

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Introduction

The Medicare Current Beneficiary Survey (MCBS) is a continuous, multi-purpose survey of a representative sample of the Medicare population, including both aged and disabled enrollees. The accompanying public use file is the second in a two part planned series of annual data releases reporting Medicare beneficiaries' use of medical services and the costs associated with that medical care. The Cost and Use file is not limited to MCBS survey data alone. It represents a COMBINATION of survey reported data from the MCBS and Medicare claims and other data from the Centers for Medicare and Medicaid Services' administrative files. However, unlike the previously released 1991 through 2009 MCBS Access User files which also combine survey reports with bill data, the Cost and Use file has undergone a careful RECONCILIATION process to separately identify health care services reported from both sources, from the bill alone, and from the survey alone. This process has produced a file with a more complete and accurate picture of health services received, amounts paid, and sources of payment. The MCBS is sponsored by the Centers for Medicare and Medicaid Services (CMS) in the Department of Health and Human Services of the U.S. Government. Westat Corporation does the field data collection.

Advantages of Combining Survey and Administrative Data

The Cost and Use file brings together survey information, which can only be obtained directly from a beneficiary with reliable information on services used, and Medicare payments made from administrative bill files. Survey reported data includes information on use and costs of health care services as well as information on supplementary health insurance, living arrangements, income, health status and physical functioning. The survey also collects information on health services not covered by Medicare, most notably, prescription drugs and long term facility care. Medicare bill data includes use and cost information on inpatient hospitalizations, outpatient hospital care, physician services, home health services, durable medical equipment, skilled nursing home services, hospice services, and other medical services. This combination file can support a much broader range of research and policy analyses on the Medicare population than would be possible using either survey data or administrative bill data alone.

Matching Survey and Administrative Data

Use and costs of Medicare covered services are reported on both the MCBS survey and in the Medicare central office billing system. This overlap in reporting from the two sources was used to verify the accuracy of survey reports of health service use. Survey reports were matched with administrative bill data to adjust for survey under-reporting using more complete administrative bill data, and to fill in and correct survey reported payment amounts with more accurate information from bills submitted to and paid by Medicare. (Note that this could only be done for services covered by Medicare such as inpatient hospital services, outpatient hospital services, physician services, home health services, acute skilled nursing facility services, durable medical equipment, and other covered services covered. For health services not covered by Medicare such as prescription drugs and long term facility care, there was no independent source to which survey reports could be matched.)

Under reporting of medical services is an enduring problem in personal interview surveys. While respondents can usually recall significant events like hospitalizations for several months, they often fail to recall more routine care like physician visits after a few weeks. In general, as the time interval between the interview date and the medical event increases, the probability decreases that the event will be recalled and reported in the interview. The MCBS interviews a person three times a year, and the average interview recall period is about 4 months. (More frequent interviews would reduce the recall problem, but it would greatly increase both survey costs and the reporting burden on sample persons). Given normal rates of memory decay and the frequency with which aged and disabled persons use medical care, it was reasonable to assume that matching survey events to administrative bills would be helpful in identifying medical events that the sample person could not recall during the interviews.

Match Results

This survey under-reporting hypothesis turned out to be correct. When 245,500 paid events in Medicare files for MCBS original sample persons were matched to 191,600 survey-reported events, only 94,600 matching survey records (39%) were found. Some small part of the unmatched 150,900 Medicare records are undoubtedly represented in the 96,900 survey-reported events that could not be matched under the criteria used. However, the 96,900 unmatched survey events would be expected to include a substantial share of events that are not covered by Medicare, and therefore would not be expected to match a Medicare paid claim. In addition, only 19,000 of the 96,900 unmatched survey-reported events have a Medicare payment amount. The 150,900 unmatched Medicare billing records strongly suggest that the survey reports seriously understate the number of Medicare services when compared to CMS billing records.

The under-reporting problem was more serious for event counts than for Medicare payments. The 150,900 unmatched Medicare events (61% of the total file) accounted for 48% of total Medicare expenditures suggesting that, on average, the events forgotten in the survey interview were less expensive than those remembered and reported. This is consistent with the hypothesis that survey respondents tend to remember major health events better than minor health treatments.

In addition to correcting for events that were completely missed in survey reports, the match also helped to fill in missing Medicare payment amounts and correct Medicare payment amounts that had been reported incorrectly. Of the 94,600 survey events matched to Medicare bill records, Medicare was reported as a payer on 71% of these events, and a Medicare payment amount was reported on 55% of these events. This means that the match and reconciliations generated corrections that:

1. made Medicare a payer of record on the 35% of cases where this information was originally omitted in the survey reports;
2. made it possible to determine the correct Medicare payment amount in the 45% of survey records where this information was omitted.

Not all services could be cleanly and easily matched from the two sources. The match employed “strength of evidence” criteria and “hierarchical algorithms” in order to identify matches, survey reports only, bill file reports only, and a small number of similar events for which it was not clear whether there was duplicate survey and bill reports or not. The methods and criteria used in the match are discussed in more detail in the EVENT LEVEL MATCHING discussion in Section 5 of this manual. In addition, Technical Appendix A, “Computer Matching of MCBS Data with Medicare Claims”, presents a full discussion of methods, criteria, and early results.

File Building

In order to get a complete and accurate file of services used and payments made, all 94,600 MATCHED service records should be added to all UNMATCHED 150,900 Medicare CLAIM ONLY RECORDS. In addition, unmatched survey reports, EXCLUDING THE 19,000 RECORDS WITH A Medicare PAYMENT AMOUNT, should be added to the matched and Medicare claim only records. This file will be the most complete and accurate file possible, and this combination minimizes the risk of double counting unmatched records. For a more detailed discussion, see the Event Level Matching discussion in Section 5 of this manual.

Imputing Missing Payment Data

In constructing this file particular attention was paid to making payment data, both the amount paid and the sources of payment, as accurate and complete as possible. In the interview itself, interviewers used Medicare and private insurance explanation of benefits forms to accurately record charges and payments. As noted above, we used Medicare administrative bills wherever possible to fill in or correct the Medicare amount reported by the respondent on the survey. For payment amounts where Medicare bills could not be used for correction, a complex imputation process was used to fill in the estimated payments.

One guiding principle used in payment imputations was to preserve insofar as possible, all partial reports from respondents. For example, many respondents knew how much they paid out-of-pocket for prescription drugs, but did not know how much supplementary private insurance or other third party payers (e.g. Medicaid, VA, HMO) may have paid for that prescription. The out-of-pocket amount reported by the respondent was kept as reported throughout the imputation process as an anchor, and the missing amounts were filled in around it. The first step was to impute a “target reimbursement” amount, that is, a total for that service that was reasonable based on similar cases in the file. The next step was to check which payers were possible (e.g. private insurance, Medicaid, VA, etc.) based on the insurance information reported on the questionnaire and the person’s eligibility for public programs. Finally, a computer intensive iterative imputation technique, which borrowed from both Gibbs sampling and “hot deck” methods, was then used to fill in missing payment data for likely payers up to the target reimbursement amount. Emphasis was placed on creating imputed numbers that were not anomalous. That is, imputed amounts were created to be consistent both in level of payment and the share distribution across payers with other similar cases in the file. The techniques and methods used in the payment imputation are described in more detail in the MISSING PAYMENTS AND PAYERS discussion in Section 5 of this manual. In addition, Technical Appendix B, “Imputation of Medical Cost and Payment Data”, provides a detailed discussion of the procedures and criteria used to impute missing payments for prescription drug data.

Supplementing the Sample

Official Medicare program statistics generally include all persons entitled to Medicare during the year, including those entitled for the entire year, whose eligibility began during the year, and those who died before the year ended. This mix of continuing enrollees, accretions, and terminations is referred to as “ever enrolled”. That is, everyone who was ever enrolled for any time during the year. However, previously released Access to Care User files from the MCBS represent the “always enrolled”, that is, persons continuously

enrolled during the entire year. Special steps were needed to improve the population coverage of the Cost and Use file to the broader concept of “ever enrolled”.

The MCBS sample (which is discussed in detail in the SAMPLE DESIGN AND ESTIMATION section of this report) was drawn from an enrollment list of persons entitled to Medicare on January 1, 2008. This list sample adequately represents persons who were continuously enrolled from January 1, 2008 into 2009. However, it DOES NOT represent persons who became newly eligible for Medicare in 2008 or in 2009.

MEDICARE CURRENT BENEFICIARY SURVEY COMPONENTS OF THE 2009 COST AND USE SAMPLE

NOTES

1. Objective was to add newly enrolled persons not on 1/1/08 sampling list.
2. This creates an ‘ever enrolled’ population to equate MCBS Cost and Use file estimates with official Medicare program statistics.
3. Since newly added persons were not asked cost and use questions in 2009 (were ‘ghosts’ added later to the 2009 file), suitable 2009 donors were identified based on their Medicare use profiles to impute their total use and costs.

Each year a supplemental sample is drawn and persons added to the MCBS sample to account for growth in the Medicare population and to replenish the sample for survey persons who died or left the survey during the previous year. This sample replenishment is primarily to insure that each year’s MCBS sample adequately represents the entire population.

However, these supplemental samples were also used to add the “missing” newly enrolled persons, that is, those who were on Medicare in 2009 but were not on the January 1, 2008 sampling list. The supplemental sample for Round 55 (September - December, 2009) added persons to the sample primarily to represent those newly enrolled in 2008. The supplemental sample for Round 58 (September - December 2010) added persons to the

sample primarily to represent those newly enrolled in 2009. Thus the full sample for the 2009 Cost and Use file is a composite of three groups: persons enrolled as of January 1, 2008 who survived into 2009 (continuing sample and Supplemental Samples XIV through XVII), persons newly enrolled in 2008 who lived until 2009 (Supplemental Sample XVIII), and persons newly enrolled in 2009 (Supplemental Sample XIX). The number of persons in each of the three groups, and their collective response rates, are shown in Table 1 in the MCBS SURVEY OPERATIONS section below.

Colloquially, the two groups of newly enrolled who were not interviewed about their use of medical services in 2009 are internally referred to as “ghosts”, because they were missing, should have been present, but were retroactively added later. Utilization for these persons is included in 2009 data even though they were not actually included in the field sample until late 2009 (Round 55) if they enrolled in 2010 or (Round 58) if they enrolled in 2009. While interview reports of services used and costs were not available for these “ghosts” in 2009, we did have complete profiles of Medicare use from administrative bill files. To get estimates of total use of services and costs, we matched these “ghosts” to the 2009 file to find appropriate donors based on their Medicare utilization profiles. Once donors were located, the donors use of total (Medicare and non-covered) services and costs were used to impute services and costs for the newly enrolled persons added to the sample in 2009 and 2010. This process brought the sample estimates for persons, use, and costs up to the more complete “ever enrolled” population for Medicare in 2009. A more detailed discussion is included in the SUPPLEMENTING THE SAMPLE discussion of Section 5 of this manual.

Should I Use the Access File or the Cost and Use File?

The Cost and Use file is a MORE COMPLETE file than the previously released Access files in two fundamental ways:

First, as described above, it includes a more comprehensive definition of the Medicare population. The Access files sample statistically represents persons continuously in Medicare during the year, the “always enrolled”. The first Access file in 1991 excluded persons dying during the year primarily as a matter of necessity, not analytical preference. Since the survey entered the field in September 1991, it was impossible to get a baseline interview with anyone who died between January 1 and August 30. The subsequent annual Access files have followed the pattern begun in 1991 in order to develop a consistent time series.

The Cost and Use file also represents the continuously enrolled, but in addition, represents persons entering the Medicare program during the year, as well as persons dying during the year. This latter group is particularly important to producing accurate

total population estimates of spending because use of medical services is generally higher on average in a person's last year of life. Recent internal tabulations of the MCBS sample showed that persons dying in the year are under 5% of the population, but represent over 15% of total expenditures. On a per capita basis, persons dying during the year have spending levels over four times higher than persons continuously enrolled for the entire year.

The second way that the Cost and Use file is more complete than the previously released Access files, relates to the services and dollars included in both files. The Access file includes use of services and spending for Medicare covered services only. The 2009 Cost and Use file showed that Medicare covers about 32% of the health expenses of its enrollees. The Cost and Use file, by contrast, includes ALL health care services whether covered by Medicare or not. The two most prominent health care services not covered by Medicare, prescription drugs and long term facility care, are included in the Cost and Use file, but are not in the Access file.

File users whose analyses require the ENTIRE MEDICARE POPULATION and/or ALL HEALTH SERVICES WHETHER COVERED BY MEDICARE OR NOT, should use the Cost and Use file rather than the Access file.

File users whose analyses are well served by the CONTINUOUSLY ENROLLED MEDICARE POPULATION and/or MEDICARE COVERED SERVICES ONLY, should use the MCBS Access files. This includes persons who do year to year or LONGITUDINAL ANALYSIS with the 1991 through 2010 Access files. For example, a comparison of changes in health status from year to year would be more appropriate using successive annual Access files. If, for example, the 2009 Cost and Use file health status information was compared to 2010 Access file information, the results would be confounded because the covered enrollment bases vary. In this situation, it would be very difficult to sort out what part of any 2009 to 2010 differences found were due to genuine year to year trends, and what part to differences between the 2009 ever enrolled and the 2010 always enrolled populations being measured.

Tri-Level File Structure

As an aid to persons using the file, Cost and Use file data is being provided at three different levels of summarization: at the PERSON level, at the TYPE OF SERVICE level, and at the individual EVENT level. The tri-level structure allows analysts to fit the research problem they are addressing to the available file summary levels, and avoid having to process all the detailed event records in the file. For example, an analysis of differences in total health spending per person between men and women could use the person level summary, and thereby avoid having to process the more numerous event

level records. Similarly, an analysis of differences in use of Medicare hospital payments by race could use the type of service summary records, and avoid having to process the more detailed event level records. Event level records would be used for more detailed analyses, for example, average length of long term facility stays or average reimbursements per prescription drug. For a more complete discussion of the TRI-LEVEL FILE STRUCTURE, see the beginning of Section 3 of this manual.

MCBS Survey Operations

Field work on the MCBS is conducted for CMS' Center for Strategic Planning by Westat, Inc., a survey research firm with offices in Rockville, Maryland. Field work for Round 1 began in September 1991 and was completed in December 1991. Subsequent rounds, involving the re-interviewing of the same sample persons or other appropriate respondents, begin every four months. Interviews are conducted regardless of whether the sample person resides at home or in a long term care facility, using the questionnaire version (discussed later) appropriate to the setting.

Repeated Interviews The MCBS is a longitudinal panel survey. Sample persons are interviewed three times a year over four years to form a continuous profile of their health care experience. The MCBS is thus capable of tracing changes in coverage and other personal circumstances, and observing processes that occur over time, such as people leaving their homes and taking up residence in long term care facilities, or spending down their assets for medical care until they become eligible for Medicaid.

Sample The MCBS is a stratified random sample of roughly 12,100 beneficiaries selected to be representative of the entire population of aged and disabled beneficiaries enrolled in Medicare in 2009. Sample persons included in the MCBS were sampled from the Medicare enrollment file to be representative of the Medicare population as a whole and the following age groups: the under 45, 45 to 64, 65 to 69, 70 to 74, 75 to 79, 80 to 84, and 85 and over. In order to insure that the sample would yield enough long-term facility stays to produce reliable estimates, some groups of enrollees more likely to enter long term care facilities were over sampled. This included over samples of disabled persons (those under age 65) and very old persons, aged 80 and over.

The sample was drawn from 107 primary sampling units (PSUs) or major geographic areas chosen to represent the nation, including the District of Columbia and Puerto Rico. The sample is annually supplemented during the September through December interview periods (Round 55 for 2009) to account for attrition (deaths, disenrollments, refusals, etc.) and newly enrolled persons.

The Community Interview Sample persons in the community (or appropriate proxy respondents) are interviewed using computer-assisted personal interviewing (CAPI) survey instruments installed on notebook-size portable computers. The CAPI program automatically guides the interviewer through the questions, records the answers, and compares them to edit specifications for allowable codes and relationships to other answers. The CAPI thereby increases the amount of accurate and complete information on the front end and lessens the need for after-the-fact editing and corrections. CAPI guides the interviewer through complex skip patterns and inserts follow-up questions where certain data were missing from the previous round's interview. When the interview is completed, CAPI allows the interviewer to transmit the data by telephone to the home office computer.

These interviews yield a series of data over time for each sample person on utilization of health services, medical care expenditures, health insurance coverage, sources of payment (public and private, including out-of-pocket payments), health status and functioning, and a variety of demographic and behavioral information (such as income, assets, living arrangements, family supports, and quality of life). To increase the accuracy of the data collected, respondents are asked to save Explanation of Benefit forms from Medicare, as well as statements from private health insurers and receipts from providers. To assist in accurate reporting of prescription medicines, respondents are also asked to bring to the interview bottles, tubes and prescription bags provided by the pharmacy.

An effort is made to interview the sampled person directly, but in case this person is unable to answer the questions, he or she is asked to designate a proxy respondent, usually a family member or close acquaintance. On average, about 11.2 percent of each round's community interviews are done by proxy.

The Facility Interview The MCBS conducts interviews for persons in long-term care facilities using a similar, but shortened instrument. A long-term care facility is defined as having three or more beds and providing long-term care services throughout the facility or in a separately identifiable unit. Types of facilities currently participating in the survey include nursing homes, retirement homes, domiciliary or personal care facilities, distinct long-term units in a hospital complex, mental health facilities and centers, assisted and foster care homes, and institutions for the mentally retarded and developmentally disabled. A complete discussion of how the FACILITY DATA was collected, edited, and formatted into stay records can be found in Section 4 of this manual.

If an institutionalized person returns to the community, a community interview is conducted. If he or she spent part of the reference period in the community and part in an institution, a separate interview is conducted for each period of time. Because of this, a beneficiary can be followed in and out of facilities, and a continuous record is maintained regardless of the location of the respondent.

Introduction

Because of the poor health of the long-term facility resident and the preferences of many facility managers that patients not be disturbed, the survey collected information about institutionalized patients from proxy respondents in the facility. In general, nurses or other primary care givers responded to questions about the person's physical functioning and medical treatment. In general, persons from the billing office responded to questions about charges, payments, and sources of payment. The need for interviewers to flexibly switch back and forth among multiple respondents is the primary reason CAPI techniques could not be smoothly used in the facility setting when the survey began. Consequently, traditional pencil and paper techniques were used to collect data for persons residing in long-term care facilities.

The facility instruments include:

- (1) The Facility Screener - This instrument gathers information on the facility to determine the facility type and the characteristics of the facility (e.g. size, ownership, etc.). It is asked during the initial interview;
- (2) The Baseline Questionnaire - Gathers information on the health status, insurance coverage, residence history, and demographic items on supplemental sample beneficiaries in a facility setting and new admissions from the continuing sample. Selected information from this questionnaire is updated annually for continuing sample persons using an abbreviated version, The Facility Component Supplement to the Core Questionnaire; and
- (3) The Facility Core Questionnaire - Collects information on facility utilization, charge and payment information. This questionnaire is asked in every round but the initial one.

Contents of this Documentation

The rest of this manual contains detailed information about this public use file and specific background information intended to make the data more understandable. The sections included are described below.

- Section 1: **FILE STRUCTURE** - Technical description of the public use file specifications and the structure of the public use file. It also provides a brief description and count of each of the record types in this file.

Section 2: **CODEBOOK** – Codebook of the file variables. This codebook is organized by record type and contains the question number (for data collected in the survey), and variable name, description and location in the record. Codes or possible values and value labels are also supplied. Frequencies for most variables (those with fewer than 120 distinct values) are also included in the codebook, as are notes concerning when variables are inapplicable (that is, questions were not asked due to skip patterns in the CAPI program). An index of variables is also included at the end of the codebook.

Variables in the CMS bill records are documented slightly differently. Record layouts are provided and are cross-walked to CMS data dictionary names. The data dictionary supplies a full explanation of all the variables and their various values.

Section 3: **NOTES ON USING THE DATA** - Begins with a description of the tri-level file structure, and goes on to describe conventions used to create each separate record (RIC) in the file. This includes notes on how individual variables were collected in cases where variable definitions are not straightforward.

Section 4: **EDITS** - A list of anomalies that exist in the survey data which were intentionally left as reported by the respondent (“No-Fix” edits), and a description of problems discovered with the CMS administrative data together with the steps taken to correct them. This section also includes a discussion of the creation and editing of Long Term Care Facility stay records.

Section 5: **FILLING IN THE GAPS** - A detailed description of the adjustments applied to the data to compensate for “missing” information. This includes supplementing the sample list to account for new persons joining Medicare and persons dying during the year, matching survey and administrative data to correct for under-reporting and missing data, and imputation methods to correct for missing payment data and missing payers. Also included is a discussion of the creation and editing of Prescription Drug event records.

Introduction

- Section 6: **SAMPLE DESIGN AND ESTIMATION** - A description of the MCBS sample design, estimation procedures and projections. A brief discussion of response rates is also included. This section concludes with a comparison of the MCBS projections to CMS control figures.
- Section 7: **QUESTIONNAIRES** - Hard copy versions of the questionnaires used in Round 58. The questionnaires have been annotated with variable names to associate the questions with the codebook. (Even though the data reflect multiple interviews, the Round 58 questionnaires most nearly represent all questions asked in both the introductory and continuing interviews.)
- Supplement: **CMS National Claims History Data Dictionary**, providing information about the claim and bill records.

Technical Appendices: Offer more detail on selected topics in this manual.

- A. Summary Counts
- B. Imputation of Medical Cost and Payment Data
- C. Computer Matching of MCBS Data with Medicare Claims
- D. Analytic Edits
- E. Setting Source of Payment Flags

Medicare Current Beneficiary Survey CY 2009 Cost and Use

File Structure

File specifications

The MCBS Calendar Year 2009 Cost and Use public use file consists of a series of separate datasets or files. These datasets contain data on the MCBS sample persons; these files are the **data files**. The other datasets contain SAS® code (SAS input statements, formats and labels) to facilitate the use of the data files by users who have access to a SAS mainframe environment. These are the **README files**.

Figure 1.1a and 1.1b show file specifications such as file names, record counts, and associated README file names.

Summary of the Data

The data files represent completed interviews covering calendar year 2009 with a sample of 10,859 Medicare beneficiaries, and supplemental information from CMS' Medicare files. Of these cases, 10,010 beneficiaries were interviewed only in the community, 692 beneficiaries were interviewed only in facilities, and 157 beneficiaries were interviewed in both settings. This release contains full information about the beneficiaries' use of medical services during 2009, and the costs of those services to all payers.

Using the Data

All datasets are standard "flat" files to allow for processing with a wide variety of operating systems and programming languages. The datasets can be divided into three subject matter groups: files related to MCBS survey data with related Medicare administrative variables, files related to cost and use data, and files related to Medicare bill data.

There are several data files containing survey data and related summary administrative variables. For each of these files there is a "README" file which includes: a SAS INPUT statement, a PROC FORMAT to interpret the coded fields, LABELs which provide more information about the variable than would be possible in an 8-character name, and a FORMAT statement which associates the code interpretations with the appropriate variables.

Claims Files

The fixed-length claims (also known as the research claims) are abbreviated versions of the full claim record layout. Each claim type has a subset of variables selected for their relevancy to data analysis of that service. Additionally, institutional claim types have a corresponding revenue center file that links back to the claim-level data file through a unique claim identifier.

Note that the SAS input statements [README files] create one observation per data record for all of the MCBS files except the Physician/Supplier Claims and DME Claims. The SAS input statements for those claim types treat each line item as a separate observation with the claim-level detail repeating for each line item.

There are several data files containing cost and use data. For each of these files there is a “README” file which includes a SAS INPUT statement, a PROC FORMAT to interpret the coded fields, and LABELS.

There are seven data files containing Medicare bill data. The MCBS.README files contain SAS input statements and labels (but no formats) for each of the seven bill record files.

As an illustration of the structure of the README files, Figure 1.2 is a copy of the README file for the Household Composition record, RIC5.

**Figure 1.2 Text of a typical README file

Structure of the MCBS public use file(s)

As mentioned above, the data files can be divided into three subject matter groups: files containing survey data with related Medicare administrative variables, files containing cost and use data, and files containing Medicare bill data.

There are 10 types of records in the survey and administrative summary data group:

- Key
- Administrative Identification
- Survey Identification
- Health Status and Functioning
- Health Insurance
- Household Characteristics
- Facility Characteristics
- Interview
- Residence Time Line
- Cross-sectional Weights

The use and cost records provide detailed and summary information about medical goods and services the beneficiary used in calendar year 2009, the costs associated with those services, and the share of those costs borne by all payers.

There are 15 types of records in the cost and use portion of the file. For some types of utilization, records are provided in two levels of aggregation--detail, and summed by type of utilization.

- Inpatient use and costs (detail and summary)
- Outpatient use and costs (detail and summary)
- Drug use and costs (detail and summary)
- Facility use and costs (detail and summary)
- Dental use and costs (detail and summary)
- Medical services and goods, use and costs (detail and summary)
- Home health use and costs (summary only)
- Hospice use and costs (summary only)
- Person summary of all use and costs

The bill records represent services provided during calendar year 2009 and processed by CMS in conjunction with our administrative functions. To facilitate analysis, the

Administrative Identification record contains a summary of the utilization that these bills present in detail. There are seven types of Medicare bill records in the detailed utilization portion of the file:

- DME
- Home health
- Hospice
- Inpatient hospital
- Outpatient
- Physician/supplier
- Skilled nursing facility

All MCBS public use records begin with the same three variables: a record identification code (RIC), a version number of the RIC (VERSION), and a unique number that identifies the person who was sampled (BASEID). These elements serve to identify the type of record and to provide a link to other types of records. To obtain complete survey information for an individual, an analyst must link together records for that individual from the various data files using the variable BASEID. In the CY 2009 Cost and Use release, none of the sample people has a record on every data file. Figure 1.3 provides an overview of the presence of data records on the various data files for community and facility respondents. The version number will be updated accordingly if the RIC is revised after its initial release.

The tables that follow Figure 1.3 describe all of the types of records in this release. Table 1.A describes the survey and administrative records. Table 1.B describes the bill records.

Section 1: File Structure

Figure 1.3 Numbers of Records present on each of the data files for community and facility respondents

Type of Record	Number of Records present if beneficiary was interviewed in..		
	Community	Facility	Both settings
RIC K - Key record	1	1	1
RIC A - Administrative Identification	1	1	1
RIC 1 - Survey Identification	1	1	1
RIC 2 - Health Status and Functioning	1	1	1
RIC 2F - Health Status and Functioning - Facility	0	1	1 (if facility in fall round)
RIC 4 - Health Insurance	1	1	1
RIC 5 - Household Composition	1	0	1
RIC 7 - Facility Characteristics	0	1	1
RIC 7S - SNF Characteristics	1, several, or none per respondent		
RIC 8 - Interview Description	1	1	1
RIC 9 - Residence Timeline	1	1	1
RIC 10 - MDS/OASIS Timeline	1, depending on the presence of an MDS or OASIS assessment		
RIC X, X3, X4 - Cross-sectional weights	1	1	1
RIC DUE - Dental Events	1, several, or none per respondent		
RIC FAE - Facility Events	1, several, or none per respondent		
RIC IPE - Inpatient Hospital Events	1, several, or none per respondent		
RIC IUE - Institutional Events	1, several, or none per respondent		
RIC MPE - Medical Provider Events	1, several, or none per respondent		
RIC OPE - Outpatient Hospital Events	1, several, or none per respondent		
RIC PME - Prescribed Medicine Events	1, several, or none per respondent		
RIC PS - Person Summary	1 per respondent		
RIC SS – Type of Service Summary	9 per respondent		
Durable Medical Equipment bills *	1, several, or none per respondent		
Home health bills *	1, several, or none per respondent		
Hospice bills *	1, several, or none per respondent		
Hospital bills *	1, several, or none per respondent		
Outpatient bills *	1, several, or none per respondent		
Physician/supplier bills *	1, several, or none per respondent		
Skilled nursing facility bills *	1, several, or none per respondent		

* These bills are summarized in the Administrative Identification record (RIC A), but are provided for more detailed analysis. If the sample person used Medicare benefits, there will be one or many bills, of one or many types, depending on what types of services were used. If the sample person used no Medicare benefits of a certain type, there will be no bills of that type. If the sample person used no Medicare benefits at all, there will be no bills. The RIC A summary provides information about how many services of each type will be found in the bill record files.

Table 1.A: Survey and Administrative Records

File: **KEY**

RIC: "K"

Number of Records: 10,859 - 1 for each person who completed an interview

Description: The BASEID key identifies the person interviewed. It is an 8-digit element, consisting of a unique, randomly assigned 7-digit number concatenated with a single-digit checkdigit.

In addition to the BASEID, the KEY file contains the type of interview conducted and other variables for classifying the beneficiary.

File: **ADMINISTRATIVE IDENTIFICATION**

RIC: "A"

Number of records: 10,859 - 1 for each person who completed an interview

Description: The ADMINISTRATIVE IDENTIFICATION file contains information about the sample person from administrative records maintained by the Centers for Medicare & Medicaid Services. It contains basic demographic information (date of birth, sex), insurance information (Medicare entitlement, Medicaid eligibility, HMO enrollment), and summarizes the sample person's Medicare utilization for 2009.

Table 1.A: Survey and Administrative Records (Continued)

File: SURVEY IDENTIFICATION

RIC: "1"

Number of records: 10,859 - 1 for each person who completed an interview

Description: The SURVEY IDENTIFICATION file contains demographic information collected in the survey. To some extent, it parallels the demographic information provided in the ADMINISTRATIVE IDENTIFICATION file (date of birth and sex, for example). Demographic information that is not available in the CMS records, such as education, income and military service, is also present.

File: HEALTH STATUS AND FUNCTIONING

RIC: "2"

Number of records: 10,070- 1 for each person who completed a community interview

Description: The HEALTH STATUS AND FUNCTIONING file contains information about the sample person's health, including: self-reported height and weight, a self-assessment of vision and hearing, use of preventive measures such as immunizations and mammograms, avoidable risk factors such as smoking, and a history of medical conditions. Standard measures - activities of daily living (ADLs) and instrumental activities of daily living (IADLs) - also appear in this file.

Table 1.A: Survey and Administrative Records (Continued)

File: HEALTH STATUS AND FUNCTIONING - FACILITY

RIC: “2F”

Number of records: 789 - 1 for each person who completed a facility interview

Description: The HEALTH STATUS AND FUNCTIONING – FACILITY file contains information about the sample person’s health, including: self-reported height and weight, a self-assessment of vision and hearing, use of preventive measures such as immunizations and mammograms, avoidable risk factors such as smoking, and a history of medical conditions. Standard measures - activities of daily living (ADLs) and instrumental activities of daily living (IADLs) - also appear in this file.

File: HEALTH INSURANCE

RIC: “4”

Number of records: 10,859 - 1 for each person who completed an interview

Description: The HEALTH INSURANCE file summarizes the health insurance information provided by the sample people. The file provides both annual and monthly indicators of health insurance coverage by Medicare, Medicaid, HMO’s, PHI, and other public plans.

Table 1.A: Survey and Administrative Records (Continued)

File: HOUSEHOLD COMPOSITION

RIC: “5”

Number of records: 10,147 - 1 for each person who completed a community interview

Description: The HOUSEHOLD COMPOSITION file contains information about the sample person’s household. It reflects the size of the household, and the age and relationship of the people in it.

File: FACILITY CHARACTERISTICS

RIC: “7”

Number of records: 916 - 1 for each sample person interviewed in a facility

Description: The FACILITY CHARACTERISTICS file provides general characteristics of the institutions, and most of the information from the facility screener. In several cases, more than one sample person resided in the same facility. In these cases the RIC 7 records are redundant (containing all of the same information), and differ only in the BASEID.

Table 1.A: Survey and Administrative Records (Continued)

File: SNF CHARACTERISTICS

RIC: “7S”

Number of records: 538 - 1 for each sample person with a Medicare claim from a skilled nursing facility

Description: The SNF CHARACTERISTICS file provides general characteristics of the skilled nursing facility from CMS’ Provider of Service file. In several cases, more than one sample person resided in the skilled nursing facility. In these cases the RIC 7S records are redundant (containing all of the same information), and differ only in the BASEID.

File: INTERVIEW DESCRIPTION

RIC: “8”

Number of records: 29,325 - 1 for each interview

Description: The INTERVIEW DESCRIPTION file summarizes the characteristics of the interview, including type of questionnaire, duration, and whether or not the interview was conducted with a proxy respondent.

File: RESIDENCE TIMELINE

RIC: “9”

Number of records: 10,859 - 1 for each sample person

Description: The RESIDENCE TIMELINE file tracks the movement of individuals between community, facility, and skilled nursing facility settings. While the majority of respondents have only one setting throughout the year, the records allow for up to twenty occurrences of movement between a community and a facility setting. See Section 3, Notes.

Table 1.A: Survey and Administrative Records (Continued)

File: MDS/OASIS TIMELINE

RIC: “10”

Number of records: 2,867 - 1 for each sample person who had an MDS or OASIS assessment

Description: The MDS/OASIS TIMELINE file shows periods of nursing home stays and home health care according to MDS and OASIS assessments. It also incorporates inpatient hospital stays from the RIC IPE (both from Medicare claims and survey-reported hospitalization.) See Section 3, Notes.

File: LONG TERM CARE MINIMUM DATA SET

RIC: “MDS”

Number of records: 19,490 – 1 for each standardized assessment for a resident in a nursing home.

Description: The Long Term Care Minimum Data Set (MDS) is a standardized, primary screening and assessment tool of health status which forms the foundation of the comprehensive assessment for all residents of long-term care facilities certified to participate in Medicare or Medicaid. The MDS contains items that measure physical, psychological and psycho-social functioning. The items in the MDS give a multidimensional view of the patient's functional capacities, and can be used to present a nursing home's profile.

Table 1.A: Survey and Administrative Records (Continued)

File: OUTCOME AND ASSESSMENT INFORMATION

RIC: "OAS"

Number of records: 5,021– 1 for each comprehensive assessment for and adult home care patient

Description: OASIS assessments are collected for adult Medicare and Medicaid patients (age 18 or over) receiving skilled health services from the HHA. Patients whose care are reimbursed by other than Medicare or Medicaid or are receiving homemaker, chore, or companion services are not required to collect OASIS data. OASIS data items address socio-demographic, environmental, support system, health status, functional status, and health service utilization characteristics of the patient.

File: CROSS-SECTIONAL WEIGHTS

RIC: "X"

Number of records: 10,859 - 1 for each sample person

Description: The CROSS-SECTIONAL WEIGHTS file provides cross-sectional weights, including general-purpose weights and a series of replicate weights.

File: TWO-YEAR SURVEY LONGITUDINAL WEIGHTS

RIC: "X3"

Number of Records: 6,874 - 1 non-zero weight for each non-ghost sample person who completed an interview in the current and preceding year.

Description: The Longitudinal Weights file provides longitudinal weights, including general-purpose weights and a series of replicate weights.

Table 1.A: Survey and Administrative Records (Continued)

File: THREE-YEAR SURVEY LONGITUDINAL WEIGHTS

RIC: “X4”

Number of Records: 3,372 - 1 non-zero weight for each non-ghost sample person who completed an interview in the current and each of the two preceding years.

Description: The Longitudinal Weights file provides longitudinal weights, including general-purpose weights and a series of replicate weights.

NOTE: The number associated with the naming convention of the longitudinal RIC’s refers to the number of years a given panel has been in the survey, not the applicable length of longitudinal study. Therefore, the RIC X3 allows for the two year longitudinal study of beneficiaries that have been in the survey for at least three years. Similarly, the RIC X4 allows for the three year longitudinal study of only those beneficiaries that have been in the survey for four years.

File: DENTAL EVENTS

RIC: “DUE”

Number of records: 10,894

Description: Individual dental events for the MCBS population.

Table 1.A: Survey and Administrative Records (Continued)

File: FACILITY EVENTS

RIC: “FAE”

Number of records: 926

Description: Individual facility events for the MCBS population. There is one record for each stay that occurred at least partly in CY 2008. Facility events only contain CY 2009 use and cost information.

File: INPATIENT HOSPITAL EVENTS

RIC: “IPE”

Number of records: 3,786

Description: Individual inpatient hospital events for the MCBS population.

File: INSTITUTIONAL EVENTS

RIC: “IUE”

Number of records: 921

Description: Individual short-term facility (usually SNF) stays for the MCBS population that were reported during a community interview or created through Medicare claims data.

Table 1.A: Survey and Administrative Records (Continued)

File: MEDICAL PROVIDER EVENTS

RIC: "MPE"

Number of records: 311,083

Description: Individual events for a variety of medical services, equipment, and supplies collected in the survey, including: medical provider (MP), separately billing doctor (SD), separately billing lab (SL), and other medical expenses (OM). See Section 3, Notes.

File: OUTPATIENT HOSPITAL EVENTS

RIC: "OPE"

Number of records: 55,720

Description: Individual outpatient hospital events for the MCBS population.

File: PRESCRIBED MEDICINE EVENTS

RIC: "PME"

Number of records: 463,851

Description: Individual outpatient prescribed medicine events for the MCBS population. See Section 3, Notes.

Table 1.A: Survey and Administrative Records (Continued)

File: PERSON SUMMARY

RIC: “PS”

Number of records: 10,859

Description: Summarization of utilization and expenditures by type of service and summarization of expenditures by payer, yielding one record per person. See Section 3, Notes.

File: SERVICE SUMMARY

RIC: “SS”

Number of records: 97,731

Description: Summarization of the seven individual event RICs along with home health and hospice utilization, yielding a total of nine summary records per person. See Section 3, Notes.

Table 1.B: Bill Records

File: DURABLE MEDICAL EQUIPMENT

RIC: DME

Number of records: 30,834

Description: Medicare Part B claims for the MCBS population that involves the use or purchase of certain medical equipment.

File: HOME HEALTH BILLS

RIC: HHA

Number of records: 1,659

Description: Home health bills for the MCBS population. Home health agencies generally bill on a cycle, e.g., monthly.

File: HOSPICE BILLS

RIC: HSP

Number of records: 1,062

Description: Hospice bills for the MCBS population. Billing practices vary by provider in that some hospices bill on a cycle (e.g. monthly) so that several bills constitute a period of hospice care; others submit a series of “final” bills.

Table 1.B: Bill Records (Continued)

File: HOSPITAL BILLS

RIC: INP

Number of records: 3,126

Description: Inpatient hospital bills for the MCBS population. These include bills from short stay general hospitals, and long-term hospitals such as psychiatric and TB hospitals. Different provider types are distinguishable. Generally, there is one bill for each stay. Some hospitals, particularly the long-term facilities, may bill on a cyclical basis and several bills may constitute a single hospitalization.

File: OUTPATIENT BILLS

RIC: OTP

Number of records: 35,854

Description: Outpatient hospital bills for the MCBS population. These bills are generally for Part B services that are delivered through the outpatient department of a hospital (traditionally, a Part A provider).

File: PHYSICIAN/SUPPLIER BILLS

RIC: PHY

Number of records: 407,390

Description: Medicare Part B (physician, other practitioners, and suppliers including DME) claims for the MCBS population. These records reflect services such as doctor visits, laboratory tests, X-rays and other types of radiological tests, surgeries, inoculations, certain other services and supplies, and use or purchase of certain medical equipment.

Table 1.B: Bill Records (Continued)

File: SKILLED NURSING FACILITY BILLS

RIC: SNF

Number of records: 1,506

Description: Skilled nursing facility bills for the MCBS population. These include Christian Science facilities and other skilled nursing facilities. Different provider types are distinguishable. Generally, several bills constitute a period of institutionalization.

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Codebooks

This section consists of two parts: 1) a description of the detail records of survey data and summary data from CMS' administrative and claims files, and 2) a description of bill and claims detail records from CMS' National Claims History (NCH) database. Included in the first part, "Survey and Claims Summary Records", are frequency distributions for all of the variables in the survey data and for the summary CMS data. The second part of this section, "Medicare Claims Records", does not include frequency distributions.

Survey and Claims Summary Records

Using the tables The tables in this section list the variables in each of the records, give their physical location in the record, list their possible values and relate them to the questionnaires or to source CMS files.

The first part of the Medicare Current Beneficiary Survey public use file (that is, the survey and CMS summary data) is made up of several different types of records. The record type (RIC) is shown on the second line both in the middle of the page and on the upper right hand corner for each page within a section. This will enable more rapid access to particular parts of the codebook. The name of the record being described is on the third line in the middle of the page.

Variable - This column contains the variable names that we have associated with the SAS version of our data files. Since SAS limits variable names to 8 characters, these names are not always immediately meaningful. You can change them to more informative names, but the names in the tables were used to annotate the copies of the questionnaires.

Certain conventions apply to the SAS variable names. All variables that are preceded by the character "D_", such as D_SMPTYP are derived variables. The variables did not come directly from the survey data, but compiled from several survey variables. Variables preceded by the characters "H_" come for CMS source files.

Col (Column) - This column locates the variable physically in the record.

Len (Length) - This column describes the length of the field of the variable.

Fmt (Format) Name - This column contains two pieces of information about the variable. First, it identifies the format name associated with the variable in the SAS README file for this variable's RIC. Second, it displays the frequency count for possible values of the variable.

Ques # - The column headed "Ques #" contains a reference to the questionnaire for direct variables, or to the source of derived variables. For example, the "Ques #" entry that accompanies the variable ERVISIT in the Access to Care record is "AC1." The first question in the Access to Care portion of the community questionnaire is the one referenced.

This column will be blank for variables that relate to neither the questionnaire nor to the CMS source files. These variables, such as the record identification code (variable name is RIC), are usually ones that we created to manage the data and the file.

Table 2.1 lists the abbreviations that may appear in this column when a section of the questionnaire is referenced.

Table 2.1 Abbreviations Used to Identify Sections of the Questionnaires

Community Questionnaire

IN	Introduction
EN	Enumeration
HI	Health Insurance
HS	Health Status and Functioning
DI	Demographics/Income
CL	Closing

Facility Questionnaire (Screener)

FQ

Facility Baseline Questionnaire

A	Demographics/Income
B	Residence History
C	Health Status and Functioning
D	Health Insurance
L	Tracing and Closing

All of the possible values of the variable appear in lines beneath that explanation. Associated with each possible value (in the column labeled “Fmt Name”) is a count of the number of times that the variable had that value, and, under the column labeled “Label,” a short format expanding on the coded value. Formats are also available in the README files.

Certain conventions were used in coding all variables to distinguish between questions that beneficiaries would not, or could not, answer, and questions that were not asked. These conventional codes are: “.” or “-1” if the question was not applicable; “-7” if the respondent refused to answer; “-8” if the respondent didn’t know the answer; and “-9” if the answer could not be ascertained from the response. With derived variables, a “.” (blank) or “.” mean that the variable could not be derived because one or more of the component parts was not available.

Many questions were posed to illicit simple “Yes” or “No” answers, or to limit responses to one choice from a list of categories. In these cases, the responses are “Yes” or “No,” or one of the codes from the list. In other questions, the respondent was given a list of items to choose from, and all of the responses were recorded. In these cases, each of the responses is coded “Indicated” or “Not indicated.”

If a beneficiary responded with an answer that was not on the list of possible choices, it was recorded verbatim. All of the verbatim responses were reviewed and categorized. New codes were added to the original list of options to accommodate narratives that appeared frequently. For this reason, the list of possible values for some variables may not exactly match the questionnaire.

Inapplicable - Each variable is followed by a statement that describes when a question was not asked, resulting in a missing variable. Questions were not asked when the response to a prior question or other information gathered earlier in the interview, would make them inappropriate. For example, if the sample person said he has never smoked (community component, question HS16), he would not be asked if he smokes now (question HS17).

The codebook for the various survey and summary RICs is followed by a Variable Name Index that lists sequentially all variables in the codebook, source of information, pertinent RIC, and page within the codebook.

Medicare Claims Records

Using the tables The tables in the bill detail section describe the Medicare utilization files included on the public use file. There are two sets of tables; they must be considered together in order to interpret the data in this segment.

Section 2: Codebooks

File Descriptions for Medicare Claims - These record layouts correspond to the seven Medicare utilization files on the public use file(s). The inpatient hospital and SNF bill files are described in the same record layout even though they are in separate datasets.

NCH No. - The number associated with each variable in the public use file bill records and CMS' Data Dictionary (discussed below). The NCH No. can be used to crosswalk from the bill record to the more detailed description in the dictionary.

Variable - The name we have assigned to the data element (variable). Names may be up to eight characters long, and are mnemonic. The variable name links the record layout to the remainder of the bill detail documentation. This name is also the name that we have supplied in the "README" SAS INPUT statement and labels.

Type - The format of the data element, or variable. Singly occurring data fields may be numeric, character or packed-decimal.

Group items may appear more than once, depending on the information that is present in the bill. For example, if several surgical procedures were reported on the bill, each of them would appear as a separate group item. One surgical procedure would translate to a single group item. A counter shows how many of each trailer type are present. For example, the number of ICD-9-CM procedure code groups present on the claim would be indicated by the counter PROCCNT.

Length - The number of bytes physically occupied by the variable in the record.

Format - How the data should be interpreted. For example, date fields may be read as six characters, interpreted as YYMMDD (two-digit year, followed by two-digit month, followed by the two-digit day of the month).

Description - A more complete explanation of what the variable contains. These descriptions can be assigned to variables with the SAS LABEL code that is provided in the "README" file.

Data Dictionary - The CMS National Claims History Data Dictionary is included as a supplement to this documentation. The data dictionary consists of tables that are maintained by CMS to describe their internal records. They contain standard definitions of the variables in this file and values for all coded variables. Some of the variables referenced in this dictionary do not appear in this file. We have deleted some fields to protect the privacy of those who are participating in the survey.

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Notes on Using the Data

This section is a collection of information about various data fields in this public use release. We have not attempted to present information on every survey data field; rather, we concentrated our efforts on data fields where we have something useful to introduce.

Tri - Level File Structure

The Cost and Use file has been summarized at three different levels for the convenience of users. Depending on the specific aims of the analysis, it may be possible for users to avoid having to process all the event records (which is the most detailed record level in the file) to get totals and subtotals. The type of service summary pulls together event records for each person by service. It is designed to aid analysts who are interested in utilization, costs, and payers of a particular type of service; for example, average Medicare payments for inpatient hospital services per person during the year, or a distribution of payers showing the amount spent on prescription drugs during the year.

While these types of analyses can be obtained from the detailed event records, they can be tabulated more easily - processing fewer records - from the type of service summary. The highest level of summarization is total health spending for each person. We recommend that one of the first issues a user addresses is whether the file has already summarized use, costs, and payment distributions at a level that would serve their analysis.

To restate this in a more structured way, the Cost and Use File Records (RICs) are assembled at three levels:

1. The **Event level** reports all payers, costs and utilization at the most detailed level available. Service types at the event level are dental, facility, medical provider, inpatient hospital, outpatient hospital, and institutional events.
2. The **Service Summary level** summarizes all payers, costs and utilization for a person at the service level. There are nine service categories: dental, facility, home health, hospice, medical provider, inpatient hospital, institutional, outpatient hospital, and prescribed medicines. Note that home health and hospice services are only included at the service and person level; there is no event level data for

these two services. Within each type of service record, separate payer totals for eleven different payers are also shown. Payer totals are summarized in two ways: once summarizing the event level records, and in adjusted form. The adjusted totals correct for any survey interviewing gaps during the year. The service summaries are adjusted to exclude unmatched survey event records that are considered duplicative of unmatched Medicare bill record events. [See **MATCHING EVENT LEVEL DATA** and **ADJUSTING FOR MISSING DAYS AND UNDATED SERVICES** in Section 5].

3. The **Person Summary level** summarizes all payers and costs across service categories and summarizes type of service amounts. These records show only one total for each person, service and payer. Again, payment amounts are shown two ways: as summarized from event records, and adjusted to compensate for Medicare covered days that were not covered by interview reference periods.

Key Record (RIC K)

There are 10,859 key records, one for each individual in the file. Each individual has a variable showing whether they had only community days (10,010 respondents), only facility days (692 respondents) or both community and facility days (157 respondents) in 2009.

The facility interview was conducted whenever the sample person was residing in a facility: 1) that contains three or more beds, 2) that is classified by the administrator as providing long-term care, and 3) whose physical structure allows long-term care residents of the facility to be separately identified from those of the institution as a whole. This broad definition allows analysis beyond traditional views of long-term care, that is, nursing home and related care homes having three or more beds and providing either skilled nursing, or rehabilitative or personal care. Analysts can narrow or extend the focus of their studies of facility care by using information from the Survey Facility Identification Record (RIC 7). This record is present for each sample person for whom a facility questionnaire was administered.

TOT_DAYS is the total number of days in 2009 that the respondent was entitled to Medicare. **C_DAYS** is the number of Medicare-entitled days in 2009 that the respondent was living in the community. **F_DAYS** is the number of Medicare-entitled days in 2009 that the respondent was living in a facility. **S_DAYS** is the number of days in 2009 that the respondent was in a skilled nursing facility based on Medicare claims information.

FIRSTRND is the survey round that the respondent was first interviewed. See the discussion of **SUPPLEMENTING THE SAMPLE** in Section 5 for a complete discussion

of the supplemental sample respondents who entered the survey in Rounds 54 and 56.

Administrative Identification Record (RIC A)

Except as noted otherwise, the variables in this record were derived from CMS' Medicare enrollment database. History records were searched to establish the beneficiary's status as of December 31, 2009, or their date of death. For example, age is the highest age attained during 2009; residence, type of beneficiary, and other status fields are as of December 31, 2009, or their date of death.

Four variables relating to the sample person's age are provided. Date of birth as reported by the respondent during the initial interview is recorded in the RIC 1 - Survey Identification record (**D_DOB**). Date of birth from the Medicare - Social Security Administration records is recorded in the Administrative Identification Record (**H_DOB**). The variable **H_AGE** represents the sample person's age as of July 1, 2009. The variable **D_STRAT** groups the sample persons by **H_AGE**.

In 2009, approximately 7.9million enrollees or 17 percent of the Medicare population had their Part B and/or Part A premiums paid by a State agency. This process, called State buy-in, is tracked by CMS and is used as a general proxy for Medicaid participation. The variables that describe this participation (**H_MCSW** and **H_MCDE01-- H_MCDE12**) were derived through a match with CMS' enrollment database.

In 2009, approximately 24 percent of the Medicare population receives Medicare benefits through a coordinated care organization (such as an HMO) which contracts directly with CMS to provide those services. The variable that describes this membership (**H_GHPSW**) was derived through a match with CMS' enrollment database.

In 2008, creditable coverage information was added to the RIC A. The variables that provide this status (**H_CRED01—H_CRED12**) come from the Part D enrollment data for 2008.

Utilization Summary For easier comparison of groups of people by the number and cost of medical services they have received, the Administrative Identification Record also includes a summary of all Medicare claims for calendar year 2009, as received and processed by CMS through December, 2010. (See the variables in the Administrative Identification Record from **H_LATDCH** to the end). Individual bill records are supplied as part of this public use release for researchers who wish to look at Medicare bills in detail.

Section 3: Notes

The utilization summary represents services rendered and reimbursed under fee-for-service in calendar year 2009. If a beneficiary used no Medicare services at all or was a member of a coordinated or managed care plan (such as a risk HMO) that does not submit claims to a fiscal intermediary or carrier, all their program payment summary variables will be empty. If the beneficiary used no services of a particular type the variables relating to those benefits will be empty. Empty variables are zero-filled, except as noted in the next paragraphs.

Adjustment bills Initial claims submitted by fiscal intermediaries and carriers for services rendered and paid for by Medicare may be modified by later transactions that result in additional submittal of information relevant to payment or utilization for a given event. There are two types of Part A (institutional) adjustment transactions: credit-debit pairs, and cancel-only credit transactions. Both types of transactions cancel out a bill that was processed earlier (the credit bill exactly matches the earlier bill, which can be viewed as an initial debit). The difference between them lies in how (or if) a new debit transaction is applied to show the correct utilization. If the adjustment consists of a credit-debit pair, the new debit is applied immediately because it is submitted as the “debit” half of the pair. If the adjustment is a cancel-only transaction, the debit may be processed at a later date through a separate bill. In some cases, as when the original bill was completely in error, the cancel-only transaction simply serves to “erase” a mistake, and no new debit would be submitted. For this file, the adjustment processing removes the original debit and the credit that cancels it out, leaving only the final, corrected debit.

[NOTE: A few rare cases of credit bills with no prior debit may be in this file; these records can be dropped from analysis because they are, in effect, canceling out something of which CMS has no record.]

For Part B claims, we summarized only accepted claims (process code is “A”), or adjusted claims if the adjustment concerned money (process code either “R” or “S” and allowed charges greater than \$0). If the claim disposition code (DISPCD) was “03” or “63” (indicating a credit), both the credit and the matching debit were deleted.

Utilization summary - Individual fields After adjustments were processed, the bills were summarized following the rules below.

Inpatient hospital bills Utilization is summarized by admissions, days, charges, covered charges, reimbursement amount, coinsurance days, and coinsurance amount. Admissions (**H_INPSTY**) were totaled by sorting the bills in chronological order and counting the first admission in each sequence. Total covered days (**H_INPDAY**) were summed from **COVDAY** in the bill. Total coinsurance days (**H_INPCDY**) were summed from **COINDAY**. Total bill charges and non-covered charges were selected from the revenue center trailer coded “0001”; total charges were summed as **H_INPCHG** and covered

charges (total charges less non-covered charges) were summed as **H_INPCCH**. Coinsurance amounts (**H_INPCAM**) were summed from **COINAMTA** in the bill. Reimbursement (**H_INPRMB**) is the sum of **PROVPAY** and “pass through” amounts. Pass through amounts were calculated by multiplying covered days (**COVDAY** in the bill record) by the pass through per diem (**PTDIEM** in the bill record).

Skilled nursing facility Utilization is summarized by admissions, days, charges, covered charges, reimbursement amount, coinsurance days, and coinsurance amount. Admissions (**H_SNFSTY**) were totaled by sorting the bills in chronological order and counting the first admission in each sequence. Total covered days (**H_SNFDAY**) were summed from **COVDAY** in the bill. Total coinsurance days (**H_SNFCDY**) were summed from **COINDAY**. Total bill charges and non-covered charges were selected from the revenue center trailer coded “0001”; total charges were summed as **H_SNFCHG** and covered charges (total charges less non-covered charges) were summed as **H_SNFCCH**. Total coinsurance amounts (**H_SNFCAM**) were summed from **COINAMTA** in the bill. Total reimbursement (**H_SNFRMB**) is the sum of **PROVPAY**.

Home Health Utilization is summarized by visits, visit charges, and other (that is, nonvisit) charges. If the second and third positions of the revenue center code were 42, 43, 44, 47, 55, 56, 57, or 58, then the units in the trailer (visits) were added to total visits (**H_HHAVST**) and the charges were accumulated as total covered visit charges (**H_HHACCH**). If the revenue center codes did not indicate visits, the charges were accumulated as other HHA charges (**H_HHACHO**). Total home health reimbursement (**H_HHRMBA**) and (**H_HHRMBB**) was summed from the variable **PROVPAY**.

Hospice Utilization is summarized by days, covered charges, and reimbursement amount. Covered hospice days (**H_HSDAYS**) were summed from the bill variable **COVDAY**. Covered charges were selected from the revenue center trailer coded “0001” and summed as **H_HSTCHG**. Total hospice reimbursement (**H_HSREIM**) was summed from the variable **PROVPAY**.

Outpatient Utilization is summarized by bills, covered charges, and reimbursement amount. Total bills were counted as **H_OUTBIL**. Total covered charges were selected from the revenue center trailer coded “0001” and summed as **H_OUTCHG**. Total outpatient reimbursement (**H_OUTRMB**) was summed from the variable **PROVPAY**.

Physician/Supplier claims Utilization is summarized by number of claims, number of line items, submitted and allowed charges, reimbursement, office visits and office visit charges. All claims and individual line items (there can be up to 13 per claim) were counted and summed as (**H_PMTCLM**) and (**H_PMTLIN**). Submitted charges and allowed charges (**H_PMTSCH**) and (**H_PMTACH**) were summed from **SUBCRG** and

ALLOWCRG in the bill. Total reimbursement for Part B claims (**H_PMTRMB**) was summed from the variable **LINEPMT** in the bill.

Office visits and their charges are summed with other services and as separate categories (**H_PMTVST** and **H_PMTCHO**). We summed office visits and office visit charges separately for two reasons. An office visit is a universally understood measure of service use and access to medical care. It also is an accurate measure of levels of service use across separate groups, unlike charge or payment figures, which vary depending on the services performed. Office visits are identified by HCPCS codes in the series 90000-90090 and 99201-99215 in the Part B line item trailer group(s).

Survey Identification Record (RIC 1)

“Initial interview” variables Some questions are asked only in the initial interview for an individual and are not asked again during subsequent sessions because the responses are not likely to change. Such questions include: “Have you ever served in the armed forces?” and “What is the highest grade of school you ever completed?” Similarly, once the sample person has told us that he or she has a chronic condition (such as diabetes), the interviewer will not ask, “Have you ever been told you have diabetes?” in a subsequent interview. For this reason, the answers to these questions are missing in later rounds for people who have continued in the survey from an earlier round. To maximize the usefulness of this file, we have filled in this missing information from the original Round 49 interview. Variables that have been reproduced this way are annotated “Initial interview” in this section.

When the complete date of birth was entered (**D_DOB**), the CAPI program automatically calculated the person’s age, which was then verified with the respondent. In spite of this validation, the date of birth given by the respondent (**D_DOB**) does not always agree with the Medicare record date of birth (**H_DOB**). In these cases, the sample person was asked again, in the next interview, their date of birth. Some recording errors have been identified this way, but in most cases beneficiaries provided the same date of birth both times they were asked. In some cases, proxies indicated that no one was exactly sure of the correct date of birth. In general, it is recommended that the variable **H_DOB** be used for analyses, since the CMS date of birth was used to select and stratify the sample. (Initial interview variable)

The VA disability rating (**D_VARATE**) is a percentage and is expressed in multiples of ten; it refers to disabilities that are officially recognized by the government as service-related. (Initial interview variable)

Race categories (**D_RACE**) are recorded as interpreted by the respondent. The interviewer did not suggest categories, nor did the interviewer try to explain or define any of the groups. Ethnic groups such as Irish or Cuban were not recorded. (Initial interview variable)

Hispanic (**D_ETHNIC**) includes persons of Mexican, Puerto Rican, Cuban Central or South American or other Spanish culture or origin, regardless of race. Again, these answers are recorded as interpreted by the respondent. (Initial interview variable)
The respondent was allowed to define marital status categories (**SPMARSTA**); there was no requirement for a legal arrangement (for example, separated). (Initial interview variable)

SPCHNLNM: Respondents were asked to report all living children, whether stepchildren, natural or adopted children. (Initial interview variable)

SPDEGRCV: Education does not include education or training received in vocational, trade or business schools outside of the regular school system. This variable only includes years the sample person actually finished. If the sample person had earned a GED, the response was coded “high school--4th year.” If the sample person said he or she earned a college degree in fewer than 4 years, the response was coded “college and graduate school--4 years.” If the sample person attended school in a foreign country, in an ungraded school, under a tutor or under special circumstances, the nearest equivalent or the number of years of attendance was coded. (Initial interview variable)

INCOME: Income represents the best source or estimate of income during 2009. Round 58 represents the most detailed information for 2009 and used when available. For individuals not completing Round 58, the most recent information available was used. It should be noted that INCOME includes all sources, such as pension, Social Security and retirement benefits, for the sample person and spouse. In some cases the respondent would not, or could not, provide specific information but did say whether the income was above or below \$25,000.

Health Status and Functioning Record (RIC 2)

The answers in the health status and functioning section of the questionnaire are a reflection of the respondent’s opinion, not a professional medical opinion. The health status questions are asked in the fall round of the year (September through December). Limitations on social life (**HELMTACT**) reflect the sample person’s experience over the preceding month, even if that experience was atypical.

Section 3: Notes

In the height measurement (**HEIGHTIN**), fractions of an inch have been rounded: those one half inch or more were rounded up to the next whole inch, those less than one half inch were rounded down. (Initial interview variable)

In the weight measurement (**WEIGHT**), fractions of a pound have been rounded: those one half pound or more were rounded up to the next whole pound, those less than one half pound were rounded down. (Initial interview variable)

The sample person was asked to recall or estimate, not to measure or weigh himself or herself.

HYSTEREC: “Hysterectomy” includes partial hysterectomies. (Initial interview variable)

Use of other forms of tobacco, such as chewing tobacco, is not relevant to the “smoking” questions (**EVERSMOK** and **SMOKNOW**). Trying a cigarette once or twice was not considered “smoking,” but any period of regular smoking, no matter how brief or long ago, was considered smoking. “Now” meant within the current month or so and not necessarily whether the sample person had a cigarette, cigar or pipe tobacco on the day of the interview. Even the use of a very small amount at the present time qualified as a “yes.” Stopping temporarily (as for a cold) qualified as a “yes.” (**EVERSMOK** is an initial interview variable)

The answers about difficulty with various tasks (**DIFSTOOP**, **DIFLIFT**, **DIFREACH**, **DIFWRITE**, **DIFWALK**) reflect whether or not the sample person usually had trouble with these tasks, even if a short-term injury made them temporarily difficult.

The questions about various conditions (**OCARTERY**, **OCHBP**, **OCMYOCAR**, **OCCHD**, **OCOTHRT**, **OCSTROKE**, **OCCSKIN**, **OCCANCER**, **OCCLUNG**, **OCCCOLON**, **OCCBREST**, **OCCUTER**, **OCCPROST**, **OCCBLAD**, **OCCOVARY**, **OCCSTOM**, **OCCCERVX**, **OCCKIDNY**, **OCCBRAIN**, **OCCTHROA**, **OCCBACK**, **OCCHEAD**, **OCCFONEC**, **OCCOTHER**, **OCBETES**, **OCARTHRRH**, **OCARTH**, **OCMENTAL**, **OCALZHMR**, **OCPSYCHO**, **OCOSTEOP**, **OCBRKHIP**, **OCPARKIN**, **OCEMPHYS**, **OCPPARAL** and **OCAMPUTE**) were coded if the sample person had at some time been diagnosed with the condition, even if the condition had been corrected by time or treatment. The condition must have been diagnosed by a physician, and not by the sample person. Misdiagnosed conditions were not included. If the respondent was not sure about the definition of a condition, the interviewer offered no advice or information, but recorded the respondent’s answer, verbatim. (Initial interview variables)

*Note that in Cost and Use 2005, the following variables were deleted: **OCAARM, OCAFEET, OCABACK, OCANECK, OCAALOVR, and OCAOTHER.***

The variables (**D_HBP, D_CHD, D_OTHRT, D_CFAIL, D_VALVE, D_RHYTHM, D_STROKE, D_CSKIN, D_CANCER, D_PSYCH, D_BRKHIP, D_PPARAL, and D_PROST**) were coded if the sample person had been diagnosed with the condition within the 12 months prior to their interview, even if the condition had been corrected by time or treatment. The condition must have been diagnosed by a physician, and not by the sample person. Misdiagnosed conditions were not included. If the respondent was not sure about the definition of a condition, the interviewer offered no advice or information, but recorded the respondent's answer, verbatim. (Initial interview variables) These variables are only applicable to "continuing" sample persons and new sample persons who responded that they had never been diagnosed with the disease/condition.

IADLs and ADLs "Difficulty" in these questions has a qualified meaning. Only difficulties associated with a health or physical problem were considered. If a sample person only performed an activity with help from another person (including just needing to have the other person present while performing the activity), or did not perform the activity at all, then that person was deemed to have difficulty with the activity.

Help from another person includes a range of helping behaviors. The concept encompasses personal assistance in physically doing the activity, instruction, supervision, and "standby" help.

These questions were asked in the present tense; the difficulty may have been temporary or may be chronic. Vague or ambiguous answers, such as "Sometimes I have difficulty," were coded "yes."

PRBTELE: Using the telephone includes the overall complex behavior of obtaining a phone number, dialing the number, talking and listening, and answering the telephone.

The distinction between light housework (**PRBLHWK**) and heavy housework (**PRBHHWK**) was made clear by examples. Washing dishes, straightening up and light cleaning represent light housework; scrubbing floors and washing windows represent heavy housework. The interviewer was not permitted to interpret the answer in light of the degree of cleanliness of the dwelling.

PRBMEAL: Preparing meals includes the overall complex behavior of cutting up, mixing and cooking food. The amount of food prepared is not relevant, so long as it would be sufficient to sustain a person over time. Reheating food prepared by someone else does not qualify as "preparing meals."

PRBSHOP: Shopping for personal items means going to the store, selecting the items and getting them home. Having someone accompany the sample person would qualify as help from another person.

PRBBILS: Managing money refers to the overall complex process of paying bills, handling simple cash transactions, and generally keeping track of money coming in and money going out. It does not include managing investments, preparing tax forms, or handling other financial activities for which members of the general population often seek professional advice.

HPPDBATH: Those who have difficulty bathing or showering without help met at least one of the following criteria:

-  someone else washes at least one part of the body;
-  someone else helps the person get in or out of the tub or shower, or helps get water for a sponge bath;
-  someone else gives verbal instruction, supervision, or stand-by help;
-  the person uses special equipment such as hand rails or a seat in the shower stall;
-  the person never bathes at all (a highly unlikely possibility); or,
-  the person receives no help, uses no special equipment or aids, but acknowledges having difficulty.

HPPDDRES: Dressing is the overall complex behavior of getting clothes from closets and drawers and then putting the clothes on. Tying shoelaces is not considered part of dressing, but putting on socks or hose is. Special dressing equipment includes items such as buttonhooks, zipper pulls, long-handled shoehorns, tools for reaching, and any clothing made especially for accommodating a person's limitations in dressing, such as Velcro fasteners or snaps.

HPPDEAT: A person eats without help if he or she can get food from the plate into the mouth. A person who does not ingest food by mouth (that is, is fed by tube or intravenously) is not considered to eat at all. Special eating equipment includes such items as a special spoon that guides food into the mouth, a forked knife, a plate guard, or a hand splint.

HPPDCHAR: Getting in and out of chairs includes getting into and out of wheelchairs. If the sample person holds onto walls or furniture for support, he or she is considered to receive "help from special equipment or aids," since the general population does not use such objects in getting in and out of chairs. Special equipment includes mechanical lift chairs and railings.

HPPDWALK: Walking means using one's legs for locomotion without the help of another person or special equipment or aids such as a cane, walker or crutches. Leaning

on another person; having someone stand nearby in case help is needed; and using walls or furniture for support all count as receiving help. Orthopedic shoes and braces are special equipment.

HPPDTOIL: Using the toilet is the overall complex behavior of going to the bathroom for bowel and bladder function, transferring on and off the toilet, cleaning after elimination, and arranging clothes. Elimination itself, and consequently incontinence, is not included in this activity, but were asked as a separate question, discussed next.

LOSTURIN: “More than once a week” was coded if the sample person could not control urination at all. Leaking urine, especially when the person laughs, strains or coughs, does not qualify as incontinence.

*Note that in Cost and Use 2008, the variable **DCTROUB** has been changed to **FOODTRBL**. The variable title is the same “Difficulty eating solid food b/c teeth problems” but the values are different. See Changes Section for new values.*

*Note that in Cost and Use 2009, the following variables were deleted: **EINTROUB**, **EMCTROUB**, **EOBTROUB**. The questions were dropped from the questionnaire. Also, **OCDIABTS** is renamed **OCBETES**; **OCPSYCH** is renamed **OCPSYCHO**; and **D_PSYCH** is renamed **D_PSYCHO**. Please see the Changes Section for the **added new variable names** and their questions.*

Health Status and Functioning Record - FACILITY (RIC 2F)

The facility survey was changed in 1997 from a conventional pen and paper interview to a computer assisted personal interview (CAPI). The new CAPI facility questionnaire was modeled after the Minimum Data Set information that CMS requires most facilities to collect. For this reason, many of the questions within the facility CAPI do not match questions found in the community CAPI. MCBS users should carefully read the two different questionnaires before attempting to combine seemingly similar community and facility data.

Questions about disease and conditions were obtained from the sample person’s Quarterly Review. If the information could not be found on the Quarterly Review, then information was taken from the sample person’s full MDS. If the sample person did not have an MDS or the sample person’s MDS was not current then the sample person’s medical record was referenced. If the facility had no Quarterly Review, MDS, or medical record, then the facility personnel were asked to think about the sample person’s medical record when answering questions.

Health Insurance Record (RIC 4)

This record type is a summary of the respondent's health insurance coverage during 2009. There are five monthly indicators that summarize the respondent's health insurance coverage. **D_CARE1--D_CARE12** specifies type of Medicare coverage: Part A, Part B, or both. **D_CAID1--D_CAID12** indicates Medicaid eligibility and how we know about it: from the survey, from CMS' administrative files, or both. To help the respondent answer the questions about Medicaid, the interviewers used the name of the Medicaid program in the state where the sample person was living. **D_PHI1--D_PHI12** specifies whether the respondent has private health insurance and the source of it: employer-sponsored, self-purchased, both, or an unknown source. **D_HMO1--D_HMO12** indicates whether the respondent was a member of an HMO and what type: private HMO, Medicare HMO, or both. **D_OTH1--D_OTH12** indicates the number of other public health insurance plans that the respondent has (e.g. VA coverage, PACE plan, state-sponsored drug plan).

In addition to the monthly health insurance variables there are five annual health insurance variables which summarize the monthly variables: **D_CARE**, **D_CAID**, **D_PHI**, **D_HMO**, and **D_OTH**.

TOT_PREM is an estimate of the total health insurance premiums paid by the respondent for all their secondary health insurance. **TOT_PREM** was imputed if premium data was missing for one or more policies and the beneficiary had some community exposure and none of their secondary health insurance policies were HMO plans.

No attempt was made to statistically impute missing premium data for persons whom have one or more HMO plans. Where possible, CMS's administrative data on the premium amount which specific HMOs are allowed to charge members was used to fill in missing HMO premium data. If the premium data for one or more policies is missing for a person with HMO coverage, **TOT_PREM** will be missing. **TOT_PREM** estimates the premium cost for coverage of the sample person only. If a policy covered more than one person, the premiums attributable to the policy were divided by the number of persons covered (**D_COVNMx**).

A private health insurance plan is one that covers any part of hospital bills, doctor bills, or surgeon bills. It does not include any of the following:

-  Public plans, including Medicare and Medicaid, mentioned elsewhere in the questionnaire.

- ✚ Disability insurance which pays only on the basis of the number of days missed from work.
- ✚ Veterans' benefits.
- ✚ "Income maintenance" insurance or "Extra Cash" policies which pay a fixed amount of money to persons both in and out of the hospital. These plans pay a specified amount of cash for each day or week that a person is hospitalized, and the cash payment is not related in any way to the person's hospital or medical bills.
- ✚ Workers' Compensation.
- ✚ Any insurance plans that are specifically for contact lenses or glasses only. Any insurance plans or maintenance plans for hearing aids only.
- ✚ Army Health Plan and plans with similar names (e.g., CHAMPUS, CHAMPVA, Air Force Health Plan).
- ✚ Dread disease plans that are limited to certain illnesses or diseases such as cancer, stroke or heart attacks.
- ✚ Policies that cover students only during the hours they are in school, such as accident plans offered in elementary or secondary schools.
- ✚ Care received through research programs such as the National Institutes of Health.

Detailed information is given for up to five health insurance plans in the plan trailer portion of the RIC 4. **D_TYPPLn** is the plan type (private employer-sponsored insurance, private self-purchased insurance, unknown private insurance, private HMO or Medicare HMO). Note that private insurance plan information collected in the facility is categorized as 'unknown' because we do not ask the facility representative the source of the respondent's private health insurance.

The beginning and ending dates of the plan are in **D_BEGPLn** and **D_ENDPLn**.

D_PHRELn, the "Policy Holder" or "Main insured person", is the member of the group or union or the employee of the company that provides the insurance plans. It would also be the name on the policy, if the respondent had it available.

D_COVNMn is the number of people covered under the policy. **D_COVRXn** indicates whether the plan covers prescription drugs. **D_COVNHn** indicates whether the plan has long-term care coverage.

D_PAYSPn indicates if the policyholder pays a premium for the plan. **D_ANAMTn** is the annual premium paid for the plan. A premium amount was recorded even if the sample person did not directly pay the premium (if, for example, a son or daughter paid the premium). Premium amounts have been annualized, even though the sample person may not have held the policy for the full 12 months.

Section 3: Notes

D_HMOPLn indicates whether the plan is an HMO. If applicable, **D_PLNUMn** is the Medicare HMO number. Otherwise, it is a 2-character plan number that was uniquely assigned in the survey. This field was first populated with the 2-character plan number in Cost and Use 1999 to allow users to track plan coverage from year to year.

D_OBTNPn indicates how the respondent obtained the plan (e.g. self-purchased, employer, etc.).

Note that the following variables were new in Cost and Use 2001: D_TRIn, D_INSn, D_RXn, D_INSOTH, and D_RXOTH].

D_TRIn indicates if the health plan is TRICARE for Life, a supplemental coverage plan for military personnel and retirees effective October 1, 2001.

D_INSn specifies whether the PHI plan has limited service coverage such as dental-only, prescription drug-only, etc. This information was developed through an editing process in which the plan names were researched and categorized into comprehensive insurance or single-service insurance plans. Furthermore, **D_RXn** was developed in conjunction with that editing process. **D_RXn** indicates if the PHI plan covers prescription drugs or is a prescription drug discount card. For example, a respondent may indicate that a plan covers drugs. If further analysis reveals that the plan is a single-service type, **D_RXn** would indicate no drug coverage in order to prevent drug imputation for all services. These flags were developed specifically to aid in accurately setting prescription drug imputation flags.

Similarly, the plan name analysis and coverage categorization was done for Other Public plans and is recorded in the variables **D_INSOTH** and **D_RXOTH**.

Note that the following variables were omitted from Cost and Use 2008 (D_INDUS1 – D_INDUS5). The related question was omitted from the questionnaire in Round 47.

Note that the following variables were omitted from Cost and Use 2009 (D_PLLTR1, D_PLLTR2, D_PLLTR3, D_PLLTR4, and D_PLLTR). The related question was dropped from the questionnaire.

Household Composition Record (RIC 5)

A household is defined as the group of individuals either related or unrelated who live together and share one kitchen facility. This may be one person living alone, a head of household and relatives only, or may include head of household, relatives, boarders and any other non-related individuals living in the same dwelling unit.

Household membership includes all persons who currently live at the household or who normally live there but are away temporarily. Unmarried students away at school, family members away receiving medical care, etc., are included. Visitors in the household who will be returning to a different home at the end of the visit are not included.

Generally, if there was any question about the composition of the household, the respondent's perception was accepted.

Because the date of birth or exact relationship of a household member was sometimes unknown (perhaps because a proxy provided the information), the sum of the variables "number related"/"number not related" (**D_HHREL/D_HHUNRL**) or "number under 50" /"number 50 or older" (**D_HHLT50/D_HHGE50**) may not equal the total number of people in the household (**D_HHTOT**). **D_HHRL18** specifies the number of persons in the household who are under age 18 and related to the respondent.

Note that D_HHRL18 was new in Cost & Use 2002.

Facility Characteristics Record (RIC 7)

When the facility survey was changed in 1997 from a conventional pen and paper interview to a computer assisted personal interview (CAPI) it was modeled after the Minimum Data Set that CMS collects. The facility survey collects slightly different data now and the RIC 7 reflects the new interview in 2002.

Interview Description Record (RIC 8)

Proxy rules Wherever possible, the community interviews were conducted directly with the sample person, e.g., 27,797 of the 29,325 community interviews which were used to construct the 2009 Cost and Use file were conducted with the sample person. In most cases, the sample person was able to respond to the interview unassisted. In a few cases, the sample person was assisted with the interview by a friend or relative. The variables **PROXY**, **D_PROXR**, **RRECHLP** and **D_IHLPRL** provide information about who was interviewed, and how those respondents are related to the sample person.

Section 3: Notes

People who were too ill, or who could not complete the community interview for other reasons were asked to designate a proxy, someone very knowledgeable about the sample person's health and living habits. In most cases, the proxy was a close relative such as the spouse, a son or daughter. In a few cases, the proxy was a non-relative like a close friend or caregiver. The variable **PROXY** indicates whether or not a community interview was conducted with a proxy respondent, and the variable **D_PROXR** indicates the relationship of the proxy to the sample person. (Since all facility interviews are conducted with proxy respondents, this variable is "missing" for facility cases.)

If the sample person appeared confused or disoriented at the time of the interview, and no proxy could be identified, the interviewer was instructed to complete the questionnaire as well as possible. If the interviewer felt that the respondent was not able to supply reasonably accurate data, this perception was recorded in the interviewer remarks questionnaire and appears in this record as the variable **RINFOSAT**.

"Sample person language problem" was given as a reason for the use of a proxy in 102 interview cases. More often, language problems were addressed without the use of a proxy. Interpreters were used in some cases, and bilingual interviewers used Spanish-language versions of the questionnaires when the respondent preferred to be interviewed in Spanish. 380 interviews were conducted in Spanish. There are both English and Spanish versions of the CAPI survey instrument; the variable **LANG** indicates which version was used.

Proxy respondents were always used in nursing homes, homes for the mentally retarded, and psychiatric hospitals. Sample persons were interviewed directly in prisons when that was permitted. The need for a proxy when interviewing respondents in other institutions was evaluated on a case-by-case basis.

In long-term care facilities, the proxy respondents were members of the staff at the facility identified by the administrator. Usually, more than one respondent was used; for example, a nurse may have answered the questions about health status and functioning, while someone in the business office handled questions about financial arrangements.

Other variables Several questionnaires are administered in the facility interview: a personal baseline for individuals in the supplemental sample found to reside in a nursing facility and for new admissions to a facility from the continuing sample; the core and supplement questionnaires for the continuing sample. The facility screener was administered in every case. Please see Section 5 for copies of all of the instruments and for a more detailed description of when each is administered.

Two variables are supplied to further characterize the interview: **LENGTH** contains the length of the interview, in minutes, and **RESTART** indicates whether or not the

interview was interrupted. Community interviews are sometimes interrupted to accommodate the respondent's schedule or for other reasons. We did not calculate the duration of the community interview if the interview was interrupted. Facility interviews are conducted with several instruments and often involve a number of respondents. Since nearly all of the facility interviews are interrupted and total duration is difficult to capture (and interpret), **LENGTH** and **RESTART** are always missing for facility interviews.

Residence Timeline Record (RIC 9)

The timeline record tracks situations as a person moves between community, facility, and skilled nursing facility settings. The majority of respondents only have one situation which is a community setting for the entire year. However, this record will account for up to twenty occurrences of movement between a community, SNF, and facility setting.

D_SIT1--D_SIT20 is the starting date of the situation period. **D_CODE1--D_CODE20** describes the situation: community, facility, SNF, *deemed* community, or *deemed* facility. *Deemed* is used for cases where there is a gap in the interview coverage period.

D_FAC1--D_FAC20 is the facility identifier, where applicable.

STATUS is the respondent's status as of December 31, 2009: living; deceased; living with at least one interview gap in 2009; deceased with at least one interview gap in 2009; respondent is part of the supplemental sample from Rounds 55 and 58.

TYPE is a summary of the respondent's situation for the entire year: community, facility, or both.

SNF is the presence of a skilled nursing facility period during the year.

MDS/OASIS Timeline Record (RIC 10)

The MDS/OASIS Timeline shows periods of nursing home stays and home health care according to MDS and OASIS assessments. It also shows inpatient hospital stay periods from the RIC IPE (both from Medicare claims and survey-reported hospitalization).

Dates from MDS and OASIS assessments were analyzed to determine periods of nursing home stays and home health care. These were combined with dates of inpatient hospital stays to produce a timeline showing movement between nursing homes, hospitals and home health care. There is one record for any respondent who had an MDS or OASIS assessment.

Section 3: Notes

NUMSIT is the number of MDS, OASIS, and Inpatient Hospital situations in the record. **RECORD1--RECORD23** designates the record type: MDS, OASIS, or Inpatient hospital with values of:

-  MDS = nursing home stay according to MDS assessments
-  OAS = home health service period according to OASIS assessment
-  IP1 = survey-reported-only Inpatient hospital event
-  IP2 = claims-only Inpatient hospital event
-  IP3 = survey-and-claims-matched Inpatient hospital event

START1--START23 is the starting date of the situation period. **END1--END23** is the ending date of the situation period. **FAC1--FAC23** is the Medicare provider number.

CDEATH is the date of death according to the MDS assessment.

Outcome and Assessment Information Set (RIC OAS)

The Outcome and Assessment Information Set is a group of standard data elements developed, tested and refined over the past two decades through an extensive research and demonstration program funded largely by the Centers for Medicare and Medicaid Services (CMS), the Robert Wood Johnson Foundation and the New York State Department of Health. The OASIS data elements are designed to enable systematic comparative measurement of home health care patient outcomes at two points in time in adult skilled Medicare and Medicaid, non-maternity home health care patients. Outcome measures are the basis for outcome-based quality improvement (OBQI) efforts that home health agencies (HHAs) can employ to assess and improve the quality of care they provide to patients.

Minimum Data Set (RIC MDS)

The Minimum Data Set is part of the federally mandated process for clinical assessment of all residents in Medicare and Medicaid certified nursing homes. This process provides a comprehensive assessment of each resident's functional capabilities and helps nursing home staff identify health problems. Care Area Assessments (CAAs) are part of this process, and provide the foundation upon which a resident's individual care plan is formulated. MDS assessments are completed for all residents in certified nursing homes, regardless of source of payment for the individual resident. MDS assessments are required for residents on admission to the nursing facility, periodically, and on discharge. All assessments are completed within specific guidelines and time frames. In most cases, participants in the assessment process are licensed health care professionals

employed by the nursing home. MDS information is transmitted electronically by nursing homes to the national MDS database at CMS.

Cross-sectional Weights Record (RIC X, X3, X4)

Cross-sectional weights apply to the entire file of 10,859 people and can be used for making estimates of the population enrolled in Medicare at any time during 2009 (the “ever enrolled” population).

NOTE: The number associated with the naming convention of the longitudinal RIC’s refers to the number of years a given panel has been in the survey, not the applicable length of longitudinal study. Therefore, the RIC X3 allows for the TWO year longitudinal study of beneficiaries that have been in the survey for at least THREE years. Similarly, the RIC X4 allows for the THREE year longitudinal study of only those beneficiaries that have been in the survey for FOUR years.

The records contain variables to permit analysis using Westat’s proprietary software, WESVAR, WESREG and WESLOG to compute variance estimates using the replicate weights. In addition, to enable SUDAAN® (Professional Software for SURvey DATA ANalysis for Multi-stage Sample Designs) users to compute population estimates and the associated variance estimates, two variables have been included in this record.

SUDSTRAT and **SUDUNIT**. Please see Section 6 for a further discussion about weights and estimation using this file.

EVENT LEVEL RICs

The following variable descriptions apply to all of the non-PM Event level RICs. The **SOURCE** specifies the origin of the event [1=event only reported in the survey; 2=event only known through Medicare claim; 3=event reported in survey and matched to Medicare claim].

EVNTNUM is a unique event identifier collected in the survey. EVNTNUMs prefixed by “C” are events “created” only through presence of a Medicare claim [SOURCE=2].

The type that the event was originally reported as is in **OREVTYPE**. In most cases this is the same as the final **EVNTTYPE**; however, some event types are reclassified as a result of the claim type that the event matched or during the imputation process. For

Section 3: Notes

example, a respondent may report that he had an outpatient event (**OREVTYPE**=OP) and the matching process determined that this event matched a physician claim.

Furthermore, an unmatched OP event may “borrow” data from this event to impute incomplete data. **EVNTTYPE** on the unmatched “beggar” event would be changed to MP, the same **EVNTTYPE** as its donor.

In addition, survey reported event types of ER (emergency room visits) have all been reclassified because there is no categorization of Medicare claims by emergency room. If the survey reported ER event matches a Medicare claim it is reclassified according to the claim’s service type, which in most cases was a physician or outpatient hospital claim. If the ER event was not matched to a Medicare claim it was reclassified depending on its donor’s event type.

CLAIMID is a unique claim identifier within service type that links matched survey events with the Medicare claim.

EVBEGBYY, **EVBEGBMM**, and **EVBEGBDD**, **EVENDYY**, **EVENDMM**, and **EVENDDD** are dates from the matched claim, if the survey event is matched. Otherwise they are dates as reported from the survey. **EVENDYY**, **EVENDMM**, and **EVENDDD** are applicable only to **EVNTTYPE**s of IP and IU. Dental, medical provider, and outpatient hospital event types (RICs DUE, MPE, and OPE) are included in this file if the date of service was in 2009. Inpatient hospital and institutional (SNF) events are included if the discharge date for the visit was in 2009. If there was a discrepancy between the survey-reported date of service and the matching Medicare claim’s date of service, the Medicare claim’s date was used to determine the year of service.

SITCODE describes the respondent’s location at the time of the event: Community, Facility, or Skilled nursing facility. Events without dates for respondents who have been in both a community and facility setting during the year have a **SITCODE** of Both.

Values of D (deemed Community setting) and G (deemed Facility setting) exist if there are gaps in a respondent’s interview coverage period. Value of SNF for those in a Skilled Nursing Facility.

AMTTOT is the total reimbursement the provider received for the service. It is the sum of the eleven payer types:

AMTCARE	Amount paid by Medicare
AMTCAID	Amount paid by Medicaid
AMTHMOM	Amount paid by a Medicare HMO
AMTHMOP	Amount paid by a private HMO

AMTVA	Amount paid by the Veterans Administration
AMTPRVE	Amount paid by a private health insurance plan that is employer-sponsored
AMTPRVI	Amount paid by a private health insurance plan that is individually purchased
AMTPRVU	Amount paid by a private health insurance plan whose source is unknown.
AMTOOP	Amount paid by the respondent out-of-pocket
AMTOTH	Amount paid by other public health plan(s)
AMTDISC	Amount of uncollected liabilities
AMTPRVU	is only applicable to respondents in Facilities because there was no distinction made during the collection of the facility data as to the source of their private health insurance plan.

Each of the eleven payer types has corresponding imputation flags. **IMPSxxxx** indicates whether the payer source was imputed. **IMPAXxxx** indicates whether the payment amount was imputed. **IMPTOT** indicates whether the total reimbursement to the provider [AMTTOT] was imputed.

AMTCOV is the amount of the total reimbursement [AMTTOT] that is for a Medicare covered service. **AMTNCOV** is the amount of the total reimbursement that is for a non-Medicare covered service. This is particularly relevant for doctor visits where Medicare covers some of the services itemized in the claim and some of the services are for non-covered routine care.

Dental Events Record (RIC DUE)

DVBRIDGE, DVCLEAN, DVCROWN, DVEXAM, DVEXTRAC, DVFILLNG, DVORTH0, DVOTHER, DVRTCNAL, DVXRAYS are dental service indicator flags collected in the survey.

Facility Events Record (RIC FAE)

There is one record for each facility stay for the respondent. If the respondent left the facility for a period greater than 30 days and returned to the facility a separate stay record was created. **REFBEGYY, REFBEGMM, and REFBEGDD** is the earliest date in 2009 that the respondent was in the facility. **REFENDYY, REFENDMM, and REFENDDD** is the last date in 2009 that the respondent was in the facility. **ADMISYY, ADMISMM, ADMISDD** is the respondent's date of admission to the facility. **DISCHYY,**

DISCHMM, DISCHDD is the respondent's date of discharge from the facility.

STAYDAYS is the number of days in 2009 that the respondent was in the facility.
BEGSTAT and **ENDSTAT** describe the respondent's situation at the beginning and ending of the reference period.

FACILID is a unique facility identifier that can be linked to the Facility Characteristics Record (RIC 7) containing facility-specific information.

AMTCARE is the amount paid by Medicare to the facility that is not included in any of the other Event records. For instance, most doctor visits that occurred while the person was in the facility was found in the Medical Provider Events Record (RIC MPE); however, if the facility reported an amount received by Medicare that exceeded the total Medicare amounts on the Event RICs, the Medicare amount reported by the facility that is in excess of the other events' Medicare amounts is reported here.

AMTTOT is the sum of the six facility payer types AMTCARE, AMTCAID, AMTVA, AMTPRVU, AMTOOP, AMTOTH. Note that according to the above explanation of AMTCARE this amount is not duplicated in the other Event records.

TOTCARE is the total amount paid by Medicare while the person was in the facility. It includes all Medicare amounts [AMTCARE] from other Event records that occurred during the person's facility stay. Additionally it includes any amount reported by the facility that is in excess of the other events' Medicare amounts.

TOTALL is the sum of TOTCARE, AMTCAID, AMTVA, AMTPRVU, AMTOOP, AMTOTH. Given the definition of TOTCARE, it is the total amount paid for the person while he was in the facility. Note that some of this amount may be duplicated in other Event records.

Inpatient Hospital Events Record (RIC IPE)

ODIAGCNT, ODIAG1, ODIAG2, ODIAG3, DRG, PROCCNT, PROC1, PROV, STATUS, UTLZNDAY, COINDAY, LRDAYs are variables from the matched Medicare claim. See the Claims Documentation in "Section 2: Codebooks Medicare Claims Records" for further explanation of these variables.

Institutional Events Record (RIC IUE)

These are short-term facility stays that were reported either during a Community

interview or created through Medicare claims data. They are in most cases Skilled Nursing Facility stays.

As in the Inpatient Hospital Record, **ODIAGCNT**, **ODIAG1**, **ODIAG2**, **ODIAG3**, **PROV**, **STATUS**, **UTLZNDAY**, and **COINDAY** are variables from the matched Medicare claim.

Medical Provider Events Record (RIC MPE)

This record type is a combination of medical provider events collected in the survey: medical provider [MP], separately billing doctor [SD], separately billing lab [SL], and other medical expenses [OM]. The **EVNTTYPE** variable distinguishes between these event types. The classifications of **EVNTTYPE**s are determined by how the respondent reported the event during the survey. For example, a respondent may report an MP event type and total costs associated with it. This may match a Medicare claim with a line item cost for the physician visit and a line item cost for a lab service. In this case there would not be a separate lab [SL] event.

When an event matched a Medicare claim an effort was made to preserve some of the cost classifications that the claims line items explicate through the HCPCS code. These groupings are found in the variables **PAMTMED** (physician costs), **PAMTSURG** (surgical costs), **PAMTLABX** (laboratory and x-ray costs), **PAMTOM** (other medical costs such as DME), and **PAMTPM** (prescribed medicine costs). These costs are total reimbursements and they sum to **AMTTOT**. Note that these variables will only have data for matched survey events and claim-only events.

PROVSPEC is as reported in the survey and will only be present for survey reported events.

OMETYPE, **ORTHTYPE**, **ALTRTYPE**, and **OTHRTYPE** are data collected in the survey for OM (other medical expenses) event types.

Outpatient Hospital Events Record (RIC OPE)

FROMDT and **THRU DT** are dates from the matched Medicare claim indicating this event represents a period of outpatient hospital visits. **ODIAGCNT**, **ODIAG1**, **ODIAG2**, and **ODIAG3** are variables from the matched claim.

Prescribed Medicines Record (RIC PME)

Some of the variables in this record are only applicable in certain situations during the interview.

Variables that are only applicable when the form of the medication is a pill or a patch are:

TABNUM	Number of Tablets/patches in the container
STRNNUM1	Strength Number
STRNNUM2	Strength Number 2nd compound, only applicable to compound drugs
STRNUNI1	Strength Unit
STRNUNI2	Strength Unit 2nd compound, only applicable to compound drugs

The following variables are asked of the SP when the medication's dosage form is not a pill, a patch, or a suppository.

AMTUNIT	Amount Unit
AMTNUM	Amount Number

SUPPNUM is inapplicable unless the dosage form is a suppository.

Often we impute characteristics about the drug to assist in assigning pricing data.

IMPDF (the imputed dosage form) was only imputed when there was no match between what was reported and the possible dosage forms found in First Data Bank, or if the form was missing. We also changed the value of **PMFORM** when **IMPDF** was present. The imputed strength, **IMPSTNG**, and the imputed amount number, **IMAMTNUM**, were imputed using various criteria and contributed to determining a unit price only.

The following variables are unadjusted totals for “non-ghosts.” These totals do not account for any gap days (days not covered by interview).

AMTTOT	Amount paid by all payers
AMTCARE	Amount paid by Medicare
AMTCAID	Amount paid by Medicaid
AMTHMOP	Amount paid by private HMO
AMTHMOM	Amount paid by Medicare HMO
AMTVA	Amount paid by VA
AMTPRVE	Amount paid by insurance -- employer sponsored
AMTPRVI	Amount paid by insurance -- self purchased
AMTPRVU	Unknown Amount
AMTOOP	Amount paid out of pocket
AMTDISC	Discounted Amount
AMTOTH	Amount paid by other

SUMMARY RICS

Type of Service Summary Record (RIC SS)

This record summarizes the Event RICS by person. For every person there are nine records: one record for each of the seven event type RICS (Dental, Facility, Inpatient Hospital, Institutional, Medical Provider, Outpatient Hospital, and Prescribed Medicines), plus two additional records which are not present at the event level: Home Health Services and Hospice Services. The records are identifiable by the **EVNTTYPE** variable:

DU	Dental
FA	Facility
HH	Home health
HP	Hospice
IP	Inpatient hospital
IU	Institutional
MP	Medical provider
OP	Outpatient hospital
PM	Prescribed medicine

When summarizing from the Event level to the Type of Service level any survey-reported event that specified Medicare as a payer that was not matched to a Medicare claim was excluded from the Type of Service summary. Our analysis showed that either 1) the survey event's monies are bundled with a Medicare claim that already matched another survey event, or 2) the respondent was incorrect in reporting Medicare as a payer.

The total amount and the eleven payer types are summarized from the Event RICS into the variables **SAMTTOT**, **SAMTCARE**, **SAMTCAID**, **SAMTHMOM**, **SAMTHMOP**, **SAMTVA**, **SAMTPRVE**, **SAMTPRVI**, **SAMTPRVU**, **SAMTOOP**, **SAMTDISC**, and **SAMTOTH**. The total number of events is summed to **SEVENTS**.

Additional events and expenditures for non-Medicare covered services were imputed for part-year respondents and ghosts. The imputed monies were added to the above SAMT variables to create total dollars in the variables **AAMTTOT**, **AAMTCARE**, **AAMTCAID**, **AAMTHMOM**, **AAMTHMOP**, **AAMTVA**, **AAMTPRVE**, **AAMTPRVI**, **AAMTPRVU**, **AAMTOOP**, **AAMTDISC**, and **AAMTOTH**. The total number of events reported and imputed is in **AEVENTS**. Note that for full-year respondents the SAMT variables will be the same as the AAMT variables.

Person Summary Record (RIC PS)

The Type of Service record is summarized by person to construct the Person Summary record. There is one record per person with the SAMT variables summed across service types in **SAMTTOT, SAMTCARE, SAMTCAID, SAMTDISC, SAMTHMOM, SAMTHMOP, SAMTOOP, SAMTOTH, SAMTPRVE, SAMTPRVI, SAMTPRVU, SAMTVA, and SEVENTS**. The AAMT variables are summed across service type in **PAMTTOT, PAMTCAID, PAMTCARE, PAMTDISC, PAMTHMOM, PAMTHMOP, PAMTOOP, PAMTOTH, PAMTPRVE, PAMTPRVI, PAMTPRVU, PAMTVA, and PEVENTS**.

Service types are also summarized across payers for AAMT variables in **PAMTDU, PAMTFA, PAMTHH, PAMTHP, PAMTIP, PAMTIU, PAMTMP, PAMTOP, and PAMTPM**. Adjusted number of events by service type is summed in the variables **DUAEVENTS, FAEVENTS, HHAEVENTS, HPAEVENTS, IPAEVENTS, IUAEVENTS, MPAEVENTS, OPAEVENTS, and PMAEVENTS**.

Claims Records (DME, HHA, HSP, INP, OTP, PHY, SNF))

The following rules were used to select bill and claims records for this file.

- ✚ Inpatient bills were included if the **discharge or “through” date** fell on or after January 1, 2009 and on or before December 31, 2009.
- ✚ Skilled nursing facility bills were included if the **admission or “from” date** fell on or after January 1, 2009 and on or before December 31, 2009.
- ✚ Home health agency and outpatient facility bills were included if the **“through” date** fell on or after January 1, 2009 and on or before December 31, 2009.
- ✚ Hospice bills were included if the **admission or “from” date** fell on or after January 1, 2009 and on or before December 31, 2009.
- ✚ Physician or supplier claims were included if the **latest “service thru” date** fell on or after January 1, 2009 and on or before December 31, 2009.

About 24.8 percent of the sample people did not use Medicare reimbursed services in a fee-for-service setting in 2009; consequently, there are no bill records for them in this file. For other individuals in the sample, we have captured bills meeting the date criteria, processed and made available by CMS through December 2010.

Medicare Current Beneficiary Survey

CY 2009 Cost and Use

Edits

The use of Computer Assisted Person Interviewing (CAPI) expands and intensifies the data editing process. Many of the edits for accuracy, completeness, and reasonableness are performed immediately as the interviewer enters the information reported. Problems arising from miscommunications or data entry errors often are detected and corrected immediately. In addition, since the CAPI computer software structures the interview by bringing up the appropriate next question without making the interviewer search for it, the software prevents most “skip pattern” errors.

Survey Data Edits

As survey information is collected, it is put into a database management system built into the CAPI software. During the interview and subsequent post interview review, the data in the database are subjected to two types of edits. First, logical relationship edits are performed between various segments of the database to ensure the integrity of the whole. Second, subject matter edits are performed to ensure the internal consistency of the data.

Logical relationship edits ensure that the database is sound by checking the links between segments. For example, every medical provider record in the provider segment must be linked to at least one sample person. The provider record alone without this linkage is not useful.

Subject matter edits ensure the internal consistency of the data. These edits are of two types: those that result in changes to the database to create internal consistency and those that do not. Some edits identify internal inconsistencies that cannot be corrected because it is not clear which entry is correct. These situations are discussed below in the section on “no fix” edits.

Administrative Bill Data Edits

02 Adjustments In the late 1980’s, CMS decentralized Medicare bill processing operations and shifted Medicare claim review functions to nine host sites around the country. Under the operating procedures in place during the first half of 2003, when the deductible field on a claim was incorrect, the host site adjusted the Medicare payment field on the claim, notified the fiscal intermediary of the adjustment, and forwarded the claim to CMS. The fiscal intermediary was not required to re-submit the corrected claim.

Only the Medicare total payment field for the entire claim was adjusted. This means that the deductible field for adjusted claims is incorrect in CMS' files. This is a significant problem for the MCBS since Medicare claims data are an integral component of our activities to verify survey reported information and fill-in gaps in the payment data.

Fortunately, we were able to correct the Part B Medicare claims data. Since only the Medicare payment field was adjusted by the host processing center, we were able to use the disaggregated event level payment data on the Part B claims to reconstruct the Medicare allowed charge and develop corrected Medicare payment and deductible fields. We arranged the discrete Medicare events by service date and adjusted the payment data to be consistent with Medicare law.

Outpatient reimbursement For a period of time, outpatient hospital billing records for three western states were incorrectly showing zero reimbursements. To correct outpatient payments for these three states, a factor relating average program reimbursement to covered program charges was developed. It was used to impute a logical reimbursement amount for these records.

Inpatient Hospital Cost Pass-throughs The Prospective Payment System (PPS) for inpatient hospital services under Medicare pays a set amount per case. However, this payment excludes some hospital expenses, particularly capital, that are reimbursed on cost basis. (Costs are "passed through" for payment). In order to get total Medicare program payments (that is, actual DRG payment + prorated share of pass-throughs) for an inpatient hospital stay, some method of calculating pass through costs for that stay is needed. Ideally, the provider's cost report could be used to create an accurate measure of pass through costs (on a per-diem basis) that could be applied to individual claims or stays. However, this process is very labor intensive and there are very long delays in getting final hospital cost reports.

In place of the final pass through amounts, each claim contained an estimated pass through amount. Total pass through costs were computed by multiplying the estimated cost pass through per-diem by the number of covered days of care to arrive at the prorated share of pass-throughs applied to each individual claim or stay.

Analysis of claims experience for several States showed that the estimated pass-throughs produced using this method were obviously too high. For three states where the amounts were clearly too high, a national average cost pass through per diem was substituted for the incorrect reports.

Facility Stay Records Data

While data was collected using Computer Assisted Personal Interviewing (CAPI) techniques for persons residing in the community, traditional pencil and paper techniques had to be used to collect data for persons residing in long-term facilities. The reasons for not using CAPI technology were tied to the ways interviews were conducted in facilities, and the limitations of early versions of the CAPI software.

In facilities, information about the patient is often collected from a variety of proxy respondents and record sources. In general, nurses or other primary care givers responded to questions about the person's physical functioning and medical treatment. Generally also, persons from the billing office responded to questions about charges, payments, and sources of payment. In addition to requiring multiple respondents, data collection was complicated because medical and billing records were often physically located in different places. Interviewers often had to move from person to person and place to place within the facility to get a complete interview.

However, early versions of the CAPI data collection computer software worked best going straight through sequentially from beginning to end. At the time the survey was being fielded, there were limits on how flexibly the early CAPI software could switch backward and forward to accommodate information collected out of sequence. These are the main reasons that facility information was collected in a pencil and paper survey. Since the data was collected in the traditional way, there was considerable emphasis placed on carefully editing this data for completeness and accuracy after collection. These edits and data validation processes are described in more detail below.

Facilities Included The MCBS survey used a broad definition of long term facility care in order to get a full picture of the types of institutions providing care received by the Medicare population. The survey includes licensed nursing homes and other long term care facilities such as retirement homes, domiciliary or personal care facilities, mental health or mental retardation facilities, continuing care facilities, assisted living facilities, and rehabilitation facilities. To qualify for the survey, a facility must have three or more long term care beds, and answer affirmatively to at least one of three questions: does this facility (1) provide personal care services to residents; (2) provide continuous supervision of residents; (3) provide any long term care.

Note that while the MCBS sample is representative of the Medicare population that uses long-term care facilities, it was not designed to be precisely representative of the universe of long term care providers. A broad definition of long-term care facilities was chosen to pull in all types of organizations that provide residential long-term care. However, no attempt was made to create a dual beneficiary/provider sampling frame to make the sample simultaneously representative of both the Medicare population and the universe of

long term care providers. This decision was made in part because of the difficulty in obtaining a stable and reliable list of non-nursing home long-term care providers from which to sample. However, the primary reason was that the MCBS is a continuous, longitudinal survey of Medicare enrollees, not providers. Our approach also avoids the multiple weights and other complications inherent in synthesizing national estimates from a dual person/provider sampling frame. The primary sampling distortion of our person sample on the distribution of long-term care facilities in the MCBS relates to each facility's chances of being included. Larger facilities had a greater chance of being included than small facilities, because at any one time there are more persons in a larger facility than in a smaller facility.

Stay Records The basic event record measuring use of facility services is a “stay” in a nursing home or other long-term care facility. Stays are measured in terms of days of residence in that facility. A stay is the period of time between admission and discharge for one person in one facility. A person who is in a single facility for an entire year represents one stay. A person who also spends the year in facilities, but spends the first six months in one facility and then transfers to another, has two stays. A stay begins when a person enters the facility, even if the admission occurred prior to 2003. A stay ends when a person is discharged from a facility or the calendar year ends.

Note: This means that all persons in a facility at the end of calendar year 2003, of necessity, will have their stays truncated prior to discharge.

There are some occasions when a person leaves a long-term care facility but is not considered discharged for purposes of creating a stay record. A person residing in a facility, who enters a hospital, stays 30 days or less in the hospital, then returns to resume residence in the same facility, does not break their facility stay. A person, who goes home for a weekend visit and then returns to the facility, also does not break their stay. However, if a person is formally discharged back into the community, their stay ends.

Need for a Uniform Definition A period of long-term facility residence interrupted only by a brief period of acute hospital care is more accurately characterized as a continuous single episode of long-term facility care treatment, rather than two shorter facility “stays” sandwiched around a hospitalization. Unfortunately, there is limited uniformity across nursing homes and other long-term care facilities, and across respondents, in defining when a discharge occurs. Some facilities or respondents treat every time the patient leaves the facility, even for a single day, as a discharge. Others may hold beds for a patient in the hospital for 30 days or more (while charging a bed holding fee) without ever formally discharging them.

These variations across facilities in their patient discharge rules introduce variations in measurements of admissions, discharges, average length of stay, and average payments

per discharge, that have little to do with underlying patterns of long term care use. For example, consider two patients in different nursing homes with identical long-term facility use profiles - 67 days between facility admission and discharge with an embedded hospital stay of 7 days in the middle. Nursing home A holds the bed for the first patient during the hospitalization, and calls it one stay that is 67 days long. Nursing home B, by contrast, considers the patient discharged when they go into the hospital, and newly readmitted when they return. It would call this identical facility use two stays, each 30 days in length. A uniform stay definition has been imposed on the MCBS data in order to remove the effect of idiosyncratic discharge policies from the data. The uniform definition allows internally consistent comparisons of facility use across nursing homes with different discharge policies.

File Editing The facility file has undergone three distinct levels of editing and consistency checking to insure that the information is as accurate and complete as possible. There was no computer driven statistical imputation process used to fill in missing data. Missing data was filled in using other information from survey responses where possible. For example, if a yearlong stay had facility payment records for the first 10 months of the year, but payments for November and December were missing, the average monthly payment over the 10 reported months was used to fill in the two missing months. This case-by-case editing approach was used judiciously, and primarily for missing payment data (see 3 below).

1. **FIELD BY FIELD ACCURACY AND COMPLETENESS** - The most basic level of editing was to insure that all necessary fields were completed with legitimate coded answers. Omissions, inaccuracies, and inconsistencies between codes were identified and corrected by staff at Westat Corporation, the primary contractor for the survey. Editors were able, when necessary, to send questions to field survey staff about missing or questionable information.

2. **GAPS AND OVERLAPS** - One of the basic difficulties in creating a stay record is that it must be built from smaller building blocks that do not automatically fit together evenly. The survey is conducted about once every four months on average. Nursing homes and other facilities usually keep their billing records on a monthly basis, generally using a full calendar month for start and end dates. The beginnings and ends of the facility's billing periods usually do not correspond exactly with the survey reference periods, or the patient's admission and discharge dates. Building the stay requires laying the survey-collected information, within and across reference periods, on a time line for the person. The object is to identify and eliminate any gaps when a person's status was not accounted for, and overlaps where records show a person to be in two places at the same time. This process is particularly complicated for persons who are both in the community and the facility during a year. This editing and file building was done by Westat, which had the most complete first hand information on the person's status during the year. When

necessary, CMS administrative records showing dates of medical service, e.g. dates of hospitalization, were also used to make the stay records as complete and accurate as possible.

3. EDITING CHARGE AND PAYMENT DATA - One of the most difficult tasks in a facility survey is collecting complete and accurate charge and payment data.

Traditionally in hospitals, there was usually a clear separation on the bill between accommodation charges (for room and board) and charges for ancillary services (for diagnosis and treatment). Taken together, hospital accommodation and ancillary charges and payments represented virtually all facility charges and payments for the period the patient was in residence. In today's more competitive environment, large payers are able to negotiate discounts from posted charges. Medicare has been able to implement an all inclusive per case payment system (the DRG system under PPS). However, most hospitals still have the ability to itemize what is and is not included in their charges and payments. Unfortunately, this ability to clearly identify what is and is not included in payments does not apply to nursing homes and long term care facilities.

a. DIFFERING SERVICE BUNDLES - Understanding differences in payments per day between facilities requires being sure that the dollar amounts apply to the same bundle of facility services. Alternatively, knowing what services are included or excluded from charges and payments helps to explain differences between facilities in average payments per day. For example, if the payments per day in Facility A are \$20 a day higher than in Facility B, one might immediately hypothesize that Facility A had higher costs, or a larger profit margin. However, if Facility A's payments include coverage of drugs and Facility B's are only for room and board, the original hypothesis about relative costs or profits are suspect because the payments cover different service bundles. In practice, service bundles included in a charge and payment amount can vary widely based on differences in nursing home practices and the patient's insurance status. Facility charges and payments can be all-inclusive, that is, accommodation charges and all necessary ancillary services and treatment are included in the one basic rate. Alternatively, a facility's charges and payments may cover only room and board. In this facility services and supplies such as drugs, therapy, and help with specific needs such as lifting and turning, etc. would be billed a la carte. Many combinations of service bundles in between all-inclusive and only room and board are possible.

To further complicate payment data collection, payments for drugs and ancillary services such as therapy furnished to patients in facilities are not always made directly to the facility itself. These payments are often made directly to providers who contract with the facility to provide this care. The task of a facility survey, therefore, is two-fold: first to get facility payment data that is as complete as possible, and then to establish what is and is not included in those facility payments. Unfortunately, a series of questions asked to try to determine whether the facility or a private contractor performed the services, and

whether the charges were included in facility payments or not, did not work as planned. We were not able to unambiguously establish what services supplied were and were not included in the reported charges and payments. Responses to these questions were so equivocal that the responses have not been included in the stay records.

b. CHARGE DATA - The MCBS attempted to collect facility charge data separately for base accommodation charges and ancillary service charges, following the traditional hospital billing model. For a number of reasons, collection of this data was very unsatisfactory. Some payers, such as Medicare, pay an all-inclusive rate covering both accommodation and ancillary charges. Other payers, such as Medicaid, pay flat rates for differing bundles of facility services based upon the level of care needed by the patient, without any relationship to posted facility charges - which apply mainly to private patients. Other facilities did not have a charge schedule because they do not treat privately insured patients. For these facilities their "charges" were whatever the third-party payor such as Medicaid would pay on behalf of the patient plus any payments collected directly from the patient (often in the form of a Social Security, SSI, or other pension check). To summarize, the quality of the collected facility charge data was so poor and unreliable, that it was decided to exclude it from the stay record file.

c. PAYMENT DATA - The approach used to test the accuracy of payments per day focused on examining outliers, that is, stays with average payments per day that seemed either too high or too low to be credible. Initially, all nursing homes and other long-term care facilities were grouped together in this analysis. A joint Westat/CMS work team looked at the top 5% and bottom 5% of average payments per day. (This is based on a SAS PROC Univariate of the entire distribution of stays using the 5% and 95% levels). A number of cases were resolved because of obvious data entry errors. For example, an extra digit added or a digit missing from either payments or days of stay that distorted average payments per day.

In order to refine the outlier analysis, six different provider categories were created. The categories pull together facilities offering the same level or type of care. The narrower facility categories were expected to have more homogeneous payment per day distributions, and thus permit more sharply focused identification of possible payment outliers within each type. The new categories included three nursing home classifications: Medicare certified, Medicaid certified, and other non-certified nursing homes. The remaining three facility categories were for mental health facilities, facilities for treatment of the mentally retarded, and all other facilities. The work team then analyzed the stay records for the top and bottom 5% of average payments per day in each of the six facility categories.

In general, under reporting or low average payments per day seemed to be a significantly greater problem than payments that were too high. In examining individual cases, one

Section 4: Edits

important cause of questionably low payments seemed to be missing billing periods. That is, monthly billing periods where the person was in the facility but no payment was recorded. It usually occurred in the billing periods closest to the interview date, presumably because of time lags in the facility's billing and payment process that made the information unavailable at time of interview. Missing billing period payment values were edited in using available data from within the stay, as described above. In addition, the missing billing period problem seemed so systemic, that ALL stay records were edited and judiciously corrected to edit in estimated payments when billing periods were missing from a stay.

This still left a number of facilities with average payments per day that were too low to be believable compared to the distribution of payment rates for other facilities in their class. In some cases these low payments were in facilities that appeared to receive funding from global budgets rather than third party or private payments, e.g., a local government facility. In order to limit the distortions to overall data from facilities with such questionably low payments, a minimum acceptable payment level was established for each of the six facility categories. This minimum average payment per day was substituted in the record for any stay record, which after editing, still showed average payments per day below the minimum acceptable amount. The minimum acceptable payments per day by facility category are as follows:

Medicare certified nursing homes \$55
Medicaid certified nursing homes \$40
Other nursing homes \$25
Mental health facilities \$20
Facilities for the mentally retarded \$20
Other facilities \$20

d. SOURCE OF PAYMENT DATA - Medicare administrative billing data were used to fill in some of the gaps in facility payment data. For stays where all or part of the stay was paid by Medicare as SNF benefits, the program amount paid in Medicare records was compared to the amount reported paid by Medicare in the survey. In cases where the survey reported amount was lower, the higher administrative record amount was substituted in the stay record.

Avoiding Potential Duplication in Facility Medicare Payments In our match of survey reported utilization to Medicare administrative bills for community records where there was a disagreement in the Medicare payment amount; we treated the Medicare amount in billing records as the more accurate report and used it as the final Medicare payment amount. (See EVENT LEVEL MATCHING in Section 5 of this manual for a discussion of matching operations). Similarly, we regard Medicare payment amounts on billing records for services while the person was in the facility (for example skilled nursing

home and medical provider bills) as more accurate than what the facility respondents said Medicare paid in the interview. However, given the tri -level structure of the file (see Section 3 in this manual for a discussion), this created a conflict in terms of what payment amounts to report in the event level facility stay record. On the one hand, the facility stay records should contain total payments for all payers to create a complete, stand-alone facility stay record of all payments. On the other hand, under the tri -level file structure (see Section 3), Medicare payments from billing records while the person was in the facility are kept separately at the facility type of service and person level. The difficulty is that if total payments from the stay record are added to payments from the Medicare bills, this creates DUPLICATION or double counting of Medicare payments.

To make the facility stay record easy to use, and at the same time prevent double counting of Medicare payments to facilities, we include payment variable in the facility stay record which compute Medicare payments to facilities in two different ways.

When RIC FAE is used **with the other MCBS Event RICs** use AMTCARE for Medicare facility payments and AMTTOT for total facility payments.

AMTCARE includes Medicare payments reported by the facility that EXCEED the total Medicare payment amounts for events which occurred during the facility stay (SITCODE = "F" or "G") which are included in the MPE, IUE and DUE RICs. (Adding AMTCARE to Medicare payments reported in all other event RICs DOES NOT create any duplication).

AMTTOT includes total facility payments for ALL PAYERS BUT MEDICARE. AMTCARE is substituted for reported Medicare payments in order to exclude Medicare payment amounts for events which occurred during the facility stay (SITCODE = "F" or "G") which are included in the MPE, IUE and DUE RICs.

When RIC FAE is used as a **stand-alone file**, i.e. without the other MCBS Event RICs, use TOTCARE for Medicare facility payments and TOTALL for total facility payments.

TOTCARE - is the greater of either the total Medicare payments reported by the facility or the total Medicare payment amounts for events which occurred during the facility stay (SITCODE = "F" or "G") which are included in the MPE, IUE and DUE RICs.

TOTALL - includes total facility payments for ALL PAYERS INCLUDING MEDICARE. In computing TOTALL, TOTCARE is used as the total Medicare facility payment amount.

Section 4: Edits

TOTCARE and TOTALL are included for the convenience of users who analyze stay records only and do not want to link to other MCBS event RICs to get total facility payments. If these amounts are added to Medicare and total payments in the other Event Records, DUPLICATION of Medicare payments will occur.

NOTE: Facility payment amounts exclude payments for inpatient hospitalizations even if the inpatient stay was embedded in the facility stay.

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Filling the Gaps

The 2009 Cost and Use File is designed to provide person level data for estimating total use of, and total payments for, all health care services, covered and non-covered, received by Medicare beneficiaries during calendar year 2009.

This section describes the adjustments that were made to the MCBS data to create a complete file. The adjustments made are as follows:

SUPPLEMENTING THE SAMPLE - These adjustments were made at the sample level to include groups of people who are in the target population (all those who were enrolled at any time in Medicare in 2009), but were not represented in the original sample.

PERSONAL AND SOCIO-ECONOMIC CHARACTERISTICS - These adjustments were made at the person level to include descriptive data (demographics, living situation, socio-economic factors) that are missing because different parts of the questionnaire are initially asked, and subsequently updated, in different interviews.

EVENT LEVEL MATCHING - These operations identified services paid for by Medicare that were not reported on the survey and corrected Medicare payment data reported inaccurately on the survey. A discussion of match results and instructions for building a complete file and avoiding duplication is included.

MISSING PAYMENTS AND PAYERS - These adjustments compensate for missing payment data when the sample person did not know how much an event cost and/or how the event was paid for (by whom, and how much by each payer).

PRESCRIPTION DRUGS - Describes the particular problems encountered in creating the prescription drug event file and how missing payment data was handled.

ADJUSTMENTS FOR MISSING DAYS AND UNDATED SERVICES - These adjustments compensate for data that are missing because some periods of time were not covered by interviews and because some types of health services use (particularly prescription drugs and other medical equipment) are undated.

Adjustments made to records in the Cost and Use file are constrained in two ways. First, because CMS administrative data are used to fill in much of the missing information, all adjustments to MCBS use, cost, and source of payment data are consistent with CMS administrative data. For example, if CMS records indicate that the beneficiary is dually entitled to both Medicare and Medicaid, then Medicaid must be considered a possible source of payment when source of payment is missing, even if the beneficiary did not volunteer that information. Second, adjusted data must be consistent with other information for the same person. For example, the source of payment for individual events must be consistent with the sample person's health insurance information.

Basic Principles Although a variety of methods were used in making the adjustments, adjustments of all types are governed by some basic principles. First, information reported by the survey respondent is retained, even if it is not complete, unless strong evidence suggests that it is not accurate. For example, a beneficiary may report having paid \$5--the "total cost"--for a prescription that is listed at \$25 in the drug wholesale price index. Although it is very unlikely to be the true total cost of the drug, the \$5 payment remains with the event as the out-of-pocket *share* of the total.

When information is not reported during the interview, CMS administrative data are the first choice as a source of supplemental, or in some cases, surrogate information. Medicare enrollment information (from the enrollment database, EDB) and bill and claims information (from the national claims history repository, NCH) are used to provide missing personal characteristics, forgotten medical events, and missing or unknown cost information, before statistical imputation. Although the EDB and the NCH are the chief sources of missing data, other CMS administrative files provide information about special areas such as drug costs and Medicaid expenditures.

Finally, when payment data are missing, a total payment ("target reimbursement") is established for each event before the component costs are estimated and allocated to the individual sources of payment. The individual sources of payment are based upon the beneficiary's insurance coverage, both what is reported, and what is known from CMS administrative files. The total cost of the event is largely based on Medicare reimbursement levels and empirically established relationships between Medicare payments and the payments made by secondary payers such as Medicaid or supplemental private health insurance.

SUPPLEMENTING THE SAMPLE

This section describes the adjustments made to the sample to include groups of people who are in the target population, but who are not represented in the interviewed population. The targeted population is the "ever enrolled," that is, all persons enrolled in

Medicare at any time during calendar year 2009. The 2009 interviewed population includes people who were on the Medicare rolls by January 1, 2008, but does not include persons enrolled after that date--people who came onto Medicare rolls during 2008 or 2009.

Note: Also excluded from the MCBS sample are residents of foreign countries and U.S. possessions and territories other than Puerto Rico.

Targeted Medicare Population--the “Ever-enrolled” The Medicare population is a dynamic group that is constantly changing. Every month, some 200,000 previously unenrolled individuals become eligible and entitled to benefits and are enrolled in Medicare. Such entitlement depends upon meeting the requirements of the aged, disabled, or end-stage renal disease provisions of the Social Security Act and filing for benefits.

In a like manner, every month there are about 150,000 individuals leaving the rolls due to death, non-payment of premiums, recovery from disability, voluntary disenrollment, and other reasons. Thus the net Medicare population continues to grow by about 600,000 people each year.

Producing estimates of total utilization and expenditures for all services (events), including Medicare covered and non-covered, requires an “ever-enrolled” target population. That is, the sample must represent all individuals enrolled in either one or both parts (A and/or B) of the program at any time during the calendar year.

Survey Operational Considerations The MCBS sample is a “list” sample; that is, the people who are selected for interviewing are chosen from a list of all Medicare enrollees. The list of enrollees is based on the Medicare enrollment database (EDB), a complete register of Medicare enrollees. The EDB contains all historical enrollment records, and, to the extent that documentation and transactions affecting the status of individuals are up-to-date, it is a current “snapshot” of the enrolled population.

In a retrospective analysis of the population, the dynamic nature of Medicare enrollment poses no particular problem. Enrollees can easily be identified, categorized and counted, and their records examined. For example, studies on the use of Medicare covered services during the last months of life would have no problems identifying persons who died during the year (after allowing a few months for death notices to flow in and be recorded).

Sampling a population for interviews to be conducted in the future, however, presents difficulties. The surveyor does not know with certainty in advance whether, or when, a person will join the ranks of the enrolled, or alternatively be removed from them. A

Section 5: Filling the Gaps

sample is selected from a sampling frame as current to the date of interest as possible and field interviews are started, in the knowledge that the great bulk of the targeted population will be covered by the survey, but that adjustments must be made later for those who should have been included but could not be.

In order to be able to estimate calendar year 2009 Cost and Use data, it was necessary to interview the continuing sample and to select and interview an MCBS supplemental sample in the fall of 2008 (September - December). This initial visit with the supplemental sample just prior to 2009 allowed us to do the following:

- ✚ introduce ourselves to the supplemental respondents and explain the purpose and procedures of the study;
- ✚ leave material to help in the collection of use and payment information;
- ✚ gather baseline data on health status and functioning, demographics, health insurance, and household composition to help in the analysis of the use and cost information to be collected later; and
- ✚ obtain data on beneficiaries' access to care to compare with the baseline data collected prior to the implementation of physician payment reform in January 1992. (Published as 1991 Access to Care).

The sample for the MCBS who were interviewed about their use of medical services in 2009 was selected from enrollees who were entitled to Medicare on January 1, 2008. Most of the people enrolled on that date survived or continued to be enrolled during some or all of calendar year 2009. While making up the greater portion of those ever-enrolled during 2009, the population interviewed for the MCBS in 2008 does not include beneficiaries who were newly enrolled in 2007 after January 1 who survived into 2008, and all beneficiaries newly enrolled in 2009.

The first group, 2008 enrollees (that is, after January 1, 2008) was precluded because of the need for time to prepare the sample for the field staff. The second group, 2009 enrollees, could not have been known with certainty in the fall of 2008.

Work on the selection of the sampling list for 2009 supplemental sample began in March 2008, with the production of a "snapshot" of the EDB of persons enrolled for one or both parts of the program as of January 1, 2008.

In mid-summer, the file was shipped to the contractor (Westat Corporation) for the selection of people who meet the selection criteria (outlined in Section 6 of this manual) to be included in the supplemental sample. After the sample selection, the contractor

developed field instructions for the interviewers, loaded identifying information from the EDB records into the CAPI computer programs, and attempted to locate the sample persons. All of these activities required sufficient lead-time to ensure that the operations could be successfully completed. The lead-time need for field survey activities made it impossible to use a later beneficiary file update to select the sample.

Compositional sample We envisioned the target population of the MCBS 2009 Cost and Use file as composed of three groups: persons enrolled as of January 1, 2008 who survived into 2009 (Supplemental Sample XIV through Sample XVII), persons newly enrolled in 2008 who lived until 2009 (Supplemental Sample XVIII), and persons newly enrolled in 2009 (Supplemental Sample XIX). As described in the previous section, beneficiaries enrolled after January 1, 2008 could not be interviewed about their medical care and expenditures in 2009. We considered two options for estimating the costs incurred by these new enrollees:

increasing the weights of individuals who resembled new enrollees,

including in the file representatives from the supplemental samples.

The solution employed in the MCBS design to yield an “ever-enrolled” population for calendar year 2009 is to make use of the data for additional enrollees added to the survey as supplemental samples in 2009 and 2010. The 2009 and 2010 supplements, in addition to replacing individuals lost to the survey through death, refusal, or rotated out of the MCBS because of the rotating panel design, etc., include some people who became newly entitled to Medicare in 2008 and 2009.

Newly enrolled persons can be any age. Typically, the new enrollee is a member of the youngest “aged” group, that is, those age 65-69. Because this group is proportionately under-represented and because as a cohort members are moving out of, and into, the next age stratum without commensurate replenishment from the next younger stratum, it was decided that re-weighting the characteristics and patterns of utilization of the remaining group could distort the patterns of use of medical services by putting heavy weights on relatively few cases. By adding new persons from the supplemental samples we increased the sample size of persons in the 65 - 69 age group.

While we had no survey data on use of health services for persons in the 2009 and 2010 supplemental samples, we did have information on their use of covered services under Medicare. The final step in adding these persons to the 2009 file was to identify donors based on similar profiles of Medicare use. The entire pattern of use for the donors, including covered and non-covered services was then transferred to the new persons. In this way, newly enrolled in 2008 and 2009, and suitable patterns of health cost and use, were incorporated into the 2009 Cost and Use file.

Section 5: Filling the Gaps

As shown in Table 1, 5,274 of the Round 46 MCBS sample, survived until 2006 and were not rotated out of the sample, and thus, were available to be included in the 2009 Cost and Use sample.

Table 1	Eligible beneficiaries	Respondents	Response Rate
Round 46	5,274	3,372	63.9 %
Round 49	5,734	3,502	61.1 %
Round 52	6,045	3,273	54.1 %
Round 55	410	329	80.2 %
Round 58	499	383	76.8 %
All	17,862	10,859	60.5 %

The Round 55 supplement includes 329 beneficiaries who became eligible for Medicare in 2008; and the Round 58 supplement includes 383 beneficiaries who became eligible for Medicare in 2009. The beneficiaries from Rounds 55 and 58 were not interviewed about their 2009 medical use and expenditures because they enrolled in Medicare after the 2009 sampling list was prepared. The 2009 Cost and Use file is composed of interviews conducted with 10,859 beneficiaries from all five panels, for an over-all response rate of 60.5 percent.

PERSONAL AND SOCIO-ECONOMIC CHARACTERISTICS

This section describes the adjustments that were made in order to include descriptive data (demographics, living situation, and socio-economic factors) that are missing because persons in the Cost and Use file were not initially interviewed at the same time.

Beneficiaries in the 2006 (Round 46) supplemental sample received only the introductory MCBS interview in the fall of 2006; those in the 2007 (Round 49) supplemental sample were not interviewed until the fall of 2007; those in the 2008 (Round 52) supplemental sample were not interviewed until the fall of 2008; and those in the 2009 (Round 55) supplemental sample were not interviewed until the fall of 2009; and those in the 2010 (Round 58) supplemental sample were not interviewed until the fall of 2010. Thus, beneficiaries in the 2009 Cost and Use file can be classified into four sub-categories, depending on the type of information available about them:

- I Those who were first interviewed in Round 46 (September through December 2006), or in Round 49 (September through December 2007), or in Round 52 (September through December 2008), and
- II Those who were first interviewed in Round 55 (September through December 2009), and
- III Those who were first interviewed in Round 58 (September through December 2010), and
- IV Those who were never interviewed.

In the initial or introductory interview, we collect demographic information such as the beneficiary's age, gender, race, education, and income. We also ask about living arrangements and health insurance policies. We ask all beneficiaries to evaluate their own general health, and we ask about chronic illnesses and some standard measures of physical functioning. If the beneficiary is institutionalized, we gather information about the facility, such as ownership and certification, and types of services offered.

The questions about the beneficiary's health are repeated each year, in the September through December round. The facility screener is also re-administered in the fall. Income is updated in the May-August round for the prior year. Insurance and household composition are updated every round.

The Cost and Use file contains our best available information for calendar year 2009 for each of the four subgroups. In some cases, we were able to use data from other years to approximate 2009, in other cases; the data were left missing, to be completed by other types of editing or imputation. Table 2 below summarizes the types of data presented in the MCBS file, and identifies the source of each type of available data.

Note that the 2009 MCBS Cost and Use file contains the same CMS administrative data for beneficiaries in all four subgroups. In every case, the file reflects services rendered during the calendar year 2009, as reported on bills received by CMS through June 2009. Other administrative data (reported in the RIC A) include demographics such as date of birth, sex and race; Medicare entitlement dates for 2009; State buy-in (proxy for Medicaid); whether or not the person belonged to a Medicare-contract HMO; and whether or not the person was receiving hospice benefits.

Section 5: Filling the Gaps

Table 2: Sources of Information for data presented in the 2009 Cost and Use file

Type of Data	Record ID	Group I	II	III	IV
Demographics	RIC 1	2006/2007/ 2008	2009	2010	Missing
Income	RIC 1	2009	2009	2010	Missing
Health Status	RIC 2	2009	2009	2010	Missing
Insurance	RIC 4	2009	2009	2010	Missing
Facility characteristics (Facility, only)	RIC 7	2009	2009	2010	Missing
Household composition (Community, only)	RIC 5	2009	2009	2010	Missing
Use (events) and costs		2009	Missing	Missing	Missing
CMS beneficiary data	RIC A	2009	2009	2009	2009
CMS billing data		2009	2009	2009	2009

The beneficiaries in Group I represent most Medicare beneficiaries, and are the largest group in the 2009 Cost and Use file. Nearly all of the survey data for this group were collected or updated in 2009. Demographic characteristics other than income are an exception because that information was collected in their initial interview, and not updated. This is also the group from whom we collected (in Rounds 54 through 57 of the survey) complete information about their use of medical services in 2009 and the cost of those services.

The beneficiaries in Groups II and III were added to the survey in supplemental samples. Because most of the descriptive data collected in the survey are collected in the initial MCBS interview, the data for Group II (first interviewed in the fall of 2009) are contemporary with those of Group I--they represent 2009. Data for Group III (first interviewed in the fall of 2010) describe these beneficiaries in 2010; while some individual characteristics might change, we reasoned that the beneficiary's own description (even as of a year later) was more likely to be accurate than one derived by strict statistical imputation. Again, income was an exception; it was self-reported, then edited by imputation for 2009 (Group II) or self-reported for 2010 (Group III). As indicated in the table, we have no survey data about use and cost of medical services for

these groups. We do, however, capture extensive data from Medicare claims and bills that were used to select appropriate donors to impute the missing data.

The beneficiaries in Group IV are people for whom we have no survey data at all. These beneficiaries died before they could be interviewed, but were nevertheless entitled to benefits for some part of 2009. For the people in this group, we selected individuals similar to them in age group, gender and insurance structure, to act as donors. All survey information for these individuals came from the donors; CMS data (that in the RIC A and the bill records) reflect their own experience.

EVENT LEVEL MATCHING

There are two primary objectives in matching survey reports to Medicare administrative bill records: to correct for under reporting of events on the survey, and to correct errors in payment information collected in the survey.

The first step in matching survey reported medical events to Medicare bill records is gathering all events for a person together. Because the MCBS sample is drawn from CMS' Medicare Enrollment Database (EDB), matching the Medicare paid claims and bills with the correct sample person is a reasonably straightforward process. The beneficiary's Medicare number, or health insurance claim number (HICN), is part of the information collected from the EDB when the sample is drawn. The beneficiary's HICN is verified in the first MCBS interview. Prior to the match, Medicare paid claims are retrieved from the Medicare national claims history repository, by HICN. The search file includes all cross-reference numbers and different beneficiary identification codes associated with each beneficiary, ensuring that all bill records are recovered.

Linking and reconciling the retrieved Medicare claims with individual events reported in the survey is a much more complicated process than matching Medicare paid bills with the correct sample person. There is no data element, or combination of elements, that provide a consistent basis for matching survey data to Medicare claims across all types of services. There are significant differences in the ways which medical goods and services are characterized in the survey and in the Medicare claims records.

Neither the MCBS nor CMS claims records capture a consistent set of data elements for all services types. For example, the MCBS does not capture total reimbursement for inpatient hospital services because the respondent is not likely to know that information; it is not typically included on the notice of utilization, and thus, this information cannot be used in matching. In other categories, especially Part B services, the total charge of the service is known because it appears on the explanation of benefits, and it is a key match field. Similarly, CMS claims data do not always have the same data elements for

Section 5: Filling the Gaps

different claims types. The carrier control number for each claim is included in CMS' claims history files and the MCBS attempts to collect the carrier control number from the sample person's explanation of benefits in the interviews. As a result, this item is extremely useful in matching survey reported utilization to Part B claims. On the other hand, the intermediary control number (Intermediaries process claims for Part A of Medicare) is not available in CMS' files, so even though it is collected in the survey, this data element is not helpful in matching the survey data to Part A bill records.

Survey-reported utilization In the utilization sections of the MCBS community questionnaire, beneficiaries are asked about all their medical events, including their visits to practitioners of all types, their prescriptions, and any medical equipment or supplies they might use. (Please refer to Section 7 for copies of the survey instruments and exact wording of the questions).

Types of utilization collected in the MCBS

DU	Dentist visits, including cleaning, x-rays and repair, purchase or repair of dentures, and orthodontic procedures.
ER	Hospital emergency room visits.
IP	Inpatient hospital stays.
IU	Other short-term institutional stays, such as skilled nursing home stays or rehabilitation hospital stays.
MP	Doctor visits, including visits with medical doctors (MD); practitioners such as chiropractors, podiatrists, audiologists and optometrists; mental health professionals such as psychiatrists, psychologists and clinical social workers; therapists such as physical therapists, speech therapists, occupational therapists, and intravenous and respiratory therapists; other medical practitioners such as nurses and paramedics; and other places offering medical care, such as clinics, neighborhood health centers, infirmaries and urgent care centers.
OP	Outpatient visits, including visits to the outpatient department or outpatient clinic of a hospital.
HP/HF	Home health visits, collected in the survey as visits by professionals or friends. Health professionals include nurses, doctors, social workers, therapists and hospice workers. Friends include persons who do not live with the beneficiary, but help the beneficiary at home with personal care or other daily needs. These persons may be home health aides, homemakers, friends, neighbors or relatives.

- OM Other medical expenses, including purchase or rental of a variety of items: eyeglasses or contact lenses and hearing aids; orthopedic items such as canes, walkers, wheelchairs and corrective shoes; diabetic supplies; oxygen supplies and equipment; kidney dialysis equipment; hospital beds, commodes, and disposable supplies such as disposable diapers and bandages.
- PM All prescription medications except those provided by the doctor or practitioner as samples and those provided in an inpatient setting.

In addition to these categories, the community survey instrument is also designed to collect some types of utilization that the beneficiary may unintentionally omit. This utilization is captured when the beneficiary's Medicare and private health insurance statements are reviewed, and is classified as SD - separate billing doctor, and SL - separate billing lab. The SD and SL categories typically include such things as anesthesiology administered while the beneficiary was an inpatient, lab tests not done at the doctor's office, and the radiologist's interpretation of an x-ray.

The facility instruments capture similar information about people who are residents of long-term care facilities, including the use of prescribed medicines.

CMS-reported utilization Medicare claims are basically organized by type of provider. The categories of Medicare claims records are as follows:

Inpatient hospital, psychiatric hospital, TB hospital, Christian Science facility and skilled nursing facility bills. Although these records all share the same format, they contain codes that allow them to be separated into these subcategories. For purposes of the match, bills from skilled nursing facilities were separated from the other types of bills, but no further subdivisions were made.

Home health bills.

Hospice bills.

Outpatient hospital bills.

Part B physician/supplier claims for physician services, diagnostic laboratory and radiology, durable medical equipment and some prescription medicines.

Match categories In matching the survey-reported utilization to the Medicare claims data, MCBS staff frequently must match a Medicare claim category to multiple MCBS categories, and vice versa. Although there are some clear relationships between the

Section 5: Filling the Gaps

categories of utilization collected in the survey and CMS claims categories, not all categories match neatly.

Event-level matching is actually a series of matches between different categories of Medicare claims and MCBS service types. In conducting these matches MCBS staff employ different match algorithms, depending on the data elements available for the particular categories being matched. Matches are arranged in sequence, so that the most similar survey-reported and Medicare claims categories are compared first. The following figure presents an overview of the categorical matches.

Figure 1. Overview of event category matches conducted during event-level matching

Matches between similar service types

IP to Inpatient hospital bills
MP, OM, SD, SL to Part B physician/supplier
OP to Outpatient hospital bills
IU to SNF bills
DU to Part B physician/supplier claims
ER to Outpatient hospital bills
HF & HP to Home health agency bills

Matches between less similar service types

ER to Inpatient hospital bills
OP to Inpatient hospital bills
IU to Inpatient hospital bills
IP to SNF bills
IP to Outpatient hospital bills
OP to Part B physician/supplier claims
MP, OM, SD, SL to Outpatient hospital bills

Each match algorithm employs a hierarchy of match criteria which are progressively less restrictive. For example, reported doctor visits are initially compared to claims records by physician's name, date of service, and total charge. If there is not an exact match, the algorithm checks for a match on physician's name and date of service, or total charge and date of service. If there is still no match, the program looks for an exact match on physician's name and total charge, with the date of service match relaxed to dates within one week of each other. (Technical Appendix B contains a more complete discussion of the match.)

The match algorithms not only link survey-reported utilization and Medicare claims records, but also code the records to indicate the strength of the link.

MCBS staff designed the match algorithms to allow survey-reported utilization to be linked to multiple Medicare claims, and vice versa, for two reasons. First, multiple links are often valid. For example, a survey-reported doctor visit may be linked to both a

Medicare claim for the physician's services and a Medicare claim for laboratory services connected with the visit. Second, a stronger match may occur later in the series of matches. A survey-reported doctor visit may have a weak link to a Medicare Part B physician/supplier claim and a strong link to a Medicare outpatient claim. MCBS' staff uses the link-strength indicator to resolve situations where the multiple matches are logically inconsistent.

Hospice bills were excluded from the match because there is no clean "hospice" category in the survey data. Survey-reported prescribed medicine (PM) utilization was excluded from the match because Medicare coverage of drugs is too limited to warrant complicating the match with immense numbers of survey drug records. Facility and home health utilization were matched in only a summary fashion to improve the accuracy of Medicare payment data.

Three outcomes are possible from the attempted match of survey data to Medicare claims data: the information from the two sources agrees (a match); or, information reported in the survey is not present in the Medicare claims data; or, information is present in the Medicare claims data which was not reported in the survey.

Pre-match edits Prior to matching, the Medicare claims data were edited for obvious omissions and inconsistencies. Please see Section 4: Edits, for a description of the edits applied to CMS bill data and to survey data.

2009 Cost and Use file "events" The matching programs produce a set of records which reflect the best combination of survey and Medicare claims categories, and present records from both sources (matched and un-matched) in a uniform format. Since the categories of utilization in the Medicare claims do not match the survey categories, utilization groups in the 2009 Cost and Use file are a combination of the two sources.

Section 5: Filling the Gaps

Event level records - The most disaggregate level of utilization records in the 2009 Cost and Use file is the “event” level record. Event records combine survey-reported

Figure 2. Categories of utilization in 2009 Cost and Use file

Event-level data

PME	Prescription medicine (Includes PDE’s for Part D covered SP’s in LTC facilities)
IPE	Inpatient hospital, including emergency room visits which result in an inpatient admission
OPE	Outpatient hospital, including emergency room visits that do not result in an inpatient admission
MPE	Medical doctor and practitioner visits, diagnostic laboratory and radiology, medical and surgical services, durable medical equipment and non-durable supplies.
DUE	Dental
IUE	Institution (other than inpatient hospital, and other than long-term care)
FAE	Facility stay records

Person-level data only

Home health
Hospice

information and Medicare claims data in the seven categories presented in Figure 2: IPE, OPE, IUE, DUE, MPE, PME and FAE. **Event records contain a variable to indicate the source of the utilization information--Medicare claims data, survey data, or both--and a variable linking the event record to the bill data, if both sources provided the information.**

Event records also provide a consistent analytic unit within a category of utilization. The following definitions apply to events in this file:

Prescription drugs (PME) The basic unit measuring use of prescription drugs is a single purchase of a single drug in a single container.

Inpatient hospital (IPE) The basic unit measuring use of inpatient hospital services is a single admission. If the beneficiary was still hospitalized at the end of the year, the inpatient event record is not complete, but all data through the end of 2009 are present.

Outpatient (OPE) The basic unit measuring use of outpatient services is a separate visit to any part of the outpatient department for a survey-reported event. For Medicare claim

only events, it may represent 1) a single visit; 2) multiple procedures or services within one visit; 3) multiple visits billed together.

Medical, surgical and diagnostic services, and equipment and supplies (MPE)

The basic unit measuring use of these services is a separate visit, procedure, service, or a supplied item for a survey reported event. For Medicare claim only events, it may represent 1) single or multiple visits; 2) single or multiple procedures; 3) single or multiple services; 4) single or multiple supplies; depending on the number of items pulled together on the bill.

Dental (DUE) The basic unit measuring use of these services is a single visit to the dentist, at which time a variety of services, including cleaning, x-rays, and an exam might be rendered.

Institution (IUE) The basic unit measuring use of these services is an admission. If the beneficiary was still in the institution at the end of the year, the institutional event is not complete, but all data for 2008 are present.

Facility events (FAE) The basic unit record measuring use of facility services is a “stay” in a nursing home or other long term care facility. Stays are measured in terms of days of residence in that facility. If a person is still in the facility at the end of 2009, the stay is not complete, but all data through the end of 2009 are included.

Emergency room The emergency room (ER) survey category was split between IPE and OPE. Under the prospective payment system, emergency room services that result directly in a hospital admission are included in the DRG payment for the inpatient stay, and thus are not associated with any separate charges or claims. Emergency room visits that are not immediately followed by an inpatient admission are classified as outpatient services. For this reason, survey-reported emergency room (ER) utilization was matched to outpatient, then inpatient bill records, and is reflected in the 2009 Cost and Use file as either OPE or IPE records. Several other survey categories (MP, SD, SL and OM) have been combined to make up the single EMP category. Hospice services do not exist as a separate category of utilization in the survey data, so this category derives from the Medicare claims data.

Post-match edits For most types of services, the MCBS collects a date of service to assist in matching survey-reported data to claims records. Respondents may not always recall exact dates, so dates are collected in three independent parts--month, day and year.

Since the year portion of a survey date may be missing or incorrect, records for services in 2008 and 2010 were not eliminated from the survey file until the match was concluded. Similarly, respondents may “telescope” events, believing them to have taken place

Section 5: Filling the Gaps

recently when in reality they occurred a year or more in the past. As matching Medicare claims might help to identify and eliminate these responses, the Medicare records were also not edited on date until after the match; for the match records included services rendered in 2008 and 2009, as well as 2010. After matching, the event file was edited to exclude all services that were rendered outside of calendar year 2009.

If the survey-reported data matched Medicare claims data, the dates of service on the Medicare record were carried into the event record. Dates of service were used as a match criterion in most of the matches, so in many cases, the dates of service in the event record did not change from those reported.

SUMMARY OF MATCH RESULTS

A total of 245,483 Medicare bill events for sample persons who were interviewed about their health care use during the time they lived in the community were matched against 191,559 survey reports. A match was recorded for 94,620 event records, which is 39% of total Medicare bill records events and 49% of survey reported events. The percentage of dollars matched was considerably higher. The 150,863 unmatched Medicare bill events represent 61% of events, but only 48% of total payments. That is, 52% of total dollars on the Medicare bill side were successfully matched with survey reports.

Unmatched Medicare events (\$233) were a little more than half as expensive on average as matched events (\$387). This is consistent with general household survey experience, which has shown, that major, more expensive medical events, are more likely to be remembered and reported at the interview.

Evidence supporting improved accuracy

On the 94,620 matched events, Medicare should have been reported as a payer on 100% of the survey reported events. However, Medicare was only reported as a payer for 67,408 or 71% of events. Consequently, the match corrected 29% of the records to make Medicare a payer of record.

On the 94,620 matched events, the Medicare payment amount was only reported on 55% of survey reports. The match filled in the correct Medicare payment for the remaining 45% of survey reports.

Examining 51,629 of the 94,620 matched events where both a Medicare payment and total payment was reported:

the survey reported Medicare payments overstated Medicare payments from Medicare bill records by about \$1 thousand;

the survey reported total payments overstated the total payment amounts from Medicare bill records by \$58.1 billion;

these erroneous survey reported payment amounts suggest that Medicare paid only 32% of total payments compared to 75% from the Medicare bill record amounts.

Evidence of survey under-reporting

The 150,900 unmatched Medicare paid bill events strongly suggest a high level of under-reporting on the survey. While there are 96,900 unmatched survey reports on the other side, many of these events could not be reasonably expected to be undiscovered matches. For example:

Unmatched survey events unlikely to match an unmatched Medicare bill

1. Over 10,800 unmatched survey events were for dental services that are rarely covered by Medicare.
2. Almost 3,100 unmatched survey events had total payments equal to zero. (These were very likely parts of bundles of services that were covered in one global payment on the Medicare side, for example, post operative services that were covered by a global surgery fee.)
3. Another 27,500 unmatched survey events were for Medicare HMO enrollees. Virtually all of the Medicare services for these persons are paid through a capitated payment amount and the likelihood is very small that their events ever match a fee for service Medicare paid bill record.
4. There were 3,000 unmatched survey events where the sample person was only entitled to Part A or Part B of Medicare, but not both. Therefore a survey reported service could reasonably not be expected to match a Medicare paid bill record.
5. Another 2,900 unmatched events were provided by the Veterans Administration or in a military installation where no Medicare bill would be expected.
6. Over 13,100 unmatched survey events were for other medical services. While Medicare covers durable medical equipment such as wheelchairs, and supplies such as

Section 5: Filling the Gaps

oxygen, it does not cover many items in the broad other medical services category such as eyeglasses, hearing aids, heating pads, incontinence supplies, etc. Average payments for unmatched survey reports of other medical events (\$300) was less than the average survey reported payments for matched events of this type (\$414) but a little more than total payments for unmatched Medicare claims in the same category (\$212). This suggests that most unmatched survey events for other medical services are probably not undiscovered matches.

7. Taken together, over 60,400 of the 97,000 unmatched survey events either definitely could not, or very likely would not, match a Medicare bill event record. This leaves 36,500 unmatched survey events to be explained.

8. Estimating conservatively, this means 114,300 medical events, or 48% of Medicare bill records for community dwelling original sample persons, were not reported in survey interviews. (Calculated using 150,900 unmatched Medicare events minus 36,500 possible undiscovered matches among the unmatched survey events)

Unmatched survey events likely to be undiscovered matches

9. On other side, over 18,000 unmatched survey-reported events reported a dollar amount that Medicare paid for the event. These unmatched survey events are very likely to be undiscovered matches.

Ambiguous events

10. This leaves about 17,500 unmatched survey events to be explained. There are many medical services and supplies that Medicare does not cover. For example, physical examinations (with the exception of the one-time “Welcome to Medicare” exams) if the person is well, most alternative medicine services, over the counter remedies, etc.

Building a Complete File

MEDICARE COVERED SERVICES

A. A complete file would include all 94,600 matched events. These events, which were reported on both the survey and in Medicare bill event records, will combine the most accurate and complete information possible from both sources.

B. All Medicare bill record unmatched events (150,900) should also be included. These event records are official records of Medicare program payments and will correct for survey under-reporting.

C. It is more debatable which of the unmatched 97,000 survey records to include. We recommend, and we have included in our file type of service and adjusted file summaries, all unmatched survey reports except the 19,000 records with a Medicare payment. For the reasons discussed above, we assume that these 19,000 records are undiscovered matches that would duplicate some of the 150,900 unmatched Medicare bill event records if they were included.

D. Home health and Hospice records, which were not entered in the event level match, should be added into the file.

TOTAL MEDICAL SERVICES INCLUDING MEDICARE COVERED AND NON-COVERED SERVICES

In addition to A, B, C, and D above, Prescription Drug and Long Term Facility records should be added to the file.

MISSING PAYMENTS AND PAYERS

This sections describes adjustments made to fill in payment amounts that are missing because the beneficiary did not know how much an event cost, or did not know how the event was paid for (by whom, and how much for each payer). The MCBS staff first established a target reimbursement or total payment for the event, identified all possible sources of payment, and then distributed the total payment across all payers. Missing amounts and payers were filled in using either analytic editing or statistical imputation. This process relied heavily on Medicare administrative records. The guiding principle of retaining as much survey data as possible, and filling in around it, was maintained throughout the process. Where feasible, information about the payers for a specific event, known payment amounts, and target reimbursement were used to determine unknown payment amounts by analytic edits. When insufficient information was available and analytic editing was impossible, unknown payment amounts were completed by statistical imputation.

Different approaches were used with different categories of utilization to define payers and determine payment amounts. Records submitted to the survey/administrative match (which was discussed in the preceding section “Event Level Matching”) were handled differently than those not matched. Survey-reported records for dental, medical practitioner, inpatient, outpatient, institutional (other than long term care), and medical equipment and supplies (survey utilization categories DU, MP, SD, SL, IP, OP and IU and OM) were entered into the match with Medicare claims data. After the match, these events were individually assigned target reimbursement amounts, and then source of

Section 5: Filling the Gaps

payment variables and separate payment amounts were calculated for each payer. Other procedures, usually some adaptation of the procedures sketched above, were used to determine payers, target reimbursements, and payments for other categories of utilization. In the next sections we discuss how target reimbursements were established, explain the procedures used for matched utilization (the largest category of utilization), and then discuss the smaller and more specific non-matched categories.

Determining target reimbursement One of our primary rules was to establish the target reimbursement for an event with a missing total payment prior to determining or imputing the payment distribution. This was done in a way to establish a target reimbursement that was consistent with payments shown for other similar services in the file. In this way, a credible target reimbursement can be used to inform and control the payment distribution. For Medicare covered services, target reimbursements were developed from Medicare claims because this is a more accurate method than determining the amounts paid by individual sources of payment, and summing them.

Another primary rule was to retain survey-reported payment data, even when it was only partial data, wherever possible. There are situations where retaining the reported payment amounts and establishing the target reimbursement amount without regard to individual payment amounts are mutually exclusive. On a few occasions, the target reimbursement had to be adjusted in order to retain reported payment data.

The rules for establishing target reimbursements depend first on whether or not Medicare claim data are available. If the survey-reported data match a Medicare claim record, or if the Medicare claim record was the only source of information about the service (nothing about the service was reported in the survey), the Medicare claim data were used to establish a target reimbursement. The target reimbursements for 64% of the events in this file were established using Medicare administrative bill payment data.

If the utilization was only reported in the survey (matching to Medicare claims was not successful in identifying a corresponding claims record), the survey data was used to create the target reimbursement. This occurred for about 36% of events in this file.

For a small subset of the survey reported events without a matching Medicare claim, but where Medicare was reported as a payer, a different approach was used to create a target reimbursement. A set of regression models, one for each type of event, was developed to predict the target reimbursement from the total charges reported in the survey.

When the respondent did not report a total charge for the event but indicated that Medicaid was a payer, an imputed target reimbursement was created which was consistent with the generally lower payments made by Medicaid.

Filling in Missing Payments and Payers for Matched Utilization Records

The following procedures were used to determine who paid for each event, how much an event cost in total, and how much each payer paid. These procedures were applied to inpatient, outpatient, institutional (other than long-term care), dental, and physician and supplier services, and medical equipment and supplies. These procedures were applied to events in the 2009 Cost and Use file designated: RICIFE (inpatient), RICOPE (outpatient), RICDUE (dental), RICIUE (institutional) and RICMPE (medical and surgical services, equipment and supplies).

Determining Potential Payers Regardless of the method used for imputation, payment amounts were only imputed for potential payers. The total reimbursement for an event was distributed among 11 sources of payment (SOP):

- + Medicare fee-for-service
- + Medicaid
- + Medicare managed care
- + Private insurance managed care
- + Veterans' Administration
- + Employment-based private health insurance
- + Individually purchased private health insurance
- + Private insurance, source unknown
- + Out-of-pocket
- + Uncollected liability
- + Other public insurance

Out-of-pocket payments are those payments made by the beneficiary or their family, either as cash or through Social Security or SSI checks to a nursing home. Medicare managed care organizations (MCOs) coverage is different enough from fee-for-service coverage to merit its being reported separately. Non-MCO private insurance is characterized as individually purchased or employment-based because there are differences in cost and coverage depending on type. As this information is not known for residents of nursing homes (the nursing home staff are not likely to know, and thus are not asked, how the insurance was purchased), a third category of private, non-MCO insurance was created for private insurers when the source is not known. Uncollected liability refers to unpaid amounts where there is a legal obligation to pay. If there is an agreement between the provider and a payment source, which reduces the amount that the provider can collect for a service, there is no uncollected liability. On the other hand, if the respondent reports a total amount payable and specific payment amounts for all known sources of payment, and the sum of those payments is less than the total amount payable, the difference is considered an uncollected liability. Other public insurance

Section 5: Filling the Gaps

includes Federal or State programs not included in the other categories, such as State drug programs like PACE in Pennsylvania.

An individual's insurance coverage can change during the course of a year. A health insurance time line, created for each person in the 2009 Cost and Use file, provided the basis for determining the potential payers for each event. The time line contained complete insurance information, including Medicare entitlement, Medicaid eligibility, and enrollment in Medicare MCOs, for every day of the beneficiary's Medicare eligibility during the year. Medicare entitlement, Medicaid eligibility, and enrollment in Medicare MCOs were captured from CMS administrative data, while information about private insurance was collected in the insurance portion of the interview, and then supplemented by information learned from statements and Medicare claims. In 1996 we refined the methodology for determining whether Medicaid was a possible payer for an event. We now distinguish whether a respondent has full Medicaid benefits or only Qualified Medicare Beneficiary (QMB) or Special Low-income Medicare Beneficiary (SLMB) status. If an individual has full Medicaid benefits, then Medicaid is a potential payer for all medical events. If an individual has QMB status, then Medicaid is a potential payer for cost sharing amounts on Medicare covered services, but not on medical events not covered by Medicare. If an individual has SLMB status, then Medicaid is not a potential payer for any medical events.

Payer indicators A payer indicator code was used to identify definite and potential payers of the total charge for an event. SOP (Source of Payment) flags were used to initialize the payer indicator. Each SOP flag corresponded to one component of the payer indicator, and could have a value ranging from 0 to 4 as shown in Figure 3.

SOP values were set by using survey information about reported events, about the type of provider for the event (that is, whether the service was delivered by a managed care provider or a VA facility), and about the type of insurance coverage and/or program participation. SOP values also depended on Medicare claims data when a survey-reported event corresponded to a Medicare claim (a "matched" event.) Based on all of this information, each source was determined to be a payer, a potential payer, or not a payer of charges for the event.

Figure 3. Source of payment (SOP) flag values

- 0 - Source definitely did not pay
 - 1 - Source definitely did pay, known amount
 - 2 - Source definitely did pay, unknown amount
 - 3 - Source possibly paid, beneficiary was covered at time of event
 - 4 - Source possibly paid, beneficiary may have been covered at time of event
-

Payers A source was a definite payer if the SOP for that source had a value of 1 or 2. An SOP value of 1 indicates that the respondent reported that the payer had paid a portion of the charges and also reported a payment amount, or that Medicare claims data provided

that information. An SOP value of 2 means that the respondent reported that a payer paid a portion of the charges, but did not know the exact amount, and no matching Medicare claim was found to provide this information.

Potential payers A source was a potential payer if the corresponding SOP had a value of 3 or 4. An SOP value of 3 meant that either the beneficiary definitely had that type of insurance coverage at the time of the event and the payer may have paid some amount, and/or the beneficiary received the service from that type of payer (i.e., a managed care provider or a VA facility), but did not report it as a payment source. An SOP value of 4 was used when there was doubt about the beneficiary's insurance coverage during the event or about the event date itself.

Non-payers If neither the respondent nor the Medicare claims data indicated that a payer had been a source of payment for an event, the SOP was set to 0.

A more comprehensive discussion of the rules used for setting the SOP flags is included in Technical Appendix D.

Translating payer indicators into sources of payment A value of 1 for a particular payer indicator meant that the payers paid a portion of the total charge for the event, and a value of 0 meant that the payer did not contribute. Final payer indicator values were determined in one of three ways: 1) directly from the corresponding SOP values; 2) through analytic edits; or 3) through statistical imputation.

Different rules applied when payer indicator values were set directly from the corresponding SOP values, depending on whether the SOP was determined to be a definite payer, a potential payer, or a non-payer. If the source was a definite payer and the payment amount was known (SOP=1), the corresponding payer indicator was set to 1. If the source was a definite payer but the payment amount was not known (SOP=2), the payer indicator value was set to 1 with one exception: if the event was for dental care or for durable or nondurable medical equipment not usually covered by Medicare, the Medicare payer component was set to 0. The rationale was that if the respondent was not able to report the Medicare payment, then it was more likely that Medicare had not actually paid for the ordinarily noncovered dental services.

When the SOP was a potential payer (SOP=3 or 4), the corresponding payer indicator was set to missing, and imputed (as 0 or 1) in a later step. However, the general rule for setting a payer indicator value based on a corresponding SOP value of 3 or 4 was sometimes modified by the analytic edits, as discussed next.

NOTE: The Medicare payer indicator value was never set to missing. It was always equal to 0 or 1, unless the SP reported that Medicare had contributed

Section 5: Filling the Gaps

toward the event but did not report the amount and the survey data was not matched to a Medicare claim. In this case, the SOP value for Medicare was set to 2 and the Medicare delta value was determined as above.

When the SOP was not a payer (SOP=0), the corresponding payer indicator was set to 0, except when the SOP was out-of-pocket or uncollected liability. If the SOP was out-of-pocket or uncollected liability and equal to zero, the payer indicator was set to missing, to be imputed (as 0 or 1) in a later step.

Analytic edits Analytic editing of charge and source of payment data at the event level also determined some payer indicator values. The general goal of the analytic edits was to resolve as many events as possible (i.e., to fully allocate total charges to payers) and to set as many payer indicator values as possible based on logic and knowledge of payer policies. The edits resolved some events without using a hotdeck procedure to impute payment sources or amounts.

The analytic edits relied on having both unambiguous SOP values and external information about interaction among the insurance or payment sources. Edits for three of the payment sources (Medicaid, MCOs, and VA) depended on information specific to those payers, but payer indicators for other payment sources were also affected. The analytic edits are discussed fully in Technical Appendix C, as they apply to each source of payment.

Medicaid: Analytic edits were used extensively when Medicaid was a potential or actual source of payment for an event. One set of edits--designed to reflect the role of Medicaid as the payer of last resort--ensured that Medicaid could not be a payer if payments were reported or imputed for another third-party insurer (except Medicare), or if the provider was an MCO or VA facility. Another set of edits was developed for dual Medicaid/Medicare eligible beneficiaries whose cost-sharing liability is covered by Medicaid.

Private and Medicare MCOs: Managed care organizations (especially Medicare-contracting MCOs) often operate differently than other third-party payers and tend to have unique payment patterns. For instance, risk and (to a lesser extent) cost Medicare MCOs are paid a set fee per enrolled Medicare beneficiary (called a capitated amount) designed to compensate the MCO for the expected costs of delivering Medicare's package of benefits. There are no Medicare claims or Medicare or insurance statements indicating the total charge for events covered by the capitated amount. Often the respondent only knows the copay amount, if there was one. Also, MCOs often provide "Medigap"-type coverage by paying for most of the member's deductibles and copays for Medicare-covered benefits. A beneficiary who belongs to an MCO does not need private Medigap insurance or Medicaid coverage for these amounts. Thus, payment patterns for

MCO beneficiaries tend to be simpler than those for fee-for-service beneficiaries. The set of analytic edits for MCOs attempted to account for these simplified patterns and for the respondent's usual inability to report charges and payments for events. The MCO edits also attempted to avoid creating "illogical" payment patterns.

Veterans' Administration (VA) coverage: If VA was a payer, no uncollected liability amounts were allowed. As both the insurer and provider of services, the VA does not "charge" more than it will be reimbursed by other payers. In this respect, services provided by the VA are similar to those provided by MCOs.

General Edits: At the beginning of the analytic editing, and after each main section of edits, an attempt was made to resolve events through addition or subtraction. Events without a known total charge but with a complete payer indicator vector (i.e., each payer was identified as either having paid or not paid for an event and each payer's amount was known) were completed by summing across all payment sources to derive the total charge. Events with a known total charge and complete except for one missing payment amount or payment source, were completed by subtraction. The excess of charges over known payment amounts was attributed to the known payer, or the one missing payer indicator was set to 1 and the excess allocated to that payer.

If a service was provided free of charge, all payer indicators and payment amounts were set to 0. However, if the respondent reported an event as free, but also reported that a source other than Medicare or Medicaid paid something for the event, the total charge was reset to "missing," and imputed.

If a source was a potential payer for an event, or if the respondent reported that the payer had contributed to an event but did not know the amount, it was assumed that the payer was not actually a source, if the current sum of reported payments equaled the reported total charge.

Payer Indicator Imputation: Delta components that still had missing values after accounting for survey data, Medicare claims data, and the analytic edits were imputed through a hotdeck procedure. The hotdeck procedure used completed payer indicators by identifying similar cases that served as donors for comparable cases with incomplete vectors (beggars). Comparability was usually defined in broad terms so that there were multiple choices for each event that needed payer indicator imputations.

If Medicaid was a payer, a Medicaid payment amount was calculated as a percentage of coinsurance and deductible for the Medicare service.

Other Utilization (Not Matched)

The following procedures were used to determine who paid for each event, how much an event cost altogether, and how much each payer paid, for events that we did not attempt to match to Medicare claims data on a service-by-service basis. These procedures were applied to home health and hospice services. (The procedures used for missing payments or payers for prescription drugs and facility utilization are described separately. We thought it would be more helpful to readers if we kept all the information on how the long term facility and prescription drug records were created, edited, and had missing data filled in one complete section. For information on the editing and creation of these types of utilization, refer to the Prescription Drugs and Long Term Facility segments in Section 4: Edits). Long term facility and prescription drug utilization are presented in the 2009 Cost and Use file as event-level records designated: RICFAE (facility) and RICPME (prescription medicines). Hospice and home health records are presented as summary records only.

Hospice Services

Hospice utilization is unusual in terms of Medicare administrative records because it is the only utilization that is recorded in two different ways, in two different files. The beginning and ending dates of the hospice benefit periods are recorded in the enrollment database (EDB), while the bill records are part of the national claims history repository (NCH). This dual reporting served as an internal check on the dates of service on the billing records.

Determining and imputing payment amounts With a target reimbursement amount (this represents the “total cost” of the event), and delta values indicating which payers contributed some payment toward the total, the share “amounts” paid by the individual payers could be determined.

If Medicare payments were known to be incomplete, then utilization for the missing periods was completed by editing from the existing billing records. The hospice benefit is paid on a per-diem basis, and the missing data were completed with average per diem rates calculated from existing bills. Virtually all services provided to the hospice beneficiary are fully covered by Medicare, and as there are no copayments or deductibles, there is no cost sharing (Prescribed medicines are an exception, as there may be a small copayment for drugs, which are reported separately, and also inpatient respite care for which the patient pays 5% of the Medicare allowed rate - under \$5 in 2009). Hence, the Medicare reimbursement is the target reimbursement, and Medicare is the sole payer of hospice bills. Hospice bills were not matched; as a result, there is some overlap between

hospice utilization and events reported in the survey. The overlapping survey events are usually, but not always, home health events.

Home Health

The home health use and payment records in the Cost and Use file are designed to represent events where medical care, as opposed to personal care and support, was furnished to the sample person. The decision to include only medical services in the user file in no way derogates the importance of unpaid assistance in maintaining the health and well being of Medicare beneficiaries. It simply reflects the primary emphasis of the MCBS Cost and Use file, which focuses on use of, and payment for, formal medical care services.

Home health events, like prescription drug events, are undated on the survey. For reference periods that spanned two years, the first step was to allocate services proportionately into 2009. The rules used to do this were identical with the procedures in the ADJUSTING FOR MISSING DATES AND UNDATED SERVICES discussion below near the end of Section 5. At this stage, a home health “event” could have represented one or more home health visits. Bundled events with multiple visits were unbundled for the allocation of home health services across years. (Note, however, that home health use and costs are summarized at the type of service and person levels in this file, and home health “event” level data is not shown. The summaries do contain counts of home health visits.)

Survey event records were originally classified in the interview according to whether a professional or a friend provided the home health services. This distinction was used in separating out home health services that were not medical in nature. In winnowing down the file to medical services only, the following decision rules were used to EXCLUDE non-medical home health services:

1. Exclude services provided by a friend where the out-of-pocket payment, if any, was equal to the total charge for the service. (The reasoning is that even if the friend was paid for delivering a service, it was very likely non-medical in nature if there was no other payer).
2. Exclude services provided by a professional where the out-of-pocket payment was equal to the total charge for the service AND the person answered NO to the question whether the professional gives nursing/medical treatment.
3. Exclude all housekeeping/cleaning services unless Medicaid is listed as a payer.

Section 5: Filling the Gaps

4. Exclude all “meals-on-wheels” types of services.

After these allocation and exclusion operations, the remaining survey reported medical home health services were matched (not at the event level but at the person level only) to Medicare bills for home health services. The survey reports and Medicare bills were combined to provide the most accurate and complete summary possible of number of visits and payments (broken down by source of payment such as Medicare, out-of-pocket, etc.)

Other Non-Covered Utilization

For services not covered by Medicare, we made an estimate of medical usage during periods not covered by interviews, in order to produce a file that can be used to estimate full expenditures for the year. For periods of missing data, we first determined the use of services not covered by Medicare, by determining the number of events of the type per day for the covered period, multiplied that number by the “gap” days, and added the number of events to the total known events of the same type. Likewise, to get the adjusted sums for all payers, we calculated the costs per event per payer per day, and then multiplied that figure by the adjusted number of events within payer. If the beneficiary had no interview data about the use of medical care, we used averages from a donor--a respondent who had characteristics in common with the beneficiary with missing data.

NOTE: These adjustments are person-level adjustments, only, and are not reflected in the event records. In addition, they only cover Medicare covered services. There is no adjustment for non-covered services.

Prescription Drug Data

Prior to 2006 all prescription drug data was based on information collected in the survey. Due to the advent of Part D, beginning 2006 Part D Events (PDE's) were available for Medicare beneficiaries enrolled in Medicare Advantage Part D Plans (MAPD's) or stand alone Part D Plans (PDP's). For survey reported events that matched to PDE's, information on the drug “claim” was used to calculate the total payment field as well as the other payer fields. The approach used to fill in missing drug payment data for unmatched events was similar to that used for other missing payment amounts described above. The first step was to establish a total payment amount for each drug event. First preference was given to using survey reports of the total payment for the drug. Approximately a quarter of survey only drug events on the file, the total payment was a reported. About three-quarters of the survey only drug events, an administrative drug pricing source (National Drug Data File User Manual published by First Data Bank –

“The Blue Book”) was used to impute prices. The administrative source was used only when no total payment was reported, and it was rarely used to supersede the survey reported payment. Finally, a small proportion (<5%) of survey only drug events had total payments established using statistical imputation techniques.

After the total payment was established for each drug event, potential sources of payment were identified using a similar approach to that outlined earlier in Section 5. In the last step, the total payment amount was distributed across the sources of payment. In cases where a total payment was available from either a survey report or the “Blue Book,” unknown payment amounts for a specific payer were handled by accounting techniques and analytic edits before employing statistical imputation. In a small percentage of cases where the total payment was derived by statistical imputation, the payer amounts were also derived through statistical imputation.

Preparation of survey reported data Prior to matching or imputation, the prescription drug data collected in the survey were edited for consistent spelling. Although respondents are encouraged to save empty packaging from all prescription medicines, inconsistencies in spelling are sometimes introduced as the data are collected. As a first step in processing the prescription drug data, MCBS staff edited the records to ensure that the same drug was always reported in the same way. All unique drug name spellings supplied in the survey from Rounds 2 through 55, including both community and facility survey responses, were gathered together in a single list. Using the “Blue Book,” MCBS staff manually assigned corrected spellings to each unique supplied spelling.

Preparation of Blue Book data The 2009 Drug Data Bank File User Manual from First Data Bank (“Blue Book”) served as a pricing reference and as a source of therapeutic class for prescription medicines. However, survey reports of total payments were given preference over a “Blue Book” price because we could not match MCBS records and “Blue Book” records exactly on all fields. The “Blue Book” generally identifies the name, form, strength, and packaging size of the drug in a single entry. The MCBS collected prescription size in the survey, but could not collect the packaging size of the drug prescribed. In the survey, form and strength are also collected, but as separate items, not as part of the name. In the initial match, therefore, a Blue Book name “Septra DS Tab 800 mg” had to be changed to “Septra DS,” to increase the likelihood of a match between the two sources on name.

Assignment of wholesale prices In the “Blue Book,” a wholesale price is assigned to each National Drug Code (NDC) entry. The NDC is an 11-digit code; the first nine digits identify a drug (including form and strength), and the last two digits identify the packaging size. As noted above, the MCBS does not collect packaging size, but prescription size, and unit average wholesale prices can differ substantially by packaging size. Using a relative frequency distribution of packaging sizes within each drug type,

Section 5: Filling the Gaps

weighted by utilization rates from CMS' Medicaid Statistical Information System, MCBS staff developed a composite price for drugs that come in multiple package sizes.

After both survey data and "Blue Book" data were cleaned as described, survey prescription data were matched to the modified "Blue Book" information by drug name, form, strength and packaging size, in that order, to develop an average wholesale price. Often, we were not able to match on all four variables. If the survey drug name was not known or could not be matched, an average wholesale price was imputed. If the drug name was known but form or strength was not known, the missing characteristic was imputed and the average wholesale price was then obtained through a match to the "Blue Book." For example, if the respondent reported a prescription of Diamox but did not know the strength, an average wholesale price was imputed using the weighted average price of all Diamox prescriptions (developed using a frequency distribution of drugs by National Drug Code in the Medicare-Medicaid dual eligible population).

A small number of survey entries could not be translated to any drug listed in the "Blue Book." In general, these entries were either misspellings that made it impossible to determine the drug name or not really even a specific drug (e.g. "little green pills"). These entries were classed as "untranslatable," and an average price was imputed based on frequency distributions of drugs taken by the Medicare and Medicaid dually eligible population.

In some cases the size of the prescription was known but the price was not. Average unit costs (per pill, per milliliter, etc.) were then multiplied by the prescription size, to derive a whole prescription cost. In other cases, prescription size was estimated through the respondent's answers to a series of probe questions, which were asked during the interview when the respondent did not know the size of the prescription.

Converting average wholesale price into event price Establishing a price for prescription drug records with no survey reported price began with the assignment of an average wholesale price. Event prices that were less than \$.50 were reset to missing, and imputed statistically. Non-missing wholesale prices were multiplied by a pricing factor that varied depending on the likely payer(s) of the event. Six pricing factors were developed: retail, managed care organization, VA, Medicaid, employer sponsored and other public insurer. The retail pricing factor was actually a series of factors which reflected empirical evidence of the relationship between the average wholesale price and what the respondents reported paying. The retail factor was 248 percent, 130 percent, or 41 percent, depending on the wholesale price of the drug. The managed care pricing factor was based upon a CIBA Geneva Pharmacy Benefit Report on 2006 prescription drug price data for managed care organizations, where it was reported that managed care organizations pay approximately 84 percent of the average wholesale price of prescription medicines. The VA factor was developed using VA drug cost data that was provided by

the Department of Veteran's Affairs. The Medicaid pricing factor was developed using composite data from CMS' Medicaid Drug Rebate System, and included a dispensing fee of \$4.77, a discount off the average wholesale price (15 percent) and a rebate percentage of 24.1 percent. The employer-sponsored insurer is 58% of the average wholesale price.

Determining target reimbursement Target reimbursements were developed differently for prescription medicines than for other services. (Target reimbursements for other types of services are described above in Section 5). Generally, Medicare does not cover prescriptions, and therefore there were no Medicare claims for price comparisons. In place of the unavailable Medicare claims data, adjusted "event prices" (described above) were used to develop target reimbursements.

The target reimbursement is defined as the price that the beneficiary paid for a single purchase of a single drug. For single purchases (one unique medicine, purchased only once and not refilled), the price reported by the respondent was the target reimbursement.

If the respondent could not give a price, the event price, adjusted by the appropriate pricing factor (discussed below) was the target reimbursement. For multiple purchases (a single prescription, filled multiple times, or multiple prescriptions), the target reimbursement was developed as for single purchases then divided by the number of purchases to yield a target reimbursement for each purchase.

If several drugs were reported together ("bundled"), but the total cost was not known, a target reimbursement was developed for each drug in the bundle, based upon the event price adjusted by the appropriate pricing factor. If several drugs were bundled together and a total cost was reported, that total cost was used to control the imputation of the individual drug prices. A relative percentage of the total cost was developed for each drug, using the event price adjusted by the appropriate pricing factor, then those percentages were applied to the reported total cost and the result became the target reimbursement for each drug. If the event price for one or more of the drugs in the bundle was missing, an average price for all strengths and forms of the drug was used in the computation, unless the drug name was not known, in which case an average event price was used. These averages were then used to calculate relative percentages, which were then applied to the amount reported in the survey for the bundle.

Determining potential payers Potential payers for prescription medicines were determined in essentially the same way that potential payers were identified for matched utilization, as described above in Section 5.

Post-imputation checks In line with our overall approach, survey data were retained unless strong evidence suggested that they were wrong. After statistical imputation, it

Section 5: Filling the Gaps

was occasionally necessary to change survey reported target reimbursements for drug events.

Sometimes, a sample person purchased a drug through a public program or through a managed care organization and reported that the out-of-pocket expense was the “total cost” of the drug. Following the procedures outlined above, the out-of-pocket cost would become the target reimbursement for the event. In order for the target reimbursement to be changed, all of the following had to be true:

The source of payment flags for Medicaid, VA, other public insurer, or a managed care organization, were coded 3 or 4, indicating these payers could have paid for the event, even though they were not so identified by the respondent.

The event price was not generated using any imputed information on form, strength or volume.

The target reimbursement was less than 50 percent of the average wholesale price adjusted by the appropriate pricing factor.

The out-of-pocket amount reported was equal to the target reimbursement, was less than \$10, and was divisible by \$0.25.

When all of these conditions were met, the target reimbursement was changed to the average wholesale price, adjusted by the appropriate pricing factor. If this pattern was observed in the total price of a bundle, it was assumed that all drugs in the bundle were reported incorrectly, and all target reimbursements were changed. In all cases, the reported out-of-pocket expenditure was retained.

If the same situation applied to an event where one of the payers was private insurance, the rules for changing the target reimbursement were not as stringent. If the source of payment flags indicated that the beneficiary’s private health insurance could have covered the drug purchase, and the respondent said that the out-of-pocket expenditure was the total cost, the target reimbursement was changed to the event price adjusted by a pricing factor. All drugs reported as a bundle were treated the same way. Out-of-pocket amounts were retained as reported.

Special cases After statistical imputation, 5 sample people had negative aggregate managed care payments for drugs. Negative dollar amounts occur in imputation because for a given prescription, the out-of-pocket payment might be higher than the actual cost of the drug. For example, the cost of a 10-day supply of Ampicillin will probably be less than a \$5-dollar co-payment. In some cases, however, negative prices were the result of

an incorrect distribution of out-of-pocket costs when the total charge of a bundle of prescriptions was missing. Because of the small number of cases with negative aggregate payments for drugs we left the data as is.

ADJUSTMENTS FOR MISSING DAYS AND UNDATED USE

This section describes the adjustments made (at the person level, not the event level) to:

1. compensate for data that are missing because some periods of the beneficiary's Medicare entitlement were not covered by interviews. CMS administrative records are used to establish the exact period of Medicare entitlement during 2009 and calculating the number of Medicare days;
2. allocate undated survey events, primarily prescription drugs and other medical equipment, between years where interview reference periods spanned two years.

Calculating Medicare covered days It is important to define, for each beneficiary in the sample, the exact period of Medicare entitlement during 2009. It is also important to accurately count the number of days in each setting for persons living in the community and living in long term care facilities.

For most sample persons, the period covered by the survey and the period of the beneficiary's Medicare entitlement are identical: they both cover all 365 days of 2009. There are, however, exceptions where the survey period and the entitlement period do not coincide exactly. Differences between the survey and Medicare entitlement dates fall into two categories: the survey period is greater than the Medicare entitlement period; or, the survey period falls short of the Medicare entitlement period.

In a few cases, the date of death recorded in the survey does not agree with the date of death in CMS records. In these cases, the date of death collected in the survey appears as the latest boundary for Medicare covered days, unless CMS *billing data* indicated that the date of death occurred after the survey reported date of death.

The Medicare entitlement period is longer than the period covered by the survey when a Round 46, Round 49, or a Round 52 individual left the survey before the end of 2009, or died without naming a proxy respondent. This is also true for people who were never interviewed about their use of services in 2009 - the Round 55 and Round 58 supplemental samples. The most common reason for incomplete data is the beneficiary's refusal to participate further in the survey. If the beneficiary participated in the survey for at least 60 percent of the period they were eligible for Medicare during the year, the sample person was retained for the 2009 Cost and Use file. If the beneficiary left the

Section 5: Filling the Gaps

survey earlier, that is, the interviews covered less than 60 percent of this sample person's eligibility in 2009, the beneficiary and the survey data were not retained.

When a sample beneficiary dies or otherwise terminates entitlement to Medicare, a closing interview is conducted with a proxy, or with nursing home staff, if the beneficiary is institutionalized. In this way, the survey is designed to capture complete information about people who die or lose entitlement before the end of the year. In a few cases, the beneficiary cooperated with the interviewers for most of the year but died without naming a proxy, leaving unreported the period of time between the last interview and the beneficiary's death. In these cases, as with the beneficiaries who "dropped out" of the survey and the supplemental samples, we used what the beneficiary reported during interviews and Medicare billing data (which is known) to guide the imputation of non-covered services (which are not known) to fill in the gaps in reporting.

Calculating community days and facility days The MCBS sample includes people who are institutionalized as well as those who live in the community, and follows people as they make the transition from one type of living situation to the other. For purposes of analysis, it is important to be able to identify people in either situation, and for people who made a transition during the year, to be able to place them in one category or the other for the appropriate amount of time. We provide three variables to show a person's status in this regard: total number of days entitled to Medicare; number of days where the beneficiary was living in the community; and number of days where the beneficiary was living in a facility.

Group I - Information about the community/facility status for this group was collected in each interview in 2009. This is the only group that will ever show a transition from community to facility, or vice versa.

Groups II and III - For beneficiaries in the supplemental samples, we deemed the entire period of Medicare entitlement to be in the same situation as we found them at the initial interview. If a beneficiary was in the community when initially interviewed in Round 55 or Round 58, the beneficiary was deemed to have been living in the community for the entire Medicare entitlement period. Similar logic applies for residents of facilities.

Group IV - These beneficiaries were never interviewed, so information about their living situation was imputed from a donor population. If the donor was living in the community during 2009, the recipient was deemed to have been living in the community for the entire Medicare entitlement period. Similar logic applies for residents of facilities.

Once the periods of Medicare entitlement and living situations are established, utilization reported in the survey is validated by and, in many cases, supplemented by information reported on claims and bills from CMS' national claims history database. This is accomplished by the matching survey-reported utilization to the CMS records that was described earlier in Section 5.

Allocating services between years The cost and use data collected during the interviews collecting 2009 data (that is, Rounds 53 - 57) cover more than just that calendar year. Each interview serves as a boundary to the next interview - the beneficiary describes medical care that took place "since the last interview" - and those boundaries are generally not the beginning or ending of the calendar year. As a result, the first (Round 53) or last two (that is, Rounds 56 and 57) interviews generally include utilization that covers part of two calendar years. To adjust the utilization in these cases, dated event records were edited to remove those that took place outside of 2009, and undated events were pro-rated according to the number of 2009 days in the interview reference period to total days in the reference period.

Simply pro-rating use between the two calendar years was considered, but rejected. By assuming that use occurred in both years, this procedure could overstate the number and rate of persons using services in a year. In place of this, a random number generator was used to assign services (primarily prescription drugs and other medical events) to calendar years. The probability of an event being placed in 2009 was based upon the ratio of 2009 days in the reference period to total days in the reference period. For example, assume a reference period had 120 days and 90 of these days were in 2009. For each event, a random number between 1 and 120 was generated. For all events where the random number was 90 or less, the service was allocated to 2009. For all events with random numbers between 91 and 120, the service was allocated to the other year.

Filling in Medicare covered days not surveyed When there is a gap in survey data, that is, a period for which a sample person was enrolled in Medicare but was not covered by a survey interview, it is necessary to estimate the medical service usage during that gap period. For persons with gaps who were interviewed in 2009, reported services were simply prorated upward to cover the gap. For example, for prescription drugs the number of prescriptions per day were calculated for the interview period, and multiplied by the number of gap days. This assumes, in effect, that the person used prescriptions at the same rate in the interview and gap periods. Likewise, to get adjusted sums for all payers, the cost per prescription per payer per day was calculated, and multiplied by the adjusted number of prescriptions for each payer.

If the sample person was not interviewed (e.g. supplemental sample persons), a different approach was used. To cover these non-interview gap periods, a donor was selected who was similar to the person in terms of personal and economic characteristics. The donor's

Section 5: Filling the Gaps

use of prescription drugs (measured in prescriptions per day and cost per prescription per payer per day) was used to impute use and payment data.

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Sample Design and Estimation

This section opens with a brief description of the sample design (also discussed in the Introduction), the population actually interviewed about medical use in 2009 (persons enrolled as of January 1, 2008), and the survey operational considerations which led to the use of “always-enrolled” population for MCBS public use file releases having to do with the issue of access to care.

Next, follows a restatement of the purpose of the 2009 Cost and Use file. That purpose is related to a particular view of the Medicare population, namely, beneficiaries ever-enrolled during calendar year 2009. Adjustments to the data for the original sample to account for individuals in the target population for the 2009 Cost and Use file but not represented in the surveyed population are discussed. Various “views” of the 2009 Medicare population (always-enrolled, ever-enrolled, and midpoint) are presented for comparison purposes.

Following the comparison is a general review of person level response rates by panel. Guidelines for preparing population estimates using full sample weights and variance estimates using replicate weights are then reviewed.

Sample Design

The MCBS is a continuous, multi-purpose panel survey of Medicare beneficiaries. The target population of the study consists of aged and disabled persons enrolled in one or both parts of the Medicare program, that is, Part A (Hospital Insurance) or Part B (Supplementary Medical Insurance), and residing in households or in long-term care facilities in the 50 States, the District of Columbia, and Puerto Rico. The sample design is a stratified area probability design with three stages of selection: (1) selection of 107 primary sampling units (PSUs), which are metropolitan statistical areas and clusters of non-metropolitan counties; (2) selection of ZIP code clusters within the sample PSUs; (3) selection of Medicare beneficiaries within the sample ZIP code clusters. The sample was designed to yield complete annual health care cost and use data on 12,000 beneficiaries.

Enrollment Reference Date by Panel

The targeted population for Round 52 of the MCBS consisted of persons enrolled as of January 1, 2008, who survived into 2009 and met the criteria listed above.

Correspondingly, for Round 55 and Round 58, the targeted population included those individuals enrolled as of January 1, 2008, and as of January 1, 2009, respectively.

Sampling Strata

The targeted universe is divided into seven sampling strata based on age as of midpoint (that is, July 1) of the year. The age categories are: 0 to 44, 45 to 64, 65 to 69, 70 to 74, 75 to 79, 80 to 84, and 85 or older. The goal of the sample design is to obtain complete annual (cost and use) data on 12,000 beneficiaries per year, with 2,000 for each of the elderly strata and 1,000 for each of the disabled strata. See Table 6.1. The MCBS sample is designed to be nearly self-weighting within the age strata. A systematic sampling scheme with random starts is employed. Uncertainties in the projection of death and response rates have led to differences from the target for several strata.

Table 6.1 Targeted number of completed cases by sampling stratum	
Total	12,000
0-44	1,000
45-64	1,000
65-69	2,000
70-74	2,000
75-79	2,000
80-84	2,000
85 +	2,000

Sample Selection

Beneficiaries for the MCBS sample are selected from the HISKEW file (Health Insurance

SKEleton Write-off). The initial large panel of 15,411 beneficiaries was fielded in the fall of 1991. Smaller supplemental panels were added in the fall of 1992 and 1993.

These supplementary panels afforded a chance of selection to beneficiaries who became entitled to either part A or Part B benefits during 1991 and 1992 in addition to maintaining adequate sample sizes in the face of death and sample attrition. At the time that the first panel was fielded, no definite decision had been made on how many years to interview sample beneficiaries.

In 1993, a decision was made phase out the 1991, 1992 and 1993 Panels after no more than 6 years of interviews and to limit future panels to four years of interviews. This meant that the new sample to be selected for 1994 had to be designed like the 1991 Panel so that it could eventually replace it, rather than being narrowly focused as the 1992 and 1993 Panels were.

At the same time, a decision was made to increase the overall sample size in terms of interviews per year in order to allow the simultaneous interviewing of 4 panels, each starting with about 6,400 sample beneficiaries. In Round 10 (September-December 1994) we began implementation of the rotating panel process with the 1994 Panel. This group consisted of 6,390 beneficiaries, including a sample of those who became entitled during 1993 or on January 1, 1994. Like the first rotating panel (Round 10), all subsequent panels are designed to be nationally representative samples of the current Medicare population. The following bullets describe panel composition for each of the four panels participating in this data file.

- In Round 46 (September- December 2006) the thirteenth rotating panel was selected, consisting of 6,676 beneficiaries. This panel was the sixth to be selected from the new (updated) sample of PSUs.
- In Round 49 (September- December 2007) the fourteenth rotating panel was selected, consisting of 6,680 beneficiaries. This panel was the seventh to be selected from the new (updated) sample of PSUs.
- In Round 52 (September- December 2008) the fifteenth rotating panel was selected, consisting of 5,532 beneficiaries. This panel was the eighth to be selected from the new (updated) sample of PSUs. A considerable reduction in sample size for Round 52 was necessary due to cost restraints.
- In Round 55 (September- December 2009) the sixteenth rotating panel was selected, consisting of 6,915 beneficiaries.

A rotating panel will be followed for 12 interviews. There are four panels active at any one time, and each panel has approximately 4,000 active sample persons. New panels that are introduced each year in the fall round will replace the oldest panel that will subsequently be retired in the following summer.

Section 6: Sample Design and Estimation

Each Fall round, under the rotating panel design, a new panel will be introduced and each Summer round a panel will be retired. Thus, for example, the new panel that was introduced in Round 55 will replace approximately 4,000 of the ongoing sample by Round 57. This rotating panel sample design allows for both the eventual termination of participation in the study for individuals and for the completion of about 12,000 interviews for an ongoing study population.

Primary Sampling Units

The 2001 panel is the first panel in which the MCBS Primary Sampling Units (PSUs) redesign is implemented. Like the original sample, 107 PSUs were selected of which 63 were retained from the original sample. Within the PSUs, the initial sample was concentrated in 1,237 second-stage units consisting of clusters of ZIP code areas (5 digit). No new ZIP code clusters were selected for the 2009 panel. Thus, the number of ZIP code clusters remained at 1,256 clusters. With the rotating panel design, the PSU redesign will be transparent to data users and no special processing is required.

All of the ZIP cluster samples were selected from CMS' master file of beneficiaries enrolled in Medicare, using the beneficiary's mailing address and the state and county code recorded in that file as of March of the year the individual was selected to be in the sample.

Composition of the Medicare Population Included in the 2009 Cost and Use File

The primary purpose of the 2009 Cost and Use file is to provide a means of estimating the total calendar year use of health care by the Medicare-covered population and to determine the associated expenditures by source of payment. This use includes Medicare-covered as well as non-covered services. To capture total use during the calendar year, it was necessary to expand the view of the covered population to include persons enrolled in the program at any time of the year (the "ever-enrolled"). The existence of sequential annual panels allows the composition of a population that represents such an ever-enrolled view. This was done with the 2009 Cost and Use file. Persons surviving from the eighth through eleventh rotating supplemental panels were used to compose a calendar year 2008 ever-enrolled population. Thus the 2009 file can be thought of as consisting of three groups of beneficiaries:

1. Sample persons from the 2006, 2007, and 2008 panels who survived into 2009.
2. Persons newly enrolled in Medicare during 2008 selected from the 2009 panel.
3. Persons newly enrolled in Medicare during 2009 selected from the 2010 panel.

The number of continuing and newly enrolled sample persons in the 2009 Cost and Use file is distributed as follows:

<u>Panel</u>	<u>Number of persons</u>
panels 2006, 2007 & 2008	10,147
2008 accretes from the 2009 panel	329
2009 accretes from the 2010 panel	383
Total	10,859

This composition of the 2009 file is further discussed in the Introduction and in Section 5, “Filling in the Gaps.”

Comparison of Selected Views of the Medicare Population

Table 6.2 shows data from CMS’ 5-percent HISKEW file that contains selected demographic and coverage information on a 5-percent sample of Medicare enrollees. Data for the targeted population are arrayed by age, gender, and race using these three views: persons “ever-enrolled,” persons enrolled as of the “mid-point of the year” (July 1), and persons “always enrolled.” We have included these relationships to allow users to compare the populations represented by these three different views of the Medicare population.

Section 6: Sample Design and Estimation

Table 6.2 Selected views of the Medicare population by age, gender, and race: 2009

	Both Sexes			Females			Males		
	Always Enrolled	July 1 Midpoint	Ever Enrolled	Always Enrolled	July 1 Midpoint	Ever Enrolled	Always Enrolled	July 1 Midpoint	Ever Enrolled
All Races

Based on 5-percent March 2011 HISKEW file, inflated to 100%. "Always enrolled" data are estimated.

Response Rates

As shown in Table 1, the Round 46 MCBS sample consisted of 5,274 Medicare beneficiaries who survived until 2006 and were not rotated out of the sample, and thus, were available to be included in the 2009 Cost and Use sample.

Table 1	Eligible beneficiaries	Respondents	Response Rate
Round 46	5,274	3,372	63.9 %
Round 49	5,734	3,502	61.1 %
Round 52	6,045	3,273	54.1 %
Round 55	410	329	80.2 %
Round 58	499	383	76.8%
All	17,962	10,859	60.5 %

The Round 55 supplement includes 329 beneficiaries who became eligible for Medicare in 2008; and the Round 58 supplement includes 383 beneficiaries who became eligible for Medicare in 2009. The beneficiaries from Rounds 55 and 58 were not interviewed about their 2009 medical use and expenditures because they enrolled in Medicare after the 2009 sampling list was prepared. The 2009 Cost and Use file is composed of interviews conducted with 10,859 beneficiaries from all five panels, for an over-all response rate of 60 percent.

Preparing Statistics (Using the Full Sample Weights)

“Full sample” calendar year 2009 weights have been provided. (The term “full sample” is used to distinguish these weights from the replicate weights discussed in the next section). The full sample weight is labeled **CS1YRWGT** (RIC X). **CS1YRWGT** is a cross-sectional weight and applies to the original sample and to the supplemental samples, all of whom are used to compose the ever-enrolled population. This weight is greater than zero for all 10,859 beneficiaries on the file. **CS1YRWGT** should be used to make estimates of the levels of use and cost of medical goods and services for the Medicare population enrolled at any time in 2009.

Variance Estimation (Using the Replicate Weights)

In many statistical packages, including SAS, the procedures for calculating variances assume that the data were collected in a simple random sample. Procedures of this type are not appropriate for calculating the variance for statistics based upon a stratified, unequal-probability, multi-stage sample such as the MCBS.

The replicate weights associated with the MCBS data can be used to create estimated standard errors for MCBS variables. The replicate cross-sectional weights are labeled **CS1YRWGT** through **CS1YR100** and may be found in the Cross-sectional Weights Record (RIC X).

Most commercial software packages include techniques to accommodate the complex design, either through Taylor-expansion type approaches or replicate weight approaches. In addition, Westat maintains a package called WesVar. A free downloadable version which can be obtained from Westat's homepage at: www.westat.com. Technical questions may be directed to David Ferraro at Westat, telephone 301-251-4261.

Identification of weight variable and variables for analysis can be done using the WesVar PC® menus. To run WesVar PC® with MCBS data and weights, the method should be specified as Fay's method with a factor of 0.3.

Another option is for the user to write a small custom program using a very simple algorithm. Let X_0 be an estimate of a statistic of interest formed using the full sample weights. Let X_1 through X_{100} be estimates (calculated by the user) of the exact same statistic of interest formed using the corresponding 100 replicate weights. The estimated variance of X_0 is then simply:

$$Var(X_0) = \frac{2.04}{100} \sum_{i=1}^{100} (X_i - X_0)^2$$

A third option is for users who prefer to use alternate software such as SUDAAN® (Professional Software for SURvey DATA ANalysis for Multi-stage Sample Designs) to compute population estimates and the associated variance estimates. Two variables, SUDSTRAT and SUDUNIT, have been included in the Cross Sectional Weight Record to allow use of SUDAAN.

An example of using SUDAAN statements to compute an estimate of the proportion of the Medicare population that had an inpatient stay in 2009 is shown below:

```
PROC CROSSTAB DATA=dsn FILETYPE =SAS DESIGN=WR;  
  NEST SUDSTRAT SUDUNIT / MISSUNIT;  
  WEIGHT CS1YRWGT;  
  SUBGROUP H_INPSW;  
  LEVELS 2;  
  PRINT NSUM ROWPER SEROW;
```

The data set dsn is the name of the file that contains the weights and statistics of interest. The variable H_INPSW is an inpatient switch indicator from the RIC A.

Note that variables specified in the NEST, WEIGHT, and SUBGROUP statements have to be numeric and that SUBGROUP must run between 1 and the number of levels with no gaps.

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Questionnaires

This section contains copies of the community and facility questionnaires that were administered during Round 55 of the Medicare Current Beneficiary Survey.

The 2009 Cost and Use file is a composite of data gathered in as many as 5 interviews per sample person and the Round 55 questionnaires, which were collected in the fall of 2009, are most representative of the person based characteristics of the sample population. Also shown are the questions asked of the continuing sample about use and cost that are asked in each interview in Rounds 54 through 56.

Questions in all of the questionnaires are preceded by a number that is cross-referred to variables in the codebook (Section 2). Since more than one variable may be collected in response to one question, each question has also been annotated with all of the variable names associated with it. Variable names are also indexed in the codebook.

Community Component

The community component is conducted in the home of the respondent. Since the community component of the survey was conducted using CAPI, the questionnaire actually exists only as a computer program, and it is impossible to replicate it exactly in hard copy. The version represented here lists the questions, verbatim, and shows the skip patterns. It also displays instructions to the programmers (enclosed in boxes), to the program, and to the interviewer. Although these instructions would be hidden from the respondent, they have been retained in this copy because they are important for understanding the flow of the questionnaire and for establishing logical links between questions.

Components of the Community Questionnaire

The community instrument consists of the following components:

- Initial interview questionnaire
- Core questionnaire
- Supplement to the core questionnaire
- Interviewer remarks questionnaire

Section 7: Questionnaires

Initial interview questionnaire

This baseline questionnaire is used for the first interview when a sample person is added to the survey, that is, Round 46 for the 2006 Supplement; Round 49 for the 2007; Round 52 for the 2008 Supplement; Round 55 for the 2009 Supplement; and Round 58 for the 2010 Supplement. In the initial interview, we collect information about the national origin, age, education and income of the sample person. The interviewer also verifies the sample person's address and telephone number and obtains the names and addresses of people who might be willing to serve as proxy respondents. The interviewer also uses this opportunity to acquaint the respondent with the intent of the survey and to familiarize him or her with the MCBS calendar, and to emphasize the importance of keeping accurate records of medical care and expenses.

In subsequent interviews, some of the information collected in the initial interview is updated. For example, the sample person's designation of his or her race is not likely to change, and will not be asked about again. On the other hand, the sample person's address or telephone number may change, so this information is verified in every interview, and updated when necessary.

Core questionnaire (community)

The core questionnaire is the major component of the community instrument. The questions focus on the use of medical services and the resulting costs, and are asked in essentially the same way each and every time the sample person is interviewed (after the first time). In each interview, the sample person is asked about new encounters, and to complete any partial information that was collected in the last interview. For example, the sample person may mention a doctor visit during the "utilization" part of the interview. In the "cost" section, the interviewer will ask if the sample person has any receipts or statements from the visit. If the answer is "yes," the interviewer will record information about costs from the statements, but if the answer is "no," the question will be stored until the next interview.

Supplement to the core questionnaire (community)

Supplemental questions are added to the core questionnaire to gather information about specific topics. The Round 55 supplement focuses on health status and access to care. It includes questions about the sample persons' general health (including standard measures such as IADLs and ADLs), their sources of medical care, and their satisfaction with that care.

Interviewer remarks questionnaire

This questionnaire is completed by the interviewer after every interview with the sample person. The interviewer is asked to evaluate the sample person's ability to respond to the questionnaire and to provide some information about the interview (for example, if the questionnaire was answered by proxy, the interviewer provides reasons why the proxy was necessary). The interviewer is also encouraged to provide comments that will assist the interviewer in remembering unique facts about the sample person, such as hearing or vision impairments, or that the sample person cannot read.

Facility Questionnaire

The facility questionnaire is conducted in the facility where the respondent is residing at the time of the interview. Information is obtained from facility records; therefore, the beneficiary is never interviewed directly. It was decided early in the design of the MCBS not to attempt interviews with sample persons in facilities, or with their family members. For that reason, the facility questionnaires do not ask about attitudes or other subjective items.

If an institutionalized person returns to the community, a community interview is conducted. If the sample person spent part of the reference period in the community and part in an institution, then a separate interview is conducted for each period of time. In this way, a beneficiary is followed in and out of facilities and a continuous record is maintained regardless of the location of the respondent.

Components of the Facility Questionnaire

The facility instrument consists of the following components:

- Facility eligibility screener
- Initial (baseline) questionnaire
- Core questionnaire
- Supplement to the core questionnaire

Facility eligibility screener

This questionnaire gathers information about the facility to determine the facility type. The initial interview is conducted with the facility administrator. All other interviews are conducted with the staff designated by the director. A facility screener is administered upon the sample person's admission to a new facility, and once a year thereafter (Round

Section 7: Questionnaires

55 or 2009) to capture any changes in the facility's size or composition. The screener is not administered if the sample person simply re-enters the same facility.

Initial (baseline) questionnaire (facility)

This questionnaire gathers information on the health status, insurance coverage, residence history and demographics of the sample person. This questionnaire is administered the first time the sample person is admitted to a facility.

Core questionnaire (facility)

This questionnaire parallels the core questionnaire for the community, collecting information about use of medical services and their associated costs, including the facility cost. Like its community counterpart, this questionnaire is administered in each and every interview after the first one, as long as the sample person continues to reside in the facility.

Supplement to the core questionnaire (facility)

This questionnaire is asked once a year (in Round 55) to update our information about the sample person's health status. It includes questions about the sample person's general health (including standard measures such as IADLs and ADLs), but excludes the questions about access and the subjective questions about satisfaction with care.

Table 5.1 - Components of the Community Questionnaire

IN	Introduction
ENS*	Enumeration\Enumeration Summary
HI	Health Insurance
DU	Dental Utilization and Events
ER	Emergency Room Utilization and Events
IP	Inpatient Hospital Utilization and Events
IU	Institutional Utilization
OP	Outpatient Hospital Utilization and Events
HHS*	Home Health Utilization Summary
HH	Home Health Utilization and Events
MP	Medical Provider Utilization and Events
OM	Other Medical Expenses Utilization
PMS*	Prescribed Medicine Summary
PM	Prescribed Medicine Utilization
ST	Charge Questions (Statement Series)
NS	Charge Questions (No Statement Series)
CPS*	Charge/Payment Summary
AC**	Provider Probes/Access to Care
SC**	Satisfaction with Care
UC**	Usual Source of Care
HS	Health Status and Functioning
US	Usual Source of Care
DI	Demographics/Income
IR	Interviewer Remarks

* Summary sections - Updates and corrections are collected through the summaries. The respondent is handed a hard copy summary of information gathered in previous interviews, and is asked to verify the material. Changes are recorded if the respondent notices information that is not accurate.

** The data collected in these sections is not included in this public use file. These data appear in the Access to Care PUF series.

Section 7: Questionnaires

Table 5.2 - Components of the Facility Questionnaire

Medicare Current Beneficiary Survey CY 2009 Cost and Use

Changes Beginning with 2009 Cost and Use

In the 2009 Cost and Use files, the **Medicare claims files are now Version J** from the National Claims History database. Cost and Use files 2000 - 2008 used Version I claims; Cost and Use files 1997 - 1999 used Version H claims; Cost & Use files 1992-1996 used Version G claims. The SAS input statements have been modified to read the Version J Claims. Version J Data Dictionary and the SAS Input statements can be found in Section 2, Codebooks for Medicare Claims.

RIC 2 - Health Status and Functioning Record has 4 **new** variables:

- OCCHOLE - Have you ever been told you have high cholesterol
- D_CHOLES - In the past year have you been told you have high cholesterol
- OCDEPRSS - Have you ever been told you have depression
- D_DEPRSS - In the past year have you been told you have depression
- OCPSYCH is now OCPSYCHO - "Have you ever been told you had a mental disorder, excluding depression."
- D_PSYCH is now D_PSYCHO - "In the past year have you been told you had a mental disorder, excluding depression."

RIC 2 - Health Status and Functioning Record has 1 **renamed** variable:

- OCDIABTS is now OCBETES;

RIC 2 - Health Status and Functioning Record has 3 **deleted** variables because the questions were dropped from the questionnaire.

- EINTROUB
- EMCTROUB
- EOBTROUB.

RIC 4 - Health Insurance Timeline Record has 5 **deleted** variables because the questions were dropped from the questionnaire.

- D_PLLTR1
- D_PLLTR2
- D_PLLTR3
- D_PLLTR4
- D_PLLTR5

Changes Beginning with 2008 Cost and Use

RIC A -- Administrative Identification Record - Creditable coverage information was added to RIC A. The variables that provide this status (**H_CRED01—H_CRED12**) come from the Part D enrollment data for 2008.

RIC 2 -- Health Status and Functioning Record - The variable **DCTROUB** has been changed to **FOODTRBL**. The variable title is the same “Difficulty eating solid food b/c teeth problems” but the values are different.

The values now are:

- 1 No trouble
- 2 A little trouble
- 3 A lot of trouble
- 9 not ascertained
- 8 don’t know
- 7 refused

RIC 4 -- Health Insurance Timeline Record has 5 **deleted** variables because the related question was dropped from the questionnaire in Round 47.

- (**D_INDUS1 – D_INDUS5**)

Changes Beginning with 2006 Cost and Use RIC PME

This note is intended to quickly highlight some of the notable changes to the 2006 MCBS Cost and Use drug data for those few receiving MCBS data prior to the official release of the documentation. The biggest change to the 2006 RIC PME file is that we can now match survey reported drug events to Prescription Drug Events (PDE’s) for survey participants enrolled in Medicare Advantage Prescription Drug plans (MAPD’s) or stand alone Prescription Drug Plans (PDP’s). In the RIC PME, the variable PDEFLAG should be used to determine if a PME event was “Survey only” (PDEFLAG=1), “PDE only” (PDEFLAG=2), or “Survey reported event matched to a PDE” (PDEFLAG=3). Costs for all “survey only” events were imputed using the same process used in previous years of the MCBS. Costs for “matched” or “PDE only” events were taken directly from the PDE and were not imputed.

The 2006 MCBS Cost and Use does **not** contain a separate file for administrative drug claims. Because of the limited amount of releasable information from the PDE’s, we have

decided not to create a separate administrative PDE file. Instead, we have appended the information from PDE's (both matched and PDE only) to the end of the RIC PME. Please refer to the RIC PME Codebook for a list of these variables.

In the past, the RIC PME contained only "community" drug events. While the MCBS still only collects prescription drug data in the community survey instrument, Medicare covers and receives PDE's for Part D enrolled beneficiaries residing in LTC facilities. To exclude these PDE's from the RIC PME would result in the MCBS underreporting Medicare's Part D benefit payments. To subset the RIC PDE to include only "community" drug events, use the variable CORF. PDE events with CORF='C' represent PDE's with a service dates corresponding to periods where the beneficiary resided in a community setting.

Also worth mentioning are a few outliers in the 2006 file that greatly skew drug analysis. At this time, the outliers are still included in the file while we do further investigation, however, we recommend removing these outliers from most drug analysis. The MCBS sample person with BASEID= '00957080' is of particular concern with un-weighted survey reported drug costs totaling nearly \$2.5 million. Obviously, weighting this SP's drug costs dramatically skews drug analysis. In fact, there are 7 cases where total drug expenditures exceed \$50,000.

Researchers should review these cases to determine if they should be included in any drug analysis. Below is a table of those cases showing their summarized number of scripts, total costs, and out-of-pocket costs.

BASEID	Scripts	AMTTOT	AMTOOP
00907881	121	89621.54	693.66
00915820	162	69165.89	1242.22
00916255	46	76061.89	4397.33
00923875	123	107627.8	105524.4
00933204	78	83938.97	52724.43
00957080	99	2457928	497089.6
00969467	112	50806.83	1544.63

One final note: The drug summary information in the RIC SS and RIC PS was created to be consistent with past summary files. PDE events determined to have occurred in a LTC facility setting were not included when building the summary files.

Changes Beginning with 2001 Cost and Use

RIC 1 -- Survey Identification Record now includes the household income of the respondent in the new variable, INCOME_H. It is applicable for community respondents

Section C: Changes

who do not live alone.

RIC 2 -- Health Status and Functioning – Community Record has eight new variables:

- BPTAKEN records when the most recent time the SP's blood pressure was taken.
- BCTAKEN records the last time the SP's blood cholesterol was taken.
- D_OTHHRT indicates if an SP reported other heart problems within the last year.
- D_CFAIL indicates if the SP reported heart failure within the last year.
- D_VALVE indicates if the SP reported problems with their valves within the last year.
- D_RHYTHM indicates if the SP reported having problems with their heart rhythm within the last year.
- TIMESAD indicates if the SP reported being depressed within the last year.
- LOSTINTR indicates if the SP reported losing interest within the last year.

RIC 2F -- Health Status and Functioning-Facility Record has two new variables:

- MLWLPRIM asks if the SP used a wheelchair as their primary means of locomotion.
- OTHDIAG was added to sum up a large group of survey questions that was too scarcely populated to produce meaningful data on their own. OTHDIAG counts a total number of diagnosis from the following:
 - DEGJNT “Did SP have degenerative joint disorder?”
 - DYSPHA “Did SP have dysphagia?”
 - EDEMA “Did SP have edema?”
 - OSARTH “Did SP have osteoarthritis?”
 - ALCOH “Was SP alcohol dependent?”
 - BREST “Did SP have a breast disorder?”
 - CERDAG “Did SP have cerebral degeneration?”
 - CONST “Did SP have constipation?”
 - HERNIA “Did SP have a diaphragmatic hernia?”
 - DIVCOL “Did SP have diverticula of the colon?”
 - EPILEP “Did SP have epilepsy?”
 - GASTR “Did SP have gastritis?”
 - GASTRO “Did SP have gastroenteritis?”
 - GHEMOR “Did Sp have a gastrointestinal hemorrhage?”
 - HYPER “Did SP have hyperplasia of the prostate?”
 - HYPOP “Did SP have hypopostasemia/hypokalemia?”
 - BRAINS “Did SP have nonpsychotic brain syndrome?”
 - PEPULC “Did SP have a peptic ulcer?”

RENTUR “Did SP have renal ureteral disorder?”

SCOLIO “Did SP have scoliosis?”

LEGULC “Did SP have a chronic ulcer of the leg?”

RIC 4 -- Health Insurance Timeline Record has new variables in the plan information trailers:

- D_TRI1—D_TRI5 indicates if the health plan is TRICARE For Life, a supplemental coverage plan for military personnel and retirees effective October 1, 2001.
- D_INS1—D_IN5 specifies whether the PHI plan provides comprehensive coverage or only limited service coverage such as dental-only, prescription drug-only, etc. This information was derived through an analysis of PHI plan names.
- D_RX1—D_RX5 indicates whether the PHI plan provides general RX insurance of prescription drugs or is a prescription drug discount card. This categorization is based in part on the new D_INSn variables and is used in the drug imputation process. For example, if a respondent indicates that a plan covers drugs but the plan is a single-service type, D_RXn would indicate no drug coverage in order to prevent drug imputation for all services.

A similar plan name analysis and coverage categorization was done for Other Public plans and is recorded in the variables D_INSOTH and D_RXOTH.

D_PAYSP1—D_PAYSP5 indicates if the respondent paid a premium for the plan. It has a new value in 2001: 3 = “SP pays a premium but does not know how much”.

RIC 5 -- The Survey Enumeration Record has a new variable, D_HHLT18, which counts the number of people under 18 years old that live in the household.

Cost 2001 introduces a new timeline, **RIC 10**, which shows periods of long term care stays, home health services, and inpatient hospital stays. The long term care and home health periods were identified by MDS and OASIS assessment data for the MCBS population. Inpatient hospital stays were identified through Medicare claims and survey-reported data from the RIC IPE.

Changes Beginning with 2000 Cost and Use

In the 2000 Cost and Use files, the **Medicare claims files are Version I** from the National Claims History database. Cost and Use files 1997 - 1999 used Version H claims; Cost & Use files 1992-1996 used Version G claims. The SAS input statements have been modified to read the Version I Claims. A crosswalk for the claim SAS variable names from Version H to Version I is found in Section 2, Codebooks for Medicare Claims.

Beginning in the 2000 Cost & Use **RIC 7S, the provider number, PROV, is the Medicare provider number.**

Record Layout Changes in 2000 Cost and Use:

Position 3 of every file has a new variable, **VERSION**. It is a one-character field specifying the version number of the RIC. If there are revisions to the file content after the initial release, the **VERSION** will be updated accordingly. Beginning with 2000 Cost and Use every file will contain RIC in positions 1 and 2, **VERSION** in position 3, and **BASEID** in positions 4 thru 11. Note that this change necessitated moving **BASEID** from position 6 to position 4 in RICs DUE, FAE, IPE, IUE, MPE, OPE; and moving **BASEID** from position 5 to position 4 in RICs SS and PS. However, all other variable placements remain the same as earlier years'.

The variable **CLAIMID** on the event files, RIC DUE, IPE, IUE, MPE, OPE, has been expanded from 6 positions to 7 positions. The **CLAIMID** is a uniquely assigned identification number that points to the Medicare claim that the event matched. In order to keep record layout changes to a minimum, **CLAIMID** has been expanded and the variable succeeding it, **HMO**, has been moved to the end of the record. All other variable placements remain the same.

Changes Beginning with 1997 Cost and Use

The MCBS Cost and Use files from 1992 to 1996 were very similar in format and content. Beginning with the 1997 Cost and Use file, and continuing on through with the 2000 Cost and Use file, some changes were made that are briefly described here. More detail is provided by file type in Section 3, *Notes on Using the Data*.

In the Cost & Use files from 1992 to 1996 the respondents have been categorized as residing in either the community or a facility. This categorization is based upon the type

of interview the respondent received. Individuals who had brief facility stays between community interviews are categorized as being in the community for that entire period on the RIC 9. Data about these short facility stays appears in the RIC IUE. The RIC IUE also contains data on all Medicare SNF stays that are embedded in the facility stays which appear in the RIC FAE. Consequently, some of the days associated with SNF stays are categorized as community days and some as facility days, depending on the stay length of the SNF stay and the respondent's status before and after the stay. This treatment of SNF days is reflected in counts of facility and community days and the indicator of living arrangement.

Beginning with the 1997 Cost and Use file there were several changes to the treatment of SNF stays to facilitate analysis of facility data. **Skilled nursing facility stays are separately identified** on the residence history timeline [RIC 9] and the medical event files. Thus, SNF stay days are no longer categorized as either community or facility days. The SNF stay periods are based on dates from the Medicare claims.

In addition, the **skilled nursing facility events in the RIC IUE are now represented as stays**. In the 1992 through 1996 files each SNF claim was a separate event in the RIC IUE. However, a stay is often made up of several monthly claims. Beginning in 1997 the claims were assembled to represent a single SNF stay.

Respondents that have a short SNF stay between community interviews do not receive a facility interview so there is not a RIC 7 facility characteristics record for the SNF stay. To address this situation, we added a **new file in 1997, the RIC 7S**. This file contains facility characteristics for these skilled nursing facilities based upon CMS' Provider of Service files.

CMS' files have some non-covered SNF claims. In the reconciliation between survey and claims data these non-covered claims are excluded. Skilled nursing facility non-covered claims usually represent a SNF stay extending beyond the benefit period. **Beginning in 1997, SNF claims with no Medicare reimbursement are used to create SNF stays in the RIC IUE.** Most beneficiaries with SNF non-covered claims have been in a long-term care facility and have been temporarily moved to skilled nursing care. Dollars for these SNF stays were estimated from facility-reported expenditures.

In Round 18 the facility questionnaire was converted to a CAPI interview from the conventional pen and paper interview. As part of the conversion activity the facility survey was re-designed to promote consistency with the Minimum Data Set information that CMS requires each certified nursing home to collect for each patient. As a result, the

Section C: Changes

data that is collected in the facility CAPI interview is slightly different than the information collected in either the community or the prior pen and paper facility interviews. **Beginning in the 1997 Cost and Use file these changes are reflected in the variables on the facility event file [RIC FAE] and the facility characteristics file [RIC 7]. Because of the facility questionnaire CAPI changes, a separate health status and functioning file, the RIC 2F, was created for facility respondents.**

Beginning with the 1997 Cost and Use file we modified the process for generating BASEIDs for sample persons who are newly enrolled in Medicare. In previous files the BASEIDs for the newly enrolled population began with ‘G’ and were sequentially numbered. **Starting in 1997 the BASEIDs of those newly enrolled in 1996 or 1997 begin with ‘G97’ and are sequentially numbered.** This group of newly enrolled beneficiaries is referred to as “ghosts” because they were not interviewed in during the calendar year about their use of medical services and the associated cost and payers. [see section I for a more complete discussion]. The ghosts are given an artificial BASEID so they will not be followed longitudinally. When they enter the Cost and Use files in the following year(s) as part of the continuing sample their actual data will be used along with their ‘real’ BASEID. The previous process for assigning BASEIDs for the Cost and Use files ‘reuse’ the artificial ghost BASEID. We found that this caused problems when users attempted to follow the ghost sample longitudinally, since the ghost BASEIDs are reassigned every year. Therefore, beginning in 1997 all ghosts were assigned BASEIDs beginning with ‘Gyy’ in order to make each year’s ghost BASEIDs unique.

Beginning in 1997 the situation code (SITCODE) in the inpatient hospital events file [RIC IPE] was assigned according to the living situation of the respondent as he entered the hospital. Previous files used the living situation to which the respondent was discharged.

Changes Beginning with 1996 Cost and Use

Beginning with the 1996 Cost and Use file, we refined the methodology for determining whether Medicaid was a possible payer for an event. We now distinguish whether a respondent has full Medicaid benefits or only Qualified Medicare Beneficiary (QMB) or Special Low-Income Medicare Beneficiary (SLMB) status. If an individual has full Medicaid benefits, then Medicaid is a potential payer for all medical events. If an individual has QMB status, then Medicaid is a potential payer for cost sharing amounts on Medicare covered services, but not on medical events not covered by Medicare. If an individual has SLMB status, then Medicaid is not a potential payer for any medical events.

Summary Counts

The Codebook in Section 2 provides un-weighted frequency counts of categorical variables which analysts can use to check tabulations of these variables. The Codebook does not contain similar information for continuous variables, such as cost and payment amounts. The table of weighted summary counts below is intended to allow analysts to benchmark their tabulations of MCBS payment variables. The table is created from the adjusted payment amounts from the Service Summary (RIC SS) and weighted by the person weight (CS1YRWGT) from the RIC X. The payments represent 41.8 million Medicare beneficiaries. **All payment amounts are in thousands.**

IMPUTATION OF MEDICAL COST AND PAYMENT DATA

Amy M. England¹, Katie A. Hubbell¹, David R. Judkins¹, Svetlana Ryaboy¹
Westat, Inc., 1650 Research Blvd., Rockville, MD 20850

Keywords: Gibbs Sampling, Hot Deck Imputation, Compositional Data¹

Medical cost and payment data are the primary focus of the Medicare Current Beneficiary Survey (MCBS). These data are compositional data (data where a finite series of random variables are non-negative and sum to another random variable). There is a large variety of missing patterns that are neither nested nor ignorable. A paper from last year presented a new technique for creating a complete set of compositional data while preserving all partial data and maintaining many types of consistency. This year, we present the results of applying the method to actual MCBS data on prescription drugs. Since the method is known to be extremely CPU intensive, a primary point of interest will be the feasibility of applying the method to a dataset with about 245,000 records and nine possible payment sources.

1. Introduction

The imputation of costs and payment sources for prescription medicines is a critical area for the Medicare Current Beneficiary Survey (MCBS) given the ongoing national debate about whether to expand Medicare coverage to include prescription medicines. There were a substantial number of partially complete reports about purchases of containers of prescription medicine. One solution is to impute the cost where necessary, discard partial payment data, and impute whole payment vectors as proportions to be applied to the cost. This solution was used for example on the 1987 National Medical Expenditure Survey (Hahn and Lefkowitz, 1992, p22). Judkins, Hubbell and England (1993), presented an alternate solution that allows the retention of all partial data payment and cost data. They presented an evaluation of the algorithm on an artificial example. That evaluation focused on the ability of the algorithm to minimize nonresponse bias. In this paper, we evaluate the algorithm in terms of practicality by presenting the results of its application to the 245,000 records for individual containers of prescription medicine in the 1992 MCBS.

In the following sections, we review briefly how prescription drug data are collected in the MCBS, define some notation, present some information on the patterns of missingness observed in MCBS prescription data, review the algorithm

(some improvements have been made over the version presented last year), and, finally, present results and ideas for future improvements.

2. Data Collection

The MCBS has a modified panel design where a core panel is supplemented once a year with new additions to the eligible universe and additional beneficiaries from the original cohort so as to maintain cross-sectional precision despite deaths and attrition in the panel. Interviews are conducted roughly every four months. The reference period for each interview extends from the date of the prior interview to the date of current interview. Data are collected about the utilization of health care services, the costs of these services, and expenditures (personal and third-party) for these services.

MCBS data are collected by CAPI (computer assisted personal interview). Interviewers carry laptop computers into the homes of Medicare beneficiaries and run a program that guides them through the interview. Figure 1 mimics a typical screen for collecting information about payments for a health care event after the cost has been determined. Figure 2 shows how it might look after completion. Note that the program presents a list of possible payment sources for the event and that the list is tailored to the beneficiary's insurance status and program participation. The payment sources mentioned by respondents were grouped into the nine categories shown in Figure 3. However, the interviewer does **not** read the sources out loud for confirmation or negation. Instead, the interviewer places an x to the left of each source that the respondent mentions (possibly with the aid of bills and statements) and then enters the payment amount (if known) to the right of each source. The computer automatically checks to see if payments sum to the reported cost. However, the respondent is not pressed hard to reconcile any discrepancy.

It is important to note that there are two categories of payment data. The actual payment amounts carry the most information, but the x's on the left side of the screen also carry information. As an example, the beneficiary may know that Medicaid paid something toward the cost of the container but not know the amount paid by Medicaid. The algorithm was designed to preserve both types of partial data, as well as cost data.

3. Notation

Let $\delta = (\delta_1, \dots, \delta_s)$ where $\delta_i = 1$ if the i-th source is known to have made a payment, $\delta_i = 0$ if the i-th

¹ The authors are all employed at Westat, Inc., Rockville, MD. The work was supported by the Office of the Actuary in the Health Care Financing Administration under contract #500-90-0007.

component is known not to have made a payment. Given the structure of the interview, setting the delta's was not entirely straightforward. If there was an x

next to the source, then it was clear that the corresponding delta should be 1 (whether or not the

payment amount was known). Also, if the insurance and program participation section of the questionnaire indicated that a person wasn't eligible for a particular source category, then it was clear that the corresponding delta should be 0. If, however, a person was eligible for coverage by source i , but there was no x next to source i , then determination of delta was more difficult. The rule we used was to set that delta component to 0 if the reported payment amounts summed to the cost or if analysis felt it unlikely that this source would pay given payments by other sources. Otherwise, that delta component was left missing. Let $h=(h_1, \dots, h_s)$ where $h_i=1$ if δ_i is "observed" and 0 otherwise.

Let $Y=(Y_1, \dots, Y_s)$ where Y_i is the payment by the i -th source. Let $g=(g_1, \dots, g_s)$ where $g_i=1$ if Y_i is observed and 0 otherwise. Let Y_+ be the total cost of the medicine container and g_+ indicate whether Y_+ is observed.

The total vector to be completed for each container of medicine is $\zeta=(\delta, Y, Y_+)$. Note that $h_i=0$ implies that $g_i=0$. Subject to that restriction, almost any pattern of missingness is possible.

To aid in the imputation, the analyst will typically have a set of background variables available which provide predictive information about the composition. In this application, the most important auxiliary data that we had for imputing δ was whether the person was eligible for assistance from each of the payment sources during the period when the purchase was made. We frequently also had information about the prescription such as name and strength, but these data were fully exploited in a separate exogenous imputation process that preceded our imputation work and is described below. In addition, we had a great wealth of background variables available at the person level such as income, education, region, metropolitan status, and so on. These person-level variables were thought to be important in imputing cost and payment amounts but unimportant in terms of predicting payment status (the delta vector) for each event. Without going into more detail about these background variables here, let X be a vector of background variables that are available for each event.

Let Ω_h be the set of distinct values of h realized in the sample. Let Ω_δ be the set of distinct values of δ realized in the sample.

The unique feature of compositional data that makes them so difficult to impute is that they must obey two constraints:

$$0 \leq Y_i \leq Y_+ \text{ for every } i \text{ and} \quad (1)$$

$$\sum_i Y_i = Y_+. \quad (2)$$

In this application where some information is contained in the delta vector, it is also necessary to have the constraints that

$$\delta_i=0 \text{ iff } Y_i=0 \text{ for every } i, \text{ and} \quad (3)$$

$$Y_i>0 \text{ implies } \delta_i=1 \text{ for every } i.$$

4. Data Editing and Exogenous Imputation

The raw data were not very amenable to imputation. A very intensive editing phase had to be carried out prior to imputation. Interviewers were encouraged to enter all relevant data about health care events that respondents shared with them. The data were collected over five interviews. The entire process of settling a large bill could take months and generate a lot of paperwork. As time elapsed since the health care event, it was not unusual for respondents to first share receipts with the interviewer, then insurance statements, then explanations of benefits from HCFA, then more insurance statements. Account statements from providers after insurance statements might also have been shown to the interviewer. Insurance companies might initially have rejected claims and then paid them upon appeal. Interviewers were trained to extract the best information from the paperwork submitted at a single interview, but there was less control over the entering of duplicate and/or contradictory data across interviews. Partly this was due to changes in interviewer assignments across time and partly it was due to a deliberate design decision to gather as many data as possible while in the beneficiaries' homes with the intent to sort it out later. An algorithm was developed by analysts at Westat to sift through the multiple reports of cost for the same event and to pull together the data that was felt to be best.

This was only half the editing battle, however. The other half involved cases where respondents submitted claims to insurance companies or other payment sources for multiple purchases of medicine (with or without other health care claims). Statements resulting from these claims often did not break the cost, copayment or deductible information down to the event level. The interviewer was trained to just enter the summary payment information for the claim as a whole. Staff at HCFA worked out a strategy to apportion the cost and payment information back to individual events. As part of this effort, they developed a means of exogenously imputing a reasonable total charge for many purchases based upon the name, strength, and volume of the purchase and industry data on average prices.² Thus, at the end of months of concerted effort by others, we

received a database where there was exactly one record per container of medicine. On that record was the best payment information that could be salvaged from respondent reports and the price indicated by the respondent or a price exogenously imputed by HCFA. The only records for which cost was still missing were those for which the respondent was unable to recall the name. Since interviewers were trained to only enter data about prescription drugs, the assumption was made that these containers of "little yellow pills" and "heart pills" were truly prescription drugs and not over the counter medications.

5. Missing Data Rates after Editing and Exogenous Imputation

Table 1 shows the missing data rates on the delta vectors and for the actual payment amounts given that a source is known to have made a contribution. Examining the missing rates for payment status, we see that for the most part, respondents know who paid for their prescription medicine -- or rather, we can rule out payors on the basis of insurance and program participation data. The greatest uncertainty concerns whether the beneficiary had to make a payment out of pocket and whether there was a provider discount. This is strongly influenced by the way in which the data were collected and edited. If known payments didn't add to the total charge and if there was no mention of self payment or discount, then we generally assumed that these payment sources were possible and hence missing.³ The pattern of uncertainty is quite different for payment amounts by known payors as is shown in the last column of Table 1. More than 75 percent of respondents could give us the amount of out-of-pocket payments and the amount of any discount. Knowledge about payments by other sources was generally weak. (The low nonresponse rate for Medicaid is a result of edit rules and the exogenous imputation of charges rather than of respondent knowledge.)

To place these item nonresponse rates in context, although the rates are high compared to those typically experienced on surveys on other subject matters (such as labor force behavior), we do not view them as extraordinarily high for a consumer expenditure survey. People have a difficult time saving all receipts and bills for us over the typical four-month span between interviews. The few dollars spent as a co-payment for one container of medicine three months earlier do not constitute a very salient

² Industry data on wholesale prices are available to HCFA for the administration of the Medicaid system. HCFA adjusted the wholesale prices to bring them up to likely retail levels with different factors depending upon the known payers. For example, it was assumed that Medicaid, HMOs, and VA usually paid considerably less for the same container of medicine than did individual beneficiaries at their local pharmacies.

³ There were some exceptions to this general rule. If Medicaid was mentioned as a payer, then unmentioned sources were ruled out except HMO. Also provider discount was ruled out unless mentioned when the VA or an HMO was a known payer.

event in the typical respondent's memory. Furthermore, for those who are good about collecting receipts, many let them accumulate for months before submitting claims to insurance companies. Even with the longitudinal nature of the MCBS, it is difficult to track these claims over time. Most importantly, certain classes of beneficiaries have no knowledge of the cost of their prescription medicine; this is true for those who receive their drugs from the VA, from HMOs, through Medicaid, and through other public programs.

Table 1. Missing data rates

Payment source	Frequency of unknown payment status (Yes/No) ⁴ (%)	Frequency of unknown payment amount given payment status = Yes (%)
Medicaid	3.1	27.7
Private insurance provided by employer	5.2	67.1
Sample person and/or family (out of pocket)	11.5	23.6
Other sources	0.1	86.6
HMO	2.1	55.7
Private insurance individually purchased	2.1	62.0
Veterans' Administration	0.0	72.1
Provider discount	32.5	18.1
Medicare	0.0	78.5
Total charge	n/a	14.0

6. Patterns of Missingness in MCBS Prescription Medicine Data and the Decision to Impute

Despite the high missing data rates shown above, the majority of prescriptions were fully resolved after editing and exogenous imputation in the sense that payments agreed with charge. Furthermore, there were at least some data about every prescription in the sense that it was always possible to at least rule out one or more sources. Frequently, the data on the

incomplete cases such as copayment amounts were useful and important.

A wide variety of approaches could have been adopted to deal with the incomplete cases. One approach would have been to discard the partial data (available on close to 50 percent of prescriptions) and then to either make up all the data about these prescriptions or to develop some sort of event-level weight that could be applied to complete records to weight up to the person level. Event-level weighting would have been problematic in that some people had no completely reported prescriptions at all. It would have been necessary to drop these people from analytic files altogether and give their weights to others. (In fact, a more extreme approach could have been taken of dropping everyone with at least one incomplete prescription, but that would have resulted in a very small analytic file. The exact number hasn't been tabulated yet, but it appears that the vast majority of people had at least one incomplete prescription.) Besides the confusion that event-level weights would have created among users, it was felt that the partial prescription reports often had valuable data within them that ought to be preserved.

Another approach would have been to discard just the partial payment data on the incomplete cases, keeping the total charge where it was known or exogenously imputed. This approach (similar to the one used for the 1987 National Medical Expenditure Survey) is very simple to implement since the cost can be imputed without any fear of contradicting the payment data (such as would be the case if a cost was imputed to be less than a payment). After imputing cost, the payment data can be imputed on a percentage basis using cases with complete payment patterns and similar insurance status as donors. This approach was considered and rejected out of the desire to preserve as much of the respondent-provided data as possible.

We wanted an approach that would preserve all the partial data (at least the partial data that were internally consistent), and build an internally consistent cost-payment report for each individual prescription while not distorting any important multivariate relationships as so often occurs with imputation.

Preserving the partial data while building an internally consistent record and not distorting distributions means conditioning upon important aspects of the partial data. This posed an enormous challenge since there were a total of 90 distinct patterns in the delta matrix prior to imputation for cases where the total charge was missing and 82 where the total charge was known. The next section describes how this challenge was met.

7. The Skeleton of the Algorithm

⁴ As discussed in the text, nonresponse on payment status is difficult to measure since the failure to mention a source can either reflect a definite nonpayment status for a source or a lack of knowledge. Edit rules were required to interpret the failure to mention as either a "no" or as a "don't know."

The algorithm has an iterative aspect that was inspired by Gibbs Sampling. However, it is not a strict application of that technique.

The first step is to make sure that the reported data obey the constraints and that nothing can be filled in by simple subtraction or addition. A variety of violations were found in the reported data. These violations were resolved in a separate editing step. The details of that editing will be covered in a forthcoming technical report.

The second step is to impute δ . This is done slightly differently depending upon whether the total cost is known and whether there are any known payors with unknown amounts. However, the basic idea is the same: For each element h of Ω_h , conduct a separate hot-deck run to impute the missing portion of δ , where the donors are chosen from among those cases that are already complete, the donors and missing cases are matched on X , the observed components of δ , and other available data. If the total cost is known, then that constitutes other available data that can be added to the match criteria (roughened into broad categories). If total cost is known and every known payor has a known amount, then the amount of money that must be covered by the missing deltas also constitutes other available data. Given the size of Ω_h and the three possibilities of reporting in Y and Y_+ for each element of Ω_h , a total number of 123 hot-decks were required for this step.⁵

The third step is to come up with an initial feasible solution for Y and Y_+ without worrying about how good the solution is. An initial solution is one where Y and Y_+ are complete, obey the constraints, and are consistent with δ . The hope is that, due to the iterative nature of the procedure, the starting solution is not very important. We used two different methods to complete ζ depending upon g . If $g_+=0$ (i.e., Y_+ is missing), then we sequentially imputed each corresponding Y_i with a simple hot-deck where δ_i and X were the conditioning variables. After completion of Y , we imputed Y_+ as the sum of the imputed and reported Y_i . If, on the other hand, $g_+=1$, then we counted up the number of missing Y_i thought to be positive as $m=\sum_i \delta_i(1-g_i)$ and set each of the positive missing $Y_i=(Y_+-Y_{R+})/m$, where $Y_{R+}=\sum_i \delta_i g_i Y_i$ is the sum of reported elements of Y .

The fourth step is to re-impute Y_1 for each case where Y_1 and Y_+ were both originally missing. This is done with a hot deck conditioned upon the sum of the other components of Y and on X . After Y_1 is re-imputed, its new value is added on to the sum of the other components to obtain a new value for Y_+ . This step is repeated for each of the Y_i . The motivation for the step is to improve the pair-wise consistency of the individual Y_i with the total, Y_+ .

The fifth step is to re-impute the division of Y_1+Y_2 between Y_1 and Y_2 for all cases where both Y_1 and Y_2 were originally missing. This is done with a hot deck conditioned on Y_1+Y_2 and X . The hot deck actually imputes $P_1=Y_1/(Y_1+Y_2)$. The program then computes appropriate new values of Y_1 and Y_2 . This step is repeated for each possible pair of components of Y . The motivation for the step is to improve the pair-wise consistency of the components of Y .

The fourth and fifth steps are then iterated until the national total number of dollars paid by each source stabilizes. The word "stabilizes" was chosen here rather than "converges," because it is not clear how to even define convergence in this setting. On each iteration, payments and charges are being resampled from similar cases. Since within each pool of similar donors, there is some variation, the individual values and, to a lesser extent, the national means will continue to fluctuate indefinitely.

8. Results

The algorithm was stopped after five iterations. Table 2 shows some summary information about CPU times and measures of change across iterations. The CPU times were much more modest than expected but still significant. The change statistics indicate that changes at the national level on broad measures were fairly small by the fifth iteration. This is comforting but doesn't exclude significant instability for more narrow measures. For example, the average Medicare payment changed by 5 percent from iteration 4 to iteration 5. This was perhaps not too surprising given that Medicare pays for only 1 or 2 prescriptions from every thousand and that the payment can be large when it does pay, but it does leave open the question of convergence in some broad sense.

⁵ The maximum possible number of runs is $3.2s$, or 1536 in this application with $s=9$. If s had been larger, this procedure may not have been practical. Judkins, Hubbell, and England (1993) discuss some possible alternatives.

Table 2. Selected results of applying algorithm to prescription medicine data

	CPU hours on IBM mainframe	Relative change in average cost per container (%)	Percentage of national dollars shifted among sources
Initial Solution	2.8	n/a	n/a
Iteration 1	0.9	-1.43	17.15
Iteration 2	0.9	0.21	0.58
Iteration 3	0.9	-0.09	0.39
Iteration 4	0.9	0.04	0.39
Iteration 5	1.1	0.05	0.24
Total	7.5	n/a	n/a

The covariance matrix of the delta vector, the covariance matrix of the Y vector, and the average payment amounts for each delta pattern were monitored as well throughout the imputation process. We noted that some correlations did change. It is difficult to know whether these changes were good or bad, but we can say that there was very little attenuation of correlations between payment amounts by different sources. Those that were negative tended to stay negative and those that were positive tended to stay positive. In fact, some correlations increased in strength as a result of the imputation. In particular, the correlation between the payment amount by private employer-provided insurance and the total charge was noticeably stronger after imputation. We hope to be able to share these more detailed results in a full technical report at a later date.

9. Limitations

Two limitations of the algorithm were noted. The first concerns instances where the observed data set does not contain any completely observed relevant data. The second concerns estimation of precision on the fully imputed dataset.

The algorithm was designed to preserve partial data by building a consistent financial reckoning around reported data. Furthermore, it was designed to do this in a way that minimally distorts observed payment patterns and relationships between amounts paid by various sources. To accomplish this, it relied upon observed distributions on similar but fully reported cases to decide how to identify payors and allocate dollars across sources. When there were no similar cases that were fully observed, the algorithm

created some very unintuitive results. Only one example of this has been detected so far, but there are probably others waiting to be discovered. The example involved Medicaid payments for insulin. There was not a single Medicaid respondent who could tell us either the cost or the Medicaid payment for insulin. The hot-deck program that was used to implement the program has an automatic feature for dealing with cells that have no donors. It borrows from the cell that is closest to the deficient cell in terms of hierarchical agreement on the background variables. In this case, the nearest cell was not an appropriate source of donors. As a result of this, the insulin data were redone separately from the true prescription drug data. The weakness in the algorithm that we have discovered thus concerns situations where no similar person in the sample could provide any useful data. In such situations, external knowledge must be brought into the imputation process.

Turning attention to the second limitation, users of the fully imputed dataset may be lulled into a false sense of security. A large percentage of total dollars and their allocation across payors is imputed. Yet, the user will appear to have complete data on close to 250,000 containers of prescriptions medicine for about 10,000 Medicare beneficiaries. Standard errors estimated from this dataset by conventional means will not be very accurate. We have provided resampling weights so that the variance estimates can be inflated for the complex sample design, but we have no very satisfactory way of adjusting estimated standard errors for the imputation process. Clearly, estimated standard errors will tend to be much too small. A burgeoning literature exists on methods for fully reflecting uncertainty in imputed datasets, but none of these methods seemed developed enough to use in conjunction with this new approach to imputing compositional data. For the moment, the best we can advise users is to inflate estimated variances by the inverse of the observed item response rate. A related question is what sort of variance to associate with the exogenous imputation process that was carried out.

10. Conclusions

The algorithm succeeded in creating a full set of internally consistent cost and payment records while discarding very little partial data. Indeed, the only partial data that were discarded were those that were already internally inconsistent prior to imputation. Some distributional changes were observed, but if that was not the case, then there would have been little point in doing the imputation. In other words, if analysis of the fully imputed dataset yielded the same results as analysis of just the fully reported cases, then the only reason to do the imputation would be to make tabulations easier for

analysts. Computer requirements were intensive but not as intensive as feared. We plan to continue to use the algorithm to impute cost and payment data for other medical services.

Analytic Edits of SOP Values for Non-PM Events

Analytic editing of charge and source of payment data at the event level also determined some delta values. The general goal of the analytic edits was to resolve as many events as possible (i.e., to fully allocate total charges to payers) and to set as many delta values as possible based on logic. The edits resolved some events without using a hotdeck procedure to impute payment sources or amounts.

The analytic edits relied on having both unambiguous SOP values and external information about interaction among the insurance or payment sources. Edits for three of the nine sources (Medicaid, MCOs, and VA) depended on information specific to those payers, but delta values for other payment sources were also affected. The analytic edits are discussed next as they apply to each source of payment.

Medicaid: Analytic edits were used extensively when Medicaid was a potential or actual source of payment for an event. One set of edits--designed to reflect the role of Medicaid as the payer of last resort--ensured that Medicaid could not be a payer if payments were reported or imputed for another third-party insurer (except Medicare), or if the provider was a managed care organization (MCO) or VA facility. Another set of edits was developed for dual Medicaid/Medicare eligible beneficiaries whose cost-sharing liability is covered by Medicaid.

The following Medicaid edits ensured that Medicaid and another payer (except for Medicare and out-of-pocket) were never both sources of payment for the same event:

1. If private insurance, the VA, an MCO, or other private or public insurance (not Medicaid or Medicare) was a source of payment for an event, it was assumed that Medicaid was not also a payer (even if the respondent had reported a Medicaid payment) and the Medicaid delta component was set to 0.¹
2. If Medicaid was reported as a definite payer for an event, all other payers with a delta value of missing were “turned off” as potential payers (set to 0).²
3. If the Medicaid delta value was missing (i.e., Medicaid was a potential but not definite payer for an event), and it was uncertain whether out-of-pocket, other public insurance, MCO, VA, or uncollected liability were sources of payment (i.e., their corresponding delta values were missing), it was assumed that Medicaid was a more likely payer and the delta values for the other payers were set to 0.

4. If, after the delta value imputations (described below), both private insurance and Medicaid were imputed as payers for an event, it was assumed that Medicaid was not a payer and its delta component was reset to 0.

Out-of-pocket payments were allowed when Medicaid was a payer only if the respondent was able to report the out-of-pocket amount. Medicaid usually picks up copays and deductibles for dual eligibles and Qualified Medicare Beneficiaries and the respondent has no out-of-pocket costs for Medicare-covered services.

Private and Medicare MCOs: MCOs (especially Medicare-contracting MCOs) often operate differently than other third-party payers and tend to have unique payment patterns. For instance, risk and (to a lesser extent) cost Medicare MCOs are paid a set fee per enrolled Medicare beneficiary (called a capitated amount) designed to compensate the MCO for the expected costs of delivering Medicare's package of benefits. There are no Medicare claims or Medicare or insurance statements indicating the total charge for events covered by the capitated amount. Often the respondent only knows the copay amount, if there was one. Also, MCOs often provide "Medigap"-type coverage by paying for most of the deductibles and copays for Medicare-covered benefits. A beneficiary who belongs to an MCO does not need private Medigap insurance or Medicaid coverage for these amounts. Thus, payment patterns for MCO beneficiaries tend to be simpler than those for fee-for-service beneficiaries. The set of analytic edits for MCOs attempted to account for these simplified patterns and for the respondent's usual inability to report charges and payments for events. The MCO edits also attempted to avoid creating "illogical" payment patterns.

1. If an MCO beneficiary reported a whole dollar total charge that was \$15 or less, if the reported out-of-pocket amount equaled the reported total charge, and if there was no insurance statement, the reported total charge most likely represented only the beneficiary's out-of-pocket cost, not the full cost of the event. Therefore, the total charge was set to missing and imputed later in the program. In addition, the delta component for MCO was set to 1 and all other payers (except for out-of-pocket) were set to 0.
2. An SOP value of 3 for dental and medical provider events for MCO beneficiaries had a different interpretation than for other payers. MCO members were asked if the dental or medical provider service had been delivered by one of the MCO's providers or by an MCO-referred provider. If the answer to either of these questions was "yes," the MCO SOP value was set to 3 and the corresponding delta value was set to 1 instead of missing.

3. If an event occurred while the sample beneficiary belonged to a Medicare MCO, if the MCO was reported as a definite payer, and if there was no matching Medicare claim and no insurance statement, all other payers (including Medicare) except out-of-pocket were assumed not to have paid for the event.³
4. If the MCO was a definite payer for an event, but information on the amount of the MCO's contribution or the total charge was unknown, other potential payers (excluding Medicare) with missing delta values were set to 0.⁴
5. If the MCO was a definite payer for the event, but information on the amount of the MCO's contribution or the total charge was unknown, other payers (including Medicare) with missing payment amounts were set to 0 even though the respondent reported them to be payers.
6. In some cases, the amount paid by the MCO was less than the total reported charge for an event and there were no other reported payment sources. For these events, one other payer's missing delta component was set to 1 to receive the residual dollars, in the following order: out-of-pocket, uncollected liability, Medigap insurance, private employer-sponsored insurance, other insurance, VA. Out-of-pocket was listed first as the most likely payer to have paid the remaining amount for an MCO event.
7. If the delta value for MCO was missing and if VA was a payer for the event or if there was an insurance statement, the MCO delta component was set to 0. It was assumed that the sample beneficiary's MCO would not be liable for any costs for VA-provided services. It was also assumed that if the respondent had a statement that did not indicate that the MCO paid for the service, the MCO most likely was not a payer.

Veterans' Administration (VA) coverage: If VA was a payer, no uncollected liability amounts were allowed. As both the insurer and provider of services, the VA does not "charge" more than it will be reimbursed by other payers. In this respect, services provided by the VA are similar to those provided by MCOs.

General Edits: At the beginning of the analytic editing, and after each main section of edits, an attempt was made to resolve events through addition or subtraction. Events without a known total charge but with a complete payment vector (i.e., each payer was identified as either having paid or not paid for an event and each payer's amount was known) were completed by summing across all payment sources to derive the total charge. Events with a known total charge and complete except for one missing payment amount or payment source were completed by subtraction. The excess of charges over

known payment amounts was attributed to the known payer, or the one missing delta was set to 1 and the excess allocated to that payer.

If a service was provided free of charge, all delta values and payment amounts were set to 0.⁵

If a source was a potential payer for an event, or if the respondent reported that the payer had contributed to an event but did not know the amount, it was assumed that the payer was not actually a source if the current sum of reported payments equaled the reported total charge.

Notes:

-
1. The interaction of Medicaid and the category “uncollected liability” was handled slightly differently. If Medicaid were only a potential payer for an event but the SP had reported there was some uncollected liability, Medicaid was assumed not to have paid for the event. However, if the SP reported that Medicaid had paid for an event, it was assumed there was, in fact, no uncollected liability even if the SP had reported one. In many states, Medicaid payment rates are less than Medicare’s and the state bases its copayment amounts on its own approved provider rates so that there is no “uncollected liability.”
 2. Medicare was not included in this edit since its delta value was never missing.
 3. In these cases, it was also assumed that any total charges reported by the SP were probably not accurate since, without an insurance statement, Medicare HMO beneficiaries rarely know the total charge for an event. The total charge for the event was set to missing and imputed later in the program.
 4. If the amount of the HMO’s contribution or the total charge was not reported, other potential payers could be turned off without creating inconsistent payments and charges for the event.
 5. If the event was reported as free, but the SP had also reported that a source other than Medicare or Medicaid had paid something for the event, the total charge was set to missing and imputed.

Setting SOP Flags

Each sample beneficiary's health insurance time line, survey-reported events and Medicare claims were used to establish an indicator variable (SOP flag) for each of the source of payment (SOP) categories. Information in the SOP flags was, in turn, used to determine the corresponding delta variables, which were used in imputation to determine whether or not a possible source of payment actually paid something toward the cost of an event.

This appendix outlines the rules that applied to the process of setting the values of the SOP flags. SOP flags can have one of five possible values:

- 0 = Source definitely did not pay
- 1 = Source reported as a payer, amount known
- 2 = Source reported as a payer, amount unknown
- 3 = Source possibly a payer, beneficiary was covered at the time of the event by applicable insurance
- 4 = Source possibly paid, but dates of insurance coverage, or of the event itself, are not clear

Setting initial values

SOP Medicare Medicare Part A and Part B entitlement dates established the period of Medicare coverage.

1. If the sample beneficiary was entitled to Medicare Part A benefits, Medicare was a potential source of payment for: Inpatient hospital -- "IP" events, SNF -- "IU" events and Home Health -- "HP" and "HF" events. The initial value of the Medicare SOP flag was 3 (possible payer) for these event types.
2. If the sample beneficiary was entitled to Medicare Part B benefits, Medicare was a potential source of payment for: Outpatient hospital -- "OP" events and Part B Physician/Supplier services -- "DU", "ER", "HP", "HF", "MP", "SD", "SL" and "OM" events. The initial value of the Medicare SOP flag was 3 (possible payer) for these event types.

SOP Medicaid If either the respondent or CMS administrative data indicated that the sample beneficiary had Medicaid coverage, the Medicaid SOP flag was initially set to 3 for all events which occurred during the period of Medicaid coverage.

SOP Managed care The managed care flag was set based on information in the beneficiary's health insurance time line and CMS' administrative records of managed care enrollments.

1. If CMS administrative records indicated that the beneficiary was enrolled in a Medicare managed care plan but the beneficiary did not report the enrollment, the Managed care SOP flag was initialized to a value of 4 for all events that occurred during the beneficiary's enrollment.
- 2) We set the HMO SOP flag to 4, for all events except DU, MP, and PM, if the Health insurance section shows that the SP was in an HMO, whether or not it is a Medicare HMO.
3. For DU and MP events where HMOASSOC and HMOREFER are applicable, if either HMOASSOC or HMOREFER = 1, the MCO SOP flag was set to 3 (possible payer, coverage definite); otherwise, if the respondent answered don't know (-7, -8 or -9) to either HMOASSOC or HMOREFER, the MCO SOP flag was set to 4 (possible payer, coverage not definite); else we set the MCO SOP flag to 0 (managed care organization did not pay).
4. For PM events, the MCO SOP flag was initialized to 3 if the respondent indicated that the MCO covers dental services, otherwise the MCO SOP flag was initialized to 4.

SOP Veterans Administration Information about the VA as a payment source was provided in the interview, by the respondent.

1. For all event types except prescription medicines, if the respondent indicated that the service was provided by a VA hospital or clinic, the VA SOP flag was set to 3; if the respondent was not certain that the service was provided by the VA, the VA SOP flag was set to 4; else the VA SOP flag was set to 0.
2. For drug events, the VA SOP flag was set to 4 if the VA paid a known amount for some other drug in the same round.

SOP Private health insurance - employer based Information about private health insurance as a payment source was provided in the insurance section of the interview, by the respondent, and through insurance statements. Information about the source of the policy (used to differentiate between employer-sponsored, and individually purchased

private health insurance) was also provided by the respondent in the insurance section of the interview.

1. The employer-sponsored PHI SOP flag was set to 3 for all types of services, except prescribed medicines, which occurred while the sample beneficiary was covered by employer-sponsored health insurance, based on the health insurance time line and the date of the event.
2. For prescribed medicines, employer-sponsored health insurance was considered a possible source of payment (initial value SOP=3) if the respondent said that the plan covered drugs. If the respondent said that the plan did not cover drugs, but reported a specific amount the plan paid for another “PM” event, the employer-sponsored PHI SOP flag for all “PM” events during the same round was set to 4.
3. If the event date was missing or ambiguous and the sample beneficiary’s insurance coverage changed during the round, the employer-sponsored PHI SOP flag was set to 4 instead of 3 where applicable.

SOP private health insurance--individually purchased Information about private health insurance as a payment source was provided in the insurance section of the interview, by the respondent, and through insurance statements. Information about the source of the policy (used to differentiate between employer-sponsored, and individually purchased private health insurance) was also provided by the respondent in the insurance section of the interview.

1. The Individually Purchased PHI SOP flag was set to 3 for all event types, except prescription medicines, which occurred while the sample beneficiary covered by individually purchased private health insurance, based on the beneficiary’s health insurance time line and the date of the event.
2. For prescription medicines, the Individually Purchased PHI SOP flag was set to 3 if the respondent reported that the individually purchased PHI plan covered drugs. If the respondent said the plan did not cover drugs, but reported a specific amount the plan paid for another prescription medicine, the Individually Purchased PHI SOP flag was set to 4 for all prescription medicines reported in the same round.
3. If the event date was missing or ambiguous, and the sample beneficiary’s insurance coverage changed during the round, the Individually Purchased PHI SOP flag was set to 4 instead of 3 where applicable.

SOP out-of-pocket and SOP uncollected liability

The out-of-pocket and uncollected liability flags were not set based on health insurance time lines. In many cases, these two categories could not be ruled out as payers based on the health insurance time line, or even after the claims match.

SOP other public insurance

1. For all events except prescription medicines, the Other Public SOP flag was set to 3 if the respondent reported coverage by “other public insurance”.
2. For prescription medicines, the Other Public SOP flag was set to 4 if the SP reported that “other public insurance” paid a known amount for another medicine in the same round.

Updating SOP flags using survey-collected cost data

The initial values of the SOP flags were updated when survey-collected cost data provided more definitive information. If the respondent reported the amount the payer paid, the appropriate SOP flag was set to 1. If the respondent did not know how much the payer paid, the SOP flag was set to 2.

Updating SOP flags based upon matching Medicare claims data

The initial values of the SOP flags were also updated when the utilization could be linked to Medicare claims records.

Matched utilization and Medicare “claims only” utilization The Medicare payment amount and the Medicare SOP flag were updated if the survey-reported utilization matched Medicare claims data, or if the Medicare claims data provided the only record of the utilization. If the Medicare claims record showed a positive, non-zero Medicare payment, the Medicare SOP flag was set to 1, to show that the payment amount was known and would not have to be imputed. If the claims record showed that the sample beneficiary’s Medicare benefits were exhausted, the Medicare SOP flag was set to 1, and the Medicare payment amount was set to \$0.00. If the claims record indicated that the service was not a Medicare covered service or that the beneficiary did not have Medicare coverage for the service, both the Medicare payment amount and the Medicare SOP flag were set to zero.

If the claims record showed that Medicare was a secondary payer, the appropriate SOP flag for the primary payer was set to 1 (identifying the insurer as the primary payer), and the Medicare claim was used to develop the amount paid by the private insurer.

Unmatched “survey only” utilization The Medicare SOP flag was set to zero for all unmatched survey events unless the Medicare SOP flag already had a value of 1 or 2.

Resolving Conflict between Person Level Survey Reported Health Insurance information and Event Specific Survey Reported Source of Payment Data

For a very limited number of events (less than .5%) the reported source of payment data conflicted with the individuals reported health insurance information. In these situations we forced the payment data to conform to the health insurance data for the following payers: Medicaid, Employer Sponsored Health Insurance, VA, HMO coverage, and Medigap insurance. Since Out-of-pocket and Provider Discount are always potential payers there were no inconsistencies for these payer categories. Inconsistencies in Medicare SOP data were not resolved, but unmatched survey reported events with Medicare reimbursement were excluded from the payment summaries.
