LOOKUP1</td><td>

FUNCTIONAL SPECIFICATIONS FOR THE DIRECTORY LOOKUP

The directory lookup is designed as a standalone module that can be called from the Facility Questionnaire, the Residence History, or any other instrument that needs to search for a place on a directory such as the HPI or a hospital list.

Input. The directory lookup module requires a place name to look up, and the name of the directory.

Output. The directory lookup module returns to the calling instrument:
1.   A return code signifying the outcome of the directory lookup.
2.   If the place was found, the name, address, city, state, zip code, and phone number.
3.   If the place was found, an ID number that uniquely identifies the place on the directory. For the NHPI directory, this means the NHPI ID. For the hospital directory, this means the AHA ID. The hospital directory must also return variables indicating whether the hospital had a SNF wing, and whether this AHA entry was also stored on the NHPI.

The directory lookup module returns to the calling instrument the required information from the directory, and a return code signifying the outcome of the lookup. Required information includes the name, street address, city, state, zip code, telephone number up to two identifying numbers.

The return value has the following codes:

1 =   The directory lookup produced a match acceptable to the interviewer.

2 =   The directory lookup produced no acceptable matches, and the interviewer entered the name and address information.

3 =   The directory lookup produced no acceptable matches, and the interviewer was unable to enter the name and address information.

Processing.

1.   Interviewer enters search criteria of choice (pressing enter through fields not to be used), including place name, address, city, state, zip code, or phone number. Interviewer may use wildcards in the place name.

2.   The directory is searched for matches to those criteria. For testing and training purposes, the NHPI and AHA directories contain "dummy" entries. If the current case is a testing or training case, search for <u>all</u> matches (including the "dummy" entries). Otherwise, search for matches only with non-dummy directory entries.

3.   If any matches, present matches in a choice list. If interviewer selects, return required information (and return code = 1) to calling program.

4.   Otherwise, if there are no matches or if the interviewer does not want to select a place from the matched places, offer option to respecify search criteria and repeat search, or to add place, or to mark as having insufficient information.
