not desirable in the home setting and visa versa, especially where the first dose of the drug is concerned. Examples include Taxol® for ovarian cancer, Lovenox® for deep vein thromboses and certain immune globulins.

In addition, most infusion drugs must be compounded by the pharmacy. Once compounded, these drugs lose stability over time or be impacted by changes in temperature. For oral drugs, the frequency of administration or stability issues usually do not pose challenges for a P&T Committees as they try to determine therapeutic equivalence.

Ultimately, the infrastructure for protecting patient interests in formulary decisions—the traditional P&T Committee—does not have the ability to evaluate the extra-pharmacological considerations that must be taken into account for infusion treatment, including the administration device, drug stability, proximity to a compounding pharmacy, available administration access site and infection risk. Typically, these factors would be addressed by a physician or pharmacist knowledgeable about an individual's patient's circumstances and history when selecting a drug and delivery device.

C. CMS should recognize home infusion patients as a particularly vulnerable population that requires additional protection.

Patients receiving home infusion therapy are one of the truly vulnerable populations of the Medicare population, and as CMS acknowledged in the Proposed Rule,[7] the medical needs of such populations necessitate that they receive special protection under Medicare Part D. Infusion drugs are used to treat some of the most severe illnesses, including cancer, severe infections, pain and loss of gastrointestinal integrity.

Although the Medicare Part D regulations do create an appeals process for patients if their physician's choice of medication is not on formulary, patients with these compromising illnesses are the least capable of exercising an appeals right. If a patient does not have a family member or physician willing to take on the burden of being an advocate, then the patient's care could be compromised.

[7] 69 Fed. Reg. at 46661.

* * * *

We commend CMS for its initial efforts to understand and accurately define home infusion drug therapy under Medicare Part D. There is an important opportunity for the program to replicate the successes achieved by private health plans and Medicare managed care plans. There is also a risk that in the absence of sufficient direction from CMS and some targeted safeguards, the benefits of home infusion drug therapy will be lost for both beneficiaries and the overall Medicare program.

We would be pleased to provide additional assistance regarding these important issues. Please contact Lisa Getson, Apria's executive vice president, at 949-639- 2021 if you have any questions or comments.

Sincerely,

Lawrence M. Higby
President and Chief Executive Officer

CMS-4068-P-1234-Attach-1.pdf

K A N S A S

JANET SCHALANSKY, SECRETARY

SOCIAL AND REHABILITATION SERVICES

October 4, 2004

Centers for Medicare and Medicaid Services
Department of Health & Human Services
Attention: CMS-4068-P
P.O. Box 8014
Baltimore, Maryland 21244-8014

Dear Sir or Madam:

The Kansas Department of Social and Rehabilitation Services respectfully submits the following comments regarding the proposed rule on the Medicare Prescription Drug Benefit published Tuesday, August 3, 2004. Comments are grouped under section identifiers as requested in the proposed rule.

One general comment needs to be made. Because of the statutory and regulatory requirements regarding states' responsibilities in implementing and administering activities related to Part D, it is absolutely critical that access to federal data be provided in a timely and thorough manner. Specifically Kansas requests access to online real time entitlement and enrollment information for not only Part D and subsidy eligibility but also Part A and B. This should occur through access to the Common Working File.

Subpart B - Eligibility & Enrollment

Section 423.34 - <u>Enrollment Process</u>

Because of the level of information required for the auto enrollment process and the resources needed to carry it out, the State would recommend that the Centers for Medicare & Medicaid Services (CMS) take the lead for this process. Information will need to be obtained in order to better guarantee that the person is enrolled in an appropriate plan taking into consideration their living arrangement, specific drug needs, and available participating pharmacies. CMS is in the best position to accomplish this task with information provided from the states and SSA.

Section 423.36 - <u>Initial Enrollment Period</u>

The State is concerned regarding the impact of the initial enrollment period for persons who are fully dually eligible at the time of this enrollment process. Per section 423.906, a person who is eligible for Part D and also is a full benefit dual eligible, medical assistance under Medicaid is not available for drugs that could be covered under Part D. It appears that in order to protect drug coverage from lapsing as of January 1, 2006 for current Medicaid eligibles, the individual would need to enroll by the

end of December 2005. If this is correct, the period of time to accomplish such enrollment (November 15 through December 31) is not sufficient for the number of beneficiaries who will be impacted. The State strongly recommends that an additional period of 90 days or more following January 1 be provided for Medicaid to continue paying drug claims for consumers who have not yet been able to complete the Part D enrollment process.

This same approach will likely be necessary for consumers who newly apply for full Medicaid coverage during this initial enrollment period for Part D. For example, a person who has not yet enrolled for Part D applies for Medicaid on December 20, 2005 and would qualify as a fully dual eligible. If the Medicaid application is not processed until January 15 but Part D enrollment does not take effect until February, the person would again appear to be left without drug coverage for the month of January.

On an ongoing basis, this additional Medicaid coverage period may need to be applied in certain instances involving the individual's own initial enrollment period for Part D. Persons may apply and qualify for full Medicaid coverage and be not only currently eligible but also eligible for Medicaid coverage in the three prior months. If not enrolled in Part D during this period, again the person would be left without drug coverage until that enrollment is completed.

Lastly such an extended Medicaid coverage period may need to be applied in situations where retroactive Medicare entitlement is established. Per section 423.4, a Part D eligible is defined as a person who is entitled to or enrolled in Part A and/or Part B. There will be instances in which an individual is retroactively enrolled in Parts A or B because of a delayed approval for disability benefits. Such persons may have received Medicaid during this time and had their drug costs covered. Once approved for retroactive enrollment in Parts A or B, the person would now become a retroactive full dual eligible. As the person was not enrolled in Part D during this time, any retroactive drug coverage would potentially be in violation of these regulations. The regulations would appear to require the State to fully reimburse CMS for the coverage provided, yet do not allow the beneficiary to enroll in Part D retroactively.

Because of these and similar instances, the State strongly encourages CMS to provide for either retroactive Part D enrollment and coverage or permit an interim period of Medicaid drug coverage to account for such situations.

Subpart C - Benefits & Beneficiary Protections

Section 423.100 - <u>Definitions</u>

Prescription drug coverage under Part D has been limited for institutionalized consumers so that only

those residing in skilled nursing facilities are eligible. The State disagrees with this limitation and believes that all institutional settings including ICF-MR's should be included. In addition, persons accessing long term care services through home and community based services waivers should also be included. Individuals in these living arrangements should be assured access to coverage of all drugs through Part D.

Subpart P - Premiums & Cost Sharing Subsidies for Low Income Individuals

Section 423.772 - Definitions

The definition of full benefit dual eligibles includes persons who meet a medically needy spenddown in a month. Such definition is extremely problematic as the person will go in and out of full benefit classification on an ongoing basis making continuity of drug coverage next to impossible. There is also an issue with persons who meet spenddown in a prior period but who are back in spenddown status in the current month of application. The State proposes that medically needy individuals who meet spenddown be viewed as meeting the full benefit dual definition for a continuous period of up to 12 months even though going back into spenddown status during this time.

Section 423.773 - Requirements for Eligibility

The State strongly concurs with the inclusion of QMB, SLMB, and QI 1's as full subsidy eligible without the requirement for a separate determination.

Section 423.774 - Eligibility Determinations, Redeterminations, and Applications

The regulations provide for a duplicative application and determination process in which persons may apply for low income subsidies with either the State or Social Security Administration. As the subsidy is directly tied to Medicare coverage, this process is best handled as an SSA function. However, it is understood that many low income subsidy applicants may qualify for the Medicaid Savings Programs (QMB, SLMB, QI1) and thus automatically qualify for a subsidy. The State recommends that where an application is filed with the State and the person does not qualify for a Medicaid category that would result in automatic qualification for a subsidy, the information be provided to Social Security for a determination of subsidy eligibility. This can best be done by permitting SSA to use the State's application to make the subsidy determination. This would prevent the State from expending substantial funds and resources on modifying eligibility systems to handle the subsidy determination. That determination uses income and resource rules as well as family size definitions that differ substantially from Medicaid rules applied is in most states. SSA should also handle the redetermination and appeal process for all subsidy-only consumers. Information systems also need to be developed to better share information gathered between the two entities.

There do not appear to be any provisions regarding treatment of individuals who lose subsidy eligibility, particularly those who are deemed eligible by virtue of Medicaid eligibility. Processes need to be put into place for SSA to redetermine subsidy eligibility before the subsidy is eliminated. This may occur in instances where the individual has failed to return a Medical redetermination form or in which they have moved to another state and not contacted the new state agency for continued

Medicaid coverage. Proper and timely notification is critical before the subsidy is withdrawn.

Subpart S - Special Rules for States

Section 423.910 - <u>Requirements</u>

The baseline for determining the state's contribution doesn't take into consideration deductions for recoveries received as a result of such activities as estate recovery, medical subrogation, consumer overpayment recoveries, and third party collections. The State requests such activities be included in the baseline calculation.

We appreciate the opportunity to provide comments regarding these regulations.

Sincerely,

Janet Schalansky
Secretary

Issue Areas/Comments

Issues 1-10

BENEFITS AND BENEFICIARY PROTECTIONS

With the use of formularies, Medicaid recipients who are currently stable on medication therapies may not have continuity of care should they be switched to MA-PD or PDP preferred drug therapies.
A Medicare Part D beneficiary who is a Medicaid dual eligible should not be disenrolled from a MA-PD or PDP plan for any reason. This group of individuals in most cases do not have an alternative drug plan.

COORDINATION WITH PLANS AND PROGRAMS THAT PROVIDE PRESCRIPTION DRUG COVERAGE

Part B drug claims which are denied covergae due to therapeutic inappropriateness, drug-disease contraindication, incorrect drug dosage, duration of drug treatment or for similar reasons related to meidal necessity should not be considered a Part D drug. Consideration should be given for coverage of drugs which are denied coverage under Part B as there may be clinical reasons for the coverage of these products.

Also, while there is much interface between drug coverage under Part B and Part D, use of the NDC number should be require in Part B billing to ensure rebate collections from drug manufacturers on federal and state supplemental rebates. Continuing the use of HCPCS codes makes it difficult to invoice drug manufacturers accurately for all drugs.

ELIGIBILITY, ELECTION, AND ENROLLMENT

Should the auto-enrollment of dual eligibles end prior to 1/1/06? The dual eligibles should have an opportunity to choose the MA-PD or PDP plan prior to an auto-enrollment period.

GENERAL

GENERAL

By Electronic Mail October 4, 2004

Mark B. McClellan
Administrator
Centers for Medicare & Medicaid Services
Department of Health and Human Services
Attention: CMS-4068-P
PO Box 8014
Baltimore, MD 21244-8014

File Code: CMS-4068-P

Dear Dr. McClellan:

On behalf of the National Coordinating Council for Medication Error Reporting and Prevention (NCC MERP), I would like to take this opportunity to respond to the proposed rule for Title 1 of the Medicare Prescription Drug, Improvement and Modernization Act under Section 423.153(c) that requires providers of qualified prescription drug coverage to implement a quality assurance program. This includes quality assurance measures and systems for reducing medication errors, reducing adverse drug reactions, and improving medication use.

At its September 24, 2004, meeting, the Council had the opportunity to carefully review and discuss these sections of the proposed rule and offers the following comments:

? The Council supports the inclusion of drug utilization review, patient counseling, and patient information record-keeping as part of the quality assurance program.

? The Council supports inclusion of the proposed elements for quality assurance systems including electronic prescribing, clinical decision support systems, educational interventions, use of barcodes, adverse event reporting systems, and provider/patient education.

? The Council strongly cautions the Agency against the inclusion of error rates or the comparison of error rates in future quality reporting systems. In June 2002, the Council issued a statement against the use of medication error rates as a basis for comparing health care organizations noting that medication error rates for this purpose are of no value because of differences in culture, interpretation of error definition, differences in patient populations, and methods of reporting and detection. This document may be found in Attachment A. The Council suggests that there is

more value in encouraging the reporting of errors to a central location (e.g., national databases such as USP MEDMARX SM and FDA MedWatch). When errors are reported to an objective third party, these data can be broadly disseminated to help avoid recurrence. It is the Council?s contention that using these data for comparisons is a step backward that will resurrect the punitive ?culture of blame? identified by IOM as a major obstacle to safer patient care. Such comparisons also foster under-reporting and less than full disclosure about events which prevent the understanding of the causes of error.

Finally, the Council would like to point out that the definition of medication error that is quoted in the proposal was originally developed by the Council (see Attachment B) and later adopted by the Food and Drug Administration. It is important to note, however, that medication errors are preventable adverse events; but not all adverse events are preventable. All drugs have intrinsic toxicities that are unavoidable in some patients. Also, some patients have unanticipated allergic or idiosyncratic reactions to drugs that cannot be prevented.

A roster of NCC MERP member organizations and individuals is included as Attachment C. These comments reflect the collective opinion of the Council, but not necessarily of its individual members.

Thank you for this opportunity to provide input on this important issue. If you require additional information, please do not hesitate to contact me at 630-792-5916 or lhanold@jcaho.org.

Sincerely,

Linda S. Hanold
Chair, NCC MERP, c/o USP, 12601 Twinbrook Parkway, Rockivlle, MD 20852

CMS-4068-P-1236-Attach-2.doc

National Coordinating Council for Medication Error Reporting and Prevention

Statement from the National Coordinating Council for Medication Error Reporting and Prevention:

USE OF MEDICATION ERROR RATES TO COMPARE HEALTH CARE ORGANIZATIONS IS OF NO VALUE

The use of medication error rates to compare health care organizations is not recommended for the following reasons:

1. Differences in *culture* among health care organizations can lead to significant differences in the reporting of medication errors. Organizations that encourage medication error reporting by providing incentives and resources to report within a non-punitive, continuous quality improvement arena will likely report more medication errors than organizations that wish to conceal errors and punish individuals who report or are involved in errors.

2. Differences in the *definition* of a medication error among health care organizations can lead to significant differences in the reporting and classification of medication errors. For example, some organizations may only consider actual errors that reach the patient as errors. Other organizations also will include potential errors and errors that do not reach the patient. The latter organizations will likely collect more medication errors, and information from reports of potential errors can sometimes be more useful in prevention efforts than reports of actual errors.

3. Differences in the *patient populations* served by various health care organizations can lead to significant differences in the number and severity of medication errors occurring among organizations. For example, tertiary care hospitals generally may serve more severely ill patients than rehabilitation hospitals. In addition, the intensity of drug therapies, the types of drugs used, and the methods of drug distribution may be substantially different in these environments, thereby leading to differences in number and types of errors.

4. Differences in the *type(s) of reporting and detection systems* for medication errors among health care organizations can lead to significant differences in the number of medication errors recorded. Passive reporting systems, relying upon voluntary reports from staff, are known to result in far fewer medication error reports than active surveillance systems are able to detect. Also, the number of error reports can be significantly different, depending on the type of active surveillance system (e.g., direct observation versus retrospective review of medical records versus computer-based data gathering from electronic medical records and order entry systems).

The National Coordinating Council for Medication Error Reporting and Prevention believes there is no acceptable incidence rate for medication errors. Use of medication error rates to compare health care organizations is of no value. The goal of every health care organization should be to continually improve systems to prevent harm to patients due to medication errors. Health care organizations should monitor actual and potential medication errors that occur within their organization, and investigate the root cause of errors with the goal of identifying ways to improve the medication use system to prevent future errors, and potential patient harm. The value of medication error reports and other data gathering strategies is to provide the information that allows an organization to identify weaknesses in its medication use system and to apply lessons learned to improve the system. The sheer number of error reports is less important than the quality of the information collected in the reports, the health care organization's analysis of the information, and its actions to improve the system to prevent harm to patients.

Adopted by the National Coordinating Council for Medication Error Reporting and Prevention
June 11, 2002

The definition of “medication error” as developed by the Council and adopted by the Food and Drug Administration reads as follows:

“A medication error is any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the healthcare professional, patient, or consumer. Such events may be related to professional practice, healthcare products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use.”

Dear Sirs/Madams:

These comments are filed by the National Coordinating Committee for Multiemployer Plans (NCCMP) in response to the request for public comments by the Centers for Medicare and Medicaid Services (CMS) on the proposed rule to implement the new Medicare Prescription Drug Benefit authorized in section 101 of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (MMA). This proposed rule was published in the Federal Register of August 3, 2004 (69 Fed. Reg. 46632).

The NCCMP is the only national organization devoted exclusively to protecting the interests of the approximately ten million workers, retirees, and their families who rely on multiemployer plans for retirement, health and other benefits. Our purpose is to assure an environment in which multiemployer plans can continue their vital role in providing benefits to working men and women. The NCCMP is a nonprofit organization, with members, plans and plan sponsors in every major segment of the multiemployer plan universe, including in the building and construction, retail food and service, and entertainment industries.

Most multiemployer plans today provide for retiree health benefits and many of those plans include some type of coverage for prescription drugs. As is well documented, the number of retirees covered by employer-sponsored health benefit plans today and in the future has continued to shrink, primarily because of the combination of accounting rule changes that force private sector employers to recognize the long-term liability of the retiree medical benefits and the rapidly escalating cost of providing that retiree health coverage.

Although facing the same marketplace cost pressures as other plan sponsors, employers and unions who have come together through collective bargaining to establish multiemployer plans have been less likely to drastically reduce or eliminate retiree coverage, in part because active workers in those industries where multiemployer plan coverage is prevalent have been willing to forgo some portion of their compensation to continue to subsidize the health benefits of their brothers and sisters who have retired. Even so, some multiemployer plans have been forced to alter the way benefits are financed in order to remain fiscally solvent. For some multiemployer plans, the rapidly escalating costs, the demographic trends, and the contraction of

the unionized workforce have required them to seriously rethink plan design and financing issues and to take steps to reduce or eliminate retiree benefits in ways that would have been unthinkable just a few years ago.

During the legislative process surrounding the passage of the MMA, the NCCMP urged Congress to consider carefully the structure of the new prescription drug program so as to avoid creating additional burdens on employer-sponsored plans and further incentives for them to reduce or drop prescription drug coverage for Medicare-eligible retirees. Although Congress incorporated an employer subsidy provision in the final legislation for plans that provided prescription drug benefits that were at least actuarially equivalent to the standard Part D drug benefit to encourage employers to continue providing retiree drug coverage, the overall structure of the new Medicare Part D benefit seriously disadvantages retirees with employer-sponsored coverage. This is particularly true with respect to the ability of retirees to meet the out-of-pocket limits that would trigger Medicare's catastrophic coverage. We recognize that CMS cannot through regulation remedy such a serious structural flaw in the statutory framework of the MMA, but we urge CMS to use its interpretive authority to ameliorate wherever possible the disadvantageous treatment of retirees with employer-sponsored coverage.

The statutory provisions of the MMA relating to employer-sponsored retiree prescription drug coverage are largely fashioned with a corporate health plan model in mind. Under this model, the plan sponsor is the employer who controls both plan design and financing decisions with little or no input from employees, unions or retirees. As you know, the world of multiemployer plans is quite different. Under applicable labor law, these collectively bargained plans are administered by a Board of Trustees consisting of equal numbers of representatives of labor and management. Under the Employee Retirement Income Security Act of 1974 (ERISA), the Board functions as both plan sponsor and the named fiduciary of the plan (and often the plan administrator as well) and therefore no individual employer can influence the operation or design of the plan because those decisions are reserved for the Board.

We appreciate the obvious effort that CMS has made in crafting its proposed rule to recognize that not all employer-sponsored plans are the same. We share your goals of maximizing the number of retirees retaining existing drug coverage, avoiding windfalls in which retirees receive a smaller subsidy from plan sponsors than Medicare would pay on their behalf, minimizing administrative burdens on beneficiaries, employers, unions, and plans, minimizing costs to the government of providing retiree drug subsidies and staying within the budget estimates. However, we believe that some of the rules that are being considered, particularly those directed at avoiding employer windfalls, may not be as relevant to multiemployer plans as they might be in a corporate plan setting, since it is the joint Board of Trustees that controls the design and financing of the retiree health plan, not any individual employer. This provides a degree of protection against potential manipulation that may be missing in other circumstances.

We have focused our comments on a handful of key issues raised in Subpart R of the proposed rule but we hope to open a dialogue with CMS staff on these and other issues of concern. Our detailed comments follow.

Comments Related to Subpart R – Payments to Sponsors of Retiree Prescription Drug Plans:

Section 423.882 Definitions

"Group health plan"

We support the use of the same definition of group health plan as found in section 607(1) of ERISA, 29 U.S.C. 1167(1). To further clarify the ability of multiemployer plans to qualify for the subsidy, we suggest also incorporating the definition of "multiemployer plan" found in section 3(37) of ERISA, 29 U.S.C. 1002(3)(37).

"Sponsor"

Although the proposed rule refers back to the definition of plan sponsor found in section 3(16)(B) of ERISA, we suggest that CMS confirm that in the case of a multiemployer plan (i.e., a plan established or maintained jointly by more than one employer and one or more employee associations), the plan sponsor is the board of trustees.

It would also be helpful for CMS to confirm how the employer subsidy provisions for prescription drug coverage operate in the context of a multiemployer health plan.

As we understand the statutory structure and legislative history of MMA regarding the employer subsidy for retiree prescription drug coverage, Congress intended for the Board of Trustees of the multiemployer plan to be the recipient of the employer subsidy since it is the plan that finances the retiree drug benefits (i.e., employer contributions and retiree contributions are placed in trust and those amounts, together with interest accumulated in the trust, are used to pay retiree prescription drug benefits). Therefore, as the entity claiming the subsidy, the multiemployer plan, not each contributing employer, will be responsible for meeting the procedural requirements to claim the subsidy, including providing the required disclosures to the Secretary and all eligible individuals (e.g., the notice of creditable coverage). The plan will apply for the subsidy (including furnishing the actuarial attestation and the list of qualified retirees covered under the multiemployer retiree prescription drug plan who are not enrolled in Medicare Part D). Once CMS has processed the application and verified the status of qualified retirees of all contributing employers, the subsidy would be paid to the multiemployer retiree prescription drug plan and these amounts would be credited toward future contributions to prescription drug coverage, by providing funds to cover costs that would otherwise have to be met through additional contributions. This approach eases burdens on CMS and individual contributing employers, while allowing the entity that pays the retiree prescription drug benefits (the multiemployer plan) to receive the subsidy and use it to cover retiree drug costs without incurring necessary administrative costs.

We would be happy to review with you the way that multiemployer plans operate and to furnish further detail why it is essential that the plan be treated as the plan sponsor for purposes of the subsidy, rather than individual contributing employers.

Section 423.884 Requirements for qualified retiree prescription drug plans

(a) Actuarial Attestation

Under the proposed rule, plan sponsors seeking to claim a subsidy for their prescription drug coverage must annually apply for the subsidy, no later than 90 days before the beginning of the calendar or plan year for which the subsidy is sought.

Although the proposed rule requires an actuarial attestation that the prescription drug benefits provided under the retiree prescription drug plan is at least actuarial equivalent to the standard Medicare Part D benefit, little guidance is given regarding the content of this attestation. CMS should consider developing a model form for this attestation, in which the plan's actuary could describe in simple terms how the determination of actuarial equivalency was made and what assumptions were used. A useful example of this type of standardized actuarial reporting for CMS to consider is the Schedule B to the Form 5500, the annual financial report that certain ERISA-covered pension plans must file with the U.S. Department of Labor. Of course, if CMS decides to promulgate a model form, its use should be considered a safe harbor for satisfaction of the attestation requirement and plan sponsors should be free to submit their own attestations in any other format as long as the required information has been included.

We think that CMS's proposal to require that an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

Establishing actuarial equivalency

Under the MMA, the federal government will pay a cash subsidy to employers and other plan sponsors (including multiemployer plans) that provide retiree prescription drug coverage that is at least equal in value to the new Medicare Part D prescription drug coverage. The subsidy would be 28 percent of a retiree's total covered drug costs between $250 and $5,000 per year, which translates to a maximum subsidy payment to a plan sponsor of $1,330 per retiree. The subsidy would be payable for each retiree covered under the employer-sponsored plan who is not enrolled in Medicare Part D.

Although the cost of providing the new drug coverage under Medicare is partially financed by the Federal government, retirees enrolled in the new Medicare Part D benefit program will still be paying a substantial amount themselves for the coverage.

The standard Medicare Part D benefit design which will be offered through stand-alone prescription drug plans (PDPs) is as follows:

- Retirees will pay a monthly premium set by the PDP (estimated to be $35 per month in 2006 when the program begins, but expected to increase as costs increase);
- The PDP decides which prescription drugs to cover, as long as the PDP's formulary meets certain statutory requirements;
- Retirees must pay the first $250 in covered drug costs out of their own pocket (the standard deductible);
- Retirees pay 25% of covered drug costs between $250 and $2,250 during the year;
- Retirees pay 100% of covered drug costs between $2,225 and $5,100 during the year;
- Retirees pay no more than 5% of covered drug costs to the extent that those costs exceed $5,100. But to be eligible for this "catastrophic" coverage, an individual retiree must pay $3,600 (in 2006) in covered drug costs. Costs covered by a third-party, such as insurance or a group health plan, would not count toward this so-called "true out-of-pocket" amount (TrOOP).

To qualify for the 28% Federal subsidy, coverage provided by the employer-sponsored retiree medical plan does not have to be identical to the standard Part D drug benefit described above; it must be at least equal in value on an actuarial basis to the Part D coverage.

The MMA defines this measurement and comparison of the values of the two benefit design "actuarial equivalence." This test makes it possible to compare the value of different benefit designs. Actuarial equivalence looks at the expected cost of a benefit for a typical person, not how much it will actually cost for any given individual. This is important because a person who has greater health care needs obviously will cost more than one who is healthier.

The term "actuarial equivalence" is not defined in the proposed rule itself. CMS will have to create a standard for determining whether an employer retiree drug benefit is actuarially equivalent to the standard Part D benefit. However, in the preamble to the proposed rule, CMS has suggested a variety of differing approaches or tests to determine whether the employer-sponsored retiree drug plan is actuarially equivalent to the standard Medicare Part D prescription drug plan. CMS has asked for public comments on which, if any, of these standards is the right one and which may not be suitable. The standard CMS ultimately chooses will determine how generous a benefit employers have to offer retirees and how big a share of the benefit employers can require retirees to pay and still qualify for the federal subsidy.

Below is a brief description of each of the standards for which CMS seeks public comment:

- Single Prong Test: Under this test, also known as the "gross value test," an employer's benefit is good enough to qualify for a federal subsidy if, on average, the total value of

the benefit is at least equal to the total value of the standard Part D benefit. It does not matter what share of the benefit, if any, the employer pays. Under this test, the employer could contribute nothing and require the retiree to pay the full cost of the plan, yet the employer would still be paid the federal subsidy.

- Single Prong/No Windfall Test: As with the test above, an employer's benefit is good enough for a subsidy if on average the total value of the benefit is at least equal to the total value of the standard Part D benefit. However, the dollar amount of the subsidy paid to the employer cannot be greater than the dollar amount the employer pays toward the retiree coverage. The employer could design the plan so that it pays nothing towards retiree drug coverage after taking the federal subsidies into account.

- Two-Prong Test: This test begins with the single prong test but applies a second test (or "prong") in which the employer would also have to show it is paying for at least a specific minimum share of the total benefit. CMS offers several examples of the level at which it could set the minimum share or amount the employer must pay under the Two-Prong Test. These include:
    - The average per person amount Medicare would expect to pay as a subsidy to employers during the year, estimated by CMS to be $611 in 2006 when the program begins.
    - The expected amount of paid claims under the standard Part D prescription drug plan minus the monthly part D premiums paid by the retiree, estimated by the Congressional Budget Office to be approximately $1,200 in 2006.
    - The after-tax value of the average per person amount Medicare would expect to pay as a subsidy to employers during the year. For employers subject to the federal corporate income tax, this would be higher than the $611 estimated subsidy payment and will vary depending on the employer's tax rate.

One of Congress's policy goals under MMA is to ensure that the subsidy is used to preserve retiree benefits and not used simply to improve the employer's bottom line or for other non-health care uses. The preamble to the proposed regulation endorses the principle that the subsidy should be passed through to the retirees to pay for retiree prescription drug benefits. In particular, the proposed regulation states:

> "The intent of the MMA retiree prescription drug subsidy provisions is to slow the decline in employer-sponsored retiree insurance. By providing a special subsidy payment to sponsors of qualifying plans, the MMA provides employers with extra incentives and flexibility to maintain prescription drug coverage for their retirees. Our intention is to make these subsidy payments as reasonably available to plan sponsors as possible. We wish to take into account as much as possible the needs and concerns of plan sponsors, consistent with necessary assurances that Federal payments are accurate and in accordance with statutory requirements, that the interests of retiree-beneficiaries are protected, and that employers do not receive ''windfalls'' consisting of subsidy payments that are not passed on to beneficiaries."[1]

[1] 69 Fed. Reg. 46737 (August 3, 2004).

The structure of multiemployer plans assures that this policy goal is met.

After carefully considering each of the proposed standards, we have the following recommendations regarding the actuarial equivalence test that we believe are consistent with CMS's goals.

- CMS should adopt the Two-Prong Test for actuarial equivalence, which requires the portion of the prescription drug plan financed by the employer to be at least equal to the portion of the Part D benefit that is financed by Medicare. Only this test is consistent with the letter and intent of the MMA to provide for alternative drug coverage that is actuarially equivalent to the standard Part D benefit. In considering the portion of the plan that is financed by the employer, earnings on employer contributions held in trust as plan assets should be included. The comparison of the employer plan to the Part D benefit should be based on the benefits provided, not the cost.

- All of the other standards described by CMS in the preamble to the proposed rules could penalize retirees covered under a retiree drug plan and should be rejected. The Single Prong Test, the Single Prong/No Windfall Test, and the two versions of the Two-Prong Test that permit the employer to limit its contribution to the average subsidy amount it would expect to be paid from Medicare could all require a retiree to pay more for drug coverage than the retiree would if he or she were covered under a Medicare Part D prescription drug plan.

- Other tests being considered by CMS would allow for even greater windfalls to an employer. The Single Prong (or Gross Value) Test would allow for enormous windfalls to employers since it would permit an employer to pay nothing toward the drug benefit and still collect federal subsidies. This option has been roundly criticized in the press, is inconsistent with the intent of Congress, and would undermine the integrity of the Medicare drug program and therefore endanger the future of the program.

- In those cases in which a plan sponsor would be prohibited from claiming the largest possible retiree drug subsidy payable under the law due to the anti-windfall protections, CMS should provide a mechanism permitting the plan sponsor to claim the larger subsidy, so long as it passes through the value of the subsidy exceeding the windfall protections to the retirees. This is very important from a multiemployer perspective.

- Where a plan is fully insured, the regulations should require the insurance carrier to provide to the plan sponsor the information necessary to apply for the subsidy.

What is a "plan"?

As CMS acknowledges, many plan sponsors provide different levels and packages of benefits to different groups of retirees. In determining whether the coverage meets the actuarial equivalency test, one must first determine what the plan is that is being compared to the standard Medicare Part D prescription drug coverage. In its proposed rule, CMS indicates that it intends

to adopt a definition of "plan" that mirrors the current approach found in the Treasury regulations regarding the health insurance continuation requirements of the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA). Under those regulations, all health benefits provided by the plan sponsor are presumed to be under a single plan unless plan documents indicate otherwise.

As a result, actuarial equivalence would be determined by evaluating the plan as a whole, not on a benefit structure by benefit structure basis, and if, on average the actuarial value of the drug coverage equals or exceeds the value of the standard Part D coverage, the plan would satisfy the actuarial equivalency test.

We support the use of such an approach because it is one that is already familiar to plan sponsors and it provides flexibility without sacrificing retiree protections.

(b) Sponsor application for the subsidy payment

In general we support the approach taken by CMS that requires the plan sponsor to apply for the subsidy annually. As previously noted above, in the case of a multiemployer prescription drug plan, it is the plan itself, not each contributing employer that will file the application for the subsidy payment.

Under the proposed rule, plan sponsors must submit their subsidy applications no later than 90 days prior to the beginning of the calendar year for which the subsidy is requested. In order to receive the subsidy for 2006, applications with accompanying documentations must be submitted by September 30, 2005. For plans that begin coverage in the middle of a year, the plan sponsor must submit an actuarial attestation no later than 90 days prior to the date that coverage begins. For new plans that begin prescription drug coverage after September 30, 2005, the plan sponsor must submit an actuarial attestation no later than 150 days prior to the start of the program.

CMS also proposes to require that a plan sponsor submit a new actuarial attestation no later than 90 days before the implementation of a material change to the plan's drug coverage that impacts the actuarial value of the plan. A material change is defined as "any change that potentially causes the plan to no longer meet the actuarial equivalence test."

Although we generally support the proposed structure, we have concerns about the need to apply for a subsidy in the first year of the program by September 30, 2005. We are not sure whether the Boards of Trustees of multiemployer plans or other plan sponsors will be able to determine with certainty what alternatives there may be for retiree coverage other than simply continuing to provide benefits in the same way as in the past. For instance, some multiemployer plans may want to contract with qualified prescription drug plans (PDPs) to offer a coordinated or supplemental benefit. There is no guarantee that all the PDPs that might ultimately be offered in the region will be up and running by September 30, 2005. CMS should consider allowing plan sponsors who think they will be claiming the subsidy to file their application by September

30, 2005, but allow some flexibility in revising that application during a somewhat more extended period.

In addition, as previously noted in our comments on actuarial attestations generally, we think that CMS's proposal to require an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

(c) Disclosure of creditable coverage

The proposed rule requires plan sponsors to disclose to retirees (and their Medicare-eligible spouses and dependents) whether the retiree prescription drug plan is actuarially equivalent to the standard Medicare Part D drug plan and therefore whether their coverage under the employer plan is creditable coverage. CMS has asked for input on a number of issues related to this requirement.

We encourage CMS to develop a model disclosure form that plan sponsors might use. We agree with CMS that it would be useful to consider as a model the approach taken by CMS, the Department of Labor and the Department of Treasury in their joint regulations regarding notices of creditable coverage under the Health Insurance Portability and Accountability Act of 1996, although the notice must be provided in a more timely fashion that would enable retirees to enroll in Part D if their plan is not actuarially equivalent.

CMS has also asked for comments regarding whether this disclosure could be incorporated into existing disclosures made to retirees in the normal course of plan operation or whether a separate notice should be required. In particular, CMS notes:

> We are soliciting comments regarding the types of materials that could provide an appropriate vehicle for this purpose, as well as ways to ensure that the notice is conspicuous and readily identified by recipients, particularly in those instances where the coverage is not creditable. 69 Fed. Reg. 46744.

Although we normally would oppose additional separate notices as unduly burdensome and would typically encourage CMS to allow plan sponsors to incorporate disclosure into existing types of dissemination, given the importance of the choice facing retirees, the need for timely disclosure of whether or not the plan's drug coverage is actuarially equivalent, and the

potential late enrollment penalties that retirees will face if they do not enroll in Part D when they are first eligible, we support requiring a separate notice regarding creditable coverage, unless the retiree prescription drug plan finds an alternative method of incorporating the notice with existing mailings or other forms of disclosure that assures that the notice will be conspicuous and readily identified by the recipients as important.

(d) HSAs, FSAs, HRAs, and MSAs

In the Preamble to the proposed rule, CMS requests input on whether the amounts used for prescription drug expenses under health savings accounts (HSAs) and other types of individual savings arrangements, including flexible spending accounts (FSAs), health reimbursement arrangements (HRAs) and medical savings accounts (MSAs) should be treated as group health payments for purposes of counting as incurred costs for purposes of meeting the Part D out-of-pocket threshold. 69 Fed. Reg. 46650. The general rule under Section 1860D-2(b)(4)(C)(ii) of the MMA is that any costs for which the individual is reimbursed by insurance or otherwise, a group health plan, or another third-party payment arrangement do not count toward incurred costs.

CMS indicates that its "strong preference" is to treat HSA amounts differently so as to allow amounts reimbursed through an HSA to count towards incurred costs. Under this interpretation, a Medicare beneficiary could withdraw funds from his or her HSA, pay Part D drug expenses, and allow these expenses to count toward the beneficiary's out-of-pocket payments. Medicare catastrophic coverage would consequently begin sooner than if these payments were not counted toward TrOOP.

We strongly oppose creating a special exception for these payments. Although the Department of Labor has established a regulatory safe harbor for certain HSAs so that they may not be treated as group health plans under the Employee Retirement Income Security Act of 1974 (ERISA),[2] not all HSAs will fall into that safe harbor and some may, in fact, be group health plans. Even under the Department's guidance this question is ultimately decided by the individual facts and circumstances of each case. There is no statutory authority for CMS to create a special rule for HSAs and it would be both illegal and inappropriate to do so. Moreover, if HHS were to create a special exception from TrOOP only for those HSAs that were not employer plans would create an enforcement problem and an administrative nightmare. Who would determine whether the HSA in question was an ERISA plan? The Department of Labor? HHS? The plan sponsor? The individual who established the HSA himself or herself? The structure of the MMA and the proposed rule places a great deal of confidence in the plan sponsor to self-police compliance. Determining whether or not an arrangement constitutes an ERISA plan has always been the purview of the Department of Labor or, ultimately, the courts through actions brought under ERISA section 502. This would create a level of complexity and administrative burden that seems unjustified and unsupportable, given CMS' goals of

[2] Department of Labor Field Assistance Bulletin 2004-1 (April 7, 2004). This can be found at: http://www.dol.gov/ebsa/regs/fab_2004-1.html.

minimizing administrative burdens on employers, unions, plans and beneficiaries and minimizing costs to the government of providing retiree prescription drug coverage.

We believe that HSA amounts should be treated as other tax-favored forms of health coverage and excluded from incurred costs. They are not "essentially analogous to a beneficiary's bank account" because individuals who establish these accounts have been given extraordinarily generous tax preferences to use this form of tax-favored savings. Individuals can deduct amounts placed in HSAs when the contributions are made "above-the-line," contributions can be made by others on behalf of an individual and deducted by the individual, even though he or she didn't make the contribution, and withdrawals from HSAs for qualified medical expenses (including prescription drug costs) are tax free. In contrast, individuals who place money in a bank account are given no special tax preferences.

CMS' desire to give HSAs special treatment is simply another example of discrimination against retirees with employer-sponsored prescription drug coverage, since HSAs can be set up by individuals without any employer involvement, although employer contributions to HSAs on behalf of employees are permitted. HSAs should be treated as all other tax-favored savings mechanisms – whether individual or employer-sponsored (including FSAs, HRAs and MSAs). In other words, payments from all four of these vehicles should be excluded from incurred costs. To do otherwise would create a substantial windfall and an unjustified double taxpayer subsidy for individuals who establish HSAs. Not only would they receive a tax subsidy for establishing such an arrangement, they would be treated more favorably than individuals who pay prescription drug expenses through salary reduction programs that are employer-sponsored. To allow HSA amounts to count toward incurred costs while barring other forms of subsidized employer coverage from doing so is just another example of the bias against retiree drug coverage provided under employer-sponsored plans that is an integral part of the structure of the MMA, notwithstanding Congress' attempt to ameliorate that bias somewhat through the offering of an employer subsidy for continuing to provide coverage.

Waivers for Plan Sponsors to contract with or become Part D Prescription Drug Plans (PDPs) or Medicare Advantage (MA-PD) plans

Plan sponsors that do not choose to provide coverage that qualifies for the subsidy or provide coverage that supplements or wraps around the Part D benefit can instead contract with or become a PDP or Medicare Advantage (MA) plan. CMS indicates that an MA-PD plan or a PDP plan may request, in writing from CMS, a waiver or modification of the Medicare Advantage or Part D requirements that hinder the design of, the offering of, or the enrollment in Medicare Advantage plans by employees or former employees receiving benefits from plans sponsored by employers, labor organizations, or multiemployer plans. MA and PDP plans that receive a waiver may restrict the enrollment to participants and beneficiaries in an employer-sponsored plan. Waivers might include restricting enrollment to the plan sponsor's retirees and offer a benefit that resembles existing active coverage. A waiver might also include authorizing the establishment of separate premium amounts for enrollees of the employer-sponsored group.

A waiver process should be established for employers and other plan sponsors to contract with or otherwise create Medicare Part D PDPs and MA-PD plans that serve employment-based populations. Waivers should be published and made easily available online. Existing waivers that were made available to Medicare+Choice plans should be catalogued and placed online so that plan sponsors can determine what requirements have already been considered for waiver.

CMS recognizes that one option available to employers under the MMA is to provide retiree prescription coverage that supplements coverage offered under a PDP or MA-PD plan. For this option to work smoothly for plan sponsors, particularly those with retirees living across the PDP and MA-PD regions to be established, CMS should take appropriate steps to encourage the development of supplemental plans by PDP and MA-PD providers. If both the Part D plan and the supplemental plan are offered a single provider, it may be easier to coordinate benefits.

In addition, a number of multiemployer plans have joined together to establish purchasing coalitions to improve their purchasing leverage for prescription drugs with pharmacy benefit managers (PBMs). We strongly urge CMS to extend waiver authority to purchasing coalitions involved with employer-sponsored plans. It is quite likely that these purchasing coalitions may be potential PDP plan sponsors, so CMS should not preclude waivers for such entities.

Conclusion

Again we appreciate your willingness to seek input from the plan sponsor community and other stakeholders in the fight to preserve employer-sponsored retiree health programs. We are especially grateful for your willingness to consider the special administrative problems of multiemployer plans because of their structural differences from plans sponsored by individual employers. Please feel free to contact me for further information. We would be pleased to meet with you to discuss these comments and any other issues on which you are seeking input. We look forward to working with you in the future.

Yours truly,

Randy DeFrehn
Executive Director

http://www.cms.hhs.gov/regulations/ecomments

Dear Sirs/Madams:

These comments are filed by the National Coordinating Committee for Multiemployer Plans (NCCMP) in response to the request for public comments by the Centers for Medicare and Medicaid Services (CMS) on the proposed rule to implement the new Medicare Prescription Drug Benefit authorized in section 101 of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (MMA). This proposed rule was published in the Federal Register of August 3, 2004 (69 Fed. Reg. 46632).

The NCCMP is the only national organization devoted exclusively to protecting the interests of the approximately ten million workers, retirees, and their families who rely on multiemployer plans for retirement, health and other benefits. Our purpose is to assure an environment in which multiemployer plans can continue their vital role in providing benefits to working men and women. The NCCMP is a nonprofit organization, with members, plans and plan sponsors in every major segment of the multiemployer plan universe, including in the building and construction, retail food and service, and entertainment industries.

Most multiemployer plans today provide for retiree health benefits and many of those plans include some type of coverage for prescription drugs. As is well documented, the number of retirees covered by employer-sponsored health benefit plans today and in the future has continued to shrink, primarily because of the combination of accounting rule changes that force private sector employers to recognize the long-term liability of the retiree medical benefits and the rapidly escalating cost of providing that retiree health coverage.

Although facing the same marketplace cost pressures as other plan sponsors, employers and unions who have come together through collective bargaining to establish multiemployer plans have been less likely to drastically reduce or eliminate retiree coverage, in part because active workers in those industries where multiemployer plan coverage is prevalent have been willing to forgo some portion of their compensation to continue to subsidize the health benefits of their brothers and sisters who have retired. Even so, some multiemployer plans have been forced to alter the way benefits are financed in order to remain fiscally solvent. For some multiemployer plans, the rapidly escalating costs, the demographic trends, and the contraction of

the unionized workforce have required them to seriously rethink plan design and financing issues and to take steps to reduce or eliminate retiree benefits in ways that would have been unthinkable just a few years ago.

During the legislative process surrounding the passage of the MMA, the NCCMP urged Congress to consider carefully the structure of the new prescription drug program so as to avoid creating additional burdens on employer-sponsored plans and further incentives for them to reduce or drop prescription drug coverage for Medicare-eligible retirees. Although Congress incorporated an employer subsidy provision in the final legislation for plans that provided prescription drug benefits that were at least actuarially equivalent to the standard Part D drug benefit to encourage employers to continue providing retiree drug coverage, the overall structure of the new Medicare Part D benefit seriously disadvantages retirees with employer-sponsored coverage. This is particularly true with respect to the ability of retirees to meet the out-of-pocket limits that would trigger Medicare's catastrophic coverage. We recognize that CMS cannot through regulation remedy such a serious structural flaw in the statutory framework of the MMA, but we urge CMS to use its interpretive authority to ameliorate wherever possible the disadvantageous treatment of retirees with employer-sponsored coverage.

The statutory provisions of the MMA relating to employer-sponsored retiree prescription drug coverage are largely fashioned with a corporate health plan model in mind. Under this model, the plan sponsor is the employer who controls both plan design and financing decisions with little or no input from employees, unions or retirees. As you know, the world of multiemployer plans is quite different. Under applicable labor law, these collectively bargained plans are administered by a Board of Trustees consisting of equal numbers of representatives of labor and management. Under the Employee Retirement Income Security Act of 1974 (ERISA), the Board functions as both plan sponsor and the named fiduciary of the plan (and often the plan administrator as well) and therefore no individual employer can influence the operation or design of the plan because those decisions are reserved for the Board.

We appreciate the obvious effort that CMS has made in crafting its proposed rule to recognize that not all employer-sponsored plans are the same. We share your goals of maximizing the number of retirees retaining existing drug coverage, avoiding windfalls in which retirees receive a smaller subsidy from plan sponsors than Medicare would pay on their behalf, minimizing administrative burdens on beneficiaries, employers, unions, and plans, minimizing costs to the government of providing retiree drug subsidies and staying within the budget estimates. However, we believe that some of the rules that are being considered, particularly those directed at avoiding employer windfalls, may not be as relevant to multiemployer plans as they might be in a corporate plan setting, since it is the joint Board of Trustees that controls the design and financing of the retiree health plan, not any individual employer. This provides a degree of protection against potential manipulation that may be missing in other circumstances.

We have focused our comments on a handful of key issues raised in Subpart R of the proposed rule but we hope to open a dialogue with CMS staff on these and other issues of concern. Our detailed comments follow.

Comments Related to Subpart R – Payments to Sponsors of Retiree Prescription Drug Plans:

Section 423.882 Definitions

"Group health plan"

We support the use of the same definition of group health plan as found in section 607(1) of ERISA, 29 U.S.C. 1167(1). To further clarify the ability of multiemployer plans to qualify for the subsidy, we suggest also incorporating the definition of "multiemployer plan" found in section 3(37) of ERISA, 29 U.S.C. 1002(3)(37).

"Sponsor"

Although the proposed rule refers back to the definition of plan sponsor found in section 3(16)(B) of ERISA, we suggest that CMS confirm that in the case of a multiemployer plan (i.e., a plan established or maintained jointly by more than one employer and one or more employee associations), the plan sponsor is the board of trustees.

It would also be helpful for CMS to confirm how the employer subsidy provisions for prescription drug coverage operate in the context of a multiemployer health plan.

As we understand the statutory structure and legislative history of MMA regarding the employer subsidy for retiree prescription drug coverage, Congress intended for the Board of Trustees of the multiemployer plan to be the recipient of the employer subsidy since it is the plan that finances the retiree drug benefits (i.e., employer contributions and retiree contributions are placed in trust and those amounts, together with interest accumulated in the trust, are used to pay retiree prescription drug benefits). Therefore, as the entity claiming the subsidy, the multiemployer plan, not each contributing employer, will be responsible for meeting the procedural requirements to claim the subsidy, including providing the required disclosures to the Secretary and all eligible individuals (e.g., the notice of creditable coverage). The plan will apply for the subsidy (including furnishing the actuarial attestation and the list of qualified retirees covered under the multiemployer retiree prescription drug plan who are not enrolled in Medicare Part D). Once CMS has processed the application and verified the status of qualified retirees of all contributing employers, the subsidy would be paid to the multiemployer retiree prescription drug plan and these amounts would be credited toward future contributions to prescription drug coverage, by providing funds to cover costs that would otherwise have to be met through additional contributions. This approach eases burdens on CMS and individual contributing employers, while allowing the entity that pays the retiree prescription drug benefits (the multiemployer plan) to receive the subsidy and use it to cover retiree drug costs without incurring necessary administrative costs.

We would be happy to review with you the way that multiemployer plans operate and to furnish further detail why it is essential that the plan be treated as the plan sponsor for purposes of the subsidy, rather than individual contributing employers.

Section 423.884 Requirements for qualified retiree prescription drug plans

(a) Actuarial Attestation

Under the proposed rule, plan sponsors seeking to claim a subsidy for their prescription drug coverage must annually apply for the subsidy, no later than 90 days before the beginning of the calendar or plan year for which the subsidy is sought.

Although the proposed rule requires an actuarial attestation that the prescription drug benefits provided under the retiree prescription drug plan is at least actuarial equivalent to the standard Medicare Part D benefit, little guidance is given regarding the content of this attestation. CMS should consider developing a model form for this attestation, in which the plan's actuary could describe in simple terms how the determination of actuarial equivalency was made and what assumptions were used. A useful example of this type of standardized actuarial reporting for CMS to consider is the Schedule B to the Form 5500, the annual financial report that certain ERISA-covered pension plans must file with the U.S. Department of Labor. Of course, if CMS decides to promulgate a model form, its use should be considered a safe harbor for satisfaction of the attestation requirement and plan sponsors should be free to submit their own attestations in any other format as long as the required information has been included.

We think that CMS's proposal to require that an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

Establishing actuarial equivalency

Under the MMA, the federal government will pay a cash subsidy to employers and other plan sponsors (including multiemployer plans) that provide retiree prescription drug coverage that is at least equal in value to the new Medicare Part D prescription drug coverage. The subsidy would be 28 percent of a retiree's total covered drug costs between $250 and $5,000 per year, which translates to a maximum subsidy payment to a plan sponsor of $1,330 per retiree. The subsidy would be payable for each retiree covered under the employer-sponsored plan who is not enrolled in Medicare Part D.

Although the cost of providing the new drug coverage under Medicare is partially financed by the Federal government, retirees enrolled in the new Medicare Part D benefit program will still be paying a substantial amount themselves for the coverage.

The standard Medicare Part D benefit design which will be offered through stand-alone prescription drug plans (PDPs) is as follows:

- Retirees will pay a monthly premium set by the PDP (estimated to be $35 per month in 2006 when the program begins, but expected to increase as costs increase);
- The PDP decides which prescription drugs to cover, as long as the PDP's formulary meets certain statutory requirements;
- Retirees must pay the first $250 in covered drug costs out of their own pocket (the standard deductible);
- Retirees pay 25% of covered drug costs between $250 and $2,250 during the year;
- Retirees pay 100% of covered drug costs between $2,225 and $5,100 during the year;
- Retirees pay no more than 5% of covered drug costs to the extent that those costs exceed $5,100. But to be eligible for this "catastrophic" coverage, an individual retiree must pay $3,600 (in 2006) in covered drug costs. Costs covered by a third-party, such as insurance or a group health plan, would not count toward this so-called "true out-of-pocket" amount (TrOOP).

To qualify for the 28% Federal subsidy, coverage provided by the employer-sponsored retiree medical plan does not have to be identical to the standard Part D drug benefit described above; it must be at least equal in value on an actuarial basis to the Part D coverage.

The MMA defines this measurement and comparison of the values of the two benefit design "actuarial equivalence." This test makes it possible to compare the value of different benefit designs. Actuarial equivalence looks at the expected cost of a benefit for a typical person, not how much it will actually cost for any given individual. This is important because a person who has greater health care needs obviously will cost more than one who is healthier.

The term "actuarial equivalence" is not defined in the proposed rule itself. CMS will have to create a standard for determining whether an employer retiree drug benefit is actuarially equivalent to the standard Part D benefit. However, in the preamble to the proposed rule, CMS has suggested a variety of differing approaches or tests to determine whether the employer-sponsored retiree drug plan is actuarially equivalent to the standard Medicare Part D prescription drug plan. CMS has asked for public comments on which, if any, of these standards is the right one and which may not be suitable. The standard CMS ultimately chooses will determine how generous a benefit employers have to offer retirees and how big a share of the benefit employers can require retirees to pay and still qualify for the federal subsidy.

Below is a brief description of each of the standards for which CMS seeks public comment:

- Single Prong Test: Under this test, also known as the "gross value test," an employer's benefit is good enough to qualify for a federal subsidy if, on average, the total value of

the benefit is at least equal to the total value of the standard Part D benefit. It does not matter what share of the benefit, if any, the employer pays. Under this test, the employer could contribute nothing and require the retiree to pay the full cost of the plan, yet the employer would still be paid the federal subsidy.

- Single Prong/No Windfall Test: As with the test above, an employer's benefit is good enough for a subsidy if on average the total value of the benefit is at least equal to the total value of the standard Part D benefit. However, the dollar amount of the subsidy paid to the employer cannot be greater than the dollar amount the employer pays toward the retiree coverage. The employer could design the plan so that it pays nothing towards retiree drug coverage after taking the federal subsidies into account.

- Two-Prong Test: This test begins with the single prong test but applies a second test (or "prong") in which the employer would also have to show it is paying for at least a specific minimum share of the total benefit. CMS offers several examples of the level at which it could set the minimum share or amount the employer must pay under the Two-Prong Test. These include:
    - The average per person amount Medicare would expect to pay as a subsidy to employers during the year, estimated by CMS to be $611 in 2006 when the program begins.
    - The expected amount of paid claims under the standard Part D prescription drug plan minus the monthly part D premiums paid by the retiree, estimated by the Congressional Budget Office to be approximately $1,200 in 2006.
    - The after-tax value of the average per person amount Medicare would expect to pay as a subsidy to employers during the year. For employers subject to the federal corporate income tax, this would be higher than the $611 estimated subsidy payment and will vary depending on the employer's tax rate.

One of Congress's policy goals under MMA is to ensure that the subsidy is used to preserve retiree benefits and not used simply to improve the employer's bottom line or for other non-health care uses. The preamble to the proposed regulation endorses the principle that the subsidy should be passed through to the retirees to pay for retiree prescription drug benefits. In particular, the proposed regulation states:

> "The intent of the MMA retiree prescription drug subsidy provisions is to slow the decline in employer-sponsored retiree insurance. By providing a special subsidy payment to sponsors of qualifying plans, the MMA provides employers with extra incentives and flexibility to maintain prescription drug coverage for their retirees. Our intention is to make these subsidy payments as reasonably available to plan sponsors as possible. We wish to take into account as much as possible the needs and concerns of plan sponsors, consistent with necessary assurances that Federal payments are accurate and in accordance with statutory requirements, that the interests of retiree-beneficiaries are protected, and that employers do not receive ''windfalls'' consisting of subsidy payments that are not passed on to beneficiaries."[1]

[1] 69 Fed. Reg. 46737 (August 3, 2004).

The structure of multiemployer plans assures that this policy goal is met.

After carefully considering each of the proposed standards, we have the following recommendations regarding the actuarial equivalence test that we believe are consistent with CMS's goals.

- CMS should adopt the Two-Prong Test for actuarial equivalence, which requires the portion of the prescription drug plan financed by the employer to be at least equal to the portion of the Part D benefit that is financed by Medicare. Only this test is consistent with the letter and intent of the MMA to provide for alternative drug coverage that is actuarially equivalent to the standard Part D benefit. In considering the portion of the plan that is financed by the employer, earnings on employer contributions held in trust as plan assets should be included. The comparison of the employer plan to the Part D benefit should be based on the benefits provided, not the cost.

- All of the other standards described by CMS in the preamble to the proposed rules could penalize retirees covered under a retiree drug plan and should be rejected. The Single Prong Test, the Single Prong/No Windfall Test, and the two versions of the Two-Prong Test that permit the employer to limit its contribution to the average subsidy amount it would expect to be paid from Medicare could all require a retiree to pay more for drug coverage than the retiree would if he or she were covered under a Medicare Part D prescription drug plan.

- Other tests being considered by CMS would allow for even greater windfalls to an employer. The Single Prong (or Gross Value) Test would allow for enormous windfalls to employers since it would permit an employer to pay nothing toward the drug benefit and still collect federal subsidies. This option has been roundly criticized in the press, is inconsistent with the intent of Congress, and would undermine the integrity of the Medicare drug program and therefore endanger the future of the program.

- In those cases in which a plan sponsor would be prohibited from claiming the largest possible retiree drug subsidy payable under the law due to the anti-windfall protections, CMS should provide a mechanism permitting the plan sponsor to claim the larger subsidy, so long as it passes through the value of the subsidy exceeding the windfall protections to the retirees. This is very important from a multiemployer perspective.

- Where a plan is fully insured, the regulations should require the insurance carrier to provide to the plan sponsor the information necessary to apply for the subsidy.

What is a "plan"?

As CMS acknowledges, many plan sponsors provide different levels and packages of benefits to different groups of retirees. In determining whether the coverage meets the actuarial equivalency test, one must first determine what the plan is that is being compared to the standard Medicare Part D prescription drug coverage. In its proposed rule, CMS indicates that it intends

to adopt a definition of "plan" that mirrors the current approach found in the Treasury regulations regarding the health insurance continuation requirements of the Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA). Under those regulations, all health benefits provided by the plan sponsor are presumed to be under a single plan unless plan documents indicate otherwise.

As a result, actuarial equivalence would be determined by evaluating the plan as a whole, not on a benefit structure by benefit structure basis, and if, on average the actuarial value of the drug coverage equals or exceeds the value of the standard Part D coverage, the plan would satisfy the actuarial equivalency test.

We support the use of such an approach because it is one that is already familiar to plan sponsors and it provides flexibility without sacrificing retiree protections.

(b) Sponsor application for the subsidy payment

In general we support the approach taken by CMS that requires the plan sponsor to apply for the subsidy annually. As previously noted above, in the case of a multiemployer prescription drug plan, it is the plan itself, not each contributing employer that will file the application for the subsidy payment.

Under the proposed rule, plan sponsors must submit their subsidy applications no later than 90 days prior to the beginning of the calendar year for which the subsidy is requested. In order to receive the subsidy for 2006, applications with accompanying documentations must be submitted by September 30, 2005. For plans that begin coverage in the middle of a year, the plan sponsor must submit an actuarial attestation no later than 90 days prior to the date that coverage begins. For new plans that begin prescription drug coverage after September 30, 2005, the plan sponsor must submit an actuarial attestation no later than 150 days prior to the start of the program.

CMS also proposes to require that a plan sponsor submit a new actuarial attestation no later than 90 days before the implementation of a material change to the plan's drug coverage that impacts the actuarial value of the plan. A material change is defined as "any change that potentially causes the plan to no longer meet the actuarial equivalence test."

Although we generally support the proposed structure, we have concerns about the need to apply for a subsidy in the first year of the program by September 30, 2005. We are not sure whether the Boards of Trustees of multiemployer plans or other plan sponsors will be able to determine with certainty what alternatives there may be for retiree coverage other than simply continuing to provide benefits in the same way as in the past. For instance, some multiemployer plans may want to contract with qualified prescription drug plans (PDPs) to offer a coordinated or supplemental benefit. There is no guarantee that all the PDPs that might ultimately be offered in the region will be up and running by September 30, 2005. CMS should consider allowing plan sponsors who think they will be claiming the subsidy to file their application by September

30, 2005, but allow some flexibility in revising that application during a somewhat more extended period.

In addition, as previously noted in our comments on actuarial attestations generally, we think that CMS's proposal to require an additional attestation must be filed with CMS no later than 90 days before a material change to the drug coverage that impacts the actuarial value of the coverage is generally reasonable, but we are concerned that the 90-day requirement may not be feasible in all situations.

The question of whether the 90-day deadline is feasible is interrelated with the issue of whether this deadline ought to be related to a calendar year or the plan year. CMS has indicated that it is leaning toward the use of a calendar year approach. Although most plan sponsors use a calendar year as the plan year, many do not. Clearly there are persuasive arguments favoring the use of a calendar year which can be made, however, we believe to reduce administrative burdens on plan sponsors, CMS should adopt a plan year approach.

(c) Disclosure of creditable coverage

The proposed rule requires plan sponsors to disclose to retirees (and their Medicare-eligible spouses and dependents) whether the retiree prescription drug plan is actuarially equivalent to the standard Medicare Part D drug plan and therefore whether their coverage under the employer plan is creditable coverage. CMS has asked for input on a number of issues related to this requirement.

We encourage CMS to develop a model disclosure form that plan sponsors might use. We agree with CMS that it would be useful to consider as a model the approach taken by CMS, the Department of Labor and the Department of Treasury in their joint regulations regarding notices of creditable coverage under the Health Insurance Portability and Accountability Act of 1996, although the notice must be provided in a more timely fashion that would enable retirees to enroll in Part D if their plan is not actuarially equivalent.

CMS has also asked for comments regarding whether this disclosure could be incorporated into existing disclosures made to retirees in the normal course of plan operation or whether a separate notice should be required. In particular, CMS notes:

> We are soliciting comments regarding the types of materials that could provide an appropriate vehicle for this purpose, as well as ways to ensure that the notice is conspicuous and readily identified by recipients, particularly in those instances where the coverage is not creditable. 69 Fed. Reg. 46744.

Although we normally would oppose additional separate notices as unduly burdensome and would typically encourage CMS to allow plan sponsors to incorporate disclosure into existing types of dissemination, given the importance of the choice facing retirees, the need for timely disclosure of whether or not the plan's drug coverage is actuarially equivalent, and the

potential late enrollment penalties that retirees will face if they do not enroll in Part D when they are first eligible, we support requiring a separate notice regarding creditable coverage, unless the retiree prescription drug plan finds an alternative method of incorporating the notice with existing mailings or other forms of disclosure that assures that the notice will be conspicuous and readily identified by the recipients as important.

(d) HSAs, FSAs, HRAs, and MSAs

In the Preamble to the proposed rule, CMS requests input on whether the amounts used for prescription drug expenses under health savings accounts (HSAs) and other types of individual savings arrangements, including flexible spending accounts (FSAs), health reimbursement arrangements (HRAs) and medical savings accounts (MSAs) should be treated as group health payments for purposes of counting as incurred costs for purposes of meeting the Part D out-of-pocket threshold. 69 Fed. Reg. 46650. The general rule under Section 1860D-2(b)(4)(C)(ii) of the MMA is that any costs for which the individual is reimbursed by insurance or otherwise, a group health plan, or another third-party payment arrangement do not count toward incurred costs.

CMS indicates that its "strong preference" is to treat HSA amounts differently so as to allow amounts reimbursed through an HSA to count towards incurred costs. Under this interpretation, a Medicare beneficiary could withdraw funds from his or her HSA, pay Part D drug expenses, and allow these expenses to count toward the beneficiary's out-of-pocket payments. Medicare catastrophic coverage would consequently begin sooner than if these payments were not counted toward TrOOP.

We strongly oppose creating a special exception for these payments. Although the Department of Labor has established a regulatory safe harbor for certain HSAs so that they may not be treated as group health plans under the Employee Retirement Income Security Act of 1974 (ERISA),[2] not all HSAs will fall into that safe harbor and some may, in fact, be group health plans. Even under the Department's guidance this question is ultimately decided by the individual facts and circumstances of each case. There is no statutory authority for CMS to create a special rule for HSAs and it would be both illegal and inappropriate to do so. Moreover, if HHS were to create a special exception from TrOOP only for those HSAs that were not employer plans would create an enforcement problem and an administrative nightmare. Who would determine whether the HSA in question was an ERISA plan? The Department of Labor? HHS? The plan sponsor? The individual who established the HSA himself or herself? The structure of the MMA and the proposed rule places a great deal of confidence in the plan sponsor to self-police compliance. Determining whether or not an arrangement constitutes an ERISA plan has always been the purview of the Department of Labor or, ultimately, the courts through actions brought under ERISA section 502. This would create a level of complexity and administrative burden that seems unjustified and unsupportable, given CMS' goals of

[2] Department of Labor Field Assistance Bulletin 2004-1 (April 7, 2004). This can be found at: http://www.dol.gov/ebsa/regs/fab_2004-1.html.

minimizing administrative burdens on employers, unions, plans and beneficiaries and minimizing costs to the government of providing retiree prescription drug coverage.

We believe that HSA amounts should be treated as other tax-favored forms of health coverage and excluded from incurred costs. They are not "essentially analogous to a beneficiary's bank account" because individuals who establish these accounts have been given extraordinarily generous tax preferences to use this form of tax-favored savings. Individuals can deduct amounts placed in HSAs when the contributions are made "above-the-line," contributions can be made by others on behalf of an individual and deducted by the individual, even though he or she didn't make the contribution, and withdrawals from HSAs for qualified medical expenses (including prescription drug costs) are tax free. In contrast, individuals who place money in a bank account are given no special tax preferences.

CMS' desire to give HSAs special treatment is simply another example of discrimination against retirees with employer-sponsored prescription drug coverage, since HSAs can be set up by individuals without any employer involvement, although employer contributions to HSAs on behalf of employees are permitted. HSAs should be treated as all other tax-favored savings mechanisms – whether individual or employer-sponsored (including FSAs, HRAs and MSAs). In other words, payments from all four of these vehicles should be excluded from incurred costs. To do otherwise would create a substantial windfall and an unjustified double taxpayer subsidy for individuals who establish HSAs. Not only would they receive a tax subsidy for establishing such an arrangement, they would be treated more favorably than individuals who pay prescription drug expenses through salary reduction programs that are employer-sponsored. To allow HSA amounts to count toward incurred costs while barring other forms of subsidized employer coverage from doing so is just another example of the bias against retiree drug coverage provided under employer-sponsored plans that is an integral part of the structure of the MMA, notwithstanding Congress' attempt to ameliorate that bias somewhat through the offering of an employer subsidy for continuing to provide coverage.

Waivers for Plan Sponsors to contract with or become Part D Prescription Drug Plans (PDPs) or Medicare Advantage (MA-PD) plans

Plan sponsors that do not choose to provide coverage that qualifies for the subsidy or provide coverage that supplements or wraps around the Part D benefit can instead contract with or become a PDP or Medicare Advantage (MA) plan. CMS indicates that an MA-PD plan or a PDP plan may request, in writing from CMS, a waiver or modification of the Medicare Advantage or Part D requirements that hinder the design of, the offering of, or the enrollment in Medicare Advantage plans by employees or former employees receiving benefits from plans sponsored by employers, labor organizations, or multiemployer plans. MA and PDP plans that receive a waiver may restrict the enrollment to participants and beneficiaries in an employer-sponsored plan. Waivers might include restricting enrollment to the plan sponsor's retirees and offer a benefit that resembles existing active coverage. A waiver might also include authorizing the establishment of separate premium amounts for enrollees of the employer-sponsored group.

A waiver process should be established for employers and other plan sponsors to contract with or otherwise create Medicare Part D PDPs and MA-PD plans that serve employment-based populations. Waivers should be published and made easily available online. Existing waivers that were made available to Medicare+Choice plans should be catalogued and placed online so that plan sponsors can determine what requirements have already been considered for waiver.

CMS recognizes that one option available to employers under the MMA is to provide retiree prescription coverage that supplements coverage offered under a PDP or MA-PD plan. For this option to work smoothly for plan sponsors, particularly those with retirees living across the PDP and MA-PD regions to be established, CMS should take appropriate steps to encourage the development of supplemental plans by PDP and MA-PD providers. If both the Part D plan and the supplemental plan are offered a single provider, it may be easier to coordinate benefits.

In addition, a number of multiemployer plans have joined together to establish purchasing coalitions to improve their purchasing leverage for prescription drugs with pharmacy benefit managers (PBMs). We strongly urge CMS to extend waiver authority to purchasing coalitions involved with employer-sponsored plans. It is quite likely that these purchasing coalitions may be potential PDP plan sponsors, so CMS should not preclude waivers for such entities.

Conclusion

Again we appreciate your willingness to seek input from the plan sponsor community and other stakeholders in the fight to preserve employer-sponsored retiree health programs. We are especially grateful for your willingness to consider the special administrative problems of multiemployer plans because of their structural differences from plans sponsored by individual employers. Please feel free to contact me for further information. We would be pleased to meet with you to discuss these comments and any other issues on which you are seeking input. We look forward to working with you in the future.

Yours truly,

Randy DeFrehn

Subject: Medicare Program: Medicare Prescription Drug Benefit, CMS 4068-P, RIN-0938-AN08

To Whom It May Concern:

CVS/Pharmacy is providing comments with regard to the proposed rule published August 3, 2004. This rule would implement Title I of the Medicare Modernization Act of 2003 that establishes the voluntary Medicare Part D prescription drug benefit.

CVS operates over 5,300 pharmacies in 36 states and the District of Columbia. CVS is the largest provider of out-patient prescription drugs in the United States. As such, our expectation is that CVS will be a major provider of pharmacy services to Medicare recipients under the Part D program.

Section 423.30-423.50 – Issues Relating to Eligibility and Enrollment (Subpart A)

The confusion that has surrounded the Medicare discount card demonstrates the need for clear and understandable materials for Medicare recipients. CVS would also encourage CMS to recognize the role of the pharmacist in helping recipients to understand this benefit. Some of the components of these materials would include:

- The network status of a pharmacy and whether the pharmacy is a preferred or non-preferred pharmacy.
- The eligibility status of the recipient, whether they have met their front end deductible, and whether they have reached a gap in coverage (ie. the donut hole).
- This information must be provided to the pharmacist via an on-line real time basis.
- The experience with Medicare recipients, who were eligible for the $600 Transitional Assistance and failed to enroll, shows a definite need for special attention to be directed to the Medicare/Medicaid dual eligible. CVS would encourage CMS to allow for a transitional period for these dual eligible beneficiaries. We would also encourage an automatic enrollment process for these individuals.

Section 423.100 – Definition of Covered Part D Drugs

Options for Dispensing Fees – 69 Federal Register 46647-48

Most Medicare recipients will receive their Part D benefits from private insurers or prescription benefit managers (PBMs). CVS is concerned that these entities will attempt to utilize dispensing fees usually reserved for private insurers for this program. The complexity of providing services to this population, because of issues such as coordination of benefits, gaps in coverage, determination of front end deductibles, product and patient eligibility, etc. makes this program considerably more difficult. Recent studies, including the newly enacted California Medicaid dispensing fee, showing that the dispensing fee has to be in excess of $7 to adequately reimburse pharmacies for providing these services.

Section 423.104 – Requirements relating to Qualified Precription Drug Coverage

Access to negotiated prices

Subsection(h) of this section requires pharmacies to pass through negotiated prices during coverage gaps and for non-covered formulary drugs. This requirement amounts to nothing less than price controls on retail pharmacies. While this burden is extended to retail pharmacies, no such burdens are required of pharmaceutical manufacturers, or plan sponsors. Plan sponsors should not be able to keep any "pharmacy spreads" on prescriptions. Thus, they should not be able to reimburse pharmacies at a lower rate than they are charging the plan for filling the prescription.

Section 423.120 – Access to Covered Part D Drugs

Section 423.120(a)(1)-(5) – Issues relating to access to pharmacies

The legislative history demonstrates that it was the intent of Congress to require plans to comply, at a minimum, with the Department of Defense TriCare access standards. These standards require that 90% of Medicare beneficiaries must live within 2 miles of a participating pharmacy in an urban area, 90% of recipients in a suburban area must live within a 5 mile radius of a participating pharmacy, and 70% of recipients living in rural areas they must live within a 15 mile radius of a participating pharmacy. The proposed rule should also clearly define whether these distances are geographic or driving distances.

Averaging Access Standards

The proposed rules allow plans to meet these standards by averaging. CVS believes that each plan must meet these standards in each state and in region in which they operate. Allowing them to average the access standards could create areas where Medicare recipients lack adequate accessibility to a participating pharmacy. For

example, in Pennsylvania, averaging could result in a situation where Philadelphia is more than adequately served while Pittsburgh is not.

Creating "Preferred Pharmacy" Network

The proposed rule also allows plans to use this averaging methodology when creating networks of "preferred pharmacies" and "non-preferred pharmacies". By utilizing this method, the plan could create a higher cost non-preferred network that meets the TriCare access standards and at the same time create a lower cost preferred network that does not meet the standard. The proposed rule should be changed to require that all networks meet the TriCare access standard.

Section 423.120(a)(4) – Contracting Terms with Pharmacies and Prohibition of Transferring Insurance Risk

This section and Congress clearly prohibited plans from requiring pharmacies to accept insurance risk as a condition of participation. The proposed rule defines insurance risk as "risk that is commonly assumed by insured licensed by a state". It further states that it should not include payment variations due to performance based measures. Although these performance based incentives are common in the market place, they are usually in addition to the basic reimbursement. They represent additional payments for meeting certain objectives and there are no deductions from the basic payment, if these objectives are not met.

The final rule should prohibit plans from utilizing a variation of the system detailed above to require pharmacies to accept any contractual terms that would require them to accept lower payment rates if a plan experiences cost over runs. The plans should also cleanly identify to the pharmacy the pricing source that they will use for payment.

Section 423.120(a)(6) – Level playing field between mail order and network pharmacies

The Legislative Record shows that it was the intent of Congress to allow community pharmacies to provide a 90-day supply with no artificial cost sharing that would "coerce" recipients to obtain their maintenance medication from a mail order entity. Thus, the only additional cost to the recipient should be the difference in the negotiated price for the covered drug at the network pharmacy and the mail order pharmacy. With this in mind, the definition of "negotiated price" should reflect the price to the plan net any rebates, discounts or other price concessions paid to the plan for a similar drug quantity obtained from either the retail pharmacy or the mail order pharmacy. These price concessions should be applied directly to reducing the cost of the prescription. The plan should not be allowed to use the price concessions to artificially lower the cost of mail order prescriptions.

Section 423.153(b)) – Quality Assurance Programs

The preamble of the proposed rule contains extensive discussion of quality assurance programs the plans should incorporate. CVS fully supports the incorporation of quality assurance programs. However, rather than requiring the prescription drug plans to establish their own quality assurance programs, the role of the plans should be to develop a system that ensures that the provider has established a quality assurance program and measures the value of such programs. The preamble also states that future reporting of error rates may be required to allow recipients to compare the quality of service in choosing a plan. All studies involved in accessing quality assurance plans have shown that the most effective quality assurance programs allow for an anonymous and confidential reporting structure with legal protection from discovery.

Section 423.851-.875 – Subpart Q – Guaranteeing Access to Choice of Coverage (fall back plans)

These sections contain the requirements that the government establish a fall back plan in the event there is a region where there are not two choices of either a risk bearing PDP or MA-PD. The final rule should make clear that these fall back plans must comply with all the access and quality standards that PDP and MA-PD must adhere to. Additionally, the fall back plan should also be required to adequately reimburse pharmacies with regard to a dispensing fee and an appropriate product cost reimbursement.

In conclusion, CVS appreciates this opportunity to comment with regard to the proposed regulations regarding the Medicare Part D portion of the Medicare Modernization Act. We would urge CMS to use its discretionary power to amend the proposed rule to address our concerns with regard to adequate reimbursement for pharmacies, access standards, quality assurance issues, and education of recipients and pharmacies.

Sincerely,

Carlos R. Ortiz, R.Ph
Vice President of Government Affairs

Medicare Drug Benefit; Comments to The Proposed Rule

Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA)

Contents

Background, Intent and Acknowledgement

Founded in 1994, PharmaCare is a wholly owned subsidiary of CVS Corporation, the nations largest operator of retail pharmacies with annual sales in excess of $33 billion. PharmaCare has more than 3,000 employees and is the most diversified pharmaceutical care management company in the country. PharmaCare holds leading positions in pharmacy benefit management services, mail-service pharmacy, specialty drug pharmacy and clinic pharmacy services. PharmaCare is also a Medicare approved national drug discount card sponsor. By the conclusion of 2004, over 140,000 Medicare beneficiaries will have enrolled in ***myPharmaCare***.

Through this document PharmaCare offers comment to the proposed rule (42 CFR Parts 403, 411, 417 and 423; Medicare program; Medicare Drug Benefit). The creation of Prescription Drug Plans (PDP's), Limited Risk Plans and Fallback Plans through the Act are of potential interest to PharmaCare. However, some aspects of the proposed rule, which we address herein, raise concerns that should be addressed by CMS. These concerns are not unique to PharmaCare as they are, in many respects, shared by our competitors. We are sure that should CMS publish a final rule that satisfactorily addresses these issues that all Medicare beneficiaries will be better served.

Finally, PharmaCare appreciates the opportunity to make comment to this proposed rule. Today PBM's are providing millions of Medicare beneficiaries drug benefits through employer sponsored plans and Medicare Choice contractor plans. Consultation between PBM's and CMS is the right course of action. Accordingly, PharmaCare offers our services freely to CMS now, and throughout the process ahead that will conclude with the successful implementation of Medicare Part-D in 2006.

The Proposed PDP Regions

Introduction. PharmaCare attended the open forum held in Chicago, IL (Rosemont) regarding the formation of regions for MA-PD and PDP's. The presentations made indicated that serious study and analysis had been given to each option under consideration. In the broader context the issue of fewer versus many regions clearly dominates the debate at hand.

Discussion. PharmaCare offers the following comments.

Comments About Fewer Regions. Of the two options being considered (10 regions or 11) we believe that the option for 11 regions has greater merit. It is our view that this option represents a better distribution of markets, or concentrations of beneficiaries, over the 10-region option. However, while fewer regions create larger pools of beneficiaries for PDP's to market to, they also offer unique barriers that also inhibit the scale value of such large multi-state regions. State insurance regulations are the most noteworthy barrier. State licensure and oversight would will prove burdensome for PDP's. As the proposed rule offers PDP's no safe-harbor in this regard, PDP's will not freely enjoy the scale inherent in multi-state regions, but will instead be forced to operate as multiple state based entities within a region. This will increase cost and hamper the ability of PDP's to effectively capitalize on the larger pools of beneficiaries offered through multi-state regions.

Comments About Many Regions. Of the four regions being considered (32, 34, 37 and 50) we believe that the option of 50 regions is most appealing and the option for 37 regions has merit as well. In summary the 50-region option simplifies many regulatory and operational considerations by equating region with state. Of the remaining regional considerations, we believe the option for 37 regions does the better job of joining several states to form the few multi-state regions. In these cases the 37 region option does the best job of preserving the

integrity of traditional regional markets; e.g. Northern New England, Pacific Northwest, etc. While not by any means uniform, insurance considerations should vary less among the states joined to form these few multi-state regions.

Recommendation. For the reasons discussed above, PharmaCare recommends many regions versus few, with 50 regions being recommended above all other considerations. We appreciate the goals and intent of CMS through the concept of larger multi-state regions. However, given the pace of this program, the challenges posed by such an approach would be too numerous and prove a barrier to program implementation. The issue of multi-state regions is always a consideration CMS could revisit in the future.

Issues Related to TROOP

Introduction. PharmaCare has studied the proposed rule regarding TROOP (True Out Of Pocket) and has participated in CMS special open door forums regarding TROOP as well. Of all of the topics worthy of comment, TROOP represents a topic in need of serious comment by industry and re-consideration by CMS.

Discussion. At the heart of the issue with TROOP is the requirement to coordinate benefits with the beneficiary's Other Health Insurance (OHI) on a real time basis. While there are several issues that make TROOP coordination problematic, it is the issue of real time coordination that is most serious.

Under the proposed rule PDP's would be required to assure TROOP through coordination with OHI as self-identified by the beneficiary upon their application. While the intent of TROOP can easily be appreciated, the practicality of coordinating OHI on a real time basis for pharmacy benefits is very problematic. In summary, with respect to pharmacy claims, the activity of claims adjudication corresponds to the actual time of service; a process that takes less than 5 seconds. This differs significantly from the process used for medical billing. Under medical claims management, claims adjudication is not associated real time with the performance of service, but instead occurs days, weeks even months later, and this lag time makes OHI coordination possible under a medical claims approach. The rule, as written, approaches TROOP coordination in the context of a medical claims management model, not the existing pharmacy model. And, it assumes this model is transferable to pharmacy, when it is not. The approach to TROOP in the proposed rule is inconsistent with pharmacy claims management standards and practice, and should be changed in the final rule. We offer amplification below to support this recommendation.

Are pharmacies the answer? Pharmacies are not the solution to accomplish TROOP. Pharmacies do not and cannot split claims. The point of sale (POS) systems used universally by pharmacies direct each claim to a designated single payor; not multiple payors. The transaction is processed in 2 to 3 seconds with a response as either paid or denied, but only from the one payor. With respect to the relationship between the patient and the pharmacy, the pharmacy is only a provider. It has no way of knowing what the beneficiary disclosed regarding OHI when the beneficiary made their application to the PDP. The pharmacy will only know to submit a beneficiaries claim to a PDP when beneficiary presents a prescription and their PDP program card.

Are PBM's the answer? Given that pharmacies are not the solution for TROOP, the question is rightfully directed to PBM systems for consideration. As the PBM system receives claims from pharmacy systems, is it possible that that the PBM system can coordinate TROOP on a real time basis? The answer is, no. The adjudication process is bi-directional only: e.g. between the pharmacy, where the claim is originated, and the PBM. PBM systems do not systematically redirect claims to other health insurance providers in real time before responding to the claims originator, the pharmacy. Coordination of benefits is most often accomplished by PBM systems by denying claims for plan members where the plan sponsor has indicated the existence of other health insurance through the eligibility file. Under these conditions a beneficiary would be denied until the plan sponsor indicated they were satisfied that the member's OHI had been exhausted. Such a determination would occur directly between the beneficiary and the plan sponsor, and outside of the claims adjudication process.

The PBM's role in coordinating TROOP is further complicated by other considerations. Today, PBM's contract almost entirely with group payers (e.g. self-insured employer plans, managed care plans, etc.), and not individuals. Should a group payer have just one source of OHI, it ***may*** be possible for the PBM to coordinate with that singular source in real-time under unique conditions;

(e.g. the PBM already had a contractual relationship with the other health insurance payer). However, as Part-D is not a group product, enrolling beneficiaries may have OHI from any number of sources (e.g. an employer wrap-plan; a Med-Sup plan; a drug manufacturer plan; etc.). As written, the proposed rule would require that TROOP be coordinated real-time with each and every OHI source identified by the beneficiary. This would require the PBM to establish contracts and real-time electronic claims processing procedures with an open-ended number of OHI sources. This is unrealistic. First, as discussed previously, PBM systems are not configured to redirect claims to OHI providers in real-time. Second, assuming the first problem could be overcome, it is unrealistic to assume that a PBM could successfully conclude contract terms and on-line claims transaction coordination with every source of OHI. Many of these sources would not even be capable of on-line claims transactions. In conclusion, PBM's and their systems are not the solution for assuring accurate coordination of TROOP.

Recommendation. PharmaCare recommends that CMS confer with the National Council for Prescription Drug Programs (NCPDP). NCPDP serves an important role for all industries associated with pharmacy programs. Most importantly they establish the electronic claims standards necessary to accomplish prescription drug program management. Together, NCPDP and CMS can coordinate a workable solution for TROOP.

Also, CMS should give serious consideration to allowing PDP's to simply deny acceptance for any applicant who indicates they have OHI. The approach to TROOP under the proposed rule is a source of unacceptable risk to potential PDP's in terms of investment and accountability. As PDP's are risk based providers they should be asked to only assume risk for beneficiaries where accurate risk accountability can be assured. Beneficiaries with OHI are perfectly suited for Limited Risk Plans or Fallback Plans, and we recommend that PDP's should not be required to enroll such beneficiaries.

The Proposed Data Set

Introduction. PharmaCare participated in a CMS sponsored Open Door Forum (ODF) on September 9, 2004 regarding the Bidders' Data Set for Prescription Drug Plans. The forum's intent was for the American Academy of Actuaries Working Group to identify the high-priority data needs for bidders, to summarize their discussions with CMS on developing a bidders data set, and to present a plan for making essential data available in a timely manner. A summary of the ODF went on to describe the need for a data set as follows: *A data set including detailed information on drug utilization is an essential element in facilitating bids by insurers to provide prescription drug coverage.*

Discussion. PharmaCare concurs that an accurate and comprehensive data set is an essential element to facilitate bidding. The ODF, however, pointed to significant problems with the approaches being pursued by the Academy's Working Group.

The data sources available to the Working Group are of little value as they are incomplete and dated. The Medicare Current Beneficiary Survey (MCBS) has significant limitations and shortcomings as an instrument for producing the necessary drug utilization information needed by potential PDP bidders. The 2001 FEP retirees' data does not reflect the many new drugs that have come to market since that time nor the changes in drug prices. In summary, these sources are inadequate and incomplete.

Recommendation. To gain the confidence of PDP's, CMS should endeavor to secure credible sources of data for the Academy's Working Group to analyze. Such sources are readily available. Three excellent sources are discussed below.

1. TRICARE. The TRICARE pharmacy benefit program includes a program unique to over 1.5 million retirees. CMS should coordinate the transfer of both a historical drug utilization file from the Department of Defense's TRICARE Management Activity (TMA) and update files as necessary. The TRICARE TMA subscribes to the standards established by NCPDP. The creation of file reflecting the data fields and layout standards of NCPDP is a task that can be easily accomplished by TMA or its contractor. PharmaCare recommends CMS act quickly as this approach to securing valuable and relevant data represents a low or no cost activity that can be accomplished in days.

2. Pharmacy Benefits Managers. Today PBM's administer pharmacy benefit programs for millions of Medicare beneficiaries through employer sponsored plans and Medicare Choice contractor plans. No better source of data is available than that which can be provided by PBM's. PharmaCare recommends that CMS ask PBM's to voluntarily offer the Working Group data files reflecting the utilization of Medicare age beneficiaries. The process would result in the largest, most robust data set possible and provide the Working Group the information they need to produce quality results.

3. Chain Drug Stores. The National Association of Chain Drug Stores (NACDS) is an excellent source of data. Pharmacies are stakeholders in this endeavor and desire a well-developed program. Their membership, if approached, would freely cooperate with CMS by sharing data.

Issues Related to PDP's and Risk

Introduction. It will be the PBM industry that makes administration of the Medicare Drug Benefit possible. However, their role as PDP's or in association with PDP's is questionable unless the proposed rule is modified. Since the enactment of MMA in December 2003, some in the PBM industry have made public comment to the issues of PDP's being treated as insurers and of the requirement to assume risk. These requirements are in inconsistent with commercial practices where PBM's are not insurers and do not assume risk. Consequently, we recommend that CMS appreciate that unless the final rule satisfactorily addresses these issues PBM's may not view Medicare as such an important new market opportunity, which in turn could place the implementation of the Medicare Drug Benefit in jeopardy.

Discussion. Risk posses many new considerations for PBM's. Several of these considerations are discussed below, and illustrate why some PBM's have indicated they may be required to forgo the opportunities presented by MMA unless the final rule is modified.

In the context of an insurer risk is defined as "the danger or probability of loss". Auto insurers, for example, know that not every policyholder will file a claim, making the probability of loss low among most policyholders and high only among a few at one time. It is the excess premium secured from non-claimant policyholders that pay for the excess costs of the few claimant policyholders. With respect to prescription drugs, however, the opposite is true. The probability of loss in never low because it can be assumed that most policyholders will be claimants and few will not. Even worse, in the case of the elderly it can be assumed that substantially ALL elderly beneficiaries will be claimants. And, as drug therapy is the primary form of treatment today for almost all chronic medical conditions that afflict the elderly, the possibility of radically curtailing drug use is unrealistic, especially given the overwhelming efficacy offered by most drug

therapies today. In summary the elderly are a very bad risk because there is almost certainty of loss.

The issue of adverse selection is also very problematic for PBM's. As the Medicare Drug Benefit will be voluntary, only the sickest beneficiaries can be expected migrate to the new Part-D leaving the premium payments for lower utilizing healthier beneficiaries unavailable to supplement the excess costs of the adverse membership. This is not conjecture, but reality. Medicare Choice contractors struggled under the weight of adverse selection for years resulting in withdrawal from numerous counties across the country. Adverse selection is assured for a PDP under the Medicare Drug Benefit.

And finally, PBM's are not insurers. Requiring PDP's to be insurance companies creates a significant new burden for PBM's and creates unintended business risk. In the precious little time available to prepare for this program a PBM faces many costly hurdles associated with state licensures. This is unknown territory for PBM's and States alike. One concern PBM's have that licensing actions may in fact trigger an unintended response from states whereby they attempt to bring substantially all PBM operations under state insurance authority. This would be a costly struggle to defend against. And, should the states succeed, it would prove very problematic to the PBM industry as it would add significant cost and seriously hamper the evolution of business practices, benefit design and even quality management programs.

Recommendation. PharmaCare recommends CMS publish a final rule that lowers the barriers posed by insurance and risk. The final rule should set out a safe harbor for PDP's with respect to state insurance regulations. And, in order to lower the adverse risk associated with Medicare aged beneficiaries, the government should consider adopting a final rule that limits the risk faced by PDP's. One example includes creating risk-free sources of revenue for PDP's such as separate program management fees rather than all-inclusive premiums.

In another example CMS could offer to cap the PDP's risk to a maximum loss. Changes such as these are important as they will serve to attract prospective PDP's. A final rule that does not mitigate the implications of insurance and risk may not attract PBM's to this program as PDP's.

Risk and The Issue of Any Willing Provider

Introduction. The issue of Any Willing Provider (AWP) is problematic for PDP's as risk bearing entities. Also, the proposed rule offers guidance that is impracticable to potential PDP's. PharmaCare believes the proposed rule should be modified to reposition the intended role of AWP to what we believe was intended by the authors of MMA.

Discussion. The MMA and the proposed rule make reference to both Any Willing Provider and pharmacy network access standards. In the context of commercial practices, the two are in some ways redundant. Prescription plan sponsors seeking pharmacy network services from a PBM, for example, specify access standards to ensure a PBM contracts with sufficient providers, but not all providers. In the process of assembling a network a PBM uses the leverage offered by the access standards to negotiate price knowing that more aggressive prices can be secured if there is no requirement to allow the participation of any willing provider. Under a requirement to assemble a network where any willing provider may participate, no such leverage exists and no access standard may be assured as providers participate at will.

It is the opinion of PharmaCare that the authors of the Act included access standards as a means for prospective PDP's to establish network contracting leverage while protecting the interests of beneficiaries. This is fundamentally consistent with any entity bearing risk and assures the government of the best possible basis of cost. And, the Federal Government also shares this opinion. The Federal Trade Commission has concluded that Any Willing Provider requirements are fundamentally in conflict with the ability of any network assembler to secure best price. Please refer to the FTC's web site at http://www.ftc.gov/opa/2004/04/ribills.htm for an example of a recent example of the Commission's position on AWP.

PharmaCare also believes the issue of Any Willing Provider has also been misinterpreted as presented in the proposed rule. The proposed rule infers that Any Willing Provider is a requirement of a PDP, which we believe incorrectly interprets the intent of the Act. PharmaCare believes the Act discusses Any Willing Provider in the context of a right of the beneficiary, not a requirement of a plan sponsor or PDP. It is common for States to extend the privilege of pharmacy Freedom of Choice (FOC) to the membership of health insurance carriers; the terms Freedom of Choice and Any Willing Provider are often used interchangeably in the context of a member or beneficiary. But this privilege offered by States to members does not necessarily flow by extesnion to health insurers as a requirement. In summary, such laws are intended to reinforce and support the freedom of individuals to secure service from providers of their choice, but not by extension require health insurers to contract with them.

Recommendation. PharmaCare recommends that the final rule clarify the intent of the Act by specifying that the law protects the right of each beneficiary to choose their own provider, but does not require the PDP to include any willing provider in their network. And, it is not sufficient enough for CMS to allow PDP's to designate such providers as "non-preferred" or "out of network" if it still requires they contract with them. In-network providers will not negotiate best price if they know other providers can participate through circuitous means. The rule should clearly state that while beneficiaries may use providers of their choice, benefits will not be payable unless they use a contracted in-network provider of the PDP. The final rule should also clarify that the access standards set out in the Act are the principle methodology for assuring adequate access and drop any reference to AWP with respect to the establishment of networks.

Medication Therapy Management (MTM)

Introduction. The final rule should make clarification with respect to Medication Therapy Management (MTM) and the role of PDP's and providers. The proposed rule raises concerns that PDP's may be required to fund MTM by themselves.

Discussion. Considerable attention has been paid to the topic of MTM. However, the proposed rule should make clarifications in several regards. First, the proposed rule leaves questions unanswered as to the source of funding for MTM services. One could interpret the proposed rule as inferring that MTM services will be paid for by PDP's. This raises concerns. Assume a provider (e.g. a pharmacy) performs an MTM service. If the obligation to pay for that service falls on the PDP then where will those funds come from? If the answer is, from the fixed premium's paid by the beneficiary and Medicare, then this poses significant risk to PDP's. Such services would represent an open checkbook to providers who could perform them at will and make payment demands on a PDP, who in turn must pay from a fixed pool of premium revenue. Even worse the MTM activity could actually cause increased drug use, which is in conflict with a fixed price risk-based program.

The proposed rule should also clarify the MTM is an activity that can be performed by the PDP itself and is not the exclusive domain of others like pharmacists, nurses and physicians. PDP's will be in the best position to perform MTM themselves as they will have all available utilization data available. The final rule should clarify that MTM is a service that may be performed by providers as exclusively determined by the PDP. Otherwise the PDP will lose control of where and how these services are performed.

And, finally, the final rule should make it clear that MTM is not an exercise or activity that is exclusively performed in person between a health care provider

and the beneficiary, but may also be performed remotely by phone, internet and by paper. These recommended approaches are very cost effective and can reach more beneficiaries than in-person approaches. And, many quality programs already exist that employ these approaches.

Recommendation. The final rule must clarify the issue of MTM. MTM cannot be an at will activity of any willing provider. PDP's must hold the authority to establish who may provide MTM to their program membership. The final rule must also clarify from what source of funds the services of MTM will be paid. PharmaCare recommends that CMS pay for MTM separately and not include MTM funding as part of an inclusive premium calculation. MTM payments should also not be subject to risk as the activity of MTM will, in many cases, cause increases in drug use (e.g. under-utilization, therapy initiation, etc.).

Beneficiary Late Enrollment Penalty

Introduction. The formula for imposing beneficiary late enrollment fees, as discussed in the proposed rule, is not aggressive enough to promote rapid beneficiary enrollment in PDP's.

Discussion. Underlying the intent of the MMA is the belief that the government's best interest is served when industry participates on a risk basis to share the financial management challenge posed by Medicare beneficiaries. To attract the most qualified entities to serve as PDP's CMS should make every effort to ensure fast and rapid adoption of Medicare Part-D through PDP's. To this end, the proposed late enrollment fee is insufficient. PharmaCare does not believe $0.36 per month is enough of a fee to motivate beneficiaries to rapidly adopt Medicare Part-D.

Recommendation. PharmaCare recommends that CMS consider a black-out period where enrollment is not authorized rather than a late penalty. For example, offering beneficiaries the right to enroll only in November and December of each year for proceeding calendar year, with January through October being closed to enrollment (e.g. the black-out). Such an approach would create a sense of urgency among beneficiaries. The late enrollment penalty, as proposed, will only promote a "wait and see" attitude. If CMS is to attract prospective PDP's, then the final rule should include an approach that creates a sense of urgency for beneficiaries to enroll in Medicare Part-D through a PDP.

Conclusive Comments & Contact Information

PharmaCare again extends our thanks to CMS for the opportunity to make comment to this proposed rule. The Medicare Drug Benefit can only be viewed as a sea change event. As such PharmaCare very much desires to take part in this exciting program. We recognize that CMS has precious little time to implement this program, however, if prospective PDP's are to value the opportunity created by the Act then CMS should give serious consideration to our recommended modifications of the proposed rule. The modifications recommended by PharmaCare are, in our opinion, modest yet essential to assuring a workable program. PharmaCare offers our service freely to CMS for the purpose of concluding a final rule.

Should CMS desire to contact PharmaCare regarding these topics, all inquiries may be made to the following individual:

Administrator
Centers for Medicare and Medicaid Services
Department of Health and Human Services
Attention: CMS-4068-P
P.O. Box 8014
Baltimore, MD 21244-8014

Dear Dr. McClellan:

The National Association of Social Workers (NASW) welcomes the opportunity to provide comments on the proposed rule "Medicare Program; Medicare Prescription Drug Benefit," 69 FR 46632. NASW is the largest professional social work organization with more than 153,000 members nationwide. NASW promotes, develops, and protects the practice of social work and social workers, while enhancing the well being of individuals, families, and communities through its work, service, and advocacy. We are concerned that the proposed rule does not provide sufficient protections for the 13 million Medicare beneficiaries with disabilities and chronic health conditions. The following are critical recommendations:

Coverage of Dual Eligibles (§ 423.34)

Of grave concern is the impact of the new Medicare drug benefit on those beneficiaries who currently have drug coverage through their state Medicaid programs, i.e. the dual eligibles. CMS must ensure that these very vulnerable beneficiaries receive coverage for the medications they need under the new drug benefit and are not harmed or made worse off when their drug coverage is switched from Medicaid to Medicare.

Based on social workers experience with this group of beneficiaries, we are gravely concerned that the proposed regulations would cause harmful disruption in care and inadequate drug coverage for dual eligibles. In particular, the proposed regulations do not address how access to needed medications by dual eligibles will be maintained when their drug coverage is switched from Medicaid to Medicare.

We urge CMS to take account of the unique circumstances and needs of this population, and delay transfer of drug coverage from Medicaid to Medicare for the dual eligibles for at least six months to allow adequate time to educate and enroll these vulnerable and often hard-to-reach individuals and to ensure they receive the drug coverage to which they are entitled.

CMS must also address the real threat of adverse health outcomes facing dual eligibles. Under the proposed rule, dual eligibles would effectively be forced to enroll in the lowest cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans (and automatic enrollment would require placement in a low-cost plan). While it is critical that the transfer from Medicaid to Medicare drug coverage maintain continuity of care, the proposed regulations provide no such protection. To the contrary, the formularies for these low-cost drug plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Without access to the coverage they need, dual eligibles would have no real choice but to switch medications. Yet changing medications is for those with complex conditions is both very difficult and potentially dangerous. For example, abrupt changes in psychiatric medications bring the risk of serious adverse drug reactions and interactions and the potential for a severe loss of functioning.

With respect to beneficiaries with mental illness, these regulations must give meaningful effect to the concern Congress itself voiced, stating in the conference report on the Act that: "[i]f a plan chooses not to offer or restrict access to a particular medication to treat the mentally ill, the disabled will have the freedom to choose a plan that has appropriate access to the medicine needed. The Conferees believe this is critical as the severely mentally ill are a unique population with unique prescription drug needs as individual responses to mental health medications are different." [Report No. 108-391, pp. 769-770] Unfortunately, the proposed rule does not adequately provide the protection for people with mental illness that Congress called for. We urge that the regulations be revised to provide for "grandfathering" coverage of psychiatric medications for dual eligibles into the new Part D benefit, as a number of states have done in implementing preferred drug lists for their Medicaid programs.

Lastly, for the dual eligibles in particular, CMS must fund collaborative partnerships with organizations representing people with disabilities and other vulnerable populations. Such partnerships will be critical to an effective outreach and enrollment process. Targeted and hands-on outreach to vulnerable Medicare beneficiaries, especially those with low-incomes, is vitally important in the enrollment process. We strongly urge CMS to develop a specific plan for facilitating enrollment of beneficiaries with disabilities and complex medical conditions in each region that incorporates collaborative partnerships with the state and local agencies and advocacy organizations that serve them.

Alternative, Flexible Formularies for Beneficiaries for Vulnerable Populations (§ 423.120(b))

For people with serious and complex medical conditions, access to the right medications can make the difference between living in the community, being employed and leading a healthy and productive life on the one hand; and facing deteriorating health, unnecessary hospitalizations and even death, on the other. Often, people with disabilities and complex medical conditions need access to the newest medications, because they have fewer side effects and may represent a better treatment option than older less expensive drugs. Many individuals have multiple disabilities and health conditions making drug

interactions a common problem. Frequently, extended release versions of medications are needed to effectively manage these conditions. In other cases, specific drugs are needed to support adherence to a treatment regimen. Individuals with cognitive impairments may be less able to articulate problems with side effects making it more important for the doctor to be able to prescribe the best medication for the individual. Often that pharmacological process takes time since many people with significant disabilities must try multiple medications and only after much experimentation find the medication that is most effective for their circumstance. The consequences of denying the appropriate medication for an individual with a disability or chronic health condition are serious and can include injury or debilitating side effects, even hospitalization or other types of costly medical interventions.

We strongly support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs, and the enormous potential for serious harm (including death) if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must have access to all medically necessary prescription drugs at a plan's preferred level of cost-sharing. We recommend that this treatment apply to the following overlapping special populations who:

- are dually eligible for Medicare and Medicaid;
- live in nursing homes, ICF-MRs and other residential facilities;
- have life threatening conditions; or
- have pharmacologically complex condition such as mental illness, Alzheimer's disease, multiple sclerosis, HIV/AIDS, and epilepsy.

Furthermore, new limits on cost management tools must be imposed for these vulnerable populations. We urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. For example we strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We urge CMS to prohibit or place limits on the use of certain cost containment policies, such as unlimited tiered cost sharing, dispensing limits, therapeutic substitution, mandatory generic substitution for narrow therapeutic index drugs, or prior authorization. We are also concerned that regulations will create barriers to having the doctor prescribe the best medication for the individual including off-label uses of medications that are common for many conditions. We strongly recommend that the final rule prohibit plans from placing limits on the amount, duration and scope of coverage for covered part D drugs.

Involuntary Disenrollment for Disruptive Behavior (§ 423.44)

The proposed regulation raises grave concerns in allowing Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" (§ 423.44(d)(2)). These provisions create enormous

opportunities for discrimination against individuals with mental illness and cognitive impairments. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and as a result they could also be subject to a late enrollment penalty increasing their premiums for the rest of their lives. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage.

As a matter of principle, for a critical safety net program such as Medicare prescription drugs for dual eligibles, NASW cannot support automatic disenrollment of this population under any circumstances. We are therefore alarmed that CMS has proposed an expedited disenrollment process that would undermine the minimal standards and protections included in the proposed rule. This expedited process proposal must not be included in the final rule. In addition, CMS must provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior and must waive the late enrollment penalty for these individuals as well. The final rule must include the following protections:

- drug plans must be prohibited from disenrolling a beneficiary because he/she exercises the option to make treatment decisions with which the plan disagrees, including the option of no treatment and/or no diagnostic testing;
- drug plans may not disenroll a beneficiary because he/she chooses not to comply with any treatment regimen developed by the plan or any health care professionals associated with the plan;
- documentation provided to CMS arguing for approval of a plan's proposal to involuntarily disenroll an individual must include:
  - documentation of the plan's effort to provide reasonable accommodations for individuals with disabilities in accordance with the Americans with Disabilities Act; and
  - documentation that the plan provided the beneficiary with appropriate written notice of the consequences of continued disruptive behavior or written notice of its intent to request involuntary disenrollment; and
- drug plans must provide beneficiaries subject to involuntary disenrollment with the following notices:
  - advance notice to inform the individual that the consequences of continued disruptive behavior will be disenrollment;
  - notice of intent to request CMS' permission to disenroll the individual; and
  - A planned action notice advising that CMS has approved the plan's request for approval of involuntary disenrollment.

Appeals Procedures (§§ 423.562-423.604)

The appeals processes outlined in the proposed regulations are overly complex, drawn-out, and inaccessible to beneficiaries. Under these proposed rules, there are too many levels of internal appeal that a beneficiary must request from the drug plan before receiving a truly independent review by an administrative law judge (ALJ) and the

timeframes for plan decisions are unreasonably long. In order to qualify for a hearing by an ALJ, beneficiaries must first request a coverage determination or exception from a tiered cost-sharing scheme or formulary which can take between 14 and 30 days, unless a plan honors a beneficiary's request that the determination or exception be expedited in which case it could still take up to 14 days. To appeal adverse determinations or exception decisions, beneficiaries must request plans to review their decision again and make a redetermination within 30 days unless the beneficiary paid out-of-pocket for the medication at issue, in which case the plan has 60 days to decide. Even if a plan honors a request to expedite a redetermination, the deadline for plans to make a decision could be as long as 14 days. Following a redetermination, beneficiaries may appeal to a so-called independent review entity for a reconsideration of their case, but these entities will not be authorized to review or question the criteria plans use to evaluate exceptions requests. The proposed rules do not even set deadlines for reconsideration decisions. After receiving a reconsideration decision, beneficiaries are only allowed to appeal to an administrative law judge if the amount in controversy meets a threshold level of $100 and it is unclear how CMS will calculate whether a beneficiary has met this threshold.

In addition to imposing unreasonable delays and burdens on beneficiaries, these appeal processes are far from transparent. Drug plans would be authorized to establish their own criteria for reviewing determination, exceptions, and redetermination requests and these criteria will vary from plan to plan. Plans would also be authorized to establish varying degrees of paperwork requirements for beneficiaries and their prescribing physicians who wish to request exceptions from tiered cost-sharing schemes or formularies. Far from ensuring that beneficiaries' rights are protected, which should be their primary function, these procedures would actually impede the right of beneficiaries to a fair hearing.

Beneficiaries with disabilities and complex health needs often have an extremely limited capacity to navigate grievance and appeals procedures. To accommodate the special needs of these beneficiaries and others who are vulnerable or with low income, CMS must establish a simpler process that puts a priority on ensuring ease of access and rapid results for beneficiaries and their doctors and includes a truly expedited exceptions process for individuals with immediate needs, including individuals facing health care crises, which should be modeled after the federal Medicaid requirement that states respond to prior authorization requests within 24 hours.

We also urge CMS to require plans to dispense a temporary supply of drugs in emergencies. The proposed system does not ensure that beneficiaries' rights are protected and does not guarantee beneficiaries have access to needed medications. For many individuals with disabilities such as epilepsy, mental illness or HIV, treatment interruptions can lead to serious short-term and long-term consequences. For this reasons the final rule must provide for dispensing an emergency supply of drugs pending the resolution of an exception request or pending resolution of an appeal.

Outreach and Enrollment (§ 423.34)

The proposed regulations do not adequately address the need for collaboration with state and local agencies and community-based organizations on outreach and enrollment of beneficiaries with disabilities and complex health conditions. In the conference report for the Medicare Modernization Act, Congress directed that "the Administrator of the Center for Medicare Choices [sic] shall take the appropriate steps before the first open enrollment period to ensure that Medicare beneficiaries have clinically appropriated [sic] access to pharmaceutical treatments for mental illness" (Report No. 108-391, pp. 769-770).

To respond to Congress's concern with ensuring enrollment and comprehensive coverage for beneficiaries, CMS must partner with community-based organizations focused on addressing the needs of vulnerable beneficiaries and the state and local agencies that coordinate benefits for them. Beneficiaries with special needs will most likely turn to organizations that they know and trust with questions and concerns regarding the new Part D drug benefit. Making information and educational materials available at these sites will help inform beneficiaries with mental illness about the new benefit, but providing community-based organizations with pamphlets and brochures alone is not adequate. To answer the many difficult, detailed, and time-consuming questions that beneficiaries will have about the new program, extensive face-to-face counseling services will be needed. Social workers and community-based organizations can provide the kind of detailed help needed, but they will need additional resources.

CMS must develop a specific plan for facilitating enrollment of beneficiaries with special needs, in each region that incorporates collaborative partnerships with and additional funding for state and local public and nonprofit agencies and organizations focused on these needs. In addition, in their bids, drug plans should include specific plans for encouraging enrollment of often hard-to-reach populations.

NASW strongly urges that the concerns discussed above be addressed in order to ensure access to psychiatric medications under the Part D drug benefit for the many Medicare beneficiaries who need them.

Thank you for your consideration of our comments.

Sincerely,

Toby Weismiller, ASCW

Dear Dr. McClellan:

The National Association of Social Workers (NASW) welcomes the opportunity to provide comments on the proposed rule "Medicare Program; Medicare Prescription Drug Benefit," 69 FR 46632. NASW is the largest professional social work organization with more than 153,000 members nationwide. NASW promotes, develops, and protects the practice of social work and social workers, while enhancing the well being of individuals, families, and communities through its work, service, and advocacy. We are concerned that the proposed rule does not provide sufficient protections for the 13 million Medicare beneficiaries with disabilities and chronic health conditions. The following are critical recommendations:

Coverage of Dual Eligibles (§ 423.34)

Of grave concern is the impact of the new Medicare drug benefit on those beneficiaries who currently have drug coverage through their state Medicaid programs, i.e. the dual eligibles. CMS must ensure that these very vulnerable beneficiaries receive coverage for the medications they need under the new drug benefit and are not harmed or made worse off when their drug coverage is switched from Medicaid to Medicare.

Based on social workers experience with this group of beneficiaries, we are gravely concerned that the proposed regulations would cause harmful disruption in care and inadequate drug coverage for dual eligibles. In particular, the proposed regulations do not address how access to needed medications by dual eligibles will be maintained when their drug coverage is switched from Medicaid to Medicare.

We urge CMS to take account of the unique circumstances and needs of this population, and delay transfer of drug coverage from Medicaid to Medicare for the dual eligibles for at least six months to allow adequate time to educate and enroll these vulnerable and often hard-to-reach individuals and to ensure they receive the drug coverage to which they are entitled.

CMS must also address the real threat of adverse health outcomes facing dual eligibles. Under the proposed rule, dual eligibles would effectively be forced to enroll in the lowest cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans (and automatic enrollment would require placement in a low-cost plan). While it is critical that the transfer from Medicaid to Medicare drug coverage maintain continuity of care, the proposed regulations provide no such protection. To the contrary, the formularies for these low-cost drug plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Without access to the coverage they need, dual eligibles would have no real choice but to switch medications. Yet changing medications is for those with complex conditions is both very difficult and potentially dangerous. For example, abrupt changes in psychiatric medications bring the risk of serious adverse drug reactions and interactions and the potential for a severe loss of functioning.

With respect to beneficiaries with mental illness, these regulations must give meaningful effect to the concern Congress itself voiced, stating in the conference report on the Act that: "[i]f a plan chooses not to offer or restrict access to a particular medication to treat the mentally ill, the disabled will have the freedom to choose a plan that has appropriate access to the medicine needed. The Conferees believe this is critical as the severely mentally ill are a unique population with unique prescription drug needs as individual responses to mental health medications are different." [Report No. 108-391, pp. 769-770] Unfortunately, the proposed rule does not adequately provide the protection for people with mental illness that Congress called for. We urge that the regulations be revised to provide for "grandfathering" coverage of psychiatric medications for dual eligibles into the new Part D benefit, as a number of states have done in implementing preferred drug lists for their Medicaid programs.

Lastly, for the dual eligibles in particular, CMS must fund collaborative partnerships with organizations representing people with disabilities and other vulnerable populations. Such partnerships will be critical to an effective outreach and enrollment process. Targeted and hands-on outreach to vulnerable Medicare beneficiaries, especially those with low-incomes, is vitally important in the enrollment process. We strongly urge CMS to develop a specific plan for facilitating enrollment of beneficiaries with disabilities and complex medical conditions in each region that incorporates collaborative partnerships with the state and local agencies and advocacy organizations that serve them.

Alternative, Flexible Formularies for Beneficiaries for Vulnerable Populations (§ 423.120(b))

For people with serious and complex medical conditions, access to the right medications can make the difference between living in the community, being employed and leading a healthy and productive life on the one hand; and facing deteriorating health, unnecessary hospitalizations and even death, on the other. Often, people with disabilities and complex medical conditions need access to the newest medications, because they have fewer side effects and may represent a better treatment option than older less expensive drugs. Many individuals have multiple disabilities and health conditions making drug

interactions a common problem. Frequently, extended release versions of medications are needed to effectively manage these conditions. In other cases, specific drugs are needed to support adherence to a treatment regimen. Individuals with cognitive impairments may be less able to articulate problems with side effects making it more important for the doctor to be able to prescribe the best medication for the individual. Often that pharmacological process takes time since many people with significant disabilities must try multiple medications and only after much experimentation find the medication that is most effective for their circumstance. The consequences of denying the appropriate medication for an individual with a disability or chronic health condition are serious and can include injury or debilitating side effects, even hospitalization or other types of costly medical interventions.

We strongly support the suggestion in the proposed rule that certain populations require special treatment due to their unique medical needs, and the enormous potential for serious harm (including death) if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and they must have access to all medically necessary prescription drugs at a plan's preferred level of cost-sharing. We recommend that this treatment apply to the following overlapping special populations who:

- are dually eligible for Medicare and Medicaid;
- live in nursing homes, ICF-MRs and other residential facilities;
- have life threatening conditions; or
- have pharmacologically complex condition such as mental illness, Alzheimer's disease, multiple sclerosis, HIV/AIDS, and epilepsy.

Furthermore, new limits on cost management tools must be imposed for these vulnerable populations. We urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. For example we strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We urge CMS to prohibit or place limits on the use of certain cost containment policies, such as unlimited tiered cost sharing, dispensing limits, therapeutic substitution, mandatory generic substitution for narrow therapeutic index drugs, or prior authorization. We are also concerned that regulations will create barriers to having the doctor prescribe the best medication for the individual including off-label uses of medications that are common for many conditions. We strongly recommend that the final rule prohibit plans from placing limits on the amount, duration and scope of coverage for covered part D drugs.

Involuntary Disenrollment for Disruptive Behavior (§ 423.44)

The proposed regulation raises grave concerns in allowing Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" (§ 423.44(d)(2)). These provisions create enormous

opportunities for discrimination against individuals with mental illness and cognitive impairments. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and as a result they could also be subject to a late enrollment penalty increasing their premiums for the rest of their lives. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage.

As a matter of principle, for a critical safety net program such as Medicare prescription drugs for dual eligibles, NASW cannot support automatic disenrollment of this population under any circumstances. We are therefore alarmed that CMS has proposed an expedited disenrollment process that would undermine the minimal standards and protections included in the proposed rule. This expedited process proposal must not be included in the final rule. In addition, CMS must provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior and must waive the late enrollment penalty for these individuals as well. The final rule must include the following protections:

- drug plans must be prohibited from disenrolling a beneficiary because he/she exercises the option to make treatment decisions with which the plan disagrees, including the option of no treatment and/or no diagnostic testing;
- drug plans may not disenroll a beneficiary because he/she chooses not to comply with any treatment regimen developed by the plan or any health care professionals associated with the plan;
- documentation provided to CMS arguing for approval of a plan's proposal to involuntarily disenroll an individual must include:
  - documentation of the plan's effort to provide reasonable accommodations for individuals with disabilities in accordance with the Americans with Disabilities Act; and
  - documentation that the plan provided the beneficiary with appropriate written notice of the consequences of continued disruptive behavior or written notice of its intent to request involuntary disenrollment; and
- drug plans must provide beneficiaries subject to involuntary disenrollment with the following notices:
  - advance notice to inform the individual that the consequences of continued disruptive behavior will be disenrollment;
  - notice of intent to request CMS' permission to disenroll the individual; and
  - A planned action notice advising that CMS has approved the plan's request for approval of involuntary disenrollment.

Appeals Procedures (§§ 423.562-423.604)

The appeals processes outlined in the proposed regulations are overly complex, drawn-out, and inaccessible to beneficiaries. Under these proposed rules, there are too many levels of internal appeal that a beneficiary must request from the drug plan before receiving a truly independent review by an administrative law judge (ALJ) and the

timeframes for plan decisions are unreasonably long. In order to qualify for a hearing by an ALJ, beneficiaries must first request a coverage determination or exception from a tiered cost-sharing scheme or formulary which can take between 14 and 30 days, unless a plan honors a beneficiary's request that the determination or exception be expedited in which case it could still take up to 14 days. To appeal adverse determinations or exception decisions, beneficiaries must request plans to review their decision again and make a redetermination within 30 days unless the beneficiary paid out-of-pocket for the medication at issue, in which case the plan has 60 days to decide. Even if a plan honors a request to expedite a redetermination, the deadline for plans to make a decision could be as long as 14 days. Following a redetermination, beneficiaries may appeal to a so-called independent review entity for a reconsideration of their case, but these entities will not be authorized to review or question the criteria plans use to evaluate exceptions requests. The proposed rules do not even set deadlines for reconsideration decisions. After receiving a reconsideration decision, beneficiaries are only allowed to appeal to an administrative law judge if the amount in controversy meets a threshold level of $100 and it is unclear how CMS will calculate whether a beneficiary has met this threshold.

In addition to imposing unreasonable delays and burdens on beneficiaries, these appeal processes are far from transparent. Drug plans would be authorized to establish their own criteria for reviewing determination, exceptions, and redetermination requests and these criteria will vary from plan to plan. Plans would also be authorized to establish varying degrees of paperwork requirements for beneficiaries and their prescribing physicians who wish to request exceptions from tiered cost-sharing schemes or formularies. Far from ensuring that beneficiaries' rights are protected, which should be their primary function, these procedures would actually impede the right of beneficiaries to a fair hearing.

Beneficiaries with disabilities and complex health needs often have an extremely limited capacity to navigate grievance and appeals procedures. To accommodate the special needs of these beneficiaries and others who are vulnerable or with low income, CMS must establish a simpler process that puts a priority on ensuring ease of access and rapid results for beneficiaries and their doctors and includes a truly expedited exceptions process for individuals with immediate needs, including individuals facing health care crises, which should be modeled after the federal Medicaid requirement that states respond to prior authorization requests within 24 hours.

We also urge CMS to require plans to dispense a temporary supply of drugs in emergencies. The proposed system does not ensure that beneficiaries' rights are protected and does not guarantee beneficiaries have access to needed medications. For many individuals with disabilities such as epilepsy, mental illness or HIV, treatment interruptions can lead to serious short-term and long-term consequences. For this reasons the final rule must provide for dispensing an emergency supply of drugs pending the resolution of an exception request or pending resolution of an appeal.

Outreach and Enrollment (§ 423.34)

The proposed regulations do not adequately address the need for collaboration with state and local agencies and community-based organizations on outreach and enrollment of beneficiaries with disabilities and complex health conditions. In the conference report for the Medicare Modernization Act, Congress directed that "the Administrator of the Center for Medicare Choices [sic] shall take the appropriate steps before the first open enrollment period to ensure that Medicare beneficiaries have clinically appropriated [sic] access to pharmaceutical treatments for mental illness" (Report No. 108-391, pp. 769-770).

To respond to Congress's concern with ensuring enrollment and comprehensive coverage for beneficiaries, CMS must partner with community-based organizations focused on addressing the needs of vulnerable beneficiaries and the state and local agencies that coordinate benefits for them. Beneficiaries with special needs will most likely turn to organizations that they know and trust with questions and concerns regarding the new Part D drug benefit. Making information and educational materials available at these sites will help inform beneficiaries with mental illness about the new benefit, but providing community-based organizations with pamphlets and brochures alone is not adequate. To answer the many difficult, detailed, and time-consuming questions that beneficiaries will have about the new program, extensive face-to-face counseling services will be needed. Social workers and community-based organizations can provide the kind of detailed help needed, but they will need additional resources.

CMS must develop a specific plan for facilitating enrollment of beneficiaries with special needs, in each region that incorporates collaborative partnerships with and additional funding for state and local public and nonprofit agencies and organizations focused on these needs. In addition, in their bids, drug plans should include specific plans for encouraging enrollment of often hard-to-reach populations.

NASW strongly urges that the concerns discussed above be addressed in order to ensure access to psychiatric medications under the Part D drug benefit for the many Medicare beneficiaries who need them.

Thank you for your consideration of our comments.

Baltimore, MD 21244-8014

To Whom It May Concern:

The National Spinal Cord Injury Association is pleased to submit comments on the proposed rule "Medicare Program;
Medicare Prescription Drug Benefit," 69 FR 46632. The National Spinal Cord Injury Association (NSCIA), founded in 1948, is the nation's oldest and largest civilian organization dedicated to improving the quality of life for hundreds of thousands of Americans living with the results of spinal cord injury and disease (SCI/D) and their families. This number grows by thirty newly-injured people each day.

Tens of thousands of individuals with spinal cord injury or disease (sci/d) are Medicare beneficiaries. NSCIA has grave concerns because the proposed rule does not provide critical protections for people with sci/d and almost 13 million other Medicare beneficiaries with disabilities and chronic health conditions. We offer the following essential recommendations:

DESIGNATE SPECIAL POPULATIONS WHO WILL RECEIVE AFFORDABLE ACCESS TO AN ALTERNATIVE, FLEXIBLE FORMULARY:

Individuals who have sci/d or other with serious and complex health issues must have access to the right medications. Such medications are critical to leading healthy, functioning, productive lives in the community as opposed to being institutionalized in nursing homes. Not having access to the correct medications can cause expensive hospital stays and life threatening events. People with sci/d and other disabilities may need the latest medications because they have fewer side effects.
Denying the suitable medication for an individual with a disability or chronic health condition can cause serious side effects, create unnecessary health problems, and lead to costly medical interventions. We strongly support the suggestion in the proposed rule that people with disabilities and other chronic conditions require special treatment due to unique medical needs, and the enormous potential for serious harm or death if they are subjected to formulary restrictions and cost management strategies envisioned for the Part D program.

We recommend the following groups be among those included in these exempt populations:

- people who are dually eligible for Medicare and Medicaid
- people with sci/
- people who live in nursing homes and other residential facilities
- people who have life threatening conditions
- people who have pharmacologically complex conditions

POSTPONE THE IMPLEMENTATION OF THE PART D PROGRAM FOR DUAL ELIGIBLES:

Dual eligibles (i.e. Medicare beneficiaries who also have Medicaid coverage) have more extensive needs and lower incomes than the rest of the Medicare population. Among these are many with sci/d. They rely extensively on prescription drug coverage to sustain their basic health. Because of low income, they are the most vulnerable beneficiaries. NSCIA believes there is not enough time allowed to address how drug coverage for these health and fiscally exposed beneficiaries will be transferred to Medicare on Jan. 1, 2006.

CMS and the private Part D plans giving drug coverage do not have enough time to implement a prescription drug benefit staring on January 1, 2006. These time constraints may well lead to plans that jeopardize the lives of people with sci/d and

other disabilities who fall into the dual eligible population. It is highly improbable that 6.4 million dual-eligibles could be identified, educated, and enrolled in six weeks (from November 15th the beginning of the enrollment period to January 1, 2006),

Therefore, **NSCIA urges that transfer of drug coverage from Medicaid to Medicare be delayed a minimum of six months even if legislative mandate is required.**
We further urge CMS to actively support such legislation in the current session of Congress.

FUND COLLABORATIVE PARTNERSHIPS WITH ORGANIZATIONS REPRESENTING PEOPLE WITH DISABILITIES THAT ARE CRITICAL TO AN EFFECTIVE OUTREACH AND ENROLLMENT PROCESS:

Organizations representing people with disabilities and other targeted populations of Medicare beneficiaries should be funded to collaborate with CMS in the outreach and enrollment process. These advocacy and service groups are one of the most effective inroads to disseminate outreach and enrollment information. **NSCIA strongly recommends that CMS develop national and regional partnerships with disability service and advocacy groups and local and state agencies.**

COST MANAGEMENT LIMITS AND CONSUMER PROTECTION:

NSCIA recommends that CMS make major enhancement to its provisions for consumer protection. One key example is not allowing any plan to require 100% cost sharing for any medication. These and other proposed cost burdens on the consumer could threaten and adversely effect people with sci/d and other disabilities. In addition to providing for special treatment for certain special populations, we urge CMS to make significant improvements to the consumer protection provisions in the regulations in order to ensure that individuals can access the medications they require. For example we strongly oppose allowing any prescription drug plan to impose a 100% cost sharing for any drug. We oppose any regulations that allow cost containment practices that would limit a physician from prescribing the best medication for an individual. This elimination of said cost containment practices is especially critical for the lives of people with sci/d and other disabilities.

ENHANCE AND STRENGTHEN INADEQUATE EXCEPTIONS AND APPEALS PROCESSES:

NSCIA believes the appeals processes in the proposed rule are not accessible, too complex and will have a major adverse and deleterious impact on beneficiaries with disabilities. We
urge that CMS develop an understandable process that allows simplicity of access and fast results for beneficiaries and their doctors. NSCIA also urges an expedited appeals process. Along with many other disability organizations, NSCIA believes that the proposed rule **fails to meet Constitutional due process requirements and fails to satisfy the requirements of the statute**. The proposed rule has so many levels of cumbersome internal appeals to the drug plan that it makes unbiased appeal nearly impossible. The appeals process itself could preclude critical medications over a duration of time so as to be life threatening to people with disabilities.

The parts of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (MMA) that call for design and implementation of an exception process are vital consumer protections that must include regulations that are enforced. Such procedures could assure that individuals with sci/d and other disabilities would receive timely coverage determination for on and off formulary medications in a manner unique to their complex needs.

NSCIA joins other disability organizations in asking that CMS revamp the exceptions process to: establish clear standards by which prescription drug plans must evaluate all exceptions requests; to minimize the time and evidence burdens on treating physicians; and to ensure that all drugs provided through the exceptions process are made available at the preferred level of cost-sharing.

REQUIRE PLANS TO DISPENSE A TEMPORARY SUPPLY OF DRUGS IN EMERGENCIES:

Persons with sci/d, other disabilities, and chronic health conditions must have access to prescribed medications at all times. The proposed system does not ensure beneficiary
access to needed medications. Said drugs are vital to the continued, productive functioning of persons with sci/d and other disabilities. Interruption of medication regimes can cause serious health complications and may even be life threatening. Consequently, the final rule must ensure that an emergency supply of drugs be made available for dispensing while pending the resolution of an exception request or an appeal.

NSCIA appreciates your consideration of these public comments.

Re: CMS-4068-P Comments on Part D, Medicare, Proposed Outpatient Drug Program Rules

Dear Dr. McClellan:

On behalf of the California Medical Association, we wish to join the American Medical Association in seeking further clarification regarding a range of patient safeguards that should be more explicitly addressed in your proposed rules. We believe it is imperative that these regulations clearly prohibit manipulations of a physician's prescribing authority that could subsequently result in disruptions in both the quality and continuity of medical care.

We strongly agree with your comments recently in the Wall Street Journal that "the choice of drugs should reflect current medical practice." In that spirit, we respectfully urge that CMS consider the following:

Benefit Design: As noted in AMA's testimony, we are concerned by 'serious deficiencies' in the USP's proposed model classification system. We find numerous circumstances whereby entire classes of vital drugs could be excluded by an HMO, PBM or other plan administrator. While some may believe this could help produce short term savings in the drug benefit program, it is inevitable that such limitations on coverage will shift the ensuing costs resulting from therapeutic failure to other parts of the Medicare program.

P&T Committee Coverage Decisions: We join the AMA in expressing our concern that absent further clarification, P&T Committees may be allowed to meet in secret, limit clinical and public input, and be stacked to favor the plan administrator's drug class preferences. It is not clear that the scope of the P&T Committees would include other coverage restriction strategies, such as prior authorization procedures or tiered/step formularies, nor if the committee's decisions would be binding on the PDP. We feel very strongly that the rule should be modified to make it clear that P&T committees must be responsible for the development of all coverage policies, and that their decisions should be made and explained openly through a transparent process that allows for public input.

Patient Protections: We are also very concerned that the plans could change formularies with only 30 days notice. You are aware that the Medicare population in general, and the dual eligible population in particular, commonly have multiple chronic conditions that require multiple ongoing drug therapies. In a majority of these patients their conditions are medically fragile and the dosages and drug products have been carefully titrated. Other than adding drug products, we believe formularies should only be modified, with adequate notice and P&T Committee approval, between plan years/contracts.

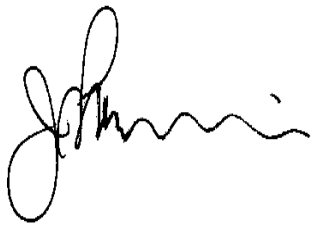
Drug Switching, Federal Preemption of State Pharmacy and Patient Protection Laws. While the preamble states that drug switching should require explicit approval by the treating physician, the rules themselves fail to expressly preserve this vital principle. Similarly, nowhere in the rule is the likely effect of the MMA on state pharmacy laws – which currently regulate the practice of therapeutic interchange – or drug switching – discussed. Switching prescriptions without the consent of the treating physician is the practice of medicine by non-physicians. Health plan or PBM employees who have virtually no history or contact with affected patients should not be permitted to override the treating physician's expert judgment. Again, Medicare is essentially a closed system—short-term savings which result in higher costs overall do not serve Medicare patients or the public well. To ensure that the final rules are not interpreted as permitting drug switching without the explicit consent of the treating physician, we urge you make it clear in the text of the regulations that state laws regulating therapeutic interchange must continue to be respected.

Office-Based Injectible Drugs for Oncology and Other Specialties: The MMA will drastically reduce the payment amount for drugs and drug administration services compared to the 2004 amounts. In addition, it appears likely that the payment methodology for drugs (106% of the manufacturer's average sales price) will result in payment amounts for many drugs that are lower than the prices at which physicians can purchase them, yet there is no mechanism in the MMA for adjustments in such circumstances. These changes have the potential to create substantial impairment of patient access to cancer and other essential treatments. Therefore, Congress should create exceptions under which CMS would be required to ensure that the payment amounts for in 2005 and later years are sufficient to cover the cost that physicians incur in purchasing the drugs. In addition, Congress should revise the MMA's transitional adjustment payment for drug administration services to an amount that will maintain the net revenue available to physicians from drugs and drug administration services in 2005 and 2006 at the same level as in 2004.

We readily acknowledge the daunting, complex nature of this new and promising program. And we applaud your efforts to implement it in a fair and responsible fashion. As you work to refine the implementing rules, we ask that the agency anticipate the consequences of arbitrarily limiting access to medically necessary drug products and work diligently to ensure that the standards and requirements that you ultimately set out for the program first and foremost do no harm.

Thank you for your consideration of these important medical principles and our mutual support of the patients we all serve.

Sincerely,



John C. Lewin, M.D.

Comments from AmeriHealth Mercy Health Plan

CMS-4068-P-1244-Attach-1.doc

October 4, 2004

Mark B. McClelland, M.D., Ph.D.
Administrator
Centers for Medicare & Medicaid Services
Department of Health and Human Services
Attention: CMS-4068-P
P.O. Box 8018
Baltimore, MD 21244-8018

Dear Dr. McClellan:

AmeriHealth Mercy Health Plan is pleased to have the opportunity to submit comments in response to the notice of proposed rulemaking by the Centers for Medicare & Medicaid Services (CMS) to establish the program for the Medicare Prescription Drug Benefit under Part D. AmeriHealth Mercy Health Plan is submitting separate comments to the Medicare Advantage (MA) regulations that relate to some of the same issues discussed here.

Background

AmeriHealth Mercy Health Plan is a subsidiary jointly owned by Independence Blue Cross and Mercy Health System. AmeriHealth Mercy Health Plan is a leading provider of Medicaid managed care programs and services. Together with its affiliate Keystone Mercy Health Plan and *PerformRx*, its pharmacy benefits management division, AmeriHealth Mercy Health Plan touches the lives of more than one million Medicaid members in seven states. AmeriHealth Mercy Health Plan and its affiliates (collectively, AmeriHealth Mercy Health Plan) are very interested in the opportunities provided by the Medicare Modernization Act (MMA) to participate both in the MA program through the offering of specialized MA plans for dual eligibles and in the offering of pharmacy benefit services on behalf of specialized MA plans serving dual eligibles.

The need to effectively manage prescription drug benefits for our large mandatory enrollment Medicaid populations led AmeriHealth Mercy Health Plan to develop *Perform Rx,* a Medicaid pharmacy care management program that meets financial objectives while improving the quality of health care for members. *PerformRx* manages drug benefits and services for almost 900,000 Medicaid beneficiaries in six states.

As further background, AmeriHealth Mercy has significant experience in serving dual eligible populations. AmeriHealth Mercy Health Plan furnishes services to about 50,000 full benefit dual eligibles in the following three health plans:

- Keystone Mercy Health Plan, Southeastern Pennsylvania's largest Medicaid managed care health plan serving more than 280,000 Medical Assistance recipients, including 31,000 dual eligibles, in Bucks, Chester, Delaware, Montgomery and Philadelphia counties**.** Keystone Mercy Health Plan operates this plan under a license held by Vista Health Plan, a subsidiary of Independence Blue Cross.
- AmeriHealth Mercy Health Plan serves about 76,000 Medical Assistance recipients, including about 6, 000 dual eligibles, in fifteen counties in Central and Northeastern Pennsylvania. AmeriHealth Mercy Health Plan operates this plan under a license held by Vista Health Plan, a subsidiary of Independence Blue Cross.
- Passport Health Plan[1] is a Medicaid managed care plan that serves over 130,000 members in Louisville and 15 surrounding counties in Kentucky. Its membership includes 12,000 dual eligibles. Passport was formed in 1997 by a group of safety net Medicaid providers. AmeriHealth Mercy provides complete health plan management and administrative support services under the governance of the Passport Health Plan board. Passport Health Plan is currently in the process of completing an application to participate in the Medicare Advantage program as a specialized MA plan for dual eligibles.

Discussion

1. Introduction

As an overall comment, AmeriHealth Mercy's experience in managing comprehensive prescription drug benefits for high risk Medicaid populations is that the management of the prescription drug benefit and medical benefits (hospital, physician, ancillary, etc.) are inherently interrelated because the quality outcomes and total costs are interdependent. Good disease management programs incorporate prescription drug data and management as integral components to clinical quality improvement and utilization/cost management efforts. Successful disease and case management programs serving high risk, low income populations focus on removing barriers to services. While total medical costs can be stabilized/reduced, an individual's prescription drug utilization may actually increase with appropriate use and adherence to medication plans. Thus, from the perspective of an MA-PD plan that is managing medical and pharmaceutical services, the sponsoring MA organization has strong motivation to ensure that the Part D drug benefit is designed and administered in a manner that serves the best interests of its enrollees. Over the years, health plans have developed effective programs to appropriately manage their drug benefits. AmeriHealth Mercy Health Plan urges CMS to develop the Part D regulations in a manner that gives health plans the discretion to continue these programs.

2. Subpart B – Eligibility and Enrollment

[1] Passport Health Plan is the trade name for University Health Care, a section 501(c)(3) tax exempt organization.

In this section of our letter, we provide our rationale for requesting that CMS adopt a policy that would allow the auto-assignment of full benefit dual eligibles into an MA-PD that is offered by a health plan in which the full benefit dual eligibles are enrolled or a health plan under common ownership and control of the health plan in which the full benefit dual eligibles are enrolled. Because of the importance of these comments, AmeriHealth Mercy Health Plan has repeated these recommendations in its comments to the MA proposed rule.

The MMA establishes a mechanism for full benefit dual eligibles who will be losing their outpatient drug coverage under Medicaid to select enrollment in an MA-PD plan or a PDP. The statute allows for default enrollment into a PDP in the event that a full benefit dual eligible fails to select a PDP or an MA-PDP Plan. Based on information provided at an open door forum, our understanding is that CMS intends to have this default enrollment occur effective January 1, 2006.

In the preamble to the PDP proposed rule (page 46638), CMS explains that there are conflicting statutory provisions related to default enrollments. To address these conflicts, CMS is proposing to default full benefit dual eligibles into an MA-PD if the full benefit dual eligible was enrolled in the MA organization previously. In the preamble, CMS articulates its policy justification for this decision as follows:

> To the extent that the MA-only portion of the MA-PD plan parallels the coverage under a full benefit dual eligible individual's MA plan, enrolling the individual in the MA-PD plan would be similar to permitting the individual to remain enrolled in the MA plan while simultaneously enrolling the individual in a PDP. In other words, enrolling the individual in a MA-PD plan offered by the same MA organization is, in effect, simply adding qualified prescription drug coverage to the individual's MA benefits. For this reason, we believe the reference to ``prescription drug plans'' in section 1860D-1(b)(1)(C) of the Act should be interpreted as requiring enrollment of a full benefit dual-eligible into a plan that will provide the individual with Part D drug benefits in addition to any other benefits the individual receives under Medicare, whether through Medicare Part A and/or Part B, or through enrollment in the Medicare Advantage program under Part C. We believe this interpretation promotes the policies underlying sections 1860D-1(b)(1)(C) and 1860D-1(a)(1)(B)(ii) of the Act, giving full effect to both statutory provisions.

AmeriHealth Mercy Health Plan fully supports CMS proposed policy, but requests that CMS expand this policy to allow for default enrollments in two additional, related circumstances illustrated below. First, Passport Health Plan currently enrolls 12,000 dual eligibles and is in the process of applying for an MA-SNP to serve dual eligibles. AmeriHealth Mercy Health Plan is recommending that CMS expand its policy to allow for the current full benefit dual eligible enrollees of Passport Health Plan's Medicaid MCO who do not otherwise select an MA-PD or PDP to default into Passport Health Plan's MA-PD. Because virtually all Medicare services are covered under Medicaid, allowing such a default enrollment would permit these full benefit enrollees to continue to receive the full range of A/B services and drug benefits from the same

health plan. Moreover, AmeriHealth Mercy Health Plan believes that allowing dual eligibles to retain their prescription drug providers and the existing pharmacy management structure is fully consistent with the objectives stated above.

AmeriHealth Mercy Health Plan believes there is legal precedence to support our interpretation that would permit members of another health plan offered by the same organization to be viewed as members of the Medicare managed care organization. Section 1851(a)(3)(B) includes the provision that prohibits beneficiaries with end-stage renal disease (ESRD) to enroll in an MA plan. This paragraph includes an exception that permits the enrollment of "an individual who develops end-stage renal disease while enrolled in an MA plan may continue to be enrolled in that plan." As part of the BBA regulations, CMS was confronted with the issue of whether a Medicare beneficiary who was enrolled in a non-Medicare+Choice plan and who developed ESRD could enroll in a Medicare+Choice plan offered by the same organization. In answering this question, CMS appropriately asserted its authority to depart from the literal reading of the statute and took the following position:

> For purposes of this provision only we are considering individuals who are enrolled in a private health plan offered by the M+C organization to have been enrollees of the M+C plan when they developed ESRD. (63 FR 34976, June 26, 1998)

While this ESRD enrollment issue is in a different context from the default enrollment issue under the MMA, it illustrates the clear willingness of CMS to depart from the literal reading of the statute to reach an important and desirable policy result. In this case, that departure entailed treating a non-MA enrollee of an organization as an MA enrollee of that same organization for purposes of enrollment into an MA plan. Consistent with CMS' willingness to extend a reference to M+C organizations to a non-Medicare health plan offered by the same entity, we believe that CMS has the corresponding legal authority to make an analogous legal interpretation. AmeriHealth Mercy Health Plan believes that strong policy reasons also support this result because this interpretation would allow a single organization to coordinate the services and be responsible for the full range of Medicare and Medicaid benefits for the full benefit dual eligibles. In making this recommendation, we emphasize that these full benefit dual eligibles would have the right to disenroll from the MA-SNP, if they want.

We also believe our recommendation has policy support under the statutory provision in Section 1851(c)(3)(a)(II), which address seamless continuation of coverage. Under that provision, CMS has the authority to establish procedures under which an individual who is enrolled in a health plan (other than an MA plan) offered by an MA organization at the time of the initial election period and who fails to elect to receive coverage other than through the organization is deemed to have elected the MA plan offered by the organization. While this provision applies to initial election period when a person is first eligible for Medicare coverage, the provision demonstrates Congressional support for arrangements that facilitate enrollment into an MA plan of an enrollee covered by a non-MA plan sponsored by the same organization. In addition, this provision offers clear authority for CMS to provide for this default enrollment in the future when an

enrollee of a Medicaid MCO first becomes eligible for Medicare and the same entity also offers an MA plan.

Our second policy recommendation related to how CMS interprets the default enrollment provision is an extension of our initial request and relates to the two Pennsylvania Medicaid managed care plans: Keystone Mercy Health Plan in Southeastern Pennsylvania, and AmeriHealth Mercy Health Plan in Central and Northeastern Pennsylvania. As noted above, AmeriHealth Mercy Health Plan and its affiliate, Keystone Mercy Health Plan, are owned by Independence Blue Cross and Mercy Health System. Both of these Medicaid plans are operated under an HMO license held by Vista Health Plan, a wholly owned subsidiary of Independence Blue Cross.

Independence Blue Cross itself and through its subsidiaries has three separate MA contracts. One contract is a PPO sponsored by Independence Blue Cross itself. The second contract is held by a wholly owned subsidiary of Independence Blue Cross, Keystone Health Plan East, Inc., and is offered in Southeastern Pennsylvania. The third contract is held by AmeriHealth HMO, Inc. AmeriHealth Mercy Health Plan is requesting that CMS adopt a policy that would allow the full benefit dual eligible enrollees of AmeriHealth Mercy Health Plan and Keystone Mercy Health Plan and who do not otherwise select another MA-PD or PDP to default on January 1, 2006, into the MA-SNP sponsored by AmeriHealth HMO, Inc, and Keystone Health Plan East, Inc., respectively. In making this request, we want to be clear that substantial efforts will be made in advance of the default date to have these Medicaid enrollees either select a MA-PD plan or a drug plan. Keystone Health Plan East and AmeriHealth HMO, Inc. will be actively marketing the dual eligibles enrolled in their affiliated Medicaid managed care organizations in a manner consistent with CMS rules. However, as CMS is aware from its experience in the drug discount card program and the challenges associated with enrolling dual eligibles in the Medicare savings programs, many dual eligibles will take no action prior to January 1, 2006. AmeriHealth Mercy Health Plan strongly believes it is in the best interests of their enrollees and the Medicare program to default these enrollees into Keystone Health Plan East's MA-SNP.

AmeriHealth Mercy Health Plan also believes there is a legal precedent for allowing affiliates of organizations to avail themselves of statutory rights under the Medicare or Medicaid program. Prior to enactment of the BBA, Medicaid MCOs were prohibited from having more than 75 percent of their enrollment comprised of persons eligible for Medicare and Medicaid. Certain community health centers, migrant health centers, and Appalachian health centers were exempt from this requirement. When CMS implemented this statutory provision, CMS departed from the literal reading of the statute and extended this exemption to HMOs owned by these health centers. CMS discussed this issue in the following manner:

> As noted in the previous section, we are proposing to amend the regulations to recognize the statutory exemption from the composition of enrollment standard for certain Community, Migrant, and Appalachian Health Centers. It has come to our attention that some of these exempt centers have joined to form larger organization in order to operate an HMO of adequate size. Under simple arrangements, several community health centers have established an HMO that

> enrolls members who are then provided primary care services through the same community health centers. The HMO serves simply as the corporate vehicle allowing the centers to combine their efforts. In this circumstance, we believe that, consistent with Congressional intent, the HMO formed by centers that are exempt from the composition of enrollment standard should itself be exempt from the standard. (53 FR 746, January 12, 1988)

This discussion illustrates CMS willingness to extend statutory rights from an organization to an affiliate of that organization in appropriate circumstances. In the context of the issues being raised to CMS here, it is important to note that the complexity arising from these different organizational structures derives both from the limitations that Independence Blue Cross has to use the Blue Cross mark outside of its designated area and Medicaid managed care program requirements. Notwithstanding this complexity, it is clear that all of the entities that hold the MA contracts and Medicaid contracts with the Pennsylvania Department of Public Welfare are wholly owned subsidiaries of Independence Blue Cross. Therefore, for purposes of developing public policy interpreting the default enrollment provisions, we believe it is reasonable and appropriate for CMS to treat these affiliated companies as a single entity.

AmeriHealth Mercy Health Plan recognizes that CMS' consideration of AmeriHealth Mercy Health Plan's requests needs to be considered in the context of a broader policy that is consistent with the objectives of the MMA and serves the best interests of full benefit dual eligibles. To achieve this end, AmeriHealth Mercy Health Plan recommends that CMS adopt the following policy:

> That CMS approve default enrollment of a full benefit dual eligible who has not otherwise selected an MA-PD or PDP into an MA-PD that is administered by an MA organization (1) that operates the Medicaid MCO in which the dual eligible is enrolled or (2) that is affiliated by common ownership or control with an organization that operates the Medicaid MCO in which the dual eligible is enrolled. As a condition of CMS approving this policy, the MA organization would be obligated to meet the following conditions:
>
> 1. The MA organization would have to assure that the full benefit dual eligibles are given notice of the default enrollment and their opportunity to select other options in advance of the default enrollment as well as their continued ability to disenroll from the specialized MA-PD plan following their enrollment.
>
> 2. The bid for A/B benefits would not include beneficiary premiums or cost sharing that would be paid by the full benefit dual eligible enrollees. If the Part D premium is determined to be in excess of the low income premium subsidy, the MA-PD plan would reallocate rebate dollars to the amount of the low income premium subsidy (if permitted by CMS).
>
> 3. The MA organization must represent that substantially all of the Medicaid providers currently furnishing services to the full benefit dual eligibles are either

part of the MA-SNP's delivery system or would have the opportunity to participate in that delivery system provided that the MA organization's credentialing requirements could be met.

4. The same pharmacy benefits manager that will administer the Part D benefit on behalf of the MA-SNP must also have previously managed the pharmacy benefit for the dual eligible enrollees of the Medicaid MCO.

AmeriHealth Mercy Health Plan would welcome the opportunity to discuss with CMS its proposal. As implicitly reflected in the above conditions, AmeriHealth Mercy Health Plan is recommending that CMS allow default enrollments into an MA-PD even if the Part D premium exceeds the low income premium subsidy. We believe the enrollees' best interests will be met by enrolling them in the MA plan under the above conditions rather than forcing them into a PDP.

3. Subpart C – Benefits and Beneficiary Protections

a. USP Classification structure

AmeriHealth Mercy Health Plan supports the proposed USP classification structure. We believe that the skeletal structure does exactly what it was primarily intended to do -- prevent enrollee discrimination through non-inclusion of certain medication types and categories. This skeletal structure provides a good basis from which to create a workable formulary that will ultimately be reviewed by CMS for appropriateness. AmeriHealth Mercy Health Plan reiterates its earlier point that it is very important for CMS to give MA organizations the flexibility to administer their drug benefit in a manner that serves the best interest of their beneficiaries. AmeriHealth Mercy Health Plan has substantial experience developing and managing formularies under Medicaid programs in a number of states. These formularies make available to enrollees in a cost effective manner the pharmaceuticals they need. AmeriHealth Mercy Health Plan urges CMS not to develop requirements that impair the ability of health plans like AmeriHealth Mercy Health Plan to continue the effective pharmaceutical programs that they currently offer to their enrollees.

b. Formulary development

AmeriHealth Mercy Health Plan supports the formulary development requirements and believes that the statutory and proposed regulatory requirements are generally consistent with industry practices in the development of formularies. Under the proposed rule, the majority of members comprising the P&T committee would be required to be practicing physicians and/or practicing pharmacists. In addition, at least one practicing pharmacist and one practicing physician member would have to be an expert in the care of elderly and disabled individuals and free of conflict with respect to the PDP sponsor and PDP or MA organization and MA-PD. AmeriHealth Mercy Health Plan believes this standard, in general, is reasonable and consistent with standard industry practice. However, AmeriHealth Mercy Health Plan has one concern with regard to how CMS is

interpreting "independent." In the preamble discussion, it appears that CMS would preclude a pharmacist from being viewed as "independent" if the pharmacist was part of the pharmacy network of the MA-PD plan. AmeriHealth Mercy Health Plan believes that many health plans attempt to create their P & T Committees composed of the "best and brightest" physicians within their geographic area. They also have this same goal for their provider networks. As a result, we have concerns that it may not be possible to obtain a physician or pharmacist who meets the requisite qualifications but is not part of the health plan's network. The health plan would be forced to find a pharmacist or physician who is located outside their service area to participate on their P & T Committee. Consequently, the selected P & T Committee member would lack a good understanding of local health care issues and concerns.

c. Use of rebates to reduce cost sharing

Under §423.100 in the definition of "required prescription drug coverage" an MA-PD plan may offer enhanced alternative coverage if there is no supplementary beneficiary premium as a result of the use of rebate dollars from A/B savings. In the preamble, CMS notes that an MA-SNP may use rebate dollars to reduce the nominal copayments that apply to low-income subsidy individuals who have incomes below 135 percent of FPL. We are seeking CMS confirmation on an issue related to this position. These dual eligibles may have copayments of $1/$3 or $2/$5. Our understanding is that an MA organization offering an MA-SNP for dual eligibles may use rebate dollars to remove both levels of copayments. AmeriHealth Mercy Health Plan is requesting that CMS confirm this interpretation in the preamble to the final regulation.

d. Drugs covered under Part B and Part D

CMS sets forth a lengthy discussion in the preamble concerning issues arising from drugs that may be provided under Part B and Part D. Based on our experience in the Medicaid program, AmeriHealth Mercy Health Plan has found that enormous issues can arise regarding the appropriate classification of drugs when the classifications dictate different financial obligations. AmeriHealth Mercy Health Plan urges CMS to the fullest extent possible to provide clear guidance regarding which drugs fall under Part B and those that fall under Part D. This guidance should also explain the rules determining treatment of newly approved drugs. This guidance should also delineate clearly the circumstances in which a drug may fall under either Part B or Part D depending on the manner in which it is administered.

4. Subpart D – Cost Control and Quality Improvement

As proposed under §423.153(b), CMS is requiring MA-PD plans and PDPs to have a cost-effective drug utilization management program. This program must:

(1) Include incentives to reduce costs when medically appropriate; and
(2) Maintain policies and systems to assist in preventing over-utilization and under-utilization of prescribed medications.

AmeriHealth Mercy Health Plan believes an effective drug utilization program is integral to the success of the Part D program. To this end, AmeriHealth Mercy Health Plan urges CMS to convey in the preamble its support for current practices that are commonly used by health plans and pharmacy benefit managers to manage utilization and control costs.

While unfortunate, the reality in today's health care environment is that a significant amount of beneficiary fraud and abuse occurs. This type of activity occurs in spite of significant efforts on the part of both pharmacists and the majority of practicing physicians to prevent this type of behavior. AmeriHealth Mercy Health Plan asks CMS to consider providing options, policies and processes that would allow health care payers/providers to investigate potential beneficiary fraud and misuse, and when verifiable, to attempt to control the activity in question. A large number of States already have beneficiary fraud and misuse programs in place for their Medicaid programs, and, in our opinion, these programs can be extremely successful in reducing the unwanted behavior.

AmeriHealth Mercy Health Plan, through its working relationship with the Commonwealth of Pennsylvania, has designed, developed, and implemented a program that attempts to eliminate/reduce fraud and misuse of drug products within our specific member population. Our particular program is referred to as "Recipient Restriction."

The pharmacy services department for the health plan constantly monitors drug claim data, looking for potential fraud and misuse. There are a number of algorithms that exist or could be developed by CMS to give guidance on what would, or would not, be considered fraud and/or misuse. The focus of these programs is typically on drugs and drug products that have "street" or "abuse" potential, with the primary products being the therapeutic class – opiate/narcotic pain medications. A number of other products have been included and are monitored as research and practice dictate.

The current process requires that once the health plan identifies a member misusing either products or services, a request to "restrict" that member is submitted to the Commonwealth's Department of Public Welfare "Recipient Restriction" oversight committee for a review and final determination. If the committee feels that there is enough data/information to support the restriction, based on the restriction criteria that has been approved and is in place, the member is restricted to using a single provider or group of providers and/or a single retail pharmacy vendor for a period of five years. What is also important is that this restriction attaches to the recipient and follows that recipient as they move from health plan to health plan. This is an extremely important component of the program as it precludes the recipient from re-initiating the unwanted behavior simply by changing health plans.

There appears to be little comment given in the MMA to programs/processes geared toward beneficiary fraud and misuse, the ability of MA-PD plans PDPs to initiate these types of programs, or CMS's willingness/ability to support this type of program.

AmeriHealth Mercy Health Plan's experience with this type of restriction program has been very positive. Once identified and "restricted," our research shows a significant decrease in the detrimental practices and behavior of the restricted recipients.

AmeriHealth Mercy Health Plan would encourage CMS to address and clarify the types of programs and support for these programs that might be forthcoming. The ability of a health plan to take limited action against a recipient that is misusing the system, with only the slightest impact of that recipient's access to the health care system, is an extremely valuable tool to improve appropriate utilization of medications and reduce unnecessary financial expenditures. While it may not be possible to establish a program under Medicare that parallels exactly the Medicaid programs, AmeriHealth Mercy Health Plan urges CMS to consider these issues and convey in the preamble to the final rule or the rule itself the manner in which these programs may be administered as well as alternative practices that may be followed by PDPs and MA-PD plans to accomplish the same objectives.

AmeriHealth Mercy Health Plan is also seeking confirmation from CMS with regard to the ability of MA-PDs and PDPs to require that certain drugs receive prior approval before a prescription is filled. Prior approval is a common practice and CMS repeats a number of times in the preamble the ability of health plans to continue their existing programs to manage costs. We also note that the Federal Medicaid law expressly provides:

> A State may subject to prior authorization *any* covered outpatient drug. Any such prior authorization program shall comply with the requirements of paragraph (5)." § 1396r- 8(d)(1)(A) (emphasis added).

Paragraph (5), entitled "Requirements of prior authorization programs," reads as follows:

> A State plan under this subchapter may require, *as a condition of coverage or payment* for a covered outpatient drug for which Federal financial participation is available in accordance with this section, ... the approval of the drug before its dispensing for any medically accepted indication (as defined in subsection (k)(6) of this section) only if the system providing for such approval-
> (A) provides response by telephone or other telecommunication device within 24 hours of a request for prior authorization; and
> (B) except with respect to the drugs on the list referred to in paragraph (2), provides for the dispensing of at least 72-hour supply of a covered outpatient prescription drug in an emergency situation (as defined by the Secretary).

42 U.S.C. § 1396r-8(d)(5) (emphasis added)

AmeriHealth Mercy Health Plan believes the process we currently use, follows the federal Medicaid guidelines. This guideline has worked well for years in the Medicaid environment, and AmeriHealth Mercy Health Plan recommends that CMS approve a comparable policy for the Part D program.

5. Subpart F Submission of Bids and Monthly Beneficiary Premiums; Plan Approval

In the preamble discussion, CMS is clear that it expects PDP sponsors and MA organizations to identify the additional costs that may arise as a result of supplemental benefits. CMS states that a portion of these costs will be associated with increased utilization of the Part D basic benefit. CMS expects that the costs associated with this increased utilization will be included in the component of the bid attributable to the supplemental benefits, not the basic benefits.

This position raises a number of very significant and troubling issues for AmeriHealth Mercy Health Plan. If AmeriHealth Mercy Health Plan were to offer a MA-SNP for dual eligibles, its enrollees would have substantial "supplemental" coverage through the payment by CMS of the low-income subsidies. Our actuaries estimate that the utilization associated with an MA-SNP is well above that associated with the basic plan -- potentially 20 percent higher. This increased utilization is for the same population; it does not reflect populations choosing the plan or the value of the cost sharing itself. It is in addition to any risk adjustment needed due to diagnosis or medical conditions of a given population. Of the total allowed costs due to the increased utilization, a portion is reimbursed through increased cost sharing subsidies or increased reinsurance subsidies. The remaining portion is not reimbursed through any of the Part D direct subsidy, the reinsurance subsidy, the low-income premium subsidy, or the low-income cost sharing subsidy. Most importantly, the additional costs associated with this additional utilization cannot be reallocated outside of the basic drug benefit because AmeriHealth Mercy Health Plan will not be offering supplemental benefits.

As a result, AmeriHealth Mercy Health Plan and other MA-SNPs will be placed at a significant competitive disadvantage to MA-PDs and PDPs that will not have these additional costs included in their basic bid. More importantly, this inequity increases the likelihood that the premium of an MA-SNP will be greater than the low-income premium subsidy in its region. If this should occur, full benefit dual eligibles, who might otherwise have no premium, will be forced to pay a premium to the MA-SNP. This occurrence could create an incentive for the full benefit dual eligibles of the MA-SNP to disenroll and enroll in another plan that may be less expensive, but may not offer the special services needed by the dual eligible population.

For this reason, AmeriHealth Mercy Health Plan opposes CMS' proposed decision to require the costs associated with increased Part D basic services that arise when supplemental benefits are provided to be removed from the basic bid.

6. Subpart G Payments to PDP Sponsors and MA Organizations Offering MA-PD plans for all Medicare Beneficiaries for Qualified Prescription Drug Coverage

On page 46688 of the preamble, CMS included the following discussion conveying its concerns that plans serving large portions of low-income subsidy beneficiaries may not be paid adequately under the new Part D risk adjustment system:

> Any risk adjustment methodology we adopt should adequately account for low-income subsidy (LIS) individuals (and whether such individuals incur higher or lower-than average drug costs). Our risk adjustment methodology should provide neither an incentive nor a disincentive to enrolling LIS individuals, and we request comments on this concern and suggestions on how we might address this issue.
>
> Our particular concern is that a risk adjustment methodology, coupled with the statutory limitation restricting low-income subsidy (LIS) payments for premiums to amounts at or below the average, could systematically underpay plans with many LIS enrollees (assuming LIS enrollees have higher costs than average enrollees). If the risk-adjustor fails to fully compensate for the higher costs associated with LIS recipients, an efficient plan that attracts a disproportionate share of LIS eligible individuals would experience higher costs to the extent the actual costs of the LIS beneficiaries are greater than the risk-adjustment compensation. Failing to discourage enrollment by LIS beneficiaries in 2006, the plan would experience higher than expected costs in that year and presumably be driven to reflect these higher costs (due to adverse selection, not efficiency) in its bid for 2007. In this hypothetical, plans would have a disincentive to attracting a disproportionate share of LIS beneficiaries. One possible solution would be to assure that the initial risk-adjustment system, which will be budget neutral across all Part D enrollees, does not undercompensate plans for enrolling LIS beneficiaries. In fact, to the extent that an initial risk-adjustor might at the margin tend to overcompensate for LIS beneficiaries, plans would have a strong incentive to disproportionately attract such beneficiaries. Plans could attract LIS beneficiaries both by designing features that would be attractive to such beneficiaries but also by bidding low. We would appreciate comments on this concern and suggestions on how we might address this potential problem.

AmeriHealth Mercy Health Plan shares the concern that the risk adjustment methodology could systematically underpay plans with many low-income subsidy enrollees. As noted above, of the total allowed costs due to the increased utilization, a portion is reimbursed though increased cost sharing subsidies or increased reinsurance subsidies. The remaining portion is not reimbursed through any of the Part D direct subsidy, the reinsurance subsidy, the low-income premium subsidy, or the low income cost sharing subsidy. Because these costs are not reimbursed, MA-SNPs will need to build them into member premium. As a result, MA-SNPs like AmeriHealth Mercy Health Plan will be less competitive than plans without such low-income eligibles.

To address this issue, CMS could include in the risk adjuster a component that reflects both the extra utilization the dually eligible Medicare/Medicaid population reflects due to its inherent risk (if it bought the basic Part D plan) and the extra utilization because it will effectively receive a much richer $1/$3 copay plan. AmeriHealth Mercy Health Plan believes that this incremental adjustment would be beyond that reflected in the standard (to be determined) diagnosis-based risk adjuster. We believe that this solution would protect both MA-SNPs and other PDP or MA-PD plans that happen to enroll low-income members.

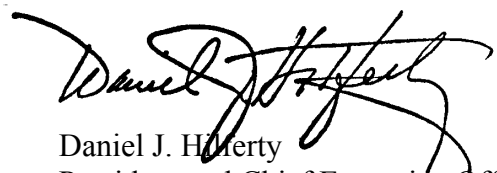
In addition to the increased costs associated with the greater utilization of services, we believe that the additional administrative expense involved in the increased utilization and the administration of the cost sharing subsidy is also unlikely to be included in:

- Standard PDP bids
- Reinsurance subsidies
- Low income premium subsidy
- Cost sharing subsidy

If so, it again would be in the member premium and put plans with LIS enrollees at a competitive disadvantage. This cost could be either a) added to a Medicaid/low income risk adjustment (as above), or b) added as a load onto the actual cost sharing reimbursement.

AmeriHealth Mercy Health Plan appreciates the opportunity to comment on these regulations. If you would like to discuss any of our comments, feel free to call me at (215) 937-8200.

Sincerely,



Daniel J. Hilferty
President and Chief Executive Officer

Issue Areas/Comments

GENERAL

GENERAL

To Whom It May Concern:

I am writing today in regards to the proposed Medicare Part D rules. As a pharmacist of the Medicine Shoppe Pharmacy located in LaCrosse, WI, I am greatly concerned about these proposed rules and the impact they will have on pharmacy services for our patients.

Please know that myself and all pharmacists want to see this Medicare Part D benefit work for all those involved. Unfortunately as past history will show, the private sector health plans have and continue to target pharmacies and pharmacy reimbursement in cost containment measures rather than teaming with pharmacy providers to enhance the quality and accessability to important health care services. We cannot continue to follow this path.

As a community pharmacist, I am concerned with three aspects of the Medicare Part D proposed rule and recommend that Centers for Medicare and Medicaid Services enable the following three policies:

1) Medicare recipients must be able to choose their own pharmacies.
It is critical that plan sponsors make every effort to include as many pharmacy providers as possible in the Part D benefit. Accessibility should be applied at a level no broader than a county to ensure all patients have ready access to the pharmacies in their community. Furthermore, plan sponsors must be required to provide pharmacy payment such that it at a minimum covers the average costs associated with dispensing prescription drugs. Private health plans often use their market force to drive down pharmacy reimbursement rates below a pharmacy's operational costs, thereby forcing pharmacy providers to shift costs to other business sectors. Medicare must now allow plan sponsors to continue this practice.

2) Implement measures to prohibit incentives designed to coerce recipients into choosing plans that exclude pharmacies.
Medicare patients should not be economically coerced into using one pharmacy over another unless the plan sponsor can justify quality reasons for a preferential pharmacy. Plan sponsors should be prohibited from providing economic incentives to recipients for using mail order pharmacies. Plan sponsors should also be prohibited from promoting pharmacies in which they have ownership interest.

3) Plan sponsors should be required to establish specified Medication Therapy Management services.
The Center for Medicare and Medicaid Services should require all plan sponsors to provide at least a specified set of medication therapy management services. Plan sponsors could provide additional MTM services, beyond the minimum required, but each must meet the CMS miminum requirements. Likewise, all plan sponsors should be directed to allow any pharmacist who receives an order for an MTM service to be able to provide that service.

All medicare eligible prescribers shoud be allowed to refer their patients in need of MTM services to a provider of such. At a minimum, each plan should be required to pay for MTM services ordered by such prescribers.

Plan sponsors should also have a plan in place to direct specifed patients, such as those with multiple chronic diseases and/or drug therapies, to MTM service providers. In turn, MTM service payment must be adequate to warrant provision of the necessary services provided by a pharmacist. As well, all pharmacists practicing within a region should be afforded the opportunity to provide MTM services.

In closing, I would like to express my appreciation for this opportunity to offer CMS my opinion of the rules being proposed for Medicare Part D benefit. I hope that my concerns and the concerns expressed by pharmacists locally and nationally are being considered.

Thank you for your time and consideration.

Sincerely,

Stephanie Belling, RPH

Issue Areas/Comments

GENERAL

GENERAL

Please see comments in attached Word document.

CMS-4068-P-1246-Attach-1.doc

Option Care of East and Central Iowa is pleased to submit these comments on the proposed rule to implement the new Medicare Part D prescription drug benefit, as issued in the Federal Register on August 3, 2004. This regulation, CMS-4068-P implements section 101 of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) enacted into law on December 8, 2003.

Option Care of East and Central Iowa is a member of the national network of the Option Care home infusion companies and is located in Cedar Rapids, Iowa. We are an employee-owned company that has been specializing in this type of home care services for over 20 years. We are a member of the largest network of home infusion companies in the country. We are accredited by the Joint Commission and have earned a rather large market share in this state through clinical excellence and the resulting high patient satisfaction. We serve several hundred infusion patients on an on-going basis and have relationships with all government payers and most managed care organizations.

Option Care of East and Central Iowa appreciates the daunting task that CMS confronts in implementing this benefit. We will focus our comments provisions of the proposed regulation that directly affect the ability of the Medicare program to reap the benefits of and ensure meaningful access to home infusion services that are provided in a manner that is consistent with established national quality standards.

We applaud CMS for recognizing the clinical and cost benefits of home infusion therapy and the essential role this area of therapy plays in the private sector health system and in Medicare managed care programs. Home infusion therapy is the administration of parenteral drugs, which are prescription drugs administered through catheters and needles, to a patient in the home or other outpatient setting. Parenteral routes of administration include intravenous, intraspinal, intrathecal, intra-arterial, subcutaneous, and intramuscular. It is clear from both the MMA itself and CMS's proposed regulation that home infusion drugs are covered under Part D because they are not currently covered under the Part A or Part B program.

The proposed regulation suggests an interpretation of the Part D benefit to include not only the drugs that can be administered in patients' homes but the essential services, supplies, and equipment that are integral to the provision of home infusion therapy ("dispensing fee option 3" as described in page 46648). If dispensing fee option 3 is adopted in the final regulation, then for the first time, the Medicare fee-for-service program coverage of home infusion drug therapy will be comparable to that of virtually all private sector health plans and Medicare Advantage ("MA") plans. At that point, Medicare finally will be able to realize the significant system-wide savings that come from the provision of home infusion drug therapy in a cost-effective setting that is most convenient for the beneficiaries and their families.

Recent experience clearly demonstrates the access issues that will arise when a Medicare adds new coverage of a home infusion drug without accompanying coverage of the services, supplies. Section 642 of the MMA created limited coverage of home administration of intravenous immune globulin (IVIG) for patients with diagnosed primary immune deficiency disease (PIDD) under Medicare Part B. According to the Immune Deficiency Foundation, which represents patients the PIDD community, his new coverage under Part B has not resulted in additional access to home IVIG under Medicare. We see this as an important "demonstration project" of what is likely to happen under Medicare Part D if drugs are covered without adequate coverage, reimbursement, and standards for the critical services, supplies, and equipment that comprise the basic standard of care for home infusion therapies.

In order for the Medicare program to provide meaningful access to home infusion therapies under Part D, we strongly recommend that CMS incorporate the following critical provisions into the final Part D regulations:

* Dispensing fee option 3 is the only proposed option that will enable Medicare beneficiaries to receive home infusion therapy under the Part D benefit. CMS should follow the well-established home infusion per diem model, encoded using the National HCPCS "S" codes, already used by commercial and Medicare managed care programs. If implemented properly, this model will ensure access and avoid duplication of services-just as it does in the private payer sector. We recommend that CMS reference the National Home Infusion Association National Definition of Per Diem for a list of the products and services included in the home infusion per diem, available at http://www.nhianet.org/perdiemfinal.htm <http://www.nhianet.org/perdiemfinal.htm> .

* CMS should establish specific requirements for prescription drug plans to contract with sufficient numbers of infusion pharmacies to ensure adequate enrollee access to home infusion therapy under Part D.

* CMS should require specific standards for home infusion pharmacies under Part D. The national accreditation organizations' standards for infusion therapy reflect the community standard of care for the provision of home infusion therapy, which far exceed the OBRA 1990 standards established for retail pharmacies.

* CMS should adopt the X12N 837 P billing format for home infusion claims under Part D so as to be consistent with the format that private sector health plans use for infusion claims.

* CMS should mandate that prescription drug plans maintain open formularies for infusion drugs to ensure that this population of vulnerable

patients has appropriate access to necessary medications.

Thank you in advance for your consideration of these important issues.

Sincerely,

Shari Mailander, RN

Subject: Comments on Medicare Prescription Drug Benefit Proposed Rule
(*69 Fed. Reg. 46632-46863,* August 3, 2004)

Dear Sir or Madam:

Thank you for the opportunity to comment on the proposed regulations that implement the new Medicare Prescription Drug Benefit enacted in last year's Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA). The Center on Budget and Policy Priorities is a non-profit policy organization that works at the federal and state levels on fiscal policy and public programs that affect low- and moderate-income families and individuals. Our comments here focus on the new Part D benefit as it will apply to low-income Medicare beneficiaries including those who are dually eligible for both Medicare and Medicaid.

One key issue that we believe has not received appropriate attention in the proposed regulations is the historic opportunity the new drug benefit offers in improving enrollment in various public programs such as food stamps for which many low-income elderly and disabled beneficiaries are eligible. We believe that it is important that the regulation ensures that eligible beneficiaries are connected to other benefits for which they are likely to be eligible. We recognize that one agency, the Centers for Medicare & Medicaid Services (CMS) is promulgating this regulation and that the regulation relates to programs under its purview. But, in addition to Medicare, full Medicaid, and the Medicare Savings Programs for which CMS is responsible, other programs like food stamps, SSI and Social Security are the linchpins of federal support for the members of our society who are aging or experience a disability. This low-income Medicare population cannot be expected to navigate overly complicated enrollment procedures. To the extent that the government as a whole fails to coordinate these benefits, it is failing a very vulnerable population.

In addition, as noted by numerous other groups concerned with the dual eligibles and low-income Medicare beneficiaries, we find that the regulation falls short in many other areas especially in transitioning the dual eligibles from Medicaid drug coverage to the new Medicare drug benefit, ensuring that dual eligibles have access to the drugs they need, and in the processes that are envisioned for enrolling low-income beneficiaries in the low-income subsidies.

Please find below our general comments to the proposed regulations on these issues. Please note that we have also submitted more comprehensive comments along with other groups. These comments were submitted by Families USA.

Sincerely,

Robert Greenstein Executive Director	Edwin Park Senior Health Policy Analyst	Dorothy Rosenbaum Senior Policy Analyst

Jo Anne B. Barnhart, Commissioner, Social Security Administration

I. General Comments on Improved Coordination with Other Programs Like Food Stamps

A. Background

Many Medicare beneficiaries who are eligible for a low-income subsidy under the Medicare Part D benefit will also be eligible for food stamps. The MMA and the proposed rule provide that applications for the Part D low-income subsidy may be filed with either a State's Medicaid program or with the Social Security Administration (SSA). The proposed rule has very little detail, however, about how the application process is likely to work. Because so many people who are eligible for but not participating in food stamps are likely to apply for the Part D subsidy, this application process presents an historic opportunity to connect eligible seniors and people with disabilities to the Food Stamp Program.

Many Medicare Beneficiaries Who Are Eligible for Part D Subsidies Also Are Eligible for Food Stamps

Many of the low-income Medicare beneficiaries who will be eligible for — and apply for — the new low-income drug subsidies that the prescription drug law provides are eligible for food stamps but not enrolled. A Medicare beneficiary will be eligible for some additional subsidy under Part D if his or her income, together with the income of any spouse who is present, is below 135 percent of the federal poverty level. The asset limit for the Part D low-income subsidy will be $6,000 for single beneficiaries and $9,000 for married couples. (Those with incomes below 150 percent of the poverty line with assets below $10,000 for individuals and $20,000 for couples receive a smaller low-income subsidy).

Food stamp eligibility rules are very similar — the universe of food stamp-eligible Medicare beneficiaries is a subset of the Part D-eligible population. Specifically, to be eligible for food stamps a household must have *net* income, after all available deductions are taken into account, below the federal poverty level and assets, not including a primary residence, personal items, and an automobile in most states, must be below $3,000.

Deductions play an important role in food stamp eligibility and benefit levels by taking into account certain household expenses in determining the amount of income that is available to purchase food. In practice, this means that a Medicare beneficiary could have gross income somewhat above the poverty level and still be eligible for food stamps. For the elderly and people with disabilities, the most important deductions are: a *medical expense deduction* for out-of-pocket medical expenses greater than $35 a month; a *dependent care deduction*, for expenses of up to $175 a month for adults who need care; and a *shelter deduction*, for households that have high shelter costs (including mortgage, rent, taxes, insurance, and utility expenses) in relation to their income.

The primary difference between the Part D subsidy eligibility and food stamp eligibility is the definition of who is considered in the family unit. For the Part D subsidy, only the Medicare beneficiary and his or her spouse, if present, will be considered unless there are related dependents who rely on the individual or his or her spouse for at least one-half of their financial support. For food stamps a household consists of individuals who live together and who purchase and prepare meals together. So in some instances where Medicare beneficiaries live

with others, the food stamp unit will include more people than the Part D family unit. USDA finds, however, that about half of elderly people who are eligible for food stamps but do not participate live alone, so in many cases there will be no difference.

Seniors and People With Disabilities Have Low Food Stamp Participation Rates, Despite Being Eligible for Sizable Benefits

Very low-income elderly and individuals with disabilities — those with annual incomes below about 75 percent of the poverty line (which is $6,788 for an individual and $8,554 for a couple) — are fairly well connected to the safety net; they are generally eligible for cash assistance under the Supplemental Security Income (SSI) Program and health coverage under Medicaid. The majority of these very low-income individuals do participate in food stamps.

But low-income elderly and individuals with disabilities with incomes above this level — including many such people who live below the poverty line — generally do not qualify for SSI or Medicaid, and although they are eligible for food stamps, they often are not enrolled. Overall, the program serves only about a quarter of eligible elderly people and just under half of the population of eligible adults with disabilities. In total, USDA estimates that there are over 6 million seniors and adults with disabilities who are eligible for food stamps but do not receive them.[1] Of course, Medicare beneficiaries who are not receiving SSI or Medicaid are the people who will be applying for the Part D benefit through SSA or state or local offices.

For many low-income Medicare beneficiaries, Social Security benefits bring them close to or modestly above the poverty line. For such households who do not have high expenses — for example, because they live in public housing and have no out-of-pocket medical costs — the food stamp benefit for which they qualify can be relatively low, perhaps only $10 a month. If, however, such a household has high shelter expenses, out-of-pocket medical expenses, or dependent care expenses, its monthly food stamp benefit will be significantly higher. The average Social Security recipient who has medical expenses and receives food stamps qualifies for about $50 a month in benefits. A typical household with members who are elderly or disabled and very high deductions can receive close to $90 a month or more in food stamps. Outreach messages that SSA or states use may be more useful if they explain that households with high expenses will qualify for more food stamps.

Current Responsibilities of SSA and States Make Them Appropriate to Play a Role in Enrolling Medicare Beneficiaries in Food Stamps

The states and SSA each currently have responsibilities related to the Food Stamp Program. Although food stamp benefits are 100 percent federally-funded and many of the program's eligibility and benefit rules are set by federal rules, the states have primary responsibility for virtually all aspects of the administration of the program (as they do with Medicaid), including outreach, certification and enrollment, issuance, and on-going case management. States receive a 50 percent federal match for administrative costs related to food

[1] For the Food Stamp Program an individual is considered to be elderly upon turning 60. So this figure somewhat overstates the number who would also be Medicare beneficiaries.

stamps. With only a handful of exceptions, the same local agency or local office that processes Medicaid applications also determines food stamp eligibility.

The Food Stamp Act envisions that SSA will play an important role in informing seniors and people with disabilities about food stamps. Under section 11(j)(1) of the Food Stamp Act, Social Security and SSI applicants and recipients are to be "informed of the availability of a simple application to participate in [the food stamp] program at the social security office." Section 11(j)(2) of the Food Stamp Act further requires SSA to "forward immediately" to state agencies food stamp applications from households where all members are applicants for or receive SSI. Finally, section 11(j)(2)(C) provides that the Secretary of Agriculture will reimburse the Commissioner of Social Security for any costs associated with these activities. To be clear, this means that food stamps, an entitlement with open-ended funding, can fully reimburse SSA for these food stamp-related activities without Congress needing to appropriate additional funds. (See 7 U.S.C. § 2020(j) — attached.)

Unfortunately, to our knowledge, SSA and USDA are largely out of compliance with Section 11(j)(2) of the Food Stamp Act. There is no uniform simple application currently available at social security offices for applicants or recipients to use to apply for food stamps. Not many social security offices make much effort to inform Social Security or SSI applicants about the availability of food stamps. Nationwide, the total amount that SSA received from USDA for these activities was less than $10 million in fiscal year 2003.

One promising exception is the "Combined Application Projects," or CAPs, that have been implemented in four states (Mississippi, New York, South Carolina, and Washington) in the past decade. In the CAP states, for SSI applicants who live alone, SSA provides a shortened food stamp application form with just a couple of additional questions to what the SSI application gathers. Data from the SSA application and interview are transferred to the food stamp agency, and food stamp benefits are determined without the applicant having to take any further action. (See http://www.fns.usda.gov/fsp/government/caps.pdf.) SSA has agreed to allow three additional states (Florida, Massachusetts, and Pennsylvania) to adopt this model but has declined to make the option available nationwide.

B. Comments on Subpart P Section 423.774 and Subpart S Section 423.904

The Part D enrollment process offers an historic opportunity to connect Medicare beneficiaries to food stamps and other assistance programs that might help them make ends meet. We urge you in the final regulation, and through other implementation decisions, to set up an eligibility process for the Part D low-income subsidy that allows low-income Medicare beneficiaries to be enrolled as seamlessly as possible in food stamps, as well as other state- or SSA-administered benefits for which they may qualify. This will require CMS to work collaboratively with SSA, USDA, and state agencies. Below are some specific opportunities that we see.

- **Provide information about food stamps and other major benefits for which applicants may be eligible in any outreach materials that CMS, SSA, and state Medicaid programs design and distribute.** CMS and SSA are planning

large-scale information and outreach efforts in the lead-up to the Medicare drug benefit going into effect. Mailings, on-line resources, and other materials that are made available to low-income Medicare beneficiaries and to groups that work with such beneficiaries could easily include information about the availability of food stamps and how to apply. USDA has developed an on-line prescreening tool at http://209.48.219.49/fns/.

- **Design procedures that allow applications that are filed and other information that applicants provide to be shared between SSA, state agencies, and CMS so that it is available to all agencies.** Such data sharing would allow states to target follow-up outreach to applicants who appear to be eligible for other programs, such as food stamps. For example, states could use the information that applicants provide to them or SSA for the drug benefit to automatically fill out significant sections of a food stamp application. The state could then mail the application to the elderly individual asking him or her simply to fill in the remaining questions and mail the application back, without having to come to the food stamp office.

- **Collaborate with other federal agencies, primarily USDA and SSA, on ways to enroll eligible applicants in all benefit programs.** The three agencies should seek to simplify federal program rules so that low-income Medicare beneficiaries can readily access all programs for which they qualify. A model may be the SSA Combined Application Projects that now operate in a handful of states, where SSI applicants are asked only a couple of additional questions and are certified automatically for food stamps based on their SSI applications. The standardized federal rules under these projects have allowed SSI applicants who live alone to apply for food stamps with significantly less burden than would otherwise be required.

- **Develop coordinated redetermination processes that are as simple as possible for Medicare beneficiaries.** Under the regulation, CMS seems to envision that once the Part D benefit is underway, Medicare beneficiaries will have their eligibility redetermined annually. It appears that a beneficiary who receives a Part D subsidy, is a QMB, and also receives food stamps would have to reapply separately for these three benefits at different times and would potentially have to provide virtually all of the same information to three different entities. This is an unreasonable burden for a poor senior or individual with a disability who may find it difficult and confusing to navigate three separate processes. In addition, this population tends to have relatively stable income and other circumstances. One option would be for SSA and state agencies to renew Part D eligibility based on information the beneficiary has provided for other programs, such as food stamps, if it is current. Many states have successfully used this type of “passive renewal” procedure in their Medicaid and State Children’s Health Insurance Programs (SCHIP).

- **USDA can reimburse SSA for the food stamp program's share of any costs associated with efforts to inform Social Security recipients of the availability of food stamps and other programs.** This could include, for example, outreach mailings to Medicare beneficiaries or costs associated with making computerized information available to states.

II. General Comments on Other Proposed Regulations

A. Comments on Subpart B — Eligibility and Enrollment

Enrollment of Dual Eligibles in Medicare Part D Plans

The proposed regulations fail to address adequately how responsibility for providing drug coverage for the 6.4 million Medicare beneficiaries with full Medicaid coverage (i.e., the full dual eligibles) will be appropriately transferred from Medicaid to Medicare on January 1, 2006. There are issues both of timing and of the mechanics of instituting the enrollment process. The proposed regulations do not adequately address these issues in a way that would ensure that these 6.4 million dually eligible beneficiaries avoid a potential loss of drug benefits or a gap in drug coverage, either of which could have unfortunate health consequences for these individuals.

According to the preamble, automatic enrollment of dual eligibles as required under section 423.34(d) will not begin until the end of the initial enrollment period on May 15, 2006. However, the Medicaid drug benefit for dual eligibles will no longer be available on January 1, 2006. (Federal Medicaid matching funds will no longer be available for providing outpatient drug coverage to the dual eligibles after January 1, 2006.) Given the difficulty of appropriately educating this population about Part D plan choices, it is a near certainty that a substantial number of dual eligibles will face a several month gap in coverage between the end of Medicaid's drug benefit and the scheduled automatic enrollment. This likely scenario would directly contravene Members of Congress' and the Administration's commitment that dual eligibles will be better off under Medicare Part D (or at least not be made worse off). The most appropriate solution would be to delay the cut-off of federal Medicaid matching funds to allow more adequate time to ensure an effective transition of the dual eligibles from Medicaid to the new Medicare Part D benefit. However, that would likely require statutory changes to the MMA. At the very least, CMS needs to encourage large-scale education efforts targeted to the dual eligibles by states and other organizations and allow for an earlier auto-enrollment deadline prior to January 1, 2006 to avoid gaps in coverage for the dual eligibles.

In the preamble, CMS requests comments on whether CMS or the states should perform automatic enrollment of dual eligibles. State officials are familiar with the needs of their dual eligible populations and have more data readily available on the dual eligibles in their state. They also will already be involved in the enrollment process because they are required to perform low-income subsidy enrollment; therefore, we recommend that states have the option of performing automatic enrollment. (We are concerned that under section 1860D-1(b)(1)(C) of the MMA and section 423.34(d)((2) of the proposed regulations, the auto enrollment must be conducted on a random basis, which may limit the ability of states that are conducting this auto

enrollment from moving dual eligibles to the plan that provides the greatest access to drugs. This too may require further statutory changes)

We are also extremely concerned with ensuring continuity of care for dual eligibles who have substantial drug needs. As discussed below in our comments on the need for special open formularies for the dual eligible population, for example, a disproportionate number of dual eligibles struggle with mental illness and need access to a wide variety of medications.

As outlined in the proposed regulations, dual eligibles would be forced to enroll (or be automatically enrolled) in the "benchmark" or average cost plans in their areas because, under the low-income subsidy, they will receive only a premium subsidy up to the cost of the premium for these plans. They will not receive additional premium subsidies for plans with premiums higher than the premium cost of a benchmark plan. The formularies for these plans, however, may not be as comprehensive as the drug coverage that these individuals currently have through Medicaid.

Without access to the coverage they need, dual eligibles may be forced to switch medications. In the treatment of HIV/AIDS, for example, such switches can be highly problematic and potentially deadly. We believe the same is true for a number of other illnesses and categories. Not ensuring continuity of care for prescription drugs for the dual eligibles could increase the costs of their care; dual eligibles with restricted access to drugs could end up requiring expensive services like hospitalization.

The regulations do provide a special enrollment period for full dual eligibles to use "at any time" (section 423.36). However, this provision of the regulations does not adequately address the needs of dual eligibles. There may not be adequate choice of low-cost drug plans in each region, particularly in rural areas which have not had much luck attracting Medicare managed care plans in the past. In addition, the dual eligibles are unlikely to have income or resources to pay the additional premiums (in addition to the low-income subsidy) necessary to enroll in higher cost plans that may have more comprehensive drug coverage and greater access to drugs. Moreover, the special enrollment provisions under section 423.36 do not specify that dual eligibles would not be subject to a late enrollment fee if this complex process of disenrollment and reenrollment results in a gap in coverage of more than 63 days.

In addition, full benefit dual eligibles (and their personal representatives) should receive a notice explaining their right to a special enrollment period both when they enroll in a plan and each time the prescription drug plan changes its coverage in a way that directly affects them, such as removing a drug from its formulary, changing the co-payment tier for a drug, or denying their appeal concerning a non-formulary drug or an effort to change the co-payment tier.

In the preamble to the proposed regulations, CMS points to the exceptions process as a means of securing coverage of off-formulary medications. But the process proposed is extremely complex and will likely be impossible to navigate for people having a psychiatric crisis, facing cognitive impairments, or in the midst of aggressive chemotherapy, to list just a few examples. Moreover, the timelines established are drawn out; an expedited determination could

take as long as two weeks. Drug plans are not required to provide an emergency supply of medications until at least two weeks following a request.

Congress and the Administration have promised that dual eligible beneficiaries would be better off with this new Part D drug benefit (or at least no worse off) than they were receiving drug coverage through Medicaid. To honor this commitment, coverage of medications currently available to dual eligibles and other special populations under Medicaid must be grandfathered into the new Part D benefit just as a number of states (such as Wisconsin, Oregon, Kentucky, Texas and California) have done in implementing preferred drug lists under their Medicaid programs. For dual eligibles (and for others with life-threatening diseases such as HIV/AIDS, mental illness, cancers, and other extreme conditions), Part D plans should be required to cover their existing medications. At a minimum, this protection should be given to dual eligibles, because it is likely to be impossible for dual eligibles to enroll in more generous drug plans by paying supplemental premiums or paying for off-formulary drugs on an out-of-pocket basis.

B. Comments on Subpart C —Benefits and Beneficiary Protections

Special Formulary Protections for Dual Eligibles

Section 423.120(b) outlines the requirements on Part D prescription drug plans and on Medicare Advantage plans for their drug formularies. We strongly support the suggestion in the preamble to the proposed rule that certain populations require special treatment due to their unique medical needs. Such populations include full dual eligibles as well as institutionalized populations, persons with life-threatening conditions, and persons with pharmacologically complex conditions. We believe that to ensure that these special populations have adequate, timely, and appropriate access to medically necessary medications, they must be exempt from all formulary restrictions and must be protected from tiered cost-sharing that could create insurmountable access barriers. We recommend that the final rule provide for alternative, flexible formularies for special populations that include coverage for all FDA-approved covered Part D drugs with a valid prescription. Furthermore, because of the clinical importance of providing access to the specific drugs prescribed, drugs prescribed to these defined populations ought to be made available at the preferred level of cost-sharing for each drug.

In enacting the MMA, Members of Congress and the Administration committed to the principle that dual eligibles (persons eligible both for Medicare and Medicaid) would be better off (or at least not be made worse off) when their coverage for prescription drugs shifted from Medicaid to the new Medicare Part D coverage. Historically, the Medicaid prescription drug benefit has been closely tailored to the poor and generally sicker population it serves, providing beneficiaries with a range of drugs that they need with little or no co-payment. Under section 1927 of the Social Security Act, states that elect to provide prescription drug coverage under their Medicaid programs must cover all FDA-approved drugs from every manufacturer that has entered into an agreement with the Secretary of Health and Human Services to pay rebates to states for the products that the states cover. All drug manufacturers currently participate in the Medicaid rebate program.

Dual eligibles are the most vulnerable Medicare beneficiaries. Dual eligibles are people with disabilities and other serious conditions who tend to need a wide variety of prescription drugs. They are more than twice as likely to be in fair or poor health as other Medicare beneficiaries; they are three times more likely to have problems with Activities of Daily Living (ADLs) as other beneficiaries; and they are ten times more likely to be in a long-term care facility than other beneficiaries. In serving dual eligibles, Medicare prescription drug plans must be able to respond to a range of disabilities and conditions, such as physical impairments and limitations like blindness and spinal cord injury, debilitating psychiatric conditions, and other serious and disabling conditions such as Parkinson's disease and HIV/AIDS. If dual eligibles are not to be worse off when Part D prescription drug coverage begins, then they must have continued access to an alternative and flexible formulary that permits treating physicians to prescribe the full range of FDA-approved medications.

This will particularly be the case for many of the dual eligibles who reside in nursing facilities and other residential facilities. Such institutionalized beneficiaries require access to flexible formularies on the basis of their complex and multiple prescription drug needs.

Moreover, although we recommend that any alternative formulary include access to all FDA-approved medications, if the final rule permits a more restrictive alternative formulary, it should ensure that all drugs included on the formulary of participating Long-Term Care (LTC) pharmacies are included in the plan's formulary, and drugs that are preferred by the LTC pharmacies' formularies should be treated by the plan as a preferred drug. Institutionalized individuals also have little or no capacity to pay cost-sharing for non-preferred drugs or to purchase drugs for which coverage has been denied. It is imperative that any alternative formulary provide strong protections that prevent such individuals from being charged cost-sharing. For dual eligibles who reside in institutions, a condition of eligibility requires them to pledge all but a nominal personal needs allowance, usually $30 per month, to the cost of the institutional care. (We note that individuals who require an institutional level of care but live in the community under home- and community-based Medicaid waivers should have the same special protections as institutionalized beneficiaries because of their similar substantial need for prescription drugs. Otherwise, providing greater access to drugs for institutionalized individuals than to those living in the community would have the adverse effect of reversing the continued progress states have made in moving people from nursing homes to the community setting.)

C. Comments on Subpart P — Premiums and Cost-Sharing Subsidies for Low-Income Individuals

Automatic Eligibility and Enrollment of Dual Eligibles for Low-Income Subsidy

Section 423.773 of the proposed regulations states that both full benefit dual eligibles (as well as Medicare Savings Program beneficiaries, as discussed below) are *eligible* for the additional low income subsidies, but it does not explicitly state that these beneficiaries are to be automatically *enrolled* in the subsidy program. The regulations should clarify that an individual treated as a full subsidy individual (such as a dual eligible or a MSP beneficiary) does not have to take any further action with respect to the subsidy (i.e., to make application or in any other to way verify their status), except to the extent that they need to enroll in a Part D plan. This will

help smooth the transition from Medicaid drug coverage for dual eligibles and should improve participation for others.

Treatment of Resources

Under section 423.772, we support the proposed regulation's limitation of countable resources to liquid assets only. However, the definitions of liquid assets and what it means for an asset to be able to be converted into cash in 20 days need to be clarified. The final rule should enumerate the list of countable resources that constitute liquid assets to promote clarity for states and beneficiaries. The scope of countable liquid assets should be construed narrowly, as experience under the MSP programs shows that assets tests tend to discourage enrollment and raise administrative costs for states. Experience among the states with MSPs has shown that when states waive the assets test or make it more reasonable by excluding, for example, burial plots, burial funds and life insurance from the list of countable assets, enrollment in MSP increases, with the additional costs of enrollment at least partly offset by administrative savings.

Moreover, it is harsh and inappropriate to deny an applicant the low-income drug benefit because the applicant will not liquidate a life insurance policy or burial fund. We are especially troubled by an SSA draft of the application for the low-income subsidy that asks whether an applicant has life insurance with a face value of $1,500 or more. Such a policy should not be acceptable; low-income elderly people and people with disabilities should not be disqualified from the low-income drug benefit because they have a modest life insurance policy that is intended to cover their funeral and burial costs when they die. The Food Stamp Program, for example, entirely excludes the value of a life insurance policy from its asset test. At most, the only part of a life insurance policy that should be considered is the cash surrender value to the extent that the value exceeds some much more reasonable amount, such as $20,000.

In addition, retirement accounts such as a 401(k) plan or IRA should either be fully exempt for all beneficiaries, or fully exempt for disabled Medicare beneficiaries up to age 65, with an assumed annuity value, based on the account, considered as income for all beneficiaries aged 65 and over. If calculating an annuity value would be too complicated, a simplified approach could be used, under which a fixed percentage of such an account is treated as income each year, based on Census (or other official) life expectancy tables. In other words, if a person aged 65 is assumed to live 20 years based on the life expectancy tables, five percent of the amount in the individual's 401 (k) or IRA would be counted as income each year. These accounts would *not* be counted as assets.

This is a much fairer and more rational approach. To count such accounts as assets and disqualify people with modest account balances would undercut efforts to encourage low- and moderate-income people to build some savings that can ease their poverty throughout their old age. Counting these accounts as assets for disabled beneficiaries who are below retirement age also may reduce work incentives. If such accounts are counted as assets, such individuals may be forced to liquidate modest retirement accounts. It would be far better to preserve such accounts so that the prospect of enlarging them if an individual with a disability can return to work may operate as a work incentive.

Counting the amounts in such accounts as assets is inappropriate. Such accounts are supposed to help support these people throughout their old age. Counting such accounts as assets implies that the accounts should be emptied out now to help pay for prescriptions, with the individual then left deeper in poverty for the rest of his or her life.

(Finally, we would note that the draft SSA application contains a problematic and confusing treatment of "annuities," which the application says should be treated as an asset rather than as income. The term "annuity" is popularly used for a range of financial instruments, including "life-time annuities." And an individual with a life-time annuity *no longer owns the underlying assets*. Such an individual has essentially sold the assets to the annuity company in return for a stream of income in the form of a guaranteed monthly payment for the rest of the individual's life. In these cases, it is wholly inappropriate to count the value of the underlying assets against the asset test; the individual no longer owns the assets and has no legal access to them. Furthermore, in these cases, the monthly payments that such an individual receives from the annuity company clearly ought to be counted as income. The draft SSA application is likely to lead to confusion and erroneous determinations in this area.)

Treatment of MSP Beneficiaries by SSA

We strongly support the decision reflected in section 423.773(c) to deem Medicare Savings Program ("MSP") beneficiaries automatically eligible for the low-income subsidy. This would greatly ease the administrative burden on states and SSA while also ensuring that many more MSP beneficiaries enroll in the low-income subsidy.

We are concerned, however, that MSP beneficiaries are likely to be treated differently depending on whether they apply for the low-income subsidy through Medicaid or through a SSA office. Inequities and confusion among beneficiaries may result because SSA would apply its standard for assets which may be less generous than the asset eligibility rules for MSPs in place in some states. For example, Alabama, Arizona, Delaware, and Mississippi have eliminated the assets test under the MSP programs. Eligibility requirements for the low-income subsidy should be as generous at the SSA office for subsidy-eligible individuals as at a Medicaid office, regardless of where and how people apply within the same state. Under the proposed rules, in states that have adopted less restrictive asset methodologies, people whose assets are slightly above the limits set in section 423.773 would likely be enrolled in a less generous subsidy, or have their application rejected entirely, if they apply directly through SSA, because SSA will apply the national guidelines proposed in section 423.773. However, the same people would have their application accepted if they applied through their states' Medicaid offices, were screened and then enrolled in an MSP, and were then automatically eligible for the low-income subsidy.

To resolve this problem, we propose that SSA should apply state-specific asset eligibility rules in determining eligibility for the low-income subsidy when they are more generous than under the national standard, an option discussed, though rejected, in the preamble at page 46,727. This means that for applicants from states that have eliminated the asset test or have more generous disregards under section 1902(r)(2) of the Social Security Act for MSP eligibility, SSA should apply the state's more generous rules to determine eligibility if applicable. This option is

permitted under Section 1860D-14(a)(3)(E)(iv) of the statute. (We note that the statute should be amended to allow SSA to also apply state-specific income eligibility rules when they are more generous as well.)

The regulations should also provide that subsidy applicants who appear to have excess assets *or* incomes either be screened by SSA for eligibility in an MSP program or have their applications forwarded to the state Medicaid agency to be screened for MSP eligibility. States would be precluded from requiring beneficiaries to resubmit information, such as income and asset levels, that they have already provided to SSA. Applicants would be enrolled in the appropriate MSP program, be deemed automatically eligible for the low-income subsidy under section 423.773(c) and then be enrolled in the appropriate low-income subsidy. Adopting this policy, which is not precluded by the statute, will ensure that all subsidy applicants are treated equitably and in a manner most favorable to the applicants, as well as increase participation in MSPs.

As part of this policy, the low-income subsidy application should allow an applicant to opt out of screening and enrollment for an MSP, as it is possible that a few applicants may not wish to participate in an MSP. Under Section 1860D-14(a)(3)(v)(II) of the statute, beneficiaries who are determined eligible for MSPs may be enrolled in the low-income subsidy. There is no requirement that beneficiaries actually enroll in an MSP. Therefore, applicants who meet the eligibility requirements for an MSP but who decline to enroll in the program should still be made automatically eligible for the low-income subsidy.

Because enrollment in an MSP can affect the amount of assistance a beneficiary may receive through other public assistance program, such as Section 8 housing vouchers or food stamps, there will be a profound need for beneficiary counseling during the enrollment process. We recommend that CMS plan for this need by making funds available to local agencies, including state health insurance assistance programs (SHIPs) and other community-based organizations.

In addition, we suggest that states not be permitted to pursue estate recoveries against MSP beneficiaries. Such recoveries are not cost-effective but can deter beneficiaries from enrolling. Any information provided to beneficiaries about MSP enrollment should tell applicants whether they will be subject to estate recovery if they enroll in an MSP. We include the same suggestion in our comments to section 423.904(c) discussed below.

D. Comments on Subpart S — Special Rules for States — Eligibility Determinations for Subsidies and General Payment Provisions

State Medicaid Screening for Medicare Savings Programs

We believe that section 423.904(c) of the proposed regulations regarding states' obligations to screen subsidy applicants and offer them enrollment in MSPs is inadequate. In particular, proposed section 423.904(c)(2) should specify what "offer enrollment" means. We believe an applicant must be offered the opportunity to enroll during the same visit or contact (in office, by phone, or by mail), without providing further documentation or completing additional

forms. Only if enrollment is easy and convenient would Congress's intent of increasing participation in MSPs be accomplished. Furthermore, because enrollment in an MSP may be the only entry into the subsidy for some low-income beneficiaries, a simple and easy application for MSP programs is essential.

As written, section 423.904(c) would permit states to say they have "offered enrollment" if they tell applicants that they might be eligible for an MSP and can return another time to complete another application form if they wish to apply. Such an outcome would defeat the purpose of the screen-and-enroll provision included in the new Section 1935(a)(3) of the Social Security Act that was established in Section 103(a) of the statute. The low-income subsidy application should include an "opt-out" provision, under which qualified applicants would be enrolled in an MSP unless they affirmatively decline to do so. This provision would make enrollment in an MSP another way to qualify for the low-income subsidy.

Moreover, it is critical that state Medicaid offices provide good quality counseling to applicants, including their potential eligibility for other benefits such as MSPs. In addition, to ensure that enrollment requirements between MSPs and the low-income subsidy are aligned, states should not be permitted to pursue estate recoveries against MSP beneficiaries. Such recoveries are not cost-effective and can deter beneficiaries from enrolling. Any information provided to beneficiaries about MSP enrollment should tell applicants whether they will be subject to estate recovery if they enroll in an MSP.

In the interest of further aligning eligibility rules for MSPs and the low-income subsidy and easing administrative burdens, we suggest that CMS should direct states to apply the definitions of resources used in Subpart P, section 423.772, if they are more generous than the MSP standards used in the individual state, in making their resource determinations for MSP applicants.

In addition, should CMS adopt a policy, as has been discussed publicly, under which most subsidy applications to state Medicaid agencies would simply be forwarded to SSA for the actual eligibility determination for the low-income subsidy, the regulations should be clear that screening for MSP eligibility must take place prior to the transmittal of the applications to SSA. Potential beneficiaries should not have to wait to be screened and offered enrollment in MSPs until after SSA processes their low-income subsidy application and provides such information back to the state Medicaid offices (if SSA in fact does so). Furthermore, an individual cannot be told by either SSA or the state that she or he is ineligible for the low-income subsidy until MSP eligibility has been determined (if the individual wishes). It would be highly problematic for an individual to receive a notice from SSA that he or she is ineligible for the low-income subsidy, have her MSP eligibility determined by the state, and then receive a notice from the state that she is eligible for both MSP and the subsidy. Alternatively, the individual may be found ineligible for the low-income subsidy by SSA and subsequently enrolled in a MSP but never redetermined for eligibility for the low-income subsidy. Whatever the mechanics, the individual must be told that MSPs are a route to subsidy eligibility.

Finally, SSA should also screen subsidy applicants for eligibility in MSPs and develop a system with states to enroll eligible beneficiaries. SSA should use the income and resource

disregards used by the state for MSPs, if they are more generous than under the uniform national definition. Applicants should not miss out on the opportunity to enroll in MSPs simply because they apply through SSA rather than state Medicaid offices. The same concerns about beneficiary education and estate recovery discussed above would apply to enrollment through SSA.

State Medicaid Screening and Enrollment for Full Medicaid

We believe that the regulations should also ensure that beneficiaries are screened not only for MSPs but also for eligibility for full Medicaid and offered enrollment if they qualify, consistent with 42 C.F.R. § 435.404. Ideally, all subsidy applicants would be screened for full Medicaid and offered enrollment if they qualify (similar to current screen-and-enroll procedures under the State Children's Health Insurance Program described in 42 C.F.R. § 457.350, and in particular for states that use separate SCHIP applications as described in 42 C.F.R. § 457.350(f)(3)). Because the importance of maintaining a simple application process for the low-income subsidy is paramount, CMS may wish to consider using a simple screening process based on information obtained through the subsidy application. This screening would trigger a follow-up with applicants who appear to be eligible for full Medicaid.

ATTACHMENT
Food Stamp Act [7 U.S.C. § 2020(j)] on SSA's responsibilities

Section 11(j) of the Food Stamp Act:

(1) Any individual who is an applicant for or recipient of supplemental security income or social security benefits (under regulations prescribed by the Secretary in conjunction with the Commissioner of Social Security) shall be informed of the availability of benefits under the food stamp program and informed of the availability of a simple application to participate in such program at the social security office.
(2) The Secretary and the Commissioner of Social Security shall revise the memorandum of understanding in effect on the date of enactment of the Food Security Act of 1985, regarding services to be provided in social security offices under this subsection and subsection (i), in a manner to ensure that—
(A) applicants for and recipients of social security benefits are adequately notified in social security offices that assistance may be available to them under this Act;
(B) applications for assistance under this Act from households in which all members are applicants for or recipients of supplemental security income will be forwarded immediately to the State agency in an efficient and timely manner; and
(C) the Commissioner of Social Security receives from the Secretary reimbursement for costs incurred to provide such services.

Issue Areas/Comments

GENERAL

GENERAL

Thank you for the opportunity to comment on the Medicare Part D proposed rules. The Medicare Drug Program is a very complex program with significant ramifications for a large number of vulnerable Missourians. The Missouri Department of Social Services (DSS) urges the Centers for Medicare and Medicaid Services (CMS) issue the next version of these regulations in a format that will allow one more round of comment, even if it is a shortened comment period. We are concerned that failure to provide for additional public input when the regulation is more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

Attention: CMS–4068–P

Thank you for the opportunity to comment on the Medicare Part D proposed rules. The Medicare Drug Program is a very complex program with significant ramifications for a large number of vulnerable Missourians. The Missouri Department of Social Services (DSS) urges the Centers for Medicare and Medicaid Services (CMS) issue the next version of these regulations in a format that will allow one more round of comment, even if it is a shortened comment period. We are concerned that failure to provide for additional public input when the regulation is more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

Enrollment Process

General

Missouri is concerned that the under the proposed Medicare Part D rule automatic enrollment of full benefit dual eligibles might not occur until May 15, 2006. This would cause dual eligibles active on January 1, 2006 who do not voluntarily enroll in Medicare Part D to go as long as five and a half months without prescription drug coverage. Many of the individuals who have been long time Medicaid recipients may be confused by the voluntary enrollment process and fail to enroll by January 1, 2006. Medicare's experience with the drug discount card has demonstrated that vulnerable populations often will not enroll on their own initiative in a program such as the Part D benefit, despite the advantages of the benefit being offered. Leaving dual eligibles with no coverage seems in conflict with the purpose of the Medicare Modernization Act (MMA). Automatically enrolling the full benefit dual eligibles prior to January 1, 2006 would not allow much opportunity to select a plan; however, this is preferable to having no coverage. Intermittent eligibility in Medicaid programs may further

complicate the transition to Part D and disrupt access to prescription drugs. Unique Medicaid "spenddown" or "medically needy" programs operate in 39 states. These programs allow people with high medical costs, including nursing home residents, to qualify for Medicaid by spending their income and resources down to a state-defined medical assistance eligibility level. In many cases, an individual may begin a month with a pension check or other source of income that makes them ineligible for Medicaid for the first part of the month, but once that income is put toward the cost of their care (that is, spent down), they become eligible for the remainder of the month. Depending on the spenddown period designed by the state, individuals can cycle on and off of Medicaid eligibility on as often as a monthly basis. This intermittent eligibility will significantly complicate the initial education and enrollment process and must be factored into continuing administrative and policy decisions for states, the federal government, and providers of prescription drug benefits.

Accordingly, Missouri seeks amendment to both §423.34(b) and §423.42(a) in order to clarify that a state may assist an individual with completion of the individual's Private Prescription Drug Plan (PDP) application, including executing the application on the individual's behalf, or may otherwise assist an individual in the Part D enrollment process as long as the individual is provided an opportunity to decline this assistance or "opt out" of any available PDP. Another option CMS should consider is allowing full benefit dual eligibles not enrolled in Part D to continue to receive prescription drug coverage under Medicaid with Federal Financial Participation (FFP) until the automatic enrollment date.

B. Eligibility and Enrollment (Federal Register page 46637)

2. Part D Enrollment Process (§423.34) (Federal Register page 46639)

CMS: *In implementing the automatic enrollment process for full benefit dual eligible individuals, we are considering which entity is best suited to perform the automatic and random enrollment function. We invite comment on the most appropriate method of performing automatic assignment of dual eligibles and the appropriate entity to do so.*

DSS Comments: The Missouri Department of Social Services believes automatic enrollment of full benefit dual eligibles can be handled most efficiently by the states if CMS is able to provide up-to-date information on persons currently enrolled in Medicare Part D. Having the states be responsible for performing the automatic enrollment would allow for the shortest period of time between the Medicaid approval and enrollment in Part D. DSS is concerned that the administrative cost of requiring the states to do the automatic enrollment would be an unfunded mandate. The preamble mentions compensating the states through FFP for administrative expenses or through contractual or other arrangements. Since the cost to develop a

system for automatic enrollment may be extensive, DSS feels states should receive more than the current administrative match for assuming this burden to meet this "new national workload of indeterminate size."

4. Effective Dates of Coverage and Change of Coverage (§423.38)

c. Special Enrollment Period (Federal Register page 46641)

CMS: *The rule states that for special enrollment periods, the effective date of the enrollment will be determined by CMS.*

DSS Comments: CMS should make the effective date of enrollment in Part D retroactive to the date the person's Medicaid was effective and they became a full benefit dual eligible. If the enrollment in Part D is not retroactive to the date Medicaid eligibility began, full benefit dual eligibles will have no prescription drug benefit during the prior quarter coverage. Longstanding Missouri statute requires that medical assistance (Medicaid) is only paid during such times as grants-in-aid (FFP) is provided or made available to the state.

Subpart P: Premiums and Cost-Sharing Subsidies for Low-Income Individuals (Federal Register page 46725)

2. Eligibility Determinations, Redeterminations and Applications (§423.774) (Federal Register pages 46727-46728)

CMS: *We invite comments on state Medicaid agency procedures how to best implement the determination, redetermination, and appeal process.*

DSS Comments: Section 1860D-14(a)(3)(B)(i) of the Act and the proposed 423.774 both say that determinations of eligibility for the subsidies are made by the state Medicaid agency or Social Security Administration (SSA). Our initial interpretation of this was that both agencies were required to make determinations and the Medicare recipient was free to choose which to apply with. However, it has come to our attention that SSA is proposing that the states can comply by taking applications and submitting them to SSA for the eligibility determination. This appears to conflict with Section 1935 of the Act and the proposed 423.904 that require the state Medicaid agency to make determinations of eligibility for the subsidies. If CMS believes that a state Medicaid agency can meet the requirements of both Sections 1860D-14(a)(3)(B)(i) and 1935 by taking applications and submitting them to SSA, that should be clarified in the regulations. The regulation should be clear on what obligation a state choosing this option has for keeping track of what applications were submitted and what happened to them.

The regulations do not specify the time standards within which an eligibility determination must be completed. Would the state Medicaid agency be required to complete determinations within 45 days as is required for most Medicaid eligibility determinations under 42 CFR 435.911? The regulations should specify a time standard that would apply to determinations made either by the state or SSA.

Subpart S: Special Rules for States – Eligibility Determinations for Low-Income Subsidies and General Payment Provisions (Federal Register page 46861)

CMS: *Each of the 50 states and the District of Columbia is required to provide for payment to the Secretary a phased-down contribution to defray a portion of the Medicare drug expenditures for individuals whose projected Medicaid drug coverage is assumed by Medicare Part D.*

DSS Comments: The regulations in Subpart S provide an overview of the clawback (phased-down state contribution) calculation, but it lacks the specifics for the states to estimate the clawback. The comments provided are based somewhat on information provided in conference calls attended by CMS.

The clawback is based on expenditures in calendar year 2003. The base year expenditures are trended based on National Health Expenditure (NHE) trends. The NHE trends are significantly higher than the actual increase experienced by the state. Therefore, the state will be paying a higher clawback and is further impacted since the state will continue to pay this "higher rate" for the life of the Medicare Modernization Act. Based on the last couple of years, it is also highly likely that the NHE trend will be higher than the trend experienced in Missouri Medicaid. This difference will also result in a higher clawback payment from the state.

The rebate adjustment factor is based on the pharmacy expenditures and rebates collected for the same period of time through the CMS-64 reports. When reporting these quarterly, the rebates will lag six months behind the expenditures due to the rebate process. The rebate adjustment factor artificially reduces the actual percent of rebate that is collected, which, in turn, results in a higher clawback that the state will be paying monthly to eternity. A more appropriate rebate adjustment factor would be the expenditures for calendar year 2003 and rebates collected for July 2003 – June 2004.

The clawback calculation apparently does not allow for adjustments. Missouri is a "Pay and Chase" state for pharmacy claims. Since there are no provisions for these collections in the clawback calculation, the gross per capita spent is artificially high, resulting in a higher clawback payment for Missouri. The clawback calculation also does not take into account that Medicaid recipients in calendar year 2003 were the beneficiaries of a drug

formulary that contained more drugs than they may have access to under a PDP. The clawback calculation does not allow adjustment for the more restrictive drug formulary.

Involuntary Disenrollment of Beneficiary by the PDPs (§423.44) Federal Register page 46641

CMS: *The proposed rule provides that PDPs may disenroll individuals whose behavior is disruptive.*

DSS Comments: The Department of Social Services has concerns regarding provisions in the proposed regulations to allow Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening." These provisions create enormous opportunities for discrimination against individuals with mental illnesses, Alzheimer's, and other cognitive conditions. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and as a result, they could also be subject to a late enrollment penalty, increasing their premiums for the rest of their lives. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage.

Under the MMA, section 1860D-1(b) directs the Secretary to establish a disenrollment process for PDPs using rules similar to a specific list of rules for the MA program. This list does not include reference to section 1851(g)(3)(B) of the Social Security Act which authorizes MA plans to disenroll beneficiaries for disruptive behavior.

Therefore, this provision regarding disenrollment of individuals by the PDP for disruptive behavior should be eliminated entirely or there should be a heightened standard for involuntary disenrollment of dual eligibles with mental health issues. There should also be expansion of the "special enrollment exceptions" for individuals disenrolled by a PDP (such as, for disruptive behavior) so that the individual will have an opportunity to join another PDP and continue with necessary medications. These "special enrollment exceptions" are necessary given the high risk of discrimination presented by the provisions for involuntary disenrollment. CMS should provide a special enrollment period for beneficiaries involuntarily disenrolled. It should include a reasonable time period for plan selection and be exempt from late enrollment penalties. Dual eligible beneficiaries who are involuntary disenrolled will face significant hardship because the Missouri Medicaid program will no longer be able to cover prescription drugs if there is no FFP.

Access to Covered Part D Drugs (§423.120) (Federal Register page 46655)

b. Formulary Requirements (Federal Register page 46659)

CMS: *To the extent that a PDP sponsored or MA organization uses a formulary to provide qualified prescription drug coverage to Part D enrollees, it would be required to meet the requirements of §423.120(b)(1) and section 1860D–4(b)(3)(A) of the Act to use a pharmaceutical and therapeutic (P&T) committee to develop and review that formulary. As a note of clarification, we interpret the requirement at section 1860D–4(b)(3)(A) of the Act that a formulary be ''developed and reviewed'' by a P&T committee as requiring that a P&T committee's decisions regarding the plan's formulary be binding on the plan. However, we request comments on this interpretation. In addition, it is our expectation that P&T committees will be involved in designing formulary tiers and any clinical programs implemented to encourage the use of preferred drugs (e.g., prior authorization, step therapy, generics programs).*

DSS Comments: Continuity of pharmaceutical treatment is of great importance to effective disease management and appropriate healthcare. As the proposed regulations themselves seem to acknowledge, PDP formularies must be developed with appropriate consideration of the point that – especially for older individuals – it is often therapeutically counter-productive, or even dangerous, to abruptly change medications. Accordingly, we believe that coordination of formulary development between State Pharmaceutical Assistance Programs (SPAP) and PDPs is especially important and should be expressly encouraged by the Part D rules.

As we understand the CMS proposal, CMS expects that the model categories and classes developed by United States Pharmacopeia (USP) will be defined so that each includes at least one drug that is approved by the Food and Drug Administration (FDA) for the indication(s) in the category or class. That is, no category or class would be created for which there is no FDA approved drug and which would therefore have to include a drug based on its "off label" indication. While DSS generally approves of the process being utilized by USP we point out an inherent flaw in the decision that, in some cases, only one drug approved in a given therapeutic class will be included in the formulary. In the case of many drugs that require lengthy periods to determine "stable" doses, abruptly changing a beneficiary's medicines in order to ensure reimbursement as a covered Part D drug could have serious consequences to that individual's health and welfare. Such negative outcomes are especially likely in the case of psychotropic compounds.

Moreover, we believe that any established formulary exceptions criteria must be flexible enough to take into account the actual circumstances of a particular beneficiary. The Secretary should provide a guideline to Medicare Advantage Prescription Drug (MA-PD) plans, as well as stand-alone

prescription drug plans, that requires such flexibility. In addition, anything less than a comprehensive formulary should be considered when calculating the state's "phase down/clawback" payment since Missouri had a non-scaled down formulary Missouri does not believe it should pay clawback/phase down for a more restricted drug formulary.

C. Voluntary Prescription Drug Benefit and Beneficiary Protections (Federal Register page 46646)

1. Overview and Definitions (§423.100) (Federal Register page 46646)

c. Long-Term Care Facility (Federal Register page 46648)

CMS: *We request comments regarding our definition of the term long-term care facility in §423.100, which we have interpreted to mean a skilled nursing facility, as defined in section 1819(a) of the Act, or a nursing facility, as defined in section 1919(a) of the Act. We are particularly interested in whether intermediate care facilities for the mentally retarded (ICF/MRs) or related conditions, described in §440.150, should explicitly be included in this definition given Medicare's special coverage related to mentally retarded individuals. It is our understanding that there may be individuals residing in these facilities who are dually eligible for Medicaid and Medicare. Given that payment for covered Part D drugs formerly covered by Medicaid will shift to Part D of Medicare, individuals at these facilities will need to be assured access to covered Part D drugs. Our proposed definition limits our definition to skilled nursing and nursing facilities because it is our understanding that only those facilities are bound to Medicare conditions of participation that result in exclusive contracts between long-term care facilities and long-term care pharmacies. However, to the extent that ICF/MRs and other types of facilities exclusively contract with long-term care pharmacies in a manner similar to skilled nursing and nursing facilities, we would consider modifying this definition.*

DSS Comments: As a result of the Olmstead decision, states have been moving seniors and persons with SSI benefits from institutions into less restrictive placements. These placements include ICF/MR facilities for the disabled, community care, and assisted living facilities for the aged. In addition to these less restrictive institutional settings, states have implemented waiver programs for home and community based care as an alternative to placement in a nursing home. Medicare beneficiaries spend down their assets until they are forced into nursing homes. These alternatives provide Medicare eligible beneficiaries with a choice of placement. Exclusive contracts with a long term care pharmacy should not be the deciding factor on whether or not to extend the definition of long term care facility to other forms of housing other than traditional nursing homes; the beneficiaries' qualification for Medicare and their placement should be the deciding factor. States can identify Medicare eligible individuals who were

institutionalized, and can also identify those individuals that, if it were not for the Olmstead decision or an 1115 waiver, would be institutionalized. These individuals are low income Medicare beneficiaries; having a Medicare prescription benefit at no cost will allow their income to be used for daily living expenses and not on prescriptions.

Therefore, we recommend that the final rule include a definition of "long-term care facility" that explicitly includes intermediate care facilities for persons with mental retardation and related conditions and assisted living facilities. We believe that many mid to large size ICF/MRs and some assisted living facilities operate exclusive contracts with long-term care pharmacies.

3. Establishment of Prescription Drug Plan Service Areas (§423.112) (Federal Register page 46655)

CMS: *We intend to initially designate both PDP and MA regions by January 1, 2005. In accordance with section 1858(a)(2)(C)(i) of the Act, there will be between 10 and 50 PDP regions within the 50 States and the District of Columbia and at least one PDP region covering the United States territories. The PDP regions, like the MA regions, will become operational in January 2006.*

DSS Comments: The State of Missouri believes that the establishment of PDP regions consistent with MA regions (as described in proposed §422.55) is of far less importance than establishing PDP regions that are defined by individual state boundaries. It is critical to a number of operational aspects of Part D benefits administration that each state should be a separate PDP region. As the proposed rule seems to acknowledge, existing SPAPs will play a critical role in coordinating benefits with the PDPs for the most vulnerable populations to be served under the Part D program, as well as in providing "wrap-around" coverage for beneficiaries within these populations. The administrative complexities and burden of effectuating these goals will be enormously – and unnecessarily – increased to the extent that the boundaries of PDP regions are not consistent with the state boundaries defining the relevant SPAP service areas.

6. Coordination of Benefits with Other Providers of Prescription Drug Coverage (Federal Register page 46700)

a. Coordination with SPAPs (State Pharmaceutical Assistance Programs) (Federal Register page 46701)

CMS: Our goal is to make the coordination of benefits process as functional for the beneficiary, pharmacy, and states as possible.

DSS Comments: SPAPs are prohibited from encouraging enrollees to join a particular PDP, and the law and regulatory language prohibits SPAPs

from discriminating based on the PDP in which the beneficiary is enrolled. The federal law does not prohibit a state from providing consumer advice to its citizens as to which plan might work best with a SPAP, which plan offers the best value, etc. Given the intense need for consumer assistance, we urge that the regulation either be silent on the issue or that the regulation actually encourage the states to help their citizens with the many difficult choices and questions they will be facing.

The proposed regulation portrays a much broader and very different non-discrimination rule than is contained in the statute, and is inconsistent with the express statutory language establishing limitations on that rule Under the statute's express language, a qualifying SPAP would quite plainly be permitted to encourage beneficiaries to enroll in a "preferred" PDP by any otherwise legal means that does not constitute disparate treatment of individuals in respect to determinations of eligibility for, or the amount of, assistance. In other words, while a Part D qualifying SPAP would be required to provide the same amount of "wrap-around" coverage to an individual in an alternative plan as would be provided to the individual if enrolled in a "preferred" PDP designated by the SPAP, this would not prevent the SPAP from implementing a preference for a given PDP through other means. CMS, in its proposed regulations, has rewritten this statutory rule so as apparently to prohibit *any* kind of SPAP activity that might grant preference to a given PDP or steer beneficiaries to a particular PDP; the law does not permit this substitution of agency policy for clearly expressed legislative intent.

The final regulations should include a revision of Section 423.464(e)(1)(ii) so that the rule conforms to the express language and intent of Congress in prohibiting qualifying Part D SPAPs from employing determinations of beneficiaries' eligibility or amount of benefits to favor one PDP over another; but the CMS regulations may not validly expand this statutory rule to preclude any preferential treatment of a PDP by an SPAP.

Subpart J: Coordination Under Part D Plans With Other Prescription Drug Coverage (Federal Register page 46696)

6b. Coordination With Other Prescription Drug Coverage (Federal Register page 46702)

CMS: *Comments requested regarding situations that might involve coordination between states and PDPs.*

DSS Comments: Case management services for our elderly and disabled full benefit dual eligible require the identification of prescription drugs being used by the client. We cannot rely on the patient's information, as they might not be capable of recalling all drugs they are currently using. To be effective in providing the best care to these individuals, their adjudicated drug claims data would be vital. We would expect to see these claims "crossover" to the state from CMS just as fee for service Medicare

claims do presently. The state would not want to set up data exchanges with every PDP versus one with CMS.

6c. Coordination of Benefits (Federal Register pages 46702-46703)

1.a. Covered Part D Drug (Federal Register page 46646-46647)

CMS: *Comments requested concerning gaps that may exist in the combined Medicare Part B and D coverage package.*

DSS Comments: Many of Missouri's full benefit dual eligibles do not have Part B coverage. Missouri is a 209b state and has different eligibility guidelines. These individuals would obtain their Part B covered drugs from Medicaid under the current system. Under the MMA, these drugs would not be covered under the Part D program as they are covered under the Part B. However, since the client does not have Part B but does have Part D (dual eligible), these drugs could not be covered by Medicaid. Interpretation of the law in this manner will limit the access to care these individuals should have available to them.

On page 46703 of the Federal Register it states, "We interpret the definition of covered Part D drug to exclude coverage under Part D for drugs otherwise covered and available under Parts A or B for individuals who choose not to enroll in either program. We interpret the words payment is available to mean that payment would be available to any individual who could sign up for A or B, regardless of whether they are actually enrolled." Thus, for all Part D individuals, Part A drugs and Part B drugs are "available" if they choose to pay the appropriate premiums. Consequently, Part D would not be required to pay for drugs covered under Parts A and B on the basis of a Part D eligible individual's status regardless whether the beneficiary is receiving Part A or B." For Medicaid recipients who are not eligible for Part A but could be enrolled in Part B if they choose to do so through the state buy-in program but do not take advantage of this offer, can their prescription drugs be covered by Medicaid with FFP? If not, dual eligibles will be receiving a lesser pharmacy benefit than they do currently. Our full benefit dual eligible population is accustomed to accessing drugs that are necessary to their health. Medicare's criteria for coverage of Part B drugs is much more restrictive than other insurance entities and/or Medicaid. Who would be responsible for payment if a dual eligible obtains a Part B covered drug as part of a recognized treatment plan by sources other than Medicare, the drug is rejected as non-covered by Medicare Part B using Medicare criteria, and it does not become a Part D drug? Will the beneficiary have to assume liability for their drugs? Would this become a non-covered Medicare drug payable by Medicaid at the normal federal match based on Medicaid coverage criteria? How would such a determination be made and relayed to the state and the provider? Could a process in which "exceptions" are processed for these drugs be implemented? An appeals process could be dangerous to the health of an individual who has relied on these drugs for successful treatments.

Those involved in such scenarios may be very physically or mentally ill and may not have the ability or resources to pursue the appeal process.

6.d. Collection of Data on Third Party Coverage (Federal Register page 46704)

CMS: *Comments on collection of third-party data.*

DSS Comments: The status of third party payer can change many times. Pharmacies will contact health insurance companies and Medicaid agencies now if they have discrepancies with eligibility data at the point of sale. To have them contact the disputed coverage entity should be no greater demand on their resources than they have now. This data would then be fed back to the PDPs through the coordination of benefits process who would send it to CMS for updated records.

The original collection of such data should be incorporated into the application process just as it is with the Medicaid eligibility determination process. This would require mandatory release of information by the beneficiary.

C. Voluntary Prescription Drug Benefit and Beneficiary Protections

b. Dispensing Fees (Federal Register page 46647)

CMS: *We invite comments on three different options for the term dispensing fee.*

DSS Comments: The Department of Social Services believes that option 1 is the best interpretation of dispensing fee. Any supplies and equipment needed for the administration of the medication and any cognitive services should be reimbursed separately.

Subpart M: Grievances, Coverage Determinations, Reconsiderations and Appeals (Federal Register, page 46717)

Coverage Determination (§423.566 through §423.576)

CMS: *The PDP sponsor must make its expedited determination and notify the enrollee and the prescribing physician as expeditiously as the enrollee's health condition requires, but no later than 72 hours after receiving the request.*

DSS Comments: Currently Medicaid recipients whose prescription requests are not being honored receive a 72-hour supply of medications pending the initial coverage request. They are entitled to notice, face-to-face

hearings, and aid paid pending an appeal if their request is denied and they file their appeal within a specified time frame. All state Medicaid appeals processes are completed more expeditiously than Medicare appeals. The appeals process as described in Subpart M does not accord dual eligible and other Part D enrollees with adequate notice of the reasons for the denial and their appeal rights, with an adequate opportunity to a face-to-face hearing with an impartial trier of fact, with an adequate opportunity to have access to care pending resolution of the appeal, or with a timely process for resolving disputes.

The Missouri Department of Social Services appreciates the opportunity to submit comments on the Proposed Rule for the Medicare Prescription Drug Benefit. We welcome questions you may have or comments you may wish to discuss. Please contact Christine Rackers, Director, Division of Medical Services, at 573/751-6922.

Sincerely,

Steve Roling
Director

Comments on the Proposed Rule Concerning the Medicare Prescription Drug Benefit

Dear Dr. McClellan,

Thank you for the opportunity to comment on the proposed rules regarding the Medicare Prescription Drug benefit. Within the Ohio Department of Job and Family Services, the Office of Ohio Health Plans administers Ohio Medicaid, the Medicare Premium Assistance Program, and the Ohio Disability Medical Assistance Program. Collectively, these programs cover 1.7 million Ohioans, including more than 200,000 Medicare beneficiaries.

Preserving access to prescription drugs for dual Medicare-Medicaid eligible beneficiaries ("dual eligibles") should be a priority for CMS. In Ohio, as in many states, dual eligibles have access to an open formulary, including many of the "Medicaid-optional" drugs that may not be covered by Medicare Part D (over-the-counter drugs, barbiturates, benzodiazepines, and vitamins). In addition, Ohio Medicaid consumers receive their prescriptions with zero out-of-pocket cost, except when drugs require prior authorization. For our most fragile residents, the benefit proposed in the Medicare Modernization Act (MMA) will replace a comprehensive, zero out-of-pocket plan with a more limited plan which will require out-of-pocket costs that may prohibit indigent Medicare beneficiaries from getting their prescriptions.

Access to prescriptions for Medicare beneficiaries receiving long-term care (LTC) is vitally important. Both patients living in LTC facilities and those receiving services through Medicaid home and community-based waivers should be included in this category. Access to a LTC pharmacy provider through the Prescription Drug Plan (PDP) or Medicare Advantage

Prescription Drug (MA-PD) plan, and appropriate formulary drugs including infusion therapy, are critically important for this population.

MMA requires the states to pay a phased-down state contribution toward the prescription costs of dual eligibles. The calculation of this "clawback" as set out in the proposed rule does not accurately represent the actual costs to either Medicare or to the state in providing this prescription benefit. While CMS staff have indicated that the MMA limits the information used to calculate the payment, Section 1935(c)(3) of the Social Security Act as amended by the MMA states that the Secretary may use "other data" to determine the appropriate amount. Ohio believes that this language allows more information to be used that may more accurately represent the actual costs that states would have incurred for prescription drugs for dual eligibles in the absence of Medicare Part D.

Subpart B: Eligibility and Enrollment

Section II.B.2 of the preamble referring to **Section 423.34(d)** of the proposed regulations discusses the process for auto-enrollment of full-benefit dual eligibles, and solicits comment regarding whether the federal government (CMS or its contractor) or the States (or their contracted entities) should have responsibility for administering the "random" automatic enrollment process for full benefit dual-eligible individuals who do not otherwise enroll in an MA-PD or PDP. Ohio strongly opposes this additional administrative burden, which CMS accurately describes as "a new national workload of indeterminate size," on the States. The governing legislation is clear that this responsibility should fall upon the federal government. Section 1860D-1(b)(1)(C) of the Act directs that, if there is more than one prescription drug plan available to a full-benefit dual eligible individual who has failed to enroll in a PDP or MA-PD plan, "*[t]he Secretary* shall enroll such an individual on a random basis among all such plans in the PDP region" (emphasis added).

Given this express designation of responsibility, neither the Secretary nor CMS has authority to impose responsibility for the auto-enrollment function on the States. The preamble to the proposed rule suggests that administrative costs of auto-enrollment activities by the states might have to be borne, at least in some substantial part, by the States themselves. Moreover, even if administrative costs of carrying out this function were to be 100% federally reimbursed (as would be more appropriate, given that the Part D program falls within the federal Medicare program, not the joint state/federal Medicaid program), it would nevertheless constitute a substantial, additional administrative burden on the States that they are not equipped to perform.

As the preamble to the proposed regulation acknowledges, CMS' assumption of the auto-enrollment responsibility will further the goals of national uniformity in, and facilitate federal oversight over, the process. Auto-enrollment will require accurate and timely information flow between CMS and the States in any event. There is no reason to assume that transmission of accurate Medicaid eligibility data from the States to CMS would be inherently any more problematic than transmission of accurate and timely Part D data from CMS to the States.

Recommendation: CMS should facilitate the auto-enrollment process for dual eligibles, either directly or through a contractor. Ohio believes there is no legitimate rationale for transferring to the States an administrative responsibility that Congress clearly indicated should fall upon the federal government.

Section II.B.2 of the preamble referring to **Section 423.34(d)** of the proposed regulations also discusses the timing of the auto-enrollment for dual eligibles, referring to a process to begin at "the end of the individual's initial enrollment period." We have concerns about the enrollment and the auto-enrollment process as established by this section of the draft regulations in relation to providing adequate communication and assistance in enrolling dual eligibles. First, we are concerned about the timing of the automatic enrollment process for dual eligibles because they will lose Medicaid prescription drug coverage on January 1, 2006. They must enroll, preferably through their own selection, prior to losing their Medicaid prescription drug coverage. The scheduled auto-enrollment process beginning on May 16, 2006, is too late to dovetail with the loss of their Medicaid prescription drug coverage. If this date is to work, CMS must communicate with dual eligibles concerning this change in their prescription drug benefits far in advance of the proposed October 15, 2005, mailing. Second, the proposed rule lists a plethora of concerns around auto-enrolling a full benefit dual eligible in an MA-PD or a PDP, specifying that involuntarily dis-enrolling a dual eligible from one plan in order to auto-enroll them into a plan charging a lower premium is not a viable option under the statute. Though finding a plan and premium that will fit within the low-income subsidy is a concern and further illustrates the need to assist dual eligibles in understanding their options. For this population, the concern is finding a plan which will cover all their medications as previously covered under their Medicaid drug benefit, thereby making the transition to Medicare drug coverage a seamless one.

Recommendation: CMS should change the scheduled auto-enrollment date or change the date that dual eligibles lose their Medicaid coverage, and provide in-person assistance (through federally contracted independent enrollment brokers) in order to adequately educate dual eligibles on their options and minimize the need for the auto-enrollment. In order to provide dual eligibles with the information they need to make an informed choice, PDPs, MA-PDs, CMS and SHIP agencies should not deluge dual eligibles with mailed notices and expect they will understand that they will lose their Medicaid prescription drug coverage, and that they must find a PDP or MA-PD that covers their medications.

Section II.B.10 of the preamble discusses the information that CMS will make available to PDPs and MA-PDs. Divulging beneficiary-specific information to PDPs and MA-PDs could be particularly risky for dual eligible beneficiaries. MA-PD plans have an incentive to enroll dual eligibles because they will receive an additional capitation payment (Medicaid add-on) for these higher risk beneficiaries. The dual eligible population is more vulnerable (due to age, limited English proficiency, limited education, etc.) to the risk of enrolling in a plan that does not meet their needs and having to pay out-of-pocket if their medications are not covered by the plan marketed to them. Some Medicare managed care plans have a reputation for being especially aggressive with regard to enrolling dual eligibles without providing clear information on plan limitations. Dual eligibles will require greater protections and individual assistance to select the plan that most meets their needs.

Recommendation: CMS should establish special protections for the dual eligible population, including prohibitions against direct marketing to dual eligibles by PDPs and MA-PDs.

Subpart C: Voluntary Prescription Drug Benefit and Beneficiary Protections

Section II.C.1.a of the preamble solicits "comments concerning any drugs that may require specific guidance with regard to their coverage under Part D, and any gaps that may exist in the combined 'Part D & B' coverage package." As proposed in MMA, the definition of a Part D drug excludes those drugs which may be excluded under section 1927(d)(2) of the Social Security Act. By excluding these drugs, Medicare beneficiaries may not have access to drugs such as phenobarbital (a barbiturate) or clonazepam (a benzodiazepine) for seizures, or potassium (a mineral) for the heart. For many dual eligible beneficiaries, these drugs are vitally important. The low income subsidies have no provisions for extended coverage to include these drugs. While these drugs are optional for state Medicaid programs, Ohio and most other states do cover these drugs for Medicaid consumers as an important part of the benefit package. Please also see comments below under the heading "Submission of Bids and Monthly Beneficiary Premiums: Determining Actuarial Valuation" information pertaining to Section II.F of the preamble regarding alternative coverage. Ohio believes that basic alternative coverage including the Medicaid-optional drugs is actuarially equivalent to standard coverage.

Clarification of coverage of prescription drugs under Medicare Part B is essential. The rules regarding Part B coverage are confusing, and if left to the interpretation of PDPs and MA-PDs, drugs not covered under Part B may be excluded from Part D plans. If these drugs are excluded from Part D coverage, our fear is that Medicare beneficiaries would be denied coverage.

Recommendation: CMS should include coverage for "Medicaid-optional" drugs in the Part D benefit for dual eligibles, as part of the standard package or a basic alternative plan, or within an extended package available with the low income subsidies. CMS should also clarify coverage of prescription drugs under Medicare Part B to ensure that all appropriate drugs are covered under either Part B or Part D.

Section II.C.1.c of the preamble asks for "comments regarding our definition of the term long-term care facility in **section 423.100**."

Specifically, comments were solicited concerning whether Intermediate Care Facilities for the Mentally Retarded (ICFs/MR) should be considered LTC facilities. These facilities are residential facilities providing long term care to residents, so as such are LTC facilities. Since virtually all residents of ICFs/MR in Ohio are dual eligibles, and therefore eligible for the low-income subsidies, they should be afforded the same benefits as residents of nursing facilities and skilled nursing facilities, along with all other beneficiaries receiving LTC.

As a result of the U.S. Supreme Court decision *Olmstead v. L.C.*, 527 U.S. 581 (1999), Ohio and other states have been moving seniors and persons with disabilities from institutions into less

restrictive placements. Ohio has implemented waiver programs for home and community based care as an alternative to placement in a nursing home. These alternatives provide consumers with a choice of placement, but allow them to receive the same level of care as those who reside in institutions.

Exclusive contracts with a LTC pharmacy should not be the deciding factor on whether or not to extend the definition of LTC facility to forms of housing other than traditional nursing homes; the beneficiaries' qualification for Medicare and their health care needs should be the deciding factors. Rather than defining "long-term care facility," it may be more useful to define "long-term care." States can identify dual eligible individuals who are institutionalized, and can also identify those individuals that, if it were not for the *Olmstead* decision or an 1115 waiver, would be institutionalized. These individuals are low-income Medicare beneficiaries; having a Medicare prescription benefit at zero out-of-pocket cost will allow their income to be used for daily living expenses and not on prescriptions.

Dual eligible residents of LTC facilities in Ohio are required to use all income toward the cost of care, except for a personal needs allowance of $40 per month. This amount is not enough to pay for the cost of medications obtained from out-of-network pharmacies or non-covered drugs. The personal needs allowance for patients under home and community based services waivers is higher, but is still not high enough to pay the added cost of medications that have previously been covered under the Medicaid pharmacy benefit. Parity between institutionalized and waiver serviced beneficiaries must be maintained. These most needy Medicare beneficiaries must be offered a comprehensive benefit plan with zero out-of-pocket costs.

Recommendation: CMS should include ICFs/MR in its definition of LTC facilities. Furthermore, CMS should define "long-term care" to include both patients in residential facilities as well as those who receive a level of care through a home and community based waiver that would be equivalent to care in a residential LTC facility. All Medicare beneficiaries who are either institutionalized or in Medicaid home and community based waivers should be afforded the same prescription benefits including zero copayments.

Section II.C.4.a of the preamble referring to **Section 423.120** of the proposed regulations discusses access to LTC pharmacies, and whether CMS should require, or merely encourage, PDPs and MA-PDs to include LTC pharmacies in their networks. A requirement that PDPs and MA-PDs include one or more LTC pharmacy providers will ensure access to LTC pharmacy services for all Medicare Part D beneficiaries. By merely encouraging this arrangement, Medicare beneficiaries who enter LTC arrangements while enrolled in a PDP or MA-PD without a contracted LTC pharmacy will be left with only potentially expensive out-of-network options. In addition, a PDP or MA-PD could effectively discriminate against patients in LTC by declining to contract with a LTC pharmacy. The rules governing PDPs and MA-PDs must include beneficiary protections against the few PDPs and MA-PDs which may choose to provide less-than-appropriate care. By requiring each PDP and MA-PD to include at least one LTC pharmacy in its network, beneficiaries will retain a measure of protection. In addition to requiring at least one LTC provider, PDPs and MA-PDs should also be required to contract with any LTC pharmacy that agrees to the PDP's or MA-PD's standard contract.

Recommendation: CMS should require each PDP and MA-PD to include at least one LTC pharmacy in its network, and to contract with any LTC pharmacy that agrees to the PDP's or MA-PD's standard contract.

Section II.C.4.a of the preamble referring to **Section 423.120** of the proposed regulations discusses access to federally qualified health centers (FQHCs), and whether CMS should require, or merely encourage, PDPs or MA-PDs to include FQHC pharmacies in their networks. Similar to the LTC pharmacy question, a requirement that PDPs and MA-PDs include FQHC pharmacy providers will ensure access to pharmacy services for all Medicare Part D beneficiaries. Recognizing that FQHC pharmacies would need different contractual terms, PDPs and MA-PDs should be required to approach these pharmacies and attempt to reach agreement about terms.

Recommendation: CMS should require each PDP and MA-PD to approach all FQHCs in its service area to attempt to negotiate a contract.

Section II.C.4.a of the preamble referring to **Section 423.120** of the proposed regulations discusses access to home infusion pharmacies, and whether CMS should require, or merely encourage, PDPs and MA-PDs to include home infusion pharmacies in their networks. Also similar to the LTC pharmacy question, a requirement that PDPs and MA-PDs include home infusion pharmacy providers will ensure access to pharmacy services for all Medicare Part D beneficiaries. By merely encouraging this arrangement, Medicare beneficiaries who require home infusion services while enrolled in a PDP or MA-PD without a contracted home infusion pharmacy will be left with only potentially expensive out-of network options. By requiring each PDP and MA-PD to include at least one home infusion pharmacy in its network, beneficiaries will retain a measure of protection.

Recommendation: CMS should require each PDP and MA-PD to include at least one home infusion pharmacy in its network.

Section II.C.4.b of the preamble referring to **Section 423.120** of the proposed regulations "invite[s] comments regarding standards and criteria that [CMS] could use to determine that a PDP sponsor or MA organization's formulary classification system that is not based on the model classification system does not in fact discriminate against certain classes of Part D eligible beneficiaries." To be sure that an appropriate formulary system is in place, CMS should consider the United States Pharmacopeia (USP) model guidelines to be the minimum acceptable to meet the criteria. This means that the PDP's or MA-PD's proposed classification system must contain at least as many **equivalent** categories and classes of drugs as USP's model. In addition, CMS must verify that a variety of dosage forms are available. Appropriate drug therapy may involve the use of alternate dosage forms such as injectable and easier-to-swallow oral forms (e.g. liquids or rapidly dissolving tablets) for patients unable to swallow tablets or capsules. Drugs for topical, ophthalmic, nasal, otic, vaginal, and rectal administration should also be included in PDP and MA-PD formularies.

Part of the goal of CMS' approval of PDP and MA-PD formulary classifications must be protection from unintended consequences of cost containment. Particularly in an elderly

population such as the one served by Medicare, inappropriate drug therapy may lead to hospitalization, worsening morbidity, and mortality. The added costs of these consequences would be borne by Medicare Parts A and B, rather than by the Part D PDP. This misaligned financial incentive must be mitigated by requirements to provide drugs in appropriate categories.

With the continued trend toward prescription drugs being granted over-the-counter (OTC) status, it is important that PDPs and MA-PDs not be able to exclude a required category or class of drugs because OTC options are available. These required categories and classes should be included in every plan's list of covered drugs.

Recommendation: CMS should use USP's model guidelines as the baseline for what is acceptable. PDP and MA-PD formularies must include a variety of dosage forms in at least as many equivalent categories and classes of drugs as USP's guidelines. The formulary classification must protect both the beneficiary and Medicare Parts A and B from unintended consequences of cost containment.

Subpart F: Submission of Bids and Monthly Beneficiary Premiums: Determining Actuarial Valuation

Section II.F.4 of the preamble referring to **Section 423.265** of the proposed regulations discusses actuarial equivalence of plans. This section considers differences in plan cost sharing that may be considered actuarially equivalent, but gives little information about plans that may choose to provide coverage of optional drugs under basic alternative plans. Section 1860D-2(a)(2)(A)(ii) of the Social Security Act as amended by MMA provides for "[c]overage of any product that would be a covered part D drug but for the application of subsection (e)(2)(A)" regarding Medicaid-optional drugs. By including these drugs, to be used as alternatives to other Part D drugs, PDPs and MA-PDs will provide a more comprehensive benefit without incurring higher costs than the basic plan. This option should be considered in the regulations and Part D plans should be encouraged to provide this coverage. As mentioned above, coverage of drugs such as phenobarbital (a barbiturate) and clonazepam (a benzodiazepine) are necessary for appropriate care of seizure disorders. OTC drugs such as laxatives, aspirin, and antacids provide cost-effective care for common ailments. The availability of drugs for cough and cold symptoms will reduce inappropriate and unnecessary prescribing of antibiotics which may cause antibiotic resistance and increase hospitalizations and other health care costs. While state Medicaid programs have the option to not cover classes of drugs including those listed here, most provide at least limited coverage. Ohio provides a comprehensive benefit including a selection of agents used for the symptomatic relief of cough and colds, prescription vitamins and mineral products, nonprescription drugs, barbiturates, and benzodiazepines.

Recommendation: CMS should issue regulations encouraging basic alternative coverage including optional drugs. A benefit plan providing this alternative coverage is actuarially equivalent to the standard plan, and offers Medicare beneficiaries a more comprehensive benefit package. PDPs and MA-PDs should be encouraged to provide this basic alternative coverage.

Subpart J: Coordination under Part D Plans with Other Prescription Drug Coverage

Section II.J.6.b of the preamble referring to **Section 423.464** of the proposed regulations invites comments regarding coordination of benefits between state Medicaid programs and PDPs and MA-PDs. While this section is specific to coordination after the implementation of Part D, it is also important to consider the transition into Part D. Dual eligible beneficiaries in Ohio and most other states have a comprehensive drug benefit including open formulary and zero out-of-pocket cost for most prescriptions. This benefit will be replaced by a Part D plan which will probably provide a much more limited formulary and will require copayments for each prescription. Medicare must ensure that the transition from Medicaid prescription coverage to Part D is seamless, and no beneficiary will be unable to obtain medications. The transition process needs to ensure that no dual eligible experiences a lapse in coverage for any reason.

This seamless transition will only be accomplished with an organized, easy-to-understand auto-enrollment process. Because Medicaid coverage will end on December 31, 2005, it is imperative that all dual eligibles be enrolled in a PDP or MA-PD before Part D coverage begins. Once enrolled, the PDP or MA-PD should cover the beneficiary's existing medications during a transition period during which the PDP or MA-PD, beneficiary, and beneficiary's physicians work together to change the drug regimen to conform to the plan's formulary or to receive prior authorizations for necessary medications. Appeals and redeterminations need to be done on an accelerated timeline during the transition period, and beneficiaries must be informed of their right to appeal.

During this transition period, dual eligibles should not be subject to higher out-of-pocket costs for out-of-network pharmacies. While beneficiaries may decline the PDP or MA-PD chosen for them in an auto-enrollment process, it will take some time for the beneficiary to choose a more appropriate PDP or MA-PD that includes his or her preferred pharmacy. For dual eligibles in LTC facilities, extra protections during this transition period are even more important because they are generally locked in to a single pharmacy provider which has contracted with the facility.

Recommendation: CMS should ensure a seamless transition period for dual eligible beneficiaries. This transition period should include expedited appeals, an open formulary, and no penalties for out-of-network pharmacy use. This transition period should last for at least six months, to give the beneficiary, physicians, and the PDP or MA-PD enough time to change any drugs that are nonformulary or to appeal the formulary decision.

Section II.J.6.b of the preamble referring to **Section 423.464** of the proposed regulations invites comments regarding coordination between state Medicaid programs and PDPs and MA-PDs. This coordination of benefits must allow states flexibility to either wrap around or not wrap around the Part D benefit. State assistance may take the form of a State Pharmaceutical Assistance Plan (SPAP) as defined in the regulations, a Medicaid state plan, or another state-financed arrangement. **Regardless of the form of assistance, states should have the ability to choose not to wrap around the benefit while being satisfied CMS has assured that the state's Medicare beneficiaries are receiving appropriate drug coverage.** States should also

have the flexibility, if they do choose to wrap around the benefit, to either pay the difference between the low-income premium subsidy and the premium for a basic or extended plan, or to pay on a per-claim basis. Related to states' decision not to wrap around the Part D benefit, CMS should provide a State Plan Amendment option to exclude dual eligibles, or any consumer eligible for Medicare, from any outpatient drug coverage under Medicaid.

Recommendation: CMS should write regulations protecting the states' ability to either wrap around or not wrap around the Part D benefit, and to choose the structure of any wrap around benefit. For states that choose not to wrap around, CMS should provide protection through the state plan to exclude any Medicare-eligible consumer from Medicaid pharmacy services.

Subpart S: Special Rules for States – Eligibility Determinations for Low-Income Subsidies and General Payment Provisions

Section II.S.1 of the preamble referring to **Section 423.904** of the proposed regulations discusses states' obligations for processing applications for the low-income subsidies. States should be able to meet this obligation by simply accepting applications and forwarding them to the Social Security Administration (SSA) for eligibility determinations to be made. Similarly, all redeterminations and appeals should be done by SSA. This approach will encourage consistency to a national standard and provide accountability to all Medicare beneficiaries. Any provision in the law that a state must perform any eligibility determination for a federal program is an unfunded mandate, and as such should be eligible for 100% federal reimbursement for any state resources expended. Staff time for Ohio to implement this program will include creating rules within the Ohio Administrative Code, training of front-line workers, training of supervisory staff, and time for hearings, appeals, and oversight. In order to accomplish this unfunded mandate, information system changes would need to be made in a short amount of time. If states are to be required to begin accepting applications by July 1, 2005, these system changes are not possible. Ohio also needs time to obtain state statutory authority to perform any functions related to the Medicare benefit but unrelated to state programs. In Ohio, we have the authority to administer the Medicaid program, including the Medicare premium assistance program, but not to administer Medicare. The requirement for states to perform any function regarding eligibility for Medicare is unnecessarily burdensome.

Recommendation: CMS should issue regulations which are clear that a state's only obligation in processing applications for low-income subsidies is to accept applications to be forwarded to SSA for processing. Any resources contributed by a state to the Medicare program should be eligible for 100% federal reimbursement.

Section II.S.4 of the preamble referring to **Section 423.908** of the proposed regulations discusses the calculation of the Phased-Down State Contribution. The calculation, as proposed in rule, closely follows the instructions from MMA. However, the authorizing legislation does contain a provision, in its amendment to Section 1935(c)(3) of the Social Security Act, to use "information reported by the State in the medicaid financial management reports (form CMS-64) for the 4 quarters of calendar year 2003 *and such other data as the Secretary may require*" (emphasis

added). Ohio believes that this language allows the Secretary to consider information that does not appear on the forms CMS-64 for calendar year 2003. The intent of the legislation is to approximate the amount that would have been spent by states for Part D drugs for dual eligibles in the absence of Medicare Part D, based on the experience of 2003. Congress clearly recognized that the forms CMS-64 would not contain the full picture of states' experience in 2003. For example, drug rebates are billed approximately two months after the end of the quarter during which they were earned. Thus, rebates for much of 2003 were not billed or received until well into 2004. Federal rebate liabilities have been steadily increasing. By considering only the rebates that were received in 2003, the calculation more closely reflects 2002 experience.

A second issue is that many states, including Ohio, implemented or planned cost-saving measures in 2003 which will reduce pharmacy costs into the future. For example, Ohio implemented a Preferred Drug List (PDL) program in April 2003 which has shown savings of about 5% in overall pharmacy program costs. As with the federal rebates, the supplemental rebates associated with the PDL were not billed until several months later, so most of the revenue was received in 2004 and reported on forms CMS-64 for quarters in 2004. The Ohio PDL has been introduced in phases, with the first phase in April 2003, second phase in October 2003, and the third phase to be implemented in October 2004. Savings projections for calendar year 2005 are close to 8% of overall program costs. These additional savings should be considered by the Secretary under the "other data" provision of MMA, because they would more closely reflect the costs to Ohio for the pharmacy benefit for dual eligibles in the absence of Medicare Part D. Along with the PDL, a copayment of $3 was instituted for drugs requiring prior authorization. This copayment has improved our cost savings by encouraging Medicaid consumers to use less expensive drugs that do not require a copayment. These savings should also be considered.

A third consideration for the calculation of the phased-down payment is the inflation factor used. The legislation directs the Secretary to use the "most recent National Health Expenditure projections" to determine the inflation factor. State Medicaid programs in general, and Ohio Health Plans in particular, have consistently contained growth to a factor lower than the National Health Expenditure projections. Ohio's recommendation is that CMS consider each state's performance relative to the National Health Expenditure data, and to use a factor appropriate to each state, not to exceed the national projection.

Each state should be required to submit data that explains adjustments to be made to the "clawback" calculation. Because there is no provision for the baseline amount to be recalculated in the future, it is imperative that the liability be accurately calculated. To consider only information that was submitted in standard reports will not reflect the full experience of the states in 2003. Because of the significance of the 2003 baseline number, CMS should develop an appeals process for the phased-down state contribution calculation. This process will enable states to have a process through which to resolve any disagreement with CMS' calculations.

Recommendation: CMS should use the statutorily authorized consideration of "other data" provided by the states to determine an accurate, fair representation of the state's cost for

pharmacy benefits for dual eligibles in the absence of Medicare Part D. Each state's calculation should be different based on experience. This one-time calculation to be used in perpetuity must accurately reflect state experience. As such, a process should be developed for states to appeal CMS' determination of the payment amount.

Conclusions

Ohio Health Plans look forward to working with CMS on the implementation of Medicare Part D. Preserving access to prescription drugs for dual eligibles, the most disadvantaged seniors in our state, is a priority. It is imperative that these and all Medicare beneficiaries have access to a comprehensive drug benefit that is affordable. The cost of providing this benefit should not be unfairly shifted to states through an inappropriate Phased-Down State Contribution payment. Please consider these recommendations before issuing final regulations. If you have any questions, please do not hesitate to contact me at (614) 466-4443.

To Whom It May Concern:

The purpose of this letter is to comment on the Medication Prescription Drug Improvement and Modernization Act of 2003 (MMA), specifically the Medication Therapy Management Program (MTMP).

The New Mexico Society of Health-System Pharmacists represents pharmacists that practice in a variety of health care settings (hospitals, federal clinics and health systems, academia, managed-care organizations, etc.). The mission of our organization is to advance the provision of pharmaceutical care and achieve optimal patient outcomes.

Currently, under New Mexico law, pharmacists can have full prescriptive authority under the supervision of a physician to provide medication therapy management limited to the scope of the physician's practice. Additionally, all registered pharmacists in New Mexico can have prescriptive authority for the following: pediatric and adult immunizations, emergency contraception, and tobacco cessation products.

Representing the New Mexico Society of Health-System Pharmacists, we make the following recommendations for successful implementation of the MTMP which will in turn lead to improved patient care.

It is our position that CMS should include in the rules:

1. **That all pharmacists are included as qualified providers of MTMP**. Pharmacists in health systems currently provide MTM services in anticoagulation clinics, cardiovascular risk reduction clinics, congestive heart failure clinics, asthma clinics, etc. These services have been repeatedly associated with improvements in the quality of patient care and reductions in healthcare costs.
2. **Targeted beneficiaries should include all patients with at least one chronic disease**. Current plans to identify beneficiaries qualified to receive MTMP focus on patients having multiple chronic conditions, receiving multiple medications and who are expected to incur high prescription drug costs. Under-use of medications often is as serious a drug-related problem as is over-use and therefore MTM eligibility should ***not*** be based solely on number of medications currently prescribed.
3. **Reimbursement rates must be determined nationally by CMS using any willing provider guidelines and ensuring appropriate coverage areas**. Ensuring standardized rates of reimbursement would inhibit PDPs from contracting with groups purely based on cost at the sacrifice of MTMP quality.

Reimbursement rates should be based upon the complexity of the service provided and commensurate with reimbursement for other healthcare providers.

4. **The patient must have freedom of choice of providers**. This would encourage competition between providers based on quality, ultimately leading to improved patient outcomes.
5. **CMS must ensure that contractors have full coverage for patient and provider access in rural and underserved areas**.

Thank you for allowing us the opportunity to provide comments on the proposed rules.

Sincerely,

RE: Comments on Medicare Modernization Act of Proposed Rule Part 403

To Whom It May Concern:

We are writing to comment on the proposed rules of August 3, 2004, which would amend 42 CFR 403.205. CMS proposes to amend the federal regulatory definition of a "Medicare Supplemental Policy" to include a stand-alone limited health benefit policy or plan. Additionally, CMS proposes a disclosure form to be sent by Medigap carriers regarding Medicare Part D.

Proposed Changes to Medicare Supplemental Definition

CMS should make no changes to the current definition of Medicare Supplemental Policy except to conform to the MMA changes regarding what is not a Medicare Supplement Policy.

The MMA requires that the definition of Medicare Supplemental Policy only change to add a prescription drug plan under Part D as a type of coverage not included in the definition of the Medicare Supplemental Policy and to replace the term Medicare+Choice with Medicare Advantage. Any other changes to the definition of Medicare Supplemental Policy proposed by CMS are not authorized by the MMA. The agency does not have statutory authority to advance any changes above and beyond the two provided pursuant to the MMA.

CMS proposes to amend the definition of Medicare Supplemental Policy by including a rider attached to an individual or group policy, a stand alone limited health benefit plan or policy that supplements Medicare benefits and is sold primarily to Medicare beneficiaries or that otherwise meets the definition of the Medicare supplement policy as defined in the section, and any rider attached to a supplemental policy to become an integral part of the basic policy. This is already addressed as a matter of state law.

Additionally, CMS proposes to delete section 403.205(d)(1 through 5). In the current law these subparts are specifically listed as exclusions from the definition of Medicare Supplemental Policy. CMS has no statutory authority to delete these provisions and therefore may not removed pursuant to the proposed rule.

Notice to Medigap Prescription Policyholders.

We recommend that CMS retain the version of the "notice" required by section 104 of the MMA for Medigap carriers that was adopted by the NAIC and submitted to CMS. The NAIC approved version of the notice meets all of the statutory requirements of the MMA. We should not as Medigap carriers be required to make any assessments regarding the "value" of coverage nor to promote Medicare Advantage. The notice should go no further than to meet such requirements.

We appreciate the opportunity to offer comments on these proposals and thank you for your consideration of these comments.

Sincerely
Paul Latchford
Vice President and Counsel

To Whom It May Concern:

On behalf of the state of Massachusetts, I appreciate the opportunity to comment on the proposed regulations entitled, "42 CFR Parts 403, 411, 417 and 423 Medicare Program; Medicare Prescription Drug Benefit; Proposed Rule," 69 FR 46632. I am extremely concerned that many of the proposed regulations could negatively impact drug coverage for people living with HIV in our state, as well increasing the financial burden on the already strapped Massachusetts AIDS Drug Assistance Program (ADAP).

1.) Explicitly excluding ADAPs from being able to provide wrap-around coverage in a manner that would allow beneficiaries to reach the catastrophic limit seriously undermines the federal government's priority of providing comprehensive health care to people living with HIV/AIDS. ADAPs are an integral component of the safety net for people living with HIV/AIDS in this country and have a long history of filling gaps left by other federal programs, including Medicaid and Medicare. We strongly recommend that the final rule count cost-sharing subsidies from ADAPs as incurred costs for beneficiaries.

Massuchusetts is very concerned that the regulation also disallows state-appropriated dollars spent by ADAPs to be counted as incurred costs. It is discriminatory and unacceptable to single out state dollars used to provide medications to people living with HIV/AIDS while at the same time allowing state dollars to be used for State Pharmaceutical Assistance Programs' (SPAPs) expenditures on behalf of a beneficiary. Under the proposed regulations, SPAPs are allowed to wrap-around in a way that all costs spent on the behalf of a beneficiary count as incurred costs. States should have the flexibility to provide prescription drugs to a variety of populations, including people living with HIV/AIDS, with the state dollars appropriated. It is inexcusable to

exempt people living with HIV/AIDS from receiving this type of assistance from their state, while allowing people with other medical conditions to benefit from the use of state dollars. Ironically, persons with AIDS who live in states with SPAPs and who are eligible for assistance will have SPAP costs count toward incurred costs, while those who rely on ADAP will not.

2.) While we understand that CMS is hopeful that all prescription drug plans (PDPs) will include all necessary HIV-related drugs on their formularies, it is not required. Therefore, even individuals who benefit from the low-income protections included in the benefit may find themselves turning to ADAPs to receive the remaining necessary medications.

Massachusetts strongly supports the CMS recommendation to implement "open formularies" for special populations and strongly recommends that people with HIV/AIDS be defined as a special population. We feel this is critical to ensuring that Medicare beneficiaries with HIV/AIDS have continued and unhindered access to all of the drugs that are medically necessary for treating the disease. Furthermore, an "open formulary" will prove cost effective because it will prevent the use of more intensive and costly health care resources such as inpatient hospitalization that will occur if Medicare beneficiaries with HIV/AIDS are denied access to medically necessary prescription drugs. While the private drug plans are not at risk for this potential cost shifting, the federal government will incur these costs either through higher Medicaid expenditures or higher Medicare Part A and B expenditures.

3.) Strengthening the language regarding coverage of drugs for off-label use. It is imperative that prescription drug plans be required to cover medically accepted uses of drugs for off-label use that are standard practice in the medical community. For HIV disease, as with many complex conditions, clinical practice frequently progresses ahead of label indications as physicians learn what drug combinations best target their patient's symptoms and side effects. As an example, tenofovir (Viread) has proven effective for treating hepatitis B for people with HIV, although treatment for hepatitis B is not yet an indicated use of the drug.

4.) Imposition of co-payments. People with HIV/AIDS depend on a daily regimen of multiple medications (most of which are non-generic). Even minimal co-payments will create a financial burden for individuals who will be left to choose between paying for medications and meeting other needs, like food and housing. Dual eligibles must maintain the protection that they currently have under Medicaid and not be denied a drug for failure to pay cost sharing.

Again, thank you for the opportunity to submit comment on the proposed rule to implement the Medicare Part D prescription drug benefit. Please contact me at kevin.cranston@state.ma.us if you need further information.

Sincerely,

Kevin Cranston, MDiv

BACKGROUND

RE: CMS?4068?P; Medicare Program; Medicare Prescription Drug Benefit; 42 CFR, Part 423, Section 159, Electronic Prescription Program

This letter is in response to the proposed rule that the Centers for Medicare and Medicaid Services (CMS) published in the Federal Register, Volume 69, Number 148, beginning on page 46632 on August 3, 2004. SureScripts appreciates the opportunity to comment on the proposed rule with respect to those provisions that will support the implementation of an electronic prescription program designed to improve the overall prescribing process for millions of Medicare beneficiaries. In fact, SureScripts has already testified before, and offered additional advice and assistance to, the National Committee on Vital and Health Statistics Subcommittee on Standards and Security as it gathered input this past summer on electronic prescribing standards that might be used for the electronic prescribing program for Medicare. We look forward to continuing to work with CMS to implement said standards and these proposed rules in a manner that improves the safety, efficiency, and quality of the overall prescribing process for all essential stakeholders.

RE: CMS—4068—P; Medicare Program; Medicare Prescription Drug Benefit; 42 CFR, Part 423, Section 159, Electronic Prescription Program

Dear Dr. McClellan:

This letter is in response to the proposed rule that the Centers for Medicare and Medicaid Services (CMS) published in the Federal Register, Volume 69, Number 148, beginning on page 46632 on August 3, 2004. SureScripts appreciates the opportunity to comment on the proposed rule with respect to those provisions that will support the implementation of an electronic prescription program designed to improve the overall prescribing process for millions of Medicare beneficiaries. In fact, SureScripts has already testified before, and offered additional advice and assistance to, the National Committee on Vital and Health Statistics Subcommittee on Standards and Security as it gathered input this past summer on electronic prescribing standards that might be used for the electronic prescribing program for Medicare. We look forward to continuing to work with CMS to implement said standards and these proposed rules in a manner that improves the safety, efficiency, and quality of the overall prescribing process for all essential stakeholders.

Introduction

SureScripts was founded in August of 2001 by the National Community Pharmacists Association (NCPA) and the National Association of Chain Drug Stores (NACDS), which represent the interests of 55,000 chain and independent pharmacies. The company is committed to building relationships within the healthcare community and working collaboratively with key industry stakeholders and organizations to improve the safety, efficiency and quality of healthcare by improving the overall prescribing process. At the core of this improvement effort is SureScripts Messenger™ Services, a healthcare infrastructure that establishes electronic communications between pharmacists and physicians and enables the two-way electronic exchange of prescription information. You and your staff can find more information about SureScripts at www.surescripts.com.

SureScripts Responses to CMS Requests for Comment on the Proposed Rule

(1) CMS: We are particularly interested in comments that help us identify consensus or reach consensus on e-prescribing standards ahead of the statutory timeframe, and to help us identify and evaluate industry experience based on pilot programs engaged in e-prescribing activities in 2004 and 2005.

SureScripts selected the nationally recognized NCPDP SCRIPT Standard to serve as the foundation for its transaction engine software in 2001, and has been actively and effectively using the standard in commerce with its various physician and pharmacy technology partners since June 2003. SCRIPT currently facilitates the electronic transmission of new prescriptions, prescription refill requests and authorizations, prescription fill status notifications, prescription change request and approvals and cancellation notifications between physicians, dispensing pharmacies and pharmacists. Future enhancements to SCRIPT could address other data communication possibilities that may include patient eligibility, compliance, lab values, diagnosis, disease management protocols, patient drug therapy profiles, prescription transfers, etc.

The NCPDP SCRIPT Standard was developed through a consensus process among community pharmacy organizations, PBMs, health plans, pharmacy software vendors, database providers, and other stakeholders. It adheres to EDIFACT syntax requirements, utilizes standard EDIFACT and ASC X12 data tables, and is an American National Standard (ANS). This being the case, and in light of the success that our organization has had in employing the standard for the past sixteen months, SureScripts believes that there *is* consensus in the industry that the NCPDP SCRIPT Standard is the best standard to meet the e-prescribing needs of ambulatory Medicare beneficiaries and the physicians and pharmacists who serve them. Therefore, we encourage CMS to identify the NCPDP SCRIPT Standard as one that can be adopted ahead of the statutory timeframe.

(2) CMS: Therefore, to the extend we determine, after consultation with affected standard setting organizations and industry users, that there already is adequate industry experience with certain standards, we may propose to finalize those standards through notice and comment rulemaking even if we have not completed the pilot testing of other standards so that a portion of the standards adoptions process could be expedited. We seek comments on the desirability of this strategy, including any concerns about potential unintended consequences.

In its September 2, 2004 letter to Secretary Tommy Thompson of the Department of Health and Human Services, the National Committee on Vital and Health Statistics did identify two existing industry standards as "foundation standards" that are ready for use by the industry and could, therefore, be finalized through notice and comment rulemaking prior to the completion of pilot testing of other standards. These standards were (1) the most current version of NCPDP SCRIPT for new prescriptions, prescription renewals, cancellations, and changes between physicians and dispensers and (2) the ASC X12N 270/271 Health Care Eligibility Inquiry and Response Standard Version 004010X092A1 for conducting eligibility inquiries from physicians to

payers/PBMs. We strongly agree that it would be desirable for all stakeholders if CMS were to finalize the adoption of the NCPDP SCRIPT Standard, see no potential unintended consequences of doing so, and hence encourage the agency to proceed accordingly at this time.

(3) CMS: In order to facilitate electronic prescribing by a PDP or MA-PD sponsor, we invite public comment on additional steps to spur adoption of electronic prescribing, overcome implementation challenges, and improve Medicare operations.

Inasmuch as CMS has already added regulations at § 423.159(b) that would allow an MA-PD plan to provide separate or differential payment to a participating physician who prescribes covered Part D drugs in accordance with electronic prescription standards, we also encourage CMS to allow MA-PD plans to make similar incentive payments to participating pharmacies. Both the upfront and ongoing costs of implementing electronic prescribing will be substantial for community pharmacies (and quite likely of greater magnitude than for physicians), so such payments to pharmacies would be entirely supportable and justified.

(4) CMS: We note that any payments must be in compliance with other Federal and State laws, including "the physician self-referral prohibition at section 1877 of the Act" and the Federal anti-kickback provisions at section 1128B(b) of the Act. We are soliciting the public's view of the application of these legal authorities to the differential payments described in this section. We will share any comments regarding the anti-kickback statute with the Office of Inspector General.

Some relief from the anti-kickback statute in support of electronic prescribing would aid adoption by physicians. We are aware that hospitals, health systems, and other stakeholders are reluctant to embark on aggressive electronic prescribing initiatives on the advice of counsel because of the provisions in anti-kickback statutes. We encourage broad relief from those statutory elements that are constraining investment in electronic prescribing.

We also encourage any such relief to be mindful of the operational difficulties that would require electronic prescribing systems to be able to parse functionality on the basis of that used to benefit only Medicare beneficiaries, versus all patients. We encourage as broad a relief as possible. We also encourage that specific emphasis be placed on relief that is tied to physician and staff training, physician utilization and bi-directional communication with pharmacies.

(5) CMS: The electronic prescribing process and the technology that enables it must be cost effective, the systems must be fast and easy to use, and alerts and other data passed back to the prescriber must demonstrate value. We invite comments on these challenges and on possible Federal activities that would promote the effective use of e-prescribing by providers, including publishing best practices, and making technical information on e-prescribing products available.

The history of electronic prescribing efforts over the past decade clearly shows that the way in which electronic prescribing technologies are—or are not—effectively woven into health care providers' workflows has a strong effect on whether said technologies are adopted. On the

physician side, the time it takes to create a prescription electronically must be nearly as brief as it now takes them to write prescriptions by hand, otherwise there is a barrier to the adoption of the technology. On the pharmacy side, it is apparent that the way in which pharmacy management systems are updated to accommodate electronic prescribing can also have a significant impact on adoption and utilization. Because both physician and pharmacy systems are proprietary in nature, the companies who market these technologies rarely, if ever, share successful design features with competitors. Therefore, CMS's publishing of best practices so that all electronic prescribing companies can offer systems that address the majority of providers' needs, as well as making technical information on e-prescribing products available so that providers can make informed comparisons, should support the effective adoption and use of electronic prescribing.

(6) CMS: In addition, receptivity to the use of electronic prescribing by consumers is not well understood, especially among the elderly and disadvantaged populations. We seek additional information on how those populations may view electronic prescribing and what step may be taken to get them to use this modality and, thus, take advantage of the safety and quality benefits it offers.

In August of 2002, SureScripts released the results of a survey that Harris Interactive conducted for the company to identify the attitudes and perceptions that the public held toward electronic prescribing. The study found that Americans associated electronic prescribing with a number of benefits including:

- 61 percent felt they would have less waiting time at the pharmacy when electronic prescribing is used
- 51 percent believed that electronic prescribing would yield faster prescription renewals
- 40 percent said electronic prescribing would minimize opportunities for errors associated with handwritten prescriptions
- 26 percent responded that electronic prescribing would allow more time to discuss the medicines with their pharmacists

Though this small study was not targeted toward elderly or disadvantaged populations, it did show that the public in general does have some understanding of the benefits that they can expect to experience when health care providers communicate using electronic prescribing.

(7) CMS: We also invite comments on how to promote the use of electronic prescribing by providers, health plans and pharmacies and other entities involved in the provision and payment of health care to Medicare beneficiaries. Beyond the grants authorized in § 423.159(b) of this proposed rule, we invite comments on what incentives could be used to spur more widespread adoption, especially for early implementers.

SureScripts encourages CMS to support the use of incentives for physician practices that adopt electronic prescribing. We caution, however, that incentives that are merely hardware or software license fee giveaways may fall short of creating the longer term utilization of the

technology we all want. We do encourage CMS to consider incentive programs that contain one or more of the following elements:

- Incentives for both physician and staff use
- Incentives that require some minimum utilization of the technology, for example a minimum number of prescriptions per month
- Incentives that require bi-directional communications with pharmacies to encourage real collaboration
- Incentives that support the training of physicians and physician practice staff
- Incentives that support both the communications of new prescriptions, but also those resulting from the refill authorization process (renewals)

With respect to pharmacies, currently over 75 percent of community pharmacies in the United States have software that enables them to communicate with physicians using electronic prescribing. Given this good faith effort on the part of the pharmacy profession to become ready to use electronic prescribing, it would make good sense for CMS to further stimulate the process by offering community pharmacies financial incentives to use the technology. This is especially important because community pharmacies will be supporting a disproportionate share of the overall e-prescribing infrastructure and transaction costs.

(8) CMS: We also invite your comments on what educational efforts or data analyses might be undertaken to help health practitioners understand, or empirically confirm, and ultimately realize, the benefits of electronic prescribing.

Although there are some reports in the literature that speak to the benefits of electronic prescribing to patients, physicians, pharmacists, and other stakeholders, few could be considered authoritative. In fact, most of these reports are anecdotal in nature. Because there is such a dearth of solid research on the benefits of electronic prescribing, SureScripts has undertaken two research projects to obtain much more definitive data on the benefits of electronic prescribing. The first project is our Prescription Process Validation Project, which is more qualitative in nature, and the second is our Pharmacy ROI Project, which is more quantitative in nature. We expect to have completed both of these projects no later than early spring of 2005, and it would be our pleasure to share the results of these studies with CMS. If this would be of interest to CMS, please let us know and we will contact you as soon as we have results that merit your attention.

Additional SureScripts Comments

(9) Commercial messaging at the point of care

Congress clearly stated its concern about the potential for the commercial abuse of the electronic prescribing process by including language in the MMA that electronic prescribing standards "allow for the messaging of information only if it relates to the appropriate prescribing of drugs, including quality assurance measures and systems to reduce medication errors, to avoid adverse

drug interactions, and to improve medication use." Therefore, commercial messaging at the point of care during the prescribing process should not be allowed. Point of care is defined as both at the physician office as well as at the pharmacy. Commercial messaging consists of two varieties:

- Any message delivered at the point of care that is paid to be delivered by a third party during the prescribing process should be considered a commercial message. There is a potential for messages that could be paid for by manufacturers, payers, pharmacies, PBMs, or any other party interested in determining the decision made for a particular medication or a particular pharmacy where the medication would be dispensed.
- Any message to persuade a decision at the point of care after a decision or selection of pharmacy or selection of medication is made by a provider of care should be considered a commercial message. In other words, if pop-up messages occur after a physician selects a pharmacy or after a physician selects a medication, such pop-ups should be considered a commercial message.

In addition to these types of commercial messages, an inappropriate commercial bias can be also be injected into the electronic prescribing process if physicians are not shown all relevant information. For example, showing only part of a formulary could lead a physician and the patient to assume medications not listed in an electronic prescribing application are not covered when, in fact, they may just have a higher copay than the preferred medication. Hence, physicians should be presented complete formulary information at the beginning of the prescribing process.

(10) The community pharmacist's role in the prescribing process should be supported by the proposed rule

CMS should ensure that the final e-prescribing rules support the integral role that pharmacists play in the prescribing process. These rules should facilitate the collaboration of physicians and pharmacists so that physicians have all the relevant information necessary to make truly informed prescribing decisions. Community pharmacists frequently have the most complete record of a patient's medication history because they routinely monitor and coordinate multiple physician medication therapies and provide counseling to patients regarding <u>all</u> of their medication therapies. Typically, payer payment history databases exclude:

- Medications that the patient received prior to coverage by the current PBM
- Medications that are covered under worker's compensation or a spouse's plan
- Medications that cost less than the PBM copayment and are paid for with cash
- Medications paid for by PhRMA company patient assistance programs
- Non-covered and/or "sensitive" medications that patients pay for with cash
- Medications covered by a major medical plan rather than a PBM plan
- Experimental medications not covered by PBMs
- Over-the-counter medications, vitamins, minerals, and other nutritional products

Payers also do not have information that patients provide specifically to the pharmacist during patient counseling, such as potential allergies, sensitivities, and other adverse reactions.

In order to provide the safest and most effective therapies to Medicare beneficiaries, physicians must be able to effectively interact with pharmacists to conduct drug utilization review and to ensure that prescribing decisions are appropriate. To support these efforts, e-prescribing standards should ensure that pharmacists have complete access to all of a patient's medical information and medication history. This will enhance the quality of care provided to patients and help ensure that the drug utilization review process is both cost-effective and comprehensive. Therefore, we strongly urge CMS to develop and implement e-prescribing rules that support this important bi-directional exchange of information.

Conclusion

SureScripts appreciates the opportunity to continue to provide advice and assistance to CMS as it works to implement the electronic prescription program requirements of the MMA through this proposed rule. We hope CMS will continue to take advantage of the experience that SureScripts can share with respect to the real-world implementation of electronic prescribing for the purposes of improving the safety, efficiency, and quality of the overall prescribing process. Please do not hesitate to have your staff contact us should they have any questions regarding the comments we have offered above or if the are any other ways that we can assist them in this important work.

Sincerely,

Ken Whittemore, Jr.

Category : Individual

Issue Areas/Comments

GENERAL

GENERAL

On behalf of Dey, L.P., we are pleased to provide CMS with comments to CMS-4068-P. We have attached our full comments and an executive summary of the comments.

CMS-4068-P-1256-Attach-2.doc

CMS-4068-P-1256-Attach-1.doc

Executive Summary
Comments on "Medicare Program; Medicare Prescription Dug Benefit; Proposed Rule"
(CMS-4068-P)

Dey, L.P. appreciates the opportunity to comment on the following issues addressed in the above-referenced proposed rule and its preamble:[1]

- Subpart C – Benefits and Beneficiary Protections
  - Section 423.100 (Definition of "Covered Part D Drug")
  - Section 423.120 (Access to Covered Part D Drugs)

- Subpart D – Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans
  - Section 423.153 (Cost and Utilization Management, Quality Assurance, Medication Therapy Management Programs, and Programs to Control Fraud, Abuse, and Waste)

Key Overall Point: CMS acknowledges the statutorily-mandated distinction between Part B and Part D drugs. Our principal concern is that the agency inappropriately suggests that certain Part B drugs with characteristics such as those described in the proposed rule's preamble – i.e., drugs covered as incident to a physician's service or furnished through an item of DME – could be covered under Part D.

"Covered Part D Drug": Dey supports the principle enunciated in the rulemaking that Part D "wraps around" Part B, providing beneficiaries with drug coverage that is seamless. However, portions of the preamble extend this "wrap around" principle beyond reasonable bounds. Specifically, the preamble cites examples that could be interpreted to confer Part D coverage on infusion and injectable drugs in situations that are currently within the Part B claims administration authority of the DMERCs. Similarly, in addressing dispensing fees for Part D drugs, CMS identifies options that, if implemented with respect to infusion drugs, could be applied more broadly – and inappropriately – to other Part B services.

> *Recommendation*: CMS should make clear that DME drugs used in situations now covered under Part B are excluded from coverage under Part D.

Access to Covered Part D Drugs: The rulemaking appropriately addresses means for ensuring that beneficiaries have access to Prescription Drug Plans (PDPs) that include in their networks' long-term care pharmacies and home infusion pharmacy providers. However, because these pharmacies/providers offer drug-related services that are typically covered under Part B, CMS should take special care to ensure that Part D coverage does not substitute for coverage available under Part B. In fact, we read the preamble's language on these points almost to invite such substitution. For example, CMS seeks comments on whether PDPs should receive performance incentives for producing Medicare savings under Parts *A and B* – virtually an open invitation to replace Part B drug coverage with Part D coverage if the PDP believes it will save money.

[1] 69 Fed Reg 46632 (Aug. 3, 2004).

The Medicare Modernization Act (MMA) clearly did not contemplate this type of Part D-Part B substitution. Indeed, the MMA, in establishing a Chronic Care Improvement Program, provided a separate means for CMS (on a demonstration basis) to test methods for identifying clinical and economic synergies among Parts A, B, and D.

> *Recommendation*: CMS should make clear that PDPs may not substitute Part D drug coverage in situations in which Part B drug coverage is available.

Medication Therapy Management: CMS solicits comments on whether the terms "multiple covered Part D drugs" and "multiple chronic diseases" should be defined by the agency itself or by PDPs. Both terms implicate use of disease management tools – tools that Dey supports. However, we are concerned that inappropriately inserting these tools into Medicare Part D, but not into Part B, could exert a counterproductive, asymmetrical effect. That is, by rewarding PDPs for exacting savings on a drug used in a situation that makes it Part D-covered (when, in other situations, it is Part B-covered) could discourage PDPs from considering the clinical factors DMERCs have long taken into account in administering Part B drug claims.

> *Recommendation*: CMS, not PDPs, should define the key terms. In so doing, the agency should maintain a level playing field among Medicare contractors, preventing PDPs from inappropriately reducing utilization for a subset of the situations in which a drug is used.

Drug Utilization Management: The preamble, in addressing industry standards for drug utilization management, suggests incentives to reduce costs "when medically appropriate" – a phrase not defined.

> *Recommendation*: The phrase "medically appropriate" should be defined to include criteria for ensuring that compounding of drugs is performed in a fashion consistent with patient safety and FDA's requirements.

Centers for Medicare and Medicaid Services

Department of Health and Human Services

Attention CMS-1429-P

P.O. Box 8012

Baltimore, Maryland 21244-8012

Re: [CMS--4068-P] Medicare Program; Medicare Program; Medicare Prescription Drug Benefit

Dear Sir or Madam:

Dey, L.P. is pleased to submit the following comments regarding the above-referenced proposed rule (Proposed Rule).[1] Dey, L.P. welcomes the opportunity to work with the Centers for Medicare and Medicaid Services (CMS) as it develops policy for drugs currently covered as a Part B benefit with the potential for coverage as a Part D benefit in 2006.

Dey, L.P. develops, manufactures, and markets prescription pharmaceuticals for the treatment of respiratory illnesses, including chronic obstructive pulmonary disease (COPD), a condition that represents a significant financial burden for the Medicare program and a serious threat to patient longevity and quality of life.

We propose that CMS clarify in the final rule to specifically exclude from Part D those drugs covered under Part B because they are incident to durable medical equipment (DME).

We are providing comments on three sections of the Proposed Rule that hold implications for the availability of drugs provided as a Part B benefit that may, under some circumstances, be provided as a Part D benefit:

1. Section 423.100, regarding the definition of a covered Part D drug;
2. Section 423.120, regarding access to covered Part D drugs; and
3. Section 423.153 in Subpart D Cost Control and Quality Improvement Requirements for Prescription Drug Plans

Various examples in the proposed rule could establish a precedent for changing coverage from an existing benefit (Part B) to a new one (Part D), thereby violating the "wrap around" principle that CMS has enunciated for Part D.

We suggest that CMS specify clearly in the final rule that drugs currently covered under Part B, either incident to a physician service, or incident to the DME benefit, be excluded from Part D coverage until such time as the Secretary issues the report on this subject (required under the Medicare Modernization Act) and the Congress acts to give CMS the authority to implement any recommended changes stemming from the report.[2]

[1] Proposed Rule, 69 Fed Reg 46631 (Aug. 3, 2004).
[2] Medicare Prescription Drug, Improvement, and Modernization Act of 2003, sec. 101(d).

1. **Subpart C. Voluntary Prescription Drug Benefit and Beneficiary Protections**

   a. ***Proposed Section 423.100 Definition***[3]

The proposed rule includes a definition of two terms that would benefit from more specificity:

- "Covered Part D Drug,"[4] and
- "Dispensing fee."[5]

Covered Part D Drug

CMS addresses the complex issue of drugs that can be covered under Part A, B or D, depending on the form of administration and site of service. While the Part D benefit is expected to be a "wrap-around" to the other benefits, the rulemaking contains descriptions of infusion or injectable drugs that have characteristics similar to a nebulized drug, and others that are administered through DME, where the drug product could be picked up at a pharmacy and be self-administered at home.

Our concern is that the examples include situations that are currently within the purview of the DMERCs and are intended to be addressed in subsequent regulations regarding the competitive acquisition programs for Part B drugs, supplies, medical equipment and related services. We recognize that some drug delivery mechanisms are not covered under Part B, and that beneficiaries could benefit from the "wrap-around" nature of the Part D benefit.

[3] 69 Fed Reg 46646.
[4] 69 Fed Reg 46646.

However, a drug administered through DME should remain a Part B covered service when it is used in a setting which is currently covered by the DMERCs; furthermore, we propose that it should be specifically excluded from Part D. Coverage for these products has evolved over many years, and the coverage criteria and decisions reflect the complex issues that need to be considered in order to structure a program that does not disrupt existing services. This consideration is beyond the scope of reform contemplated by Congress, prior to an analysis by the Secretary.

Part D Dispensing Fee

We commend CMS for clearly stating that the definition of a dispensing fee would apply specifically to Part D, and we agree with the agency's preference for the first of the three options described in the proposed rule; i.e., a single fee associated solely with dispensing of the prescription. We recognize the need for CMS to consider Options 2 and 3 (involving the necessary equipment and supplies and the necessary professional services of a nurse or pharmacist) for home infusion drugs.

However, if Options 2 and 3 are part of the final rule, PDPs should be excluded from applying such fees to reimburse for the costs of services currently subject to Part B coverage. Our concern is that permissible instances in which Options 2 and 3 may be needed (e.g., to reimburse for the costs of supplies and services associated with home infusion drugs that may not be covered currently under Part B) could be applied more broadly and inappropriately to other Part B covered services. Our concern is specifically

[5] 69 Fed Reg 46647.

grounded in the reimbursement circumstances surrounding Dey's product, DuoNeb® Inhalation Solution ("DuoNeb"), used in the treatment of COPD. We presented these concerns in our September 17, 2004 letter in response to **[**CMS-1429-P] Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule for Calendar Year 2005. A summary of the rationale is provided in Exhibit A.

b. Proposed Section 423.120 Access to Covered Part D Drug[6]

Our concerns relate to two provisions regarding the ways in which Medicare beneficiary access to pharmacies can be assured. Specifically, we have concerns regarding CMS preamble language pertaining to availability of PDP access to 1) long term care pharmacy, and 2) home infusion pharmacy providers.

1) Long Term Care Pharmacy

While it is appropriate for CMS to consider whether the new Medicare Prescription Drug Plans (PDPs) should be required to include long-term care pharmacies in their plans and to take into account how the PDP might reimburse these pharmacies for services such as infusion therapy and 24 hour medication delivery, our concern is that such services should be excluded from Part D coverage if Part B coverage is available.

2) Home Infusion Pharmacy

The issue is the same for home infusion pharmacies, although we note with some concern that CMS is seeking comments on ways to encourage PDPs, who do not have a medical benefit and therefore cannot realize efficiencies from reduced hospital costs, to establish

contracts with home infusion pharmacies. The potential to offer performance incentives for Part D contractors for savings under Part A or Part B goes beyond the scope of what MMA contemplated. These types of savings could more appropriately be captured under the Chronic Care Improvement Program, which MMA established as a demonstration.

2. Subpart D. Cost Controls and Quality Improvement Requirements for Prescription Drug Benefit Plans

a) Proposed Section 423.153 Cost and Utilization Management, Quality Assurance, Medication Therapy Management Programs and Programs to Control Fraud, Abuse and Waste

Two provisions of this proposed section could be detrimental to Medicare beneficiaries' continued access to Part B covered drugs and related services:

- Cost Effective Drug Utilization Management[7] (relating to the use of compounded drugs); and
- Medication Therapy Management[8] (relating to providing appropriate nebulizer utilization).

Cost Effective Drug Utilization Management

CMS solicits comments on industry standards for cost effective drug utilization management, which includes the use of incentives to reduce costs, "when medically

[6] 69 Fed Reg 46655.
[7] 69 Fed Reg 46666.
[8] 69 Fed Reg 46668.

appropriate," which is not defined. We suggest that the term "medically appropriate" should specify criteria as to when using compounded drugs would be considered a medically appropriate incentive to reduce costs.

Specifically, we believe CMS should ensure that compounding is done on a patient-name prescription basis, and that pharmacies use all compounding and admixing precautions to ensure product sterility and freedom from microbe ingress contamination. Patient safety is crucial, and the quality of the compounded product should be comparable to a commercial drug product.

Another area of concern regarding compounding is that the FDA prohibits pharmacy compounding of two or more separate FDA-approved products when a combination product approved by the FDA is commercially available.[9]

Specifically, in the past six months alone, the FDA has cited and sent warning letters to several pharmacies for the following compounding violations: preparing drug products that are commercially available, and compounding drugs "without the necessary controls to ensure drug product sterility and potency."[10,11,12]

[9] Food and Drug Administration. Compliance Policy Guidance for FDA Staff and Industry. Sec. 460.200 (Pharmacy Compounding). June 7, 2002. Accessed August 10, 2004 at http://www.fda.gov/ora/compliance_ref/cpg/cpgdrg/cpg460-200.html.
[10] FDA warning letter to Axium Healthcare Pharmacy, June 7, 2004, at http://www.fda.gov/cder/warn/2004/AXIUM%20%20wl.pdf.
[11] FDA warning letter to Gentere, Inc., July 13, 2004, at http://www.fda.gov/foi/warning_letters/g4863d.htm.
12 FDA warning letter to delta Pharma, Inc., September 17, 2004, at http://www.fda.gov/foi/warning_letters/g4965d.htm.

Violations of the FDA policy against compounding commercially-available drugs affect DuoNeb, since it is a currently marketed, sterile, non-allergenic, premixed combination drug; these manufacturing processes are designed to lower the risk of drug cross-contamination and to minimize waste. The premixed, unit-dose combination of the two agents within DuoNeb enhances patient safety by minimizing the chance for medication errors, and it eliminates the need for the Medicare patient to nebulize two different solutions, resulting in faster treatment times and improved compliance.

As for the second category of violation – compounding drugs "without the necessary controls to ensure drug product sterility and potency" – quite obviously patient safety is at risk, and a threat to public health is created. We also note that, in 2002, the FDA sampled 29 drugs from compounding pharmacies and found that 10 were subpotent.[12] In all, the compounded drugs sampled by the FDA registered a 34 percent failure rate – far in excess of the comparable two percent rate for commercially-available drugs.[13]

These examples highlight the complexity unique to prescription drugs covered under Part B and the need for greater clarity and precision in the Part D proposed rule.

Medication Therapy Management Program

CMS solicits comments on whether it should define the terms "multiple covered Part D drugs" and "multiple chronic diseases", or allow the PDPs to define the terms as part of their bids to CMS. While we support the use of appropriate disease management tools

---

[12] Report: Limited FDA Survey of Compounded Drug Products. Food and Drug Administration. Accessed August 24, 2004 at http://www.fda.gov/cder/pharmcomp/survey.htm.
[13] *Id.*

such as the Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines, our concern is that CMS maintain a level playing field among its contractors and not create an advantage for PDPs who potentially could be rewarded for reducing nebulizer use among a sub-set of COPD patients, without adequately considering clinical factors such as those included in the DMERC coverage policies.

Conclusion

Dey, L.P. appreciates the opportunity to comment on these three proposed sections that – absent additional clarification – could affect Medicare beneficiaries' access to life-saving and quality-of-life enhancing medications. We base our observation on examples contained in the proposed rule that, while casually presented, belie the underlying complexity that results when coverage could be provided under different benefits, depending on the route of administration and site of service. Coupled with the concerns we raised in our response to the proposed rule on Part B payment, we are compelled to reiterate our recommendation that CMS develop a cohesive strategy for inhalation drug therapy based on clinical guidelines and correct assumptions as to the medical necessity of nebulizer-based therapy by some patients. In addition, including pharmacy compounding as an activity whose costs may be included in the dispensing fee could be troublesome, given that on certain occasions pharmacy compounding is not appropriate and should not be reimbursed by PDPs.

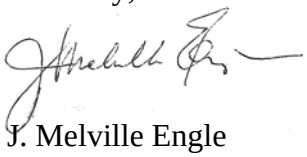
We urge CMS to revisit the proposed changes regarding a revised (or incremental) dispensing fee by conducting a study of the appropriate activities and their costs, and by considering the considerable operating and patient-support expenses borne by pharmacies.

The concept of a "service fee" may be a more appropriate description of the various pharmacy activities and expenses.

Dey, L.P. believes that CMS needs to be more specific in the final regulation about the Part D benefit for those prescription drugs that can be covered under the Part B benefit. The MMA includes several provisions related to the latter that will be implemented over the next few years and also calls for the Secretary to study these issues and report to Congress. We know the complexity of the issues related to inhalation products and support an approach that considers them in the overall context of respiratory disease costs to the Medicare program. It is important to get the right prescriptions to patients using the most appropriate delivery mechanism, be it nebulizers, MDIs, or dry powder inhalers (DPIs), all of which are found in clinical practice guidelines and will be included in Medicare's benefits as of 2006. CMS and its contractors need to strive for consistency with existing Medicare policies and FDA polices to ensure that payment policy changes do not create incentives for activities that are not consistent with the coverage of products under existing benefits and the assurances provided to the public by the FDA.

Thank you for the opportunity to present our views with respect to these selected provisions detailing how the Part D benefit will be implemented.

Sincerely,



J. Melville Engle

President and CEO

Nebulizers versus MDIs

We feel compelled to correct the record regarding the stance CMS has taken regarding the relative and comparative value of nebulizers versus MDIs. In the portion of the Proposed Rule preamble pertaining to MMA Section 305, CMS states that Medicare beneficiaries have a "strong" financial incentive to use nebulizers since the alternative inhalation drug delivery mechanism, metered dose inhalers (MDIs), currently are not covered under Part B, and beneficiaries will have to wait until January 2006 to be covered under the new Part D drug benefit. CMS also states that, based on a literature review, nebulizers are no more effective than MDIs in delivering bronchodilators, and CMS predicts a substantial shift from nebulizers to MDIs once the latter become covered under Part D beginning in 2006.[14] We fear CMS may underestimate the clinical value, patient preference and improved outcomes for nebulized respiratory medication which is based on a reduction of symptoms and improved quality of life, not financial incentives.

While it is true that some studies have shown that nebulizers and inhalers are equally effective, the performance of inhalers was augmented by spacers.[15,16,17] Spacers are designed to deliver MDI-delivered medication more easily and effectively. In common

practice, studies have shown that patients only use spacers to be used with inhalers approximately 50 percent of the time.[18,19] **Without** accessories such as spacers, much of the medication is left in the mouth and throat, thus reducing absorption and efficacy.[20]

In addition, the literature is replete with studies showing that many patients, up to 89%, do not employ proper inhaler technique.[21,22,23] Therapeutic benefit depends on sufficient deposition of drugs in the medium and small airways; this is largely determined by a competent inhaler technique.[24,25] The most recent report of the Global Initiative for Chronic Obstructive Lung Disease (GOLD) states that "COPD patients may have more problems in effective coordination and find it harder to use a simple Metered Dose Inhaler (MDI) than do healthy volunteers or younger asthmatics."[26]

Market research has confirmed the practical superiority of nebulizers to MDIs, as judged from the patients' perspective. One study compared the value of nebulizer systems with MDIs from the patient's perspective, based on an analysis of 1,369 questionnaires.[27] According to the study, nebulizer systems were preferred and considered by patients to be more effective at symptom control than MDIs. Key findings were as follows:

- Fifty-seven percent (57%) of patients surveyed said their symptoms were better controlled with a nebulizer system than with an MDI.
- Eighty-two percent (82%) said the nebulizer system controlled their symptoms for a longer period of time than the MDI.
- Over 80% of patients said the nebulizer system had given them a better quality of life than an MDI alone. Nearly 70% of patients surveyed said the nebulizer system had helped them avoid a trip to the emergency room.
- Fifty-six percent (56%) of these patients said use of a nebulizer system helped to avoid hospitalization.
- Fifty-eight percent (58%) of these patients had avoided unscheduled office visits by using their nebulizer systems.

In short, nebulizers are the preferred method of delivery of bronchodilators for a large proportion of COPD patients, including Medicare beneficiaries. In the preamble, CMS expresses concern that the access of beneficiaries to nebulized bronchodilators in 2005 might be restricted, due to the reduction in Part B payment rates for frequently used

[27] Safian Communications, Inc. Patient Assessment of Efficacy of Nebulizer Systems on Their Respiratory Health. April 1995 (report available on request).

bronchodilators.[28] We agree this is a serious concern, but we submit that it is not a short-term problem that will disappear in 2006. Beneficiaries' continued need for nebulized bronchodilators, even after MDIs become covered under Part D, will make it all the more essential that CMS adequately reimburse providers for these drugs under Part B on an ongoing basis.

[28] Proposed Rule, 69 Fed Reg 47549.

EXHIBIT B

Circumstances Where Compounded Combination Albuterol and Ipratropium Should Not Be Covered Under Medicare

FDA Prohibition of Certain Types of Pharmacy Compounding

Certain types of pharmacy compounding are discouraged by FDA policy, as articulated in Compliance Policy Guide (CPG), Section 460.200, issued on June 7, 2002.[29] The CPG contains factors that the agency considers in deciding whether to exercise its enforcement discretion. One factor is whether a firm **compounds drug products that are commercially available, or which are essentially copies of commercially available FDA-approved products**.[30]

If one or more of the factors identified in CPG section 460.200 are present, such compounding pharmacies may be manufacturing drugs which are subject to the new drug application (NDA) requirements of the Federal Food, Drug, and Cosmetic Act (FFDCA), but for which the FDA has not approved an NDA, or which are misbranded or adulterated. If the FDA has not approved the manufacturing and processing procedures used by these facilities, the FDA has no assurance that the drugs produced are safe and efficacious. Safety and efficacy issues pertain to such factors as chemical stability, purity, strength,

[29] Compliance Policy Guidance for FDA Staff and Industry. Sec. 460.200 (Pharmacy Compounding). Food and Drug Administration. June 7, 2002. Accessed August 10, 2004 at http://www.fda.gov/ora/compliance_ref/cpg/cpgdrg/cpg460-200.html.

[30] Emphasis supplied. In certain circumstances, it may be appropriate for a pharmacist to compound a small quantity of a drug that is only slightly different than an FDA-approved drug that is commercially available. In these circumstances, FDA will consider whether there is documentation of the medical need for the particular variation of the compound for the particular patient.

bioequivalency, and bioavailability. Dey, L.P. is concerned that patients may be receiving unsafe, unsterile drugs of unknown potency and composition, a needless risk when, in the case of pharmacy-compounded albuterol and ipratropium, an FDA-approved inhalation solution is available in DuoNeb® Inhalation Solution.

Based on 1) the NDA requirements of the FFDCA, and 2) CPG §460.200, pharmacy-compounded combinations of albuterol and ipratropium that contain equivalent amounts of the active ingredients in DuoNeb® Inhalation Solution are prohibited by the FDA.

Medicare Denial of Payment for Certain Types of Pharmacy Compounding

If the FDA prohibits pharmacy-compounded combinations of albuterol and ipratropium, then chapter 15, section 50.4.7 of the Medicare Benefit Policy Manual, entitled "Denial of Medicare Payment for Compounded Drugs Produced in Violation of Federal Food, Drug, and Cosmetic Act," should apply. The applicable portion of §50.4.7 reads as follows:

> Section 1862(a)(1)(A) of the Act requires that drugs must be reasonable and necessary in order to be covered under Medicare. This means, in the case of drugs, the FDA must approve them for marketing. Section 50.4.1 instructs carriers and intermediaries to deny coverage for drugs that have not received final marketing approval by the FDA, unless instructed otherwise by CMS. The Medicare Benefit Policy Manual, Chapter 16, "General Exclusions from Coverage," §180, instructs carriers to deny coverage of services related to the use of noncovered drugs as well. Hence, if DME or a prosthetic device is used to administer a noncovered drug, coverage is denied for both the nonapproved drug and the DME or prosthetic device.[31]

[31] Centers for Medicare and Medicaid Services. Medicare Benefit Policy Manual. Chapter 15 (Covered Medical and Other Health Services); §50.4.7 (Denial of Medicare Payment for Compounded Drugs

In order to provide consistency across all benefit categories, all Medicare contractors, including PDPs should adhere to provisions such as those in the Medicare Benefit Policy Manual. This would ensure that any claim for a drug that requires FDA approval but is not FDA-approved would be denied, regardless of the benefit category under which the claim was made. For example, payment for combination products such as albuterol and ipratropium, and the delivery system used to administer the drugs, should be limited to FDA-approved formulations.

Produced in Violation of Federal Food, Drug, and Cosmetic Act). Rev. 13. May 28, 2004. Accessed August 11, 2004 at http://www.cms.hhs.gov/manuals/102_policy/bp102c15.pdf.

Executive Summary
Comments on "Medicare Program; Medicare Prescription Dug Benefit; Proposed Rule"
(CMS-4068-P)

Dey, L.P. appreciates the opportunity to comment on the following issues addressed in the above-referenced proposed rule and its preamble:[1]

- Subpart C – Benefits and Beneficiary Protections
  - Section 423.100 (Definition of "Covered Part D Drug")
  - Section 423.120 (Access to Covered Part D Drugs)

- Subpart D – Cost Control and Quality Improvement Requirements for Prescription Drug Benefit Plans
  - Section 423.153 (Cost and Utilization Management, Quality Assurance, Medication Therapy Management Programs, and Programs to Control Fraud, Abuse, and Waste)

Key Overall Point: CMS acknowledges the statutorily-mandated distinction between Part B and Part D drugs. Our principal concern is that the agency inappropriately suggests that certain Part B drugs with characteristics such as those described in the proposed rule's preamble – i.e., drugs covered as incident to a physician's service or furnished through an item of DME – could be covered under Part D.

"Covered Part D Drug": Dey supports the principle enunciated in the rulemaking that Part D "wraps around" Part B, providing beneficiaries with drug coverage that is seamless. However, portions of the preamble extend this "wrap around" principle beyond reasonable bounds. Specifically, the preamble cites examples that could be interpreted to confer Part D coverage on infusion and injectable drugs in situations that are currently within the Part B claims administration authority of the DMERCs. Similarly, in addressing dispensing fees for Part D drugs, CMS identifies options that, if implemented with respect to infusion drugs, could be applied more broadly – and inappropriately – to other Part B services.

> *Recommendation*: CMS should make clear that DME drugs used in situations now covered under Part B are excluded from coverage under Part D.

Access to Covered Part D Drugs: The rulemaking appropriately addresses means for ensuring that beneficiaries have access to Prescription Drug Plans (PDPs) that include in their networks' long-term care pharmacies and home infusion pharmacy providers. However, because these pharmacies/providers offer drug-related services that are typically covered under Part B, CMS should take special care to ensure that Part D coverage does not substitute for coverage available under Part B. In fact, we read the preamble's language on these points almost to invite such substitution. For example, CMS seeks comments on whether PDPs should receive performance incentives for producing Medicare savings under Parts *A and B* – virtually an open invitation to replace Part B drug coverage with Part D coverage if the PDP believes it will save money.

[1] 69 Fed Reg 46632 (Aug. 3, 2004).

The Medicare Modernization Act (MMA) clearly did not contemplate this type of Part D-Part B substitution. Indeed, the MMA, in establishing a Chronic Care Improvement Program, provided a separate means for CMS (on a demonstration basis) to test methods for identifying clinical and economic synergies among Parts A, B, and D.

> *Recommendation*: CMS should make clear that PDPs may not substitute Part D drug coverage in situations in which Part B drug coverage is available.

Medication Therapy Management: CMS solicits comments on whether the terms "multiple covered Part D drugs" and "multiple chronic diseases" should be defined by the agency itself or by PDPs. Both terms implicate use of disease management tools – tools that Dey supports. However, we are concerned that inappropriately inserting these tools into Medicare Part D, but not into Part B, could exert a counterproductive, asymmetrical effect. That is, by rewarding PDPs for exacting savings on a drug used in a situation that makes it Part D-covered (when, in other situations, it is Part B-covered) could discourage PDPs from considering the clinical factors DMERCs have long taken into account in administering Part B drug claims.

> *Recommendation*: CMS, not PDPs, should define the key terms. In so doing, the agency should maintain a level playing field among Medicare contractors, preventing PDPs from inappropriately reducing utilization for a subset of the situations in which a drug is used.

Drug Utilization Management: The preamble, in addressing industry standards for drug utilization management, suggests incentives to reduce costs "when medically appropriate" – a phrase not defined.

> *Recommendation*: The phrase "medically appropriate" should be defined to include criteria for ensuring that compounding of drugs is performed in a fashion consistent with patient safety and FDA's requirements.

Attention CMS-1429-P

P.O. Box 8012

Baltimore, Maryland 21244-8012

Re: [CMS--4068-P] Medicare Program; Medicare Program; Medicare Prescription Drug Benefit

Dear Sir or Madam:

Dey, L.P. is pleased to submit the following comments regarding the above-referenced proposed rule (Proposed Rule).[1] Dey, L.P. welcomes the opportunity to work with the Centers for Medicare and Medicaid Services (CMS) as it develops policy for drugs currently covered as a Part B benefit with the potential for coverage as a Part D benefit in 2006.

Dey, L.P. develops, manufactures, and markets prescription pharmaceuticals for the treatment of respiratory illnesses, including chronic obstructive pulmonary disease (COPD), a condition that represents a significant financial burden for the Medicare program and a serious threat to patient longevity and quality of life.

We propose that CMS clarify in the final rule to specifically exclude from Part D those drugs covered under Part B because they are incident to durable medical equipment (DME).

We are providing comments on three sections of the Proposed Rule that hold implications for the availability of drugs provided as a Part B benefit that may, under some circumstances, be provided as a Part D benefit:

1. Section 423.100, regarding the definition of a covered Part D drug;
2. Section 423.120, regarding access to covered Part D drugs; and
3. Section 423.153 in Subpart D Cost Control and Quality Improvement Requirements for Prescription Drug Plans

Various examples in the proposed rule could establish a precedent for changing coverage from an existing benefit (Part B) to a new one (Part D), thereby violating the "wrap around" principle that CMS has enunciated for Part D.

We suggest that CMS specify clearly in the final rule that drugs currently covered under Part B, either incident to a physician service, or incident to the DME benefit, be excluded from Part D coverage until such time as the Secretary issues the report on this subject (required under the Medicare Modernization Act) and the Congress acts to give CMS the authority to implement any recommended changes stemming from the report.[2]

[1] Proposed Rule, 69 Fed Reg 46631 (Aug. 3, 2004).
[2] Medicare Prescription Drug, Improvement, and Modernization Act of 2003, sec. 101(d).

1. **Subpart C. Voluntary Prescription Drug Benefit and Beneficiary Protections**

   a. ***Proposed Section 423.100 Definition***[3]

The proposed rule includes a definition of two terms that would benefit from more specificity:

- "Covered Part D Drug,"[4] and
- "Dispensing fee."[5]

Covered Part D Drug

CMS addresses the complex issue of drugs that can be covered under Part A, B or D, depending on the form of administration and site of service. While the Part D benefit is expected to be a "wrap-around" to the other benefits, the rulemaking contains descriptions of infusion or injectable drugs that have characteristics similar to a nebulized drug, and others that are administered through DME, where the drug product could be picked up at a pharmacy and be self-administered at home.

Our concern is that the examples include situations that are currently within the purview of the DMERCs and are intended to be addressed in subsequent regulations regarding the competitive acquisition programs for Part B drugs, supplies, medical equipment and related services. We recognize that some drug delivery mechanisms are not covered under Part B, and that beneficiaries could benefit from the "wrap-around" nature of the Part D benefit.

[3] 69 Fed Reg 46646.
[4] 69 Fed Reg 46646.

However, a drug administered through DME should remain a Part B covered service when it is used in a setting which is currently covered by the DMERCs; furthermore, we propose that it should be specifically excluded from Part D. Coverage for these products has evolved over many years, and the coverage criteria and decisions reflect the complex issues that need to be considered in order to structure a program that does not disrupt existing services. This consideration is beyond the scope of reform contemplated by Congress, prior to an analysis by the Secretary.

Part D Dispensing Fee

We commend CMS for clearly stating that the definition of a dispensing fee would apply specifically to Part D, and we agree with the agency's preference for the first of the three options described in the proposed rule; i.e., a single fee associated solely with dispensing of the prescription. We recognize the need for CMS to consider Options 2 and 3 (involving the necessary equipment and supplies and the necessary professional services of a nurse or pharmacist) for home infusion drugs.

However, if Options 2 and 3 are part of the final rule, PDPs should be excluded from applying such fees to reimburse for the costs of services currently subject to Part B coverage. Our concern is that permissible instances in which Options 2 and 3 may be needed (e.g., to reimburse for the costs of supplies and services associated with home infusion drugs that may not be covered currently under Part B) could be applied more broadly and inappropriately to other Part B covered services. Our concern is specifically

[5] 69 Fed Reg 46647.

grounded in the reimbursement circumstances surrounding Dey's product, DuoNeb® Inhalation Solution ("DuoNeb"), used in the treatment of COPD. We presented these concerns in our September 17, 2004 letter in response to **[**CMS-1429-P] Medicare Program; Revisions to Payment Policies Under the Physician Fee Schedule for Calendar Year 2005. A summary of the rationale is provided in Exhibit A.

b. Proposed Section 423.120 Access to Covered Part D Drug[6]

Our concerns relate to two provisions regarding the ways in which Medicare beneficiary access to pharmacies can be assured. Specifically, we have concerns regarding CMS preamble language pertaining to availability of PDP access to 1) long term care pharmacy, and 2) home infusion pharmacy providers.

1) Long Term Care Pharmacy

While it is appropriate for CMS to consider whether the new Medicare Prescription Drug Plans (PDPs) should be required to include long-term care pharmacies in their plans and to take into account how the PDP might reimburse these pharmacies for services such as infusion therapy and 24 hour medication delivery, our concern is that such services should be excluded from Part D coverage if Part B coverage is available.

2) Home Infusion Pharmacy

The issue is the same for home infusion pharmacies, although we note with some concern that CMS is seeking comments on ways to encourage PDPs, who do not have a medical benefit and therefore cannot realize efficiencies from reduced hospital costs, to establish

contracts with home infusion pharmacies. The potential to offer performance incentives for Part D contractors for savings under Part A or Part B goes beyond the scope of what MMA contemplated. These types of savings could more appropriately be captured under the Chronic Care Improvement Program, which MMA established as a demonstration.

2. Subpart D. Cost Controls and Quality Improvement Requirements for Prescription Drug Benefit Plans

a) Proposed Section 423.153 Cost and Utilization Management, Quality Assurance, Medication Therapy Management Programs and Programs to Control Fraud, Abuse and Waste

Two provisions of this proposed section could be detrimental to Medicare beneficiaries' continued access to Part B covered drugs and related services:

- Cost Effective Drug Utilization Management[7] (relating to the use of compounded drugs); and
- Medication Therapy Management[8] (relating to providing appropriate nebulizer utilization).

Cost Effective Drug Utilization Management

CMS solicits comments on industry standards for cost effective drug utilization management, which includes the use of incentives to reduce costs, "when medically

[6] 69 Fed Reg 46655.
[7] 69 Fed Reg 46666.
[8] 69 Fed Reg 46668.

appropriate," which is not defined. We suggest that the term "medically appropriate" should specify criteria as to when using compounded drugs would be considered a medically appropriate incentive to reduce costs.

Specifically, we believe CMS should ensure that compounding is done on a patient-name prescription basis, and that pharmacies use all compounding and admixing precautions to ensure product sterility and freedom from microbe ingress contamination. Patient safety is crucial, and the quality of the compounded product should be comparable to a commercial drug product.

Another area of concern regarding compounding is that the FDA prohibits pharmacy compounding of two or more separate FDA-approved products when a combination product approved by the FDA is commercially available.[9]

Specifically, in the past six months alone, the FDA has cited and sent warning letters to several pharmacies for the following compounding violations: preparing drug products that are commercially available, and compounding drugs "without the necessary controls to ensure drug product sterility and potency."[10,11,12]

[9] Food and Drug Administration. Compliance Policy Guidance for FDA Staff and Industry. Sec. 460.200 (Pharmacy Compounding). June 7, 2002. Accessed August 10, 2004 at http://www.fda.gov/ora/compliance_ref/cpg/cpgdrg/cpg460-200.html.
[10] FDA warning letter to Axium Healthcare Pharmacy, June 7, 2004, at http://www.fda.gov/cder/warn/2004/AXIUM%20%20wl.pdf.
[11] FDA warning letter to Gentere, Inc., July 13, 2004, at http://www.fda.gov/foi/warning_letters/g4863d.htm.
12 FDA warning letter to delta Pharma, Inc., September 17, 2004, at http://www.fda.gov/foi/warning_letters/g4965d.htm.

Violations of the FDA policy against compounding commercially-available drugs affect DuoNeb, since it is a currently marketed, sterile, non-allergenic, premixed combination drug; these manufacturing processes are designed to lower the risk of drug cross-contamination and to minimize waste. The premixed, unit-dose combination of the two agents within DuoNeb enhances patient safety by minimizing the chance for medication errors, and it eliminates the need for the Medicare patient to nebulize two different solutions, resulting in faster treatment times and improved compliance.

As for the second category of violation – compounding drugs "without the necessary controls to ensure drug product sterility and potency" – quite obviously patient safety is at risk, and a threat to public health is created. We also note that, in 2002, the FDA sampled 29 drugs from compounding pharmacies and found that 10 were subpotent.[12] In all, the compounded drugs sampled by the FDA registered a 34 percent failure rate – far in excess of the comparable two percent rate for commercially-available drugs.[13]

These examples highlight the complexity unique to prescription drugs covered under Part B and the need for greater clarity and precision in the Part D proposed rule.

Medication Therapy Management Program

CMS solicits comments on whether it should define the terms "multiple covered Part D drugs" and "multiple chronic diseases", or allow the PDPs to define the terms as part of their bids to CMS. While we support the use of appropriate disease management tools

---

[12] Report: Limited FDA Survey of Compounded Drug Products. Food and Drug Administration. Accessed August 24, 2004 at http://www.fda.gov/cder/pharmcomp/survey.htm.
[13] *Id.*

such as the Global Initiative for Chronic Obstructive Lung Disease (GOLD) guidelines, our concern is that CMS maintain a level playing field among its contractors and not create an advantage for PDPs who potentially could be rewarded for reducing nebulizer use among a sub-set of COPD patients, without adequately considering clinical factors such as those included in the DMERC coverage policies.

Conclusion

Dey, L.P. appreciates the opportunity to comment on these three proposed sections that – absent additional clarification – could affect Medicare beneficiaries' access to life-saving and quality-of-life enhancing medications. We base our observation on examples contained in the proposed rule that, while casually presented, belie the underlying complexity that results when coverage could be provided under different benefits, depending on the route of administration and site of service. Coupled with the concerns we raised in our response to the proposed rule on Part B payment, we are compelled to reiterate our recommendation that CMS develop a cohesive strategy for inhalation drug therapy based on clinical guidelines and correct assumptions as to the medical necessity of nebulizer-based therapy by some patients. In addition, including pharmacy compounding as an activity whose costs may be included in the dispensing fee could be troublesome, given that on certain occasions pharmacy compounding is not appropriate and should not be reimbursed by PDPs.

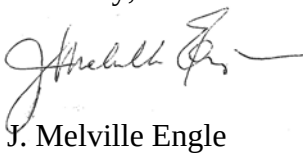
We urge CMS to revisit the proposed changes regarding a revised (or incremental) dispensing fee by conducting a study of the appropriate activities and their costs, and by considering the considerable operating and patient-support expenses borne by pharmacies.

The concept of a "service fee" may be a more appropriate description of the various pharmacy activities and expenses.

Dey, L.P. believes that CMS needs to be more specific in the final regulation about the Part D benefit for those prescription drugs that can be covered under the Part B benefit. The MMA includes several provisions related to the latter that will be implemented over the next few years and also calls for the Secretary to study these issues and report to Congress. We know the complexity of the issues related to inhalation products and support an approach that considers them in the overall context of respiratory disease costs to the Medicare program. It is important to get the right prescriptions to patients using the most appropriate delivery mechanism, be it nebulizers, MDIs, or dry powder inhalers (DPIs), all of which are found in clinical practice guidelines and will be included in Medicare's benefits as of 2006. CMS and its contractors need to strive for consistency with existing Medicare policies and FDA polices to ensure that payment policy changes do not create incentives for activities that are not consistent with the coverage of products under existing benefits and the assurances provided to the public by the FDA.

Thank you for the opportunity to present our views with respect to these selected provisions detailing how the Part D benefit will be implemented.

Sincerely,



J. Melville Engle

President and CEO

Nebulizers versus MDIs

We feel compelled to correct the record regarding the stance CMS has taken regarding the relative and comparative value of nebulizers versus MDIs. In the portion of the Proposed Rule preamble pertaining to MMA Section 305, CMS states that Medicare beneficiaries have a "strong" financial incentive to use nebulizers since the alternative inhalation drug delivery mechanism, metered dose inhalers (MDIs), currently are not covered under Part B, and beneficiaries will have to wait until January 2006 to be covered under the new Part D drug benefit. CMS also states that, based on a literature review, nebulizers are no more effective than MDIs in delivering bronchodilators, and CMS predicts a substantial shift from nebulizers to MDIs once the latter become covered under Part D beginning in 2006.[14] We fear CMS may underestimate the clinical value, patient preference and improved outcomes for nebulized respiratory medication which is based on a reduction of symptoms and improved quality of life, not financial incentives.

While it is true that some studies have shown that nebulizers and inhalers are equally effective, the performance of inhalers was augmented by spacers.[15,16,17] Spacers are designed to deliver MDI-delivered medication more easily and effectively. In common

practice, studies have shown that patients only use spacers to be used with inhalers approximately 50 percent of the time.[18,19] **Without** accessories such as spacers, much of the medication is left in the mouth and throat, thus reducing absorption and efficacy.[20]

In addition, the literature is replete with studies showing that many patients, up to 89%, do not employ proper inhaler technique.[21,22,23] Therapeutic benefit depends on sufficient deposition of drugs in the medium and small airways; this is largely determined by a competent inhaler technique.[24,25] The most recent report of the Global Initiative for Chronic Obstructive Lung Disease (GOLD) states that "COPD patients may have more problems in effective coordination and find it harder to use a simple Metered Dose Inhaler (MDI) than do healthy volunteers or younger asthmatics."[26]

Market research has confirmed the practical superiority of nebulizers to MDIs, as judged from the patients' perspective. One study compared the value of nebulizer systems with MDIs from the patient's perspective, based on an analysis of 1,369 questionnaires.[27] According to the study, nebulizer systems were preferred and considered by patients to be more effective at symptom control than MDIs. Key findings were as follows:

- Fifty-seven percent (57%) of patients surveyed said their symptoms were better controlled with a nebulizer system than with an MDI.
- Eighty-two percent (82%) said the nebulizer system controlled their symptoms for a longer period of time than the MDI.
- Over 80% of patients said the nebulizer system had given them a better quality of life than an MDI alone. Nearly 70% of patients surveyed said the nebulizer system had helped them avoid a trip to the emergency room.
- Fifty-six percent (56%) of these patients said use of a nebulizer system helped to avoid hospitalization.
- Fifty-eight percent (58%) of these patients had avoided unscheduled office visits by using their nebulizer systems.

In short, nebulizers are the preferred method of delivery of bronchodilators for a large proportion of COPD patients, including Medicare beneficiaries. In the preamble, CMS expresses concern that the access of beneficiaries to nebulized bronchodilators in 2005 might be restricted, due to the reduction in Part B payment rates for frequently used

[27] Safian Communications, Inc. Patient Assessment of Efficacy of Nebulizer Systems on Their Respiratory Health. April 1995 (report available on request).

bronchodilators.[28] We agree this is a serious concern, but we submit that it is not a short-term problem that will disappear in 2006. Beneficiaries' continued need for nebulized bronchodilators, even after MDIs become covered under Part D, will make it all the more essential that CMS adequately reimburse providers for these drugs under Part B on an ongoing basis.

[28] Proposed Rule, 69 Fed Reg 47549.

EXHIBIT B

Circumstances Where Compounded Combination Albuterol and Ipratropium Should Not Be Covered Under Medicare

FDA Prohibition of Certain Types of Pharmacy Compounding

Certain types of pharmacy compounding are discouraged by FDA policy, as articulated in Compliance Policy Guide (CPG), Section 460.200, issued on June 7, 2002.[29] The CPG contains factors that the agency considers in deciding whether to exercise its enforcement discretion. One factor is whether a firm **compounds drug products that are commercially available, or which are essentially copies of commercially available FDA-approved products**.[30]

If one or more of the factors identified in CPG section 460.200 are present, such compounding pharmacies may be manufacturing drugs which are subject to the new drug application (NDA) requirements of the Federal Food, Drug, and Cosmetic Act (FFDCA), but for which the FDA has not approved an NDA, or which are misbranded or adulterated. If the FDA has not approved the manufacturing and processing procedures used by these facilities, the FDA has no assurance that the drugs produced are safe and efficacious. Safety and efficacy issues pertain to such factors as chemical stability, purity, strength,

[29] Compliance Policy Guidance for FDA Staff and Industry. Sec. 460.200 (Pharmacy Compounding). Food and Drug Administration. June 7, 2002. Accessed August 10, 2004 at http://www.fda.gov/ora/compliance_ref/cpg/cpgdrg/cpg460-200.html.

[30] Emphasis supplied. In certain circumstances, it may be appropriate for a pharmacist to compound a small quantity of a drug that is only slightly different than an FDA-approved drug that is commercially available. In these circumstances, FDA will consider whether there is documentation of the medical need for the particular variation of the compound for the particular patient.

bioequivalency, and bioavailability. Dey, L.P. is concerned that patients may be receiving unsafe, unsterile drugs of unknown potency and composition, a needless risk when, in the case of pharmacy-compounded albuterol and ipratropium, an FDA-approved inhalation solution is available in DuoNeb® Inhalation Solution.

Based on 1) the NDA requirements of the FFDCA, and 2) CPG §460.200, pharmacy-compounded combinations of albuterol and ipratropium that contain equivalent amounts of the active ingredients in DuoNeb® Inhalation Solution are prohibited by the FDA.

Medicare Denial of Payment for Certain Types of Pharmacy Compounding

If the FDA prohibits pharmacy-compounded combinations of albuterol and ipratropium, then chapter 15, section 50.4.7 of the Medicare Benefit Policy Manual, entitled "Denial of Medicare Payment for Compounded Drugs Produced in Violation of Federal Food, Drug, and Cosmetic Act," should apply. The applicable portion of §50.4.7 reads as follows:

> Section 1862(a)(1)(A) of the Act requires that drugs must be reasonable and necessary in order to be covered under Medicare. This means, in the case of drugs, the FDA must approve them for marketing. Section 50.4.1 instructs carriers and intermediaries to deny coverage for drugs that have not received final marketing approval by the FDA, unless instructed otherwise by CMS. The Medicare Benefit Policy Manual, Chapter 16, "General Exclusions from Coverage," §180, instructs carriers to deny coverage of services related to the use of noncovered drugs as well. Hence, if DME or a prosthetic device is used to administer a noncovered drug, coverage is denied for both the nonapproved drug and the DME or prosthetic device.[31]

[31] Centers for Medicare and Medicaid Services. Medicare Benefit Policy Manual. Chapter 15 (Covered Medical and Other Health Services); §50.4.7 (Denial of Medicare Payment for Compounded Drugs

In order to provide consistency across all benefit categories, all Medicare contractors, including PDPs should adhere to provisions such as those in the Medicare Benefit Policy Manual. This would ensure that any claim for a drug that requires FDA approval but is not FDA-approved would be denied, regardless of the benefit category under which the claim was made. For example, payment for combination products such as albuterol and ipratropium, and the delivery system used to administer the drugs, should be limited to FDA-approved formulations.

Centers for Medicare & Medicaid Services
Department of Health and Human Services

Attention: CMS-4068

Dear Madam or Sir:

On behalf of the clients represented by the undersigned, we wish to submit the following comments on your proposed rule for the Medicare Prescription Drug Benefit. The Medicare Advocacy Project has over 15 years of experience advocating on behalf of Medicare beneficiaries, particularly those with low incomes; the Massachusetts Law Reform Institute is a statewide advocacy organization representing low income individuals, including elders and persons with disabilities; and the Disability Law Center (DLC) is a private, nonprofit protection and advocacy agency that provides free legal assistance to individuals with disabilities throughout Massachusetts. A key mandate of DLC is ensuring that people with disabilities are able to access needed supports to live and work in the community. Because of the limited time allowed and the magnitude of the proposed rule, we are not commenting on CMS-4069, dealing with Establishment of the Medicare Advantage Program. Neither are we commenting on all the sections of the proposed prescription drug rule. Rather, we are focusing on the impact of the rule on low income beneficiaries and persons with disabilities, particularly in the Eligibility and Enrollment and Grievances, Coverage Determination, and Appeals sections. In addition, we support and agree with the more detailed and comprehensive comments submitted on one or both of the proposed rules by the Medicare Consumers Working Group and the Center for Medicare Advocacy, Inc.

We also request that time be provided for another comment period due to the many unaddressed or only vaguely addressed issues. The final regulations could include a number of errors and provisions that result in unintended consequences because so much of the final regulations will not have been seen by the public. We urge CMS to issue the next version of these regulations in a format that will allow one more round of comment, even if a shortened comment period. This is a very complex program with significant ramifications for a large number of citizens. We are concerned that failure to provide for additional public input when the regulations are more fully drafted will create some serious problems in the fall of 2005 when the program is launched.

PART 423-VOLUNTARY MEDICARE PRESCRIPTION DRUG BENEFIT

General comments.

1. Many pro-consumer statements in the preamble do not appear in the proposed rule. These protections bear no weight unless captured in the regulations. More should be done to reflect the Preamble's good intentions in the body of the regulations. For example:

> The Preamble discusses providing affected enrollees, prescribers, pharmacists, and pharmacies with written notice when a drug will be removed from the formulary or moved to a different tier for cost-sharing. The regulatory language does not specify that the notice should be in writing. Requirement for written notice is critical and should be specified.
>
> The Preamble gives examples of situations when a plan will be required to allow an enrollee to use a non-network pharmacy. These include situations such as when an enrollee's plan does not contract with the long-term care pharmacy which an enrollee in a nursing home must use. The regulations should include the examples CMS discusses in the preamble.

2. There are a number of areas where the law is unclear or contradictory and these areas are creating serious problems for the regulation drafters. CMS should take advantage of the law's provision calling for the submission of technical and corrective amendments. While this was supposed to have been done by June 8, 2004, it should still be done, and Congress should address these issues as soon as possible.

3. Simplicity, as well as additional support for information and counseling, is necessary to ensure that beneficiaries are reached in a comprehensible way. The sheer size and complexity of these regulations is a testament to the fact that this new law is incredibly confusing. If beneficiaries are confused, enrollment and use of the new program will be very difficult, particularly for lower income, sicker, and limited English proficiency beneficiaries. Thus whenever it is possible, CMS should seek to simplify the new program.

Addressing some of our specific concerns:

Subpart B-Eligibility and Enrollment

1. The draft regulations addressing enrollment of beneficiaries into private drug plans (PDPs) or Medicare Advantage Prescription Drug Plans (MA-PDPs) do not adequately address the need for hands-on outreach, particularly to low-income beneficiaries, or to beneficiaries with special needs, such as mental illness. More attention must be given to developing materials and education and enrollment campaigns focused on informing beneficiaries with disabilities, including mental illness and cognitive impairments, and those with other special needs about the new drug benefit and helping them to enroll in the best plan available.

2. Of particular concern, is enrollment of the dual eligibles. Beneficiaries covered by both Medicare and Medicaid are by definition poor and cannot afford to pay privately fo fill any gaps in medication. Congress and the Administration promised that dual eligible beneficiaries would be better off with this new Part D drug benefit than they were receiving drug coverage through Medicaid. To honor this promise, coverage of medications for dual eligibles and other special populations must be grandfathered into the new Part D benefit. In addition, CMS must require plans to establish an alternative flexible formulary for dual eligibles as suggested in the preamble to the proposed regulations. This flexible formulary would incorporate utilization management techniques that focus on improving inefficient and ineffective provider prescribing practices but

do not restrict access to medications through prior authorization, fail first, step therapy, or therapeutic substitution requirements.

3. The regulations do not adequately address how drug coverage for the dual eligibles will be transferred to Medicare on January 1, 2006. There are issues both of timing and implementing the enrollment process in a way that will ensure that these beneficiaries do not confront a loss of benefits or a gap in drug coverage, either of which could have disastrous health consequences. Specific comments on enrollment of dual eligibles and our recommendations appear in our comments on §§423.34, 423.36, 423.48 and on Subpart P.

A. We are concerned with ensuring continuity of care for dual eligibles and access to needed prescriptions. These issues and concerns apply equally to all dual eligibles, and particularly to those with special health care needs, as well as to other populations with specific needs (See our comments in Subpart C, §423.120.)

B. The proposed regulations would force dual eligibles to enroll (or be automatically enrolled) in the "benchmark" or average cost plans in their areas because the low-income subsidy they will receive will only cover the premium for these plans. The formularies for these plans will not be as comprehensive as the drug coverage these individuals currently have through Medicaid. Even though Massachusetts has restricted access to drugs in its Medicaid program with preferred drug lists and prior authorization requirements, Massachusetts has taken many steps to ensure that special populations can readily access medically necessary drugs. For example, individuals who have been stabilized on one antidepressant are not required to try another one.

C. Without access to the coverage they need, dual eligibles will be forced to switch medications, which for certain populations, such as beneficiaries with HIV/AIDS or mental illness can have serious adverse consequences. Also, failing to ensure continuity of care for dual eligibles may benefit the plans, but will undoubtedly lead to Medicare and/or state increased costs for more physician and emergency room visits, and hospitalizations. The regulations do provide a special enrollment period for dual eligibles to use "at any time" (§423.36). However, being able to enroll in a different Part D plan is inadequate to meet the special needs of dual eligibles.

D. In the preamble to the proposed regulations, CMS points to an exceptions process as a means of securing coverage of off-formulary medications (See our comments to **Subpart M-Grievances, Coverage Determination and Appeals**) But the process proposed is extremely complex and cumbersome to navigate for someone having a psychiatric crisis, facing cognitive impairments, or in the midst of aggressive chemotherapy-to list just a few examples. Moreover, the timelines established are inordinately drawn out; for example, an expedited determination could take as long as two weeks. Drug plans are not required to provide an

emergency supply of medications until at least two weeks following a request. Exception, grievance and appeal processes should not be used to substituted for open formulary access to medications.

§423.34 Enrollment Process.

§423.34 (b) Enrollment.
The final rule should provide that an authorized representative may complete the enrollment form on behalf of a Part D eligible individual.

§423.34(c), Notice Requirement.
The notice must be in writing and inform an individual who is denied enrollment of his or her appeal rights, including the right to appeal the imposition of a penalty for late enrollment.

§423.34(d) Enrollment requirement for full benefit dual eligibles.
In the Preamble, CMS requested comments on whether CMS or the states should perform automatic enrollment of dual eligibles. State officials have more readily available data identifying the dual eligibles in their state and they also will be involved in the enrollment process because they are already required to perform low-income subsidy enrollment. In addition, there is an incentive for them to enroll these individuals in Medicare drug plans because without drug coverage they will increase utilization of other Medicaid services. Thus, states should be afforded the ability to conduct auto-enrollment and receive full federal financing for this function. In addition, CMS should develop its own systems for automatic enrollment of dual eligibles in states that do not elect to do so. Also, because the proposed rule leaves unanswered key questions about who will conduct automatic enrollment of dual eligibles and how it will occur, CMS must give the public the opportunity to provide input on any proposal it develops on this issue before publishing a final regulation.

§423.34(d)(1) General Rule.
The draft regulations provide that dual eligibles will be automatically enrolled in a Part D plan if they do not enroll themselves, by the end of the initial enrollment period, which, under §423.36, is May 15, 2006. However, their Medicaid prescriptions drug coverage will end on January 1, 2006. This proposed timeline for automatic enrollment must be changed because it could expose millions of dual eligibles to a four and half month coverage gap that could have serious health consequences for this vulnerable population. Given the difficulty of reaching this population coupled with inadequate provisions for outreach and education, it is almost certain that a substantial number of dual eligibles will face a several month gap in coverage between the end of Medicaid's drug benefit and automatic enrollment. This is untenable, and directly in conflict with Congress' and the Administration's promise that dual eligibles will be better off under Medicare Part D. The transfer of drug coverage from Medicaid to Medicare Part D should be delayed. Absent a delayed transition date for dual eligible drug coverage, however, dual eligibles should be randomly assigned and enrolled in a plan that best suits their needs as early as November 15, 2005 but no later than December 1, 2005. While we would prefer to provide individuals an extended period to make informed choices, it is critical to complete auto-enrollment as early as possible to leave as much time as possible to distribute plan information

and cards to beneficiaries, allow them to switch plans, and educate them about their new drug coverage before January 1, 2006. To make this process work more smoothly, states can begin profiling individual drug histories to prepare for random auto-assignment among plans that are appropriate for the individual even before plan information is released on October 15, 2005. Additionally, CMS should fund a campaign of individualized counseling and assistance both before and after auto-enrollment to explain to individuals their choices and how to enroll in a plan; explain, if applicable, how to get benefits under the plan to which they have been auto-assigned; and explain, if applicable, that they can choose a different plan from the one to which they have been auto-assigned and assist in choosing and enrolling in such a plan.

§423.34(d)(1)(ii)
CMS must develop a solution to the issue of automatic enrollment of dual eligibles who are enrolled in MA plans that have a prescription drug benefit with a premium that is above the low-income benchmark. The solution should be the one least disruptive to medical care and should not force a dual eligible to choose among continued MA enrollment, paying added premiums, or foregoing drug coverage. For institutionalized dual eligibles, the difference between the premium and the premium subsidy should be considered an incurred medical expense and deducted from their monthly "patient paid amount" to the facility. For non-institutionalized dual eligibles, in states with pharmacy assistance programs (SPAPs) which will wrap around Part D coverage and will cover dual eligibles, the SPAPs should be authorized to pay the difference. For medically needy individuals, the cost differential would be an incurred medical expense contributing toward their spenddown, if appropriate. Otherwise, individuals should be counseled about the premium discrepancy and about their right to withdraw from the MA plan and return to original Medicare. Ideally, dual eligibles who want to remain in the MA plan should be allowed to do so and not have to pay any amount by which the MA-PD basic premium exceeds the low-income benchmark amount.

§423.34(d)(2), When there is more than one PDP in a PDP region.
Because not every PDP plan may be appropriate for each dual eligible (for example, due to formulary restrictions), CMS should limit "on a random basis" to "among such plans in the region that meet the beneficiary's particular drug needs." Also, this subsection undermines the §423.859 right of assured access to a choice of at least two qualifying plans, by acknowledging that there may be regions where there is only one PDP in a PDP region with a monthly beneficiary premium at or below the premium subsidy amount.

§423.36 Enrollment Periods.

§423.36(a)(3)(ii) Exception.
It is not clear who these beneficiaries would be.

§423.36(c) Special Enrollment Periods.
This section should be expanded to provide "special enrollment exceptions" for individuals disenrolled by a PDP (such as for disruptive behavior) so that the individual will have an opportunity to join another PDP and continue with necessary medications. These "special enrollment exceptions" are necessary given the high risk of discrimination presented by the

provisions for involuntary disenrollment. CMS should provide a special enrollment period for these beneficiaries. It should include a reasonable time period for plan selection and be exempt from late enrollment penalties. It should also be expanded to make clear that involuntary loss of creditable prescription drug coverage includes loss because the beneficiary, or beneficiary's spouse, stops working; because COBRA coverage ends or because the premiums became unaffordable.

§423.36(c)(4) Special Enrollment Periods and Dual Eligibles.
We support granting dual eligibles special enrollment periods. However, this provision does not adequately address their needs. It is unlikely that there will be much choice of low-cost drug plans in each region, particularly in rural areas which have not historically attracted many Medicare+Choice plans. For example parts of Cape Cod and Western Massachusetts have no Medicare+Choice plans. In addition, these individuals will not have the resources to pay for more comprehensive coverage. Moreover, the special enrollment provisions do not specify that dual eligibles would not be subject to a late enrollment fee if this complex process of disenrollment and reenrollment resulted in a gap in coverage of over 63 days.

In addition, full benefit dual eligibles should receive notice explaining their right to a special enrollment period when they enroll in a plan, and every time their PDP changes its plan in a way that directly affects them, such as removing a drug from its formulary, changing the co-payment tier for a drug, or denying their appeal concerning a non-formulary drug or an effort to change the co-payment tier.

§423.36(c)(8)
The regulations should include a special enrollment period similar to the one for dual eligibles for all beneficiaries eligible for a full or partial-low income subsidy. This is necessary because if coverage for a drug is denied, these low-income beneficiaries will be unable to afford to pay for drugs during a period of appeal, or if their appeal is denied and they are locked into a plan that does not cover a drug they need.

Special enrollment periods should also be provided for all institutionalized individuals, not just institutionalized dual eligibles, since their access to needed drugs may be compromised by the design of the plans and by pharmacy access requirements, such as if their long-term care pharmacy is not required to be included in the network of all PDPs. Individuals with life-threatening situations and individuals whose situations are pharmacologically complex should have the same rights as well.

§423.38 Effective Dates.

§423.38(c) Special Enrollment Periods.
Effective date should be first day of first calendar month following special enrollment in which individual is eligible for Part D.

§423.42 Coordination of enrollment and disenrollment through PDPs

§423.42(c)(2)
Notice of disenrollment should be in writing.

§423.44 Disenrollment by the PDP.

§423.44(b)(2)(I)
CMS requested comments about the requirement to involuntarily disenroll individuals from a PDP if they no longer reside in the service area. This raises the issue of "snowbirds"-the large number of Medicare beneficiaries who move for large parts of the year. This is a problem in Massachusetts where many elders winter in warmer climates. The churning-the enrolling and disenrolling-that plans serving this population will face as they apply this section will be enormous. Because of different formularies between plans and problems of coordination, the regulations should seek to minimize plan changes and maintain continuity of care. This section, as written, could result in a significant number of plan changes, disrupting continuity of care.

Some suggested ways to address this issue better would be to require that plans as a condition of participation have a system of visitor or traveler benefits, consider exempting regional PDPs and PDPs with out-of-network services from the disenrollment requirement, require plans to provide prospective enrollees specific information on traveler benefits and "out-of-plan service policies" and clearly define the time period that a plan could consider an enrollee as "no longer resid(ing) in the PDP's service area." such that it accommodates seasonal travelers who maintain a residence in the service area.. In many cases, 90 day mail order service and arrangements with other plans will make enrolling and disenrolling unnecessary. However, beneficiaries must have a clear understanding of how a plan will serve them while temporarily out of the service area; how when they are traveling and need emergency pharmaceutical services their plan will (or will not) reimburse for those services.

§423.44(d)(2)
Provisions in the proposed regulations to allow Medicare drug plans to involuntarily disenroll beneficiaries for behavior that is "disruptive, unruly, abusive, uncooperative, or threatening" create enormous opportunities for discrimination against individuals with mental illnesses, Alzheimer's, and other cognitive conditions. Those who are disenrolled will suffer severe hardship as they would not be allowed to enroll in another drug plan until the next annual enrollment period and accordingly be subject to a late enrollment penalty permanently increasing their premiums. Plans must be required to develop mechanisms for accommodating the special needs of these individuals, and CMS must provide safeguards to ensure that they do not lose access to drug coverage. Moreover, CMS lacks statutory authority to authorize PDPs to involuntarily disenroll beneficiaries. Under the MMA, section 1860D-1(b) directs the Secretary to establish a disenrollment process for PDPs using rules similar to a specific list of rules for the Medicare Advantage program. This list does not include reference to section 1851(g)(3)(B) of the Social Security Act which authorizes MA plans to disenroll beneficiaries for disruptive behavior. Thus, these proposed regulations must not be included in the final rule.

Concerns with specific provisions in this section and recommendations for beneficiary protections, which, at a minimum should be provided, are as follows:

§423.44(d)(2)(vi) Reenrollment in the PDP.
In the preamble, CMS appears to be asking for comments on whether a PDP should be allowed to refuse reenrollment of an individual who has been involuntarily disenrolled if there is no other drug plan in the area. As discussed above, it is our position that there is no statutory basis for involuntarily disenrollment. If the regulations allow this for disruptive behavior, then the plans must be required to allow reenrollment. Those individuals most likely to be subject to involuntary disenrollment will not have the resources to pay for their medications out-of-pocket. These individuals are entitled to this benefit. Disruptive behavior does not disqualify you from access to prescription drug coverage and may in fact be an indication that one is in need of medical assistance. Individuals who are involuntarily disenrolled would not have the opportunity to reenroll in a plan until the next annual enrollment period and may therefore be subject to a late penalty and increased premium as a result. This result is unfair in light of the fact that the disruptive behavior may have resulted from denial of access to needed medications. CMS should therefore provide a special enrollment period for beneficiaries who are involuntarily disenrolled for disruptive behavior, must waive the late enrollment penalty for these individuals, and the regulations must include detailed articulated protections to lessen the risks inherent in authorizing sanctions for "disruptive behavior."

§423.44(d)(2)(vii) Expedited Process.
This provision should be deleted from the final rule. The proposal to establish an expedited disenrollment process in cases where an individual's disruptive or threatening behavior has caused harm to others or prevented the plan from providing services is undefined, and provides no standards, requirements or safeguards. It allows plans to employ this mechanism on the basis of behaviors described in the broadest of terms - terms which could easily be mis-applied or applied capriciously or punitively. Thus, it would undermine all the minimal protections that would otherwise apply.

§423.46 Late enrollment penalty.
CMS should delay implementation of this section for two years. The drug benefit is a new and complex program. Many beneficiaries will be confused about their enrollment opportunities and obligations, or not understand that they must choose a plan and enroll. The Medicare-endorsed prescription drug discount card program has shown that, even with significant outreach, the majority of individuals eligible for the $600 low-income subsidy have not yet enrolled. We disagree that healthy beneficiaries will not apply. We believe that the people most at risk of not applying are the most vulnerable beneficiaries, including people with mental illness and cognitive disabilities. Implementation of the late enrollment penalty should be delayed for individuals eligible for the low-income subsidy who may not understand that they have to apply separately for the subsidy and a drug plan, thinking that application for the subsidy is sufficient.
